CONTENTS

REVENUE ACT OF 1951

MONDAY, JULY 23, 1951

UNITED STATES SENATE,
COMMITTEE OF FINANCE,
Washington, D. C.

The committee met, pursuant to recess, at 10 a. m. in room 312, Senate Office Building, Clyde R. Hoey presiding.

Present: Senators Hoey, Millikin, Taft, and Williams.

Also present: Elizabeth B. Springer, chief clerk; Colin F. Stam, chief of staff, Joint Committee on Internal Revenue Taxation.

Senator HOEY. The committee will come to order.

Mr. G. G. Tegnell of the New York State Chamber of Commerce was to testify this morning, but he sent in a statement and asked that it be inserted in the record, so I will give that to the reporter to place in the record.

(The prepared statement of Mr. G. G. Tegnell follows:)

CHAMBER OF COMMERCE OF THE STATE OF NEW YORK,
New York 5, N. Y.

To the Members of the Finance Committee of the United States Senate:

The committee on taxation of the Chamber of Commerce of the State of New York has given careful consideration to H. R. 4473. The committee has concluded that it is such an unsatisfactory bill that it cannot be amended; and that it should be rejected by the Senate Finance Committee.

INDIVIDUAL INCOME TAX RATES NOW AT LIMIT

It is the opinion of our committee that the limit in individual income taxes has been reached and that no further increases should be made in this area.

The flat 12½-percent increase in the individual taxes proposed in H. R. 4473 is unrealistic and inequitable. It would add strong inflationary pressures through further discouragement of savings, so needed for expansion of productive facilities. It would further discourage incentives, particularly on the part of younger, ambitious persons, to work and establish new businesses of their own. It would impose tremendous new burdens on present taxpayers who are already bearing such a disproportionate share of the tax load. Any increase in this burden could have catastrophic consequences for our economy and society.

THE CORPORATE INCOME TAX

Corporation income taxes were substantially increased in the Revenue Act of 1950, and the present rates for normal and surtaxes combined are very close to the limit for this kind of taxation without serious detriment to our economy. The proposed increase of 5 percent, in the opinion of our committee, definitely raises the total past that limit, and it should be rejected.

THE EXCESS PROFITS TAX

There can be no justification for the changes in so-called excess-profits taxation as incorporated in H. R. 4473. Definite assurance was given by the House that no increases in the excess-profits tax would be made without hearings being afforded to businessmen to present their views on the various provisions of the act. The increases made by the committee in H. R. 4473, without any discussion allowed to the House, should be rejected in toto. They would add greatly to the inflationary effects inherent in this type of taxation, and they would aggravate the discriminations of the present law. If any changes are to be made in the present act, the opportunity for a reconsideration of all of the provisions of the act should be given.

EXCISE TAX INCREASES

The increases in excise taxes in H. R. 4473 fall almost entirely on a few products which are already heavily taxed. It is the opinion of this committee that it is unfair and unwise to levy heavier excise taxes on these products alone.

DOES THE FEDERAL GOVERNMENT NEED ADDITIONAL REVENUE

In his recent testimony, Treasury Secretary Synder indicated that Federal expenditures for the 1951-52 fiscal year would approximate $68.4 billion. He estimated receipts from current taxes at present rates at $58.5 billion.

In this connection it should be noted that the net receipts of the Federal Government for the first 6 months of the calendar year 1951 totaled $29.7 billion—or an annual rate of return of approximately $60 billion at the present level of economic activity.

It must be borne in mind, moreover, that the effects of the Revenue Act of 1950 and the excess profits tax bill of 1950 have not yet become fully known. Many of the provisions of these measures were not completely effective until 1951. There has not been sufficient time, therefore, to verify the expectancy of yield of these tax increases already levied.

Taking into consideration the continuing growing volume of employment, as well as increases in personal income and the rate of industrial production, there is every reason to believe that the yield of present taxes will increase substantially over the current rate of receipts.

If Secretary Snyder's estimated receipts fall as far below the actual figures as the estimate made 6 months ago for the fiscal year ending June 30, 1951, his $58.5 billion figure can be increased by $4 to $5 billion.

The Federal Government closed its books on fiscal 1950-51 with a net surplus of $3.5 billion. The actual cash surplus exceeded $6 billion.

In the opinion of the committee, the yield of present taxes at present rates, with the application of the surplus remaining from 1951, can result in sufficient revenues to balance the proposed 1952 expenditures, if reasonable and necessary economies are made. No further tax increases are necessary at this time, therefore, to maintain the Federal Government on a pay-as-you-go basis. This would appear to make it unnecessary to rush through any revenue act at this time.

THE NEED FOR FEDERAL GOVERNMENT ECONOMY

The President has urged the citizens of this country to tighten up their belts and reduce expenditures.

Our committee believes that the Federal Government should do likewise, and that a substantial reduction in the 1951-52 budget, both civilian and military, can be effected without curtailing the necessary activities of Government or the preparations for more adequate defense.

It is not necessary here to document again the need for greater economy in the operation of the Federal Government. The Members of Congress are well aware of the overwhelming demand for substantial reductions in Federal spending through elimination of unnecessary and wasteful operations and personnel. It is squarely up to Congress to effectuate the economies so urgently demanded; and we urge increased and more vigorous action to accomplish this essential goal.

TYPE OF TAX BILL TO BE LATER CONSIDERED

If it should be determined at some later date that additional Federal revenues are immediately required, our committee recommends that a consumption or retail sales tax would best serve the needs of the Treasury for such revenues. Such a tax would be immediately productive, and in addition, it would be anti-inflationary in effect in contrast to the seriously inflationary aspects of H. R. 4473.

Our committee urges, therefore, that early consideration be given by the Senate Finance Committee and by the House Ways and Means Committee, to the preparation of a consumption or retail sales tax which could be put into effect if, as and when needed.

Respectfully submitted.

PERCIVAL F. BRUNDAGE, *Chairman,*
DUNCAN G. HARRIS,
CHARLES A. HOYLER,
EDMOND E. LINCOLN,
CEDRIC A. MAJOR,
HENRY G. WOOD,
Of the Committee on Taxation.
ROBERT L. HAMILL, *President,*
GEORGE H. COPPERS,
Chairman, Executive Committee.

Attest:

B. COLWELL DAVIS, Jr.,
Executive Secretary.

NEW YORK, *July 18, 1951.*

Senator HOEY. The first witness is Joseph H. Ball.

Senator, we are glad to have you come and testify. Give your name and identify who you represent.

STATEMENT OF HON. JOSEPH H. BALL, VICE PRESIDENT, ASSOCIATION OF AMERICAN SHIP OWNERS

Mr. BALL. My name is Joseph H. Ball, vice president of the Association of American Ship Owners, which has offices at 1713 K Street NW., in Washington, D. C., and 90 Broad Street, New York.

The association comprises a number of old and well-established shipping companies, none of which have ever been subsidized. They operate in both the foreign and domestic trades.

Senator MILLIKIN. It is good to see you, Senator.

Mr. BALL. Thank you, sir.

Mr. Chairman, I understand that time is limited. I came prepared to put this statement in the record, and I wish to make an oral statement.

Senator HOEY. It will be entirely agreeable, if you desire to insert it in the record and make an oral statement.

I might say, as the supreme court of my State said to me the first time I appeared before it and the chief justice who was presiding—I asked how much time I had and he said 30 minutes. He said, "I understand the court will not hold it against you if you do not use it all." So the committee will pursue the very same policy.

Mr. BALL. Mr. Chairman, we are interested in an amendment to the excess profits tax law and we are urging the Senate Finance Committee in its consideration of H. R. 4473, to include a relief provision for unsubsidized companies which have deposited over $200,000,000 in construction reserve funds, established under section 511 of the Merchant Marine Act of 1936.

With the increases in tax rates that have taken place since 1946 and 1947, when most of these deposits were made, the conditions under which they were made have changed materially for the worse for the people who made the deposits.

I am sure that this committee will recall that when the excess profits tax bill was under consideration in the Senate in 1950 the Senate did adopt an amendment giving relief to shipowners who had deposited funds in both section 511 funds and in section 607 funds.

There are two opportunities for tax benefits under section 607 but they apply only for the subsidized shipping companies, those receiving an operating differential subsidy, of which there are some 13 companies.

However, the Senate amendment to the excess profits tax bill was deleted in conference. The House conferees, as I understand it, insisted that the Treasury needed more time to study the proposal and comment on it.

We are not concerning ourselves at this time with section 607 funds. They are quite a different problem from the 511 funds because they are in effect only as long as an operating differential subsidy contract is in effect. The 511 funds are open to any shipping company, whether it is subsidized or unsubsidized but, in fact, were used only by the unsubsidized lines because the so-called tax benefits under section 607 were much greater than under 511.

Section 511 is somewhat comparable to section 112 (f) of the Internal Revenue Code dealing with involuntary conversions.

The section provides that if a shipowner's vessel is lost or sold, and the proceeds of the purchase or the requisition of the vessel are deposited in a construction reserve fund, which is administered under rules adopted jointly by the Treasury and the Department of Commerce, that any capital gains resulting from that loss or purchase are not recognized for tax purposes as long as the funds are used within a specified time, which is 2 years with a permissible extension for 2 more years, to purchase or build a new vessel.

The purpose of section 511, of course, was to offer shipowners an incentive to convert their capital gains into ships as rapidly as they were realized. The incentive was the fact that they could use the 25 percent tax they otherwise would pay to increase their capital investment, and pay that back in lower depreciation over the life of the vessel.

The entire gains were not recognized in the tax basis of the vessel which meant that, for instance, if a shipowner used a million dollars in capital gains in 511 funds to buy a ship, the tax basis of the ship was zero, so that he could take no depreciation over the life of the vessel and, in effect, paid the 25 percent capital gains tax, if the vessel earned its depreciation over its life, at the rate of 38 percent, the combined normal and surtax income rate.

That was a fairly high price to pay for the immediate use of the capital, since the owner always was liable for capital gains tax when he disposed of the vessel if he realized any gain.

When the combined corporate normal and surtax rate was 38 percent, which it was in 1946 and 1947 that was one thing. But today the shipowner is paying a pretty high price for taking advantage of that section, as this Government wanted him to, because the combined normal and surtax rate is now 47 percent. The pending bill proposes to increase it 2 percent, and we have an excess profits tax of 30 percent in addition, and of course, these vessels bought with 511 funds do not enter into the owner's invested capital base for the excess profits tax, so he is caught again there and he is subject to the over-all tax rate now of 62 percent, which the pending bill proposes to increase to 70 percent, so that he is going to pay back this 25 percent capital gains tax which was deferred at a rate nearly three times as high. That is a very different situation from the 38 percent rate on which he made his calculations when he originally put the funds into the 511 construction reserve fund.

Actually, of course, the incentive did work very well. The figures show that by the end of 1949 shipowners had invested $264 million plus in the 511 funds, and had used $222 million of it to buy ships.

There is an actual example in my statement showing the effect of the reduction in tax base, resulting from the application of 511 on a shipowner purchasing a vessel out of section 511 funds with the taxes of a shipowner who bought the same priced vessel out of non-511 funds, free funds, in other words.

The comparison shows that as of today, if they are both in the 30 percent excess-profits tax rate, the shipowner who used 511 pays $87,780 taxes on $114,000 of earnings, whereas the shipowner who did not use it pays $30,080 on the same earnings because he can take the 5 percent-a-year depreciation, which is the normal depreciation, plus the fact that he has a larger invested capital base on which to compute his excess-profits earnings.

We have submitted in the brief two alternative proposals to correct this. One is an amendment to the excess-profits tax directly; the other would add a new subsection to section 511 of the Merchant Marine Act. Both would have exactly the same effect. They would permit a shipowner who had invested funds in a construction reserve fund under section 511 one option in his 1951 tax year to go back and unwind the whole transaction, to pay the 25 percent capital-gains tax which he did not pay, less a credit for the higher income and excess-profits taxes he has paid in the intervening years due to the fact that he took advantage of section 511. The option could be exercised only once; it would be irrevocable once made.

I think that it has one advantage. I understand that the Treasury prefers that the tax basis of a corporation for both the normal and surtax and the excess-profits tax be the same; in other words, that you do not have one capital base or depreciation base for the normal tax, and a different one for the excess-profits tax.

The amendment which the Senate adopted last year would have applied only to excess profits and a vessel owner who took advantage of it would have had one base for the normal income tax and a different one for the excess-profits tax.

The proposal we make would give him the same tax valuation for both the normal and the excess-profits tax.

The language we propose, and we are not too insistent on this point, does not provide for payment of any interest either on the capital gains tax which the shipowner would pay or on the refund of income taxes and excess profits taxes with which the Government would credit him.

We did not include interest because under section 511 as it now stands if a shipowner has moneys still on deposit in his construction reserve fund and has not put it into ships he can withdraw it now, pay the 25 percent capital gains tax without interest, and have the capital free.

It seemed a little unfair to penalize, by charging interest, the shipowner who had deposited the funds and used them for the purpose intended, which was to buy new ships.

I think that is about all I have to say, Mr. Chairman. I appreciate very much this opportunity to present the problem, and I hope that we can get the Treasury views on it this time.

Senator HOEY. Do you have any questions at this time?

Senator MILLIKIN. Senator Ball, have you talked to Mr. Stam on it?

Mr. BALL. I have not talked with him recently. I talked with him last year, when this-----

Senator MILLIKIN. May I suggest that you get in touch with him and have a talk with him so that we can bring the whole matter up to date from the technical standpoint.

Mr. BALL. I will do that, Senator.

Senator HOEY. Thank you very much, Senator.

Mr. BALL. Thank you, Mr. Chairman.

(The prepared statement of Joseph H. Ball follows:)

STATEMENT OF JOSEPH H. BALL, VICE PRESIDENT AND WASHINGTON REPRESENTATIVE OF THE ASSOCIATION OF AMERICAN SHIP OWNERS

My name is Joseph H. Ball. I am vice president of the Association of American Ship Owners, which has offices at 1713 K Street NW., Washington, and 90 Broad Street, New York. Our association comprises some of the oldest and best-established shipping companies operating under the American flag in both the domestic and foreign trades. None of them has received any subsidy from the Federal Government under the Merchant Marine Act of 1936. A list of the member companies of the association is attached as exhibit A.

On behalf of the association, I respectfully urge the Senate Finance Committee, in its consideration of the pending revenue bill, H. R. 4473, to include a relief provision for unsubsidized shipping companies which have deposited upward of $200 million in construction reserve funds set up under section 511 of the Merchant Marine Act, 1936, and have constructed vessels with the funds so deposited. These companies are penalized severely, as compared with companies which made no such deposits, as a result of the increases in corporation normal and surtax income rates and enactment of the excess-profits tax.

Members of this committee will recall that when the excess-profits tax was under consideration in 1950, the Senate included in the bill it passed a provision granting relief both to shipowners with section 511 funds and to subsidized ship operators who had made deposits of both capital gains and earnings in funds authorized by section 607 of the Merchant Marine Act, 1936. The entire provision was deleted from the bill in conference, the House conferees contending that the Treasury had not had sufficient time to study and report on the proposed language. Because of the very substantial differences in section 511 and section 607 funds, our association is not attempting to deal with the problems of section 607 funds in its current presentation, but is confining itself entirely to the tax problems faced by the unsubsidized ship operators who utilized the provisions of section 511 of the Merchant Marine Act.

Section 511 of the Merchant Marine Act is comparable to section 112 (f) of the Internal Revenue Code dealing with involuntary conversions. Ordinarily if a shipowner's vessel is lost, sold, or requisitioned, and the insurance proceeds on account of the lost, or the proceeds from the purchase or requisition exceed the depreciated tax basis of the vessel, a taxable gain would be recognized and taxed at the maximum 25-percent rate. Section 511 of the Merchant Marine Act, 1936, defers recognition of this gain if the shipowner deposits such proceeds in a construction reserve fund, which is regulated jointly by the Secretary of the Treasury and the Secretary of Commerce. Nonrecognition of the gain ceases to apply, however, unless the funds deposited are obligated within a designated period of time to purchase or construct a new vessel (the period is 2 years initially with extensions up to 2 years additional at the discretion of the Secretary of Commerce). If the funds are obligated within the designated period, the tax basis of the new vessel so purchased or constructed is reduced by the entire amount of the unrecognized gains used in acquiring the vessel. If the deposited proceeds are not obligated within the designated period to purchase or construct a new vessel or vessels, the original gain is recognized and included in the shipowner's gross income for the year in which it was realized, and the deferred tax then becomes due. The same result likewise follows if the shipowner withdraws gains on deposit for any purpose other than acquisition of a new vessel. In neither case, however, is interest payable on the deferred tax.

The purpose of section 511 of the 1936 act obviously was to encourage the reinvestment of capital gains in shipping enterprises. The incentive offered was deferment of the 25-percent tax on such gains for as long as the funds remained invested in ships. That the incentive worked reasonably well is indicated by the fact that through October 31, 1949, unsubsidized shipping companies had deposited a total of $264,512,540 in section 511 construction reserve funds and had obligated $222,582,483 of such funds for purchase of new vessels (table XXII-D, p. 328, S. Rept. 2494, Committee on Interstate and Foreign Commerce, 81st Cong., 2d sess.).

Shipowners who made these deposits of capital gains and used them to acquire ships are finding today that the price they thought they were paying in using section 511 has almost gone through the roof and appears to be still rising. When the combined normal and surtax rate on corporations was 38 percent the price tag was high enough. In return for deferment of the 25-percent capital-gains tax, the shipowner who used his deposits to acquire a new vessel paid tax at the rate of 38 percent a year on depreciation he might otherwise have taken on the vessel that he acquired. That is to say, if he had not used section 511 he would have gotten the benefit of depreciation on the full cost basis, whereas by using section 511 he gave up the benefit of depreciation on the portion of the cost that was financed with unrecognized gain. Hence, the original price to the shipowner of using section 511 was the difference between 25 percent of the gain and 38 percent of the gain—the latter spread over the vessel's useful life.

However, with the combined normal and surtax rate on corporations now increased to 47 percent, and the pending bill proposing to increase it to 52 percent, with an excess-profits tax rate of 30 percent in addition, and the pending bill proposing to reduce the credit to 75 percent of normal profits and to increase the over-all ceiling to 70 percent, the cost of the incentive to buy ships in section 511 has become terrifically high. For the privilege of having his original capital-gains tax deferred (not excused, since whenever the vessel is liquidated the tax once again becomes payable), the shipowner who acquired a new vessel with section 511 funds is now confronted with a possible tax liability on the depreciation he cannot deduct at a rate almost 3 times that of the 25-percent capital-gains tax rate. This situation, which no one in 1946 or 1947 could have foreseen, works a very serious inequity on the shipowner who took advantage of section 511, as his Government wanted him to do, as compared to the shipowner who did not utilize section 511 at all.

The effect of the reduction in tax basis provided by section 511 can perhaps best be illustrated by comparing the taxes of a shipowner purchasing a vessel out of section 511 funds with the taxes of a shipowner purchasing a vessel out of nondeposited funds. For this illustration let us assume that shipowner A lost a World War I vessel in World War II after it had been fully depreciated for tax purposes and that he received $1 million of insurance proceeds on account of his loss. Let us further assume that, instead of paying the $250,000 tax gains tax thereon, he deposited all of the proceeds in a section 511 construction reserve fund and on January 1, 1947, withdrew the $1 million so deposited in order to purchase a new vessel. By way of comparison, let us assume that shipowner B purchased a similar vessel on the same date out of $1 million of nondeposited funds.

Because shipowner A's vessel was purchased entirely out of nonrecognized gains, section 511 (d) requires that his vessel's tax basis be zero, whereas the basis of shipowner B's vessel would be the full $1 million. If the depreciable life of the vessels is deemed to be 20 years, then shipowner B is entitled to an annual depreciation allowance of $50,000, being 5 percent of his $1 million basis, whereas shipowner A's annual depreciation allowance, being 5 percent of his zero basis, is also zero. In each of the years when corporate tax rates were 38 percent, shipowner A's taxes would therefore have been $19,000 (38 percent of $50,000) more than shipowner B's taxes. In the course of 20 years with taxes at the same 38-percent rate, shipowner A would pay, in lieu of his original $250,000 capital-gains tax liability, $380,000 more in income taxes than shipowner B.

When shipowner B purchased his vessel in 1947, he could not foresee that excess-profits taxes would be enacted and that he might in fact be obligating himself to pay his deferred 25-percent tax at rates as high as 70 percent and, further, that he would be denied any recognition for his investment in his vessel if his excess-profits taxes were computed on an invested-capital basis.

The wide disparity in taxes payable by shipowner A and shipowner B under the new combined normal and surtax rate and the new Excess Profits Tax Act can be seen from the attached schedule, where it is assumed that both shipowner A and shipowner B are in the 8-percent invested capital credit bracket and that their top earnings are subject to the 30-percent excess-profits tax. It is further assumed that the earnings before taxes and depreciation of both shipowner A and B are $114,000 (this happens to be the amount of income which fully absorbs shipowner B's invested capital credit without subjecting him to an excess-profits tax). With these earnings shipowner A's taxes are $87,780, or nearly 3 times as much as shipowner B's taxes of $30,080. Shipowner A's taxes actually amount to 37 percent more than shipowner B's normal tax net income.

Comparisons of income taxes (computed on an invested capital basis) and net return on capital investment attributable to purchase of $1 million vessel in 1947 (A) out of sec. 511 deposited gains and (B) out of nondeposited corporate funds.

	Shipowner A	Shipowner B
1. Vessel cost, Jan. 1, 1947	$1,000,000	$1,000,000
2. Adjusted basis, Jan. 1, 1947	0	1,000,000
3. Less depreciation (5 percent 1947-50)	0	200,000
4. Adjusted basis, Jan. 1, 1951	0	800,000
5. Net income before depreciation, 1951	114,000	114,000
6. Less depreciation	0	50,000
7. Normal tax net income	114,000	64,000
8. Less invested capital credit (8 percent of line 4)	0	64,000
9. Excess-profits net income	114,000	0
10. Normal and surtax taxes (47 percent of line 7)	53,580	30,080
11. Excess-profits tax (30 percent of line 9)	34,200	0
12. Total taxes	87,780	30,080

Our association suggests two alternative methods of curing this inequity and proposed drafts are attached as exhibits B and C. Both drafts would achieve the same result: permit the shipowner with section 511 funds or vessels acquired with such funds in effect to go back and reverse his original decision to deposit capital gains in section 511 funds rather than pay the capital-gains tax of 25 percent. The exhibit B draft would accomplish this by adding a new section to chapter 1 of the Internal Revenue Code (excess-profits tax), while the exhibit C draft would do it by adding a new subsection (o) to section 511 of the Merchant Marine Act of 1936. The result in either case would be identical.

A shipowner with section 511 funds would be given one irrevocable option, in the 1951 taxable year, to restore the full tax basis of vessels purchased with such funds by paying the 25-percent capital-gains tax minus the additional income and excess-profits taxes he has paid in the years intervening since deposit of the funds because of the lower tax basis of his enterprise. Thus, under the example cited above, shipowner A could increase the tax basis of his vessel to that of shipowner B's vessel upon payment of $250,000 capital-gains tax. His income taxes, however, would be recomputed for the intervening years and he would be credited with the amount of increased income taxes paid by reason of section 511. In the example used above, shipowner A would pay $250,000 (the 25-percent capital-gains tax on $1 million) less $19,000 for each of the years 1947, 1948, and 1949, and less $29,000 for 1950 ($21,500 in normal and surtax taxes and $7,500 in excess-profits tax), or a total of $86,000, making the balance due on his capital-gains tax $164,000.

This proposal we believe would be more acceptable to the Treasury than the amendment included in the excess profits tax bill last year by the Senate for two reasons: (1) Vessels of a shipowner exercising the option granted would have the same tax basis for both normal and surtax taxes and for excess-profits tax, whereas the language proposed last year would have provided one basis for excess-profits taxes and a different one for normal and surtax taxes. It is our understanding the Treasury Department strongly favors having the tax basis of a corporation be the same for both normal and surtax and excess-profits tax. (2) Enactment of this amendment and its use by shipowners would produce substantial additional revenues to the Government in the current fiscal year and reduce them only slightly in future years while at the same time establishing tax parity in future years between shipowners who did use section 511 and those who did not.

Our proposed amendment, in either form, would require no payment of interest, either by the shipowner on the deferred capital gains tax, or by the Government on the credits or refunds of extra income and excess-profits taxes paid in the intervening years by reason of section 511. Interest was waived in the proposed drafts primarily because under section 511 as it now stands, a corporation which still has uncommitted capital gains on deposit in section 511 funds may withdraw such funds and use them as he wishes by payment of the 25-percent capital gains tax, without any interest. To charge interest to the shipowner who had complied with the intent of the law and invested his section 511 funds in ships would be to discriminate against him and in favor of the shipowner who failed to invest the funds in ships.

Exhibit B

Amend H. R. 4473 by inserting at the proper place in the bill a new section reading as follows:

"Subchapter D (excess profits tax) of chapter 1 of the Internal Revenue Code is amended by inserting after section 458 a new section reading as follows:

"'Sec. 459. Corporations Which Have Established Construction Reserve Funds Under Section 511 of the Merchant Marine Act, 1936

"'(a) Election To Treat Certain Gains as Taxable.—Any taxpayer which, on the date of the enactment of this section—

"'(1) has on deposit in a construction reserve fund established under section 511 of the Merchant Marine Act, 1936, as amended, funds representing net proceeds of the sale, or the net indemnities with respect to the actual or constructive total loss, of any one or more vessels; or

"'(2) owns one or more vessels that were constructed or acquired in whole or in part from withdrawals (from a construction reserve fund established under section 511 of the Merchant Marine Act, 1936, as amended) of deposits representing gains, that by reason of section 511 (c) of such Act, was not recognized, may elect, in its return for its taxable year beginning in 1951 (or in the event more than one taxable year of the taxpayer begins in 1951, in its return for its last taxable year so beginning) to treat the gains from such sales and the gains from the indemnities with respect to such losses as having been gains that were recognized when they were realized and to adjust its liability for income- and excess-profits taxes for the taxable year and all prior taxable years accordingly. Such election shall also apply to all subsequent taxable years to which this subchapter is applicable and, in the case of all taxable years to which this subchapter is applicable and all prior taxable years, shall be irrevocable when once made.

"'(b) Method of Adjustment.—If an adjustment specified in subsection (a) is, with respect to any taxable year, prevented, on the date of the election by the taxpayer under subsection (a), or within two years from such date, by any provision or rule of law (other than this subsection and other than section 3761, relating to compromises, (1) such adjustment shall nevertheless be made, (2) the amount of the adjustment shall be limited to the increase or decrease in the income and excess profits taxes previously determined for such taxable year, which results solely from the effect of subsection (a), and (3) such amount shall be assessed and collected, or credited or refunded, in the same manner as if it were a deficiency or an overpayment, as the case may be, for such taxable year and as if on the date of such election two years remain before the expiration of the period of limitation upon the assessment or the filing of claim for refund for such taxable year except that no interest shall be held or considered to have accrued with respect to any amount to be assessed and collected under this paragraph in the same manner as if it were a deficiency, and no interest shall be allowed or paid on any amount to be refunded or credited under this paragraph in the same manner as if it were an overpayment, for any period prior to the date of the election by the taxpayer under subsection (a). The income- and excess-profits taxes previously determined shall be ascertained in accordance with section 452 (d). The amount to be assessed and collected under this subsection in the same manner as if it were a deficiency or to be refunded or credited in the same manner as if it were an overpayment, shall not be diminished by any credit or set-off based upon any item, inclusion, deduction, credit, exemption, gain, or loss, other than one resulting from the effect of subsection (a). Such amount, if paid, shall not be recovered by a claim or suit for refund, or suit for erroneous refund, based upon any item, inclusion, deduction, credit, exemption, gain, or loss, other than one resulting from the effect of subsection (a).

" '(c) DEFINITION.—As used in this section the term "income and excess profits taxes" means the tax imposed by this chapter, subchapter A of chapter 2, subchapter B of chapter 2, and subchapter E of chapter 2, for taxable years beginning after December 31, 1939.' "

EXHIBIT C

Amend H. R. 4473 by inserting at the proper place in the bill a new section reading as follows:

"Section 511 of the Merchant Marine Act, 1936, as amended (relating to construction reserve funds) is amended by inserting at the end thereof a new subsection reading as follows:

" '( ) (1) Any taxpayer which, on the date of the enactment of this subsection—

" '(A) has on deposit in a construction reserve fund established under this section funds representing net proceeds of the sale, or the net indemnities with respect to the actual or constructive total loss, of any one or more vessels; or

" '(B) owns one or more vessels that were constructed or acquired in whole or in part from withdrawals (from a construction reserve fund established under this section) of deposits representing gains that, by reason of subsection (c) of this section, were not recognized, may elect, in its income-tax return for its taxable year beginning in 1951 (or in the event more than one taxable year of the taxpayer begins in 1951, in its return for its last taxable year so beginning) to treat the gains from such sales and the gains from the indemnities with respect to such losses as having been gains that were recognized when they were realized and to adjust its liability for income- and excess-profits taxes for the taxable year and all prior taxable years accordingly. Such election shall also apply to all subsequent taxable years to which subchapter D of chapter 1 of the Internal Revenue Code is applicable, and, in the case of all taxable years to which such subchapter is applicable and all prior taxable years, shall be irrevocable when once made.

" '(2) If an adjustment specified in paragraph (1) of this subsection is, with respect to any taxable year, prevented, on the date of the election by the taxpayer under paragraph (1), or within two years from such date, by any provision or rule of law (other than this subsection and other than section 3761 of the Internal Revenue Code, relating to compromises), (A) such adjustment shall nevertheless be made, (B) the amount of the adjustment shall be limited to the increase or decrease in the income and excess profits taxes previously determined for such taxable year, which results solely from the effect of paragraph (1), and (C) such amount shall be assessed and collected, or credited or refunded, in the same manner as if it were a deficiency or an overpayment, as the case may be, for such taxable year and as if on the date of such election two years remain before the expiration of the period of limitation upon the assessment or the filing of claim for refund for such taxable year, except that no interest shall be held or considered to have accrued with respect to any amount to be assessed and collected under this paragraph in the same manner as if it were a deficiency, and no interest shall be allowed or paid on any amount to be refunded or credited under this paragraph in the same manner as if it were an overpayment, for any period prior to the date of the election by the taxpayer under paragraph (1). The income and excess-profits taxes previously determined shall be ascertained in accordance with section 452 (d) of the Internal Revenue Code. The amount to be assessed and collected under this paragraph in the same manner as if it were a deficiency or to be refunded or credited in the same manner as if it were an overpayment, shall not be diminished by any credit or set-off based upon any item, inclusion, deduction, credit, exemption, gain, or loss, other than one resulting from the effect of paragraph (1). Such amount, if paid, shall not be recovered by a claim or suit for refund, or suit for erroneous refund, based upon any item, inclusion, deduction, credit, exemption, gain, or loss, other than one resulting from the effect of paragraph (1).

"'(3) As used in this subsection the term "income and excess profits taxes" means the tax imposed by chapter 1, subchapter A of chapter 2, subchapter B of chapter 2, and subchapter E of chapter 2 of the Internal Revenue Code, for taxable years beginning after December 31, 1939.'"

Senator HOEY. Our next witness is Mr. Ellsworth C. Alvord. Please have a seat.

I will say, Mr. Alvord, that the committee has allotted 15 minutes to you, and if you will bring your statement within that time, we would appreciate it. We will put the full statement in the record and you can make such statement as you would like.

STATEMENT OF ELLSWORTH C. ALVORD, CHAIRMAN, COMMITTEE ON FEDERAL FINANCE, CHAMBER OF COMMERCE OF THE UNITED STATES

Mr. ALVORD. I would like to place my written statement in the record, Mr. Chairman. I have one in respect to the general policies to the bill, which I will give to the reporter, and I also have an unmimeographed set of so-called technical administrative amendments which I would like to give to the reporter, to be included in the record.

Senator HOEY. They will be included in the record.

Give your name, please.

Mr. ALVORD. Mr. Chairman, my name is Ellsworth C. Alvord.

Senator HOEY. And your connection?

Mr. ALVORD. I am chairman of the committee on Federal finance of the United States Chamber of Commerce and I appear and present the views of the United States Chamber of Commerce as adopted by our committee.

I am a bearer of very good news for the committee, and in contrast and conversely, I am the bearer of very bad news.

The good news I have for you is that you do not need additional revenues to balance your 1952 budget. Many of the statistics which have been presented to you, are not quite current.

On the basis of the official estimates of expenditures for fiscal 1952 you will spend about $68 billion.

On the basis of Mr. Stam's most recent estimate of revenues you will raise $61,000,000,000. That leaves an apparent deficit of $7 billion.

The $68 billion estimate of expenditures does not take into consideration any of the proposed reductions in expenditures. It contains, as you know, a good many items of proposed expenditures for legislation which has not yet passed, and which I think probably will be not passed, and it contains no cuts in any of the requests for expenditures.

It seems quite probable, at least we sincerely hope—that you gentlemen will cut the proposed $68 billion expenditures by at least $10 billion; $5 billion are easy, $7 billion is a little more difficult, $10 billion is tough; but could be done.

Senator MILLIKIN. Mr. Alvord, it is not going to be done; let us be realistic.

Mr. ALVORD. How much will be done, Senator?

Senator MILLIKIN. Well, I think you might take a couple of billion off of foreign aid, foreign economic assistance, but when you aggregate the other things there can still be some, but it is not going to reach the magnitude of 7 or 10 billion dollars.

Mr. ALVORD. With respect to the 10 I certainly agree.

Senator MILLIKIN. Let us agree that it should be done, let us agree that it ought to be done, but we are talking very practical business here——

Mr. ALVORD. That is very true, sir.

Senator MILLIKIN. And when you talk about a cut of $7 billion or as much as $10 billion, it just is not going to happen.

Mr. ALVORD. Well, let me come down then, Senator,——

Senator MILLIKIN. That is my own notion. Maybe others will feel differently.

Mr. ALVORD. Yes, sir.

That is a very realistic approach, and I also attempt to have a realistic approach.

The most moderate estimate by the advocates in Congress of economy is that they expected to attain at least a $5 billion cut; that would include $2 billion on foreign aid, and a scattered couple of billion, which is already in existing appropriations and another billion which could easily be picked up.

Senator TAFT. Foreign aid, just to begin with, however, and I have not seen the actual estimate, but my impression is that about $8½ billion were requested; the actual expenditures are only about $4½ billion, so if you cut the program in half I do not think you will save over $2 billion and I do not think you will ever do that.

Now, the $8½ he cut, but when it comes to cutting the $4½ billion of actual expenditures, I just do not know how it can be done. Maybe a half billion dollars or so could be cut off it, and that is one of the main sources that people are looking to for savings.

That is one discouraging factor. I am not sure about it, because I have not the entire thing broken down yet. We will know more about that this week.

Mr. ALVORD. I think you will find, Senator, that the estimated expenditure for foreign aid, including military, is about $7 billion for 1952.

Senator TAFT. That is what I was not sure of.

Mr. ALVORD. And I am quite sure you can knock $2 billion off that without a great deal of difficulty and without any harm, and possibly a great deal of good.

Senator TAFT. I do not think that they will be able to spend as much as 6 or 7 billion dollars. I do not think that they are able to spend it even if it is appropriated in this fiscal year.

Mr. ALVORD. In fiscal 1952. I think that is very possibly true, and that is one of the reasons I say why the current estimate of expenditures of $68 billion is high, even without economies.

I think, and I would strongly urge the committee to ask Mr. Stam to prepare new estimates of revenues—my own guess is that the $61 billion, which I think was about 3½ months ago, is low by at least $2 billion so that if you knock $5 billion off expenditures, it will bring you down to $63 billion, and if you increase receipts by $2 billion, it gives a precisely balanced budget on the basis of budgetary principles. In no event can we have a cash deficit in 1952.

Now, I think my position in that respect is supported by the members of the committee who are concerned about 1953. Consequently, I suggest that you defer action on the present bill until we know more about 1953, and until we know more about what can be done with respect to expenditures.

The only estimates I have seen on 1953 are that the expenditures may run 85, 90, 95 billion dollars. It was not long ago that I heard a rather wild estimate, I thought at the time, that the expenditures in 1953 might approach $125 billion.

Well, gentlemen, any such level of expenditures simply cannot be financed through taxes, but if expenditures are going up, it seems to me that it would be the wise thing for Congress at the present time, after having studied what the revenue needs will be, to write a tax bill for 1953 based on probable expenditures and probable receipts for 1953.

It is much too early now to have any estimate at all for 1953 on which revenue legislation should be based.

Senator TAFT. I noticed, however, that up to date during this month we have got a deficit of a billion dollars already in July, which compares to two or three hundred million dollars a year ago.

Mr. ALVORD. You will find that is always so, Senator, in July.

Senator TAFT. No, as compared to two or three hundred million a year ago so this year we are $700 million behind in 1 month from what we were last year.

Mr. ALVORD. You see—bear in mind that June 15 payments come into fiscal 1951, all of which contributed to the $3½ billion surplus for 1951.

The month of July has virtually no receipts whatsoever, except on accumulation of the witholding tax provisions and the accumulation of excise tax collections; but big collections will not be until September, so that July and August invariably run at a deficit even in the days of balanced budgets.

Now, the Secretary, as you will recall, before the House Committee on Ways and Means estimated a $16½ billion deficit for 1952.

That was last January. He proposed a $10 billion quickie bill.

Well, on the basis of present estimates there will be no $16½ billion deficit. There will be no $10 billion deficit. There need be no deficit whatsoever. Consequently there is no hurry with respect to pending legislation, and there is no necessity for making any of it retroactive.

The best suggestion I can make, the best advice I can give this committee and the Committee on Ways and Means at the present time is to begin to study all of the elements which are giving rise to this inflation which we are here talking about and which we hear talked about a great deal, and which should be seriously feared. Study our debt policies, study our monetary policies, study our spending policies and study our tax policies from the point of view of inflation, and I think you will come out with a different legislative proposal from any that I have now seen.

Senator MILLIKIN. Studying the inflationary policies, we have got to assume under the various estimates that are before us that there would be no further inflation.

Mr. ALVORD. No, sir.

Senator MILLIKIN. Yes, sir.

Mr. ALVORD. No; quite the contrary, Senator. I would adopt policies—under our present policy we cannot help but have additional inflation.

Senator MILLIKIN. Well, that is exactly what I am talking about. This committee does not have control over the matters that you are discussing.

We are assuming now that there will be no further substantial inflation in the estimates that we are working on.

Mr. ALVORD. In the estimates. Yes, sir.

Senator MILLIKIN. That is a part of the military program assumptions, which is that there will be no further substantial inflation. If you do have any further substantial inflation, obviously, your expenditures are going to rise.

Mr. ALVORD. And your revenue is going to rise, Senator.

Senator MILLIKIN. And your revenue will rise. But whether your revenue rises proportionately to the expenditures over a given period of time is something else again.

Mr. ALVORD. Of course, it depends on the level that your expenditures reach.

Senator MILLIKIN. Yes.

Mr. ALVORD. But if expenditures for 1952 remain at $68 billion, then the only effect on 1952 can be an increase in revenue.

Do you realize our national income is now running at the rate of almost $270 billion?

Senator MILLIKIN. I think that is well realized by this committee. These various matters that you so vehemently ask us to have studied, we have not neglected to study.

Mr. ALVORD. I appreciate that you have not neglected them.

Senator MILLIKIN. We have quite thoroughly considered it. We are doing as much as we can do about it in our jurisdiction.

Mr. ALVORD. All these policies that I have suggested, Senator, are within your jurisdiction.

Senator MILLIKIN. Yes, sir.

Mr. ALVORD. And I think it is highly important to begin to stop inflation at the source.

For example, I do not think that the citizens of Kansas City prayed for rain or employed rain makers in order to stop that flood; and that is precisely what Congress is doing. More money is being poured into the inflationary stream than can possibly be taken away. A study of those policies, I am sure, will lead to that necessary conclusion.

Senator MILLIKIN. We have got a job of trying to carry on a pay-as-you-go system as long as we can do it, and you have been a strong advocate of that. We have got to do the best we can with the various estimates before us, trying to figure on expenditures, "guesstimates," if you wish; you always have "guesstimates" as to revenue.

We have got to take all of those into consideration and, as an individual, I suggest to you there will be a tax bill. I suggest to you that it may be somewhat less than \$7½ billion but I suggest that there will be one. I doubt whether you can marshal much opinion that there will not be one, so we are dealing now with the practical question of where to put it. What do you suggest on that?

Mr. ALVORD. The fact that there will be a tax bill, I do not deny, Senator, but my point is, you do not need it for 1952; consequently, you can take adequate time in order to prepare whatever adequate revenue is necessary, taking all the matters into account necessary for 1953, and make the taxes apply only as to their future effect.

Senator MILLIKIN. That raises the question as to how we are going to tax for 1953, with a possible deficit of 20 to 30 billion dollars, and that raises the question of whether you tax in one fell swoop for fiscal 1953 or whether, perhaps, an easier approach to the shock of 1953 is preferable.

Mr. ALVORD. That is very true, sir. It is utterly impossible——

Senator MILLIKIN. If you happen by chance to be wrong, if we had no tax bill to cover fiscal 1952, and if we did have a deficit in fiscal 1952 of 5, 6, or 7 billion dollars, then you add to the shock of making that good in 1953 when you are bound to have a deficit of from 20 to 30 billion, and we might not be exactly acting in the wisest possible way.

Mr. ALVORD. I am not quite so sure of that, Senator, because there is no chance of a cash deficit in 1952, even if you do not change estimates at all.

Senator MILLIKIN. Well, I wish I could feel your own assurance on the subject.

Mr. ALVORD. I can assure you that I will not be \$16½ billion over, and I assure you I will not be \$7.6 billion over both current estimates of the Secretary of the Treasury.

I am using the 61 and 68 billion dollars as your own official estimates. I think \$61 billion is low, and I suggest that Mr. Stam prepare new ones.

This national income figure is going up terrifically.

Senator MILLIKIN. I think that is a good idea, and I imagine that Mr. Stam will give us an informal on that before we finish here.

Mr. ALVORD. So that the points that you make, Senator, I am in entire agreement with. I think that the thing for this committee to do is to begin to consider some sound tax policies for 1953.

Senator MILLIKIN. That is what we are doing.

Mr. ALVORD. Now, if you do that, then——

Senator MILLIKIN. And it is a very gloomy picture.

Mr. ALVORD. It is a very gloomy picture. It is bad news I am giving you.

Senator MILLIKIN. Well, we knew that before you gave it to us.

Mr. ALVORD. As of today I know of no statistics you can base anything for 1953 on except on the best "guesstimates" that we can make and I think that is an excellent word, Senator, on the best "guesstimates" that we can make, that there will be a deficit in 1953.

But let us approach that proposed deficit from a common sense point of view. Regardless of your economies for 1952 you can still have economies in 1953. We are spending, presently, much more than we can afford to spend, much more than is necessary to spend.

Senator MILLIKIN. I am in entire agreement with you on that.

Mr. ALVORD. Consequently, for 1953 you must simply get your spending policies under control and get down to the basis of what is absolutely necessary.

Senator MILLIKIN. If that were correct, this committee does not control that end of the business.

Mr. ALVORD. That is true, Senator, but you are Members of the Senate, as well as members of the Finance Committee, and I think that one of the best ways to control spending, Senator, is to say to the administration, in effect—you cannot say quite this—you get no more money than this.

"Now, you bring your own spending within that amount if you possibly can, but you get no more money than this."

Pay-as-you-go on a basis of a 20 or 25 or 30 or 35 billion dollar deficit, Senator, is utterly impossible, and I have never advocated pay-as-you-go so long as we were throwing dollars down the rat hole, as we have been doing for years.

I would plug the rat hole first. Having plugged that rat hole, then I would be one of the strongest advocates of pay as you go insofar as it is conceivably possible. But 85, 90, 95, or so billion dollars is far beyond the possibility of the pay-as-you-go plan, even on the basis of confiscation.

Senator MILLIKIN. We have been trying for weeks here to get someone to suggest just how we could cover a 20 or 30 billion dollar deficit——

Mr. ALVORD. It cannot be done, Senator.

Senator MILLIKIN. What you say is in harmony with all the testimony we have had on the subject.

Mr. ALVORD. It cannot be done, and consequently, I think it would be very well for this committee to study the present methods of financing deficits, and see if you cannot come up with better ones. You are going to have to finance a deficit in 1953, and I would strongly urge that this committee come up with policies of deficit financing which are noninflationary, and I think it can be done.

But so long as we continue to borrow from the commercial banks, we are just pouring more water into the stream than the stream can possibly carry off.

Senator MILLIKIN. Off the record.

(Discussion was continued off the record.)

Mr. ALVORD. Now, let me show you the consequences of the House bill for just a minute. Let me assume a man with an income of say, $80,000, and fortunately in America it is still possible for a substantial number of men to make $80,000, but just so that I am not accused of representing only the "filthy rich," let me talk about myself.

Do you know how much it costs me to buy a Ford automobile under the House bill? $35,000.

Do you know how much it costs me to buy a $25,000 house? $400,000.

Do you know how much it costs me to buy a suit of clothes? $2,275.

Do you know how much it costs me to buy a pair of shoes? $455.

A doctor's bill of $100 will cost me $2,000 a hospital bill of $500 will cost me $9,090.

And if you want to go down to a very practical question, to send my boy to college, and he goes this year—will cost me $58,000.

Now, let us get down to something even more practical. I will have to make $20 to buy a pound of coffee; and I will have to make $2 to buy a 10-cent-glass of beer.

Senator TAFT. I do not quite admit those figures. I know the theory of them.

Mr. ALVORD. It is perfectly simple; I will guarantee the figures.

Senator TAFT. No; you cannot prove it.

Mr. ALVORD. It is perfectly simple.

The answer is I will not buy the Ford or the house. These figures are all based on the additional income which I must make if I am going to live within my income——

Senator TAFT. To which some appropriation must be made for you.

Mr. ALVORD. No; which I must make individually.

Senator TAFT. You must be a very rich man.

Mr. ALVORD. I cannot do it. The answer is I cannot do it. It is utterly impossible and foolish. On top of that you also state to the man who makes in excess of $80,000, "Until you make $433,000, we are going to tax you for more than 100 percent of your increased income."

Now that, I would suggest, is probably the direct consequence of legislating by caucus, as they did in the Committee on Ways and Means.

Senator TAFT. I suggest, however, that a lot of this is passed on to other people in order that you may have that money. You double your legal fees, and people's salaries have been increased because they have to pay large taxes.

In other words, these taxes, as they stay they get passed on in the economy to other people and they are spread out over the great bulk of consumers, so that I think what you say, while it makes the point, is not true; it just is not true.

Mr. ALVORD. The gross is not true. How you make that money is the point that I raised. I wish I could double the legal fees.

Senator TAFT. You have over the last 10 years if you are like any other lawyer.

Mr. ALVORD. I doubt very much if my gross has increased very much during the last 10 years. I am getting a little bit older, Senator, than I was. But in any event, I can assure you that that opportunity which we used to hold out to individuals is completely abolished. We used to tell the individual, "Now, listen, just work a little bit harder, get a little more efficient, make more money and you can pay the tax increases."

That is utterly impossible under the tax bill, and equally impossible under the Corporation tax bill. If I were planning a tax program for 1953, I will be more specific now, I would base 60 percent of the necessary increases—gentlemen, using a term that is political anathema—on either a manufacturer's general sales tax or a retailer's general sales tax or a combination of both. Sixty percent of the revenue I would get from that source.

Now, I quite well realize that it is said that you cannot do that this year, but you must lay the tax foundation for 1953 this year if you are going to do anything this year.

Senator MILLIKIN. How much money would you raise by those taxes that you referred to?

Mr. ALVORD. Senator, it depends, of course, on exemptions, and I realize that any bill that goes through the Congress will have exemptions to it.

Roughly speaking, for every 1 percent of a manufacturer's tax you will get $800,000,000 and for a one-point retail sales tax you will get a billion.

Senator MILLIKIN. As a practical matter, would you anticipate, considering the exemptions which you wisely foresee as being inevitable, that you could possibly raise more than $5 billion that way?

Mr. ALVORD. I would not raise more than $5 billion in 1953 that way, but I would get the tax on the books, Senator, so that we stand some chance of getting more revenue if we want it.

Senator MILLIKIN. If you want to get it on the books, you would get it on this year, you said you do not need it this year.

Mr. ALVORD. January 1, 1952, is the date that I would hope to make this sort of a tax effective.

The 30 percent I would get from individuals, not through the confiscatory, purely arbitrary, unsound and unrealistic proposals of the House bill, but through a one-, two-, or three-point increase in existing rates.

After all, that is the way the reductions came down; that is the way they should come down. I do not think I would decrease credits because the $600 credit is not worth much more than $300 today.

Senator MILLIKIN. The reductions did not come down flat. They came down in reverse progression.

Mr. ALVORD. They came down in inverse——

Senator MILLIKIN. Reverse.

Mr. ALVORD. Reverse.

Now, we are putting them in inverse reverse.

Senator MILLIKIN. We gave the highest reductions to the lowest income brackets.

Mr. ALVORD. That is right, Senator. Then I would collect not more than 10 percent of the increase from corporations subject to an overriding principle that under no circumstances would I impose a tax, whether we called it a normal tax or an excess profits tax, on corporate incomes, normal corporate incomes, in excess of 50 percent. I do not believe that a rate in excess of 50 percent can be tolerated even temporarily, and every one agrees we cannot stand it more than temporarily.

Now, I do not know how long this cold war is going to last, no one does, but the best picture we can get of it is that it probably will last during my lifetime, and perhaps through the lifetime of each of you gentlemen on the committee. Certainly it will last during our period of, call it reasonable earning power. Maybe we can maintain present incomes for another 5 to 10 years, and then we will begin to slip. It is just normal. That is what age does to us.

So that represents the basic principle upon which I would approach 1953. If I wanted to collect taxes from a capital gains tax, I mean net revenues—we do not get much revenue these days from the capital gains tax—I would reduce the rates and certainly never increase them. A lower capital gains tax will produce more revenues for you than either the existing law or the proposed 12½ percent increase in the House bill.

Senator MILLIKIN. How about shortening the period?

Mr. ALVORD. Shortening the period will give more revenues.

The period on the holding of capital gains represents a matter of judgment. What we are trying to do is to draw the line between honest investments and those who make a business of speculation.

Three months, I think, does it. Six months, I am sure will do it. The opinion of others more familiar with the speculators, for example, say that 3 months is adequate. It will certainly produce more revenues.

Senator TAFT. It seems to me the case for a short period to produce more revenues is clear. I am not so perfectly sure about a case for producing more revenues by reducing the rate. That certainly is not true. I mean if you reduce it to nothing then you get no revenues at all.

Mr. ALVORD. I am not so sure that would not produce money, Senator.

Senator TAFT. So it does not go on indefinitely.

Mr. ALVORD. I am not sure it would not produce money. Most of the countries in the world have a zero rate on capital gains.

It cuts all possible losses out; I do not think we would lose money on the zero rate, but we are not prepared to do it.

Senator TAFT. I would like to see that case presented. People keep saying that we get more money from a lower rate. It is easy to prove that the period thing produces more money.

Senator MILLIKIN. Is not your point that if you do away with capital gains taxation entirely, at least, so far as the upper income bracket people affected by it are concerned, their capital becomes income earning, and thus it carries higher rates of income taxes?

Mr. ALVORD. No.

Senator MILLIKIN. No?

Mr. ALVORD. No, because their capital transactions would be exempt from tax.

Senator MILLIKIN. When they realize the money, they make an investment which is income-producing, and the income from it——

Mr. ALVORD. Oh, yes.

Senator MILLIKIN. At least to the middle and upper income people carries the higher rates of tax.

Mr. ALVORD. That is true, Senator. I did not get the question.

Now, let me follow your idea for just a moment. Most capital gains today are the result of inflation. Consequently, if this inflation continues, as Senator Millikin and I think it probably will if present policies are continued, you are taxing capital and it will not be long before you will hear almost everyone before you advocate no tax at all on capital grains. I am not advocating that today, but I would advocate a reduced rate.

Capital gains, Senator Taft, as you well know, are the results of almost entirely an intentional sale of property. You must have a buyer and you must have a seller.

Now, today every time I consider—just let me give my own views so I do not express the views of others—a sale of property on which I have a gain, I say, can I afford to pay 25 percent of that gain to the Government? Is it not smarter for me to hold it? I am still getting a yield on my original cost. Is it not smarter for me to hold the property? A 25 percent rate, I am sure, influences me a great deal to continue to hold. A lower rate would wipe out that influence to a very large extent, and you would have many more sales.

While we are on capital gains, Senator——

Senator TAFT. I do not think, though, if you reduced your capital gains from 25 to 12½ you would get twice as many sales.

Mr. ALVORD. Many more.

Senator TAFT. Many more? I do not think twice as many. I do not see any evidence of it or any proof of it in what has happened, and I personally would be inclined to abolish the capital gains tax myself, that is my inclination; but I am only saying that people who contend that have not furnished any conclusive proof of the fact, and I do not think that to reduce the tax from 25 to 12½ is going to produce as much revenue—twice as much revenue.

Mr. ALVORD. There are no statistics, Senator. If you take history——

Senator TAFT. If you double the 25 to 50 percent, I think, perhaps, that would defer all sales and you would get less money; that is a possibility.

Mr. ALVORD. If you take history, you will see receipts from capital gains increased from 1921 straight through to 1930, with a declining rate all the way and you got more net revenues.

Senator TAFT. But you also had a steady increase in transactions and in sales and in stocks and we had a stock inflation and all that, so that it is a little hard to say that that proves the point.

Mr. ALVORD. It is hard to say. It is a matter of opinion. Now, whether we would get twice as many transactions with a 12½ percent rate, my guess is we would. I know of transactions being held up.

Senator MILLIKIN. The more rapid turn-over produces more money at a lesser rate.

Mr. ALVORD. That is right, sir.

Senator TAFT. If you go down to zero, there is some point at which you get your maximum revenue. That is a guess.

Mr. ALVORD. I am not sure as to your guess of a zero rate producing a loss.

Senator TAFT. Well, it obviously produces no revenue from capital gains.

Mr. ALVORD. That is right, but you pick up on other revenues a great deal, just as Senator Millikin pointed out.

Senator MILLIKIN. These contentions go on and on and on, and you cannot reach a solution until you try it. What would you think of an experimental try?

Mr. ALVORD. I would like to see it.

Senator MILLIKIN. What would you think of an experimental try, reducing the period and reducing the rate and see what happens?

Mr. ALVORD. I would like to try a 15-percent rate for a 3 months' period, and see what happens. That is what I would like to see you do.

Senator TAFT. I think a 50-percent rate would choke everything. It would choke everything. Of course, this rate in the House bill is increased from 25 to 28 or something——

Mr. ALVORD. Twenty-eight and one-twelfth, I think.

Senator TAFT. Twenty-eight and one-third.

Mr. ALVORD. Now, you see you are dealing with the psychology of investors. For many years it has been the position of the Congress not to increase the rate on capital gains.

You raise the capital gains tax three points, and what is the investor going to think? It looks like they are going to push this rate beyond all possibility, and what you do is remove all hope, and the only hope there is now in any equity financing is a hope for capital gains. The income from it is not worth anything. You have completely dried up the sources of equity financing.

Senator MILLIKIN. You are also dealing with the psychology of the voters.

Mr. ALVORD. That is true. That I appreciate, Senator, and it has always been my position to state what I think is sound policy, and you who have to get votes have to take those policies and discard them or revamp them, depending on the voter. Fortunately I am not a politician.

Senator MILLIKIN. It would not be a bad idea for all who are interested in taxes to give some attention to what can be done and what cannot be done, considering that Congress is and should be a political institution.

Mr. ALVORD. Well, Senator, for 30 years at least I have always considered that my position was worth more to you people if it was not salted with political flavoring. I can tell you what I think sound policy is under given circumstances, and it is up to you in politics to decide what is politically possible and what is not. I do not know. I have never had a vote in my life for anything.

Senator WILLIAMS. If you reduce the holding period to 3 months, as you point out, unquestionably the revenue would increase in that bracket, I mean from a capital gains levy but is it not also true that we would have to face the fact that the normal income tax revenue would decrease some to offset that because those transactions that were now in between the 3 and 6 months' period were sold and converted over into capital gains, and increasing that they would likewise decrease the amount that a man would be paying in his normal income. There is an offset to your gains.

Mr. ALVORD. I would discount that offset very considerably because today this is the present practice. A person, if he holds a security say, for more than 3 months, sells, if he has a loss, in order to realize a short-term loss. He holds it if he has a gain, so that your short-term loss between that 3 months and 6 months would probably represent a very substantial portion of the sales.

Senator WILLIAMS. But that same proportion of the sales—and that same thing could be true with the 3-month period left as it would be?

Mr. ALVORD. Yes, but short-term losses in 3 months, I assume, would be considerably less than in 6 months.

Senator WILLIAMS. I have seen them——

Mr. ALVORD. So have I, but I am talking about general principles now.

Senator WILLIAMS. But there is an offsetting provision to this gain.

Mr. ALVORD. We do not expect to get a loss in 3 months buying.

Senator WILLIAMS. You do not really expect to get it in 6 months.

Mr. ALVORD. That is true, but the likelihood of a loss in 3 months is less than in 6 months, and we would only have 3 months in which to convert our loss into a short-term loss, and a 15-percent rate would, I am quite confident, greatly reduce the incentives to hold, or the incentives to buy, or the incentives to sell based on tax consequences, and it would get you into a market based more on values.

Senator MILLIKIN. There are inflationary angles considered, but for goodness sake, do not let us go into that.

Mr. ALVORD. Let us not go into those.

I would like to suggest—the committee has no policy—while we are talking capital gains, I would like to suggest this rather simple policy that any person who sells, in order to convert into a different investment, could well do so tax-free. That would follow along Senator Taft's concept of no tax on capital gains if we convert. It is the same principle you have here on private homes.

I would like to see the experiment with that idea. Certainly it is true in the case of trusts and estates. They should be able to convert their investments with no gain, and I think that the individual should, too. It is worth considering. I am just reminded that that seems to be the policy that Senator Ball just advocated to the committee, for ships. I did not hear the testimony, so I do not know.

Now, those give you my basic policies for 1953. I think I do not have to state my objections to the House bill any more completely than I have.

I would scrap the House bill completely and I would build a tax bill more in accordance with sound tax policies and for the purpose of 1953 and thereafter.

Now, how long our demand for exceedingly high revenues is to continue I do not know. If it continues long enough, Senator, you are going to have everybody in this country, which means the private citizen who runs his own business, coming to the Congress for retirement pay. While I am on the subject, I certainly think that the retirement-plan provisions should be made applicable to unincorporated organizations.

Also, while I am on the subject, I think this country could well, at the present time, adopt a very general policy with respect to foreign investments, and it might save you a great deal in your foreign aid.

I think it would be eminently sound to exempt from tax all investment income earned abroad, dividends and interest, basically.

Now, we are, just as much as you are, sincerely hopeful that this inflationary trend can be stopped. There is a great deal of misunderstanding about inflation, and the word is used very, very generally. The basic cause of inflation that I am concerned with is what we call monetary inflation. There will be increased prices, certainly, as you take the supply away for military use. Prices would normally increase just by reason of a lesser supply with the same or greater demand. There will be price increases as costs increase.

From the point of view of taxes, I would certainly remodel the excess-profits tax so that we can continue to progress and expand and get new products and new markets, so that we can continue to explore, discover, and exploit natural resources, so that we continue research and bring out such things as aureomycin, streptomycin, and so forth.

The excess-profits tax says: "Thou shall not do those things."

I still think there is a chance to resusciate depressed industries, and I think there is a chance to revive businesses that are almost lost, but it cannot be done under your present tax system.

I think that presents about all the views I have, Mr. Chairman, and gentlemen. I could talk on this subject for hours, as you know, but I think that I have covered everything that—I am reminded of something.

Senator TAFT. Mr. Alvord——

Mr. ALVORD. Yes, Senator.

Senator TAFT. To the matter we are talking about, the budget estimate for MDAP, that is Military Defense——

Mr. ALVORD. That is right.

Senator TAFT. And other foreign aid in January was $7.1 billion of expenditures.

Mr. ALVORD. Expenditures, yes, sir.

Senator TAFT. The revised estimate is only $2 billion. They have cut the whole saving in the cut that they have estimated—it comes in the $5 billion for foreign aid and, consequently, I do not think when you are talking about expenditures in this fiscal year, you are going to be able to save any more on foreign aid.

Mr. ALVORD. I have analyzed that, Senator, and I think you will find that that purported cut—which I do not think is $5 billion—represents a transfer of that foreign aid over to the military.

Senator TAFT. Well, that may be but it is transferred over to the Defense Department which has increased from $40 to $42 billion, and the MDAP, and other foreign aids, ECA is cut from $7.2 billion——

Mr. ALVORD. I do not think that you will find ECA in there. You will not find ECA in there at all. I am quite sure you will not.

Senator TAFT. Oh, yes; it is in there.

Mr. ALVORD. I doubt it.

Senator TAFT. Oh, yes. There is the official——

Mr. ALVORD. Yes; I know.

Senator TAFT. So that I am only saying that you are not going to cut this $68 billion of expenditures any further by reductions in foreign aid, so far as this fiscal year is concerned. As to the next fiscal year, that is a tremendous difference.

Mr. ALVORD. I will try to tell you what they did in the estimate that you have got there. They did some juggling between MDAP and other foreign aid, and the military functions of the Defense Department. In your 1951 estimate they total $47.1 billion. In the July 1951 revised estimate they total $44 billion, and I think that is the figure you have there, showing a cut of $3.1 billion. If we could analyze it I think you would find it is all in the military and not in the foreign aid.

Senator TAFT. It is not what they tell us then.

Mr. ALVORD. It is not explained, and we think it is in the military.

Senator TAFT. That is another thing. That is what—that is not what they say.

Mr. ALVORD. I do not have the benefit of what the administration says, but ECA—on the last figures I have, contemplated for this fiscal year——

Senator TAFT. The only note here is that the revisions are based on detailed military budget. They say "rate of deliveries of military equipment lower than anticipated in January."

Mr. ALVORD. That is right. I think the entire cut is in the military and represents a slow-up. It is not a cut in final expenditures, but it is a slow-up.

Senator TAFT. That is right.

Mr. ALVORD. I do not think foreign aid is going to slow up quite that much. At least ECA apparently is not.

Senator TAFT. But you start with a figure of $68 billion in estimating your deficit.

Mr. ALVORD. That is a current estimate.

Senator TAFT. Which already has eliminated $3 billion in foreign aid. That is the point I am going to make, and they are going to estimate another $3 billion cut in foreign aid.

Mr. ALVORD. Let me try to make this clear, the January budget came up with a figure of $41 billion for the military. It was stated in the January budget that that was only an estimate then because they had not prepared the budget.

Now the $38 billion is merely a substitute for the $41 billion because they discovered as they began to make their actual budget estimates of expenditures, that they could not spend the $41 billion, and cut it down to $38 billion. There is no saving at all. It is just a $38 billion figure estimated for $41 billion, so there is no saving in it.

Senator TAFT. I agree with that. I am only saying that the $68 billion in which you start, in the absence of a deficit, you cannot deduct for savings in foreign aid, which have already been counted in those figures.

Mr. ALVORD. I think $3 billion does not include foreign aid. It is almost entirely due to a delay in the military period. I do not have the information that you have, but I would suggest, if I am wrong, that you get them accurately corrected.

Senator HOEY. Thank you very much, Mr. Alvord.

Mr. ALVORD. I call especial attention to that part of my statement with respect to withholding of the 20 percent on dividends, interest and royalties. We oppose it very violently.

We tell you it will cost a great deal of money and will produce a great deal of hardship.

The point there that I might suggest you consider: If you start with withholding, the poor recipients never catch up. What you do is to take 20 percent of his income the first year, and he never catches up. Now, that applies to your individuals, you nontaxable individuals; it applies to your charities, your charitable organizations and everything else. This committee killed it last year, and I trust you will kill it again.

Senator HOEY. Thank you very much.

Mr. ALVORD. Thank you, sir.

(The prepared statement and technical and administrative amendments referred to follow:)

STATEMENT OF ELLSWORTH C. ALVORD, CHAIRMAN, COMMITTEE ON FEDERAL FINANCE, CHAMBER OF COMMERCE OF THE UNITED STATES

INTRODUCTION

My name is Ellsworth C. Alvord. As chairman of the committee on Federal finance, Chamber of Commerce of the United States, I am submitting for your consideration the views of the chamber, based upon the recommendations of its committee, concerning new and additional taxes.

STOP-LOOK

Almost exactly 1 year ago, the Secretary of the Treasury urged you to enact the tax reduction bill of 1950—which had been passed by the House of Representatives 4 days after Korea. Almost simultaneously, we urged that the proposed tax reductions be postponed. In our opinion, Korea had made the proposed reductions inadvisable and we were quite certain that tax increases would prove necessary. Within a few days the administration joined us. The Revenue Act of 1950 and the Excess Profits Tax Act of 1950 were adopted by the Congress by the end of the year.

We again urge a policy of "Stop and look."

THE 1952 BUDGET

The Secretary of the Treasury, in January of this year, told the Congress that $16.5 billion additional revenues were needed to balance the 1952 budget. He urged a "quickie" bill of $10 billion—that is, one dictated by the Treasury for adoption without adequate consideration.

Consistent with its earlier position, the Treasury is precipitate again. The 1952 budget can be balanced without additional revenues.

A cash deficit is not forecasted.

Estimates (in round figures) for fiscal 1952 before your committee are:	*Billions*
Expenditures	$68
Receipts	61
Possible budget deficit	7

The actual expenditures, however, should be several billion less (without considering the "cuts" we are urging), and revenues at least $2 billion higher. But even on the basis of the figures as shown, the simple safe and sensible way to balance the 1952 budget is to cut $7 billion from the proposed expenditures.

Additional revenues should not be necessary to balance the 1952 budget and should be neither advocated nor imposed for that purpose.

We make this statement even though we observed 3½ months ago, in our presentation to the Committee on Ways and Means, that application of pay-as-we-go might require additional revenues.

Developments since then, including changes in official estimates of revenues and expenditures, support the position we took that, with feasible reductions in less essential expenditures, no such amount of additional revenues as proposed by the Treasury was needed.

We advocated specific cuts in expenditures totaling $7 billion. These included no reduction in the total of military expenditures proposed—without specification—in the budget message. We stated, however, that the feasibility of reducing this total should be examined carefully.

We observed that from the facts then available, it might be necessary to raise a few billion dollars more of revenues to assure pay-as-we-go, but that less than $5 billion should be ample, reserving a specific total until the military budget and new estimates of other expenditures and of revenues became available.

We suggested that if it is clearly demonstrated that new revenues for fiscal 1952 should be sought, a general sales tax, either at the manufacturer's level or at the retail level, should be the main dependence. We recommended that if increase in the income taxes could not be avoided, the new revenues should be sought approximately 60 percent from excises (including the general sales tax), 30 percent from the individual income tax (through addition of percentage points to present brackets), and 10 percent from corporate income tax (through moderate increase of the normal rate).

That is still our position. We believe, however, that the prospect of a budget deficit (not to say a cash deficit) for fiscal 1952 is not now such as to warrant assumption of the risks involved in imposing crushing taxes to raise even a few billion dollars of additional revenues, with the danger of upsetting the whole economy.

If it is established some months from now that larger receipts should be sought for fiscal 1952, we believe that new or additional taxes should not be retroactive; that they should not become effective before January 1 next, or possibly later.

We wish to make it clear, in urging such an approach, that we are not unwilling to support a program of additional taxes should the need for them be established and the burden spread widely and equitably.

THE 1953 BUDGET

Attention has been concentrated upon the possibilities in 1953. But there are no reliable estimates whatsoever available for 1953. We hear that expenditures may exceed $80, $85, $90, or $95 billion. Several weeks ago I heard $125 billion mentioned as a possibility. Expenditures on any such level cannot be financed by taxes—even "temporary" taxes.

TIME TO LOOK

Now is the time for the administration and the committees of Congress to study and evolve sound fiscal policies for the future. There may still be time.

The program should include, but need not be limited to, the following:

(1) Cutting down expenditures—and the military should not be spared.
(2) Monetary and credit policies.
(3) Debt management.
(4) Taxes.

THE PROBABLE PICTURE

If the next 5 months are devoted to the suggested studies, we confidently predict the following conclusions:

(1) Our fiscal policies, especially the Government's spending and lending policies, have been the blood stream upon which inflation has fed and fattened.

(2) A continuation of present fiscal policies will lead to further and possibly uncontrollable inflation.

(3) There are fiscal policies which will help immediately in our fight to prevent further inflation.

(4) There are no effective "brakes" for inflation so long as we keep our foot on the accelerator.

(5) Unless sound fiscal policies are adopted, we will continue to confiscate the savings and earnings of our people and to aid the enemies of our freedoms and opportunities. Whether the result is socialism or communism, or some other form of dictatorship and tyranny, is inconsequential.

(6) If sound fiscal policies are adopted, our national defense program should prevent war and we shall have a real chance through leadership and a restoration of confidence in us and our objectives to promote and maintain peace and to succeed in our fight for religious, civil, economic, and political freedoms.

A LOOK AT THE PRESENT

An expert photographer need not be employed to give us a picture of the present.

Internationally

(1) Our potential military power is feared—free nations know that development of military strength can lead to war.

(2) Our economic strength is questioned—our friends abroad fear that if we slip, we shall pull them with us.

(3) Our policies of aid and assistance are misunderstood—it is feared that political domination must be the undisclosed motive.

(4) American inflation has occasioned more economic damage and tension abroad than the Marshall plan has or could overcome.

Nationally

(1) It is generally assumed that the present international emergency is of indefinite duration—and may continue for a decade or more.

(2) Existing tax rates cannot be borne for any such period—the damage will be much more costly than the revenues produced, and much more costly than the failure to raise huge additional revenues.

(3) The Revenue Act of 1950 and the Excess Profits Tax Act of 1950—designed to increase revenues by an aggregate of about $10 billion—were both intended to be "temporary and emergency" measures.

(4) Our greatest military potential is our productive capacity and ability.

(5) Our system of free, private, competitive enterprise, upon which we rely for the production of the goods and services required for military and civilian use, is being stifled—it can be destroyed.

(6) The Excess Profits Tax Act of 1950 must be completely revamped—if we approve and desire progress, growth, expansion; research, exploration, development; new products, new methods, discoveries; the survival of small business.

PAY-AS-WE-GO

The National Chamber urges that the Congress try realistically to apply the principle of pay-as-we-go through the reduction of less essential expenditures. Only then should new or increased taxes be sought.

A balanced budget must be the objective over a period of years, when defense expenditures rise and inflation may menace. But that objective should be attained mainly through the elimination, reduction, and postponement of nonessential spending, and through the elimination of waste. With expenditures and spending policies under control, revenue requirements can be faced with hope and perhaps confidence.

The application of the principle of pay-as-we-go, solely by increasing taxes, is not the answer. It must be realized that other policies and actions have a direct influence upon control of inflation. Spending policies, monetary policies, debt management, borrowing and lending activities, controls, and related questions have a dominant role. Individual and business savings are highly important in combating inflation. Taxes frequently contribute to inflation.

The chamber has urged, in this period of defense emergency, domestic economic policies which will most effectively gain our ends by building and preserving our economic strength.

It has stated that the objectives of these policies should be:

> To achieve maximum use of the productive potential of private industry.
>
> To promote the most effective balance of economic output as between military and civilian needs, and within these two categories: (*a*) To restrain inflation, (*b*) to distribute the burdens of mobilization equitably and efficiently, and (*c*) to maintain the vitality of an economy with free competitive markets.

To meet these objectives it has urged a number of economic policies. With regard to inflation, it has stated that there should be main reliance on indirect controls which strike at the sources of inflation. It recognizes that new and additional taxes may become necessary to assure pay-as-we-go, consistent with necessary expenditures, and consistent also with maintaining incentives to work and produce.

The chamber believes, however, there should be firm adherence to the policy that Federal taxes should be levied for the purpose of obtaining essential Government revenues, with careful weighing of collateral effects, and not for social reforms.

A LOOK AT THE HOUSE BILL

One look at the House bill is both shocking and conviciing.

(1) It embraces no basic revenue-producing policy which should be adopted; and

(2) It violates the policies which should underlie a sound fiscal system.

We deal now with the more important specific provisions of the bill.

THE PROPOSED INDIVIDUAL INCOME TAX INCREASES

The Revenue Act of 1950 increased the burden of the tax on individual income. It is now proposed to increase the burden again, this time by one-eighth of the total tax as determined by present rates. The superficiality of this approach has been amply demonstrated by the initial action of the Ways and Means Committee which found this method, without the subsequent change, placed a tax of more than 100 percent upon individuals in brackets of over $100,000 of taxable income.

Raising the individual income tax as the House proposes increases disproportionately the already highly progressive rates. Comparison of the effect of the proposed 12½-percent increase in tax liability on the "take home" pay of individuals in the various tax brackets shows this clearly. In the case of an income below $5,000 the increase, depending upon marital status, will take from about one-half of 1 percent to 3 percent of the income retained after taxes, but in the case of an income of $100,000 from 13 percent to 24 percent.

At a time when rapid productive expansion is imperative there is grave danger that excessive tax burdens placed upon individuals will impair both their incentive to produce and their ability to invest for production.

In any endeavor to increase Federal revenues from the individual income tax, it should be recognized that serious risks are involved, requiring the exercise of great caution.

It has been demonstrated repeatedly that confiscatory rates placed upon the income of individuals which lies in tax brackets over $10,000 would produce less than $3.5 billion and not only would preclude industrial financing by individuals but would destroy our American system.

The bill increases most harshly the tax upon individuals already hit the hardest and, with other levies upon them, could destroy revenue potentialities of middle-sized or higher incomes.

At least 10 of the 31 States which levy personal income taxes do not permit the deduction of Federal income taxes. This is true also of the District of Columbia. In six States the combination of income taxes would produce a rate higher than 100 percent, where the proposed Federal rate of 94.5 percent would apply, namely, on taxable incomes of $80,000 (single returns) or $160,000 (joint returns).

Any raise in the individual income tax should be applied by adding points to the basic rate, the method advocated by the Secretary of the Treasury.

PROPOSED CORPORATE INCOME TAX INCREASES

The proposed 5 percentage point increase in the corporate income tax is clearly excessive. Within the past year corporations have suffered the largest tax boost of all taxable categories. The Revenue Act of 1950 raised corporate normal and surtax rates from 38 to 47 percent and a 30 percent excess profits tax was added early in 1951. These two acts will double the tax revenues from corporations.

Corporations fully expect to bear their just share of the tax burden. Discriminatory increases, even in time of emergency, may defeat the primary objective of maximum production.

Corporate financing today comes largely from retained earnings and borrowings. Individuals are no longer able to supply equity capital sufficient to meet corporate needs for replacement of equipment and industrial expansion. Should too great a portion of corporate earnings be drawn off in taxes, industrial financing requirements would lead to greatly increased borrowing from banks or Government sources. Over reliance on either method would mean unsound corporate financing.

Much has been said about the magnitude of corporate profit, with little recognition that these profits today are highly overstated. Established depreciation allowances have failed by many billions of dollars to meet cost of replacements. Inventory profits, too, are illusory. And certainly the more than $100 billion investment since World War II in new plant and facilities is entitled to a reasonable return.

As a percentage of gross national product or income the total of corporate profits is smaller today than in many past years.

Increase of corporate taxes should be avoided in the public interest if at all possible. Tax-exempt competitors of corporations should be required to pay equivalent taxes.

If it should become unavoidable to increase the tax on corporations we urge that the combined normal and surtax be kept below 50 percent. Even the present rate much exceeds that of the World War II period.

No change in the corporate rates should be made retroactive as proposed in the House bill. The increases imposed on corporations by the Revenue Act of 1950 did not become fully effective until July 1, 1951. Overlapping tax increases are not justifiable.

Corporate earnings are taxed first in the hands of coporations and, when distributed as dividends, are subject to the individual income tax. The chamber has steadily maintained that the impact of the high income taxes has demonstrated the unfairness and unsoundness of the double taxation. Further increases in the corporate or individual income tax rates intensify the gravity of the situation, which already requires alleviation.

Ideally, the tax rate on corporate incomes should be the same as the basic rate on the income of individuals, with dividends received by individuals exempted from this basic rate and made subject only to the individual surtax. While this presently is not practicable, it does seem advisable to provide for the exemption of dividends received by individuals from a portion if not all the basic rate on individual incomes. Without resort to an undistributed profits tax there should be early diminution, and eventual elimination, of the harmful double taxation.

PROPOSED EXCESS PROFITS TAX INCREASES

Under any circumstance, the so-called excess profits tax is fundamentally a bad tax. It is impossible to frame legislation accurately defining either normal or excess profits of all corporations.

To impose an excess profits levy on ordinary income, as the 85 percent base period credit in the present law now does, is, beyond question, unfair. To increase this inequity, as the House bill proposes, compounds the nature of the injury.

A relistic base-period credit would be at least 100 percent, and possibly higher to compensate for the lowered purchasing power of the dollar. Other important changes should be made, as suggested later in this presentation, if the tax cannot be repealed. Certainly, the position of the Secretary of the Treasury that the tax should not be increased until there is opportunity to observe its operation should be endorsed.

LIMITATION ON SURTAX EXEMPTION AND EXCESS PROFITS CREDIT

The proposal to limit an affiliated or related group of corporations to a single surtax exemption and one minimum excess profits credit would seriously injure many businesses which, for sound operational reasons, and in some situations unavoidably, have organized separately.

CAPITAL GAINS RATES

The proposal to increase the alternative capital gains rates, for both individuals and corporations, by 12½ percent is explained as being necessary because of the increase in the individual income tax. This is a nonsequitur, failing to recognize the essential difference between capital gains and ordinary income.

The bill also would change the method of applying capital losses against capital gains.

Both these proposals should be rejected. If additional revenues are sought, the rate should be reduced. If fairness is a consideration, the rate should be lowered and excess losses should be deductible. If a capital levy is to be avoided (recent appreciation in the value of capital assets being a consequence of inflation), then there should be no tax upon capital gains, which is the established policy in many other countries.

EXCISES

If additional revenues prove necessary, Congress may increase some of the existing excises, reduce some of the highest ones, and add new ones. Even so, a general sales tax would be advisable.

There is undue reliance upon the income taxes as sources of revenue. They tend now to pass the point of diminishing returns. Higher rates will further aggravate the situation. A general sales tax will operate not only to decrease dependence upon the income taxes but also to restrain spending. It can be established upon a practical basis, with minimization of pyramiding. It should be looked upon as a necessary supplement to the income tax.

We append a summary of the relative advantages of applying a general sales tax at the retail level and at the manufacturing level.

WITHHOLDING TAX ON DIVIDENDS, INTEREST, AND ROYALTIES

The House bill proposes a withholding tax of 20 percent on dividends and on interest paid on corporate obligations, deposits with stockbrokers, insurance proceeds, certain tax overpayments and royalties. The plan contemplates a gross withholding without any exemptions and without any report to the Treasury Department of the persons from whom the tax is withheld.

There would be no requirement that the corporation advise either the stockholder or the Government of the amount of tax withheld from each individual stockholder. Claims for refund on the part of persons or organizations not subject to the full amount of the tax would be approved by the Government.

If this proposal becomes law, there would be substantial over withholding for persons in the low-income brackets not ordinarily subject to tax, for certain tax-exempt organizations where no tax at all is due, and for holding companies whose assets consist primarily of corporate stock.

It would prove a tremendous hardship on all individuals who expect to receive less than $600 total income from all sources for the year. These persons, who may be widows and orphans, would be required to file claims for refund for the nominal amounts withheld. In many cases, they might fail to receive the refund because they might not be aware of the proper method of obtaining a refund payment.

Certain tax-exempt organizations would be deprived of a percentage of their income until refund claims are filed and acted upon. While the bill proposes some relief to tax-exempt organizations with employees subject to wage withholding, it must be borne in mind that there are many tax-exempt organizations without paid employees. These organizations are generally more in need of financial assistance than those with paid employees and the bill provides them with no relief from overwithholding.

It is estimated that at least half a million individuals would be eligible for refunds under this plan and all of them would lose part of their income until refunds had been made.

Consider, for example, the married couple over 65 who are entitled to exemptions totaling $2,400 per year and assume their sole source of income is dividends on stock. Although Congress does not believe they should be subjected to tax, 20 percent, or $480, of their income would be taken from them and withheld until they could prepare claims for refund and the refund made by the Government. Or take the case of a taxpayer who is blind and over 65. A sizable portion of his income may be taken from him. It will be little comfort to him to be told that he can file a claim for refund at a subsequent time.

Trustees of nearly every small trust would be required to perform much extra work under the withholding plan. Dividends and interest would have to be apportioned between the beneficiaries and the trust. Claims would have to be filed for refund of the trustee's share of the income tax in every small trust. In addition each beneficiary would also have to file a separate claim for his pro rata share of the tax withheld. These are just a few examples of the effect of such a withholding plan. Such examples would be multiplied many times over.

Any holding company whose principal assets are corporate stocks would be in a difficult position. Only 15 percent of the dividends received are subject to corporate tax, yet 20 percent of the total dividends would be withheld. This is an effective withholding tax of 133 percent.

A number of corporations pay dividends in property rather than in cash. The bill provides for an exemption from withholding of dividends paid in the stock or rights to acquire stock of the distributing corporation. No provision is made for exemption from withholding in the case of dividends paid in other types of property. The payment of such dividends would encounter insurmountable difficulties under the proposed withholding. It would be necessary for the paying corporation to collect the withholding tax from the recipient of the dividend even though the recipient might not be subject to income taxes at all.

Another minor problem would result in constant taxpayer irritation. This problem has to do with such a simple matter as fractional cents. For example, a corporation declares a dividend of 62 cents per share on 1,000,000 outstanding shares. This is a total dividend of $620,000. Under the proposal, the company (or its dividend-paying agent) would remit 20 percent, or $124,000, to the Government. How much shall the company (or its paying agent) pay to the holder of seven shares of stock? If $3.48, the stockholder is overpaid and if $3.47, the stockholder is underpaid. It is no answer to say that fractions less than one-half cent will be dropped and those over one-half cent will be increased to a full cent for there will always be either money left over or a shortage and the corporation (or its paying agent) can never balance its accounts. Of course, the amount will usually be small but how can the overage be disposed of and how can the shortage be made up? Multiply this by thousands of times and the taxpayer irritation can destroy confidence in the whole withholding system. The bill attempts to meet this problem but it seems hardly adequate to provide merely that this can be covered by regulations.

The mechanics of bond interest collections would have to be completely readjusted to the nonpayment at par of interest coupons. Even the simple process of posting books would be affected. One-line entries will become two-line entries, thus increasing the amount of clerical work at a time when manpower demands are at their peak.

Representatives of the life insurance industry have pointed out the difficulties involved in applying the withholding provisions to interest on amounts held by an insurance company under an agreement to pay interest thereon and on the interest paid the life insurance companies on their investments.

I was also explained that interest credited on policy dividends and retained by the life insurance companies becomes an integral part of the accumulated dividend fund subject to the contractual provisions of the policy. This dividend fund may be used in a variety of ways under the terms of the policy contract. It may pay a premium due under the policy; it may shorten the period within which a policy may mature as an endowment; it may extend the term for which insurance coverage is provided after lapse; it may become a part of the policy proceeds at maturity, with all the rights, options, and privileges applicable to policy proceeds.

To require a withholding of any portion of such funds would disrupt the operation of these policy provisions and result in hardship to hundreds of insureds and beneficiaries alike.

It was explained that the bill in effect would require life insurance companies to pay their income tax in advance of the March 15 due date, and also would destroy for them the privilege of paying their tax in quarterly installments following that date. This discrimination arises because such a large amount of the taxable income of a life insurance company would be subject to the 20-percent withholding.

The imposition of the burden of withholding on payors of royalties would substantially increase the burdens of withholding agents. The cost to employers of withholding on wage payments has been substantial. In the case of corporations engaged in the oil business the imposition of a requirement to withhold on payment of royalties would impose an additional regular monthly burden greater than the burden now imposed by reason of payroll withholdings. For example, one oil company has 18,000 employees and withholding tax calculations on approximately 30,000 payments during each month are required. However, with respect to its oil and gas producing activities, there are 80,000 different divisions of interest, each requiring monthly calculations and payments. With respect to delay rentals, more than 40,000 payments are made annually for the account of approximately 125,000 different individuals.

In the case of small corporations and small oil producing companies, partnerships, and individuals who are not large enough to use machine methods economically, such as those used by the larger companies, the cost of withholding on dividends and royalties would be even more disproportionate to the present cost of such companies, partnerships and individuals in withholding on wage payments.

The increase under the bill in the burdens imposed on withholding agents would necessarily result in the use of employees in enforcing the withholding requirements at a time of national emergency and full employment and at a time when such individuals should be employed in activities other than clerical work. Additionally, the Treasury Department would be required to devote an increased amount of manpower to the enforcement of the withholding provisions thereby greatly increasing the already high cost of government.

In addition to the more valuable loss of manpower for the reasons set out in the preceding paragraph, the Government would lose tax revenues by reason of these provisions because withholding provisions would incur additional expenditures which are deductible for tax purposes.

Delay-rental payments with respect to mines and oil and gas leases are included in the definition of the term "royalty" in the bill. As a practical matter, no benefit would accrue to the Government from withholding from delay-rental payments for the reason that it is impossible as a practical matter. This is based on the fact that with respect to ordinary delay rentals the lessee does not know the division of interest in cases where the leases have been executed by more than one person. In one oil company's case, 85 percent of its delay-rental payments are made to more than one individual. In most cases the payments to multiple individuals are made to a depository bank for the account of the individuals and the corporation has no knowledge of the interest which each individual has in the total payment. Therefore, it would be impossible to furnish the Treasury Department with the amount of withholding applicable to each interest owner and each interest owner would, therefore, be unable to furnish proof to the Government from the withholding agent of the amount applicable to the interest which he had received. The same condition exists, to a degree, in the case of payments to owners of an interest in oil-producing properties in those cases where more than one individual is the owner of an interest in the producing property.

A much simpler procedure for insuring the Government that proper taxes are being paid by royalty owners is the system by which information returns are made by the payor showing amounts paid to each individual and the present requirements could be lowered and an amendment to the present law could be made so that all payments of royalties in excess of $100 per year would be reported on an information return. Such information returns, together with the requirements with reference to estimated tax, should be sufficient to furnish the Government with all facts necessary to ascertain the income-tax liability of taxpayers who receive royalties, dividends, or interest.

Not only would the bill produce a great deal of hardship on individuals, certain tax-exempt organizations and holding companies but the Treasury Department would be required to process at least one-half million claims for refund. This would require a large addition to Treasury Department personnel, thus increasing the cost of government.

Another difficulty is that it might encourage nontaxable individuals to overstate the amounts of interest and dividends they received. By merely making overstatements in claims for refunds, they would be able to obtain refunds of a fixed percentage of the amounts they claim to have received. There would be no way for the Treasury Department to check overstatements made by individuals and the door would be wide open to fraud by taxpayers. Nontaxable indivduals might soon learn that it is profitable to overstate their interest and dividends. If this were done on a wide scale, taxpayers' morale and confidence in the tax system would be impaired. It is believed that the risk involved is substantial and that it would be dangerous for the Treasury Department to adopt a system which would be almost impossible to check.

The report of the Ways and Means Committee, which accompanies H. R. 4473, contains many misleading and, perhaps, inaccurate statements with respect to the manner in which the proposed withholding on dividends, interest, and royalties would operate. It is stated that the proposed regulation would require that information returns be filed by the payor, showing all dividend payments regardless of size and that the elimination of the present $100 limit on the reporting of dividends paid would mean a large increase in the amount of work required by the payor. This is incorrect. It is actually more work to the payor to report under the present $100 limit than would be the case if all the dividends were reported. This is because of the manner in which such reports are made. Paying agents have developed facilities for writing the required form 1099 at the same time the dividend check is written and it would be a very simple matter to file with the Government 1099's to correspond with every dividend check written. Under the present $100 limitation, it is necessary for the paying agent to re-sort and combine dividends so as to eliminate those which total less than $100.

The report speaks of the substantial administrative costs involved to the Government in determining the amounts of unreported income, in preparing deficiency notices and in actually collecting the tax. This raises the interesting question: On whom these administrative costs should fall? It is conceded that any system of personal-income taxation involves substantial administrative costs. When those administrative costs are shifted from the Government itself to the tax-paying public, the Government is generally the loser. This is because the administrative costs become an income-tax deduction to the taxpayer as an expense item and thus operate to reduce the amount of tax payable.

The report contains rather fantastic figures of estimated under-reporting, the total involved being over $3 billion. It must be remembered that the income tax is a self-assessed tax and if under-reporting of $3 billion of income can be substantiated, our system of personal-income taxation has reached the breaking point. It may also be noted that this alleged figure of $3 billion of unreported income is out of line with the claims for $323 million of tax revenue supposed to result from the withholding provisions.

The report speaks of the unfair disadvantage which is present in the existing law for those who report their income accurately. This proposal is one which would penalize those who owe no tax in order to reach the few who omit interest and dividends either through deliberate evasion or forgetfulness. All other provisions of the income-tax law penalize the guilty. This provision would penalize the innocent. This is an incorrect philosophy of tax administration.

The House committee report tries to make the procedure for withholding and mechanics of treatment by the taxpayer seem easy and simple. Unfortunately, the actual practice under current business operations is considerably more complicated than the authors of the report realize. The taxpayer, in making his return, will not always have solely interest on which the tax has been held. There is no withholding on Government bond interest, interest on bank accounts, etc. Consequently, the return must provide for two classes of interest; that on which the tax is withheld and that on which the tax has not been withheld. It thus becomes necessary for the taxpayer to keep an accurate set of books so that his return can properly reflect the true situation. It seems entirely likely that the same carelessness which now results in under-reporting will cause the taxpayer to treat all his interest received as being subject to withholding, with the result that larger credits for withholding will inadvertently be taken than are justified. Certainly, the administrative cost to the Government in untangling these careless or deliberate errors would be just as great as the administrative costs of preventing the errors in the first place. There is no simple, easy, foolproof method of a withholding tax on interest and dividends.

It is interesting to note that Government bond interest is exempt from withholding. Is this intended to discourage the faithful reporting of interest on

Government bonds? Or is it a recognition of the administrative cost (this time to the Government) involved in the proposed withholding procedure? It is alleged that most of the deliberate evasion, forgetfulness, or carelessness is on the part of the smaller taxpayer. Is it not true that Government E bonds and bank-savings accounts are the principal sources of interest income to these smaller taxpayers? If the proposed withholding procedure is so complicated and difficult to administer in these situations where probably the bulk of under-reporting occurs, it hardly seems justifiable in other situations.

The withholding plan in any form should be rejected.

COLLAPSIBLE CORPORATIONS

The bill attempts to deal with an alleged abuse of the use of collapsible corporations. Proper administration of existing laws should be relied upon to reach any improper transactions in this field. This feature of the bill should be rejected.

SALE OF PROPERTY TO A CONTROLLED CORPORATION

The bill would deny to individuals the privilege of selling property directly to a corporation owned by them, except under penalty conditions. There would be no bar upon the sale of property to a third person who then could sell to the corporation. Any abuses connected with the sale of depreciable assets to closely held corporations would seem to be controllable through existing powers of administration, particularly with regard to depreciation allowances to corporations.

SALE OF TAXPAYER'S RESIDENCE

The provision of the House bill relating to capital gain from the sale or exchange of a taxpayer's principal residence is a highly desirable step in the right direction.

COAL ROYALTIES

The House bill provides for the taxation of coal royalties in the same manner as timber royalties have been taxed for a number of years. The section is designed to remove a tax discrimination which has become increasingly inequitable with each rise in the tax rates.

Coal royalties should be treated as proceeds of the sale of capital assets. Benefits of such change would extend to all coal lessors.

We commend the provision.

NEEDED MODIFICATIONS

Tax-exempt organizations

The chamber has long maintained the position that:

"No form of lawful enterprise should be favored by Government over any other form, and each, whether cooperative or individual, whether in single units or multiple units, should stand on its own merits with protection from unfair competition and free from tax exemptions and other public subsidies."

In testimony before congressional committees, chamber witnesses have repeatedly stated that the special tax treatment and privileges now extended to cooperatives are so broad as to expose other businesses to unfair and destructive competition at their hands.

Now that the favorable position, under income, estate, and gift taxes, so long enjoyed by educational and charitable organizations, has been curtailed in the Revenue Act of 1950, the tax favoritism available to cooperatives is even more unjustifiable.

APPENDIX I

GENERAL SALES TAX

The relative advantages of applying a general sales tax at the retail level and at the manufacturing level may be summarized as follows:

AT THE RETAIL LEVEL

(1) It could be an exposed tax, being collected from the consumer as an additional item at the time of sale. It should make the public more conscious and critical of Government spending. This has not been fully accomplished in respect to withholding of personal income taxes from wages, nor in respect to the exposed

retail sales tax in some 30 States and 100 cities. Much can be said as a matter of principle in favor of exposing all taxes to voters.

Congress could pass a concealed retail sales tax, as some States have done, by imposing it on the retailer without mandatory passing on and with no stated bracket system for collecting it. The temptation to do this may be strong. The struggle has been to keep retail sales taxes exposed. New York City, to cite an instance, has both an exposed 2 percent sales tax and a concealed one-tenth percent gross receipts tax.

(2) An exposed retail sales tax will avoid the possibility of pyramiding by the retailer, simplify price fixing, and assist in keeping the tax out of cost-of-living indexes, thus limiting its influence upon wage increases.

(3) A retail sales tax would have the advantage of bringing in large revenues at a low rate. It also would permit the continuance of some manufacturers' excise taxes on selected items. Existing manufacturers' excise taxes are currently estimated to yield $4 billion on liquor and tobacco and another $2 billion on gasoline, oil, autos, radios, refrigerators, sporting goods, business machines, photographic apparatus, matches, and revolvers. Presently, at the retail level there is a Federal tax on furs, toilet preparations, jewelry, and luggage, which at the 20 percent rate is expected to produce $430 million.

(4) While there is likely to be evasion of a retail sales tax to the extent of almost 15 percent because of the many small retailers (90 percent are small single stores doing 40 percent or more of the sales) a retail sales tax would avoid the complicated licensing system and the decisions as to what is the last step in manufacturing.

(5) A final advantage of a retail sales tax is the absence of tax content in retail inventories, the avoidance of accusations of profiteering if the tax is imposed without floor-stock impositions, and the avoidance of retail-inventory losses if the rate is reduced without floor-stock credits.

AT THE MANUFACTURER'S LEVEL

(1) Evasion would be more difficult and the cost of collection would be less. There are 10 times as many retail outlets as manufacturers—approximately 2,500,000 retailers, including garages, restaurants, and manufacturers who also sell at retail, compared to 300,000 manufacturers. Many retailers are seasonal, occasional, or otherwise temporary operators. Many are very small and located out of the centers of population.

(2) The whole principle of sales taxes would be easier established at the manufacturer's level, particularly in respect to its application to processed food and clothing, without exemptions. The essence of a Federal sales tax is breadth of application. This should be more acceptable at the manufacturing level.

(3) The retail sales tax field has already been preempted by the States and cities. To impose now an exposed Federal tax would greatly increase their nuisance. It is not practical at this time, if it ever was practical, for the Federal Government to take over the field and share the income with localities which now use various rates depending on their needs.

(4) While the Canadian tax law is somewhat complicated, largely due to exemptions, it has been a satisfactory revenue producer since 1920. At an 8 percent rate since 1936, it is producing in Canada about two-thirds of the revenue of its personal income tax and about two-thirds of the revenue of its corporate income tax, each of which, like ours, usually produces similar amounts. The complication of the law, the equitability of the tax, pyramiding, and the cost of collection apparently are not sources of serious complaint from any interests in Canada.

There is reason to believe that with exemptions of food and medicine, a manufacturer's sales tax would yield approximately $750 million for each 1 percent in the rate and a retail sales tax about $900 million for each 1 percent in the rate. The rate of either tax, of course, would be influenced by the new revenues which might be obtained from selective excises.

APPENDIX II

TECHNICAL AND ADMINISTRATIVE AMENDMENTS

A supplemental statement urging the inclusion in any forthcoming revenue measure of a number of needed technical and administrative amendments to the revenue laws, including changes in the Excess Profits Tax Act, is being submitted for inclusion in the record of the hearings. The more important of these recommended amendments will be referred to in the oral statement.

TECHNICAL AND ADMINISTRATIVE AMENDMENTS

The following represent a few of the necessary technical or administrative changes which should be considered at the present time.

REPLACEMENT OF LIFO LIQUIDATIONS

During the early months of World War II, taxpayers using the LIFO inventory method found their taxable incomes artificially inflated by the unavoidable depletion of their base stocks of materials then in short supply, which would have to be replaced after the war at prices much higher than those at which they had originally been acquired. As part of the Revenue Act of 1942, the Congress provided for relief in this situation in the form of certain inventory adjustments defined in section 22 (d) (6) of the Code. Prior to the enactment of Public Law 919 last January, the right to these adjustments was available only where the taxpayer had made a replacement of previously depleted stocks by December 31, 1950.

Before this permissible replacement period had ended, the Korean war, with its various effects on commerce, and on the supply of many raw materials in particular, had made replacements impossible in certain instances, and had also forced new inventory liquidations. By Public Law 919, Congress accordingly extended the time within which World War II liquidations might be replaced, and also provided similar treatment for current liquidations if replaced by the end of 1955.

Unfortunately, these two provisions of Public Law 919—that extending the replacement right for World War II liquidations, and that establishing rights respect to current liquidations and subsequent replacements—were not properly correlated. This lack of correlation is attributable to the preexisting rule that replacements are to be attributed in all cases to the most recent liquidations not already replaced, and to the Public Law 919 termination date on World War II replacements of December 31, 1952.

The effect of this oversight maybe illustrated by the following example. A particular taxpayer, who at the outbreak of the Korean war had not completed his replacements of World War II liquidations, suffers further inventory depletion in the latter half of 1950 and throughout 1951. During 1952 he is able to effect a considerable amount of replacements, and during 1953 he is able to bring his inventory up to the pre-World War II level. He nevertheless loses the benefit of the Public Law 919 extension of World War II replacement rights because the 1952 replacements must be alllocated to 1950 and 1951 liquidations, and replacements in 1953, although within the period during which Korean liquidations might be replaced, are too late to be used as World War II replacements.

Congress certainly did not intend to deny the benefit of its extension of the date for replacement of World War II liquidations to those taxpayers most in need of it—those who now, because of the defense program, are not even able to maintain inventories, much less rebuild them.

This situation should be corrected by making December 31, 1955, the termination date for replacements of World War II as well as current liquidations.

OBSOLESCENCE DEDUCTION ON AIRCRAFT EQUIPMENT

Since the end of World War II the commercial airlines have generally had two major change-overs in the type of airplanes and related flight equipment used for passenger transportation service. These changes were dictated by the impact on the industry of the extraordinarily high rate of technological progress, resulting in the development of more economical, faster, and safer planes, and the consequent obsolescence of older planes. In the next few years the development of jet and turbo-jet aircraft will without doubt bring about the obsolescence of the DC-6's, Stratocruisers and Constellations which now constitute the first-line equipment, and that change-over will be the most complete and radical yet experienced.

In order to maintain their fleets in operation with the maximum of safety and the minimum of interruptions, the airline companies are required to keep on hand at all times certain stocks of parts and assemblies—ranging from spark plugs to landing gear—which can be quickly placed in flight service in lieu of parts requiring replacements, repair, or inspection. Although these parts are interchangeable as between different individual planes, the major portion can be used only on the single type of plane or engine for which they were specifically designed. They, too, therefore, have an extraordinarily high rate of obsolescence, and one which is equal to the rate of obsolescence of the plane to which they pertain.

These stocks of parts now held by the industry have an aggregate dollar value in excess of $81 million. This figure is increasing sharply.

Legislation is required so that the airlines may write off the costs of these stocks over the lives of the planes to which they relate, instead of being required to deduct substantially the entire cost as a loss in the last year of service. This would not only bring about the recognition of an obsolescence factor which is clearly present, but would make for a clearer reflection of income in the charging of the costs of the stocks ratably over the entire service period. The proposed treatment is in accord with the method of accounting recognized by the Civil Aeronautics Board.

The necessity of legislation is occasioned by the refusal of the Bureau to accept the principle of such a write-off, notwithstanding that obsolescence is expressly mentioned as a basis for a ratable deduction of cost by section 23 (l) of the Internal Revenue Code. The theory underlying the Bureau's position in this connection, and the limits of its position, are not entirely clear. It does accept the obsolescence factor in determining the useful life of the planes themselves. It does also in determining the life and providing for the write-off of the cost of the stocks of certain of the so-called "assemblies." But it does not admit that the rule governing these practices extends to stocks of parts in general.

The only difference between the "assemblies" on the stocks of which the write-off is allowed, and those parts on which it is not allowed, is that the former are generally somewhat larger and more complex. This rule-of-thumb physical distinction is certainly not such a difference as should be made the basis for allowing or disallowing an obsolescence deduction, or as the Congress has approved for such a purpose.

Furthermore, the parts and assemblies in stock at any given time are making a contribution to the maintenance of service which is equally as vital as that made by the parts and assemblies then on the planes, on which an obsolescence allowance is of course recognized. Without either group of parts, the carrier's service could not be continued with the required regularity and safety. Those parts on the plane are subject to greater physical deterioration, but as this factor is not the basis of the allowance in either case because the obsolescence factor is generally the more severe, this difference is immaterial.

Litigation of this issue with the Bureau is not a satisfactory solution. The airlines not presently enjoying the allowance which the amendment would recognize failed to press their rights to it in past years when the amounts invested in such stocks were small, and today are forestalled from asserting such a right because to do so involves a change from present accounting methods for which the law requires the Commissioner's prior approval.

Moreover, the practical needs of the air transport industry are such that a spreading of this cost cannot be achieved by a gradual liquidation of any such stocks over the last few years of their use. Being maintained generally at levels no higher than required for purposes of the necessary ready availability, they cannot be substantially reduced until the actual date of the change-over which renders them completely obsolete in the hands of that company.

MEDICAL EXPENSE DEDUCTION

Section 23 (x) of the Code, as added by section 127 of the Revenue Act of 1942, allows a limited deduction by individuals for amounts expended for medical care. The term "medical care" is defined to include amounts paid, according to the statute, for the "diagnosis, cure, mitigation, treatment, or prevention of disease, or for the purpose of affecting any structure or function of the body," and, according to the pertinent finance committee report, for the alleviation of a physical defect.

In making such amendment it was obviously intended that the term "medical care" be broadly construed. Recently, however, the Commissioner has ruled that the cost of a wheelchair attendant necessitated by the loss of use of the lower limbs from poliomyelitis does not constitute a medical expense within the meaning of the statute. That particular case involved a disability incurred in the course of service in World War II, and has resulted in the necessity of the taxpayer contesting before the tax court a proposed deficiency amounting to $77.

The constant service of an attendant is often necessary by reason of the loss of sight, or of limbs, paralysis, or other severe afflictions. It is clear that the Congress did not intend to discriminate narrowly against expenses for this class of assistance.

A clarifying amendment is therefore appropriate, and it should be made retroactive for the period during which section 23 (x) has been in effect.

EXCLUSION OF CAPITAL GAINS FROM SECTION 102 INCOME

Long-term capital gains should be excluded from the income subject to the penalty tax on corporate accumulations imposed by section 102 of the Code.

Long-term capital gains, when realized by a corporation, are now taxed at a rate of 25 percent. Under H. R. 4473 as passed by the House, they would be taxed at a rate of 28¼ percent. In both instances, this is equal to the maximum rate at which the same income would be taxed if realized directly by an individual. As the purpose of the section 102 surtax is to penalize the accumulation of corporate earnings retained with the purpose of avoiding individual surtaxes, it is clear that there can never be any justification for applying the tax to this type of income.

Moreover, under existing law, long-term capital gains are not subject to the special tax imposed on the undistributed net income of personal holding companies. It is not believed that ordinary corporations should be treated more severely. The adoption of the proposal would not prevent long-term capital gains from being considered in determining whether earnings were allowed to accumulate in excess of the reasonable needs of the business.

H. R. 6712, which passed the House during the second session of the Eightieth Congress, contained such a provision.

LUMP SUM PAYMENT OF CUMULATED DIVIDENDS

Suppose X, an individual, owns 1,000 shares of $6 cumulative preferred stock. For one reason or another, he receives no dividends for 4 years. Suddenly, 5 years' dividends, or $30,000, are paid in a lump sum.

Having received all the income in 1 year, X will be taxed under the present law about $13,000. If he had received the dividends regularly at the rate of $6,000 a year for the 5 years, his tax for the 5 years would have amounted to only about $6,000 in the aggregate. In the one case he has only $17,000 left of his $30,000 dividend, and in the other, $24,000. Obviously, it is harsh to treat X as a $30,000-a-year man when he is really only a $6,000-a-year man.

The same unfortunate result follows under existing law from the lump-sum receipt of several years' back bond interest.

When it is remembered that the taxpayer in these cases is frequently a widow, a retired person, an estate, or the beneficiary of a trust, who may already have suffered considerable hardship from the failure to receive the income periodically, without compounding the misfortune through the tax laws, the result is unduly harsh.

The solution is an easy one. In fact, it lies ready to hand—limit the tax for the year of receipt to what it would have been if the income had been received periodically. This is what section 107 of the Internal Revenue Code already does in the case of back pay, lump-sum payments for personal services, and income from patents or copyrights, and no reason exists why this treatment should not be extended to cumulative preferred stock dividends or defaulted bond interest.

Retroactivity to 1945 is essential. The subject was first broached at that time. Taxpayers should not be penalized because of the delay by Congress in considering so-called technical and administrative amendments.

DISTRIBUTION OF SECURITIES HELD MORE THAN 10 YEARS

There are numerous situations where, for sound business reasons, corporations should divest themselves of stock or securities in other corporations, but cannot do so because of the disastrous tax consequences which would result to them or their shareholders from sale or distribution, and the destruction of values which would often follow as a consequence of forcing a liquidation of holdings to meet tax liabilities. The stock or securities may be that of a wholly owned subsidiary which ought to be separated from its parent. Or they may represent an investment no longer appropriate, or one which imposes undue supervisory responsibility on management at a time when it should be devoting its energies to the taxpayer's own operating business. It is imperative to facilitate such divestitures. To provide that they can be made tax-free will not injure the revenue, since otherwise they will not be made at all and, through proper allocation of basis, a tax will ultimately be obtained from the distributees.

The code should, therefore, be amended to permit tax-free distribution of stock or securities so held, with the same tax consequences to the distributees as would exist upon the receipt of a nontaxable stock dividend, i. e., an allocation of basis. To make certain that no anticipatory division could be employed, it would be appropriate to limit such treatment to a distribution of stock or securities held by the distributing corporation for a minimum of 10 years.

EXEMPTION OF INCOME EARNED ABROAD

Section 116 (a) of the Internal Revenue Code, which provides for the exemption under certain circumstances of income earned outside the United States, was intended to relieve American citizens who go abroad in the pursuit of a trade or profession from the burden of double taxation on their earnings, and also to provide an incentive for foreign employment by exempting such earnings from Federal income tax. Such an incentive is especially necessary today and the purpose of the incentive has a vastly increased importance.

Under present law, however, the exclusion fails to achieve its purpose in two respects. In the first place, the exclusion is allowed only where the taxpayer has been resident abroad for the entire taxable year. The Treasury has rightly suggested on several occasions that there is no reason not to allow the exclusion from the date that foreign residence is first assumed. This would end the present arbitrary denial of the exclusion for the first and last few months of foreign residence.

In the second place, the courts have construed the term "residence" as being substantially equivalent to "domicile", even in the case of an employee engaged in bona fide foreign service for his employer. For example, they have refused to recognize foreign residence where the taxpayer left his family in the United States, or gave other evidence of an intention to return to the United States at some time in the future.

The interpretation misconstrues the purpose of the exclusion. The people supposed to be benefited were not expatriates who had renounced the United States forever. They were the armies of managers, technicians, and skilled workmen who were induced to commit themselves for 18 to 36 months abroad. In many instances the nature and location of their work and the lack of adequate educational facilities do not permit them to take their families. In practically no instances do such men have an intention on their original departure of making their home abroad permanently, even though they may renew their contracts many times and stay abroad for years. Clarification is apparently necessary in order to make certain that the exclusion is available to such employees who are living abroad by reason of bona fide employment, for the period they are absent from the United States.

GAIN TO EMPLOYEE ON RECEIPT OF TERMINATION PAYMENTS

Action is required to relieve the hardship resulting from the present inapplicability of the capital gains provisions of the Internal Revenue Code to certain payments received by employees or retired employees in liquidation of continuing rights arising out of a long-continued period of employment.

Employment contracts frequently provide for payments beyond the employment period, based upon a percentage of future profits of all or part of the employer's business, or a percentage of gross receipts from the exploitation of some particular devices, productions, ideas, or other property, for which, or for the development of which, the employee was largely responsible. Upon termination of his employment, the employee may not wish to have his future income depend upon the hazards of a business with which he is no longer connected. He may prefer a lump-sum realization of his essentially contingent rights. The employer will also in many cases desire to liquidate its contingent liability. Since, however, the employee will be receiving the commuted value of several years' income in 1 years, the concentration of income will result in a prohibitive tax cost, unless the profit realized is treated as a long-term capital gain. The code should be amended to make certain that such treatment will be accorded, for the same basic reasons exist for such treatment as in other cases where it is available, i. e., for realization of several years' income in a single year. The justice of this approach has already received congressional approval in the pension field. It is provided in section 165 (b) that a lump-sum settlement with a beneficiary shall be treated as capital gain rather than ordinary income. Even in the type of case under discussion, no uncertainty would exist if, for example, the employee's efforts gave him a property right in a particular patent which, upon termination of his employment, he sold to his employer. It should be immaterial whether the sale or release occurs prior to or after the actual termination of employment.

REDEMPTION OF STOCK TO PAY DEATH TAXES

Section 209 of the Revenue Act of 1950 added to the code a provision—section 115 (g) (3)—which in appropriate situations permits the stock of a closely held corporation to be redeemed from the estate of the decedent proprietor without the estate incurring any risk of the imposition of a dividends tax on the distribution. This provision was intended to make such distributions possible as a means of paying estate taxes without the highly inequitable and undesirable losses of value and of control involved in the forced sale of family businesses. As the provision now stands, however, it contains certain arbitrary limitations on its application which have the effect of denying relief in some situations where it is most needed.

In the first place, the provision applies only to distributions "within the period of limitations for assessment of estate tax * * *." Thus it has been of no benefit to those executors of estates already in the process of administration who, before the enactment of the 1950 act, had conscientiously proceeded to discharge the estate tax liability with borrowed funds, but were still faced with the basic problem of discharing the resulting loan.

Furthermore, the provision is limited to situations in which the decedent's business was operated through a single corporation only. Where the estate consists largely of the stock of two or more closely held corporations, the same problem exists.

Section 115 (g) (3) should be extended to the two situations just indicated. This change should be effective as of the date of enactment of the 1950 act.

REORGANIZATION IN THE FORM OF "SPIN-OFFS"

The House, during the Eightieth Congress, and the Senate, during the Eighty-first Congress, each approved a provision which would have recognized the nontaxability of corporate reorganizations taking the form of "spin-offs." A "spin-off" occurs when a part of the assets of an existing corporation are transferred to a new corporation and the stock of the latter is distributed to the stockholders of the existing corporation. A "spin-off" is distinguished from a "split-up," the latter consisting of a transfer by an existing corporation of all of its assets, part to one new corporation and part to another, the stock in the new corporations being distributed to the shareholders of the existing corporation in complete liquidation.

Under existing law a "split-up" may be carried out without recognition of gain or loss. There is, however, no substantial difference between a "spin-off" and a "split-up" or the purposes for which they may be used. Only where some technicality of corporate law may impede the use of a "split-up" is it necessary for corporations to resort to "spin-offs", but in this situation it is economically unsound to prevent the one type of reorganization which can accomplish the division of an existing business into smaller units.

The principle which was approved by each of the two Houses of Congress within the past 3 years should be given effect by the inclusion of "spin-offs" as a proper type of corporate reorganization within the ambit of section 112 of the code.

NET OPERATING LOSS DEDUCTION FOR 1951–53

Prior to the Revenue Act of 1950, the Internal Revenue Code recognized a limited right of averaging income over a 5-year period. By virtue of this right taxpayers could reduce their taxable income each year by the aggregate of their "net operating losses" during each of the 2 years immediately before and immediately after the taxable year—i. e., by a 2-year "carry-forward" and a 2-year "carry-back."

When H. R. 8920, the bill which was later to become the 1950 act, was under consideration in each House, notice was taken of the fact that small and new businesses were peculiarly subject to fluctuating incomes. It was further reasoned that these types of businesses in particular and venture capital in general would derive a real stimulus from an extension of the averaging period, and also from increased emphasis on the carry-forward (see H. Rept. No. 2319, p. 59, and S. Rept. 2375, p. 56, 81st Cong., 2d sess.). Both revenue committees accordingly recommended a measure intended to accomplish these two ends by extending the 5-year averaging period to 7 years, comprising a new 5-year carry-forward and a 1-year carry-back. This measure was eventually enacted as section 215 of the 1950 act without apparent opposition from any quarter.

Contrary to the general understanding when the 1950 changes were before the Congress, the literal terms of the provision in which they were embodied do not make the 7-year averaging period actually available to taxpayers until 1955.

Indeed, during a substantial interim period they have the effect of reducing the preexisting averaging period from 5 to 4 years. Moreover, they effect no increase in the carry-forward until 1953.

As an illustration, under the terms of the 1950 amendment, taxpayers are permitted to set off against their income for the current year—1951—only whatever net losses they may have sustained in the years 1949, 1950, and 1952, and against their income in 1952, only losses in 1950, 1951, and 1953. For a tabular representation of the inadequate articulation of the 1950 changes with prior law, see the attached schedule.

At a time when taxpayers are faced immediately with the severe burden of sharply increased surtax rates and excess profits taxes, no justification for a current reduction in the averaging period can be found in the prospect that taxpayers still in existence at some time several years in the future will then enjoy the benefit of an extended period. The principles of a 7-year averaging period and of a longer carry-forward, which are conceded to be desirable for 1955 and later years, are equally appropriate today.

The anomaly of this situation is most evident in connection with the recent enactment of the excess profits tax. Both revenue committees, in formulating the relief provisions under that tax, acted on the stated assumption that there were several new rules reducing the need for such relief, relative to that under the old excess profits tax, and that one of these new rules was "the substitution of a 5-year carry-forward and a 1-year carry-back of * * * net operating losses for the 2-year carry-forward and the 2-year carry-back used under the World War II law" (H. Rept. 3142, p. 16, and S. Rept. 2679, p. 18, 81st Cong., 2d sess.). The fact was, however, that under the actual terms of the 1950 amendment the averaging period for these losses had been reduced, rather than increased, for 3 of the 4 years for which the excess profits tax was enacted (1950, 1951, and 1952), and merely maintained at its previous extent for the fourth year (1953). The increase in the averaging period which was seen as easing the impact of the new excess profits tax will not actually become effective until after the excess profits tax expires.

An amendment could minimize this interim inequity by extending the right to carry forward 1948 and 1949 losses to 4 years instead of 2. This would have no effect on deductions presently allowable for years prior to 1951, or subsequent to 1953, when the benefits of the 1950 changes will first begin to make themselves evident. It would merely bring about a gradual transition to the new 7-year averaging principle already established, by making a 5-year averaging period (i. e., equal to that under the old law) available for 1951, and a 6-year period available for 1952 and 1953.

Although a complete correction of the inequity would require that such an amendment also apply to years prior to 1951, its application has been limited so as not to necessitate refunds for years for which returns are already filed. Moreover, the need for correction with respect to 1951 and subsequent tax years is more acute by reason of the higher tax rates applicable to such years, and because 1946 and 1947 losses will already be largely used up by being carried back into the high-profit World War II years.

Net operating loss carry-forwards and carry-backs for taxable years from 1946 to 1956, inclusive, as allowed by existing law and by the proposed amendment

Carry-forward allowed from	Taxable year	Carry-back allowed from
1944–1945	1946 [2]	1947–1948
1945–1946	1947	1948–1949
1946–1947	1948	1949
1947–1948	1949	1950
1948–1949	1950	1951
(1948)–1949–1950 [1]	1951 [3]	1952
(1948–(1949)–1950–1951 [1]	1952 [3]	1953
(1949)–1950–1951–1952 [1]	1953 [3]	1954
1950–1951–1952–1953	1954	1955
1950–1951–1952–1953–1954	1955	1956
1951–1952–1953–1954–1955	1956 [4]	1957

[1] The years shown in parentheses are not permissible sources of loss carry-forwards under present law, but would be so under the proposal.

[2] For all years prior to 1946, beginning with the year 1941, the averaging period is the same as for the year 1946.

[3] These years would be affected by the proposal.

[4] 7 years is also the averaging period for all years subsequent to 1956.

EMERGENCY AMORTIZATION

Section 124A permits the amortization of facilities the construction of which was begun prior to the beginning of the conflict in Korea. Some have questioned the propriety of this.

Before the fighting began in Korea, aircraft manufacturers, for example, had begun to expand their facilities in response to military demands. In turn, suppliers of aircraft manufacturers had begun to increase their capacity, again to meet emergency demands. There is no sound basis for treating these leaders in the current industrial expansion on a basis different from those whose participation in the expansion program began at a later date.

Under section 124A, the amount of the cost of a facility which is attributable to construction prior to January 1, 1950, is not subject to the amortization deduction. This goes further than to afford adequate protection against the certification facilities which cannot properly be regarded as related to the emergency. Actually, it creates an inequitable situation. The companies most directly related to military procurement who had the foresight to expand early for the defense program are denied the right to write off the cost of these facilities during the period they are reasonably certain to produce income. To some extent a premium is placed on postponement of necessary expansions.

There are two ways in which our committee feels section 124A should be changed. The changes recommended have to do with the determination of the percentage of certification and with the question of a further acceleration or "compression" of amortization in certain circumstances.

The percentage of certification is now based in part on the estimated post-emergency usefulness of the facility. Thus, for example, if it is estimated an emergency facility has no post-emergency utility and there is the greatest possible risk in the investment, certification may be for the entire cost. If it is estimated the entire plant will have post-emergency utility and there is little or no risk in the investment, certification may be denied entirely. If the plant expansion is estimated to be 50 percent useful after the emergency, certification may be for 50 percent or less, depending on the evaluation of the investment risk. The trouble with this is that no one can accurately predict post-emergency utility and whether earnings will ever be produced by the facilities beyond the emergency period—or for that matter during all or a substantial part of this period.

Considerable time and effort is being spent in the delegate agencies on the question of the percentage of certification in terms of future usefulness. This is unfortunate because it is largely a futile effort carrying little assurance of equitable results and, possibly more important, because it is delaying the issuance of many certificates which in turn is delaying construction. Some companies with limited working capital due principally to greatly increased inventories are genuinely concerned about borrowing money for plant expansions without assurance of amortizing the cost against the earnings to be produced.

The answer to this difficult problem is to determine the percentage of certification solely on the basis of the present emergency military and essential civilian need for the product of the facility. The Senate recognized this in an amendment to the 1950 act but the provision was deleted in the conference committee.

The statute is not entirely clear on the question of percentage certification. The doubtful language requires a determination of the portion of a facility "attributable to defense purposes." Administrative interpretation has been that the percentage should be based on both present emergency utility and post-emergency utility, although there is some indication other considerations have been taken into account in an effort to achieve fair results. The legislative history of the provision indicates that the language was intended to require the determination only of the use of the facility during the emergency period. General principles of fairness and considerations of sensible administration suggest that the interpretation indicated by the legislative history should be made express in the statute.

The second suggested change is forward looking. Section 124A, like section 124, sets an arbitrary 60-month amortization period. Under 124A, as under section 124, a taxpayer is given the right to elect amortization and, subsequently, to abandon it in favor of the depreciation deduction. But section 124A differs sharply from old section 124 with respect to amortization in the case of termination of the emergency or termination of the emergency need for a certified facility. In such circumstances, section 124 provided alternatives to the 60-month amortization period. The taxpayer was permitted to use a shorter period in case the emergency terminated before the end of 60 months or the facility became unnecessary for defense purposes during the emergency. In the case of an election of either alternative, taxes for prior years were to be recomputed so as to adjust the difference in the deduction.

Such provisions are needed in the present law. The taxpayer should be permitted to recover the cost of producing income before the application of the tax. If termination of the emergency terminates the usefulness of an emergency facility, the entire cost of the facility is a charge on the income produced during the emergency period. This fundamental principle is overlooked in the present statutory provision.

Even more important, in view of the likelihood of a prolonged continuation of the emergency, provision should be made for a further acceleration of amortization of facilities which become unnecessary and idle within the period of the emergency. For example, industrial expansion in its early tooling-up stages requires tremendous increases in the production of machine tools and other machinery. For this purpose great plant expansion has been taking place. But the history of World War II and earlier emergency periods indicates that even before general defense production reaches full proportions the demand for machine tools and many other facilities will have been met; sales will slacken and then sharply decline.

Provision should be made, as in section 124, for "compression" of amortization if (1) the emergency period actually ends before the 60-month period, or (2) there is a determination by the certifying authority that the certified facilities are no longer necessary in the interest of national defense.

EMPLOYEE STOCK OPTIONS

Under section 130A of the Internal Revenue Code, as added to the code by the Revenue Act of 1950, an employee who holds a "restricted stock option" from the employer corporation may exercise his right under the option to purchase stock in the corporation without incurring an income tax liability until he later disposes of the stock. The law defines a "restricted stock option" in a way which is generally intended to include options granted as employee incentive devices and to exclude options merely calculated to permit the holder to realize income in the form of capital gain.

One element of this definition excludes from the category of "restricted stock options" any options which by their own terms are subject to assignment, whether actually assigned or not.

This provision works an unnecessary hardship on employees who were granted assignable options prior to the adoption of the 1950 act, but who have not assigned them and have never intended to do so. The parties may have failed to include in the option a prohibition on assignment merely because it was thought to be unnecessary, but today they cannot modify the option to add such a prohibition without causing the option to be treated as one originally granted at the time the modification is effected.

Section 130A should be amended to permit options granted prior to the 1950 act to be so modified without being treated as new options.

AMENDMENT OF SECTION 131(F)

Section 131(f)(1) of the code allows a domestic corporation a credit against the United States tax for taxes paid other countries by a foreign corporation from which it receives dividends, but only if the domestic corporation owns a majority of the voting stock of the foreign corporation .

This restriction on the availability of the credit is without justification. The credit is limited in any event to that proportion of the foreign taxes paid which the amount of the dividends received by the domestic corporation bears to the profits with respect to which the taxes are paid. Thus the credit is otherwise made to be in proportion to the relative interest held in the foreign corporation. The effect of the restriction is simply to deny the lesser credit which would be allowed to noncontrolling stockholders if the restriction were not present.

In many instances, foreign law or business conditions or sound policy dictate large local participation in foreign enterprises. In others, two or more domestic corporations desire to enter a foreign venture on an equal footing. The credit should be extended at least to all situations in which the domestic corporation owns more than 10 percent of the foreign corporation.

This follows a recommendation made last year to the House Ways and Means Committee and to the Committee on Finance by Secretary Snyder. It is in accord with the policies of the administration and there is no reason to postpone action upon it.

For the same reasons, a relaxation is required of the provision in section 131 (f) (2) limiting the allowance of a credit for foreign taxes paid by a foreign subsidiary of a subsidiary to cases where the top subsidiary owns 100 percent of the bottom subsidiary. A 50 percent minimum in this situation would be ample.

CONSOLIDATED RETURNS

For the "privilege" of filing consolidated returns, section 141 (c) of the code exacts a penalty of a tax of 2 percent, in addition to normal tax, surtax, and excess profits tax. Theoretically, this additional 2 percent is designed to neutralize the tax saving which results from the immediate advantages of consolidated returns: (1) The offsetting of one affiliate's losses against another's profits, and (2) avoiding the tax on intercorporate dividends and transfers of property.

But despite these immediate advantages, whether there is a long-range tax savings in most cases is doubtful. The corporation filing separate returns can utilize its losses under the carry-back and carry-forward provisions of the code; and in the transfer of property between corporations filing consolidated returns, not only is realization of gain merely postponed, but the lower bases remains effective for all other purposes, including depreciation. In addition, consolidated corporations are allowed only one section 15 surtax exemption, and only one $25,000 minimum excess profits credit. For purposes of the excess profits credit based on income, consolidated corporations are required to use a consolidated base, and for purposes of the credit based on invested capital, they must aggregate their capital and subject themselves to the lower rates applicable to larger businesses.

Nevertheless, whether corporations using the consolidated return are not paying more than the privilege is worth is not or should not be the determinative point. If it is believed that consolidated returns result in a fair reflection of group income, there is no justification for superimposing a penalty tax for the "privilege" of using the appropriate method of income computation. It would, of course, be difficult to maintain that consolidated returns do not result in a clear reflection of income, in the light of the number of occasions in the past in which the Congress has approved their use, and even in some instances, made such use compulsory.

The only just conclusion is that the 2-percent tax should be repealed. If, however, for purely revenue reasons, this step is not feasible at the moment, the least that should be done is to authorize an annual election as to the use of the consolidated return.

Under present law, it has been left to the Treasury to fix the conditions under which eligible corporate groups might file consolidated returns. Heretofore the Treasury regulations have not limited the right of eligible corporate groups to elect a change from an individual return basis to consolidated returns. But they have made such an election binding for all subsequent years, unless new corporations are added to the group, except when in the opinion of the Commissioner some change in the Internal Revenue Code or Treasury Regulations makes the continued filing of consolidated returns less advantageous to "affiliated groups as a class." In the majority of years since 1941, when section 141 in its present form was first enacted, a new election has actually been permitted. The Treasury's decision has usually not been issued, however, until after the close of the taxable year affected, and in some instances not until after the due date for the filing of returns.

It is certainly not improbable that future changes in the tax laws and regulations will be sufficiently frequent so that consolidated groups will actually have the privilege of a new election substantially as often as they would under this proposal. The present system, however, places eligible corporate taxpayers in a position of uncertainty in which an election must be made not only without knowledge of how new tax legislation may change the consequences of the election, but also in complete ignorance as to whether the Treasury will consider the new laws or regulations as working to the disadvantage of "affiliated groups as a class," and thus as to how long the effects of the election will last.

Moreover, changes in the tax laws and regulations are not the only factors making for uncertainty as to the consequences of a consolidated return election. Many other governmental actions are, practically speaking, equally as important to the corporate taxpayers in making their decisions in this connection, e. g., new price and wage ceilings promulgated by the OPS and WSB, new public utility rates promulgated by Federal or State agencies, changes in Government programs involving procurement contracts, changes in renegotiation law or practice, etc. These actions not only may affect the consequences of taxpayers' decisions as to whether to file consolidated returns just as much as changes in the tax law, but are also just as much the responsibility of the Government and just as much outside taxpayers' control. It is clear that any requirement that consolidated return elections must bind taxpayers for subsequent years places them in the impossible position of having to predict the course of events outside their control.

If the 2-percent penalty must be retained as a means of offsetting the over-all loss of revenue believed to be involved in the use of consolidated returns, there is no basis for denying to taxpayers the right to make an effective election as to whether the privilege will be claimed.

SUPPLEMENT R TRANSFERS

Supplement R of the Internal Revenue Code provides for the nonrecognition of gain or loss in the case of certain property transfers pursuant to an SEC order in furtherance of the integration provisions of the Public Utility Holding Company Act of 1935. This treatment was provided because of the compulsory nature of the transactions, and the thought that recognition of gain or loss should, wherever possible, be postponed until a voluntary realization occurred.

Among the transfers covered by supplement R are those within a "system group." A "system group" is defined in section 373 (d) in a way which is intended to insure that the companies involved in the transaction are a group of closely related corporations. The test now used to determine the closeness of the relationship in section 373 (d) is the percentage of ownership of each class of stock other than stock which is preferred as to both dividends and assets. The percentage of ownership required is 90 percent.

As is the case whenever an arbitrary line is drawn, the establishment of a requirement of ownership of 90 percent of each class of stock may exclude a particular taxpayer from the benefits of supplement R although the group would be regarded in all other respects as involving closely related corporations. Thus ownership by corporation A of 90 percent of the total equity stock of corporation B may not qualify them as being members of the same "system group." For example, where, as in an existing situation, the equity stock of B consists of two classes—one of over $40,000,000 and one of about $15,000—and A, while owning 96.8 percent of the total equity stock owns slightly less than 90 percent of the smaller class, the two corporations, under a strict interpretation of the existing law, will not be considered members of the same "system group." Moreover, this would be true even though A owned 99 percent of the total equity stock and possessed 90 percent of the voting power of B.

A reasonable alternative to the existing test should be established to determine, as to any corporation in a chain, whether the chain is closely related. This might reasonably be done by requiring compliance either with the present test, or with one involving ownership of 95 percent of the voting power and 95 percent of the aggregate of all classes of nonpreferred stock.

PERSONAL HOLDING COMPANY AND FOREIGN PERSONAL HOLDING COMPANY

Because of widespread tax avoidance through the use of the so-called "incorporated pocketbook," Congress in 1934 and 1937 introduced the basic provisions of the personal holding company and foreign personal holding company surtaxes which continue as part of the Internal Revenue Code today.

The original stimulus occasioning the use of the "incorporated pocketbook" was the much higher level of taxation applicable to individuals in the middle and upper brackets than that applicable to corporations. The practice itself involved transferring assets—primarily securities—to a holding company, which would receive the income from them, pay taxes thereon at the relatively low corporate rates then in effect, and reinvest the balance. The tax on personal holding companies was intended to frustrate this avoidance of the individual surtaxes by levying an additional corporate surtax on the income of closely held holding companies to the extent such income was not distributed to its stockholders. The tax on foreign personal holding companies was intended to accomplish the same purpose with respect to corporations outside United States jurisdiction by taxing their United States stockholders on the undistributed corporate income in the same manner that they would have been taxed if such income had actually been distributed.

The personal holding company surtax should not apply to income which, if distributed, would not be taxable in the hands of the stockholder, and neither surtax should apply to income which the corporation may not or should not distribute by reason of certain other specified laws of the United States.

Insofar as these taxes as presently constituted apply to income which the proposal would exempt, they both go beyond the only purpose which they have ever been intended to serve—preventing the avoidance of individual surtaxes, and also impose an unnecessary and extraordinary hardship on innocent investors.

For example, the proposal would prevent the personal holding company tax from applying to income which, if distributed, would not be then taxable because received by an exempt charitable or educational organization, or by one who is exempt on such receipts under applicable provisions of United States tax treaties. It would prevent either tax from applying to income the distribution of which the Government has prohibited under the Trading With the Enemy Act of October 16, 1917, or the First War Powers Act of 1941, or on which the Government has asserted a lien prior to the end of the taxable year.

REPEAL OF SILVER BULLION TRANSFER TAX

Section 1805 of the Internal Revenue Code levies a tax of 50 percent of the proceeds from transfers of an interest in silver bullion. This tax originated as a part of the Silver Purchase Act of 1934. The tax was imposed to prevent speculation in silver arising out of the adoption of the silver program. It was not intended to produce revenues and, with sporadic exceptions, has never raised enough to pay the cost of administration.

The present effects of the tax are to prevent the operation in this country of a normal nonspeculative commercial market for silver and arbitrarily to penalize from time to time commercial users of that commodity.

The tax serves no useful purpose at the present time. It should be repealed.

EXCESS-PROFITS CREDITS

The basic problem under any excess profits tax is how to measure "normal" profits—which will not be subject to this particular tax. This is done, first, by the establishment of some general formulae or "credits," and, second, by the formulation of methods of specially accommodating such credits to the infinitely varying circumstances of business development. The latter methods are the "relief" provisions. To the extent that the credits are unrealistic or the relief provisions are inadequate, the excess-profits tax becomes merely a progressive, discriminatory, and confiscatory tax on normal profits.

The credits provided under the present excess-profits tax are clearly incapable of covering normal profits. The 85-percent rule, which the present bill would reduce to 75 percent, is, of course, explicitly directed at normal profits. Moreover, the methods of arriving at average base period net income before this percentage reduction is itself faulty.

Elimination of one of the 4 years in the base period is no more than necessary to cut out the height of the reconversion period. Many fiscal year corporations, it must also be remembered, will have 1945 experience reflected in their base period under this bill. It would be necessary to eliminate a second of the 4 years if it were desired merely to eliminate the eccentric abnormalities of 1945 and 1946.

The number and magnitude of the abnormalities affecting business in general during the past 5 years have been such that many firms will not show even 2 years of normal experience within this period. The least protection that could be afforded them would be to permit the use (as a "basement") of the average base period earnings under the old law—1936-39—adjusted for capital additions since 1939 and increased by 50 percent, for example, to adjust for the subsequent inflation. It is believed that as a matter of principle any taxpayer should be entitled as a minimum to the use of the same earnings credit which it used in 1945 under the World War II law. This is the credit to which it would have been entitled if the excess-profits tax had not been repealed. It makes no allowance for the tremendous price inflation which occurred in the meantime.

Furthermore, there are many taxpayers which unfortunately suffered declining earnings throughout the base period. Certainly they should be encouraged to restore their profits to the highest level of the base period, without confiscation or penalty.

The formula for the determination of the "base period capital addition," in taking the taxpayer's "last two taxable years" preceding its first excess profits taxable year as the period during which capital expansion will be recognized for this purpose, seriously prejudices the firm which has recently changed its taxable year. Such a firm might not get this type of credit for capital additions in more than 13 months instead of the 2 years which are generally contemplated.

An intelligent and fair selection of base-period years will eliminate many problems. 1950 should be included, for example, in the base period for the 1951 tax. There simply were no high profits in 1950 from the defense program. There were, however, in some cases, unusually high profits during 1950. A

15-percent discount of 1950 earnings might, therefore, be justified. But there is no justification for discounting the earnings of 1946, 1947, 1948, or 1949.

The earnings of 1 year during the base-period years are unquestionably the best measure available of "normal" profits, and should be used. In no other way can confiscation of normal nondefense earnings be avoided. And other adjustments discussed hereinafter are essential to exempt from the proposed tax normal profits resulting from growth, increased efficiency, expansion, and new products.

ADJUSTMENTS TO BASE PERIOD NET INCOME

Under the old excess-profits tax, for purposes of computing net income during the base period, casualty and abandonment losses were disallowed without regard to their "abnormality." Insofar as a taxpayer has sustained such losses in the base period, its experience in that period is obviously distorted from the "normal" in any reasonable sense, and there is no justification for arbitrarily prohibiting the exclusion of 15 percent of those losses, as the present law does. There is less justification and no logic whatever, in ruling that a taxpayer which has had a series of such losses can exclude none of them, which is the effect of the 4-year average limitation. There is also no justification in making the disallowance contingent upon the amount of the deduction exceeding 5 percent of the average base period net income. This is simply a discrimination between taxpayers on the basis of their size.

The purpose of the condition to the disallowance of "abnormal" deductions that they should be shown not to be a "cause" of an increase in the taxpayer's gross income is not clear. The committee reports on this provision incorrectly stated that it was also present in the old law. It would seem to have the anomalous effect of denying a casualty deduction to the extent that the taxpayer increased its income in future years through rebuilding a more modern plant than the one which was destroyed.

Another type of "abnormal" loss for which an adjustment should be, but is not, made is illustrated by the postwar experience of many businesses. For example, it was not uncommon for a business to lose money, or to make insignificant profits, during 1 or 2 or even 3 years following World War II, on contracts entered into ill-advisedly. Its "experts" on civilian business had not returned from the war and the "substitutes" were inexperienced. If the losses actually realized on business operations (even though the over-all business was not in the "red") exceeded losses actually realized on similar business operations over a 10-year period, they should certainly be disregarded in computing "normal" base-period earnings. As in the case of many other adjustments, this proposed adjustment will not be necessary, however, if 1950 is included in the base-period years and if 1 year is selected for the earnings credit.

PURCHASE OF ASSETS

The excess-profits-tax law should permit a corporation which has acquired all the assets of another corporation, the transferor corporation having been liquidated, to use the earnings experience of the transferred assets in computing its average earnings credit for excess-profits-tax purposes.

This privilege of using the earnings experience of another taxpayer has been heretofore extended, both under the World War II law and under the present excess-profits-tax law, only to cases involving the acquisition of assets in certain tax-free exchanges. Clearly, however, to a corporation using the average base period earnings credit, there is no proper connection between its basis in operating assets acquired from another corporation and its right to use the earnings experience of those assets. It is equally as logical for the acquiring corporation to enlarge its earnings credit upon the taxable purchase of the productive facilities of another corporation as it is for it to do so where it acquires such facilities at the transferor's tax basis.

Admittedly, some problem might be involved if it were proposed that the earnings experience should follow business assets through sales and exchanges of all kinds. This would lead to duplicating claims to such experience on the part of both transferor and transferee corporations. No such problem can arise, however, where the properties acquired are substantially all the properties of the transferor, and the transferor is liquidated. Indeed, in these cases, if this experience may not be used by the transferee, it is completely lost as a measure of normal earnings.

SALE OF A LOSS DIVISION

The law should also permit taxpayers to exclude from their standard of normal earnings, as determined for purposes of the excess-profits-tax income credit, any over-all deficit during the base period in the operation of a trade or business which the taxpayer has wholly disposed of, thereafter using the proceeds of sale for different purposes.

The propriety of this proposal may be illustrated as follows: Suppose that during its base period the taxpayer was engaged in two distinct enterprises—the operation of a coal yard and an ice plant. The former was profitable and the latter unprofitable. In 1950 it decided to abandon the unprofitable ice business. It sold this business outright for cash, and using the proceeds of sale, opened a lumber yard. Under present law the taxpayer would be required to use a base-period earnings record which has no relation, logically or historically, to its new lumber business, and which is less than its actual base-period earnings from its coal business. The proposal would permit the net deficit on the ice-plant operations during the base period to be ignored, leaving the taxpayer with a standard of normal earnings for the coal business of its actual base-period earnings, and for the lumber business of zero.

The treatment which would be accorded by such a provision approximates that already accorded by present law in a situation in all respects identical except for the two businesses being held through two separate corporate entities. The only difference is that in the latter situation, the corporation acquiring the new lumber business could use any of the ice business' base-period profits years, while treating the loss years as zero. Under the proposal, the lumber business is, in effect limited to a zero standard for the entire base period.

The discrimination imposed by existing law against several businesses operated by a single corporation constitutes an unnecessary inducement to the formation of multiple corporations under the same ownership, which other provisions of the the bill are directed at discouraging.

The old excess-profits tax had a provision somewhat similar to the proposal, in that it allowed section 722 relief for a change in the character of the business. There, too, the remedy was more complete than in the proposal. Under proper circumstances, the taxpayer could not only discard the deficit record of the old business, but also adopt and use the reasonably expected standard of earnings of the new business.

There is no justification for shackling a taxpayer with a deficit earnings record on a business which it no longer operates. Even if it gets no affirmative relief, it should at least be able to go into a new business with a zero credit.

RELIEF PROVISIONS

The relief provisions of the present excess-profits-tax law are inadequate for two reasons: (1) they are faulty in their application to certain of the situations to which they are generally addressed, and (2) they are not addressed to certain general situations which clearly require relief.

Section 442 is intended to deal with interruptions of production, such as strikes and natural casualties. But let us look at cases where it fails to accomplish the purpose of affording the needed relief.

Suppose that the taxpayer had a bad year in 1946 owing to reconversion from war production, normally good years in 1947 and 1948, and in 1949 a strike tied up production and caused that year to result in a deficit. The year 1949, being the worst of the 4 years in the base period, must first be eliminated. Section 442 thereupon becomes unavailable and the taxpayer must use as the third of its base-period years the reconversion year 1946. If, on the other hand, the section 442 adjustment to 1949 could be made first, and after so determining normal income for 1949, the worst of the 4 years could then be eliminated, the taxpayer could have 3 years left of reasonably normal actual or constructiveincome from which to compute its base-period average.

Assume another case in which the effects of a strike were particularly severe and continued for more than one of the base-period years. In this case the taxpayer is required to use the industry rate of return for the entire base period, even though its own actual earnings during the years not affected by the strike were considerably higher than the industry average. If the law permitted these other 2 years to be averaged with a third year after a section 442 adjustment had been made to the third year alone, the taxpayer would enjoy a better base period average than relying on the industry rate of return alone.

A third example of the peculiar operation of section 442 is afforded by the situation in which the industry rate of return produces a base-period average only slightly higher than the taxpayer's actual average—say, 8 percent higher. Even though a strike or casualty may have severely affected taxpayer's earnings throughout 2 or 3 years of the base period, section 442 would not authorize relief because the reconstructed income would not exceed 110 percent of taxpayer's actual income.

More generally, it may be noted that use of the base-period rate of return, either under section 442 or any of the other relief provisions, does not afford relief to the efficient firm which, even though it qualifies, has an actual earnings record better than that produced by using an average which incorporates the record of less efficient firms and perhaps less speculative branches of the same industry.

Section 443 has at least two technical flaws. In the first place, when the alternative net income from new products test was added to the gross-income test, section 443 (a) (3) was not correspondingly amended to tie in the general growth requirement with the alternative net income requirement. In the second place, a taxpayer is apparently required to claim the benefits of section 443, if at all, in the first year in which it meets all of the required conditions, and consequently, in situations in which it thereafter continues to grow, may be held down to a lower constructive average base period net income than it might have had if it could elect the year in which it would first claim this benefit.

The basic shortcoming of all of the relief provisions is that they fail entirely to give any recognition to post-base period growth. This failure means that no encouragement is given to scientific research or development. The most pressing need is for an additional relief provision which will allow an addition to the credit otherwise computed for the current development of new products. This might perhaps be limited even to products not generally available to the public prior to the end of the base period. The amount of the additional credit could easily be determined by taking as a standard the ratio between the physical volume of sales of the product and the profit per physical unit on it during the first year it is sold, and applying this ratio to the volume of sales in subsequent years. Or, if it were desired to adhere to the general scheme of using an industry rate for all relief, the determination might be made by allowing the taxpayer to apply an industry rate to its assets employed in making the new product, providing that the industry rate used is that of the particular industry of which the new product itself is a part.

RECOVERIES WITH RESPECT TO WAR LOSSES

Under section 127 of the Code, originally enacted as part of the Revenue Act of 1942, taxpayers owning property in enemy countries were permitted to treat such property as having been seized or destroyed on the date war was declared, and thus to have an income-tax deduction computed in the same manner as for an involuntary conversion or casualty loss. This provision was prompted by the impossibility of ascertaining whether a seizure or destruction had actually occurred after the declaration of war, and also by the fact that rights in such properties were probably as completely severed by the outbreak of war itself as they would be by a later technical confiscation. As part of section 127, it was also provided that any recoveries of such properties would be treated as a realization of taxable income to the extent that the value of the recovered property exceeded all allowable war-loss deductions for prior years which had not resulted in a tax benefit.

This rule governing the tax treatment of recoveries with respect to war losses works considerable hardship. For example, suppose that a United States citizen owned two properties in Italy before the war which were then worth $10,000 each, but his cost basis in each property was only $6,000. Under section 127 the amount of his allowable losses in 1941 would have been limited to twice $6,000, or $12,000. Suppose that the war leaves one of those properties undamaged, and after the war the owner is restored to possession, but the other property is totally destroyed. If the deductions resulted in a tax benefit, the rule as to recoveries under section 127 would require him to include in his income in the year of recovery not only the $6,000 for which he was previously entitled to take a deduction with respect to the recovered property, but also an additional $4,000 because of another loss deduction on an entirely different property for which he will never recover anything.

This result represents a perversion of the tax-benefit rule which should be cured by limiting the amount of the recovery deemed to have been effected in any particular case to the lesser of the fair-market value on the date of recovery of the particular item recovered, or its adjusted basis.

Furthermore, an adjustment should be made so that the tax imposed on a recovery should be no greater than the tax benefit with respect to the corresponding loss.

Senator Hoey. Mr. Laylin, give your name and connection to the reporter.

STATEMENT OF CLARENCE D. LAYLIN, THE COUNCIL OF STATE CHAMBERS OF COMMERCE, AND THE OHIO CHAMBER OF COMMERCE

Mr. Laylin. My name is Clarence D. Laylin. I live in Columbus, Ohio. I am a lawyer and counsel for the Ohio Chamber of Commerce. I happen also to be chairman of the taxation division, or section, of the Federal finance committee of the Council of State Chambers of Commerce.

Senator Taft. I might say that Mr. Laylin was also counsel for the Joint Committee on Taxation on which I served, which rewrote the Ohio taxation laws in 1931.

Mr. Laylin. Unfortunately, that is getting to be a longer time ago every year.

Senator Taft. I am sure we all feel that way.

Mr. Laylin. This Council of State Chambers of Commerce, as the Senators probably know, consists of about 33 State and regional bodies. They are autonomous. Nobody makes up their mind for them. They do their own thinking. Therefore, there is some natural diversity of opinion among them. When anyone such as myself tries to speak for them, he has to take account of that natural diversity.

However, Senators, the first thing I say in my statement, which I am going to file, is that with respect to the merits and demerits of H. R. 4473, there is very little diversity of opinion. I think it is very bad, with the exception of some good measures like the long-awaited deferment of capital gain on the sale of taxpayer's residence, and some others of that character.

Our considered judgment—and here we are unanimous—is that this committee would do well to discard the House bill and start afresh.

In so doing, you will, of course, consider how much, if any, revenue in addition to what will be yielded by the present laws is needed to avoid deficit financing on a disastrous scale.

The revised estimates have just been discussed in my hearing, and I need not go into them further than to say that the apparent need for approximately $10 billion on the basis of these revised estimates does not convince us. We observe that the revised expenditure budget, for example, as submitted to you by the Assistant Director is, as I think Mr. Alvord said a moment ago, is just the same $71,600,000,000 estimated expenditure budget brought down to date. It still takes no account of what the Congress may do in reducing or eliminating spending programs, reducing appropriations, denying obligational authority that is requested, and so forth.

So until we are more thoroughly convinced, Mr. Chairman, than we are now that substantial additional revenue on top of the yield of present laws is needed, we would oppose any increased taxation at all.

In that same connection, we observe that the estimate of revenue yield of the existing laws is $58,500,000,000, and we think that you will conclude, as we have, that $61 billion would be a better figure there.

Now, we do not stop by saying that we are opposed to any increased taxation, because we apprehend that you may ultimately conclude that you do need more revenue. So we have some recommendations which are supported with substantial unanimity in the committee for which I am speaking, and have the general concurrence of the 33 State bodies to which I have referred.

The House bill recognizes that the only significant source of increased revenue is to be found in the three major categories—the corporation, the individual income tax, and the excises. Many State chambers, nearly all of them, would eliminate the corporation-tax increases, for this reason. Existing tax laws tax corporate income more severely than ever before, even during all-out war. These taxes have been increased twice, within the year, and in another way of speaking, I might say three times within the year, and the revenue effect of these increases has not yet been fully felt.

These corporation-income taxes, as I believe someone remarked a moment ago, are not direct taxes, either in contemplation of law or in economic effect. They are borne ultimately by human beings.

Now, in a free economy, their burden is or may be widely diffused. But when Government imposes economic controls and seeks at the same time to increase production, the stockholders, already doubly taxed in respect of their dividends, receive a heavier impact.

This impact is either direct, by immediate reduction of dividends, or indirect, by impairing the ability of the corporation to expand its facilities to meet the demand for increased production, thus driving it to the money lender and diluting the stockholder's interest.

We say in our statement that it would be inaccurate to say that the stockholder is a forgotten man under the House bill. He is too well remembered. His income is diminished at the source. As diminished, it is in part withheld at the source under this bill, and as it reaches him, it is doubly taxed, all this despite the fact, known to you gentlemen, that a large proportion of the stockholders of the country are in the fixed-income class, and despite the fact, too, that incentives to invest in the productive plants of our economy must be preserved and not stifled, if we are to carry forward the defense effort and at the same time fight inflation.

Furthermore, extremely high taxes on corporation incomes have in themselves an inflationary effect. I need not labor that point. I am sure you are familiar with it.

I suppose there is a limit somewhere, Mr. Chairman, beyond which corporation income taxes should not go even under actual war conditions. We do not say that the income taxes we now have exceed that limit. But we do believe that the present laws go as far as they should go under existing conditions, and that the House bill is beyond reason under any conditions.

So we oppose any increase in the normal or surtax rates of the corporation income tax.

We oppose raising the ceiling on the combined effective rates of corporation income and excess profits taxation. We strenuously oppose any lowering of the percentage of average base period net income excess profits tax credit, and we oppose limiting the members of the so-called controlled group to one $25,000 surtax exemption and one similar minimum excess profits tax credit.

In fact, we think no change should be made in the present structure and rates of the corporation income taxes unless it be to correct the numerous inequities in the excess profits tax law.

Now, before considering any increase in the individual income taxes, your committee, in the opinion of practically all of the State chambers, should look to an expansion of the field of excise taxation for any revenue that may be needed. The House bill, as we see it, fails lamentably at this point, and the Treasury's proposals are equally wide of the mark. Neither would appreciably broaden the base of excise taxation, but would merely increase the rates of a few of the time-honored excises and add a limited number of new taxes of a similar nature.

The Ohio Chamber of Commerce, for which I must speak in the first instance, believes that the selective excise system should be more widely extended, with continued emphasis upon those commodities and services which are in the nature of luxuries and those which utilize materials and labor critical to the defense effort, and that if additional revenue is needed to balance the 1952 spending budget, a sufficient amount could be obtained by this means with perhaps some recourse to moderately increased individual income taxes.

Some State chambers have recorded a strong preference for a uniform manufacturers' excise tax in substitution for the existing selective excises, and covering all commodities excepting liquor, tobacco, and food products.

The taxation subcommittee of the Council of State Chambers of Commerce recommends a uniform retail sales tax or consumers' defense tax at a moderate rate on all commodities, including those presently taxed at either the manufacturers' or at the retail level, but excluding food and food products.

For example, instead of raising the excise rates on liquor, tobacco, and gasoline, or on automobiles, let the defense tax apply on those commodities at the retail level, and let it apply as a surtax on sales of commodities now taxed at the retail level, and on admissions and some services, such as those of barber shops and beauty parlors.

Such a tax at 1 percent would, we believe, produce approximately $1 billion in new revenue.

I repeat that while there is this diversity of opinion as to means, practically all of the State chambers of commerce unite in the deep conviction that broad based excise taxation should be the first resort of your committee, should you find it necessary to raise more revenue in the fiscal year 1952.

I shall not take any time to present the arguments pro and con with respect to the means or the choice of means for accomplishing this broad objective. I assume that the committee is familiar with them. They have been widely discussed.

Let this committee accept the principle of excise taxation on a broad base and apply that principle with substantial uniformity so far as additional excises are concerned. That is perhaps more important than the precise method which you might employ.

In the statement, Mr. Chairman, which I shall file, I present some reasons why the State chambers believe in that general principle. The first is that consumption taxes are historically the oldest form of

Federal taxation, and their record has been one of stability throughout the years.

Secondly, in a balanced system, such taxes, adding the customs and the estate and miscellaneous receipts—in other words, all the taxes excepting the income taxes—should contribute at least a fourth of the revenue, and in 1950 they did produce $11 billion out of the gross total, before refunds, of approximately $39 billion. But as a result of what you have been doing, and I say the Congress has been doing, to the income taxes, individual and corporate, and the excess profits tax legislation, the revenue estimates now before you show a gross yield of approximately $12 billion from the excises and miscellaneous taxes combined, as against an estimated total before refunds of $61 billion.

If you were to keep the excises in line with the increases that you have already made in the individual and corporation income taxes, and desire to raise, let us say, picking a figure out of the air, $66 billion gross before refunds, which I suppose would be about $63,800,000,000 after refunds, you should have, to preserve that relationship, approximately $16,500,000,000 of gross yield from all the excises combined, as against $8 billion—no, more than that before refunds, I am sure—under the present system.

Senator MILLIKIN. Have you given study to the increased burden that would result from your suggestion on the lower income brackets?

Mr. LAYLIN. Yes, sir.

Senator MILLIKIN. Give me your ideas on that.

Mr. LAYLIN. We would not advocate imposing a tax at this time on food or rent, of course, rent not being a commodity——

Senator MILLIKIN. Would you impose it on medical?

Mr. LAYLIN. That would be probably for the Congress to decide. We have not said anything in our statement about that.

Senator MILLIKIN. Hospitalization?

Mr. LAYLIN. No. That would be a service, primarily.

Senator MILLIKIN. You say you would exempt rent?

Mr. LAYLIN. Oh, yes.

Senator MILLIKIN. You would exempt food?

Mr. LAYLIN. Yes.

Senator MILLIKIN. And you would let us decide whether to exempt medicine and hospitalization, and doctors' and dentists' fees?

Mr. LAYLIN. Of course; yes, sir.

Senator MILLIKIN. And when you got all through, we would have, your figure, a net of $1 billion for each point of increase?

Mr. LAYLIN. That is right.

Senator MILLIKIN. Now, on which category of income people would that $1 billion finally land with its main impact?

Mr. LAYLIN. With its main impact?

Senator MILLIKIN. Yes.

Mr. LAYLIN. I think it would land, of course, on all the people, on all the people as they spend.

Senator MILLIKIN. Yes. Seventy percent of the spending is in people that have incomes of less than $5,000?

Mr. LAYLIN. Surely.

Senator MILLIKIN. So the major part of the impact would fall on those people?

Mr. LAYLIN. Just as the major part of the impact, figured that way, even of income taxes, falls on those people.

Senator MILLIKIN. Now, that is exactly what I am coming to. So do you not have the problem of what would be the burden on those lower-income people, and to do that you have to figure on what they are paying now in open taxes, State, Federal, local, and what they are paying already in concealed taxes, and when you add that up you come to the question, Are you or are you not imposing too much burden on the lower-income people?

Mr. LAYLIN. Are you ready for me to comment, Senator?

Senator MILLIKIN. Yes.

Mr. LAYLIN. In the first place, we do not advocate a drastic tax. We would not impose a tax rate of more than 4 or 5 percent on the taxed transactions, in addition to what is now being imposed. We think that the imposition of a broad-based excise tax does not raise any serious problem of so-called regressivity, which I think you may have in mind, Senator, certainly not weighty enough to overbalance the already extreme progressivity of the individual income tax, and we think it is desirable to make everybody conscious of his responsibilities to support the Government in this time of need.

Senator MILLIKIN. I am merely tossing out a suggestion here. You might make everybody conscious of his inability to support the Government in this time of need.

I am not advocating this at all, but I am merely probing to try to get some perspective. A witness here not so long ago testified that a $2,500 income family is paying over $700 in taxes, $300 plus, in State direct taxes, State, local, and everything else, and about $400 of indirect taxes.

Now, let us call it $750, on a $2,500 income. That is a pretty good hunk of taxes for a citizen who has no margins?

Mr. LAYLIN. I would suggest that he, in common with all the rest of us, is paying even more in hidden taxes than he realizes because of inflation.

Senator MILLIKIN. Whether it is hidden or whether it is open, it is tax on him.

Mr. LAYLIN. It is a tax.

Senator MILLIKIN. And I am just trying to figure what would be the impact of taxes of the kind you suggest on that citizen, who is already paying a very high tax and who, as I say, is not operating on any fat, so far as income is concerned.

Mr. LAYLIN. That is right. He would be obliged to make new choices as he spent. I think that would be the full measure of the impact on him.

Senator MILLIKIN. That is an easy disposition of a very serious problem to the fellow that has to make those choices, because as I say, the limit of the amount of leeway that he has in figuring out his budget does not make that an inviting choice.

Mr. LAYLIN. I suspect that anything this committee may do by way of raising taxes will not present an inviting choice to any taxpayer.

Senator MILLIKIN. I quite agree with you. But we get into the subject there of relativity.

Mr. LAYLIN. I think we have a full appreciation for those considerations, Senator.

Senator MILLIKIN. To put it another way, I am not suggesting that what you are saying would put an excess burden on these lower income brackets, but if you put an excessively large, or unbearable burden on them, you are going to have strikes to redress their position.

Mr. LAYLIN. Right.

Senator MILLIKIN. And in the end, where do you come out?

Mr. LAYLIN. My thought with respect to the suggestion embodied in your last statement, Senator, is this: that all taxes have more or less that effect of inflation, by encouraging demands for higher gross income. That is the point you have in mind, I believe. But we think that this type of tax, the payment of which is at the option, so to speak, of the taxpayer to a certain extent—I do not want to overwork that proposition—is the least inflationary, in fact, of all forms of taxation that you could think of.

Senator HOEY. Is it not true, though, that a man with only an income of $2,500 has not much choice? He has to spend it all to support his family, so that he must pay these taxes without having much choice about it, because he cannot save much out of that. He cannot fail to spend much out of that. And if he is taxed on everything except food, for instance, he is paying it on everything that he buys for his family.

Mr. LAYLIN. All of his purchases; yes.

Senator HOEY. There is not much choice on his part. He has to pay it all.

Mr. LAYLIN. However, not upon his food nor upon his rent, nor upon his hospitalization or certain advices of his physician, and so forth. He pays nothing on that, under the idea that we have.

Senator TAFT. Of course, this is true as to the taxes. To a certain extent, it is not regressive because as you go down the income scale, a larger and larger percentage is spent for food. So it runs from 25 percent, we will say, in the upper brackets to 50 percent in the lowest income scale.

So, to a certain extent the burden of a 5 percent sales tax is lesser as you get down. I think that should be borne in mind.

The other point that I would make on the question is that after all, what we are spending this money for is to protect ourselves against the destruction of this country by atomic bombs and everything else, and the fellow with a low income is going to be wiped out just as fast as anybody else by such threat.

So it certainly is fair to ask him to pay some part of that defense of himself against attack.

Mr. LAYLIN. Yes, sir.

Senator TAFT. Now, as to how much and as to what his present burden is, those are all questions that we ought to study in trying to get this thing as fair as possible. That is about all that I could say at the present time.

Mr. LAYLIN. We have every confidence that you will, of course, Senators. We are presenting our view as to what we think is best. We do think that there is much there to both of the points suggested by Senator Taft. In the first place, we think that actually the greater amount of the revenue that will be derived from a tax of the kind that we have been discussing will come proportionately from the higher brackets rather than from the low income tax brackets, because of the high percentage that is spent for food and rent.

Senator TAFT. I am inclined to think the burden of taxation from local and State taxation on the lower-income groups is out of proportion, through the payment of real estate taxes, which are, in fact, sales taxes through the levy on downtown property, and the sales taxes themselves, in the local district.

Mr. LAYLIN. That is right.

Senator TAFT. I think if we made a complete study of that, we would find that that burden on the low-income people was pretty heavy. That is my impression.

Mr. LAYLIN. It could be. And yet, as you know, Senator, there has been very slight resistance to the 3 percent bracketed sales tax that we have in Ohio. People are quite accustomed to it, and accept it. I believe I can say that.

Senator TAFT. Now you are advocating the old theory that has been advanced of what is a good tax. I am reminded of the fellow who said, "The only principle in taxation is to get the most feathers with the least squawk."

That is another consideration. But whether they squawk or not, it may be unfair even though they do not squawk.

Mr. LAYLIN. You know, Senator—perhaps the other Senators do not know—that in our Ohio tax we expose that tax to the light of publicity by giving a little prepaid sales tax receipt. So everybody that pays that sales tax in Ohio, whether he is in the low income tax group or the high income tax group, is perfectly conscious that he is paying a tax. It is not hidden in any way. That is correct, is it not, Senator?

Senator TAFT. That is right.

Senator MILLIKIN. The burden is not less.

Mr. LAYLIN. The burden is not less.

Senator MILLIKIN. Whether it is a labeled tax or an indirect tax.

Mr. LAYLIN. That is right.

Senator MILLIKIN. The burden is not less. And I think the problem before the committee is to study the burden all the way along the line.

Mr. LAYLIN. We agree with you 100 percent.

I have not said anything about the individual income tax. We have some suggestions there. That is a direct tax, of course, except insofar as the withholding of wages may tend to pass the burden along. So even though the rates are pretty steep now, the progressive rates, there has been some mitigation of those rates recently, and to our way of thinking it would be less objectionable to increase the individual income tax properly than to raise corporate taxes. We do not like the method of the meat ax approach adopted by the House, the 12½ percent, and I think that that should be discarded. In fact, the very fact that the House found it necessary to adjust the top surtax brackets in order to prevent the proposed 12½ percent defense supertax from causing confiscation exposes, we think, the injustice and absurdity of that approach.

It magnifies unduly the practical effect of the progression that we do have. Of course, moderate progression is inherent, no doubt, in the time-honored conception of a tax on individual net income, but I think that we must agree that progression can be overdone, and we think it is, under the House bill.

We would accept the defense-tax principle that the House seems to have in mind if the additional tax could be levied in such a way as to mitigate the progression, or at least not unduly exaggerate it.

To the Ways and Means Committee of the House, we endorsed the plans proposed by the Committee on Economic Development as a method of obtaining additional revenue from individual income taxes, which would have that effect, and we commend that plan to your favorable consideration. But the addition of a given number of percentage points not exceeding three, we think, to each surtax bracket would have a somewhat similar effect and would be in line with the Treasury's original proposal. And we would accept that method. But we would suggest that if you adopted that method, the revised surtax schedule should be written as a defense tax in lieu, rather than as an amendment of the present statutory schedule. We do not favor lowering the individual exemptions and credits for dependents at this time.

There are a few features of the House bill which seem to us to be especially obnoxious, and we particularly recommend their objection here, and they are these:

First, the proposed defense-tax increase in the rate of taxation of net capital gains. What I have already said perhaps is a sufficient reason for that belief.

Second, we oppose the proposed withholding of taxes on dividends, interest, and royalties.

Now, from the point of view of the withholding agent, the provisions of the House bill may be superficially less objectionable than those relative to dividends which this committee struck out of the Revenue Act of 1950, though we believe them to be still subject to serious criticism. But from the point of view of the receipient, and particularly the very many low-income recipients of such payments who are not liable for income taxes, the proposal seems to us to be outrageous, in that at best it would amount to a continuing forced loan, and at the worst, to a sort of larceny by default, if you will permit a mixing of metaphors at that point.

I think the Senators understand what I mean when I say those things about the proposed withholding.

Now, we of the State chambers have long advocated the more effective taxation of various types of organizations which now enjoy tax advantages, yet compete with taxed business. The Ways and Means Committee of the House heard much testimony on this subject, but did nothing about it. We trust that this committee, with the record of that testimony before it, will rectify this glaring inequity.

Senator HOEY. Do you care to identify what the organizations are that you have in mind?

Mr. LAYLIN. The State chambers of commerce?

Senator HOEY. I am talking about those that ought to be taxed.

Mr. LAYLIN. We say in our statement that while we favor true cooperation by farmers, consumers, and other groups, we think that cooperatives are getting off too lightly under the present laws.

Senator HOEY. Is there anybody else that you think ought to be taxed?

Mr. LAYLIN. The House committee heard testimony relative to mutual savings banks and building and loan associations, and so forth. We would place them all in the same category. But I am not suggesting any specific remedy for that situation, Mr. Chairman.

Senator TAFT. I noticed that the larger sum involved seems to come from mutual savings banks and building and loans, compared to farmer cooperatives.

Mr. LAYLIN. Apparently so.

Senator TAFT. There seems to be three times as much there as in the farmer cooperatives.

Mr. LAYLIN. Yes; I suppose that is so.

Senator TAFT. I was wondering whether the Ohio chamber was advocating taxation of building and loans. Have they taken an official position on it?

Mr. LAYLIN. They have not taken an official position on it, Senator. I think we have only one mutual savings bank in Ohio, but we have plenty of building and loans.

I am instructed to say this, and I do so with considerable emphasis and seriousness. We are State organizations. We know what is going on in our State capitals and in the courthouses and on the main streets, and right now we see some real pressure building up for a constitutional limitation on the Government's power to tax the incomes and savings of the people. You know what I am talking about.

The State chambers, thus far, as organizations, have been chary of such a drastic safeguard against the excessive exploitation of these forms of taxation, but our committee senses a growing sentiment in its favor as a result of the passage of this House bill. We believe it our duty to call your attention to that and to suggest that that situation, which is a sort of incipient revolt against excessive rates of income taxes——

Senator HOEY. I think that that amendment has been ratified by 24 States.

Mr. LAYLIN. We hope that you will take account of that recommendation.

Thank you.

Senator HOEY. I have noticed in the paper that 24 States have passed resolutions to that effect.

Mr. LAYLIN. Twenty-four States. Some have sent in previous resolutions. But there seems to be considerable steam behind that right now.

Senator HOEY. Thank you, Mr. Laylin, for your statement. We are very glad to have had you.

(The prepared statement of Mr. Laylin is as follows:)

STATEMENT OF CLARENCE D. LAYLIN, ON BEHALF OF THE COUNCIL OF STATE CHAMBERS OF COMMERCE AND THE OHIO CHAMBER OF COMMERCE

MR. CHAIRMAN AND SENATORS: I am Clarence D. Laylin. I live in Columbus, Ohio. I am a lawyer, and counsel for the Ohio chamber of commerce. I am also chairman of the taxation section of the Federal finance committee of the council of State chambers of commerce. I appear in behalf of that committee, and, through it, in behalf of the 33 State and regional chambers of commerce and similar organizations which are represented in the council, including my own Ohio chamber.

These State chambers are autonomous bodies, principally interested in safeguarding and promoting the welfare of the business communities in their several States. The council and its committees constitute a clearing house for the interchange of opinions on matters of common concern. Federal expenditures and taxation are of that character.

On other occasions when I have had the honor to speak here for the State chambers, I have had to take account of some natural diversity of opinion among the 33 organizations. Today, in discussing H. R. 4473, I am not so constrained. Conceding to that measure a few minor virtues, such as the long-awaited deferment of capital gain from the sale of the taxpayer's residence, they feel that the bill as a whole is the worst of its kind in the history of the country. Saving only those fragmentary good provisions, this committee should, in the unanimous opinion of the State chambers, discard the monstrosity which has come from the House and start afresh.

In so doing, you will, of course, first consider how much, if any, revenue, in addition to what will be yielded by existing laws, is needed to avoid deficit financing on a dangerous scale. You have a revised estimate of revenue yield on the order of \$58.5 billion and a revised estimate of budget expenditures on the order of \$68.4 billion, indicating, on the surface, a need for approximately \$10 billion in additional revenue to balance the budget for fiscal 1952. These figures do not convince us. The full impact of the present tax laws, twice amended within the year, has yet to be felt; and we believe that the 1952 yield will probably approach \$61 billion, after refunds.

REDUCTION IN SPENDING ESSENTIAL

On the other side of the scale, we observe that the revised expenditure figures submitted by the assistant director of the Bureau of the Budget take no account of what the Congress may, and in our opinion must do by way of reducing appropriations, nor of several other factors which may well lessen the actual expenditures for 1952. Moreover, these figures assume that the Congress will in no case reduce, eliminate or postpone spending programs required by existing laws, and will grant new obligational authority as requested. We are convinced that the time has come when Federal public money must be saved by every means available to the Congress. All requests for new spending authority, not strictly military, should be refused. Existing military spending programs, and requests for additional obligational authority of that character, should be critically examined both as to amount and as to timing. We believe that substantial reductions in military appropriations for each of the next two fiscal years can be made by so doing. Foreign aid expenditures should be likewise scrutinized. Many public works and similar programs should be suspended or at least curtailed during the peak of defense spending.

These conditions have not yet been satisfied; but they could be, and we believe the Congress is in a mood to do so to the best of its ability. Until the outcome is more certain than it now seems to us to be, and the extent of the revenue needs can be more definitely appraised than can now be done, we would oppose any increased taxation.

On the assumption that your committee may ultimately find that it is necessary to raise some additional revenue, we have certain recommendations as to which there is substantial unanimity on the part of our committee and general concurrence on the part of the constitutent chambers of commerce.

FURTHER CORPORATION-TAX INCREASE UNWISE

The House bill recognizes that significant sources of increased revenue are to be found only in the three major categories of the corporation-income tax, the individual-income tax, and the excises. Most State chambers would eliminate the first of these. Existing laws tax corporate income more drastically than ever before, even during all-out war. Twice within the year have these taxes been increased, and the revenue effect of these increases has not yet been fully felt.

Corporation-income taxes are not direct taxes, either in contemplation of law or in economic fact. They are borne utlimately by human beings. In a free economy their burden is or may be diffused widely. When Government imposes economic controls and seeks also to expand production, the stockholders, already doubly taxed in respect of their dividends, receive a heavier impact. This impact is either direct by immediate reduction of dividends, or indirect by impairing the ability of the corporation to expand facilities, driving it to the money lender, and thus diluting the stockholder's interest.

It would be inaccurate to say that the stockholder is the forgotten man under the House bill. He is too well remembered. His income is diminished at the source; as diminished, it is in part withheld at the source; and as it reaches him, it is doubly taxed. All this despite the fact that a large proportion of the stockholders of the country are in the fixed-income class; despite the fact, too, that incentives to invest in the productive plant of our economy must be preserved, not stifled, if we are to carry forward the defense effort, and at the same time fight inflation.

Furthermore, extremely high taxes on corporation-incomes have in themselves an inflationary effect. I need not labor the point, as I am sure you are familiar with it.

There is a limit somewhere beyond which corporation-income taxes should not go, even under actual war conditions. We do not say that the income taxes we now have exceed that limit; but we do believe that the present laws go as far as they should under existing conditions, and that the House bill is beyond reason under any conditions.

So we oppose any increase in the normal or surtax rates of the corporation income tax.

We oppose raising the ceiling on the combined effective rates of corporation-income and excess-profits taxation.

We strenuously oppose any lowering of the percentage of average base period net income excess-profits-tax credit.

And we oppose limiting the members of a so-called "controlled group" to one $25,000 surtax exemption and one similar minimum excess-profits-tax credit.

In fact, we think no change should be made in the present structure and rates of the corporation-income taxes, unless it be to correct the numerous inequities in the excess-profits tax.

BROAD-BASED EXCISE TAXATION RECOMMENDED

Before considering any increase in the individual income taxes, your committee, in the opinion of practically all the State chambers, should look to an expansion of the field of excise taxation for any revenue which may be needed. The House bill fails lamentably at this point, and the Treasury's proposals are equally wide of the mark. Neither would appreciably broaden the base of excise taxation, but would merely increase the rates of a few of the time-honored excises, and add a limited number of new taxes of a similar nature.

The Ohio Chamber of Commerce believes that the selective system should be more widely extended, with continued emphasis upon those commodities and services which are in the nature of luxuries and those which utilize materials and labor critical to the defense effort; and that, if additional revenue is needed to balance the 1952 spending budget, a sufficient amount could be obtained by this means with perhaps some recourse to moderately increased individual income taxes.

Some State chambers have recorded a strong preference for a uniform manufacturer's excise tax, in substitution for the existing selective excises, and covering all commodities excepting liquor, tobacco, and food products.

The taxation subcommittee of the Council of State Chambers of Commerce recommends a uniform retail sales or consumers' defense tax at a moderate rate, on all commodities, including those presently taxed at either the manufacturer's or the retail level, but excluding food and food products. For example, instead of raising the excise rates on liquor, tobacco, and gasoline, or on automobiles, let the defense tax apply on these commodities at the retail level; and let it apply as a surtax on sales of commodities now taxed at the retail level, and on admissions and some services, such as those of barber shops and beauty parlors. Such a tax at 1 percent would, we believe, produce approximately $1 billion in new revenue.

This recommendation of our committee has been framed after long consideration of many alternatives. We are assured that it is supported by a substantial majority of the State chambers.

I repeat, however, that practically all of them unite in the deep conviction that broad-based excise taxation should be the first resort of your committee, should you find it necessary to raise more revenue in the fiscal year 1952.

I shall not take space to present the arguments, pro and con, with respect to the choice of means for accomplishing this broad objective. I assume that you are familiar with them, as the merits and demerits of each have been widely discussed. Let this committee accept the principle of excise taxation on a broad base, and apply that principle with substantial uniformity so far as additional excises are concerned. That is perhaps more important than the precise method which you might employ.

The case for the broad-based excise-tax principle as a dominant feature of a revenue measure at this time is this:

1. Consumption taxes are the oldest and most stable source of Federal revenues.
2. In a balanced system, such taxes, including customs and adding estate taxes and miscellaneous receipts, should contribute at least one-fourth of the revenue.

In 1950, such taxes produced approximately $11 billion out of a gross total of approximately $39 billion. But as a result of the 1950 income and excess-profits tax legislation, the system as it now exists shows an estimated gross yield of approximately $12 billion from excises and miscellaneous receipts against an estimated total of $61 billion. To keep the excises in line, and assuming that it is desired to raise, say $66 billion of gross revenue before refunds, or $63.8 net, the combined gross yield of this entire group should be at least $16.5 billion. The whole $4.5 billion of such an assumed increase could come from the excises, as I assume there will be no thought of increasing the customs or the estate taxes. And if $61 billion net is a more realistic estimate of the yield of the present revenue system than $61 billion gross, then, still assuming $63.8 billion net as the goal, the excises alone should be capable of yielding the approximately $3 billion required on that assumption.

3. Excise taxes are generally anti-inflationary. As a means of bridging the gap between spendable income and the supply of goods, they are the most effective of the available taxes.

4. Nearly half of the aggregate individual incomes is not taxed at all. Many individuals and associations of individuals pay no income taxes. It is sound policy to exact a felt contribution from every one who spends

Inasmuch as the principle which I am advocating would not involve the taxation of food or rent, and at most would impose upon the low-income recipient new choices in the making of occasional purchases, the so-called regressive aspect of the broad-based excise tax is not a serious problem, certainly not weighty enough to overbalance the already extreme progressivity of the individual income tax. Furthermore it seems desirable to make everybody conscious of his responsibility to support the Government in its time of need.

INDIVIDUAL INCOME TAX INCREASE TOO PROGRESSIVE

All of the State chambers believe that adequate development of excise taxes may make it unnecessary to resort to any increase in the individual income tax; and some of them are directly opposed to such an increase. The individual income tax is a direct tax, excepting insofar as the withholding of wages operates to pass the burden along. Hence, steep as the progressive rates now are, it would be less objectionable to increase the individual tax properly, than to raise corporate taxes. But if it be found necessary to raise additional revenue from this source, the "meat-ax" method adopted by the House should by all means be discarded. The very fact that the House found it necessary to adjust the top surtax brackets in order to prevent the proposed 12½ percent defense supertax from causing confiscation exposes the injustice and the absurdity of the proposal. This method magnifies unduly the practical effect of the progression in the surtax schedule. Moderate progression is doubtless inherent in the time-honored conception of a tax on individual net incomes, but progression can be overdone, and is, under the House bill.

ALTERNATIVES TO HOUSE PROPOSAL SUGGESTED

We would accept the defense tax principle, if the additional tax could be levied in such a way as to mitigate the progression, or at least not unduly exaggerate it. We endorsed to the Ways and Means Committee of the House the plan proposed by the Committee on Economic Development as a method of obtaining additional revenue from individual incomes which would have this effect and commend that plan to your favorable consideration. The addition of a given number of percentage points, not exceeding three, to each surtax bracket would have a somewhat similar effect and would be in line with the Treasury's original proposals. So we would accept this method, so limited, and suggest that the revised surtax schedule be written as a defense tax in lieu, rather than as an amendment, of the present statutory schedule. While considerable revenue would result from lowering the personal exemptions and credits for dependents, we are opposed to so doing under present conditions.

OTHER BAD FEATURES OF HOUSE BILL

While we have recommended that this committee discard the House bill as a whole, with some exceptions, certain other of its detailed features are especially obnoxious and we particularly recommend their rejection here. They are:

1. The proposed defense tax increase in the rate of taxation of net capital gains. Our reasons may be gleaned from my previous discussion.

2. The proposed withholding of taxes on dividends, interest and royalties. From the point of view of the withholding agent, the provisions of the House bill may be superficially less objectionable than those relative to dividends, which your committee struck out of the Revenue Act of 1950, though we believe these to be still subject to serious criticism. But from the point of view of the recipient, and particularly the very many low-income recipients of such payments who are not liable for income taxes, the proposal is outrageous in that it would at best amount to a continuing forced loan, and at worst to a sort of larceny by default.

Finally, the State chambers of commerce have long advocated the more effective taxation of various types of organizations which now enjoy tax advantages, yet compete with taxed business. The Ways and Means Committee of the House heard much testimony on this subject, but did nothing about it. We trust that this committee, with the record of that testimony before it, will rectify this glaring inequity.

We favor true cooperation by farmers, consumers, and other groups, but we vigorously oppose the enjoyment by such groups of special tax advantages for the purpose of avoiding the taxes that must be paid by competing private enterprises. If it is our purpose to drive private enterprises out of existence, no surer way can be found than by taxing them heavily while relieving their competitors from similar responsibilities. With taxes for all Government now taking a third of the people's income, it is more vital than even hat we provide the broadest possible tax base to support such a burden.

In conclusion may I say this:

The organizations I represent are State organizations. We know what is going on in our State capitols, in our country courthouses, and on our main streets. Right now we are seeing some real pressure building up for a constitutional limitation on the Government's power to tax the incomes and the savings of the people. State chambers of commerce have thus far been chary of such a drastic safeguard against the excessive exploitation of these forms of taxation. But our committee senses a growing sentiment in its favor as a result of the passage of the House bill; and we believe that this situation merits your earnest consideration as you proceed with your deliberations.

Senator Hoey. This concludes the morning hearings, and the committee will take a recess until 10 o'clock tomorrow morning.

(Whereupon, at 11:45 a. m., the committee recessed to reconvene at 10 a. m., Tuesday, July 24, 1951.)

REVENUE ACT OF 1951

TUESDAY, JULY 24, 1951

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
Washington, D. C.

The committee met, pursuant to recess, at 10 a. m., in room 312, Senate Office Building, Senator Harry F. Byrd presiding.,

Present: Senators Byrd, Johnson of Colorado, Millikin, Taft, and Williams.

Also present: Elizabeth B. Springer, chief clerk; Colin F. Stam, chief of staff, Joint Committee on Internal Revenue Taxation.

Senator BYRD. The meeting will come to order.

I understand that Mr. Bernard N. Burnstine, merely desires to insert his statement in the record.

STATEMENT OF B. N. BURNSTINE, DIRECTOR, NATIONAL ASSOCIATION OF CREDIT JEWELERS

Mr. BURNSTINE. That is correct, Senator.

Senator BYRD. Mr. Burnstine, if you will identify yourself for the reporter, please, you may then proceed.

Mr. BURNSTINE. I am B. N. Burnstine. I would like to have my statement placed in the record.

Senator BYRD. Thank you very much.

(The prepared statement follows:)

STATEMENT OF B. N. BURNSTINE, DIRECTOR OF THE NATIONAL ASSOCIATION OF CREDIT JEWELERS, NEW YORK, N. Y.

Section 123, which proposes that the surtax exemptions and minimum excess-profits-tax credit of related corporations be limited and restricted in their applications, where certain common ownership of voting stock exists, is an inequitable application of the taxing authority. It will impose an uneconomic burden, and will prevent creation and expansion, particularly in small business.

IMPACT ON GROWTH OF SMALL BUSINESS

The growth of our economy has been achieved through the ingenuity and ability of enterprising individuals to commence businesses with relatively modest amounts of capital and by retention of earnings increase their capital funds, thereby providing additional employment for producers, manufacturers and retailing.

The enactment of this section will retard, if not stifle, the growth of small business. Presently it is most difficult for young and growing businesses to retain earnings to build a capital structure sufficient to meet adverse conditions. This section will make it almost impossible. Plans for formation of new small business enterprises are being suspended awaiting the passage of this revenue bill. If section 123 remains a part of this bill, most of these plans will be abandoned.

UNWARRANTED TAX ADVANTAGE DOES NOT EXIST

Though this section is intended to prevent some businesses from taking so-called unwarranted tax advantage by a series of corporations, rather than a single corporation in fact, no such unwarranted advantage is present. All corporate businesses may avail themselves of the privilege of operating through multiple corporations if there is a sound business purpose to so operate. The revenues are protected since the Treasury may prevent truly unwarranted tax advantage through corporate split-ups.

Multiple corporations that have not split up, despite their ability to do so under present law, have refrained because of disadvantages they seek to avoid. To place an increased burden on those stockholders that find it advisable and necessary to operate through several corporations is to penalize them unfairly.

INEQUITIES THAT WILL ARISE UNDER SECTION 123

An individual or a group of not more than five, who have similar stockholdings in more than one corporation, are conducting principally more than one individual small business or essentially unrelated businesses. Should such an individual or group, who conduct two retail stores, each in a different city (or even under different trade names) through separate corporations; or who, through one corporation, operate a grain and feed business and through another own real estate, be subjected to competitive disadvantage and an unfair tax burden?

The effect is to tax small business at rates intended for big business solely because the ownership of the voting stock classifies the corporations as related under the proposed section.

EXCESSIVE TAX INCREASE IMPOSED BY SECTION 123

The revenue sought to be raised will weigh unevenly upon existing businesses. In the following illustration, two small corporations whose stockholders cause them to be classified as "related" corporations, will pay 64 percent more income taxes than under present law, whereas the pending bill is intended to increase the rate of small corporations (earnings under $25,000) 5 percentage points or 20 percent:

Income taxes

	Net income	Present law	Proposed, including sec. 123
Corporation A	$25,000	$6,250	$10,250
Corporation B	25,000	6,250	10,250
Total	....	12,500	20,500

This increase is exclusive of and in addition to the burden of the proposed limitation on the minimum excess-profits-tax credit. The limitation on the minimum excess profits tax credit may add as much as $7,500 in excess-profits taxes to the above two taxpayers. In that event, their total income and excess-profits-tax liability would rise from $12,500 under the present law to $28,000, or an increase of 122 percent.

RELIEF FOR INSTALLMENT BASIS TAXPAYER

The National Retail Furniture Association has appeared before your committee and filed a statement on provisions needed to provide an equitable imposition of tax on installment basis taxpayers during a period of emergency.

Our membership is in full and complete accord with the position set forth in that statement, and recommends that your committee give favorable consideration to the suggested legislation contained therein to relieve installment basis taxpayers from what would constitute otherwise a harsh and inequitable impact of emergency income-tax rates.

Senator BYRD. Our next witness will be Mr. J. Carter Fort. Have a seat, sir, and identify yourself to the reporter.

Mr. Fort, I would like to say at the beginning of the hearing this morning that we have a large number of witnesses and we are trying to hear them all, and we would like, if possible, for you to confine your statement, I think, it is, to 10 minutes, is it not?

STATEMENT OF J. CARTER FORT, VICE PRESIDENT AND GENERAL COUNSEL, ASSOCIATION OF AMERICAN RAILROADS

Mr. FORT. Mr. Chairman, I will have part of my statement copied into the record to save time.

Senator BYRD. I say you are provided 10 minutes; is that right?

Mr. FORT. Thirty minutes.

Senator BYRD. What?

Mr. FORT. A half hour, so I was told, but I will hurry through.

Senator BYRD. Please hurry through it.

Mr. FORT. Mr. Chairman, and members of the committee, my name is Carter Fort.

I am a lawyer with offices and residence in Washington, D. C.

I appear here for the Association of American Railroads, of which I am vice president and general counsel.

That association is a voluntary nonprofit organization, including in its membership almost all the class I railroads of the United States—that is to say, railroads with operating revenues of more than a million dollars a year.

Its membership comprises railroads operating approximately 95 percent of the railroad mileage of the country, and having operating incomes approximately 95 percent of the gross revenues of all the rail carriers of the country.

I shall confine myself to a discussion of a limited number of the features of the pending tax legislation which are of special concern to the railroad.

The first subject I shall discuss is the matter of the corporate tax rate.

It goes without saying that rail transportation is a primary essential to both the civilian economy and the national defense. In the present emergency period the railroads are called upon to undertake a heavy program of capital expansion, through acquisition, at current high costs, of a large number of new freight cars and much additional motive power and the enlargement of their fixed properties to meet the exigencies of the present and the prospective emergency.

There are only two sources of funds for these expenditures, namely, investment capital and earnings; and in the case of the railroads, the availability of investment capital under existing conditions is, in large measure, limited to borrowings for expenditures for unencumbered new equipment, because fixed property is already mortgaged, and the level of railroad earnings is not such as to attract equity capital.

At the now existing burdensome level of corporate tax rates, the availability of earnings as a source of funds is severely, even critically, restricted by the circumstance that it takes $1.90 of earnings to produce $1 for capital expenditures, after 47 percent is deducted for Federal income taxes.

Senator TAFT. Say that again.

Mr. FORT. $1.90 of earning is required to produce——

Senator TAFT. Earnings?

Mr. FORT. In order to have a dollar left to buy new equipment, or to expand in any way.

That, Senator Taft, is not all. In replacement of equipment our new costs are so much greater than the cost of the equipment which is being replaced that our depreciation reserves fall far short of being sufficient to replace the property.

In the circumstances, it will hardly be a cause for surprise that the railroads view with great concern the provision of the House bill, H. R. 4473, which would exact in the form of Federal income taxes, more than one-half of each dollar of net income, and would indeed carry the rate to the unprecedented level of 52 percent.

Just how the railroads could carry such a tax burden and at the same time meet the imperative requirements of the present emergency, it is difficult to comprehend.

The railroads, therefore, have associated themselves with those who have appeared before your committee in opposition to any further increase in corporate tax rates.

In the case of the railroads, the menace of an unsupportable burden of Federal income taxes is even more serious than in the case of general industry. To some extent, at least, industries in general are in a position to ride with the business cycle through curtailment of operation and adjustment of price, as circumstances indicate.

Railroads do not have the same freedom to discontinue or curtail operations even though they may be unprofitable. Nor can they adjust their charges to variations in their cost without prior authorization of sundry regulatory agencies, with the inevitable procedural delays involved in the process.

The regulatory system under which the railroads operate not only requires that the price of their services be fixed but also affects nearly all of their other activities.

Under that system the railroads, during the 30-year period from 1921 to 1950, have had to function at an average rate of return on depreciated investment of approximately 3.64 percent.

In the decade of the forties, which included the peak World War II traffic years, the rate of return averaged 4.11 percent.

During the five postwar years, 1946–50, when business activity was great, the traffic was heavy and corporate earnings in general were at a high level, the rate of return for the railroads averaged only 3.51 percent.

With this history in mind, it is small cause for wonder that equity capital is largely unavailable to the railroad industry and that earnings must be looked to as a principal source of funds for railroad upkeep and expansion.

In view of the imperative current needs for adequate maintenance and substantial expansion of the railroad plant, we respectfully suggest that nothing short of the most dire necessity could justify an increase in the rate of the Federal income tax imposed upon the railroads.

The present rates are all but insupportable.

And in our considered judgment there is no justification for entertaining a proposal to take away in Federal income taxes more than one-half of corporate net income as is proposed in H. R. 4473.

Senator TAFT. With the provisions which we put into the law last year, are any railroads subject to excess-profits tax?

Mr. FORT. Yes; Senator Taft, some railroads are.

Senator TAFT. Not too many?

Mr. FORT. Not a great many, sir.

Senator MILLIKIN. Well, those that are do not have the difficulties that you are referring to; do they?

Mr. FORT. I am sorry, Senator Millikin, I did not hear you.

Senator MILLIKIN. Those that are subject to the excess-profits tax do not have the difficulties to which you are referring.

Mr. FORT. There is a wide range in railroad earnings, in the earnings between the different railroads, and necessarily so. There is a uniformity about the rate level, and necessarily, by reason of the competitive situation. The fact is, therefore, and I think it will always be the fact, that there is a very wide range in railroad earnings. The earnings of some railroads, some few railroads, are quite satisfactory. The earnings of most are quite unsatisfactory. The average earnings of the industry as a whole are unsatisfactory and inadequate.

Senator TAFT. But so far as maintenance and improvement, what is the rule for the maintenance and improvement of roadbed? Is that all expenses? You do not get depreciation, and you do get all expenses?

Mr. FORT. There is no depreciation as to many roadway items. Generally speaking, rails, ties, and track items are not depreciated but bridges, buildings, and like structures are. There is depreciation as to equipment.

Senator TAFT. I was talking about roadway.

Mr. FORT. As to some items there is depreciation, but as to many there is not.

Senator MILLIKIN. As to rails, for example, is that depreciated?

Mr. FORT. No, they are not depreciated.

Senator MILLIKIN. Maintenance of the roadbed?

Mr. FORT. That is an operating expense.

Senator TAFT. I just wondered whether, in view of the peculiar situation of the railroads, some similar treatment of equipment might not be justified, that is, just like the man replacing his old house with a new house—with the possible expensing of actual replacement, where the equipment was no larger——

Mr. FORT. When rail is replaced which is heavier than the rail that it replaces, the additional weight goes in as a capital item.

Senator TAFT. Yes, sir. That would be true of equipment, but not the increase in price due to inflated prices.

Mr. FORT. When ballast is made heavier and thicker than it was before, the additional thickness of the ballast goes in as a capital item, so it is necessary for the railroads constantly as a part of what most people would regard as maintenance, to make large additional capital investments in roadway. The roadway of course, is already mortgaged.

There is no way to get that additional capital except from earnings.

So, to a large extent, very large extent, the railroad is required—and there is no other possibility—to use earnings for capital expenditures.

Returning to my prepared statement: For reasons I have given, we oppose the increase in over-all ceilings upon Federal taxes from 62 to 70 percent, as provided in the House bill.

Highly objectionable also, in our view, is the retroactive feature of the House bill whereby the increased rates would apply beginning

January 1 of this year, although it seems certain that the tax bill will not be enacted before September or later.

In the case of individuals the House bill avoids retroactivity, at least in large part, by deferring them until September—deferring until September the proposed increase in rates.

It is certainly no less important that retroactivity be avoided in the case of corporations. As to the railroads, their books are kept on an accrual basis; their budgets are on the basis of current tax rates, allocating to capital improvements, revenues not needed to meet operating expenses, taxes, interest and relatively minor distributions to stockholders by way of dividends.

A retroactive increase in taxes can hardly fail to bring about a serious curtailment in capital improvements already planned and even already actually in progress. Obviously, such a result would not be in the interest of national defense.

During the past 5 years we have expended roughly about $1½ billion in improvements to roadway, and about $3½ billion in equipment, so it is an enormous sum of money that must be constantly available for capital expenditures.

Senator BYRD. What is the average rate of depreciation in the equipment and roadbed, what percentage?

Mr. FORT. What percent depreciation? It varies.

On freight cars, I think the depreciation is on the basis of a 33-year life. Even, however, if the rate of depreciation were entirely correct and accurate, it would not solve our problem, because we are depreciating a car that cost $2,700, and if you assume we have the entire amount depreciated and the $2,700 in the bank, when the car is replaced it costs over $5,000.

Senator MILLIKIN. That is the problem of all industry.

Mr. FORT. Yes, sir.

Senator MILLIKIN. That is a problem of all industry.

Mr. FORT. That is true. But all industry is not regulated and not held down in its earnings to the same extent.

Senator MILLIKIN. I understand.

Senator BYRD. What about the roadbed, what is the depreciation?

Mr. FORT. Well, some items are depreciated as I have said. Many of the items of roadway are not depreciated at all, but on a retirement basis.

Senator BYRD. What is the percentage rate where you do depreciate?

Mr. FORT. I do not know, but I will know before I leave.

Senator BYRD. You say rails are not depreciated——

Mr. FORT. No.

Senator BYRD. Unless you replace them with a heavier rail, is that correct?

Mr. FORT. That is true. Rails as I understand it, Senator, are on a retirement basis.

Senator TAFT. You replace a rail, and if it is replaced with a rail of the same size, you charge it to expense.

Mr. FORT. That is right, operating expense, but a heavier rail goes in as capital expenditure.

I now have the depreciation figures on road structures.

On road property the average depreciation is about 2 percent. It is the inflationary cycle, of course, that has caused the deep trouble in respect to depreciation, and which has made our depreciation reserves wholly inadequate to serve the purpose that they were intended to serve, and that we had every right to think they would serve.

There is another feature of retroactive tax increases in their application to railroads which should not be overlooked. The charges received by the railroads for their services are fixed by governmental authority, and this, of course, is generally true of the charges of all public utilities.

The level of such charges is not fixed, and could not be fixed, with any reference to a possible retroactive increase in taxes which might be accomplished by a law to be enacted in the future, at some future date.

Neither could increases in railroad charges granted subsequent to the enactment of the new tax law be made retroactive to correspond to the retroactive tax increase.

Thus, a grossly inequitable situation would arise which would not only work irreparable injury to the railroads, but also would operate adversely to the public interest in an adequate and efficient national transportation system.

If a policy is to be adopted of making tax increases retroactive, it will render difficult, if not virtually impossible, any orderly and constructive regulation of railroad rates and the rates of other utilities by the governmental agencies which have been set up for that purpose.

I come now to the single surtax tax exemption provisions of the House bill.

As we understand it, a principal purpose of the provision in section 123 of the House bill, restricting a group of affiliated corporations to a single surtax exemption and a single minimum excess-profits credit, is to prevent tax avoidance through the artificial division of a single enterprise into a number of so-called split-off or spin-off corporations created to obtain the benefit of the separate surtax exemption and a separate excess profits tax credit for each.

The report of the Ways and Means Committee of the House indicates that the split-off device came into considerable use during World War II, and may be expected to become more prevalent under the incentive of current high corporate tax rates.

We do not quarrel with the purpose to curtail tax avoidance through artificial division of the single enterprise into a chain of separate corporate entities, but the provision of the House bill reaches far beyond such a purpose.

It would reach many corporate set-ups of long-standing, created as the result of legal requirements or by reason of wholly legitimate business considerations, quite apart from tax avoidance.

In the case of the railroads, virtually all of these corporate relationships are of long standing, and antedate any possible motive to split off corporations for tax avoidance purposes.

Public convenience and necessity require that railroads operate across State lines, but the provisions of law in some States have necessitated, as a practical matter, the existence of subsidiary corporations.

For example, where a State has prohibited railroad property from being owned by a foreign corporation or has refused to grant the power of eminent domain to foreign corporations, it is apparent that a separate corporation had to be continued or created under the laws of that State.

The result has been that the major railroad systems of this country have developed, not only by mergers, but also by a process of leasing railroad property, which form an integral part of the operating system of the lessee.

In the railroad field, therefore, multiple corporate set-ups are the rule rather than the exception, and this is in no sense the result of artificial splitting off, with an eye to the tax laws.

We strongly urge, therefore, that if the single exemption feature of the House bill is to be retained, it be modified to apply only to corporations created subsequent to a certain specified date, say, October 8, 1940, the date of the enactment of the Second Revenue Act of 1940, when the World War II excess-profits tax was first imposed.

Prior to that date, there could have been no motive for corporate split-offs for the purpose of obtaining additional exemptions or credits.

We would also suggest further amendment to make the single exemption provision inapplicable to corporations created after the date selected in those instances where it is shown to the satisfaction of the Commissioner that the corporation was created for legitimate business purposes, other than tax avoidance.

Thus amended, section 123 of the House bill would be confined in its scope to the effectuation of a purpose to discourage split-offs for tax avoidance and the section would not be applicable where no element of tax avoidance is involved.

Coming now, Mr. Chairman, to the feature of withholding on dividends and interest, the railroads are in complete agreement with the premise that taxes should be paid on all taxable income, and that all reasonable means should be used to prevent an escape from the payment of taxes, either by individuals or corporations, and whether as a result of underreporting of dividends and interest or otherwise.

However, they question the advisability of further transferring the tax-collecting function from the Treasury to corporations. There is no question, it seems to me, that serious hardship will result in many instances from the want of relationship between the amount withheld and the amount of taxes due, if any. Many taxpayers will be put to the necessity of procuring refunds and will be deprived of the use of their money, at least for a season.

In important instances, indeed, overwithholding would be inevitable.

A case in point is the payment of dividends to corporations. These dividends are taxable to the extent of 15 percent of their amount.

Assuming a combined normal and surtax rate as high even as the 52 percent proposed in the bill, the tax would not exceed 7.8 percent—yet 20 percent would be withheld.

In many instances this result and the attendant delay in obtaining a refund would seriously impair the working capital of the recipient corporation.

This situation would seriously affect many railroads.

Senator BYRD. Where do you get the figure that the tax would not exceed 7.8 percent?

Mr. FORT. Well, the tax would be, under the law as I understand it, on 15 percent of the dividends received by the corporation, and at the rate of 52 percent in the House bill would be 52 percent of 15 percent, which makes 7.8.

Senator BYRD. You have assumed that the taxpayer has no other income, I assume?

Mr. FORT. No; this——

Senator TAFT. This is intercorporate.

Mr. FORT. Intercorporate; yes.

There are a number of railroads which receive dividends in quite large amounts from the stock of other railroads which they own.

To ameliorate this particular hardship, it would seem that if withholding on dividends is to be required, the corporate recipient of dividends should be permitted to set off the amount withheld against any amount due from such corporation as income, or payroll taxes, along the lines of the provision already in the House bill with respect to tax-exempt corporations.

The House bill would exempt from withholding, among other things, interest on equipment trust certificates, and we think that is a very wise provision.

The report of the Ways and Means Committee of the House indicates that the reason for the exemption of equipment trust certificates from the requirement of withholding is that they are ordinarily held by corporations.

Conditional sales agreements are widely used by railroads in financing the acquisition of new equipment. They serve in that connection the same purpose as equipment trust agreements. Like equipment trust certificates they are ordinarily held by corporations.

Unpaid balances on such agreements entered into by the railroads aggregated slightly in excess of $392 million as of December 31, 1950.

We urge that if a withholding requirement is to be retained in the bill, the exemption with respect to interest on equipment trust certificates should be enlarged to include interest payable under conditional sales agreements.

But we think that in any event the requirement of tax withholding on dividends and interest, as provided in the House bill, should be deferred until the effect of the new reporting requirements can be known.

This year, for the first time, under the regulations of the Commissioner, corporations are required to report all payments of dividends regardless of amount, and the recipient taxpayer is required to itemize all dividends received.

No opportunity has yet been afforded to judge the efficacy of these measures in minimizing the evil at which the proposed withholding is directed. Until that is known, we think your committee is not in a position to gage the extent of the evil, and to measure the benefits of the proposal against the hardships involved in it.

I come now, Mr. Chairman, to the matter of the penalty for filing consolidated returns.

The railroads have frequently urged your committee, and have urged the Ways and Means Committee of the House, to repeal the 2-percent penalty for filing consolidated returns.

In practical effect, the impact of this penalty is, of course, increased sharply as the corporate tax rates rise.

We think the penalty without justification in any event, but when consideration is being given to a bill which would place the combined corporate normal and surtax at 52 percent, it is especially important, we think, that your attention be directed to the fact that the combined rate under such a measure would reach 54 percent in the case of consolidated returns, and leave a bare 46 percent of net earnings available for corporate purposes.

The exigencies of the present situation impel us again to urge the repeal of this penalty.

It may be taken for granted, we suppose, that under existing emergency conditions and the consequent revenue needs of the Government, the combined corporate normal and surtax rate will be fixed at the maximum figure deemed consonant with the preservation of a sound and vigorous economy.

If this is so, it follows that the exaction of a penalty of two additional percentage points in the rate would, in many cases, carry the rate to a level higher than the maximum regarded by Congress as justifiable. And yet consolidated returns are consonant with the principle of levying taxes according to the true net income of a single enterprise, and they have, as we understand it, been favorably regarded by the Treasury from an administrative standpoint.

The imposition of a penalty for filing consolidated returns is particularly inappropriate in the case of railroads. Most of the railroad systems, as I have already pointed out, have of necessity been built up through a combination of a number of comparatively small railroads.

By reason of sundry controlling factors, including in many instances the requirement of State law, it has often been impossible to effectuate integration through consolidation or merger.

The continuance of subsidiary corporate entities has frequently been a practical and a legal necessity, and the acquired properties in such cases have been integrated into the operating system through long-term leases or by other means.

Multiple corporate entities within a single railroad system have thus resulted as an incident of the process of evolving a limited number of railroad systems capable of rendering a national transportation service in accordance with the requirement of the national economy and the dictates of the national transportation policy.

At times in the past Congress has recognized the special situation of the railroads with reference to consolidated returns.

Thus, when consolidated returns were abolished insofar as other businesses were concerned, by the Revenue Act of 1934, railroads, because of their special situation, were still permitted to file them.

In 1934—from 1934 to 1939, railroad companies alone were permitted to file consolidated returns, and in 1940 and 1941 railroads alone were permitted to file consolidated returns with respect to normal taxes and surtaxes, other corporations being confined to consolidated returns for the purpose of excess-profit taxes alone.

During the latter years mentioned no penalty was exacted. We think that on principle the penalty should be removed as to all corporations, but, in any event, we submit that the particular situation of the railroad industry should be recognized under present conditions, and the penalty eliminated as to that industry.

I come now, Mr. Chairman, to a point which I will touch very lightly, and ask leave to have copied in the record an additional statement.

Senator Byrd. Yes.

Mr. FORT. We understand that your committee may conclude to defer until next year any revision of the excess-profits-tax law of 1950, but that suggestions for revision are acceptable now for consideration at such time as that act may come under review.

The railroads do not urge that the Excess Profits Tax Act be reconsidered at this time. They are in accord with the thought that the matter would be better deferred until there has been more adequate experience under the act as it now stands.

Senator MILLIKIN. We thought that the railroads were fairly well satisfied with what we did.

Mr. FORT. That is entirely correct, Senator. The point——

Senator MILLIKIN. We went to extraordinary pains to take care of the situation and—that is the railroad situation and the public utility situations.

Mr. FORT. The point I have in mind to be considered for amendment in the future is a technical point, having nothing to do with the philosophy of the law as it is written. I will make that clear in just a minute. We are concerned that at an appropriate time consideration be given to a clarifying amendment having to do with the status of the long-term lessor and lessee railroad companies with respect to the availability of consolidated returns.

The apprehension is that, under the technical provisions of the Excess Profits Tax Act, consolidated returns may be available to those corporations only in the event that the lessee, that is, the operating company, foregoes the public utility excess-profits credit provided for by section 448 of the act.

It is not believed that any such result was anticipated or intended. A simple clarifying amendment would prevent it. I do not wish to go at length into the matter here and now, but I ask that there be incorporated at this point in the record a brief statement with respect to it, as a part of my testimony.

May I have that permission, Mr. Chairman?

Senator BYRD. It will be incorporated, sir.

(The matter referred to is as follows:)

Section 448 of the Internal Revenue Code provides an alternative excess profits credit for regulated public utilities. This credit, in the case of railroads, is measured by a return of 6 percent upon net assets, after allowance for normal tax and surtax liabilities. To be entitled to this alternative credit a railroad corporation must be engaged as a common carrier in the furnishing or sale of transportation by railroad, subject to the jurisdiction of the Interstate Commerce Commission, and at least 80 percent of its gross income (computed without regard to dividends and capital gains and losses) must be derived from the furnishing or sale of transportation by railroad (sec. 448 (c) (3); 448 (d)).

Section 141 of the Internal Revenue Code, as amended by the Excess Profits Tax Act of 1950, provides for the filing of consolidated returns by affiliated corporations which are regulated public utilities within the meaning of section 448.

We believe that the law should be clarified to make certain that a lessor railroad corporation which leases substantially all of its property to an operating lessee railroad corporation which utilizes the public utility credit may be joined with such lessee in the filing of a consolidated return. Although the lessor company is subject to the jurisdiction of the Interstate Commerce Commission, and its properties are operated by the lessee as integral parts of its system in the furnishing or sale of transportation by railroad, and its revenues, in the form of rental, derive from such operation, nevertheless the lessor does not itself operate the property and it does not derive its revenues directly from the furnishing or sale of transportation. It should be made clear that section 141 of the code does not preclude the lessee from joining the lessor in a consolidated return, except at the sacrifice of the alternative credit to which the lessee is entitled under section 448.

It is believed that Congress did not intend that the consolidated return provisions applicable in the case of these lessor-lessee railroad relationships should operate as a barrier to the availability to the lessee of the special public utility credit, or that utilization of that credit by the lessee should preclude a consolidated return.

As has already been stated, most of the major railroad systems today are the result of the combination of a number of comparatively small railroads. In many cases, substantial obstacles have prevented the merger and consolidation of these smaller companies into one large corporation. Among these obstacles are State laws; franchise rights; rights of minority stockholders; and mortgage, lease, and contract provisions. As a result of these and other considerations, the major railroad systems of the country have developed, not only by mergers and consolidations, but in substantial part through long-term lease arrangements.

Under an arrangement of the latter type, the company which owns the properties leases them for a long period of years to an operating company. Thereafter, the lessor ceases operations, although it continues its corporate existence, receiving rental for the use of its properties ordinarily measured by the requirements of interest on the indebtedness of the lessor and dividends on its capital stock.

The lessee takes over the complete management and control of the properties of the lessor and incorporates them into its railroad system. The facilities of the lessor and lessee become integrated parts of a single unified system. It is then not possible to determine for any given period of operation the amount of income attributable to the operations of the leased properties and the amount attributable to the operations of the properties owned by the lessee. Revenues and expenses have become amalgamated. The properties of the respective corporations are regarded as a unit by the Interstate Commerce Commission for rate making and other regulatory purposes and the value of the properties of the lessor is included in the rate base of the lessee, the operating company.

There is thus presented the typical case for a consolidated return and there is certainly no reason why it should be available only at the cost to the lessee of the alternative public-utility credit.

It is accordingly urged that section 448 (d) be amended by adding at the end thereof a clarifying provision that, for the purposes of section 448 and of section 141, a railroad corporation which has leased substantially all of its property to a common carrier shall be deemed to be a common carrier engaged in the furnishing or sale of transportation and that the rents receivable under such a lease shall be considered to be derived from the furnishing or sale of transportation.

Under such an amendment any possible impediment to consolidated returns would be removed where at least 80 percent of the lessor's income was derived from rentals under the lease.

The untoward—and, it is believed, unintended—deprivation in the typical railroad lessor-lessee relationship of the right to file a consolidated return and utilize the regulated public-utility credit would be obviated.

The suggested amendment is submitted with confidence that it accords with the policy embodied in section 448 and eliminates a possible obstacle to the filing of consolidated returns which ought not to be interposed in the case of railroad leases of the character described.

Mr. FORT. May I ask those of you who are following what I say in the written statement to turn to the bottom of page 13. There begins a discussion of the treatment of back mail pay.

There is one additional matter which I am constrained to call to the attention of your committee because the railroads may become compelled at a somewhat later date to request an amendment of the tax bill with respect to it. The situation to which I refer is this:

In February 1947 the railroads filed an application with the Interstate Commerce Commission seeking additional compensation for the carriage of mail, and in December of that year the Commission found that the rates in effect were unduly low, and awarded an interim increase of 25 percent, continuing the case for the determination of the amount of its final award.

After protracted proceedings, a final award was made in December 1950 in the amount of $312 million which included the 25-percent interim increase theretofore granted.

Senator BYRD. What was that percentagewise?

Mr. FORT. What was that percentagewise? It was in the neighborhood of 50 percent altogether in the final award; 25 percent as an interim increase, and then an additional increase.

Senator BYRD. The permanent increase was around 50 percent?

Mr. FORT. Yes, sir. You will see figures that will sustain that in a moment, Mr. Chairman.

Senator BYRD. All right.

Mr. FORT. Amounts resulting from the interim increase of 25 percent, which in round figures totaled $160,000,000, were received by the railroads in the several years 1947 to 1950, in which the services were rendered, and were included in the tax returns for those respective years.

The remainder of the award, namely, $152,000,000, represents additional compensation for the services rendered in the period 1947 to 1950.

In other words, the additional amounts payable under the final award merely supplement the payments made in each of the years involved under the interim award, which latter amounts, as stated, were included in the income in each of the respective years.

In December 1950 the railroads submitted to the Commissioner of Internal Revenue a request for a ruling that the additional pay awarded in 1950 is properly to be accrued for Federal income-tax purposes in the years during which the services were rendered, namely, 1947, 1948, 1949, and 1950. This request is still pending.

We think the case clearly is one for administrative handling, particularly in view of the fact that in his most recent ruling concerning the accrual of back mail pay, the Commissioner authorized the airlines, which had obtained a like award from the Civil Aeronautics Board, to account for the revenues in the years in which the service was performed.

The railroads are under legal obligation to transport mail pursuant to the provisions of the Railway Mail Pay Act, and by the express terms of the act are entitled to receive fair and reasonable compensation for such transportation.

Certainly for tax purposes the railroads should be permitted to allocate to the years in which the service was rendered the payments made at a later date but representing compensation for that service.

A measure of hardship will be involved even in the event of a favorable administrative ruling in that interest will be payable upon the deficiencies involved. This interest factor, of course, becomes of increasing importance with the passage of time.

In these circumstances, should a ruling be much longer delayed, or should an unfavorable ruling be made by the Commissioner, the railroads will seek an opportunity to urge an amendment of the tax bill to afford legislative relief.

We are hopeful, however, that the matter may shortly be disposed of through an administrative ruling.

That concludes my statement, sir.

Thank you for your courtesy.

Senator BYRD. Thank you very much, Mr. Fort.

(The prepared statement of J. Carter Fort follows:)

STATEMENT OF J. CARTER FORT, VICE PRESIDENT AND GENERAL COUNSEL OF THE ASSOCIATION OF AMERICAN RAILROADS

My name is Carter Fort. I am a lawyer with offices and residence in Washington, D. C. I appear here for the Association of American Railroads, of which I am vice president and general counsel. That association is a voluntary nonprofit organization including in its membership almost all of the class I railroads of the United States—that is to say, railroads having annual operating revenues of $1,000,000 or more. Its membership comprises railroads operating approximately 95 percent of the road mileage of all railroads in the United States and having approximately 95 percent of the total gross revenues of all the rail carriers of the country.

I shall confine myself to the discussion of a limited number of the features of the pending tax legislation which are of special concern to the railroads.

THE CORPORATE TAX RATE

The first subject I shall discuss is the matter of the corporate tax rate.

It goes without saying that rail transportation is a primary essential to both the civilian economy and the national defense. In the present emergency period, the railroads are called upon to undertake a heavy program of capital expansion, through acquisition, at current high costs, of large numbers of new freight cars and much additional motive power and the enlargement of their fixed properties to meet the exigencies of the present and prospective emergency.

There are only two sources of funds for capital expenditure, namely, investment capital and earnings. In the case of the railroads, the availability of investment capital under existing conditions is in large measure limited to borrowings for expenditures for unencumbered new equipment, because fixed property is already mortgaged and the level of railroad earnings is not such as to attract equity capital. At the now existing burdensome level of corporate tax rates, the availability of earnings as a source of funds is severely, even critically, restricted by the circumstance that it takes $1.90 of net income to produce $1 for capital expenditure, after deduction of 47 percent for Federal income taxes.

In these circumstances, it will hardly be a cause for surprise that the railroads view with great concern the provision of the House bill, H. R. 4473, which would exact in the form of Federal income taxes more than one-half of each dollar of net income, and would, indeed, carry the rate to the unprecedented level of 52 percent. Just how the railroads could carry such a tax burden and at the same time meet the imperative requirements of the present emergency it is difficult to comprehend.

The railroads, therefore, associate themselves with those who have appeared before your committee in opposition to any further increase in the corporate tax rate.

In the case of the railroads, the menace of an insupportable burden of Federal income taxes is even more serious than in the case of general industry. To some extent, at least, industries in general are in a position to ride with the business cycle, through curtailment of operations and adjustment of price as circumstances may indicate. Railroads do not have the same freedom to discontinue or curtail operations, even though they be unprofitable, nor can they adjust their charges to variations in their costs without prior authorization of sundry regulatory agencies, with the inevitable procedural delays involved in the process.

The regulatory system under which the railroads operate not only requires that the price of their services be fixed but also affects nearly all their other activities. Under that system the railroads, during the 30-year period 1921–50, have had to function on an average rate of return on depreciated investment of approximately 3.64 percent. In the decade of the 1940's, which included the peak World War II traffic years, the rate of return averaged 4.11 percent, while in the decade ending with 1939, the average was only 2.30 percent. During the five postwar years, 1946–50, when business activity was great and corporate earnings in general were at a high level, the rate of return for the railroads average only 3.51 percent.

With this history in mind, it is small cause for wonder that equity capital is largely unavailable to the railroads and that earnings must be looked to as a principal source of funds for railroad upkeep and expansion. In view of the imperative current need for adequate maintenance and substantial expansion of the railroad plant, we respectfully suggest that nothing short of the most dire necessity could justify an increase in the rate of Federal income taxes imposed upon the railroads. The present rates are all but insupportable. In our considered judgment, there is no justification for entertaining a proposal to take away in Federal income taxes more than one-half of corporate net income, as is proposed in H. R. 4473.

By the same token, we oppose the increase in the over-all ceiling upon Federal taxes from 62 percent to 70 percent, as provided in the House bill.

Highly objectionable also, in our view, is the retroactive feature of the House bill, whereby the increased rates would apply beginning January 1 of this year, although it seems certain that the tax bill will not be enacted until September or even later. In the case of individuals, the House bill avoids retroactivity by in effect deferring until September the proposed increase in rates. It is certainly no less important that retroactivity be avoided in the case of corporations. As to the railroads, their books are kept on the accrual basis and their budgets are on the basis of current tax rates, allocating to capital improvements revenues not needed to meet operating expenses, taxes, interest, and relatively minor distributions to stockholders by way of dividends. A retroactive increase in taxes can hardly fail to bring about serious curtailment in capital improvements already planned and even already actually in progress. Obviously such a result would not be in the interest of national defense.

There is another feature of a retroactive tax increase, in its application to railroads, which should not be overlooked. The charges received by railroads for their services are fixed by governmental authorities, and this, of course, is generally true also of the charges of all public utilities. The level of such charges is not fixed, and could not be fixed, with any reference to a possible retroactive increase in taxes which might be accomplished by a law to be enacted at some future date. Neither could increases in railroad charges, granted subsequent to the enactment of the tax law, be made retroactive to correspond to the retroactive tax increase. Thus, a grossly inequitable situation would arise, which would not only work an irreparable injury to the railroads but would also operate adversely to the public interest in an adequate and efficient national transportation system. If a policy is to be adopted of making tax increases retroactive it will render difficult, if not virtually impossible, any orderly and constructive regulation of railroad rates and the rates of other utilities by the governmental agencies which have been set up for that purpose.

THE SINGLE SURTAX EXEMPTION

I come now to the single surtax exemption provisions of the House bill.

As we understand it, a principal purpose of the provision in section 123 of the House bill, restricting a group of affiliated corporations to a single surtax exemption and a single minimum excess-profits credit, is to prevent tax avoidance through the artificial division of a single enterprise into a number of so-called split-off or spin-off corporations created to obtain the benefit of a separate surtax exemption and a separate excess-profits credit for each. The Report of the Ways and Means Committee of the House indicates that the split-off device came into considerable use during World War II and may be expected to become more prevalent under the incentive of current high corporate tax rates.

We do not quarrel with a purpose to curtail tax avoidance through artificial division of a single enterprise into a chain of separate corporate entities, but the provision of the House bill reaches far beyond such a purpose. It would reach many corporate set-ups of long standing created as a result of legal requirements or by reason of wholly legitimate business considerations quite apart from tax avoidance.

In the case of the railroads, virtually all of these corporate relationships are of long standing and antedate any possible motive to split off corporations for tax-avoidance purposes.

Public convenience and necessity require that railroads operate across State lines. But the provisions of law in some States have necessitated, as a practical matter, the existence of subsidiary corporations. For example, where a State has prohibited railroad property from being owned by a foreign corporation or has refused to grant the power of eminent domain to foreign corporations, it is apparent that a separate corporation had to be continued or created under the laws of that State. The result has been that the major railroad systems of this country have developed not only by mergers but also by a process of leasing railroad properties which form an integral part of the operating system of the lessee. In the railroad field, therefore, multiple corporate set-ups are the rule rather than the exception, but this is in no sense the result of artificial splitting off with an eye to the tax laws.

We strongly urge, therefore, that if the single exemption feature of the House bill is to be retained it be modified to apply only to corporations created subsequent to a specified date; say, October 8, 1940, the date of enactment of the Second Revenue Act of 1940, when the World War II excess-profits tax was first imposed. Prior to that date there could have been no motive for corporate split-offs for the purpose of obtaining additional exemptions or credits. We would also suggest further amendment to make the single exemption provision inapplicable to corporations created after the date selected in those instances where it is shown to the satisfaction of the Commissioner that the corporation was created for legitimate business purposes other than tax avoidance.

Thus amended, section 123 of the House bill would be confined in its scope to the effectuation of a purpose to discourage split-offs for tax avoidance and the section would not be applicable where no element of tax avoidance is involved.

WITHHOLDING ON DIVIDENDS AND INTEREST

The railroads are in complete agreement with the premise that taxes should be paid upon all taxable income and that all reasonable means should be used to prevent an escape from the payment of taxes either by individuals or corporations and whether as a result of underreporting of dividends and interest or otherwise. However, they question the advisability of further transferring the tax-collecting function from the Treasury to corporations.

There is no question, it seems to us, but that serious hardship will result in many instances from the want of relationship between the amount withheld and the amount of taxes due, if any. Many taxpayers will be put to the necessity of procuring refunds and will be deprived of the use of their money, at least for a season.

In important instances, indeed, overwithholding would be inevitable. A case in point is the payment of dividends to corporations. These dividends are taxable to the extent of 15 percent of their amount. Assuming a combined normal tax and surtax rate as high, even, as the 52-percent rate proposed in the House bill, the tax would not exceed 7.8 percent, yet 20 percent would be withheld. In many instances this result, and the attendant delay in obtaining a refund, would seriously impair the working capital of the recipient corporation. This situation would seriously affect many railroads. To ameliorate this particular hardship it would seem that, if withholding on dividends is to be required, the corporate recipient of dividends should be permitted to set off the amount withheld against any amount due from such corporation as income or payroll taxes, along the lines of the provision in the House bill with respect to tax-exempt organizations.

The House bill would exempt from withholding, among other things, interest on equipment-trust certificates. The report of the Ways and Means Committee of the House indicates that the reason for exemption of equipment-trust certificates from the requirement of withholding is that they are ordinarily held by corporations. Conditional-sales agreements are widely used by railroads in financing the acquisition of new equipment. They serve in that connection the same purpose as equipment-trust agreements. Like equipment-trust certificates, they are ordinarily held by corporations. Unpaid balances on such agreements entered into by railroads aggregated slightly in excess of $392 million as of December 31, 1950. We urge that, if a withholding requirement is to be retained in the bill, the exemption with respect to interest on equipment-trust certificates be enlarged to include interest payable under conditional-sales agreements.

But we think that in any event the requirement of tax withholding as proposed in the House bill should be deferred until the effect of the new reporting requirements can be known. This year, for the first time, under regulations of the Commissioner, corporations are required to report all payments of dividends, regardless of amount, and the recipient taxpayer is required to itemize all dividends received. No opportunity has been afforded as yet to judge the efficacy of these measures in minimizing the evil at which the proposed withholding is directed. Until that is known, we think your committee is not in a position to gage the extent of the evil and to measure the benefits of the proposal against the hardships inherent in it.

THE PENALTY FOR FILING CONSOLIDATED RETURNS

The railroads have frequently urged upon your committee and upon the Ways and Means Committee of the House repeal of the 2-percent penalty for filing consolidated returns. In practical effect, the impact of this penalty is, of course, increased sharply as the corporate tax rates rise. We think the penalty without justification in any event; but, when consideration is being given to a bill which would place the combined corporate normal and surtax rate at 52 percent, it is especially important, we think, that your attention be directed to the fact that the combined rate under such a measure would reach 54 percent in the case of consolidated returns and leave a bare 46 percent of net earnings available for corporate purposes.

The exigencies of the present situation, therefore, impel us to again urge the repeal of this penalty.

It may be taken for granted, we suppose, that under existing emergency conditions and the consequent revenue needs of the Government the combined corporate normal and surtax rate will be fixed at the maximum figure deemed consonant with the preservation of a sound and vigorous economy. It this be so, it follows that the exaction of a penalty of two additional percentage points in the rate would in many cases carry the rate to a level higher than the maximum regarded by Congress as justifiable. And yet consolidated returns are consonant with the principle of levying taxes according to the true net income of a single enterprise, and they have, as we understand, been favorably regarded by the Treasury from the administrative standpoint.

The imposition of a penalty for filing consolidated returns is particularly inappropriate in the case of the railroads. Most of the major railroad systems, as already pointed out, have of necessity been built up through the combination of a number of comparatively small railroads. By reason of sundry controlling factors, including in many cases the requirements of State law, it has often been impossible to effectuate integration through consolidation or merger. The continuance of subsidiary corporate entities has frequently been a practical or a legal necessity, and the acquired properties in such cases have been integrated into the operating system through long-term leases or by other means. Multiple corporate entities within a single railroad system have thus resulted as an incident to the process of evolving a limited number of railroad systems capable of rendering a national transportation service in accordance with the requirements of the national economy and the dictates of the national transportation policy.

At times in the past, Congress has recognized the special situation of the railroads with reference to consolidated returns. Thus, when consolidated returns were abolished insofar as other businesses were concerned by the Revenue Act of 1934, railroads, because of their special situation, were still permitted to file them. From 1934 to 1939 railroad companies alone were permitted to file consolidated returns, and in 1940 and 1941 railroads alone were permitted to file consolidated returns with respect to normal taxes and surtaxes, other corporations being confined to consolidated returns for purposes of excess-profits taxes. During the latter years mentioned, no penalty was exacted.

We think that on principle the penalty should be removed as to all corporations, but in any event we submit that the particular situation of the railroads should be recognized under present conditions and the penalty eliminated as to them.

A SUGGESTED AMENDMENT OF THE EXCESS PROFITS TAX ACT OF 1950

We understand that your committee may conclude to defer until next year any revision of the Excess Profits Tax Act of 1950 but that suggestions for revision are acceptable now for consideration at such time as that act may come under review. The railroads do not urge that the Excess Profits Tax Act be considered now. They are in accord with the thought that the matter would better be deferred until there has been more adequate experience under the act as it stands. They are concerned, however, that at the appropriate time consideration be given to what may be a serious defect in the act as it affects them in one important respect. It has to do with the status of long-term lessor and lessee railroad companies with respect to the availability of consolidated returns. The apprehension is that under the technical provisions of the Excess Profits Tax Act consolidated returns may be available to these corporations only in the event the lessee (the operating company) foregoes the public-utility excess-profits credit provided for by section 448 of the act.

It is not believed that such a result was anticipated or intended. A simple clarifying amendment would prevent it. I do not seek to go at length into the matter here and now, but ask that a brief statement with respect to it be incorporated at this point in the record as a part of my testimony.

(The statement to be copied into the record, but not read, is as follows:)

PROPOSED AMENDMENT OF SECTION 448 OF THE EXCESS PROFITS TAX ACT OF 1950 IN RESPECT OF CERTAIN LESSOR RAILROAD CORPORATIONS

Section 448 of the Internal Revenue Code provides an alternative excess-profits credit for regulated public utilities. This credit, in the case of railroads, is measured by a return of 6 percent upon net assets after allowance for normal tax and surtax liabilities. To be entitled to this alternative credit a railroad corporation must be engaged as a common carrier in the furnishing or sale of transportation by railroad, subject to the jurisdiction of the Interstate Commerce Commission, and at least 80 percent of its gross income (computed without regard to dividends and capital gains and losses) must be derived from the furnishing or sale of transportation by railroad (sec. 448 (c) (3); 448 (d)).

Section 141 of the Internal Revenue Code, as amended by the Excess Profits Tax Act of 1950, provides for the filing of consolidated returns by affiliated corporations which are regulated public utilities within the meaning of section 448.

We believe that the law should be clarified to make certain that a lessor railroad corporation which leases substantially all of its property to an operating lessee railroad corporation which utilizes the public-utility credit may be joined with such lessee in the filing of a consolidated return. Although the lessor company is subject to the jurisdiction of the Interstate Commerce Commission, and its properties are operated by the lessee as integral parts of its system in the furnishing or sale of transportation by railroad, and its revenues, in the form of rental, derive from such operations, nevertheless the lessor does not itself operate the property and it does not derive its revenues directly from the furnishing or sale of transportation. It should be made clear that section 141 of the code does not preclude the lessee from joining the lessor in a consolidated return, except at the sacrifice of the alternative credit to which the lessee is entitled under section 448.

It is believed that Congress did not intend that the consolidated return provisions applicable in the case of these lessor-lessee railroad relationships should operate as a barrier to the availability to the lessee of the special public-utility credit, or that utilization of that credit by the lessee should preclude a consolidated return.

As has already been stated, most of the major railroad systems today are the result of the combination of a number of comparatively small railroads. In many cases, substantial obstacles have prevented the merger and consolidation of these smaller companies into one large corporation. Among these obstacles are State laws; franchise rights; rights of minority stockholders; and mortgage, lease, and contract provisions. As a result of these and other considerations, the major railroad systems of the country have developed not only by mergers and consolidations but in substantial part through long-term lease arrangements.

Under an arrangement of the latter type the company which owns the properties leases them for a long period of years to an operating company. Thereafter the lessor ceases operations, although it continues its corporate existence, receiving rental for the use of its properties ordinarily measured by the requirements of interest on the indebtedness of the lessor and dividends on its capital stock.

The lessee takes over the complete management and control of the properties of the lessor and incorporates them into its railroad system. The facilities of the lessor and lessee become integrated parts of a single unified system. It is then not possible to determine for any given period of operation the amount of income attributable to the operations of the leased properties and the amount attributable to the operations of the properties owned by the lessee. Revenues and expenses have become amalgamated. The properties of the respective corporations are regarded as a unit by the Interstate Commerce Commission for rate-making an other regulatory purposes, and the value of the properties of the lessor is included in the rate base of the lessee, the operating company.

There is thus presented the typical case for a consolidated return, and there is certainly no reason why it should be available only at the cost to the lessee of the alternative public-utility credit.

It is accordingly urged that section 448 (d) be amended by adding at the end thereof a clarifying provision that, for the purposes of section 448 and of section 141, a railroad corporation which has leased substantially all of its property to a common carrier shall be deemed to be a common carrier engaged in the furnishing or sale of transportation and that the rents receivable under such a lease shall be considered to be derived from the furnishing or sale of transportation.

Under such an amendment any possible impediment to consolidated returns would be removed where at least 80 percent of the lessor's income was derived from rentals under the lease.

The untoward and, it is believed, unintended deprivation in the typical railroad lessor-lessee relationship of the right to file a consolidated return and utilize the regulated public-utility credit would be obviated.

The suggested amendment is submitted with confidence that it accords with the policy embodied in section 448 and eliminates a possible obstacle to the filing of consolidated returns which ought not to be interposed in the case of railroad leases of the character described.

(End of statement to be copied into the record but not read.)

ALLOCATION FOR TAX PURPOSES OF BACK MAIL PAY TO THE YEARS IN WHICH THE MAIL WAS TRANSPORTED

There is one additional matter which I am constrained to call to the attention of your committee because the railroads may be compelled at a somewhat later date to request an amendment of the tax bill with respect to it. The situation to which I refer is this:

In February 1947 the railroads filed an application with the Interstate Commerce Commission seeking additional compensation for the carriage of the mail, and in December of that year the Commission found that the rates in effect were unduly low and awarded an interim increase of 25 percent, continuing the case for determination of the amount of its final award. After protracted proceedings a final award was made in December 1950 in the amount of $312 million, which included the 25-percent interim increase theretofore granted.

Amounts resulting from the interim increase of 25 percent, which in round figures totaled $160 million, were received by the railroads in the several years 1947 to 1950, in which the services were rendered, and were included in the tax returns for those respective years. The remainder of the award—namely, about $152 million—represents additional compensation for the same services rendered in the period 1947–50. In other words, the additional amounts payable under the final award merely supplement the payments made in each of the years involved under the interim award, which latter amounts, as stated, were included in income in each of the respective years.

In December 1950 the railroads submitted to the Commissioner of Internal Revenue a request for a ruling that the additional mail pay awarded in 1950 is properly to be accrued for Federal income-tax purposes in the years during which the services were rendered; namely, 1947, 1948, 1949, and 1950. This request is still pending.

We think the case clearly one for administrative handling, particularly in view of the fact that in his most recent ruling concerning the accrual of back mail pay the Commissioner authorized the airlines, which had obtained a like award from the Civil Aeronautics Board, to account for the revenues in the years in which the service was performed.

The railroads are under legal obligation to transport the mails pursuant to the provisions of the Railway Mail Pay Act, and by the express terms of the act are entitled to receive fair and reasonable compensation for such transportation. Certainly for tax purposes the railroads should be permitted to allocate to the years in which the service was rendered the payments made at a later date but representing compensation for that service.

A measure of hardship will be involved even in the event of a favorable administrative ruling, in that interest will be payable upon the deficiencies involved. This interest factor, of course, becomes of increasing importance with the passage of time.

In these circumstances, should a ruling be much longer delayed, or should an unfavorable ruling be made by the Commissioner, the railroads will seek an opportunity to urge an amendment of the tax bill to afford legislative relief. We are hopeful, however, that the matter may shortly be disposed of through an administrative ruling.

Senator BYRD. The next witness is Mr. William Neff.

Mr. Neff, will you identify yourself to the reporter, please?

STATEMENT OF WILLIAM NEFF, SECRETARY AND GENERAL MANAGER, THE VANCE CO., INC.

Mr. NEFF. Senator Byrd, and gentlemen of the committee, I am William Neff, secretary and general manager of the Vance Co., Inc., of Chilhowie, Va.

Senator BYRD. Mr. Neff, you have been assigned 10 minutes.

Mr. NEFF. I think that will be enough, thank you, Senator Byrd.

Senator BYRD. Proceed.

Mr. NEFF. I am speaking for the Vance Co. of Chilhowie, Va., which is a small company, operating 12 retail stores in the southwest part of the State's agricultural section.

The company is, itself, an operating and also a parent corporation. It owns a hundred percent of five companies and less than 95 percent of—considerably less than 95 percent—two others.

The company has a sales volume of a little less than $3 million; its capital is $835,000, and it has 174 stockholders, no 1 of which—well, the largest stockholder owns 14 percent of the stock, and the others lesser amounts, and the stockholders are widely separated in the different counties in which we operate. They are not concentrated.

I am submitting a statement for the benefit of the committee, and attaching to it sheets which show the relation of the parent company to the subsidiary, and also showing the sales, the net taxable income, and the income taxes for the year 1950.

Senator BYRD. What you do not cover in your oral statement will be included in the record.

Mr. NEFF. Yes.

I will not, of course, give that orally, but it is attached to the statement, and showing the effect of the House bill H. R. 4473, especially section 123 on our taxes.

Our position is that we are not opposing the increase in corporate income taxes due to the higher rates that are proposed in H. R. 4473, if the increased revenue is needed and necessary to pay for the defense of our country.

We favor meeting these costs on a pay-as-you-go basis so as to avoid increasing the national debt and further inflation. The proposed increased rates alone, not counting 123, would mean for our eight companies an increase in our Federal income tax of about 25 percent as compared with the taxes in 1950. This is a heavy increase, but we are willing to bear it if it is necessary, and if other taxpayers are required to carry their part of the burden.

We would prefer that economies in Government expenditures be effected to make possible a smaller increase in taxes.

We need this extra money badly to replace equipment and to pay debts which we have incurred to carry inventories at inflated prices now prevailing.

I would express the hope that the committee may find it possible to balance the budget at lower tax rates than those proposed.

We wish, however, to register our emphatic opposition to the provisions of section 123 as applied to "related corporations," especially as defined in the bill, section 123, as members of a group of corporations, 95 percent or more of the stock of which is owned by one corporation of the group. This section provides that for all the members of such a group, there shall be only one $25,000 exemption for surtax.

Senator MILLIKIN. How long have your separate companies been organized?

Mr. NEFF. As I will bring out, they date back to the beginning, in 1907, and it has occurred through that period. Attached to my statement is a schedule showing just when each one was organized.

The same provision is applicable to excess-profits tax, but our interest in that is purely theoretical at this time, although we would object to that in principle—we might get in those brackets sometime.

We will illustrate the effect of this section by its application to our business, which I am treating as a case in question.

As defined in section 123, the Vance Co. and five of its subsidiaries are related corporations. For these six companies as shown in the attached schedule, the Federal income tax in 1950 was about $43,000, using round figures.

Under the rates proposed in H. R. 4473, under the rate change alone, this tax would be changed over 27 percent, and under the provisions of section 123 there would be a further increase of about $17,000 for those companies, or a total increase of 67 percent.

Senator MILLIKIN. What degree of independence do your separate companies have?

Mr. NEFF. I beg your pardon?

Senator MILLIKIN. What degree of independence do your separate companies have?

Mr. NEFF. Each one has its own board of directors, its own officers, although the officers are interlocking to some extent. They do bring in local stockholders because we have stockholders in each locality. They have their own managers; they have generally local employees, and they are closely tied in with their community.

In general, our ownership for part of them has succeeded the existence of previous corporations that we acquired usually to bail out the owners who are not doing so well, and who want to sell out.

Now we treat them, and we think of them, as community stores which are associated by over-all common policies.

Senator MILLIKIN. They do not follow a rigid pattern of direction imposed by the mother company?

Mr. NEFF. No. We do not operate on commonly called chain-store principles. We think of it as a group of stores rather than as a chain of stores.

Senator BYRD. How many stores in all?

Mr. NEFF. There are 12 altogether.

As I just said, with the application of section 123, our taxes would be increased 67 percent over what they were in 1950, and the increase due to section 123 would be approximately 144 percent of the increase due to the change in rates.

We submit that that is an excessive increase in taxation for such a group of companies.

Now, answering Senator Millikin's questions, I have a brief statement on the attached sheet, upon which is shown the relation of the subsidiaries to the Vance Co., the parent company.

They were not set up as separate corporations for tax-avoidance purposes. The business policy of operating the stores in each location as separate corporations dates back to 1907 before any tax benefit existed.

With one exception, each continued or succeeded existing corporations. Each is located in a different town, and each is a community store with its own management, own employees, services, and community responsibility.

They are not operated on the chain-store principle, but as a group of community stores.

Senator BYRD. Do you make purchases from a central point?

Mr. NEFF. We make some group purchases, as a central—probably, oh, 20 percent of the purchases are bought as a group. The remainder are bought by the individual store management.

Their status as separate tax entities has been recognized all these years. To change the rules of the game now, and to reverse established tax policy in regard to long-standing corporate relationships and impose such a heavy tax increase as is proposed in section 123 seems unfair and unduly burdensome.

If it were proposed in the bill to prevent future split-ups from getting tax advantages, we would have no objection.

Our objection is to changing established tax policies in reference to corporations which have been set up for a long time.

Senator MILLIKIN. You have a little difficulty there. I am in complete sympathy with the general purport of your statement. But when it comes to the future, if you have a future rule prohibiting what has happened in the past and, let us say, has become legitimatized in the past, why then, the future companies are at a disadvantage against those that have been established that way.

Mr. NEFF. Yes; except that it can be so defined, it seems to me that the purpose of tax avoidance can be distinguished from sound business reasons, not associated with that.

I believe that principle is already in the law and it was incorporated in the Excess Profits Tax Act of 1940.

Senator MILLIKIN. You have the future group subject to discretion, and the past group not subject to discretion?

Mr. NEFF. Well, it seems to me there is some obligation to existing corporate set-ups in the fact that they have been organized and they have operated under that basis.

Senator MILLIKIN. I agree with that.

Mr. NEFF. And all of their commitments and everything have been made on that basis.

Senator MILLIKIN. I am in complete sympathy with that.

Mr. NEFF. And those in the future would go into it with their eyes open and hence it seems to me, would be in a different status.

I understand it is estimated that the changes in section 123 would yield $55,000,000 additional revenue. This is a considerable sum of money, but it is small in comparison with the estimated yield of the whole bill, about three-quarters of 1 percent of the whole amount.

It seems unreasonable that this comparatively small amount of revenue should be obtained by changing established rules to impose such a heavy increase on a limited group of taxpayers whose burden is already heavy.

We feel that it would be more equitable to secure the needed revenue by collecting income taxes from some tax-exempt organizations, who are competing with us—I will not go into that. I think the committee has heard something about that.

There already exists a very considerable tax penalty—and I think this is a point—or liability due to the operation of such a group as separate corporations in the tax on 15 percent of intercompany dividends.

Again, to illustrate by our company, there is in the taxable income of the Vance Co. for 1950 the amount of $19,729, which is 15 percent of dividends received from subsidiaries.

The income on this amount at the 52 percent rate would be $10,259.

Now this seems a sufficient tax penalty incident to that kind of operation, without adding another $17,000 by changing the rules as proposed in section 123.

In other words, we are already paying taxes because of our intercompany operations, a considerable amount of them, and to put this other on would be adding burdens on top of burdens.

This is a statement which I hesitate to make, but I think it is true. As a matter of fact, section 123 may be characterized as a nuisance provision rather than a revenue-raising law. The tax yield has been estimated at $50 million.

Well as a matter of fact, I think it would be very much smaller, very much smaller indeed. The burden imposed on the companies affected is so heavy that they would be compelled to change their corporation relationships and that would be so true that the yield from the bill, I think, would be very small indeed, and the result then of this enactment would not be the raising of revenue but just compelling a lot of companies to change corporate relationships which have been in existence for many years and which have sound reasons for existing, as illustrated by the gentleman who preceded me, and it is certainly in our case and I am sure many others.

Senator MILLIKIN. Mr. Stam, how much revenue do they figure they can get under the House provisions?

Mr. STAM. I think the estimate is $55,000,000.

Senator MILLIKIN. $55,000,000.

Mr. NEFF. My statement is that because of the changes that would be made that would be very much smaller. In fact, I think it would practically vanish, but we would have a lot of disturbance in corporate relationships. These are some of the reasons, and I can name many others—but I think my time is about up—why we oppose the changes in section 123.

We respectfully request the committee to omit the provisions of that section which radically changes a long-standing tax policy and imposes such a burdensome tax increase on the related corporations affected by it.

We repeat the hope that the committee may find it possible by economies in expenditures or by taxing presently tax-exempt business to even reduce the tax rates proposed in H. R. 4473.

Senator BYRD. Thank you very much, Mr. Neff. The balance of your statement will be put in the record.

(The statement of Mr. William Neff referred to follows:)

STATEMENT OF WILLIAM N. NEFF, SECRETARY AND GENERAL MANAGER OF THE VANCE CO., INC., CHILHOWIE, VA.

I am speaking for the Vance Co., Inc., of Chilhowie, Va., which is both an operating company and a parent corporation. It operates a fertilizer-mixing plant and retails hardware, farm, and building supplies. Its subsidiaries are all located in southwest Virginia and operate retail stores selling similar lines of merchandise. The Vance Co. owns 100 percent of the stock of five companies and less than 95 percent of two others.

I am submitting attached to this statement sheets showing the relation of these companies to the parent company and how they were acquired, and also a sheet showing for the year 1950 for each company, its sales, its net taxable income, the actual Federal income taxes for that year, and what those taxes would be under the rates and other provisions, especially section 123, of H. R. 4473.

Our position is that we are not opposing the increase in corporation-income taxes due to the higher rates set up in H. R. 4473 if the increased revenue is needed and necessary to pay for the defense of our country. We favor meeting these costs on a pay-as-you-go-basis, so as to avoid an increased national debt and further inflation.

The proposed increased rates alone would mean for our eight companies on our 1950 income an increase in Federal income taxes of $22,170.64, or a 21.7-percent increase compared with the actual taxes for 1950. This is a heavy increase. We are willing to bear it if it is necessary and if other taxpayers are required to carry their part of the burden.

We would greatly prefer, however, that economies in Government expenditures be effected to make possible a smaller increase in these taxes. We need the money badly to replace old equipment and to pay debts incurred to carry inventories at inflated prices. I would express the hope that the committee may find it possible to balance the budget at lower tax rates than those proposed in H. R. 4473.

We wish, however, to register emphatic opposition to the provisions of section 123 as applied to "related corporations," defined as the members of a group of corporations 95 percent or more of the stock of which is owned by one corporation of the group. This section provides that, for all the members of such a group, there shall be only one $25,000 exemption for surtax. The same provision is applicable to the excess-profits tax, but our interest in that is purely academic at this time, although we would oppose it in principle.

We will illustrate the effect of this section by its application to our business. As defined in section 123, the Vance Co. and five of its subsidiaries would be "related corporations." For these six companies, as shown in the attached schedule, the Federal income tax in 1950 was $42,835.22. Under the rates proposed in H. R. 4473, this tax would be increased $11,746.97, or 27.4 percent. Under the provisions of section 123 there would be a further increase of $16,863.16, or a total increase of 66.8 percent over 1950. The increase due to section 123 is approximately 144 percent of the increase caused by the higher rates. We submit that this is an excessive increase in taxation for such a group of companies.

On an attached sheet is shown the relation of the subsidiaries of the Vance Co. to the parent company. They were not set up as separate corporations for tax-avoidance purposes. The business policy of operating the stores in each location as separate corporations dates back to 1907, before any tax benefit existed. With one exception, each continued or succeeded existing corporations. Each is located in a different town, and each is a community store with its own management, employees, services, and community responsibility. They are not operated on the chain-store principle, but as a group of community stores. Their status as separate tax entities has been recognized all these years. To change the rules of the game now, to reverse established tax policy in regard to long-standing corporation relationships, and impose such a heavy tax increase as is proposed in section 123 seems unfair and unduly burdensome.

I understand it is estimated that the changes in section 123 would yield $55,000,000 additional revenue. This is a considerable sum of money, but small in comparison with the estimated yield of the whole bill, about three-fourths of 1 percent of it. It seems unreasonable that this comparatively small amount of revenue should be obtained by changing established rules to impose such a heavy increase on a limited group of taxpayers whose burden is already heavy.

We feel that it would be more equitable to secure the needed revenue by collecting income taxes from cooperatives and other tax-exempt business who now operate tax-free in direct competition with us.

There already exists a very considerable tax penalty or liability due to operation of such group as separate corporations in the tax on 15 percent of intercompany dividends. Again to illustrate by our company, there is in the taxable income of the Vance Co. for 1950 the amount of $19,728.90, which is 15 percent of dividends received from subsidiaries. The income tax on this amount at the 52 percent rate proposed in H. R. 4473 would be $10,259.03. Is not this a sufficient tax penalty incident to such operation without adding another $17,000 by changing the rules as is proposed to be done by section 123?

As a matter of fact, section 123 may be characterized as a nuisance provision rather than a revenue-raising law. The tax yield would probably be very small, much less than the $55,000,000 estimated. The burden imposed by that section is so heavy that the groups affected would almost surely rearrange corporate relationships to save taxes. By operating as one corporation instead of separate corporations, the tax on intercompany dividends can be avoided; or, by disposing of a small part of the stock owned in subsidiaries, the provisions of section 123 can be avoided. Either of such actions will result in making the net yield of the proposed change very small. The final result would be little revenue but troublesome and undesirable changes in corporate set-ups which have been established and should be continued for sound business reasons. We submit that this change in tax law would have a serious nuisance effect, but would yield little net increase in revenue and should not be made.

These are some of the reasons, and I could name others, if time permitted, why we oppose the proposed changes in section 123. We respectfully request the committee to omit the provisions of that section, which radically changes long-standing tax policy and imposes such a burdensome tax increase on the related corporations affected by it. We repeat the hope that the committee may also find it possible by economies in expendiutre or by taxing present tax-exempt business to reduce the tax rates proposed in H. R. 4473.

History of the Relation of the Vance Co., Inc., the Parent Company, and its Subsidiaries

Corporation Z, which is the Vance Co., Inc., of Chilhowie, Va., was incorporated in 1920 as the successor of corporation X, a retail hardware business, which began in 1903 as a partnership, but became a corporation in 1912. Corporation Z in 1926 merged with corporation Y, a farm-supply business in the same town, which began as a partnership in 1902 and was incorporated in 1907.

Corporation Z and its subsidiaries are all located in different towns in the southwestern part of Virginia and are engaged in the retail selling of hardware, building, and farm supplies. Corporation Z owns 100 precent of the stock of corporations A, B, C, D, and E, 90½ percent of corporation M, and 57.6 percent of corporation N. These interests were acquired as follows:

Corporation A of Marion, Va., was organized in 1910 and was consolidated with another hardware business in that town purchased by corporation Y in 1920 and acquired by corporation Z in the 1926 merger.

Corporation B of Glade Spring, Va., was organized in 1915, and its stock at different times was acquired by corporation X and sold to corporation Z in 1920.

Corporation C of Saltville, Va., was organized as a wholly owned subsidiary by corporation Z in 1949.

Corporation D of Rural Retreat, Va., was organized in 1935 by corporation Z to take over a farm-supply business and a hardware business, both of which had been operated as corporations for several years in that town.

Corporation E, of Radford, Va., was organized by corporation Z in 1946 to take over a hardware business in that town which had been operated as a corporation for several years.

Corporation M, of Abingdon, Va., was incorporated in 1907 with a majority of its stock owned by corporation Y to succeed a former corporation of the same town. Corporation Z acquired this interest in the 1926 merger and later purchased additional stock up to its present interest of 90.5 percent.

Corporation M, operating stores in Pulaski, Christiansburg, and Wytheville, Va., was incorporated in 1917 as an outgrowth of former corporations. Corporation Z acquired its interest in corporation M by purchase of stock in 1940 and 1949, now owning 57.6 percent.

It is seen that none of these corporations is the result of split-ups, but they result, except in one case, from acquiring previously existing corporations in different town locations over a long period of years dating back to 1907. Business reasons, not tax avoidance, actuated the separate incorporation of each subsidiary. Each company operates a community store, with its own management, its own books, its own buying and credit facilities, its own directors and officers. Each is an independent operation, except that they follow common over-all policies, do some joint buying, and are under the general supervision of one person. They do not receive their merchandise from a central-distributing warehouse, although they draw stocks from each other, do some group buying, and two of the larger stores keep extra stocks in some lines for the convenience of the others.

The business is not a chain store, but a group of affiliated independent stores.

Federal income taxes of the Vance Co., Inc., and subsidiaries

Senator BYRD. The next witness is Mr. F. A. Eustis. Mr. Eustis, will you take a seat, and please identify yourself for the record.

STATEMENT OF FREDERIC A. EUSTIS, TREASURER, VIRGINIA SMELTING CO.

Mr. EUSTIS. My name is Frederic A. Eustis.

I am the treasurer of the Virginia Smelting Co., whose principal business is located at West Norfolk, Va.

Senator BYRD. Mr. Eustis, before you proceed, we have six other witnesses, and we have got an hour within which to hear them.

Mr. EUSTIS. I understand that I have been requested to confine my oral remarks to 10 minutes, and I am going to try to do that.

Senator BYRD. Please try to do it, because there are six other witnesses to follow you.

Mr. EUSTIS. Yes, sir.

Senator BYRD. We will consider your other statemet carefully.

Mr. EUSTIS. The Virginia Smelting Co., which is my principal business, is a moderate-sized manufacturer of chemical specialties whose headquarters are at West Norfolk, Va.

It has approximately 350 employees. It is a modest-sized company, and it has to compete with a great many large companies.

I have handed to your clerk 15 copies of the printed testimony, which I wish to submit to you.

In my 10 minutes I shall try, in my oral presentation, to touch the highlights of this statement.

Senator BYRD. You desire your complete written statement to be put into the record?

Mr. EUSTIS. Please.

Senator BYRD. It will be inserted into the record.

Proceed, sir.

Mr. EUSTIS. I want to first stress the importance in our national economy of the modest-sized growing companies.

My company is one, and I have been asked by four friends who have similar companies in the chemical business to state that they find themselves in the same position that we do.

The very heavy increased taxes on income are a very serious burden to a company that is seeking to grow, and I shall stress more on that later.

During the latter part of my 10 minutes I shall point out to you the great hardship that the present excess-profits tax further creates on my particular company and, also, I am convinced, on many other modest-sized chemical manufacturers, and I would like to leave out "modest sized"—on all chemical manufacturers.

It is actually forcing us to pay now currently up to $52,000 a year additional taxes because we had losses. We had losses in the base period.

It does not seem equitable that the tax law should require a taxpayer to pay heavy additional taxes because of losses, and I shall try to make that clear toward the end of my brief.

My company has grown steadily, slowly, for 35 years. I personally have been connected with it for longer than that.

It has to grow in order to compete with its very much larger competitors. The products we make are 10 different chemical products, and those products are all manufactured by the large chemical concerns; and we have found through our 35 years of experience that the only way we can successfully compete with these giants is to keep growing, and we have continuously reinvested in our business a very large part of our earnings in order to keep our plant up to date and to provide the ability to grow.

The burden which is now placed on us of taking for the Federal Government 62 percent of our income—and we have to pay, of course, some more to Virginia and to local taxes—leaves us distressingly little with which to carry on our growth—to do the things that we have always sought to do.

One of my major efforts in my remarks will be to urge that you not increase further the 62 percent.

I have pointed out that I know my company is not alone in the predicament of suffering from these rather heavy drains on our earnings.

There are four companies controlled by business acquaintances, who have individually asked me to express to your committee their serious concern over the tax burden being put on them by the Federal Government.

These four companies are the R. J. King Co., Inc., Norwalk, Conn., Lotte Chemical & Dye Co., Paterson, N. J.; Magnus Chemical Co., Garwood, N. J.; Purocaine, Inc., Hockessin, Del.

I realize perfectly that five of us are a very small group in our Nation's picture, but I want to stress to you, as urgently as I can, that the growth of the modest-sized companies which are seeking to come up and take their important part in the industry of the country is in the aggregate, tremendously important to the Nation.

If these modest-sized companies are more discouraged, pressed harder on taxes, than the 62 percent, or some such figure, inevitably the result will be to push a larger and larger part of our manufacturing and distributing activities into the hands of the very few large companies.

I realize fully the difficult position in which our Nation finds itself. I realize keenly the threat of communism. I want to do my full part to do everything to help the country to defend itself.

I realize that to do that we have to raise very great amounts of money.

My appeal to you is that you do not push the tax burden on income to the point where the small-growing companies will stop growing.

I urge you as Senators to curtail nondefense expenditures as far as possible, and to distribute the tax burden that is necessary to provide the income you find necessary as far as possible in a way that will not too much stifle the growth of these small-growing companies, which seems to be so important in our national economy.

More specifically, I ask that the maximum Federal tax on corporations, on corporate income, be not increased above the 62 percent of the present law.

I believe the House bill proposes a further increase and one of my principal purposes for coming here is to urge that that 62 percent be kept, and that an increase above that be not allowed.

Gentlemen, the ceiling which is provided by this 62 percent in the case of chemical manufacturers has become practically the tax rate. Any growing concern, with the very limited base that we are granted on our excess profits, 85 percent of what we earn, are mostly—the fellows who are really getting ahead, get up to that 62 percent and if you can realize that, I think you can see how stifling that burden is already, and how much more stifling it will be if you should increase that figure, to the growth of these small, and I think, important companies.

I want to now turn a little to the burden the Virginia Smelting Co. must carry.

Base-period abnormalities occur in all businesses. I know them chiefly in the chemical business. My company, and every chemical company that I know, makes a practice of introducing new products. Some of our older products gradually died.

We are making today two that are just coasting down. We must bring in these new products to replace the disappearing markets. That means that in the chemical world changes are constant, and that to succeed we must keep abreast of the change, and we must produce new products.

The present excess-profits-tax law works an extreme hardship on our company because the provisions of section 443, which are intended apparently to provide relief in the case of abnormalities of the base period, just do not fit the chemical industry.

Practically every successful chemical company manufactures a large number of products. My small company manufactures 10. Many of my larger competitors manufacture several hundred. To introduce a new product and bring it to profitable operation takes, in the chemical industry, a great deal longer than the 3 years mentioned in the tax bill, and it is entirely impossible—I feel I can say as much as that—it is impossible for a chemical company bringing in a new product, when they generally have a hard time during the first few years, to bring them to a point where any one or any small group that they brought in of these new products, could possibly produce even approaching 40 percent of the gross income of the company or 33 percent of the net income.

I am sending to Mr. Stam and Mr. Kirby, your advisers, quotations from periodical literature, which are too long to present to you here, but which I have referred to in the written testimony. They are not written in there but simply are quotations from well-known people, pointing out these two important facts in chemistry.

(1) That it takes much more than 3 years—the average is probably around 7 years—to bring a new product to fruition.

The well-known writer, Mr. William S. Haynes, says in his book on chemicals called The Chemical Front, that—

> The development of a new product rarely takes less than 5 years, and often as long as 15 years.

Senator BYRD. I am sorry to interrupt you, but you have exceeded your 10 minutes.

Mr. EUSTIS. May I show you this? I did not realize that time had gone so fast. It is a graph showing the experience of our company during the base period, which is the measure.

These first four columns represent the 4 years of the base period. The top line is the earnings which our company enjoyed from the sale of its older and well-established products. During that time we brought out one new product, namely, aerosol insecticides.

As is not unusual, during its early years, that product showed a loss, and reduced our income which we can use as a base in measuring our proper procedure down to here.

This column is the average of the three best years, as provided in the law. The average loss there reduced our income that we really made from our regular products by this amount, and the net result is that we are currently paying $52,000 a year in additional taxes because of that loss during the base period.

I find it very hard to believe that the Government thinks it is right to place a tax on losses.

Senator BYRD. Thank you very much, Mr. Eustis.

Mr. EUSTIS. In closing may I say to you gentlemen that I am a great admirer of your committee. Frankly, you gentlemen are my principal hope for the future of this country. I am an old-timer, and I do not like too much the way things are going. I know you will give consideration to these abnormalities and hardships that I point out. I do thank you for giving me the chance to speak to you.

Senator BYRD. Thank you, Mr. Eustis. We will give your statement full consideration.

(The prepared statement of Frederic Eustis follows:)

STATEMENT OF FREDERIC A. EUSTIS

My name is Frederic A. Eustis. I am treasurer of the Virginia Smelting Co. This company is a modest-sized manufacturer of chemical specialties. Its headquarters are at West Norfolk, Va., and it has approximately 350 employees.

This company has grown slowly but steadily for 35 years. Its competitors are mostly much larger than it is. I am deeply concerned over the impact of mounting tax rates on its future history. I am also concerned over the discriminatory way in which these high rates operate because of the failure to provide individualized standards of normality under the excess-profits tax.

My company has to grow to be able to continue to compete successfully with its bigger competitors. It has always used a large part of its earnings to keep its plant up to date, to increase its production, and to produce new products. When it has to give up 62 percent of its earnings for Federal taxes alone—and there are State and local taxes also—it is seriously threatened in its ability to continue to grow and prosper.

I know that my company is not alone in this predicament. Four of my business acquaintances who operate modest-sized chemical manufacturing companies tell me that they are in a similar position and they have each individually asked me to express to your committee their serious concern over the tax burden being put upon them by the Federal Government. These companies are: R. J. King Co., Inc., Norwalk, Conn.; Lotte Chemical & Dye Co., Paterson, N. J.; Magnus Chemical Co., Garwood, N. J.; Purocaine, Inc., Hockessin, Del.

We are a small group in the Nation, but I submit to you in the most earnest way possible that the welfare of this country depends very largely on the vast number of smaller concerns who are growing up.

If by taxation and other burdens the Government handicaps much more the small growing companies, more and more of our manufacturing and distributing activities will be handed over to the few very large corporations. Too much concentration of power and wealth in the hands of a few very large companies does not augur well for the future of our country.

I realize fully the difficult position in which our country finds itself. I realize the serious threat of communism and I want to do my full share to help our Nation in this emergency. I realize that our country has to raise each year a very large amount of money to enable our Government to build up the defenses we need.

My appeal to you is that you do not push the tax burden on income to the point where the small growing companies will stop growing.

I urge you, as Senators, to curb nondefense expenditures as much as possible and to distribute the tax burden needed to raise the funds absolutely required in such a manner as will give the small growing companies a chance to keep on growing.

There are other means of increasing the Federal income besides taxes on income of corporations and individuals. Excise taxes are less burdensome on small growing companies.

I admire your committee and the men on it. You are, to me, one of the chief sources of hope for the continued growth of our country. I know you will face courageously this terribly serious tax problem and take action that will safeguard the continuance of growth of our Nation's industry, even if that action be not too popular. Our Nation today needs men of foresight and courage.

Congress' concern over the growth problem of small business is evident from the effort made in the Excess Profits Tax Act of 1950 to protect small business, especially through devices intended to reflect growth in the determination of the excess-profits credit. Two things must not be lost sight of, however.

One is that no set of relief provisions will ever be completely adequate, which means that a large number of taxpayers will be forced to look to the ceiling provision to keep from being taxed out of business. The second is that the excess profits credit has been set so low with reference to current earnings standards that, even where there are no base period abnormalities or where the present relief provisions are adequate for their correction, the maximum rates are likely to be pretty generally effective, leaving out of account, of course, the $25,000 minimum excess profits credit. Though not completely, it is in large part, true, therefore that, disguised as an excess-profits tax, what we have really had is a 15-percentage-point rise in the corporate income tax for progressive companies. Under the House bill, with the further drop it proposes in the average earnings credit, this situation would become even more pronounced.

The maximum wartime corporate rate, after postwar credit, was between 72 and 73 percent. But this rate did not operate until the taxpayer's income was from 3⅓ to 5 times its credit, depending on the year, whereas now the ceiling rate cuts in at twice the taxpayer's credit. Moreover, the point of departure in World War II was the 40 percent normal and surtax rate, whereas now it is a 47 percent normal and surtax rate, proposed to be raised to 52 percent by the House bill. The net result is a higher over-all effective rate in most instances than prevailed in World War II. Regardless of what is done with the normal and surtax rates, to raise the ceiling under these circumstances is to push corporate tax rates beyond what business, particularly small business, ought to have to bear. In fact, even the 62 percent current rate is obviously too high when, as shown above, it is so universally applicable as to become in effect the regular corporate rate.

Only if we realize that for live companies the regular corporate rate is really now 62 percent and that the House bill proposes to raise it to 70 percent, and stop deluding ourselves with talk of 47 and 52 percent rates, supplemented by some sort of excess profits tax, will we fully appreciate what a terrific burden the corporate tax load is.

The virtual conversion of the ceiling rate into the ordinary rate is largely the result of an inadequate excess profits credit structure. The most glaring defect is the use of only 85 percent (with a reduction to 75 percent proposed in the House bill) of average base period net income as the point beyond which profits are regarded as excessive. But of almost equal importance to my company is the failure to make adequate provision for base period abnormalities. During the base period Virginia Smelting Co.'s earnings were reduced by about one-third as a result of developmental losses incident to the introduction of a new product. Because of the rigid requirements of section 443—which are unrealistic when applied to the chemical industry—new product relief is unavailable. Therefore, and since the product in question is now an income-producer, not only is every penny made on that product treated as excess profits, but 85 percent of the base period loss is also currently treated as excess profits every year the excess-profits tax is in effect. The latter factor increases our tax by $52,000 per year (see attached graph). The situation in which we find ourselves and suggested solutions are discussed in a memorandum, attached, prepared by our counsel.

As will be seen, section 443 fails to take cognizance of two facts important in the chemical manufacturing industry. In the first place, based on the assumption that a normal earnings level for a new product will be attained within 3 years of introduction, it excludes new products introduced more than 3 years prior to the close of the base period. I am sending to Mr. Stam and to Mr. Kriby three sheets, each quoting well-known books or periodicals giving the opinions of different authors on the time required to bring a new chemical product to profitable manufacture. These show that the general experience is about 7 years. The well-known writer on chemicals, Mr. Williams Haynes, says in his book the Chemical Front: "The development of a new product rarely takes less than 5 years and often as long as 15 years".

Ave. 3 best years

Secondly, section 443 is unrealistic from the standpoint of the chemical industry in requiring that more than 40 percent of the taxpayer's gross income or 33 percent of its net income must be attributable to the new product within 3 years of its introduction. Chemical manufacturers generaly each produce a large number of products. The number of new products produced per year by each company is relatively small, the average for 100 leading chemical manufacturers being 2¾₀ percent of the number of old products. I am sending to Mr. Stam and to Mr. Kirby a sheet giving data from which these average figures are derived. This being the situation, it is almost impossible for a chemical company to meet the requirements of section 443, since virtually never will one new product or group of new products introduced within the span of 3 years produce the proportional change required by the section. I seriously doubt whether Congress intended to rule out an entire industry, particularly one as dynamic as the chemical industry.

Excess-Profits Tax Relief—New Product Losses in Base Period

I. GENERAL

This memorandum is written on behalf of the Virginia Smelting Co., West Norfolk, Va., and deals with an important new product type of case which is not covered by section 443 or any other relief provision of the new Excess Profits Tax Act. Briefly stated, this type of case is one where the new product has produced substantial losses throughout the base period, thereby materially distorting the taxpayer's base-period experience, but where it does not qualify the taxpayer for the affirmative type of relief provided by section 443, either because the 3-year test period is too short, or because the taxpayer manufacturers too many other products for one new one to produce the required relative effect on earnings, or for other reasons. Under the law as it stands, the taxpayer is at a double disadvantage: Not only is it denied the right to have its excess-profits credit reflect a normal earnings level [1] for the new product, but its excess-profits credit will actually be reduced because of the base-period losses of the product.

II. THE TAXPAYER'S FACTS

Following the close of the war and as part of a program of expansion, Virginia Smelting embarked upon the introduction of a new product, aerosol insecticides for industrial use. The venture was a large one. Almost $200,000 was invested in the construction of a plant, placed in operation in 1947, for the manufacture of this new product. Large amounts of working capital were also dedicated to the new venture. Raw materials and containers were assembled and a new organization to market the product was created. There can be no question of the substantiality of the change in the taxpayer's normal operations represented by its entrance into the aerosol field.

The aerosol operation was "in the red" throughout the entire base period. The relative size of the losses from this source and their depressing effect upon income from other sources are shown by the following schedule:

Year	Net income before aerosol loss	Aerosol loss	Net income after aerosol loss
1946	$260,200	$31,800	$228,400
1947	579,900	235,800	340,100
1948	534,000	216,200	317,800
1949	408,300	159,400	248,900

These calculations have been conservatively made, in that allocation of indirect expenses is made on a percentage-of-sale basis, whereas a much higher allocation based on time would have been wholly justified.

Low profitability, and even losses, during the initial period of introduction were not unexpected. Such experience is usual. But losses of the magnitude actually suffered were not anticipated. Because of faulty nozzle design, much of the application equipment had to be discarded. Taxpayers' principal customer did not purchase the quantities expected. New outlets had therefore to be developed. The overcoming of these development difficulties was slow, laborious,

[1] Though this is sec. 722 language, we assume the industry-ratio approach did not intend to alter the concepts, but merely the mechanics, of relief.

and costly. By the end of the base period, however, the battle had been largely won and it was plain that the aerosol operation was about to go from red to black. But this "getting over the hump" will be largely illusory if, by leaving the base period unadjusted, the Excess Profits Tax Act in effect levies a 30-percent tax on the aerosol losses in perpetuity.

III. HOW TO PROVIDE RELIEF

There is unquestionably a gap in the statute. Two methods are available to fill this gap. One is to amend section 443 so as to eliminate its restriction of eligible changes to those taking place in the last 36 months of the base period and to include costs and expenses as an alternate substantiality test. The other is to forego the plus type of relief afforded by section 443 and to provide merely for the elimination of base period losses, if any, in new product cases which do not measure up to the standards of section 443 as presently drawn. By coincidence, either form of relief would produce about the same credit in taxpayer's case, which indicates that taxpayer is above the industry average rate of return in its established business. The probability that, given time, the company would attain equal profitability on its new venture thus becomes a virtual certainty.

A. Amendment of section 443

Two things are wrong with the present section 443. The first is the 3-year limitation on eligible changes, which appears to be an outgrowth of the old 2-year push-back provision. It is well known, however, that as much as 10 years are often required in the chemical field to bring a new product up to the earnings level of older and more established ones. The need for a precise cut-off date is not so great when the reconstruction is not individualized, as it was under section 722, but generalized, as it is under the industry approach of section 443. It is necessary only to be certain that enough time has not elapsed for fully realizing the potentialities of the change. Three years is too short a period to serve as a rule of thumb for this purpose. Five or six years would be much better geared to the realities of industrial life. This defect could be cured by amending section 443 (a) (1) to read as follows:

"(1) During so much of its five immediately preceding taxable years as falls within the sixty-month period ending on the last day of its base period, there was a substantial change in the products or services furnished by the taxpayer, and either."

The second thing wrong with section 443 is that its substantiality tests are entirely in terms of income. At first blush it may appear that, if the relief provided by section 443 represents an addition to income on account of new products, a substantiality test in terms of income is appropriate. But, on further reflection, the logical necessity of such an approach is less apparent. A fundamental change in the new relief provisions over section 722 is the basic assumption that the use of industry rates of return will produce the required normal earnings level. Under such a philosophy, we think that materiality might as appropriately be tested by large relative losses as by large relative additions to income. Neither the new corporation nor the increased capacity-relief provisions require taxpayer-specific proof of profitability. Moreover, in the increased capacity section, where, as in new product cases, proof of substantiality is required, the magnitude of the change is expressed in terms of percentage of capacity increase or capital expenditure, not gross or net income. The corresponding approach for section 443 purposes would be to test materiality by the ratio of new-product losses to net income; in other words, if new-product losses have reduced the net income from other sources substantially, the section would be deemed to apply. This could be accomplished by adding as an alternative test to the tests now specified in section 443 (a) (2) and (3) one expressed as follows:

"(4) Its average monthly excess profits net income for the base period (determined under subsection (e) and without reference to the gross receipts, cost of goods sold, and deductions attributable to the new products or services) is at least 125 per centum of the taxpayer's average monthly excess profits net income for the base period (determined under subsection (e) after taking such gross receipts, cost of goods sold, and deductions into account),".

B. Amendment of section 433 (b) (9) and (10)

An alternative to the section 443 approach is, as already indicated, the abnormal deduction approach. This could take the form of amending section 433 (b) (9) and (10) to make certain that new product losses are regarded as a single deduction and that adjustment is not prohibited by the change in the character of the business test. To accomplish this it is necessary only to add after paragraph (9) (C) a new subparagraph (D), reading as follows:

"(D) A net loss attributable to new products or services introduced by the taxpayer in the sixty-month period ending on the last day of its base period.", and insert at the beginning of paragraph (10) (C) the following:

"Except for deductions described in paragraph (9) (D),".

C. Rudolf Peterson,
Counsel for Virginia Smelting Co.

July 24, 1951.

Senator Byrd. The next witness is Mr. C. H. Baldwin.

Mr. Eustis. May I show this? It is reproduced in a smaller way, but it stands out better that way.

Senator Byrd. Mr. Baldwin, will you identify yourself to the stenographer, please, sir?

STATEMENT OF C. H. BALDWIN, LANSING, MICH.

Mr. Baldwin. Mr. Chairman, and gentlemen of the committee. my name is C. H. Baldwin of Lansing, Mich.

I would like to speak to you not to exceed 3 minutes on the family partnership.

Senator Byrd. All right, sir.

Mr. Baldwin. I would like to speak in the second person, please. There are just a few of us here.

Assuming that you men were the heads of families and you had a boy reaching his majority, and also had two daughters, and your son wanted to go into business with you, you would feel flattered. I did.

We made the arrangement, went to our attorneys, and they looked over the situation—this was in 1941—and suggested that we form a family partnership, which was absolutely legal, and not running afoul of any State laws or Federal laws at that time.

We operated as such, went on for several years, made approximately $2 million, and the Federal Government has taken every cent that I have and has levied a deficit of $244,510 against me.

I have not a cent in the world. If we would have made $5 million, we would have had a deficit of $600,000 against us. We cannot understand it.

I do not think it is the intent of this committee to allow that sort of thing to go on. I have nothing more to say. I think every one of you has a copy of this in your files.

Senator Byrd. Thank you, Mr. Baldwin.

Mr. Stam, will you make a note to prepare a memo on this case?

Mr. Baldwin. I have an extra copy, after which I am all through.

Senator Byrd. Does Mr. Stam have your figures?

Mr. Baldwin. We have a 90-day notice now that Mr. Stam does not have. I have to have that.

Senator Byrd. I think that would be worth while to get a special memorandum of from Mr. Stam.

Mr. Baldwin. You have a copy of this, Mr. Stam.

Senator Byrd. We will certainly go into it very fully, Mr. Baldwin.

Mr. Baldwin. I thank you a lot.

Senator Byrd. The next witness is Mr. Frank S. Boice.

STATEMENT OF FRANK S. BOICE, CHAIRMAN, NATIONAL LIVESTOCK TAX COMMITTEE, SONOITA, ARIZ.

Mr. BOICE. Mr. Chairman, I anticipate that there will be legal questions asked, and I would like to have our attorney sit here with me. He is Mr. Stephen Hart.

Senator BYRD. Will you identify yourself, please.

Senator MILLIKIN. Mr. Hart is a very fine lawyer and citizen of Colorado, and I commend him to the attention of this committee.

Mr. BOICE. My name is Frank S. Boice, and I am a cattleman from Sonoita, Ariz.——

Senator BYRD. You have been assigned 10 minutes.

Mr. BOICE. And make this statement as chairman of the National Live Stock Tax Committee, representing the American National Cattlemen's Association, the National Wool Growers Association, the three National Beef Breed Associations, namely, Hereford, Aberdeen Angus, and Shorthorn and some 33 State cattle and wool growers associations covering the bulk of the western and southern cattle and sheep producing States.

We are intensely interested in section 306 of H. R. 4473 concerning sales of livestock held for draft, breeding, or dairy purposes. This question has deteriorated into a fight between the Bureau of Internal Revenue on the one hand and Congress, the courts, and the taxpayers on the other.

We, as taxpayers, are asking for nothing more than the courts and all expressions of Congress to date have said we should have. The Bureau persists in refusing to recognize the requests of Congress and the decisions of the courts.

Section 117 (j) of the present code applies to "property used in the trade or business." Treasury rulings issued in 1944 and 1945 (I. T. 3666 and I. T. 3712) rightly held that such term includes livestock held for draft, breeding, or dairy purposes but attempted to exclude from such term normal sales of old animals sometimes referred to as "culls." Such limitation was held invalid by the Eighth Circuit Court of Appeals in the Albright case (173 F. (2d) 399), and numerous Tax Court and district court decisions. (2) *Emerson* (12 T. C. 875), *Oberg* (1949 Memo T. C.), *Fawn Lake Ranch* (12 T. C. 1139), *Fritz* (1950 Memo T. C.), *Flato* (14 T. C. 1250), *Mitchell* (U. S. District Court Northern District California), *Retz* (U. S. District Court Northern District Iowa), *Millef* (U. S. District Northern District Nebraska), and many others.

The conference committee on the Revenue Act of 1950 requested the Bureau to follow the Albright decision, but the Treasury refused to do so, and continued its litigation with uniform lack of success. Finally, after the Fifth Circuit Court of Appeals in the *Bennett case* (186 F. (2d) 407) reached the same conclusion as the eighth circuit in the Albright case and after the introduction of bills in the House to force acquiescence, the Bureau in April 1951 announced that it would recognize capital gains on these "culls." Shifting its ground, however, simultaneously it announced its decision to deny capital gains on younger animals, those "not used for substantially their full period of usefullness." Such policy has been implemented by a new ruling, mimeograph 6660 released subsequently to the passage of the House bill.

I would like to add that our reports from the field, that is, reports from taxpayers, indicate that the revenue agents are interpreting this mimeograph to mean that only animals that have completely outlived their usefulness will be allowed to qualify for capital gains treatment. We have that report.

Senator MILLIKIN. That presents a complete reversal on the part of the Bureau.

Mr. BOICE. That is rather complete.

Senator MILLIKIN. When they adhere to what they should have adhered to from the beginning, to wit, the court decisions, then they put in the hook by reversing themselves on the younger animals.

Mr. BOICE. That is right.

Senator MILLIKIN. Is that right?

Mr. BOICE. And apparently the revenue agents are interpreting it to mean that only animals that have completely outlived their usefulness will be qualified for capital sales treatment.

Such denial of capital gains on prime and young animals used for draft, breeding or dairy purposes is contrary to earlier rulings of the Bureau and at least eight Tax Court, district court and court of appeals decisions and it discriminates against livestock, for no such principle applies with respect to other types of business property.

It has compounded the confusion. Hundreds of thousands of farmers are in a turmoil over disputed returns and claims for refund and in ignorance as to what to do. If such Bureau policy is permitted to stand, the litigation and conflict will continue, perhaps for years.

The larger operators can take care of themselves. They will hire adequate counsel and fight this thing. It is the smaller operator, the ones who cannot afford to hire competent counsel, who will suffer under such a condition of affairs.

We favored the addition of section 306 to the House bill. In view of the unreasonable limitations, however, contained in the subsequent ruling we feel that the language of the House bill should be elaborated by the Senate so as specifically to negative these invalid limitations and to anticipate other threatened retaliatory interpretations—so as to say to the Treasury, "This means you."

Senator MILLIKIN. Have they threatened retaliatory measures or is that something which you fear?

Mr. BOICE. Yes. It was in their press release issued by them about a month or 6 weeks ago.

Senator MILLIKIN. What was the guts of that?

Mr. BOICE. They were going to reconsider the rulings related to this problem. We understand they have in mind those governing inventories and cash-basis method of accounting for livestock people, and that is the threat.

We feel that the bill should be amended to specify that it applies to livestock used for draft, breeding or dairy purposes, whether old or young, and that the holding period starts with the date of acquisition, not the date the animal is put to use.

We feel that it should state that it is retroactive except in the extension of the holding period from 6 to 12 months. We would like the committee report to refer to these decisions and to spell out the fact that the amendment confirms present accounting methods for computing gain. We are not asking that animals held primarily for sale be treated as capital assets, but we are asking that the Treasury fairly and sincerely allow capital gain on these held for draft, breeding or dairy purposes. In order to reinforce this distinction, we are willing to accept the increase in the holding period to 12 months. If so amended we feel that the bill would merely be stating more clearly what the House bill already intends.

Accordingly, we request that the bill be amended to read as follows:

SEC. 306. SALES OF LIVESTOCK.

Section 117 (j) (1) is hereby amended by adding at the end thereof the following new sentence: "Such term also includes livestock, regardless of age, held by the taxpayer for draft, breeding, or dairy purposes, and held by him for 12 months or more from the date of acquisition." The amendment made by this section shall be applicable with respect to taxable years beginning after December 31, 1941, except that the extension of the holding period from six to twelve months shall be applicable to taxable years beginning after December 31, 1950.

We would also like permission to consult with your technical advisors with respect to the language in the report.

We appreciate very much, Mr. Chairman, the opportunity to appear before you, and will be happy to answer any questions which occur.

Thank you.

Senator BYRD. Thank you very much.

Senator MILLIKIN. Mr. Chairman, they do not need any permission to talk to the staff, but I hope they do talk to the staff, and I hope that the staff will be prepared to talk with us about it when we come to the executive session.

Senator BYRD. Thank you very much, sir.

Mr. BOICE. Thank you.

Senator BYRD. The next witness is Mr. T. P. Tonne, of Chicago. Mr. Tonne, will you please be seated.

STATEMENT OF T. P. TONNE, ASSISTANT TREASURER, NATIONAL CITY LINES, INC.

Mr. TONNE. My name is Theodore P. Tonne. I am assistant treasurer of National City Lines, Inc., Chicago, Ill.

Senator BYRD. Proceed.

Mr. TONNE. I was not aware when I became concerned about the provisions of section 123 that there were so many other people interested in it. Therefore, what I am going to read to you may be redundant.

Section 123 of H. R. 4473 would amend the Internal Revenue Code to provide a "limitation on surtax exemption in the case of related corporations."

If enacted into the code this amendment would inflict an unfair tax burden on a related group of corporations such as National City Lines, Inc., and subsidiaries, which I represent. It would be applied where tax avoidance has not been attempted; where tax avoidance by split-ups would be impossible.

Section 123 denies the use of all but one of the $25,000 surtax exemptions which would otherwise be allowable to a group of affiliated corporations. Ownership of 95 percent of the stock of one or more of a group of corporations, by a member of that group, automatically brings section 123 into effect. No exceptions are provided for cases where inequity would result.

Through the holding of the entire outstanding capital stock of each of 43 operating companies, National City Lines, Inc. owns the local bus-transportation systems in 43 cities in 14 States of the United States. The communities served range in population from about 43,000 to 343,000. This arrangement has been in effect for over 16 years and was dictated by legal and practical requirements of the business without reference to any tax-avoidance scheme. Some States require a company operating a local transit system to be a domestic corporation of that State. Each of the companies in the normal course of operations must make frequent appearances before State or local governmental bodies in connection with service and rates of fare.

In connection with these appearances a great deal of financial and other information must be submitted pertaining to the individual operating companies. If several units were each operated as a division of one company, the latter would not only have to submit figures for each of its operations when any one operation was appearing before a governmental body but it would also have to prove the propriety of the allocation of every item of income and expense as between the operating divisions.

The cost of this additional work would often be prohibitive. Each operating company now has its own union contract. If the companies were combined, varying local conditions such as prevailing wage rates, working conditions, cost of living, and so forth, would place serious obstacles in the way of satisfactory negotiation of future union contracts. Everything considered, National City Lines, Inc., can only function through the use of a separate corporation for each city in which it operates.

Each operating company is regulated by a State or local governmental body which, through determining the rates of fares to be charged, fixes the income which the company may earn. Such earnings are after all charges including Federal income taxes. As the regulatory authorities treat each operation as an independent unit, the effect of section 123 would certainly be ignored by them in any future computation, since it would only apply when they are affiliated companies.

The end result would be that the increase in surtax would result in reducing the amount of allowable profit, which allowable profit is, in other respects, after Federal income tax.

The ownership of numerous small- and medium-sized operations in one holding company is very desirable, as it allows a centralization of such functions as supervision, management, purchasing, public and employee relations, safety, accounting and finance. This results in a much higher degree of efficiency and economy than could be obtained or afforded if each company were independently owned and operated. We just could not give the service that we can, having a much larger field.

I wish to point out that the savings resulting from such common ownership are passed on to the riding public in the communities served.

And from the viewpoint of National City Lines, Inc., the State or local regulatory bodies are required by law to fix the earnings of the operating companies at a level which will attract and hold capital in the public transit business.

As section 123 would be ignored by regulatory bodies, it would reduce the annual profits of each company about $5,000, below the point where investment is attractive to capital. It would not prevent tax avoidance because no tax avoidance has been attempted. It would simply place a penalty on an arrangement which, by grouping, gives the advantages of size to many small transportation companies. By reducing the combined earnings by approximately $225,000, a year below the fair return level, section 123 would tend to destroy the progress of the past and far future improvement.

The possible effectiveness of section 123 as a bar to tax avoidance appears doubtful. It seems to me that if a split-up for tax purposes were planned a tax expert would not have much trouble in devising a scheme outside the terms of section 123. The introduction of a 6 percent minority interest might work. There must be other possibilities. I am no expert but it seems to me the section would be most effective against the innocent.

I have tried to show that section 123 would impose a severe penalty on our business which is organized in a manner that has been good for the people that own the business and good for the people they serve. From the standpoint of our riders, they should not be denied the benefits arising from the grouping of several small operations into an economical unit. From the standpoint of National City Lines, it should not be subjected to a substantial tax which would be treated by State commissions in a way different from other taxes merely because National City Lines, Inc., operates in 43 small cities instead of in one big city.

If the section is needed to plug a loophole, its application should be designed for and limited to instances where corporations are grouped without business purpose other than tax avoidance, or else exception should be provided for related corporations where the operating companies are subject to public regulation.

I wish to thank you for granting me this opportunity to appear before you gentlemen.

Senator BYRD. Thank you, Mr. Tonne.

Mr. TONNE. Thank you, sir.

Senator BYRD. The next witness is Mr. J. Stanley Halperin.

STATEMENT OF J. STANLEY HALPERIN, WOMEN'S APPAREL CHAINS ASSOCIATION, INC.

Mr. HALPERIN. Senator Byrd, copies of my statement have been filed with the clerk of the committee, and I would like to have the formal statement inserted in the record.

Senator BYRD. Yes.

Identify yourself, please, sir.

Mr. HALPERIN. My name is J. Stanley Halperin, an attorney, of 46 Cedar Street, New York (5), N. Y.

I appear on behalf of the Women's Apparel Chains Association, Inc., of New York City.

I wish to point out that the time of Samuel D. May and Mr. Julius Altman have been consolidated with my own time, and I am including their statements in mine.

Senator BYRD. That does not make it possible for you to take more than 10 minutes, does it?

Mr. HALPERIN. No, it does not. I will do my best to keep it within the limitation.

The members of our association are engaged in the sale at retail of popular-priced women's apparel through over 1,100 stores located throughout the country. Each of the members is the operator of a number of retail stores and outlets, many of which are operated as separate corporations.

In many cases such subsidiary corporations are owned 100 percent by the parent corporation. In other cases, however, the stock ownership percentage is less than 95 percent.

In the great majority of cases, the net profit of each store, before taxes, is substantially below $25,000.

Our position respecting section 123 of H. R. 4473, as to which I appear in opposition, is respectfully set forth hereinafter.

The first point I would like to make is that a distinction should be made between multiple corporation structures which are bona fide, and those which are artificial.

As presently worded, the provisions of the bill, as passed by the House, make no distinction whatsoever between a multiple corporation structure which is bona fide and which is not a tax-avoidance scheme, and one which is the result of the artificial splitting-up of the enterprise.

It applies equally to the new multiple corporation structure, and the one which has been in existence for 20 years and upward.

It is difficult to reconcile this House proposal, which confessedly was adopted on the recommendation of the Treasury Department, with the two basic fundamentals of policy which have always been followed in tax legislation, and especially by this committee, namely, firstly, the bona fide conduct of business in the ordinary way shall not be impeded; and secondly, retroactivity, especially where the practice has been known to and approved by the Treasury Department, is to be avoided and the corrective provision shall be made prospective only, in its operation.

I will not take the time of this committee to discuss the many business reasons which justify the method of operation known as the multiple corporation structure. That has been discussed many times by other witnesses.

I also would like to point out that the Treasury Department over the years has admitted that the multiple corporation structure represents the bona fide conduct of business in the ordinary way. In this respect, Senators, we have had a number of our members who have gone through reorganizations having, as the end result, a multiple corporation structure whereby there is a parent corporation with each store owned and operated by a separate subsidiary corporation.

In order to arrive at that particular corporate structure, they have had to go through a tax-free reorganization under the provisions of the Internal Revenue Code. To be rules as a tax-free reorganization, it has to necessarily be found that the main purpose was not tax avoidance, but rather that there was a good underlying business purpose for the reorganization.

Without exception, in every single case in which, in our association, our members have gone through this type of reorganization, it has received the approval of the Treasury Department. As a matter of fact, in a few cases, even before any steps were undertaken to set up a multiple corporation structure to do this kind of business, the Treasury Department has issued a closing agreement before any steps were taken. In each and every case, in order to obtain such a closing agreement—and I do not mean just a ruling, I mean a closing agreement, which means going through the 30 or some-odd hands that it must go through in order to secure approval—it was necessary to establish what our business purposes were, and the very fact that we received that approval clearly indicates that the Treasury admits that this is the bona fide conduct of the business in the ordinary way.

Now if we take that as the fact, then it seems to me that the purpose of this proposal is something more than merely to stop the artificial splitting up of companies. In these particular situations, the Treasury Department, even before we took the step, stated that it was proper and issued a closing agreement to the effect that the proposed reorganization was tax-free. Under these circumstances, this particular provision would seem to be designed to do something more than merely go after the artificial split-up, because in our cases we have obtained the blessing and approval that ours were a bona fide reorganization.

That being the case, then it would seem that this provision is more designed to regulate business than to raise revenue. If we take that as the assumption, that that is what this provision is designed to do, then it would be contrary to the policy which has always guided this committee. That the policy has been to use the revenue laws only for the purpose of raising revenue and not for the purpose of reforming and changing the procedures and practices of business.

Moreover, the House provision, if its design is to treat a multiple corporation structure as a single taxpayer, does not do so. In fact, it makes the effective tax rate even higher than if a consolidated return were to be filed.

If the Treasury does concede, as we believe it must, that the multiple corporation structure is a proper method of conducting business in the ordinary way, then it is unfair to base the House provision on the fact that in certain cases there may have been an artificial split-up, and then make the House provisions applicable to all taxpayers, honest and dishonest. If that is the true purpose, then the Treasury could have requested a provision making mandatory the filing of consolidated returns, which it never did.

I would also like to point out to the committee that I do not believe that the Ways and Means Committee ever intended that this provision should apply to anything other than an artificial split-up.

Whichever way you examine the House provision, you must reach that particular conclusion. A reading and a rereading of the Ways and Means Committee report discloses that the intention, at least of the Ways and Means Committee, is to make the provision applicable only to the artificial split-up.

The summary which is set forth in table 12 of page 62 of the report describes section 123 as—

> Closing of loopholes concerned with * * * (b) Corporate split-ups to obtain multiple exemptions and credits.

Your attention is directed to the descriptive language "to obtain" which clearly evidences an intention to make section 123 applicable only to the artificial set-up or split-up.

Furthermore, I would like to point out that there is no justification for making the House provision applicable to existing bona fide multiple corporation structures. The Treasury has been aware of this method of operation for many years.

It was at the Treasury's request that section 129 of the Internal Revenue Code, which is and was designed to deny to the artificial split-up any tax advantage which might accrue, was enacted in the Revenue Act of 1943.

At that time, too, the House proposal was so broad in its language as to include those bona fide taxpayers who were not intended to be included within its scope.

This committee, the Senate Finance Committee, delimited the language so as to effectuate the true purpose, namely, to deny the beneficial provisions of the tax laws to the artificer, the tax dodger.

Moreover, the original House provision in the 1943 bill made section 129 retroactive to all years beginning after December 31, 1939. The Senate refused to give it retroactive effect, making it applicable only to years beginning after December 31, 1943. In so doing (which amendment was agreed to by the House), the Senate compelled both the taxpayer and the Government to rely upon the then existing laws for past years.

This would be the fair thing to do with the present section 123. If a split-up was a tax-avoidance scheme, the existing sections 45 and 129 are sufficiently strong to upset it.

It is impossible to explain why, in 1951, it is justifiable to deny the status of separate entities to multiple corporation structures which, for example, have had such a structure since they came out of insolvency proceedings in 1932, whereas, in 1943, when we were at war, it was not considered justifiable to do so to the very same multiple corporation structure.

Even the House, in proposing section 129 of the 1943 act, made it applicable only to transactions, split-ups, occurring on and after October 8, 1940, yet this new provision in the 1951 bill could and would apply to transactions which occurred long before that time.

Thus, we have a situation where the Treasury has requested implementation of section 129, implementation sufficient to give it the broad coverage it sought in 1943, and which the Senate then denied.

The Treasury desires such implementation to be retroactive, not merely to the date specified in the existing section 129, namely, October 8, 1940, but rather to the very beginning of time, and the House provision has granted the Treasury's requests.

Multiple corporation structures which antedated October 8, 1940, whether or not spawned in tax-avoidance, were exempted from the operation of section 129 as added by the 1943 act despite the recognized tax advantage they would enjoy by reason of such exemption.

The new section 123, which would now apply to such taxpayers, does not even give to them the same privileges which they would have had under section 129, namely, the right to prove that the multiple corporation structure was not adopted because of the tax-avoidance motive. In truth, even if such right were granted, it would be difficult at this late date, if not impossible in many cases, to present adequate proof because of the death of witnesses, destruction of records, and so forth.

It seems more logical to assume that the provision should have contained some cut-off date, prior to which time multiple corporation structures would be vulnerable only under existing law as at that time, and after that date, vulnerable to the new provision as well.

We believe, therefore, that a distinction could and should be made between a bona fide and artificial split-up, and that a bona fide split-up, regardless of when consummated, whether before or after the enactment of the Revenue Act of 1943, should result in the same tax treatment as is presently accorded to a split-up which may have occurred, for example, in 1932.

It is our position that existing law does give the Treasury adequate remedies and safeguards against a split-up which is nothing more than a tax-avoidance scheme. If it is ultimately determined that additional safeguards are necessary, they should then be enacted.

However, they should be made prospective in their application, applying only to transactions occurring after a date upon which the tax-paying public could be said to have been put on notice of the intended change in the law.

In the case of section 123, this date would be May 3, 1951, the first time that the proposal was mentioned in the Congressional Record.

I do not believe that section 123 as passed by the House, should remain in the bill, but rather, should be entirely eliminated.

I should like——

Senator BYRD. I am sorry to interrupt you, but your time has expired. We have two other witnesses to hear before we recess at 12 o'clock.

Mr. HALPERIN. I was going to spend just about another 3 or 5 minutes, Senator Byrd, if I can have your indulgence. I will not read all of it, I promise you.

Senator BYRD. You can insert it in the record.

(Discussion was continued off the record.)

Senator BYRD. Your entire statement will go in the record.

Mr. HALPERIN. Thank you, sir.

(The document referred to is as follows:)

STATEMENT OF J. STANLEY HALPERIN ON BEHALF OF WOMEN'S APPAREL CHAINS ASSOCIATION, INC.

Mr. Chairman and gentlemen, I am J. Stanley Halperin, an attorney, of 46 Cedar Street, New York 5, N. Y. I appear on behalf of the Women's Apparel Chains Association, Inc., 41 East Forty-second Street, New York 17, N. Y., in opposition to section 123.

The members of our association are engaged in the sale at retail of popular-priced women's apparel through over 1,100 stores located throughout the country. Each of the members is the operator of a number of retail stores and outlets, many of which are operated as separate corporations.

In many cases, such subsidiary corporations are owned 100 percent by the parent corporation. In other cases, however, the stock ownership percentage is less than 95 percent.

In the great majority of cases, the net profit of each store, before taxes, is substantially below $25,000.

Our position respecting section 123 is respectfully set forth in the following paragraphs.

POINT I. A DISTINCTION SHOULD BE MADE BETWEEN MULTIPLE CORPORATION STRUCTURES WHICH ARE BONA FIDE AND THOSE WHICH ARE ARTIFICIAL

We do not, nor could anyone raise any objection to the general purpose of the House provision—if such purpose is to prevent the artificial splitting-up of corporations solely for tax purposes. As worded, however, the provision is equally applicable to multiple-corporation structures which antedate the present excess-profits tax provisions not by just a few years, but 20 years or more and whose method of operation constitutes the bona fide conduct of business in the ordinary way.

The House provision makes no distinction between a multiple-corporation structure which is bona fide and which is not a tax avoidance scheme and the one which is the result of an artificial splitting-up of the enterprise. A multiple-corporation structure, no matter how long ago created, no matter how valid and bona fide the business reasons underlying its creation, no matter how many times examined and approved by the Bureau of Internal Revenue—is now to be classified, under the House provision in the same category as the artificial, unbusinesslike enterprise. It is not believed that it was the intention of the House proposal to label such taxpayers as "tax avoiders."

It is difficult to reconcile the House proposal, which confessedly was adopted upon the recommendation of the Treasury Department, with the two basic fundamentals of policy which have always been followed in tax legislation, namely—

(A) the bona fide conduct of business in the ordinary way shall not be impeded; and

(B) retroactivity, especially where the practice has been known to and approved by the Treasury Department, is to be avoided and the corrective provision shall be made prospective only in its operation.

(A) THE BONA FIDE CONDUCT OF BUSINESS IN THE ORDINARY WAY SHOULD NOT BE IMPEDED

Business reasons justify bona fide multiple-corporation structures

There is no doubt but that the multiple-corporation structure is the usual and ordinary method of operation in the case of retail organizations. If there were any doubt about this point before the present hearings were held, the number of trade associations and others who have and will testify on this provision should dispel any such doubt.

There are many sound business reasons why the multiple-corporation structure is the proper way of conducting a retail store organization. Previous witnesses have enumerated many of the business purposes which dictate this method of operation and, accordingly, they are not here again detailed.

Treasury Department admits multiple-corporation structure represents bona fide conduct of business in ordinary way

However, I should like to point out that the Treasury Department itself has recognized the business purposes underlying the multiple-corporation structure. In fact, more than once in recent years, it has given its blessing and approval to a corporate reorganization having as its end-result the ownership and operation of each retail unit in the organization by a separate subsidiary corporation.

If we bear in mind that for a corporate reorganization to be treated as tax-free, it must be conclusively established that the underlying purposes of the reorganization were sound business purposes and not a tax-avoidance purpose—the admission by the Treasury Department that a multiple-corporation method of conducting business is tax-free should be conclusive proof that it is not and was not a tax-avoidance scheme. Furthermore, it is conclusive proof that the multiple-corporation structure, where approved by the Treasury Department, does constitute the bona fide conduct of business in the ordinary way.

We do not know how many rulings and closing agreements have been issued in toto, approving reorganizations which resulted in multiple corporation structures. For the members of our association, however, every member which went through some revamping or other of its method of conducting business which resulted in a multiple corporation structure has had its returns examined by the Bureau of Internal Revenue. Without exception, the tax-free status of the transaction (and therefore, the finding that tax avoidance was not the underlying purpose) has, in each and every case, been approved. This has been the experience of our industry. We understand that this is true in others, as well.

Treasury issues closing agreement approving proposed reorganization resulting in multiple corporations

To further demonstrate the irreconcilability between what the House now proposes, based on the Treasury's recommendation and what the Treasury has been doing all these years, not only has its Bureau of Internal Revenue approved these transactions in past years upon examination of the tax returns, but also, the Secretary of the Treasury has approved the execution of closing agreements holding such multiple-corporation transactions to be tax-free.

For example, one of our members, Angerman Co., Inc., presently the owner and operator of 57 retail outlets, all of which are owned by separate subsidiary corporations, reorganized its corporate structure in 1949 to achieve this result. Before doing so, however, it made application for a closing agreement to the effect that the proposed reorganization would be tax-free. Such a closing agreement was granted and entered into and approved by the Secretary of the Treasury.

The Angerman Co. is a typical example of the multiple corporation structure. It represents a constant and steady expansion of retail outlets for more than 25 years, some of which it acquired by the purchase of outstanding stock, others of which were started by itself. In 1948, it was decided to clear up its corporate structure and to have a separate corporation own and operate each store.

Accordingly, a plan of reorganization was prepared and it was submitted to the Commissioner of Internal Revenue, requesting the issuance of a ruling and closing agreement to the effect that the proposed reorganization, when consummated, would be tax-free. The application which was filed with the Commissioner set forth the business reasons which justified the change in corporate structure. In fact, it was stated in the company's application that there might be a savings in taxes, but the company did not know if such would prove to be the case. The Commissioner issued a favorable ruling and the closing agreement was entered into.

In actual fact, however, Angerman Co. paid more in taxes than if it had not adopted the plan of reorganization. For its fiscal year ended January 31, 1950, it had 55 retail outlets. The average sales for each outlet for the year was $156,363, on which the average profit before taxes was $3,709, approximately 2.4 percent on sales. The average Federal tax liability per store was $1,563, whereas if Angerman Co. had remained as it had been before, the average Federal tax liability per store would have been $1,409, a savings of $154 per store. Does this smack of tax avoidance? Also, the average store was left with but $2,146 after taxes on an average sales volume of $156,363, approximating 1.37 percent on sales—certainly not an exorbitant profit on its volume. Is the Treasury Department now to be heard to say that the Angerman Co. reorganization was "artificial" and did not represent the bona fide conduct of business in the ordinary way?

Is House provision designed to regulate business?

Or is it to be assumed that the Treasury concedes that the multiple-corporation structure does represent the bona fide conduct of business in the ordinary way, but nevertheless, despite their respective bona fide separateness, they should be treated as one? And if such latter be the case, it would seem that this provision is more designed to regulate business than to raise revenue—a purpose and a design which is opposed to the policy invariably followed in the past by the tax-writing committees of Congress. That policy has been to use the revenue laws only for the purpose of raising revenue, and not for the purpose of reforming and changing business practices and procedures. Economic and social reform has been left to the other committees of Congress, and the tax-writing committes have always opposed the use of the revenue laws for the accomplishment of any purpose other than the raising of revenue. We agree with that policy and endorse its continuance.

Moreover, the House provision, if its design is to treat a multiple corporation structure as a single taxpayer, does not do so. In fact, it makes the effective tax rate even higher than if a consolidated return were to be filed. This is because there is no 100-percent dividends received credit allowable in the tax computation, only the 85-percent credit, leaving the remaining 15 percent subject to a double tax.

If the Treasury concedes that the multiple-corporation structure is a proper method of conducting business in the ordinary way, then it is unfair to base the House provision on the fact that in certain cases there may have been an artificial split-up and then make the House provisions applicable to all taxpayers, honest and dishonest. If that is the true purpose, then the Treasury could have requested a provision making mandatory the filing of consolidated returns, which would have accomplished such a purpose and would have laid bare on the table the full impact of this proposal. Yet this was not requested.

Ways and Means Committee intended provision only for artificial split-ups

Whichever way one examines the House provision, the conclusion is reached that what is really sought to be accomplished is the prevention of artificial split-ups in the future and the denial of any tax advantages to artificial split-ups of the past.

A reading and a re-reading of the Ways and Means Committee report discloses the intention is to make the provision applicable only to the artificial split-up. The summary set forth in table 12 on page 62 of the report describes section 123 as "Closing of loopholes concerned with— * * * (b) Corporate split-ups to obtain multiple exemptions and credits. * * *." Your attention is directed to the descriptive language "to obtain". This clearly evidences an intention to make section 123 applicable only to the artificial split-up.

At all times, however, the bona fide conduct of business in the ordinary way is not intended to be impeded.

(B) RETROACTIVITY IS NOT JUSTIFIED ON THE GROUND OF LACK OF KNOWLEDGE

There is no justification for making the House provision applicable to existing bona fide multiple-corporation structures. The Treasury has been aware of this method of operation for many years.

Senate refused to make section 129 retroactive to pre-October 8, 1940 structures

It was at the Treasury's request that section 129, which is designed to deny to the artificial split-up any tax advantages which might accrue to it, was enacted in the Revenue Act of 1943. At that time, too, the House proposal was so broad in its language as to include those bona fide taxpayers who were not intended to be included within its scope. The Senate Finance Committee delimited the language so as to effectuate the true purpose, namely, to deny the beneficial provisions of the tax laws to the artificer, the tax dodger.

Moreover, the House provision made section 129 retroactive to all years beginning after December 31, 1939. The Senate refused to give it retroactive effect, making it applicable only to years beginning after December 31, 1943. In doing so (which amendment was agreed to by the House), the Senate compelled both the taxpayer and the Government to rely upon the then existing laws for past years.

This would be the fair thing to do with the present section 123. If a split-up was a tax avoidance scheme, the existing sections 45 and 129 are sufficiently strong to upset it.

House provision would apply to pre-October 8, 1940 structures

It is impossible to explain why, in 1951, it is justifiable to deny the status of separate entities to a multiple-corporation structure which, for example, has had such a structure since it came out of insolvency proceedings in 1932 whereas in 1943, when we were at war, it was not considered justifiable to do so to the very same multiple-corporation structure. Even the House, in proposing section 129 in the 1943 act, made it applicable only to transactions occurring on and after October 8, 1940. Yet this new provision in the 1951 bill could and would apply to transactions which occurred before that time.

Thus, we have a situation where (a) the Treasury has requested implementation of section 129, implementation sufficient to give it the broad coverage it sought in 1943 and which the Senate then denied; (b) the Treasury desires such implementation to be retroactive not merely to the date specified in section 129, viz. October 8, 1940 but rather, to the beginning of time, and (c) the House provision has granted the Treasury's requests.

Multiple corporation structures which antedated October 8, 1940, whether or not spawned in tax avoidance, were exempted from the operation of section 129 despite the recognized tax advantages they would enjoy by reason of such exemption. The new section 123, which would not apply to such taxpayers, does not even give to them the same privileges which they would have had under section 129, namely, the right to prove that the multiple-corporation structure was not adopted because of the tax avoidance motive. In truth, even if such right were granted, it would be difficult at this late date, if not impossible in many cases, to present the proof because of the death of witnesses, destruction of records, etc.

No provision made for "cut-off date"

It seems more logical to assume that the provision should have contained some cut-off date, prior to which time multiple-corporation structures would be vulnerable only under existing law and after the time vulnerable to the new provision as well.

Our position

We believe that a distinction should be made between a bona fide and an artificial split-up, and that a bona fide split-up, regardless of when consummated, whether before or after the enactment of the Revenue Act of 1943, should result in the same tax treatment as is presently accorded to a split-up which may have occurred, for example, in 1932.

It is our position that existing law does give the Treasury adequate remedies and safeguards against a split-up which is nothing more than a tax avoidance scheme. If it is ultimately determined that additional safeguards are necessary, they should then be enacted. However, they should be made prospective in their application, applying only to transactions occurring after a date upon which the taxpaying public could be said to have been put on notice of the intended change in the law. In the case of section 123, this date would be May 3, 1951, the first time that the proposal was mentioned in the Congressional Record.

We do not believe that section 123 as passed by the House, should remain in the bill, but rather, should be entirely eliminated.

Point II. Section 123 Will Represent an Inordinate Increase in the Tax Burden of Those Affected by It

CONGRESS DOES NOT DISCRIMINATE

It has always been the policy of the Congress not to discriminate against a single class of taxpayer. Yet that is what section 123 will do. By reason of the denial of the surtax exemption to each of the corporations, except one in the structure, the effective tax on each one's first dollar of taxable net income will rise from the proposed normal tax of 30 to 52 percent, an increase of 74 percent over and above the increase which is proposed to be levied against all corporations. Moreover, by reason of the denial of the minimum excess-profits credit to each corporation, many a corporation will now have part of its income subject to excess-profits tax.

There is no doubt but that many such corporations will have an effective tax rate which is more than double what it would have been were it not for section 123. This has been graphically presented to you in the case of Southern Department Stores, Inc. through their representative, W. Gibson Harris, in his testimony on July 10, 1951.

BEFORE DRASTIC CHANGE, CONGRESS MAKES STUDY

It is our position that section 123 is so drastic in its concept and operation that to make its application effective at one fell swoop is contrary to congressional policy.

At no time has there ever been a 74-percent increase in the tax rate, limited to one particular class of taxpayers. There is no justification for such an increase at this time.

Point III. Section 123 Will Not Raise the $55 Million in Revenue Which Is Predicted for It

NO STUDY HAS BEEN MADE

Ordinarily, when a structural change of such impact as section 123 is proposed, it is based upon an intensive and exhaustive study made by the Treasury Department and by the staff of the joint committee. Yet no such study seems to have been made in this case. There does not appear to be any basis for the estimate of the revenue yield anticipated. To our knowledge, no industry or trade associations were requested to furnish any statistics of any kind which would aid the Treasury and the joint committee staff in this regard.

TREASURY RECOMMENDATION

So far as we have been able to ascertain, the Treasury Department recommended this provision after public hearings before the Ways and Means Committee had been closed. It is believed that the request for this provision was inspired by two recent decisions of the Tax Court of the United States, in both of which it was held that a multiple-corporation structure was bona fide and was not adopted for tax-avoidance purposes.

BASIS OF ESTIMATED REVENUE YIELD UNKNOWN

At any rate, in making the estimate, we understand that the Treasury relies on a study made by the Securities and Exchange Commission in 1947 from which it appears that there might be 16,000 corporations belonging to multiple-corporation structures. On the assumption that 50 percent filed consolidated returns, that left 8,000 corporations.

As to these 8,000 corporations, we further understand that it was assumed that the denial of a separate surtax exemption to each would mean an additional 22 percent on the first $25,000 of income, or $5,500 per corporation, or $44 million for all 8,000 corporations. Presumably the remaining $11 million to complete the estimated revenue yield is attributed to excess-profits taxes. The point is, nobody seems to know how the Treasury Department arrived at this estimate.

PREDICTED REVENUE YIELD WILL NOT MATERIALIZE

If our understanding as to what occurred is correct, then the promise that each corporation will pay an additional $5,500 in tax is fallacious, at least in our industry. Our stores are all small stores, in some cases a formerly independently owned store which has now come into the organization lock, stock, and barrel—with its former owner and manager still remaining as manager and retaining a profit-sharing interest, and all former employees continuing on. Practically all never have and still do not make $25,000 a year in profits.

We understand that other witnesses have likewise testified that the predicted revenue yield will not materialize and, in fact, for other reasons such as retarding of expansion, may result in an over-all net revenue loss.

A STUDY SHOULD FIRST BE MADE

It is our position that before so drastic a provision is approved, a more detailed study should be made in order to determine not only the necessity for and the advisability of such a provision, but what the true revenue yield might be. It is unlike the prior practice of the tax committees of the Congress to enact a provision which has not been thoroughly investigated before being proposed.

POINT IV. SECTION 123 IMPOSES TAX DISADVANTAGES WITH NO ELECTION TO ESCAPE THEM

At the risk of repetition, I should like to reiterate that the House provision, if it is designed to treat a multiple-corporation structure as a single taxpayer, does not accomplish its purpose. In fact, it makes the effective tax rate on such a group even higher than if a consolidated return were to be filed. This is because there is no 100-percent dividends-received credit allowable in the tax computation, only the 85-percent credit, leaving the remaining 15 percent subject to a double tax. The fact remains that, in many cases, a consolidated return will not be able to be filed because many multiple-corporation structures do not qualify under the consolidated returns regulations as an affiliated group entitled to filing a consolidated return. Thus, although treated as one for the tax computation, the corporations within the group would not be prmitted to offset losses of one corporation against the profits of others, would not escape the double taxation on the 15 percent of the dividends received, and would not be able to eliminate intercompany profits—all of which will result in a higher effective rate than if a consolidated return were filed, except, or course, that if it may not file a consolidated return, it has no choice. Here again the unfair discrimination of section 123 is crystal clear.

POINT V. SECTION 123 WILL SERIOUSLY INJURE OUR INDUSTRY AND THE PEOPLE WHO DEPEND ON IT

The fact that no study has ever been made as to the impact of section 123 is amply demonstrated by the injury which it will inflict on our industry and the people who depend on it for their livelihood. Other witnesses have testified as to the damages which their industries will sustain. It is clear that had all this information been available at the time the proposal was first advanced by the Treasury, section 123 would not have emerged in the form which it now has.

A TYPICAL ORGANIZATION—ITS BEGINNING

I should like to briefly describe a typical member of our industry. It usually was organized about 15 to 20 years ago, starting off as a one- or two-store operation, and in rural areas primarily. Profits were plowed back into the business and additional stores were acquired, either by the opening of new units or the purchase of existing stores. Where there was a purchase, the former owner was usually retained as manager, with a percentage interest in the profits.

Many of our members have followed the practice, since their inception, of operating each store as a separate corporation. Others have had a varied experience, depending upon whether it was a new store which the member was opening or a store the capital stock of which was being purchased. In such cases, the new store was not separately incorporated.

Ultimately, as the number of stores grew, it no longer was advisable to purchase the services of a resident-buying office in New York City and, accordingly, executive offices were opened on behalf of the group. This executive office would act as the central buying office for the entire group. The ability to buy in volume enabled the group to merchandise its inventory at a much smaller mark-up than could possibly be done if each were operating as an independently owned, completely unaffiliated store, as many of the units had previously done.

SIMPLIFICATION OF CORPORATE STRUCTURE BY ADOPTION OF MULTIPLE CORPORATIONS

During the middle 1940's, many of them, primarily those with a hodgepodge corporate structure, adopted plans of reorganization which had, as their end result, the ownership and operation of each store by a separate corporation. In every single case where this was done, the Bureau of Internal Revenue has examined the reorganization and has accepted its treatment as a nontaxable transaction, thus expressly finding that tax savings was not the motive. In a number of cases, moreover, the Treasury Department entered into closing agreements to the effect that the reorganization was tax-free.

THE DAMAGE THIS PROVISION WILL CAUSE

The incalculable damage will be caused to our industry by an effective 74-percent increase in the tax burden, if the House provision is enacted, will affect our creditors, our employees, our suppliers, and our local communities.

(a) The harm to our creditors

It goes without saying that the only source for the repayment of loans is the profit remaining after taxes. The inordinate increase proposed by section 123, in some cases will not leave sufficient profit after taxes with which to meet the annual repayment required to be made. Indications from lending institutions already indicate that loan commitments will have to be met, regardless of the proposed section 123. In such cases, if the loans cannot be refinanced, the consequences will be drastic.

Not only is this true as to such creditors as banks, insurance companies, and other lending institutions—it is also true with respect to such creditors as contractors who have made store alterations and improvements and are being repaid over a course of years.

The restriction of credit by one creditor very often sets off a chain reaction, other creditors follow suit, and, ultimately, the debtor can be thrown into an involuntary reorganization.

(b) The harm to our employees

There was a time when certain of our employees, particularly store managers and executive personnel, were paid a percentage of profits after taxes. This is not too widespread a practice although, where it still exists, section 123 will have a serious impact.

However, it is obvious that an employee's security lies in the fact that his employer is in a sound financial position. If taxes take so much away from the employer that, along with payments to be made to creditors, there is not enough left to build up a reserve to weather bad times, the employer's financial position is unsound, and it follows that the employee's position is equally unsound and insecure.

Many of the stores are marginal stores, barely breaking even on their operations. In adverse times, they are the ones which sustain the greatest losses. It is but natural that if there will not be any profits left after taxes and loan repayments, the risk of maintaining a marginal store should be eliminated, resulting in the closing of a store and the loss of jobs by six or seven employees.

(c) The harm to our suppliers

The retardation of expansion and growth of our members because of lack of capital will affect not only our trade suppliers but our contractors as well. Local contractors in small rural towns, to whom a $35,000 store alteration is a major piece of business for the entire year, can no longer look forward to this source of business. There will be not only a lack of capital, but a lack of incentive to open any new retail units.

(d) *The harm to the local community*

We believe that the damage done to the local community will likewise be far greater than the proponents of section 123—if ever they thought about this point—calculated. Just see what happens when one of our members comes to a community. Take, for example, a store of one of our members in Bucyrus, Ohio. Bucyrus is a small rural town, which never had the benefits of big-city merchandising, styling, and low prices. Bucyrus shoppers would travel many miles to shop at department stores in the big cities, until one of our members came along.

It rented a store, which brought income to the landlord, a native of Bucyrus. The store was altered and improved, which gave employment and income to the general contractor and his many suppliers and employees. The store was staffed with local employees, thereby creating six jobs which had never before existed, and bringing additional income and purchasing power to the community. A local attorney was engaged, giving him an additional client. The local bank received a new depositor. Because of its low prices, it attracted customers from surrounding areas who never before considered Bucyrus a shopping center, and whose coming brought additional business to the other stores on Main Street.

What did it really do? It did nothing more than to come to a small town and say to a likely potential storekeeper, in effect: "You don't have the money with which to open a store. We will advance the money to you, and put you in business and give you an interest in the profits." A big business such as a large department store in nearby Cleveland doesn't come to Bucyrus. It brings nothing to the community—it only draws business away from it. On the other hand, our member brought business to the community. In effect, it has enabled someone to open his own small business.

Our members are very proud of the part they have played in bringing back to life the vacant stores on Main Street in our rural areas. The job which the big stores would not or could not do, we have done. We have gone into cities of 8,000, 9,000, and 10,000 population and have invested sums of $40,000 and more to give Main Street a store every bit as good and comparable to the big-city stores.

We should not like to be prevented from continuing this expansion, but it stands to reason that if we do not have any money left after taxes to venture into new areas, we cannot expand. We feel that we are part and parcel of the small-business movement of our country. Organizations such as our members are nothing more than a group of small businesses in competition with other small businesses in their respective communities.

POINT VI. SECTION 123 DISCRIMINATES UNFAIRLY AMONGST COMPETITORS IN THE SAME INDUSTRY

WHERE STORE MANAGERS HAVE STOCK INTEREST

As has been indicated before, at one time it was the practice in the industry to pay store managers a percentage of the profits after taxes. Very often, this was accomplished by the manager owning a percentage of the stock of the particular store he managed. Moreover, in those cases where a former owner sold his store to a multiple-corporation group, he retained a stock ownership in the corporation he was selling.

COMPETITIVE ADVANTAGES OF STRUCTURE EXEMPT FROM SECTION 123

In those cases where more than 5 percent of the stock of a store corporation is owned outside the related or affiliated group, that particular corporation is exempt from the application of section 123. Under such circumstances, it does not have to resort to higher prices in order to net the same profit after taxes, as must its next-door competitor which is subject to section 123. From the competitive point of view, it is in a position to reduce its gross profit mark-up and, because of the additional volume reduced prices will bring, still earn the same net profit after taxes.

UNFAIR COMPETITION

It is difficult for us to justify why we should be, or how we are expected to be, able to compete with a well-known organization which has approximately 300 separate corporations in the South but which sells a partial stock interest of over 5 percent in its stores to its managers. Our store managers do as well as theirs, our employees are compensated equally as well—but, now, due to the change in tax treatment, we could no longer effectively compete.

NO DIFFERENCE IN TREATMENT OF MANAGERS

We cannot stress too strongly the fact that there is no substantial difference in the treatment or compensation of a store manager in this southern group and a store manager of one of our members. In the former case, the manager's bonus comes to him as a dividend on stock. In the latter case, it comes as a percentage of the profits before taxes. In both cases, they average the same income. In both cases, they are treated the same and have the same authority within the store.

In fact, the only difference between the two is that this southern group follows the old practice of compensation by means of a percentage of profits after taxes whereas our member compensates on the basis of a percentage of profits before taxes. Yet because of this deviation in compensation, the tax position of our competitor will give it a competitive advantage which is unfair and was never intended.

We cannot believe and do not believe that it was ever intended that section 123 would have this effect. Granting relief to certain members of our industry and not to others will give rise to unfair competition, a drastic and unjustified result of a revenue-raising statute.

RECOMMENDATIONS

A. Section 123 should be deleted entirely from the bill.

B. Once it is deleted, the staff of the joint committee should be instructed to make a study of the necessity for and the advisability of and the effect of such a provision.

C. If section 123 is to be retained in some form, then—

1. It should not be retroactive, and existing laws should govern the recognition to be accorded to multiple-corporation structures existing as at a certain date.

2. For its prospective operation, a distinction should be made between a multiple-corporation structure which is such pursuant to the bona fide conduct of its business in the ordinary way and one which is a tax avoidance dodge. A bona fide multiple corporation structure, even if created after the effective date, should not be subject to the new section 123.

3. The effective date of the new section 123 should not be earlier than May 3, 1951, the date the new proposal was first announced.

4. In the case of newly organized corporations, created for bona fide reasons and which are created after May 3, 1951, then, the new section 123 should not apply if there was only made a cash investment in said new corporation, which thereafter proceeded to engage in business.

We respectfully urge you to delete section 123 until such time as a study has been made and the conclusion reached that it is necessary and advisable.

Respectfully submitted.

J. STANLEY HALPERIN.

Senator BYRD. The next witness is Mr. Cyrus B. King.

STATEMENT OF CYRUS B. KING, ATTORNEY AT LAW

Mr. KING. Mr. Chairman and members of the committee, my name is Cyrus B. King. I am a member of the State bar of California.

I reside and practice in San Francisco, Calif., limiting my practice to tax matters.

I am here representing Wixson & Crowe, Inc., of Redding, Calif.

They are general contractors, but they specialize in clearing dam reservoir sites for the Bureau of Reclamation. They have worked on some of the big dams in the country, and they are currently engaged in clearing the site for the reservoir of the Hungry Horse Dam in Montana.

I am here because there is no relief for us and similarly situated taxpayers, except from Congress.

While I am here to discuss the excess-profits-tax relief provisions, it is my sincere and considered belief that we are not asking for any new relief provision.

We simply want to call to the attention of this committee the operation of one section of the present provisions, and I want to stress that word "operation" because, I repeat, we feel that we are not seeking any relief beyond that which has already been provided by Congress, but we feel that an amendment is necessary to clarify one of the present provisions so that the intent of Congress will be carried out.

In the present Excess Profits Tax Act, the Congress has wisely omitted such general relief provisions as section 722 of the World War II act. The expense and difficulty of preparing a case to establish a right to relief under that section, and the uncertainty of the results, led to complaints from taxpayers and their advisers.

Congress has consequently, in the present law, quite wisely set up more or less automatic formulas with respect to relief provisions, but because we are confined to formulas, we think that they should be applied with equality to all taxpayers.

Our specific problem is this: Part II of the present Excess Profits Tax Act provides that when a taxpaying corporation has acquired the properties of one or more other corporations in tax-free exchanges, the taxpayer may compute its average base-period net income by taking into account the earnings history of the properties which it has taken over.

Further, even though the taxpayer itself was not in existence on January 1, 1946, which was the beginning of the base period for most corporations, it can trace its history back to that date if one or more of its components was in existence then; and if the entire financial history of the acquiring and the component corporations, taken together, meet certain requirements, certain qualifications, the taxpayer is entitled to the relief afforded to growing corporations, that is, corporations whose growth during the base period has been so rapid that it would be unfair to compute their excess-profits-tax credit on a straight average.

The statute further provides that the taxpayer's earnings history can include the earnings of, and its existence can be traced back through the existence of, the corporations from which the components of the corporations have acquired properties—corporations which the components have taken over—that is, it can rely on its predecessor's predecessors, to be nontechnical.

By statute the same rule applies to a taxpaying corporation which takes over the properties of a partnership or a sole proprietorship.

Let me say that, for brevity's sake, hereafter when I mention a "partnership" I mean a partnership or proprietorship.

In operation, however, there has been added to the statute a condition or limitation not written into the statute itself: that the relief provisions will be applied with respect to properties acquired from a partnership only where there has been no change in the composition of the partnership.

This additional limitation results from the Bureau's interpretation, and is evidenced by one of its regulations promulgated under section

740 of the World War II law—which is almost identical to the present section.

I want to say that as late as last Friday I checked, and I found that the Bureau has not yet prepared regulations under the section of the present law.

Senator TAFT. You mean the Bureau has not yet prepared any regulations under the new excess profits tax law?

Mr. KING. Oh, yes, Senator, but not under this particular provision, part II.

Senator TAFT. I see.

Mr. KING. The only thing—the old regulation said in detail that a partnership cannot be an acquiring corporation. That means that where a partnership has taken over properties or where there has been any change in the composition of the partnership, the corporation cannot go back beyond that change.

This regulation under the old law, has been before the courts in several cases, and the Tax Court has looked at the regulation and said that it is "reasonable."

The courts have not examined the intent of Congress behind the regulation. To us this appears to be bureau-made law, and not in accord with the intent of the Congress.

This interpretation may deny relief to a corporation because of the merest accident in the history of the predecessor partnership, such as the withdrawal or addition of a partner, or the death of a partner.

Actually, there is no requirement in the statute that the partnership shall have been engaged in business without any change in its composition up to the time of the transfer of its properties to the corporation.

What Congress intended, we submit, was that a corporation which succeeded in a tax-free exchange to substantially all of the properties which had been utilized in a business—whether conducted by a corporation or by a partnership—would be entitled to utilize the earnings experience of the business and properties during the period of their operations.

It is the income from the properties that Congress had in mind. Congress has not required that the relief would be applicable only in the case of a partnership transferring its properties to a corporation without any change in the ownership of the properties prior to the transfer.

Instead, Congress used the words "a corporation which has acquired." The relief is afforded to a corporation which has acquired.

If Congress intended to confine the relief only to those situations covered by the Bureau's interpretation, it could easily have done so.

The incongruity of the Bureau's position is shown by the fact that if there had been a corporate set-up all the way back through the business it would not have made any difference if there had been a dozen or a hundred transfers of 100 percent of the stock of any of the component corporations during the entire base period.

Senator TAFT. Don't they let you go back as long as the corporation is the same, exactly the same, as it was before—as long as the partnership was exactly the same when the corporation took it over, that they let you go back to the last change——

Mr. KING. That is correct.

Senator TAFT. And then stop?

Mr. KING. That is correct, sir.

We feel that an amendment is needed either to repudiate the interpretation of the section by the Bureau, or to assure, through the language of the statute, a uniform nondiscriminatory application of the law.

I have suggested in my prepared statement—and I ask that the full text of that statement be made part of the record—the language of an amendment which would accomplish the purpose which we have in mind.

The proposed amendment would give to corporations which have acquired partnership properties after reorganization of a partnership, the same treatment accorded to those corporations which have taken over properties from other corporations or from partnerships which have been in continuous and unchanged existence during the entire base period.

At the same time, this treatment would be available only where there has been an actual and true continuity of business, and discrimination would be done away with.

I am told by other practitioners that this is a fairly common situation with small businesses. I know that a number of small businesses represented by friends of mine feel that they are being discriminated against, and that they have no hope of relief.

I am going to take about 2 minutes to talk about my client and trace the history of my client to illustrate the operation of the law under the Bureau's interpretation.

Until July of 1940, Saul Wixson was a dragline and cableway operator, working on dam construction jobs. He was cableway and rigging superintendent in the construction of Boulder and Shasta Dams.

In 1940, Mr. Wixson formed a partnership with J. H. Crowe, of Redding, Calif., and the firm entered the field of general contracting. During the early months of the enterprise, considerable sums were advanced to the partners by Mr. Frank Crowe, Mr. J. H. Crowe's uncle. Mr. Frank Crowe decided to leave this money in the business instead of demanding its repayment, and thereby purchased a one-third interest in the business, which he turned over to trustees for his daughters. The firm thereby became, effective January 2, 1941, a three-way partnership.

On April 30, 1946 (just after the beginning of the excess-profits-tax base period) the trust withdrew as a partner, because the trustees felt that the contracting business was so hazardous that trust funds should not be invested in it.

Mr. Wixson and Mr. J. H. Crowe bought out the interest of the trust.

Let me emphasize, gentlemen, that in no case was there a split-up of the assets. Through each of these changes the assets continued, and the continuing partners bought out, for cash, the interest of the retiring partners.

Early in 1947, Mr. Crowe decided to retire from the contracting business. Mr. Wixson bought out his interest, and after February 28, 1947, he transacted business as a sole proprietor under the firm name of "Wixson & Crowe" until June 1, 1949, when the present corporation was formed and the business and its assets transferred to it in a 112 (b) (5) transaction.

In August of 1949, the new corporation first bid on the Hungry Horse project. There are some interesting figures on it in my prepared statement which I will not take your time with now.

The net result is that after a series of bids, this job was done for the Government at a savings of millions of dollars at a fixed-price contract which was let months before Korea, a year before Congress started to consider the excess-profits tax, and over 6 months before the effective date of the Excess Profits Tax Act.

It is questionable whether in truth there are really any excess profits. We are not making any point of that; we want to pay excess-profits taxes the same as everybody else, but we do contend that we should not be peanlized by an unfair, discriminatory application of the taxing laws.

Wixson & Crowe, Inc., should not pay one cent more tax than it would have if Mr. Wixson had conducted the business as a sole proprietor from the first day of 1946 until the transfer to the corporation or if Mr. Wixson and Mr. Crowe had been partners during all of the base period and until the transfer.

Nobody can be certain of any such thing, but I am as certain as I can be that under the old law, Wixson & Crowe would have had a good chance for relief under section 722.

I am even more certain that they have no chance for relief under the law as presently applied. The only possibility of preventing the discrimination against these small businesses is for this committee to recommend some such amendment as I have suggested.

In addition to the statement which I ask to be filed, I have asked the clerk to give to each of the members of the committee a printed statement which goes a little more fully into this problem.

I have never felt that I have placed a matter before a tribunal from which I could expect better results than I do from you gentlemen.

Thank you.

Senator BYRD. Thank you very much, Mr. King.

Senator TAFT. May I ask, Mr. Stam, has that question been up with your committee? Has it been up with your staff, Mr. Stam?

Mr. STAM. We have discussed it with Mr. King, and we have the matter——

Senator TAFT. Do you see any particular reason why it should not be done? Is there any argument against it?

Mr. STAM. I think it is a matter that we certainly should try to see if we cannot remedy without opening the door too wide in a lot of other cases.

Of course, the whole problem where you have what we call a closed transaction is that where part of the assets go over and part are retained, you get into this question of a double credit; and that is, the old company continues to keep the credit and the new company gets the same credit, and we have tried to work out many of these tax-free exchange provisions under this particular section to keep the credit in the hands of just one taxpayer.

Senator TAFT. Does this involve not only the question of the excess profits tax base, but also the question of tax-free exchange?

Mr. STAM. It involves really the question of excess profits tax base, but it is tied up with the tax-free exchange.

Mr. KING. May I come in again, sir?

Senator TAFT. Yes.

Mr. KING. The difficulty is, of course, as Mr. Stam has pointed out, that where you have transfers from one corporation to another you can come in within the tax-free exchange provisions of the code, but there are no comparable provisions with respect to partnerships. There just is no such thing as a transfer from one partnership to another in a tax-free exchange, so Mr. Stam's point, of course, against double credit is very important from the Government's point of view.

But I think that the matter can be protected, the Government can be protected and, I submit, sir, that my amendment will protect them.

Senator BYRD. Thank you very much, Mr. King.

Mr. KING. Thank you very much, Mr. Chairman.

(The prepared statement of Mr. King, together with a proposal for an amendment referred to by Mr. King, are as follows:)

STATEMENT OF CYRUS B. KING, OF SAN FRANCISCO, CALIF.

Mr. Chairman and members of the committee: My name is Cyrus B. King. I am a member of the State bar of California. I reside and practice in San Francisco, limiting my practice to tax matters.

I represent Wixson & Crowe, Inc., of Redding, Calif. My client is a general contractor, but specializes in clearing dam reservoir sites for the Bureau of Reclamation. Among its larger operations in the past have been clearing the sites for the reservoirs of the Shasta and Cascade Dams and the site for the Seattle-Tacoma Airport. It is currently engaged in clearing the site for the reservoir of the Hungry Horse Dam in Montana.

I have come across the country to appear before this committee because my client, like a number of other small businesses, is being discriminated against in a way that we are sure was not intended by Congress, and because, for reasons I shall develop, apparently only Congress can effectively correct the situation. Because of events which occurred years before the business was incorporated, my client, under present interpretation of the law, will pay a discriminatorily high excess profits tax; in short, while the business has been in continuous existence for over 10 years, it will not be allowed to take into account all of its history as other corporations do, unless Congress clarifies the law.

While I am here to discuss the excess profits tax relief provisions, it is my sincere and considered belief that we are not asking for any new relief provision. We want to call to the attention of the committee the operation of one section of the present provisions. I want to emphasize that word "operation" because, I repeat, we feel that we are not seeking any relief beyond that which has already been provided by the Congress. We do feel, however, that an amendment of the statute is necessary to clarify one of the present provisions, so that the intent of Congress will be carried out and the law will be applied to all taxpayers in a nondiscriminatory manner.

Technicalities are not involved to any great extent, so I shall not have to burden the committee with any technical discussion. Further, to save the time of the committee, I shall, in some instances, oversimplify things. Because I am talking largely about the intent of the law, as we see it, I hope to be able to state my points briefly and simply.

In the present Excess Profits Tax Act, the Congress has wisely omitted such general relief provisions as section 722 of the World War II Act. The expense and difficulty of preparing a case to establish a right to relief under that section, and the uncertainty of the results, led to complaints from taxpayers and their advisers.

Probably because of these complaints,[1] the Congress has written into the present statute a series of definite and more or less automatic relief provisions.[2] These give taxpayers a degree of certainty they didn't have under the former law; they do away with the necessity of employing attorneys, statisticians, economists, and other high-priced specialists and with the expensive and time-consuming

[1] These provisions "of the World War II law have resulted in extended delay in the settlement of relief claims which discriminated against taxpayers who had neither the time nor the financial resources necessary for the establishment of their cases." From House Ways and Means Committee Report 3142, and Senate Finance Committee Report No. 2679, 81st Cong., 2d sess.

[2] The present law "provides relief by a set of formulas, thus reducing the area of administrative discretion to a minimum." Summary of Excess Profits Tax Act of 1950 prepared by the staff of the Joint Committee on Internal Revenue Taxation.

preparation of cases, presentation of those cases to the Bureau of Internal Revenue, and the even more expensive litigation, all of which were engendered by the old law; to that extent that are beneficial.

But the purpose of Congress in establishing the present simpler plan will be thwarted if the language of the statute, or the interpretation of that language by the Bureau of Internal Revenue and the courts, lead to discrimination and to unjustly heavy tax burdens which result from pure accident.

Briefly, our specific problem is this: Part II of the present Excess Profits Tax Act provides that when a tax-paying corporation has acquired the properties of one or more other corporations in tax-free exchanges, the taxpayer may compute its average base period net income by taking into account the earnings history of the properties which it has taken over. That average is used in measuring the extent of the corporation's taxable excess profits. Further, even though the tax payer itself was not in existence on January 1, 1946 (the beginning of the base period for most corporations), it can trace its history back to that date if one or more of its components was in existence then; and, if the entire financial history of the acquiring and the component corporations, taken together, meet certain qualifications, the taxpayer is then entitled to the additional relief afforded to growing corporations, that is, corporations whose growth has been so rapid in the base period that it would be unfair to compute their excess-profits credit on a straight average of actual base period earnings.

The statute further provides that the taxpayer's earnings history can include the earnings of, and its existence can be traced back through, corporations from which the components of the taxpaying corporation have acquired properties; in other words, a component may be made up of its own components.

The same rules apply, by statute, to a taxpaying corporation which takes over the properties of a partnership or a sole proprietorship. And, for brevity's sake, let me say that, hereafter, when I refer to a partnership, I meam a partnership or proprietorship.

In operation, however, there has been added to the statute a condition or limitation not written into the statute itself: That the relief provisions will be applied with respect to properties acquired from a partnership only where there has been no change in the composition of the partnership.

This additional limitation results from the Bureau's interpretation and is evidenced by one of its regulations promulgated under section 740 of the World War II law (which is almost identical to the provisions of the present law as to properties acquired from a partnership). This part of the regulations[3] reads as follows:

"A partnership (or a business owned by a sole proprietorship) can be a component corporation * * *. However, a partnership (or a business owned by a sole proprietorship) cannot be an acquiring corporation, and therefore, * * * (the law) cannot operate to make of its predecessors component corporations of its acquiring corporation."

This regulation has been before the courts in several cases.[4] The courts have held that the regulation is reasonable; but it is submitted that, in no case, has a court squarely considered the question: "Does the regulation express the intent of Congress?"

To us, this appears to be bureau-made law, not in accord with the intent of Congress. This interpretation may deny relief to a corporation because of the merest accident in the history of the predecessor partnership, such as the withdrawal or addition of a partner, or the death of a partner.

Actually, there is no requirement in the statute that the partnership shall have been engaged in business without any change in its composition up to the time of the transfer of its properties to the corporation. The statute does not require that, at the time of the transfer, the properties shall have belonged continuously to the partnership. As a matter of fact, in a number of jurisdictions a partnership is not regarded as a legal entity at all and cannot, as such, own any properties; this rule is particularly true of real estate. Did Congress intend that such a local rule would render this relief inoperative?

It is submitted that what Congress intended was that a corporation which succeeded, in a tax-free exchange, to substantially all of the properties which had been utilized in a business (whether conducted by a corporation or by a partnership) is entitled to utilize the earnings experience of the business and properties during the period of their operations. It is the income from the properties that

[3] Regulations 112, sec. 35.740-4.

[4] See, for instance, *E. T. Renfro Drug Co.*, *11 T. C. 994; affirmed, 183 F. 2d 846; certiorari denied, U. S. Supreme Court, February 26, 1951;* and *Hawaiian Freight Forwarders, Ltd.*, *15 T. C. 55.*

Congress had in mind. Congress has not required that the relief would be applicable only in the case of a partnership transferring its properties to a corporation without any change in the ownership of the properties prior to the transfer. Instead, Congress used the words "a corporation which has acquired." If Congress had intended to confine the relief only to those situations which would be covered by the bureau's interpretation, it could easily have done so; but there would be neither logic nor equity in such a requirement.

The incongruity of the position assumed by the bureau is further highlighted by the fact that a corporation's right to relief would not be affected one iota by a dozen, or a hundred, transfers of 100 percent of the stock of the taxpaying corporation or its components.

But, even if it be admitted for argument's sake that the language of the statute is not clear and that its ambiguity might support the bureau's construction, it cannot be assumed that Congress intended such discrimination. It is submitted, therefore, that an amendment of the statute is necessary, either—

(a) to repudiate the erroneous interpretation; or

(b) to assure a uniform, nondiscriminatory application of the law so that all corporations, large and small, will receive equal treatment.

Because the application of the present relief provisions permits no administrative discretion (except insofar as administrative interpretation may grant or withhold any relief), because the bureau has already indicated its attitude, and because the issue has been clouded by the court decisions I have mentioned, taxpayers who are subject to the discriminatory effects of the law's operation have only one hope of relief: the Congress. That is why we are here.

The discriminatory effects of the present provisions of the law can be obviated by a simple amendment. For this purpose, the following is suggested:

"Sec. —. Acquisition of Properties From Partnerships

"(a) Amendment of section 461 (a).—Section 461 (a) is hereby amended by adding, at the end thereof, the following new sentence: "'Subparagraph (D) shall apply with respect to properties acquired from a partnership despite the fact that, prior to said acquisition, (i) there have been deaths of partners, or withdrawals of partners from, or addition of partners to, the partnership, or (ii) the properties have been transferred from a partnership to a sole proprietor, or from a sole proprietor to a partnership, or (iii) there has been any change in the ownership of the properties through any combination of any of the events mentioned in clauses (i) or (ii) of this sentence: *Provided that*, during the base period and until the said acquisition, at least one individual, a member of the partnership from which the properties were acquired, had been owner of the said properties or a member of a partnership which had been the owner of said properties.'

"(b) Effective date.—The amendment made by this section shall be applicable to taxable years ending after June 30, 1950."

This proposed amendment would give to corporations which have acquired partnership properties after reorganization of the partnership the same treatment accorded to those corporations which have acquired properties either from other corporations or from partnerships which have been in continuous and unchanged existence during the entire base period. At the same time this treatment would be available only where there has been an actual and true continuity of the business. Discrimination and unfairness in the application of the relief provisions would thus be done away with.

While, of course, I am authorized to speak only on behalf of my client, I would say to the committee that I gather from discussions with other practitioners that there are a number of small businesses similarly situated and that their owners and advisers feel that they are being discriminated against.

The essential justice of the proposal is illustrated by the history of my client. Until July of 1940 Saul Wixson was a dragline and cableway operator, working on dam construction jobs. He was cableway and rigging superintendent in the construction of Boulder and Shasta Dams.

Then Mr. Wixson formed a partnership with J. H. Crowe of Redding, Calif., and the firm entered the field of general contracting. During the early months of the enterprise, considerable sums were advanced to the partners by Mr. Frank Crowe, Mr. J. H. Crowe's uncle. Mr. Frank Crowe decided to leave this money in the business, instead of demanding its repayment, and thereby purchased a one-third interest in the business, which he turned over to trustees for his daughters. The firm thereby became, effective January 2, 1941, a three-way partnership.

On April 30, 1946 (just after the beginning of the excess-profits tax base period), the trust withdrew as a partner because the trustees felt that the contracting business was so hazardous that trust funds should not be invested in it; Mr. Wixson and Mr. J. H. Crowe bought out the interest of the trust.

Early in 1947, Mr. Crowe decided to retire from the contracting business. Mr. Wixson bought out his interest and, after February 28, 1947, transacted business as a sole proprietor under the firm name of Wixson & Crowe until June 1, 1949, when the present corporation was formed, and the business and its assets transferred to it in a 112 (b) (5) transaction.

In August of 1949, the new corporation first bid on the Hungry Horse project. Its first bid was made jointly with J. H. Trisdale, Inc., and was for $8,384,670 (the highest bid was $11,250,190). For various reasons, not material to this statement, all bids made at that time were rejected, as were all other bids submitted for the same project on September 26, 1949, except for one schedule covering 1,000 acres, which was awarded for $475,000. A third set of bids was submitted December 20, 1949; at this time Wixson & Crowe, Inc., bid for about one-half of the remaining work, and J. H. Trisdale, Inc., for the other half. Their respective bids were accepted, for a total of $4,931,210; the Bureau of Reclamation's engineer's estimate for the project was $6,231,850.

The startling difference between the first and final bids (and between the Bureau's final estimate and the final bid) is attributable solely to one fact: Mr. Wixson had invented and perfected a new device and a new method for clearing operations. It would be inappropriate to describe this device and method in this statement, but it has been given wide publicity in technical, and even popular, periodicals.

Here, then, is a situation in which, over 6 months before the invasion of Korea, almost a full year before the Congress started to consider the Excess Profits Tax Act of 1950, over 6 months before the effective date of that act, and a full year before the adoption of our present high military budget, a corporation undertook a fixed-price contract at a price which saved the United States Government millions of dollars. The only effect of hostilities and a large military budget on this contract could be to lessen the contractor's profit because of the spiraling costs of labor, equipment, and materials resulting from the present economy. Surely, in truth, none of the profits from this contract can actually be excess.

At the least, it must be conceded that the contractor should not be penalized by an unfair, discriminatory application of the taxing laws. Wixson & Crowe, Inc., should not pay one cent more tax than it would have if Mr. Wixson had conducted the business as a sole proprietor from the first day of 1946 until the transfer to the corporation, or if Mr. Wixson and Mr. Crowe had been partners during all of the base period and until the transfer.

I am as certain as I can be of any such thing that Wixson & Crowe, Inc., would have had a good chance for relief under the old section 722. I am even more certain that, for the reasons I have tried to explain, there is no hope for relief under the mechanics of the act as presently administered by the Bureau. This committee by recommending such a clarifying amendment as I suggest can remove the existing discrimination and can assure that the law will be applied to all taxpayers, large and small alike. We, therefore, respectfully request your favorable consideration of our request.

A Proposal for an Amendment of the Excess Profits Tax Relief Provisions To Prevent Discrimination

(By Cyrus B. King, San Francisco, Calif.)

I. THE PROBLEM

Drafting an excess-profits tax law is probably the most difficult task of the congressional committees which have the responsibility for tax legislation.

The difficulty arises from the effort to tax only those profits which are truly excess [1] and from the necessity of laying down rules which will determine what part of a corporation's profits is excess and what part is normal or average. One of the rules permits this determination to be made by comparing the earnings of a corporation before the years covered by the excess-profits tax with its earnings

[1] "An excess-profits tax selects for additional tax those corporations whose profits are higher than they probably would have been in the absence of hostilities and a large military budget." House Ways and Means Committee Report No. 3142, 81st Cong., 2d sess.

"One of the main advantages of an excess-profits tax in periods of large military expansion is that it selects for additional tax those corporations whose profits are higher than they would have been in the absence of hostilities and a large military budget." Senate Finance Committee Report No. 2679, 81st Cong., 2d sess.

during those years; it is assumed that, to some extent, if the earnings in the latter years are greater, the difference constitutes excess profits.[2] But no single yardstick will apply to all the numberless forms and kinds of American business enterprises. The Congress has, therefore, always included relief provisions, the general purpose of which is to insure, so far as possible, uniform and just application of the tax.

Under the World War II law, relief was provided, among other ways, by such general relief provisions as section 722. Under this section, within broad limits, a taxpayer was allowed to reconstruct a substitute level of normal earnings[3] if, due to any one of many specified conditions, its actual prior normal earnings were not truly representative of its normal earnings during the excess-profits-tax years. The application of these general relief provisions involved highly technical and expensive processes and called for the services of expert lawyers, accountants, economists, statisticians, and other specialists.

Many taxpayers and their advisers complained about the operation and the uncertainty of these provisions. Probably because of these complaints,[4] the Congress has written into the present statute a series of definite and more-or-less automatic relief provisions.[5] These give taxpayers a degree of certainty they didn't have under the former law; they do away with the expensive and time-consuming preparation of cases, presentation of those cases to the Bureau of Internal Revenue, and the even more expensive court litigation, all of which were engendered by the old law; to that extent they are beneficial.

But the benevolent effects of the present relief provisions will be greatly diminished if they, or their interpretation by the Bureau of Internal Revenue and the courts, lead to discrimination or to unjustly heavy tax burdens which result from pure accident.

The purpose of this statement is to call attention to one such provision and to the need for its amendment and clarification.

For the sake of brevity, the problem will be stated as simply as possible, and many of the complexities of the law will be disregarded.

To determine what portion of a corporation's profits are excess under the present law, the taxpayer may compare them with its profits, after certain adjustments, during a 4-year base period, generally the calendar years 1946-49. To the extent that a corporation's profits in the current year exceed a percentage of the average yearly profits during that base period, they are taxed as excess. For this purpose, 85 percent of the base-period average (which incidentally can be arrived at only by computations and adjustments so involved that space does not permit discussion of them here) is called the excess-profits credit.

Example.—Assume that in each of the years 1946-49 a corporation had a net profit of $100,000, and that, under the law, no adjustments would be required to determine the average (a most unlikely assumption). The average base-period net income would be $100,000; and any profits of the corporation after July 1, 1950, or in later years in excess of $85,000 would be taxed as excess profits.

There are many kinds of circumstances under which this formula will not establish a fair or equitable credit. This statement will cover one such circumstance which points to the need, mentioned above, of an amendment: the problem of the corporation which has not been in existence in its present form for the full 4 years of the base period.

For many reasons, the make-up and form of business enterprises change frequently. A corporation will merge with another, or will take over other corporations. A corporation may split into two or more separate entities. A partnership may incorporate. A sole proprietor may take in a partner. A partner may die, and, under State law, a new parternship may result. Despite any of these, or other sorts of changes of form, there may well be, in any case, an actual continuity of the business and of its capital, its assets, its management, and its true business experience. In such case, the present corporation should be allowed to measure the extent of its excess profits by the normal profits of its predecessors.

[2] The other method of measuring excess profits, based on the rate of return on capital, is not considered in this statement.

[3] "Under sec. 722 a hypothetical base-period earnings, credit had to be tailor-made for the individual taxpayer on the basis of almost all the factors which influenced the taxpayer's business during the base-period years." Summary of Excess Profits Tax Act of 1950 prepared by the Staff of the Joint Committee on Internal Revenue Taxation.

[4] These provisions "of the World War II law have resulted in extended delay in the settlement of relief claims which discriminated against taxpayers who had neither the time nor the financial resources necessary for the establishment of their cases." From both the House and Senate committee reports cited in footnote 1.

[5] The present law "provides relief by a set of formulas, thus reducing the area of administrative discretion to a minimum." From the joint staff's summary, cited in footnote 3.

The present law provides for some of these situations; but, as interpreted, it does not cover all of them, and therein lies the possibility of discrimination.

Under part II of subchapter D (secs. 461–466) of the Internal Revenue Code (part of the present excess-profits-tax law), a reorganized corporation can generally take advantage of the earnings history of its predecessors; and, if one or more of those predecessors had, in turn, been a reorganized corporation, the present corporation can go back and use the earnings history of the predecessors' predecessors. To express this in terms of the technical language of the law, an acquiring corporation can carry its existence and financial history back through its component corporations; and one or more of the components of a present and existing corporation can be an acquiring corporation as to its components.

Example.—The White corporation was in existence on January 1, 1946. In 1947, the Black corporation was formed and acquired all of the assets of the White corporation in exchange for the Black stock. In 1949, the Green corporation acquired the assets of the Black corporation in exchange for voting stock.

The Green corporation will be considered to have been in existence during the entire base period, and can then use the earnings of the White and the Black corporations to measure its excess profits.

Further, if the entire financial history of the "acquiring" and the "component" corporations, taken together, meet certain qualifications, and if the continuity dates back to before January 1, 1946, the existing corporation is entitled to other relief afforded to "growing corporations," that is, corporations whose growth has been so rapid in the base period that it would be unfair to compute their excess profits credit on a straight average of actual base period earnings.[6]

These provisions as to reorganizations also apply to a corporation which "has acquired substantially all of the properties of a partnership" (or a sole proprietorship) in a tax-free exchange.[7] So, all of the benefits of these provisions apply to a corporation which took over a partnership (or a sole proprietorship) which existed on January 1, 1946.

But—and here is the problem toward which this statement is directed—the Bureau and the courts have read into the law a requirement which doesn't appear in the statute: that, to get the benefits of this relief provision, the partnership or proprietorship must have existed in exactly the same form during the entire base period and until its properties were acquired by the corporation.

Examples.—(1) If the partnership of Brown & White existed on January 1, 1946, and, in 1949, the partners decided to incorporate, the resulting corporation could base its excess profits tax credit on its own earnings history and that of the old partnership, and its "growth" would be measured from January 1, 1946.

(2) But, according to the Bureau of Internal Revenue, if Mr. Brown had conducted the business as a sole proprietor until 1948, and then had taken Mr. White in as a partner; and if the partners incorporated in 1949, the corporation could not take into account any of the financial history of the enterprise before the date of the formation of the partnership. Further, it could not qualify for relief as a "growing corporation" because its "component" was not in existence on January 1, 1946.

(3) On the other hand, if Mr. Brown had been the sole proprietor of the business until 1949, had then incorporated, and thereafter sold an interest in the corporation to Mr. White, the corporation could trace its existence and earnings history back to the beginning of 1946.

(4) If, in the example No. 1 above, Mr. White had died just before the incorporation and Mr. Brown had brought out his interest, the corporation would probably[8] not have been entitled to relief.

These examples clearly show that the relief offered by the law may be afforded, or denied, to a particular corporation, depending on pure accident.

It is submitted that this possibility of discrimination was not intended by Congress. It arises primarily from an interpretation of the Bureau of Internal Revenue, and, secondarily, from the fact that the wording of the statute is such that its meaning is not clear.

The Bureau's interpretation is evidenced by one of its regulations, promulgated under section 740 of the World War II law (which is almost identical to the provisions of the present law as to properties acquired from a partnership). This part of the regulations[9] reads as follows:

[6] See sec. 435 (e) and 462 (c), IRC.
[7] See secs. 461 (a) (1) (D) and 461 (f), IRC.
[8] Unless, perchance, Brown & White had entered into a particular type of a contract during their lives. See Ransohoff's, Inc., 9 T.C. 376.
[9] Regulations 112, sec. 35.740-4.

"A partnership (or a business owned by a sole proprietorship) can be a component corporation * * *. However, a partnership (or a business owned by a sole proprietorship) cannot be an acquiring corporation and, therefore * * * (the law) cannot operate to make of its predecessors component corporations of its acquiring corporation."

This regulation, and the precise problem toward which this statement is directed has been before the courts in several cases.[10] The courts have held that the regulation is "reasonable"; but it is submitted that, in no case, has a court squarely considered this question: "Does the regulation express the intent of Congress?"

Actually, there is no requirement in the statute that the partnership (or sole proprietorship) shall have been engaged in business without any change in the composition of the partnership up to the time of the transfer of its properties to the corporation. The statute does not require that, at the time of the transfer, the properties shall have belonged continuously to the partnership. As a matter of fact, in a number of jurisdictions a partnership is not regarded as a legal entity at all and cannot, as such, own any properties; this rule is particularly true of real estate. Did Congress intend that such a local rule would render this relief inoperative?

It is submitted that what Congress intended was that a corporation which succeeded directly, or perhaps even indirectly, but in a tax-free exchange, to substantially all of the properties which had been utilized by a partnership is entitled to utilize the earnings experience of the business and properties during the period of their operations. It is the income from the properties that Congress had in mind. Congress has not required that the relief would be applicable only in the case of a partnership (or sole proprietorship) transferring its properties to a corporation without any change in the ownership of the properties prior to the transfer. Instead, Congress used the words "a corporation which has acquired." If Congress had intended to confine the relief only to those situations which would be covered by the Bureau's interpretation, it could easily have done so; but there would be neither logic nor equity in such a requirement.

But, even if it be admitted for argument's sake that the language of the statute is not clear and that its ambiguity might support the Bureau's construction, it cannot be assumed that Congress intended such discrimination. It is submitted, therefore, that an amendment of the statute is necessary, either—

(a) to repudiate the erroneous interpretation; or

(b) to assure a uniform, nondiscriminatory application of the law so that all corporations, large and small, will receive equal treatment.

II. THE REMEDY

The discriminatory effects of the present provisions of the law can be obviated by a simple amendment. For this purpose, the following is suggested:

"SEC.—. ACQUISITION OF PROPERTIES FROM PARTNERSHIPS

"(a) AMENDMENT OF SECTION 461 (a)—Section 461 (a) is hereby amended by adding, at the end thereof, the following new sentence: 'Subparagraph (D) shall apply with respect to properties acquired from a partnership despite the fact that prior to said acquisition, (i) there have been deaths of partners, or withdrawals of partners from, or addition of partners to, the partnership, or (ii) the properties have been transferred from a partnership to a sole proprietor, or from a sole proprietor to a partnership, or (iii) there has been any change in the ownership of the properties through any combination of any of the events mentioned in clauses (i) or (ii) of this sentence, provided that, during the base period and until the said acquisition, at least one individual, a member of the partnership from which the properties were acquired, had been owner of the said properties or a member of a partnership which had been the owner of said properties.'

"(b) EFFECTIVE DATE—The amendment made by this section shall be applicable to taxable years ending after June 30, 1950."

It is submitted that the proposed amendment would give to corporations which have acquired partnership properties after "reorganization" of the partnership the same treatment accorded to those corporations which have acquired properties either from other corporations or from partnerships (or sole proprietorships)

---

[10] See, for instance, E. T. Renfro Drug Co., 11 T.C. 994; affirmed, 183 F. 2d 846; certiorari denied, U. S. Supreme Court, February 26, 1951 and Hawaiian Freight Forwarders, Ltd., 15 T.C. 35.

The Renfro case involved a partnership of three persons. The interest of one of the partners was bought by the others before acquisition of the assets of the partnership by the corporation. The Tax Court, after citing and approving of the regulation quoted above, held that the business experience of the partnership during the base period could not be transferred to the corporation because the "intervening proprietors were not 'acquiring corporations' as defined in the * * * Code."

which have been in continuous and unchanged existence during the entire base period. At the same time this treatment would be available only where there has been an actual and true continuity of the business. Discrimination and unfairness in the application of the relief provisions would thus be done away with.

III. AN EXAMPLE

This statement is presented on behalf of Wixson & Crowe, Inc., a Nevada corporation with its main offices in Redding, Calif. It is adversely affected by the discriminatory operation of the present law. In this respect, it is typical of many small corporations throughout the country; its attorneys and accountants have been told by other practioners of many similar cases. To illustrate the sort of injustice that can result from the present law, the following history and facts are presented:

Wixson & Crowe, Inc., is engaged in the general contracting business, but specializes in clearing dam sites for the United States Bureau of Reclamation and similar work. Among its larger operations have been the clearing of the sites of the Shasta and Cascade Dam reservoirs and of the Seattle-Tacoma Airport. It is currently engaged in clearing large portions of the site for the reservoir of Hungry Horse Dam in Montana.

Saul L. Wixson started his business life as a dragline and cableway operator. He worked for years on dam-construction jobs. He was cableway and rigging superintendent in the construction of Boulder and Shasta Dams.

In July of 1940, Mr. Wixson formed a partnership with J. H. Crowe, of Redding, Calif., and the firm entered the field of general contracting. During the early months of the enterprise, considerable sums were advanced to the partners by Mr. Frank Crowe, Mr. J. H. Crowe's uncle. Mr. Frank Crowe decided to leave this money in the business, instead of demanding its repayment, and thereby purchased a one-third interest in the business, which he turned over to trustees for his daughters. The firm thereby became, effective January 2, 1941, a three-way partnership.

During the period of this partnership, the firm was engaged largely in its work on the Shasta Dam Reservoir (1941–43), the Seattle-Tacoma Airport (1943) and some tunneling work (1944–45). The partnership also acquired a ranch as an investment.

On April 30, 1946 (note that this was just after the beginning of the excess-profits tax "base period"), the trust withdrew as a partner because the trustees felt that the contracting business was so hazardous that trust funds should not be invested in it; Mr. Wixson and Mr. J. H. Crowe bought out the interest of the trust. From that date, too, the contracting business and the ranch were conducted as separate partnership enterprises, the contracting business being owned in equal shares by Messrs. Wixson and J. H. Crowe.

Early in 1947, Mr. Crowe decided to retire from the contracting business. Mr. Wixson bought out his interest and, after February 28, 1947, transacted business as a sole proprietor under the firm name of Wixson & Crowe until June 1, 1949, when the present corporation was formed, and the business and its assets transferred to it.[11]

In 1946, 1947, and 1948, the principal project of the enterprise was clearing the site at Cascade Dam in Idaho for the Bureau of Reclamation. In 1948, it also engaged in some tunneling work.

In August of 1949, the new corporation first bid on the Hungry Horse project.[12] Its first bid was made jointly with J. H. Trisdale, Inc. and was for $8,384,670 (the highest bid was $11,256,190). For various reasons, not material to this statement, all bids made at this time were rejected, as were all other bids submitted for the same project on September 26, 1949, except for one schedule covering 1,000 acres, which was awarded for $475,000. A third set of bids was submitted December 20, 1949; at this time Wixson & Crowe, Inc. bid for about one-half of the remaining work, and J. H. Trisdale, Inc. for the other half. Their respective bids were accepted, for a total of $4,931,210; the Bureau of Reclamation's engineer's estimate for the project was $6,231,850.

The startling difference between the first and final bids (and between the Bureau's final estimate and the final bid) is attributable solely to one fact: Mr. Wixson had invented and perfected a new device and a new method for clearing

[11] The transfer was one "to which sec. 112 (b) (5) * * * is applicable," and therefore the corporation became an "acquiring corporation" within the meaning of sec. 461 (a) (1) (D), Internal Revenue Code.

[12] All facts regarding these bids are shown in U. S. Bureau of Reclamation "Abstract of Bids," Spec. R1-HH9, R1-HH10, and R1-HH11, dated, respectively August 23, 1949, September 26, 1949, and December 20, 1949.

operations. It would be inappropriate to describe this device and method in this statement, but it has been given wide publicity in technical, and even popular, periodicals.[13]

Here, then, is a situation in which, over 6 months before the invasion of Korea, almost a full year before the Congress started to consider the Excess Profits Tax Act of 1950, over 6 months before the effective date of that act, and a full year before the adoption of our present high military budget, a corporation undertook a fixed-price contract at a price which saved the United States Government millions of dollars. The only effect "hostilities and a large military budget"[14] could have on this contract would be to lessen the contractor's profit because of the spiraling costs of labor, equipment, and materials resulting from the present economy.

Further, it is to be noted, that the contract was awarded in 1949. Because of climatic conditions, work could not be started until the spring of 1950. Because of the nature of these huge projects, the expenses of the first year's operations are the largest—and the profits consequently the smallest. So, by pure chance, the greatest profits will be earned in the years 1951 and 1952, when they are subject to the full impact of the excess profits tax.

Surely, in truth it must be admitted that none of the profits from this contract can actually be excess. Indeed it might well be argued that, under such circumstances, profits derived from such a contract would properly be exempted from excess profits tax altogether.

At the least, it must be conceded that the contractor shall not be penalized by an unfair, discriminatory application of the taxing laws. Wixson & Crowe, Inc. should not pay one cent more tax than it would have if Mr. Wixson had conducted the business as a sole proprietor from the first day of 1946 until the transfer to the corporation, or if Mr. Wixson and Mr. Crowe had been partners during all of the base period and until the transfer.

The accountants for the corporation have advised that, under present law, its "excess profits tax credit" will be about $78,000. If, however, it were not prevented by the present discriminatory statute and its interpretation from tracing its earnings and history back to January 1, 1946, the credit would be about $186,300. The difference between those two figures can be taxed each year, under present law at 30 percent, and at whatever higher rate the Congress may have to fix the excess profits tax in the future.

The history of this enterprise clearly illustrates the need, the justice, and the equity of the proposed amendment.

Senator BYRD. Our next witness is Mr. J. P. Wenchel, attorney at law.

STATEMENT OF J. P. WENCHEL, ATTORNEY AT LAW

Mr. WENCHEL. Mr. Chairman, and gentlemen of the committee, I can save a lot of time if you will permit me to file my statement.

Senator BYRD. We certainly will permit you to do so, Mr. Wenchel.

Mr. WENCHEL. I have extra copies.

My name is J. P. Wenchel, and I am an attorney with offices at 1625 K Street NW., Washington, D. C.

Senator BYRD. Who do you represent?

Mr. WENCHEL. I represent the Lerner Stores Corp., Howard Stores Corp., A. S. Beck Shoe Corp., Lane Bryant, Inc., Dejay Stores; Miles Shoes, Inc., and Edison Bros. Stores, Inc.

Thank you very much.

Senator MILLIKIN. Thank you.

Senator BYRD. Thank you very much.

Senator TAFT. It is the $25,000 question.

(The prepared statement of J. P. Wenchel is as follows:)

[13] See, for instance: The Reclamation Era, official publication of the Bureau of Reclamation, January 1951; Western Construction, July 1950; Excavating Engineer, August 1950; and Popular Mechanics Magazine, August 1950.

[14] See footnote 1.

STATEMENT OF J. P. WENCHEL

My name is J. P. Wenchel. I am an attorney at law with offices at 1025 K Street NW., Washington, D. C. I appear here as counsel for Lerner Stores Corp., Howard Stores Corp., A. S. Beck Shoe Corp., Lane Bryant, Inc., Dejay Stores, Inc., Miles Shoes, Inc., and Edison Bros. Stores, Inc., all retail chain-store organizations.

My purpose in appearing here is to register the opposition of these organizations to section 123 of the revenue bill of 1951, which proposes to place a limitation on the surtax exemption and minimum excess-profits credit of related corporations.

The use of related corporations is not new. Long before there could have been any tax advantage involved and, in many cases, long before there were any income taxes at all, the multi-corporate set-up was used for good and valid business reasons. Some of the objectives deemed desirable or necessary have been the following:

1. To limit liability on leases, mortgages, contracts, or other claims.
2. To eliminate allocation or other similar problems under State franchise or income-tax laws.
3. To retain the good will of corporations purchased as going concerns.
4. To separate manufacturing from retail activities or otherwise to separate reals estate and other unrelated activities.
5. To segregate the activities of high-grade and popular-priced stores.
6. To act as a possible hedge against anti-chain-store legislation.

The organizations on whose behalf I appear adopted the separate corporation procedure many years ago for one or more of the foregoing reasons and not for tax purposes. Let me cite several examples.

One organization commenced business with a single corporation in 1920 and still operates most of its units as part of the original corporation. However, as it acquired manufacturing plants, it prudently kept them as separate corporations. It did the same thing when it acquired additional stores which were already in operation and which it continued to operate under the old names. It now has 17 corporations; 14 of these were incorporated prior to 1940. Of the three corporations formed after 1940, one operates a manufacturing plant, the second is a textile converter, and the third acts as a wholesaler. Certainly no one can say that there has been an artificial splitting up in this case.

Another of the organizations was caused to recognize during the depression because the rentals under the leases of some of its stores were so high that not only were the operations of those stores made unprofitable, but in addition the entire chain was threatened. In 1932, having learned its lesson by bitter experience, it established a separate corporation for its operations in each State. In some cases where a particularly large operation has been contemplated, the organization has gone one step further and has insulated the particular unit from the others by forming a separate corporation. In most cases, however, each corporation owns a number of stores.

Another organization has separate corporations because it purchased some of its stores as going concerns and has continued to operate these stores as separate businesses under their old names. This has enabled it to hold the good will (for which it paid substantial amounts of money) of the former proprietors. It also maintains several separate real-estate corporations for buildings on which there are large mortgages. Most of its corporations were organized prior to 1942, six of them in 1920 or earlier years.

Another organization has over 200 stores. Despite the large number of stores, it has only 19 store-operating corporations, each of which, except in one instance, operates all of the stores in its State. Fifteen of the corporations were organized in the twenties or thirties.

The business reasons which prompted these and other organizations over the years to form separate corporations are still valid and I do not think that an attempt would be made to change the law if it were not for the fear expressed in the House committee report that corporations would be artificially split up. Moreover, I believe that the revenue effects of the proposed new section have been greatly overestimated. I also am of the opinion that the adoption of section 123 will not cure the evil and that, in the process, many innocent taxpayers will be penalized.

Let us take first those presently existing corporations which fall within the definitions provided by section 123. Many undoubtedly will continue to follow the practice of filing consolidated returns, and as to them the proposed section would take away nothing. As to many of the remaining number, the forced division of the excess-profits-tax credit also would mean nothing since their credits already are equal to or greater than the minimum provided by law. Some, it might seem, would benefit from separate credits and from separate surtax exemptions. The position of these companies, however, is not one of unmixed blessing. By filing separate returns, the gains of one corporation cannot be offset against the losses of another, and the adverse effects of this in dollars and cents may in a single year wipe out any apparent advantage otherwise gained. Again, there is the matter of the 85 percent limitation on the credit for dividends received, which offsets in whole or in part the benefit of a separate surtax exemption.

In this connection I would like to say that the Congress has always sought in a spirit of fairness to make the tax laws of this country consistent. If section 123 should be adopted, then in the same spirit of fairness and justice the law also should be changed to provide a full 100 percent credit for dividends received from related corporations. The section is bottomed upon the premise that the income of two or more corporations owned entirely or almost entirely by the same corporation or by the same individuals is really the income of but one corporation. If this be so, then, by the same token, the transfer of what we now call a dividend from a subsidiary to a parent corporation should have no tax significance, and accordingly no additional tax should be due. Similarly, if separate entities are to be disregarded then there is no justification for the retention of the 2 percent tax now paid for the privilege of filing consolidated returns.

I think, however, there is much wrong in the philosophy that, under the circumstances described in section 123, the income of two corporations should be regarded as if it were the income of but one company. By way of illustration, assume that Mr. A owns a retail store which he operates in corporate form. Last year the company had a net income before taxes of $30,000. If this year the company has a net income of $50,000, it will pay more in taxes and, in fact, Mr. A will expect a larger tax bill. Suppose, however, that after much deliberation Mr. A opens a new store in a different part of the city or in a nearby town, which store is separately incorporated. Assume, further, that the old company again makes $30,000, and that the new store earns $20,000. I think Mr. A would be more than perturbed to find that the tax of the old company had greatly increased. He would argue, and rightly so, that in order to start the new business he had risked what was to him a great deal of capital, and the new company should therefore have the same benefits as any other new company, regardless of its ownership.

The proposed law will work a severe hardship upon some related corporations whether they be large or small and regardless of how long and for what valid reasons they were organized. It will also work a hardship upon the small-business man who might otherwise risk his capital in new ventures or expand his activities by purchasing an existing business. While the proposed section would work these inequities, I doubt very much if it will stop those who are seriously interested in obtaining additional exemptions and credits. If the owners of an existing corporation are thus inclined, apparently all that is necessary is for their corporation to form a new subsidiary and to sell to others 6 percent of the voting stock of that new company. That part of section 123 which deals with the ownership by individuals of two or more corporations is apparently equally susceptible of tax avoidance by those who would so use it.

On the other hand, the long-established multicorporate organizations, for very practical reasons, cannot indulge in the same sort of shifting about even if they wished to do so. The new section therefore will hit those who have conducted their affairs as prudent men would do and with no thought of tax advantage but will not affect the real tax avoiders. The proposed section comes upon the long-established related corporations as a penalty for having followed the correct business route.

Under the foregoing circumstances I believe that careful consideration should be given to the effects of this proposal. I do not think that it will aid small business. It will inhibit expansion. It will impose severe penalties upon establishments which adopted the related corporation basis for valid and sound reasons. If it is intended to close a tax-avoidance loophole it will not be effective and it is much too broad, since it brings within its purview not only the potential tax avoiders but also many others who have conducted their affairs in a prudent and businesslike fashion for many years.

Senator BYRD. In lieu of an appearance the Chair inserts the statement of the Reynolds Metal Co.

STATEMENT OF RICHARD S. REYNOLDS, JR., PRESIDENT OF REYNOLDS METALS CO.

I am Richard S. Reynolds, Jr., president of the Reynolds Metals Co., of Richmond, Va.

I am mindful of the terrific problem involved in trying to bring equity into any excess-profits tax law. When the Committee on Finance wrote the relief provisions in the act, it doubtless thought that they would be adequate to cover any hardship situations which might be encountered by a company such as ours. We, too, had that hope.

I regret to report that not one of the so-called relief provisions will relieve Reynolds from excessive and discriminatory taxation on its normal earnings. No formula contained in the law meets our situation. I therefore desire to bring to your attention the situation of our company.

WHY REYNOLDS SHOULD HAVE RELIEF

The Reynolds Metals Co. and its subsidiaries mine bauxite, extract alumina from the bauxite ore, and reduce this to aluminum. In addition to the production of primary aluminum, Reynolds has extensive fabricating facilities. It owns ore deposits in Arkansas and Jamaica, and its manufacturing interests extend into the States of Alabama, Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Georgia, Illinois, Indiana, Kentucky, Michigan, Missouri, New Jersey, New York, Oregon, Pennsylvania, Tennessee, Texas, Virginia, and Washington.

From its outset, Reynolds has been the apostle of expanded production and low cost. Since commencing the production of primary aluminum 10 years ago, it has greatly expanded its productive capacity. During the 5 years since the war, it has explored and developed new ore deposits, has acquired extensive plant facilities, and has proceeded continuously to integrate and improve its facilities and capacity. Even in the latter part of 1949 it launched a substantial increase in its capacity for peacetime use of aluminum, an increase in capacity which was just completed in the second half of 1950.

The base period determined by Congress to be used in the application of the excess-profits tax is unreasonable, inequitable, and unfair as it applies to Reynolds.

The base period fixed by Congress for determining our "normal earnings" is precisely the period when we as newcomers to peacetime operation in the aluminum field were attempting to expand our plants, create new products, and develop new outlets for aluminum. These were the features receiving our main effort; we were anticipating normal profits in the future and were engaged in building up to reach that objective.

In 1945, the year immediately preceding the base period, Reynolds' production of primary aluminum was 137,713,707 pounds. But during the base period, 1946 through 1949, Reynolds was greatly expanding its production. In pounds of metal Reynolds produced—

	Pounds
In 1946	184, 388, 235
In 1947	320, 480, 084
In 1948	338, 313, 153
In 1949	364, 654, 635

Over 1946, the year 1949 was an increase of approximately 100 percent.

During the 4 years 1946 through 1949 Reynolds spent nearly $95,000,000 for new plant and facilities. From the beginning to the end of the base period the Reynolds investment in plant and equipment increased more than four times.

After the war Reynolds sought to secure markets for primary production because it was a new producer of aluminum with no established outlets. Many new end products were manufactured, and heavy promotional expenses absorbed part of the earnings of the reduction and fabricating divisions. During the base period Reynolds was experimenting with, developing, and exploiting new products. Among these were roofing, siding, windows, gutters, downspouts, and various other building products, cable, truck bodies, railroad cars, automobiles, various kinds of foil wrap for the preservation of food, etc.

Furthermore, the enormous expansion represented by the postwar quadrupling of its investment in plant and facilities required time for integration and scheduling into an economical and efficient operation.

Despite this great increase in production and in plant investment, Reynolds' dollar profit was the same in 1949, the last year of the base period, as in 1946, the first year in the base period.

Reynolds had been brought to the point where it was just ready to receive the benefit from this huge expansion. It would have done so without regard to mobilization. The base period was not normal, and it is unfair to use it as the standard in determining what earnings are now to be subjected to the excess-profits tax.

In total this expansion was a heavy undertaking. The result is that Reynolds was a low-profit operation throughout the base period. Wholly aside from the events in Korea and the defense demands of the country, Reynolds had been confidently looking forward to the latter part of 1950 and the year 1951 as the time when it would begin to realize the profit normally and reasonably to be expected from these extensive undertakings. The soundness of this view was being demonstrated by the facts. Even prior to Korea the demands made upon it were exceeding its expanded capacity.

The result of these circumstances is that Reynolds has been in a solid but costly state of expansion and integration that would have yielded increased production and profit now and in the immediate future without the occurrence of any of the present critical developments of defense mobilization. The result is also that Reynolds typifies a growth company for which no formula of relief has been enacted. The Excess Profits Tax Act is inflicting a heavy penalty on Reynolds, and at the very time when it is making its maximum effort for defense.

In making the maximum use of its expanded capacity during the present emergency, it is required to accelerate the consumption of its limited domestic sources of bauxite. Furthermore, since Korea, at the urgent request of the Government, it has undertaken heavy financing for still greater productive facilities. It is obvious, however, that its ability to maintain sound and sufficient financing for such expansion (already having reached the sum of $85,000,000) and to do the maximum of which it is capable is affected by its ability to earn a fair profit. Especially is this true since it had already contracted substantial debt in the expansion of its facilities during the years prior to Korea.

Since the normal earnings of Reynolds are now subjected to the extraordinary rate of the excess-profits tax, plain equity and justice call for an amendment which will alleviate the hardship which the Excess Profits Tax Act now imposes, but which was never intended by the Congress.

RECOMMENDED AMENDMENTS

There are several practical ways of giving just and proper relief to Reynolds and other companies deserving of relief, while still subjecting a large part of their earnings to the excess-profits tax:

A lower ceiling—of, say, 60 percent—will be of assistance to all companies injured by the various kinds of unfairness inflicted by the excess-profits tax law.

A revised and strengthened section 722 procedure will eliminate some of the most serious inequities.

Another realistic approach is to grant relief based on the increase in actual production rather than in mere productive capacity without regard to the extent of its use. This should not be tied to such an unrelated criterion as the "average industry base period rate of return." That is so much of a lowest common denominator as to afford no relief at all.

Another approach is an amendment to the strategic-minerals provision by the addition of one more strategic mineral (metallic aluminum) to the 26 already included. This is explained in the next section.

WHY AN AMENDMENT OF THE STRATEGIC-MINERALS PROVISION IS IN THE PUBLIC INTEREST

The basic mineral resources of the Nation are among the richest in the world, and additional ones are constantly being discovered and developed. Not so, however, with bauxite ore, an aluminum-bearing clay, the mineral from which aluminum is made. The most recent, and the most significant, evidence of this fact is the amended MO 5 just issued this month by the Defense Minerals Administration setting forth the procedure under which Government aid may be obtained in financing the cost of projects for exploration for unknown or undeveloped sources of strategic metals or minerals. In the current amendment issued under the authority of the Defense Production Act, bauxite is added to the list of strategic and critical minerals for which the Government will contribute 50 percent of the total cost of the exploration projects. Significantly the list of metals in this MO is almost identical with the strategic minerals in the exemption provision of section 450 of the Excess Profits Tax Act. The same fact which caused the addition of bauxite to the list of strategic minerals included in the regulation for

Government aid in defense exploration projects should cause the adoption of the amendment submitted herewith.

Another proof of the strategic and critical nature of aluminum is the fact that both aluminum and bauxite are on the Munitions Board A list of strategic and critical materials for stockpiling.

Significantly, only in a small restricted area consisting of a portion of but two counties in the lone State of Arkansas is bauxite mined domestically for the production of aluminum. The Government and private interests have spent substantial sums in the search for new deposits of domestic bauxite and other aluminum-bearing clays. The search for and development of this critical and strategic mineral requires Government encouragement in all practical ways. Not only is this in the national interest, as it involves the economic well-being of our civilian economy, but is most important in the furtherance of national defense, since aluminum is indispensable in any modern war effort.

As indicating the dependency of the country upon foreign sources of bauxite, only a relatively small portion of the total virgin aluminum currently produced in the United States is produced from domestic bauxite. So short is the country of domestic bauxite suitable for the economic production of aluminum that the Munitions Board has stockpiled large quantities of imported bauxite. The transportation and storage of this foreign ore has presented difficult problems. This dependency on foreign countries is a burden on our economy and the American taxpayers and should be relieved by Congress if practical means can be found therefor.

One practical means of encouraging the exploration for domestic bauxite and other aluminum-bearing clays and the discovery of feasible and economical means for converting such ore into aluminum would be for Congress to extend to domestic bauxite and other aluminum-bearing clays, and the conversion thereof to a metallic state, the provisions of section 450 of the Excess Profits Tax Act of 1950. It is presently extended in that section to 26 other specifically named critical and strategic minerals and metals, including fluorspar, molybdenum, tungsten, nickel, tin, etc., which are no more critical and strategic than aluminum. After all, the production of aluminum in this country is, at the direction of the Government, being increased to meet the present emergency to a greater extent than is proposed in connection with any other basic critical, or strategic material. The already greatly expanded aluminum industry is at the urgent request of the Government being expanded from 75 to 100 percent.[1]

An amendment, completely consistent with the theory of section 450 as it now appears in the excess-profits tax law, is suggested as follows:

(*a*) Add bauxite (including aluminum-bearing clays) to the list of 26 strategic minerals in section 450 (b) (1).

(*b*) Include the conversion of a strategic mineral so as to cover not only the mining of bauxite but its conversion into primary aluminum.

Attached hereto is a draft of section 450 as so proposed.

The effect of this amendment would be to add primary aluminum to the strategic minerals listed in the act, but only when made from domestic ore. Certainly no metal is more strategic or critical to defense than aluminum.

Since aluminum results from (*a*) the mining of bauxite, (*b*) the extraction of alumina from the ore, and (*c*) the reduction of the alumina to aluminum, it is clear that the simple addition of bauxite to the list of 26 minerals in section 450 (b) (1) is not sufficient. Bauxite is an unconverted ore. In order to obtain aluminum, it is necessary to convert bauxite into alumina and then into the metallic form of aluminum.

There should be an incentive to create processes for the economic conversion of low-grade domestic bauxite and other aluminum-bearing clays into aluminum, since it is now possible but far more costly to convert low-grade bauxite and aluminum-bearing clays with a low alumina content than to convert high-grade imported bauxite with a high aluminum content. The exemption to be effective must therefore apply both to mining and to conversion. Such an incentive should tend to bring the resources of private enterprise into the active exploration for new deposits of bauxite (and other aluminum-bearing clays) and into the research needed for the development of such economical processes.

---

[1] In his recent Midyear Economic Report, President Truman confirmed this statement when he said in part:

"The Council of Economic Advisers estimates that we have the ability to increase our total output by at least 5 percent within a year's time. * * * A major obstacle to the further expansion of production is the shortage of capacity in a number of key industries. * * * A number of basic expansion programs have been prepared by the defense agencies, and are now going forward under continuing review. * * * The aluminum program is planned to more than double our 1950 rate of output by the end of 1953. * * *" (Midyear Economic Report of the President to Congress, July 23, 1951.)

The proposed amendment would serve to create new virgin wealth, increase employment, and generate new sources of tax revenue, with resulting benefit to our civilian economy.

If the amendment resulted in bringing about its objective and purpose, it would tend to free the country from its almost complete dependency upon foreign sources of not only a critical and strategic meterial but one without which the country would be defenseless. The enemy now menacing not only our country but the rest of the free world has placed significant emphasis upon a vast modern submarine fleet which it is known to possess. So enormous is its submarine fleet that it doubtless could and would, in the event of war, be employed in such wise as to cut this country completely off from its source of foreign bauxite upon which it is almost entirely dependent. Since that source is restricted to the Caribbean area alone, the Germans in World War II, with nothing like the submarine resources of the present potential enemy, almost succeeded in preventing the importation of bauxite into our ports. Large numbers of ore-carrying vessels were sunk, and the loss of life to our seamen was distressingly high. Thus, if the amendment accomplishes its objective and purpose, it might be the factor determining the success or failure of our whole defense effort, for without aluminum we would be impotent.

SUMMARY AND CONCLUSION

To summarize the foregoing:

Throughout the base period 1946–49 Reynolds was expanding, developing, and integrating, with the result that it was low in profit. During this period it spent nearly $95,000,000 in new plant and equipment; it doubled its production of primary aluminum; it quadrupled its plant investment; but its dollar earnings in 1949 were no greater than in 1946. By 1950 it was ready to reap the benefit from this long and costly preparation. Its demand was already greater than its production by mid-1950. The result is that a lrage part of its normal earnings in 1950 and 1951 (resulting from its pre-Korean expansion) are being unfairly subjected to an excess-profits tax.

We therefore respectfully recommend the following amendments: A lower ceiling; a revised and strengthened section 722 procedure, a relief provision based on the increase in actual production but not tied to an "industry base period rate of return," and the addition of metallic aluminum (produced from domestic ores) to the strategic minerals provisions of section 450.

"SEC. 450. CORPORATIONS ENGAGED IN MINING *OR CONVERSION* OF STRATEGIC MINERALS

[*Additions italicized—No deletions*]

"(a) EXEMPTION FROM TAX.—In the case of any domestic corporation engaged in the mining of a strategic mineral *or the conversion of a strategic mineral into a metallic state*, the portion of the adjusted excess profits net income attributable to such mining in the United States *or such conversion in the United States of a strategic mineral mined in the United States* shall be exempt from the tax imposed by this subchapter. The tax on the remaining portion of such adjusted excess profits net income shall be an amount which bears the same ratio to the tax computed without regard to this section as such remaining portion bears to the entire adjusted excess profits net income.

"(b) DEFINITIONS.—For the purposes of this section—

"(1) the term 'strategic mineral' means antimony, *bauxite (including other aluminum-bearing clays)*, chromite, manganese, nickel, platinum (including the platinum group metals), quicksilver, sheet mica, tantalum, tin, tungsten, vanadium, fluorspar, flake graphite, vermiculite, perlite, long-fibre asbestos in the form of amosite, chrysotile or crocidolite, beryl, cobalt, columbite, corundum, diamonds, kyanite (if equivalent in grade to Indian kyanite), molybdenum, monazite, quartz crystals, and uranium, and any other mineral which the certifying agency has certified to the Secretary as being essential to the defense effort of the United States and as not having been normally produced in appreciable quantities within the United States.

"(2) the term 'certifying agency' means the department, official, corporation, or agency utilized or created to carry out the authority of the President under section 303 (a) of the Defense Production Act of 1950 to make provisions for the encouragement of exploration, development, and mining of critical and strategic minerals and metals.

"(c) CERTIFICATION DURING TAXABLE YEAR OF TAXPAYER.—In determining under subsection (a) the portion of the adjusted excess profits net income which is attributable to the mining of a mineral which is a strategic mineral by reason of a certification made during the taxable year, such protion shall be an amount which bears the same ratio to the portion of the adjusted excess profits net income, determined without regard to this subsection, attributable to such mining during the entire taxable year as the number of days for which the taxpayer held the mineral property during the taxable year and after the date of the making of the certification bears to the number of days for which the taxpayer held the property during such taxable year.

"(d) APPLICATION OF SECTION TO LESSOR.—In the case of a mining property operated under a lease, income attributable to such property derived by a lessor corporation shall, for the purposes of this section, be considered to be income of a corporation engaged in mining."

Senator BYRD. We will recess until 10 o'clock tomorrow morning.

(Whereupon, at 12 noon, the committee recessed to reconvene at 10 a. m. Wednesday, July 25, 1951.)

REVENUE ACT OF 1951

WEDNESDAY, JULY 25, 1951

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
Washington, D. C.

The committee met, pursuant to recess, at 10 a. m., in room 312 Senate Office Building, Senator Harry F. Byrd presiding.

Present: Senators Byrd, Johnson (Colorado), Hoey, Kerr, Millikin, Taft, and Williams.

Also present: Senator Warren G. Magnuson, Senator Richard M. Nixon, Elizabeth B. Springer, chief clerk; Colin F. Stam, chief of staff, Joint Committee on Internal Revenue Taxation.

Senator BYRD. The meeting will come to order. The first witness is J. Howard Marshall. You have been assigned 15 minutes. Will you identify yourself for the record, sir.

STATEMENT OF J. HOWARD MARSHALL, THE AMERICAN PETROLEUM INSTITUTE, THE WESTERN OIL AND GAS ASSOCIATION, AND THE PACIFIC AMERICAN TANKSHIP ASSOCIATION

Mr. MARSHALL. My name is J. Howard Marshall. I am vice chairman of the board of Ashland Oil & Refining Company, Ashland, Ky., and I appear here today on behalf of the American Petroleum Institute, the Western Oil and Gas Association, and the Pacific American Tankship Association, and in opposition to section 493 of H. R. 4473, The Revenue Act of 1951.

Section 493 would impose a 3 percent tax on the "fair charge" for the transportation of petroleum and petroleum products by water, between points within the United States, where the shipper transports his own oil or oil products in his own vessel or his own barges. My company operates a substantial number of oil barges and towboats on the Ohio and Mississippi Rivers and their tributaries.

By way of personal qualification on matters relating to the petroleum industry in general, I might mention in passing that I served as Assistant Deputy Administrator and chief counsel of the Petroleum Administration for War during World War II and some years before that as a member of the Petroleum Administrative Board of the Department of the Interior from 1933 to 1935.

While this committee has before it the House committee report stating that this particular part of the tax bill would only produce a revenue of $3 million, I do not believe that you have information on the practical effect of such a tax bill, the many inequities it would cause and the extremely burdensome administrative problems it would present.

Senator TAFT. Does this tax relate solely to transportation by water?

Mr. MARSHALL. Solely to transportation by water, Senator Taft, of petroleum and petroleum products that are carried in the shippers' own vessels.

Senator TAFT. It would not apply to a man shipping it in his own trucks, for instance?

Mr. MARSHALL. It would not apply to shipment in his own trucks. It singles out water transportation alone.

For the information of the committee, I wish to submit a summary of the important adverse effects of this proposal. For this purpose I desire to proceed by first examining the theory and effect of transportation taxes in general and then to an analysis of the discrimination and difficulties of administering this particular tax proposed to be levied under H. R. 4473 against one single commodity—petroleum.

The differential between the fortunately situated community and the less fortunately situated community with respect to commerce is the difference in transportation cost. The differential between a limited and an expanded market is transportation cost. The differential between less and more competition is mainly transportation cost. That a less fortunately situated community which must pay high transportation costs naturally should have its existing burdens compounded unnaturally by the imposition of a tax is surely unfair to consumers in areas remote from production. That markets made available by a reasonable transportation cost should be made unavailable by a tax on that transportation cost reverses the free flow of commerce. That competition in a community should be lessened by denying to that community the entry of goods from greater distances because of transportation taxes stifles free enterprise by stifling competition. All of these things are contrary to the public interest.

In the case of oil, for example, is it not bad enough for consumers in New England, along the east coast, the Pacific Northwest, in Virginia or Ohio, or in the great midwestern part of this country to be compelled to pay the cost of transporting an essential commodity from Texas, Oklahoma, Louisiana, or California without having to pay a transportation tax piled on top of a transportation cost? And, to make matters worse, to have that tax levied so that the further away from the source of supply, the higher the tax.

Senator KERR. Does not that principle apply to all transportation costs? Is that not the basis of the principle of the tax on transportation costs of all commodities shipped on the railroads?

Mr. MARSHALL. Senator, that is the basis of transportation costs by rail.

Senator KERR. I mean the cost is based on a flat percentage of the transportation costs; is it not?

Mr. MARSHALL. That is correct.

Senator KERR. And, the further the transportation, the higher the cost?

Mr. MARSHALL. The further the transportation, the higher the cost. And what it does, of course, is to penalize additionally those communities or those States, or those sections of the country, that are far removed from where the particular material is produced.

Senator KERR. I mean, is that not incident to the operation of the principle of the percentage tax on transportation costs?

Mr. MARSHALL. It is.

And I would submit to you, sir, that the theory of that tax, as the method of raising revenue, leaves something to be desired.

Senator KERR. There is no disputing that. But I presume that it is just as certain, as of the present, that not only is the theory but the reality of the tax that we do have with reference to transportation. Is that correct?

Mr. MARSHALL. That is correct, if it be transportation for hire. With respect to private transportation, at the present time no such tax is levied against any commodity.

Senator KERR. With reference to what?

Mr. MARSHALL. With respect to private transportation. If you are a shipper, for example, of gravel or coal or coke or iron ore, in your own equipment, and you owned the commodity, no such tax at the present time is levied; nor is it levied against petroleum or petroleum products.

Senator TAFT. But your present argument is an argument against any tax? It is really a repeal of the 3-percent tax you are advocating?

Mr. MARSHALL. It was merely examining the underlying basis of the whole theory of transportation taxes.

Senator KERR. I would think that your position is that of one of a group of operators who transport their own products. I do not think that there is much probability that there is going to be any change in our tax law of the operation of the percentage factor applied to transportation.

Mr. MARSHALL. Transportation for hire.

Senator KERR. In the event of the tax being levied.

Mr. MARSHALL. I suppose that is true, Senator.

Senator KERR. You do not recommend that?

Mr. MARSHALL. Over the long run, it would seem to me that it would be sounder not to have transportation taxes.

Senator KERR. I think it would be more desirable if you did not have any taxes.

Mr. MARSHALL. Of course. But, as we both recognize, there are many different ways of levying a tax. I am simply saying that as a matter of general theory—and this statement considers it just generally as a starter—in the original days of the establishment of the United States Constitution, as you know, the various States that were fortunately situated tried to levy a tax on their commerce to make the less fortunately situated States pay it. And that was abolished.

Senator KERR. I must say they were amazingly successful in their effort; and, so far as I have been able to determine, still are.

Mr. MARSHALL. Even so, I think——

Senator KERR. But we cannot change that.

Mr. MARSHALL. We both might agree that it was an unsound principle.

Senator KERR. It is a harsh reality.

Mr. MARSHALL. It is a harsh reality.

Senator KERR. Yes.

Mr. MARSHALL. However, my particular point—and I will not debate with you or take the committee's time to discuss the general theory, except to mention in passing that it does seem to me that a transportation tax as such tends to put the Federal Government in the position where it is taxing particular sections of the country in a somewhat discriminatory manner, depending on whether you are fortunate enough to be located close to the source of supply or not.

Senator KERR. Of course, that is immaterial to me, as to how you make the presentation, but I am of the opinion that the presentation of a situation where you seem to be discriminated against as one of many who transport their own products would be far more persuasive than the presentation of a situation that, as I see it, is a reality and probably will be after this bill is rewritten.

Mr. MARSHALL. I am perfectly delighted to do that. And, in my formal statement here, if you will turn to page 4, I deal specifically with the discriminatory——

Senator KERR. No; I do not want you to turn to page 4. Go right ahead.

Mr. MARSHALL (continuing). I deal with the discrimination involved in this particular commodity.

Senator KERR. Go right ahead and make your statement. I just felt that way about what you said.

Mr. MARSHALL. I think, Senator, in the light of our discussion, that I have made the point that is covered in the first three pages of this statement; and, to save the committee's time, I think the point is perfectly clear in the record and that is all that is necessary.

Turning now from the general on to the specific—and now I am turning to page 4 of this statement—the proposed tax contained in section 493 of H. R. 4473 singles out the private transportation of petroleum and its products to the exclusion of all other commodities transported on the navigable waters of the United States by the owners of the commodities themselves, who are also the owners of the barges and vessels used for such purposes. These commodities include: Coal, coke, ores, sand, and gravel, chemicals, grain, sulfur, iron and steel products, lumber, and many other manufactured and fabricated products. The tonnages and the cost of transportation by water of these commodities in the aggregate greatly exceed the volume of petroleum and its products moved by water in equipment owned and operated by oil companies.

Senator KERR. Would you have any estimate of the cash revenue that would be derived by applying the tax to all of these other products equally in the amount as the House bill fixes it with reference to petroleum?

Mr. MARSHALL. No specific figures, but I am sure it would be many, many times.

Senator KERR. On account of the fact that you are positive there is many times the volume of the other commodities?

Mr. MARSHALL. That is correct.

If a Federal tax of this nature has any merit at all, it should be levied against all transportation of all commodities by their owners.

It constitutes, in our judgment, the rankest discrimination to pick out one commodity and one class of consumers for this kind of tax treatment. Surely this committee and the Congress desire to levy needed Federal taxes in a fair and equitable manner and not to discriminate against particular sections of the country and a single commodity, as is the case with respect to section 493 of H. R. 4473 as it was passed by the House of Representatives.

Senator KERR. Now, let me ask you this question: If the tax were left in the bill, it would not per se constitute a tax either against oil or the oil industry, but it would constitute a tax against a very limited number of those engaged in that industry, and to the extent only that they transport their own products?

Mr. MARSHALL. Except this: With respect to very large sections of our country—the east coast is a good example, and the Pacific Northwest another, and the great Middle Western States another—a very, very large proportion of the total amount of petroleum and petroleum products that are supplied to these regions of the country is moved by water, and the great bulk of that is moved by private carriers where the oil company owns the vessel or the barge in which the product is moved.

Senator KERR. Is it not a fact that much more of it is carried by nonprivate carriers?

Mr. MARSHALL. In the case of the east coast——

Senator KERR. I mean, the total volume.

Mr. MARSHALL. The total volume in some certain sections of the country would be almost exclusively by other means of transportation.

On here, on the east coast, and the Pacific Northwest, the east coast ratios, during the war, when World War II broke out, Senator, were that about 90 percent of the total consumption of petroleum and petroleum products on the east coast was moved by water.

Senator KERR. Is it not a fact that, if the tax were permitted to stay, it would be one that would be levied against certain operators in an industry rather than against the industry?

Mr. MARSHALL. It would be levied fundamentally against the consumers of the States dependent upon that method of transportation. It would be paid initially, of course, by the operators and subsequently, of course, by the consumers, in the long run, in the areas in question.

May not this tax on the private transportation of petroleum be used as a precedent for similar taxes on farmers hauling their own products to market in their own vehicles or fishermen moving their own catch in their own boats. Where will it end?

The report of the House committee dealing with section 493 of H. R. 4473 suggests that this proposed tax on the private transportation of petroleum and its products by water is justified because the movement of such commodities by pipeline is subject to a transportation tax. Aside from the fact that some discrimination against particular sections of the country and a particular class of consumers does not justify still more discrimination, as a practical matter, the administration of a pipeline transportation tax, complicated as it is, is simplicity itself compared to what is here proposed on water movements.

In almost every important instance covering pipeline movements, there are definite tariffs on file with Federal or State regulatory authorities. Pipeline routes are definite and fixed; on any particular route equipment is standardized; tariffs once posted change infrequently. But with tankers and barges nothing is or can be standardized. Ports of call, routes, and destinations change constantly just as do the products to be hauled and the equipment in which they are hauled. There are big tankers and little tankers, large and small barges, low-cost and high-cost equipment. Practically all shipping rates are spot rates. They are based on conditions that prevail at the moment such as the availability of the barge or ship at a particular place at a particular time or season, its size, speed, whether in clean oil or crude oil service, whether equipped with heating coils and a multitude of other variables too numerous to mention.

All of the foregoing was recognized in the data on proposed revenue bill of 1942, submitted to Ways and Means Committee by the Treasury Department and the staff of the Joint Committee on Internal Revenue Taxation April 24, June 27, 1942. I wish to quote specifically from page 444, exhibit 212—Transportation of property tax 4 (b).

It would be administratively impracticable to extend the tax to cover those businesses that conduct their own transportation service. In the absence of published rate schedules, it probably would be necessary to base the tax on the cost of conducting such service. This determination for literally hundreds of thousands of taxpayers seems an almost impossible task.

It is significant that even in the midst of our greatest war, the Congress of the United States and the Treasury Department did not deem it appropriate to levy a tax on private transportation.

Notwithstanding the modest revenue of $3 million that the House committee states this tax will provide and the warning just quoted to the effect that the collection of a tax on private transportation is administratively impracticable, I do not believe a more difficult collection problem could be found than that associated with the private transportation of petroleum. To give you just a few examples:

Out on our midwestern rivers barging is well over a century old. When it started, single barges were used by after a while two or more barges were tied together and towed in flotilla. Then the barges got bigger and the trips got longer and then it turned out that the towboat could not carry enough fuel for itself so some forgotten genius got the idea of putting the extra fuel for the tow boat in the rake ends of the barges it was pushing because the rake ends were not being used anyhow. This made it possible for the flotilla to keep on moving along day and night and it saved time and was safer.

This bill as passed by the House exempts "transportation in a vessel of products to be used (without unloading) as fuel supplies * * *." Does this exemption include fuel oil carried in barge rakes for the use of the vessel towing the barge?

In this case you will certainly have to pump it out from the rake into the towboat. Is that unloading?

From Texas to Maine and from California to Alaska, there are thousands of small fish, shrimp, sponge, oyster, and lobster boats and even sealers and shalers which operate from base or mother boats. Many of these boats receive their gasoline, diesel, lamp, and lubricating oils in barrels, cans, and other containers.

This proposed tax law does not exclude this packaged oil from tax until it arrives on the boat that uses it. How will this tax be applied in this instance and the many other cases of packaged petroleum products which might be mentioned?

The tax is stated to apply to liquid products of petroleum. There are more than a thousand products of petroleum. Some are gases until they are cooled or compressed in a tank to a liquid. Bottled petroleum gas is commonly used for cooking and heating in millions of homes in rural districts. This commodity is sometimes a liquid and sometimes a gas, depending on temperatures and pressures. What is it under this act when moved by water?

Take the same problem in reverse. There are many petroleum products which only become liquid when heated or in hot weather.

Asphalt, wax, and the heavy lubricating oils and greases are examples. Under this proposed law, are these products' to be taxable in the summer but not in the winter; exempt if shipped cold but not if shipped hot?

Let me suggest a further complication. There are thousands of tons of asphalt used each year in the surfacing of roads. This asphalt is normally solid but to make road oil it is "cut back," that is, dissolved in a thin solvent so it will become a liquid. This process can be safely undertaken at a plant regularly engaged in this blending operation. The product, then, if transported by water, would then be taxable. But if an individual moved his own solid asphalt in his own boat and then blended it or cut it back on the job, presumably he would avoid most of the tax. Does this make any sense?

Take the case of floating service stations which service fishing boats, work boats, and motorboats. Sometimes the oil is brought to them but often they are towed to an oil dock to be filled up after which they return to station to serve other boats. How much transportation tax based on what rate or fair charge will be due in hundreds of cases of this kind?

Given time, gentlemen, I think I could recite for hours the administrative complexities, the lawsuits and arguments that are bound to follow an attempt to apply and collect a private transportation tax on the transportation by water of literally thousands of liquid, semiliquid, liquefiable, solid or semisolid petroleum products moved daily to hundreds of thousands of consumers in a multitude of different types, kinds and sizes of tankers, barges and dry-cargo vessels.

One final point. Not only does the singling out of petroleum for a tax on its private transportation by water between points in the United States discriminate against domestic consumers distant from the sources of supply, but since this tax does not apply to any movement of either petroleum or its refined products from any foreign country into the United States whether for hire or by the owner of the product, the proposed domestic tax actually has the effect of a tariff levied against our own domestic oil producers, refiners, and marketers.

Thank you.

Senator BYRD. Thank you, Mr. Marshall.

Senator BYRD. Dr. Ethan A. Lang.

Dr. Lang, you have been assigned 10 minutes. Will you identify yourself, please?

STATEMENT OF ETHAN A. LANG, COMPTROLLER, CITY OF CAMDEN, N. J.

Mr. LANG. Thank you.

Senator BYRD. I might say that Senator Hendrickson has expressed his interest in your presentation.

Mr. LANG. Thank you.

Gentlemen, I am presently comptroller of the city of Camden, N. J.; former president of the Camden Board of Education, past president of the Middle Atlantic Association of the Amateur Athletic Union, member of the United States Olympic Committee, 1936, and member of the Municipal Finance Officers Association of the United States and Canada.

Mr. Chairman, you undoubtedly have been offered many suggestions and formulas for raising moneys to meet the fiscal needs of our Nation. What I am about to say will not suggest any ways or means of raising money. It will only present the facts of the harm the 20 percent Federal admissions tax has done and is doing to our schools. I have tried to make this report clear and concise.

It might be well, though, to point out that I represent no lobby group. I am not being paid by any individual, organization, or group of organizations, nor do I expect any personal gain from the elimination of the Federal admissions tax as it affects the thousands of primary and secondary schools in the Nation and their vitally important extracurricular programs.

I have been interested in the elimination of the Federal admissions tax for several years. During that time I have used my personal moneys and devoted much of my time and effort to waging, as a citizen, a campaign urging elimination of the tax.

I would like to present, for your consideration, some facts concerning a tax which never should have been enacted. I refer, of course, to the 20 percent Federal admissions tax to school plays, school dances and athletic contests.

Your colleagues in the House of Representatives, realizing what is happening to the school's extracurricular programs mainly because of the serious financial drain caused by the tax, recently approved a tax program that eliminated the admissions tax as it affected nonprofit religious, educational, and charitable institutions.

I feel fairly certain that when you too become cognizant of the same facts realized by the House Members, you will also recommend its elimination.

Gentlemen, following are some examples of hardship imposed on our primary and secondary educational institutions by this most unfair tax. Although the figures are from Camden, N. J., and Philadelphia, Pa., they are typical of a problem facing every primary and secondary school in the Nation.

A financial report of home athletic events at Woodrow Wilson High School, Camden, N. J., submitted by Mitchell Mozeleski, former athletic director, reveals a 1-year deficit of $47.50. Mr. Mozeleski points out that—

> if we did not have to pay the Federal tax, and charged the same admission as we do now, we would have shown a balance of $1,336.14 instead of a deficit.

He substantiates that statement with the following figures:

	Net gate	Federal tax
Football	$3,364.87	$841.36
Basketball	772.77	517.68
Baseball	49.50	24.60
Total	5,187.14	1,383.64

His financial breakdown for the various sports indicates as follows:

	Receipts	Expenditures
Football	$5,835.00	$5,323.88
Basketball	2,185.31	1,077.02
Baseball	71.50	1,187.07
Track		101.63
Tennis		62.70
Total	8,091.81	8,112.33

Then there is a breakdown in my brief of Mr. Mozeleski's figures.

Camden High School is another good example. Carlton R. Hopkins, principal, reported Camden High paid $1,031.91 in Federal admissions tax as a result of sporting events, causing the school, after other expenses, to operate its sports program at a loss of $863. Hopkins attributes that loss directly to the tax and further states, "It eventually will lead to the removal of physical training programs for our youths." He added the Government actually is taxing "athletic programs out of existence."

A spokesman for the public schools in Philadelphia said 10 of the 16 Philadelphia public high schools were in the red on their sports program during the school year recently ended and added most of them would have been able to meet expenses if there had been no Federal tax.

The Philadelphia public high schools paid a total of $10,109 in taxes during the year, including $1,847 which represented half of the Federal levy on city championship games conducted by the Interleague Commission. Parochial schools paid the other half. Among the schools paying heavy taxes on sports were: Southern High School, $1,441, and Frankford High School, $1,145.

Those are just a few examples of what is happening. The problem is not restricted to Camden and Philadelphia, but is harming nearly every school in the Nation.

This Federal admissions tax problem has become so great and aroused so much public interest that literally every board of education in New Jersey has passed a resolution urging elimination of the tax, joining forces with athletic and educational organizations in the State and Nation for its repeal.

Typical comments from educators in New Jersey regarding the tax all express hope that something can be done to eliminate it. Charles W. Mintzer, Fair Lawn High School principal in 1948, pointed out:

It is only a very few of the larger schools, representing a small percentage of the total school enrollment, that show a profit on athletic contests. The smaller schools have enough trouble struggling along even without the tax. Since these affairs are not run for profit, and any money accrued is spent in the interests of the children in furthering their educational program, it seems unfair that any agency should tax these affairs.

P. W. Averill, principal at Thomas Jefferson High School, Elizabeth, N. J., joined the rising protests when he said:

I would like to go on record as one schoolman who feels that if there is to be a reduction in our national tax, this is the first one that should receive consideration. Our games, our dances, and other things connected with the school are not run for personal profit to anyone. They are conducted for the best good of the students in the school and for school morale. Sometimes it is hard enough to carry all these activities and it is much harder when 20 cents of every dollar coming in must go into the Federal Treasury.

Not only have the boards of education been aware of what is happening in the schools because of the tax, but other organizations are alive to its effect and also have urged its elimination. Among them are the National Federation of State High School Athletic Associations, the New Jersey State League of Municipalities, the New Jersey State Interscholastic Athletic Association, and many others.

Even the sports columnists, both nationally prominent and hometown writers, have become aware of the situation and have commented editorially on the detrimental effects of the tax.

Dan Parker, New York Daily Mirror, nationally syndicated writer, recently devoted a lengthy paragraph to the tax, calling it "unfair." He said:

In the tax bill passed by the House recently, the unfair 20 percent tax on high and primary school entertainments and sports events was eliminated, thanks mainly to the campaign being conducted for its repeal by Dr. Ethan Allen Lang, for 10 years president of the board of education in Camden, N. J.

Soon the Senate will act on the tax bill and it is fervently hoped by all who have the interests of American youth at heart that the House's action will be backed up.

In most high schools, the entire program of extracurricular activities is financed by the revenue derived from football and basketball games or school plays or school dances. The amount paid in taxes often means the difference between success and failure for the program aimed at developing healthy outside interests for the children of school age. Surely our Government which can scatter billions around the world will not miss the comparative drop in the bucket that the tax on school athletic meets and entertainment represents. The money thus saved for expanding the program of extracurricular activities is the best investment that America could make for combating juvenile delinquency.

Ed Pollock, sports editor of the Philadelphia Evening Bulletin, is another writer who took the time to show his readers what happens to a percentage of moneys derived from gate receipts at high school sporting events. Mr. Pollock warns that—

At many of the schools, it is feared that a curtailment of athletic programs will be necessary if the tax remains in effect.

Administrators now are making an effort to retain sports which have participation appeal, but draw few if any spectators.

Charlie Schuck, a sports writer for the Camden, N. J., Courier-Post, in a recent sports editorial, expressed a belief elimination of the admissions tax would enable the schools—

to continue present programs on a larger basis and possibly expand to include such sports as golf and larger tenis schedules.

Pointing out that some of the athletic programs are on the "verge of collapse," he wrote that—

athletic directors are looking toward an exemption from the tax as their only ray of hope.

"Bear in mind"—he wrote—

high school athletic programs are strictly nonprofit ventures, designed purely for the development of character in America's youth, to help them learn sportsmanship, gain initiative, and how to become a good loser as well as a good winner.

Mr. Schuck also pointed out that Walter O. Ettinger, principal at Woodrow Wilson High School, Camden, and John McCarthy, athletic director at Camden Catholic High School, agreed:

An end to the tax without a doubt would save many high school athletic programs from complete collapse.

And, in conclusion, allow me to list seven reasons for elimination of the tax as outlined by the National Federation of High School Athletic Associations:

1. The work in collecting the tax and in keeping records adds an undue burden on an already overworked school staff.

2. A large proportion of the tax falls on grade-school and high-school students and this increases the cost of attending school since attendance is usually considered a valuable part of the student's responsibilities.

3. In many cases, the tax is actually assumed by the school and this reduces the funds which are available for maintaining a good activity program.

4. When the tax is added to the price of school event tickets, it tends to discourage attendance and this, in turn, reduces the income for maintaining the school activity program and also reduces the value of the public relations program which is considered vital in most school districts.

5. A tax on an activity tends to reduce interest on the activity. The admissions tax was primarily designed for professional events such as horse racing, boxing, and similar spectacles. The school activity program has little resemblance and relationship to such programs.

6. The grade schools and high schools receive practically no direct returns from Federal appropriations. The taxes are paid in the interests of the school program and used for activities only indirectly related to the schools.

7. Since funds which are secured from school admissions are used to maintain and expand the school program and since the school program is maintained by local taxes, the collection of the admissions tax merely decreases the amount of tax money which is available for administering the school activities.

Gentlemen, I urge you to give full consideration to the facts I have enumerated. Certainly the moneys derived from these school activities represent only a very, very small portion of the over-all tax structure. Yet to the schools, it represents the very lifeblood of the extracurricular program.

It tends to prohibit the school plays which discover the hidden talent and develop ability already established. It discourages the school dances where students of all races, color, and religion mingle on the same social level and it means in some schools the difference between obtaining good shoulder pads or helmets or ones of inferior quality, making the boy wearing it more prone to injury.

In some of the smaller communities, it means the discontinuance of most of the extracurricular activities.

Here is an opportunity to give direct aid to the schools without the accompanying cry of "Federal control."

Gentlemen, I call upon you to retain in your version of this tax bill the provision voted by the House which eliminates the 20-percent Federal tax on school plays, school dances, and athletic contests.

Senator BYRD. Thank you very much, Dr. Lang.

Mr. LANG. Thank you.

Senator BYRD. Mr. John M. Barker.

Will you identify yourself for the record, please?

STATEMENT OF JOHN M. BARKER, MANAGER OF TAXATION, GENERAL MILLS, INC., MINNEAPOLIS, MINN.

Mr. BARKER. I will try to keep within the 10 minutes.

My name is John M. Barker. I am manager of taxation for General Mills, Inc., Minneapolis, Minn.

My purpose in testifying before you is to bring to your attention an inequity in the "base period" under the Excess Profits Tax Act of 1950.

The "base period" as defined in the act and in section 435 (b) of the Internal Revenue Code is the period from January 1, 1946, to December 31, 1949.

One exception is made for certain corporations whose fiscal year ended between January 1 and April 1, 1950. The information that I shall present and the remedy I shall propose concerns only the small number of corporations with fiscal years ending after April 1. These corporations are not treated equitably; they are penalized in computing the base period excess-profits-tax net income as compared to taxpayers on a calendar year or a fiscal year ended before April 1.

When the Excess Profits Tax Act of 1950 was under consideration, it was decided the "base period" should end at March 31, 1950, because corporation income before taxes increased appreciably thereafter. If there should be no favored group permitted a base period beyond March 31, 1950, by the same token there should be no group which suffers a penalty by reason of its income year. Evidently no consideration was given to the fact that corporations whose fiscal year ended after April 1 would be required to include in their base period excess-profits income some months of abnormally low income.

You all are in possession of a copy of my brief. I explain in that brief how a fiscal corporation establishes its base period income. I will skip that.

Senator BYRD. Very well.

Mr. BARKER. Published figures show that corporate income before Federal income tax for 1945 and 1946 varied considerably from quarter to quarter. The rates of corporate profits before taxes will correspond approximately with the excess-profits-tax base period rates of income. I have a table which shows the annual rate of corporation income before Federal income taxes by calendar quarters.

You will note in that table that in the year 1945, in the last two calendar quarters, corporate income was at the rate of $17 billion in the third quarter, and $13.9 billion in the fourth quarter of 1945.

It went up to $15.8 billion in the first quarter of 1946, and then jumped until it got to $30. 5billion at the end of 1946, and it kept going up until in 1948 it reached a high of $36 billion, and then it dropped down again in 1949 and started back up again in 1950.

It should be noted that the rate of profit in the third and fourth quarter of 1945 and in the first quarter of 1946 was exceedingly low as compared with the annual rate of corporate profits after the first quarter of 1946. The rate of profit in these three calendar quarters is, in many instances, less than one-half of the rates of profit in subsequent quarters. Only a corporation whose fiscal year ends after April 1 has to include in the base period earnings for all or a part of the last two quarters of 1945 and all of the earnings of the first quarter of 1946.

While it is true that all corporations are permitted to compute their excess-profits-tax credit by using the best 3 or 4 years, there should, as far as possible, be available to all corporations an equality of choice for the 4-year earnings from which the best 3 years are to be chosen. Only the fiscal year corporation with years ending after April 1 has the penalty of low 1945 earnings in its excess-profits net income for the base period. It also, like other corporations, includes in its base the decline of profits experienced in 1949.

The brief here goes into how many corporations are involved in this. It is not applicable to the point, so I will not recite that.

The corporations whose fiscal year ends after April 1 and whose base periods consequently include a part of the calendar year 1945 are comparatively few in number. In the computation of their excess-profits-tax net income for the base period, they are affected by the following factors which no other corporation needs to consider.

(1) The excess-profits-tax law for World War II applies to 1945 earnings and thus there is taken into account the many economic factors which accompany this type of law and which affect each corporation's earnings differently.

(2) Corporations whose fiscal year ends on April 30, May 31, and June 30, 1946, must deduct from their excess-profits-tax net income for the base period the declared value excess profits tax which was repealed for taxable years ending after June 30, 1469. This tax, according to Treasury figures in Statistics of Income for 1945, part 2, totals over $13 million for this group of corporations.

(3) Earnings in 1945 reflect the economic conditions accompanying the surrender of Germany on May 8, 1945, and the surrender of Japan on September 2, 1945.

(4) The year 1945 reflects the economic results attributable to the cancellation of war contracts following the surrender of Germany and Japan.

(5) Corporate profits before taxes declined materially in 1945 and in the first calendar quarter of 1946. They declined again in 1949. Only the corporations whose fiscal year ends after April 1 take both the 1945 and 1949 declines into their base period.

(6) Only the corporation whose fiscal year ends after April 1 has to include in its excess-profits-tax income for the base period a part of five income years which cover a part of six calendar years.

(7) The economic results of conversion from a war economy to a peace economy affected both 1945 and 1946. These depressing conditions seem to have weighted heaviest in the last two quarters of 1945.

(8) Profits refunded under the Renegotiation Act which expired December 31, 1944, but which was extended by Presidential proclamation to June 30, 1945, must be eliminated from income of the base period. Government contracts and subcontracts thereunder did not again become subject to renegotiation until May 21, 1948.

For these reasons, it is suggested that corporations whose fiscal year ends after March 31, 1950, be permitted at their option to retain the base period provided under the present law or to choose a base period which will cover the period of 48 consecutive months ending on March 31, 1950. An option is suggested because only the corporations whose fiscal year ends after April 1 must use a longer time period in computing their base-period earnings and thus should be permitted a slightly greater leeway of choice. We are not suggesting that the base period be extended beyond March 31, 1950. This is approximately 3 months prior to the beginning of hostilities in Korea.

I will skip the technical amendment included in the statement to do it.

The following corporations join with General Mills, Inc., in respectfully requesting adoption of this suggestion:

Amalgamated Sugar Co., Ogden, Utah; Argus Cameras, Inc., Ann Arbor, Mich.; Chain Belt Co., Milwaukee, Wis.; Cornell-Dubilier Electric Corp., South Plainfield, N. J.; Crown-Zellerbach Corp., San Francisco, Calif.; Cunningham Drug Stores, Inc., Detroit, Mich.; the Dow Chemical Co., Midland, Mich.; the Harshaw Chemical Co., Cleveland, Ohio; King-Seeley Corp., Ann Arbor, Mich.; Nash-Kelvinator Corp., Detroit, Mich.; Omar, Inc., Omaha, Nebr.; Pepperell Manufacturing Co., Boston, Mass.; and the Procter & Gamble Co., Cincinnati, Ohio.

Thank you, gentlemen.

Senator BYRD. Thank you very much, Mr. Barker.

You kept within your time.

(The prepared statement of Mr. Barker is as follows:)

STATEMENT OF JOHN M. BARKER OF GENERAL MILLS, INC., MINNEAPOLIS, MINN.

My name is John M. Barker. I am manager of taxation for General Mills, Inc., Minneapolis, Minn. My purpose in testifying before you is to bring to your attention an inequity in the base period under the Excess Profits Tax Act of 1950. The base period as defined in the act and in Section 435 (b) of the Internal Revenue Code is the period from January 1, 1946, to December 31, 1949. One exception is made for certain corporations whose fiscal year ended before April 1 in 1950. The base period for these corporations is the 48 consecutive months ending with the close of the fiscal year which ended between January 1, and April 1, in 1950. The information that I shall present and the remedy I shall propose concerns only the small number of corporations with fiscal years ending after April 1. These corporations are not treated equitably; they are penalized in computing the base-period excess-profits-tax net income as compared to taxpayers on a calendar year or a fiscal year ended before April 1.

When the Excess Profits Tax Act of 1950 was under consideration, it was decided the base period should end at March 31, 1950, because corporation income before taxes increased appreciably thereafter. If there should be no favored group permitted a base period beyond March 31, 1950, by the same token there should be no group which suffers a penalty by reason of its income year. Evidently no consideration was given to the fact that corporations whose fiscal year ended after April 1 would be required to include in their base-period excess-profits income some months of abnormally low income.

The corporation with a fiscal year which ends after April 1, 1950, must establish its excess-profits net income for the base period in a manner different from all other corporations. To illustrate the method by which these corporations must reconstruct income for the calendar years 1946 to 1949, let us consider a corporation with a fiscal year ending June 30. The corporation must first start with the income for the five income years:

July 1, 1945, to June 30, 1946
July 1, 1946, to June 30, 1947
July 1, 1947, to June 30, 1948
July 1, 1948, to June 30, 1949
July 1, 1949, to June 30, 1950

The income for each of the 5 years is divided by 12 to obtain an income per month. The income per month for each of these income years is considered to be earned in the respective months of the income years which are in the calendar years 1946 to 1949. For instance, the year 1946 of the base period consists of

6 months of the earnings from the income year July 1, 1945, to June 30, 1946, and 6 months of earnings from the income year July 1, 1946, to June 30, 1947.

Published figures show that corporate income before Federal income tax for 1945 and 1946 varied considerably from quarter to quarter. The rates of corporate profits before taxes will correspond approximately with the excess-profits-tax base-period rates of income. I have a table which shows the annual rate of corporation income before Federal income taxes by calendar quarters.

Annual Rates of Corporate Profits Before Taxes [1]

[Billions of Dollars]

Calendar quarters	1945	1946	1947	1948	1949	1950
First quarter	24.0	15.8	31.4	33.0	28.3	29.2
Second quarter	24.0	21.6	30.9	35.0	26.4	37.4
Third qurter	17.0	26.4	31.3	36.6	28.2	46.4
Fourth quarter	13.9	30.5	32.8	34.5	27.6	50.8

[1] Sources: 1945-49 Statistical Supplement, Survey of Current Business, Department of Commerce, 1949; 1950 Economic Indicators, June 1951.

It should be noted that the rate of profit in the third and fourth quarter of 1945 and in the first quarter of 1946 was exceedingly low as compared with the annual rate of corporate profits after the first quarter of 1946. The rate of profit in these three calendar quarters is, in many instances, less than one-half of the rates of profit in subsequent quarters. Only a corporation whose fiscal year ends after April 1 has to include in the base period earnings for all or a part of the last two quarters of 1945 and all of the earnings of the first quarter of 1946. While it is true that all corporations are permitted to compute their excess-profits-tax credit by using the best 3 of 4 years, there should, as far as possible, be available to all corporations an equality of choice for the 4-year earnings from which the best 3 years are to be chosen. Only the fiscal year corporation with years ending after April 1 has the penalty of low 1945 earnings in its excess-profits net income for the base period. It also, like other corporations, includes in its base the decline of profits experienced in 1949.

The Statistics of Income for 1945, part 2, the latest publication by the Treasury Department shows that 303,019 corporations reported income for 1945. Of these corporations 60,307 had fiscal years which ended March 31. This is approximately 20 percent of the total. The same publication indicates 52,097 corporations filed excess-profits-tax returns which showed an excess-profits-tax liability and that 16,266 of these used the income method to determine their excess-profits-tax credit. I would estimate there are about 3,250 corporations involved in this base period problem if the percentage of corporations whose fiscal year ends after March 31 is applicable to the corporations who use the income method to determine excess-profits-tax credit.

The corporations whose fiscal year ends after April 1 and whose base periods consequently include a part of the calendar year 1945 are comparatively few in number. In the computation of their excess-profits-tax net income for the base period, they are affected by the following factors which no other corporation needs to consider.

(1) The excess profits tax law for World War II applies to 1945 earnings and thus there is taken into account the many economic factors which accompany this type of law and which affect each corporation's earnings differently.

(2) Corporations whose fiscal year ends on April 30, May 31, and June 30, 1946, must deduct from their excess-profits-tax net income for the base period the declared value excess-profits tax which was repealed for taxable years ending after June 30, 1946. This tax, according to Treasury figures in Statistics of Income for 1945, part 2, totals over $13 million for this group of corporations.

(3) Earnings in 1945 reflect the economic conditions accompanying the surrender of Germany on May 8, 1945, and the surrender of Japan on September 2, 1945.

(4) The year 1945 reflects the economic results attributable to the cancellation of war contracts following the surrender of Germany and Japan.

(5) Corporate profits before taxes declined materially in 1945 and in the first calendar quarter of 1946. They declined again in 1949. Only the

corporations whose fiscal year ends after April 1 take both the 1945 and 1949 declines into their base period.

(6) Only the corporation whose fiscal year ends after April 1 has to include in its excess-profits-tax income for the base period a part of five income years which cover a part of six calendar years.

(7) The economic results of conversion from a war economy to a peace economy affected both 1945 and 1946. These depressing conditions seem to have weighted heaviest in the last two quarters of 1945.

(8) Profits refunded under the Renegotiation Act which expired December 31, 1944, but which was extended by Presidential proclamation to June 30, 1945, must be eliminated from income of the base period. Government contracts and subcontracts thereunder did not again become subject to renegotiation until May 21, 1948.

For these reasons, it is suggested that corporations whose fiscal year ends after March 31, 1950, be permitted at their option to retain the base period provided under the present law or to choose a base period which will cover the period of 48 consecutive months ending on March 31, 1950. An option is suggested because only the corporations whose fiscal year ends after April 1 must use a longer time period in computing their base-period earnings and thus should be permitted a slightly greater leeway of choice. We are not suggesting that the base period be extended beyond March 31, 1950. This is approximately 3 months prior to the beginning of hostilities in Korea.

To accomplish this suggestion, we propose that section 435 (b) of the Internal Revenue Code be amended to read as follows (italicized portion added to present statute):

"(b) BASE PERIOD.—As used in this subchapter the term 'base period' means the period beginning January 1, 1946, and ending December 31, 1949, except that in the case of a taxpayer whose first taxable year under this subchapter was preceded by a taxable year which ended after December 31, 1949, and before April 1, 1950, and which began before January 1, 1950, the term 'base period' means the period of 48 consecutive months ending with the close of such preceding taxable year", *or in the case of a taxpayer whose first taxable year under this subchapter was preceded by or includes a taxable year which began before January 1, 1950, and ended after March 31, 1950, the term "base period" at the option of the taxpayer means the period of 48 consecutive months ending with March 31, 1950.*

The following corporations join with General Mills, Inc., in respectfully requesting adoption of this suggestion.

Amalgamated Sugar Co., Ogden, Utah
Chain Belt Co., Milwaukee, Wis.
Crown Zellerbach Corp., San Francisco, Calif.
The Dow Chemical Co., Midland, Mich.
King-Seeley Corp., Ann Arbor, Mich.
Omar, Inc., Omaha, Nebr.
The Procter & Gamble Co., Cincinnati, Ohio
Argus Cameras, Inc., Ann Arbor, Mich.
Cornell-Dubilier Electric Corp., South Plainfield, N. J.
Cunningham Drug Stores, Inc., Detroit, Mich.
The Harshaw Chemical Co., Cleveland, Ohio
Nash-Kelvinator Corp., Detroit, Mich.
Pepperell Manufacturing Co., Boston, Mass.

Senator BYRD. Mr. Boeschenstein.

Senator KERR. Mr. Chairman, I am sure the committee is aware of the fact that Mr. Boeschenstein was one of the men who came up during World War II and devoted most of his time to an important assignment in the War Production Board.

Mr. BOESCHENSTEIN. Thank you, sir.

Senator BYRD. Will you identify yourself for the record?

STATEMENT OF HAROLD BOESCHENSTEIN, PRESIDENT, OWENS-CORNING FIBERGLAS CORP.

Mr. BOESCHENSTEIN. My name is Harold Boeschenstein. My address is the Nicholas Building, Toledo, Ohio.

I am president of the Owens-Corning Fiberglas Corp., which is the pioneer in the development of and leading manufacturer of glass in fibrous forms. Our company competes in building, industrial, transportation, and domestic appliance insulation and in the synthetic textile yarn fields.

I appreciate the opportunity to appear before your committee to petition immediate action by the Congress in the Revenue Act of 1951 to alleviate the unfairness of the 1950 Excess Profits Tax Act as applied to the Owens-Corning Fiberglas Corp.

We are filing a prepared statement and brief, Mr. Chairman; so as to conserve the committee's time, I will cover only the high spots here.

Senator BYRD. You are assigned 10 minutes.

Mr. BOESCHENSTEIN. Without additional relief my company will not only pay excess-profits taxes on all earnings attributable to the defense program, but on 50 percent of our normal peacetime earnings as well.

This unfair taxation of normal profits comes about because our excess-profits-tax credit under the most favorable of the relief provisions will be only $6 million, although our normal level of earnings at the end of the base period was $12 million per annum.

This wide discrepancy between our excess-profits-tax credit and our normal earnings level results because the present act does not give adequate recognition to extraordinary growth.

During the base period, 1946 to 1949, we quadrupled our investment in plant, doubled our productive capacity, doubled our sales, and increased our earnings more than tenfold.

I submit, gentlemen, that this is a record of extraordinary growth.

The Korean War and accelerated defense needs had nothing whatever to do with these facts.

During 1946 to 1950, our growth in plant was twice that of our eight principal competitors and 3 times that of manufacturing corporations in general. Our increase in sales was 2½ times those of all manufacturing corporations.

But, after taxes, we were permitted to keep, in 1950, 18 percent less of our net income than the average for all manufacturers.

As the impact of the excess-profits tax increases in 1951 and subsequent years, this spread will become even greater.

We do not believe that the members of this committee and Congress intend to place a growing and expanding corporation at such a serious competitive disadvantage. Indeed, your chairman said on the floor in closing the debate on the bill:

> Whether the new relief formulas will adequately meet these situations, of course, the committee cannot say. We only express the hope that they will.

My statement is designed to show that the relief formulas provided fail to meet adequately our situation; that such relief can be provided without changing the policy and purview of the existing law or subjecting the Treasury to substantial losses of anticipated revenue.

Owens-Corning Fiberglas Corp. was organized in November 1938. We were pioneers in the development of glass in fibrous forms.

With an entirely new basic material and no developed and few known applications and uses, we had been in existence barely 2 years when the World War II preparedness program began.

To meet military needs and make the maxmum contribution to the war effort, we abandoned our civilian products and converted almost entirely to war materials.

As a result, we lost most of our newly created markets and newly found customers.

Throughout the war period, more than 90 percent of our production was for war purposes, a great proportion of which had no carry-over into civilian markets.

Senator MILLIKIN. What are the peculiar properties of Fiberglas?

Mr. BOESCHENSTEIN. The peculiar properties of Fiberglas, Senator, that made it valuable in war are its strength in relation to weight, its inorganic qualities, which mean that it will not rot and will not deteriorate, and its fire safety, because it will not burn.

We submit as exhibit 1 an account of the war production record of the Fiberglas Corp. in World War II. I think that will give you the details, sir.

What we did in World War II is the root source of our troubles today under the excess-profits-tax law as it exists.

When VJ-day came and our war contracts were canceled, our production facilities were completely out of balance with our civilian markets. We had expanded our production of textile fibers more than 700 percent to meet requirements of the Armed Forces for specialized products which had no counterpart in civilian markets.

On the one hand, we had a potential demand for insulation greatly in excess of the capacity of our one wool plant, and, on the other, we had two war-created plants equipped to produce textile fibers, for which civilian demands were entirely undeveloped.

To meet the crisis which faced us, we turned all of our energies and resources to the construction of facilities to meet the rapidly expanding insulation needs, and during the years 1946 through 1949 we constructed two new plants and reconverted and rehabilitated three existing plants at a cost of more than $23 million, which was a lot for a small business.

We also instituted vigorous research and sales programs to develop markets which would absorb the excessive capacity of our textile fiber facilities.

It was not until the last quarter of 1949 that the fruits of this broad expansion and development program began to be realized to any substantial degree.

During each year from 1946 through 1949, our profits were seriously depressed by our program for expanding our facilities for insulation and developing markets to utilize excess facilities that we had for Fiberglas textiles.

By the end of 1949, however, the development of new markets indicated that for the first time since World War II our textile capacity could be maintained at a profitable level of operation. This came about through the development of new markets.

The expansion program, more than doubling our facilities, was nearly finished. Sales for the first half of 1950 were greater than for the entire year of 1946.

Senator KERR. Right there, Mr. Boeschenstein, that was sales in the domestic markets?

Mr. BOESCHENSTEIN. Entirely, sir.

Senator KERR. And not in any way connected with war production or the preparation for war?

Mr. BOESCHENSTEIN. That is right. Our sales, or, rather, our profits for the 6 months were $6,000,000, compared with less than $1,000,000 for each of the years 1946 and 1947. This potential level of income of $12,000,000 at the end of 1949 was in no way related to the war. Those were normal, developed earnings.

We have prepared exhibit 2 showing this growth in plant, sales, and earnings in tabular form, for your convenience.

The provisions of the present law do not recognize this tremendous growth.

I will not attempt to go into details of the inadequacies of the present provisions, because time does not permit, and, also, these are technical, detailed, legal problems.

Senator MILLIKIN. Is your corporation a subsidiary of the Owens-Illinois Glass Co.?

Mr. BOESCHENSTEIN. No. It is not a subsidiary of any company, sir.

The Owens-Illinois Co. has an investment in it, but it is a minority investment.

I am not qualified to get too deep into technical legal problems, but I can only say that the provisions of the act are entirely inequitable, applied to our situation. They are discussed in a memorandum which is exhibit 3.

You may ask, Why is the present act so unfair that it should be remedied now?

First, it subjects to excess-profits tax not a relatively minor fraction of our normal profits, but roughly half of our normal profits.

Second, by subjecting 50 percent of our normal profits to excess-profits tax, we will be seriously restricted in our efforts to maintain our research and expand the production of our products necessary to defense and to maintain competitive civilian production.

The market for glass fibers is expanding dramatically. At present we are supplying approximately 100 important products to the defense program.

Essential civilian needs are also straining our present capacity.

Incidentally, this situation has been worsened by the recent flood in Kansas City, which has caused severe damage and serious loss of production in one of our principal plants.

Senator KERR. What area was your plant in?

Mr. BOESCHENSTEIN. We were in the Fairfax district. We have 9½ feet of water in our plant. They thought those dikes were impregnable in that area. It did not work out that way.

Third, we will be unable to compete on equal terms with much older and well-established companies in our respective fields. And that is a very important matter to us.

In 1950, one of the largest companies in the insulation field had only 20 percent of its income subject to excess-profits tax. Another principal competitor in textiles had only 28 percent subject to excess-profits tax.

In contrast, we had 62½ percent subject to excess-profits tax.

I would like to emphasize that very strongly, gentlemen, because the crux of it is in there. Over a period of years you cannot remain competitive under those circumstances.

Our case is unusual but certainly not unique. A credit could be provided by a specific growth formula similar to that now applicable to the new product corporation. No valid reason is apparent for providing a growth formula in the one situation and not in the other.

For example, a formula which would grant the corporation experiencing extraordinary growth the same type of relief as is now afforded a new products corporation might require that the taxpayer establish the fact of that type of growth by meeting tests which are set forth on page 10 of my statement, which I will not go into.

If the taxpayer could show this requisite growth in sales, plant, and income, its credit would be based on the level of its business at the end of the base period, and prior to any influence of the Korean War or the abnormal defense program.

I have, of course, oversimplified the corrective formula for purposes of my statement. When one attempts to propose a specific statutory provision, one must choose between technical alternatives.

However, to illustrate the type of provisions, we are submitting two proposals. This is quite technical for me, but I would like to read these proposals which are very brief. I know you gentlemen will understand them a great deal more readily than I have, and you can evaluate them for yourselves.

Proposal A would allow a credit based upon the assets actually employed in the business during the last half of 1949 and the first half of 1950, and the rate of return realized during the first half of 1950.

Proposal B would allow a credit based upon the earnings for the first half of 1950 or the weighted excess-profits net income for the first taxable year.

I am offering these two proposals as exhibits 5 and 6 for your consideration and convenience.

An alternative to such a growth formula would be the reenactment of the general relief provisions similar to section 722 of the World War II excess-profits tax.

But I would hope, gentlemen, that the administrative difficulties, which have greatly delayed and confused the disposition of cases under that section, might be alleviated if such a provision were made, by statutory standards specifying qualifications for relief and for measuring the scope of relief; in other words, limit the area of discretion in the administration.

Thank you very much.

Senator BYRD. Thank you, Mr. Boeschenstein. You made a fine statement.

Mr. BOESCHENSTEIN. Thank you.

(The prepared material is as follows:)

STATEMENT OF HAROLD BOESCHENSTEIN, PRESIDENT OF OWENS-CORNING FIBERGLAS CORP.

My name is Harold Boeschenstein. My address is the Nicholas Building, Toledo, Ohio. I am president of the Owens-Corning Fiberglas Corp., which is the pioneer in the development of and leading manufacturer of glass in fibrous forms.

Our company competes in building, industrial, transportation, and domestic appliance insulation and in the synthetic-textile-yarn fields.

I appreciate the opportunity to appear before your committee to petition action by the Congress in the Revenue Act of 1951 to alleviate the unfairness of the 1950 Excess Profits Tax Act as applied to the Owens-Corning Fiberglas Corp.

Without additional relief over and above that provided in the present Excess Profits Tax Act, my company will not only pay excess-profits taxes on all earnings attributable to the defense program, but on 50 percent of our normal peacetime earnings, as well. My company is being deprived of profits which have resulted from research and product development leading to growth in sales and productive capacity accomplished prior to, and which had no relation to, the Korean outbreak.

This unfar taxation of normal profits comes about because our excess-profits-tax credit under the most favorable of the relief provisions will be only $6,000,000, although our normal level of earnings at the end of the base period was $12,000,000 per annum.

This wide discrepancy between our excess-profits-tax credit and our normal-earnings level results because the present act does not give adequate recognition to extraordinary growth.

During the base period, 1946–49, we—

Quadrupled our investment in plant.

Doubled our productive capacity.

Doubled our sales.

Increased our earnings more than tenfold.

During 1946 to 1950 our growth in plant was twice that of our eight principal competitors; three times that of manufacturing corporations in general. Our increase in sales was 1½ times that of our eight principal competitors; 2½ times that of all manufacturing corporations. Our increase in net income was 7 times that of our eight principal competitors, and 10 times that of all manufacturing corporations. After taxes, however, we were permitted to keep in 1950 18 percent less of our net income than all manufacturing corporations, and 8 percent less than our eight principal competitors. As the bite of the excess-profits tax increases in 1951 and subsequent years, this spread will become even greater.

This discrimination against us is solely because the present act does not take into account extraordinary growth, so that our excess-profits-tax credit does not reflect the stature we had attained upon the completion of our major expansion program some 6 months prior to the Korean outbreak. We do not believe that the members of this committee and Congress intended to place a growing and expanding corporation at such a serious competitive disadvantage and subject its normal peacetime earnings to an excessive and discriminatory tax. Indeed, officials of the company realize that in the time available preceding the enactment of the present law this committee and Congress sought earnestly to provide adequate relief for corporations experiencing this type of extraordinary growth. Your chairman said on the floor in the closing debate on the bill:

"Whether these formulas (the new relief formulas) will adequately meet these situations, of course the committee cannot say. We only express the hope that they will * * *."

My statement is designed to show that the relief formulas provided fail to meet adequately our situation, that the resulting unfairness to taxpayers in our situation is so substantial as to require legislative relief, and that such relief can be provided without changing the policy and purview of the existing law or subjecting the Treasury to substantial losses of anticipated revenue.

HISTORY OF FIBERGLAS' EXTRAORDINARY GROWTH

Owens-Corning Fiberglas Corp. was organized in 1938. We were pioneers in the development of glass in fibrous forms. We were just becoming established when the World War II preparedness program began. To meet military needs and make the maximum contribution to the war effort we abandoned our civilian products and converted almost entirely to war materials. As a result, we lost most of our newly created markets and newly found customers. Our extensive research projects designed to develop civilian uses for Fiberglas products were shelved for the duration and our research efforts were shifted to the development of materials for war. Throughout the entire war period more than 90 percent of our production was for war purposes, a great proportion of which had no carry-over into civilian markets. We submit as exhibit 1 an account of the war-production record of the Fiberglas Corp. in World War II because what we did in World War II is the root source of our troubles today under the excess-profits-tax law.

When V-day came and our war contracts were canceled, our production facilities were completely out of balance with our civilian markets. We had expanded our production of textile fibers more than 700 percent to meet requirements of the Armed Forces for specialized products which had no counterpart in civilian markets. Glass textiles, which amounted to only a very small percent of our production in the prewar period skyrocketed to 60 percent of our production throughout the war. In the postwar economy textiles fell abruptly to 20 percent of our production. The year 1946 found our company with a potential demand for insulation greatly in excess of the capacity of our one wool plant, on the one hand, but with two war-created plants equipped to produce textile fibers for which civilian demand was undeveloped—except to a limited extent in the electrical-insulation field—on the other hand. Moreover, large Government surpluses of Fiberglas textiles more than saturated this meager Fiberglas-textile market.

To meet the crisis which faced us, we turned all of our energies and resources to the construction of facilities to meet the rapidly expanding needs for house, transportation, and appliance insulation and corrosive protective mats, and to build up our technology and our market position in these fields. During the years 1946 to 1949, we constructed two new plants and reconverted and rehabilitated three existing plants, at a cost of more than $23,000,000.

We also instituted vigorous research and sales programs to develop markets which would absorb the capacity of our textile-fiber facilities. For the 4 years immediately following the war our textile capacity was four times our average textile sales. It was not until the last quarter of 1949 that the fruits of this broad expansion and development program began to be realized to any substantial degree. During each year from 1946 through 1949 our profits were seriously depressed by our program for both expanding our facilities for insulation production and developing markets for Fiberglas textiles.

By the end of 1949, however, the gradual and costly development of new textile markets indicated that for the first time since World War II our textile capacity could be maintained at a profitable level of operation. The expansion program to provide additional insulation capacity was nearly finished. Facilities having a production potential of more than $100,000,000 had been completed. Our maximum production potential at the beginning of the base period was less than half this amount.

Sales for the first 6 months of 1950 were $34,000,000, compared with $33,000,000 for the entire year of 1946. Our earnings for the 6 months were $6,000,000, compared with less than $1,000,000 for each of the years 1946 and 1947. This potential annual level of income of $12,000,000 at the end of 1949 was in no way related to the war. These were normal 1950 earnings.

We have prepared an exhibit showing this growth in plant, sales, and earnings in tabular form, and I would like to offer it as exhibit No. 2.

THE PRESENT LAW DOES NOT GIVE ADEQUATE RECOGNITION TO OUR EXTRAORDINARY GROWTH

The provisions of the present law do not recognize this tremendous growth.

The earnings credit is based primarily upon the average net income of our three best base-period years. But not one of these years was normal in our case. During the entire base period our income was greatly depressed by the many problems connected with developing, building, and getting new plants into operation and in developing acceptable textile products and new markets. Any credit which assumes that our base-period income was normal will be entirely inadequate.

The present growth formula comes the nearest to recognizing our problem, for it provides that 40 percent of 1950 earnings shall make up one-half of the excess-profits-tax credit. But the growth formula is probably inapplicable in our case. It requires that 40 percent of net sales in 1950 must be from new products. Furthermore, even if it were applicable, it would not provide an adequate measure of relief. As in the case of the earnings credit it assumes that 1949 was a normal year, and bases one-half of the credit upon it.

The present law also contains three relief provisions under one or more of which we undoubtedly qualify. These are the provisions relating to abnormalities during the base period, increase in capacity, and changes in products. But all of these have the same common fault. They allow in computing the credit a rate of return which is the average for the many heterogeneous businesses making up the stone, clay, and glass industry, a return of only 16.5 percent before taxes. Such a return is entirely unrealistic for a dynamic corporation such as ours, pioneering with a new product, and creating broad new markets and demands in many fields.

I will not attempt to go into the details of the inadequacies of these provisions because time does not permit, and also because these are technical legal problems. They are discussed, however, in a memorandum, which we have prepared on the subject matter covered by my statement. I would like to offer a copy of the memorandum as exhibit No. 3, and refer you to it for a discussion of the inadequacy of the various provisions of the present law in our situation.

THE FAILURE TO GIVE ADEQUATE RECOGNITION TO GROWTH RESULTS IN UNFAIR TAXATION OF OUR NORMAL PROFITS

Why is the present act so unfair that it should be remedied now?

First, it subjects to excess-profits tax not a relatively minor fraction of our normal profits, but roughly half of our normal profits.

The new level of earnings which we reached during the first 6 months of 1950 resulted from the expenditure of $23,000,000 in plant expansion during the base period, almost three times our existing investment in plant—and the plowing back of base-period earnings into research, market development, and personnel training. Our new profits at a rate of $12,000,000 per annum for the first 6 months of 1950 were not war profits, but the result of carefully planned expansion.

Second, by subjecting 50 percent of our normal profits to excess-profits tax, we will be seriously restricted in our efforts to maintain our research and expand the production of our products so necessary to defense and essential civilian production.

The market for glass fibers is expanding dramatically. We are at present supplying approximately 100 important products to the defense program. Essential civilian needs are also straining our present capacity to the utmost. We need every available dollar for further development. The situation has been made more critical by the recent flood in Kansas City which has closed down one of our principal plants and caused damage to it estimated in excess of $2 million.

Third, we will be unable to compete on equal terms with much older and well-established companies in our respective fields.

I think members of this committee would be interested in knowing how the inequity under which we suffer under this law compares with the happier fortune of our older and better-established competitors who expanded at a far lesser rate than we did during the base period.

One of our principal competitors in the insulation field has a credit equal to 80 percent of its 1950 income, leaving only 20 percent subjected to excess-profits tax.

Another principal competitor in our other major market, i. e., textiles, has a credit of 72 percent of its 1950 income, leaving only 28 percent subject to excess-profits tax.

Contrast these examples with our case. Our credit will be only 37½ percent of our 1950 income, leaving 62½ percent subject to excess-profits tax.

PROPOSED ADDITIONAL RELIEF PROVISIONS

Our case is unusual, but certainly not unique. There will be other coprorations which have enjoyed extraordinary growth and reached a new level of sales and income at December 31, 1949. Such corporations are not protected by the relief provisions of the 1950 act. They should be entitled to a credit reflecting the new level of growth attained at the end of the base period.

Such a credit could be provided by a specific growth formula similar to that now applicable to the new-product corporation. No valid reason is apparent for providing a growth formula in the one situation and not in the other.

For example, a formula which would grant the corporation experiencing extraordinary growth the same type of relief as is now afforded the new-product corporation is as follows:

Tests.—The taxpayer would establish the fact of extraordinary growth by showing—

1. That its sales for the first half of 1950 were 50 percent or more above the level of 1946 and 1947;
2. That either its plant facilities or productive capacity had increased 100 percent during the base period, or that both had increased by 50 percent; and
3. That its level of income for the first half of 1950 was, say, 100 percent or 200 percent in excess of its average base-period income.

Credit.—If the taxpayer could show this growth in sales, plant, and income, its credit would be based on the level of its business at the end of the base period.

This formula is based on tests similar to those already adopted, and could be made effective by simple amendments to section 435.

Under such a formula our credit would be between $10,000,000 and $11,000,000; rather than $6,000,000—a credit more nearly commensurate with our normal peacetime-earnings level of $12,000,000. It would still leave $5,000,000 to $6,000,000 of our 1950 earnings—roughly one-third—subject to excess-profits taxes.

I have, of course, oversimplified the corrective formula for purposes of my statement. When one attempts to propose a specific statutory provision, one must choose between various technical alternative approaches, which may have varying degrees of acceptability to this committee, its technical advisers or others concerned. We want to make it clear that we are not wedded to any particular drafting approach so long as the corrective provision adjusts our situation fairly and adequately. However, to illustrate the type of provisions which, in our judgment, would suffice we are submitting two proposals:

(*a*) Proposal A which would allow a credit based upon the assets actually employed in the business during the last half of 1949 and the first half of 1950, and the rate of return realized during the first half of 1950.

(*b*) Proposal B which would allow a credit based upon the earnings for the first half of 1950 or the "weighted excess profits net income" for the first taxable year.

Proposal A would seem to be nearer to the present growth formula for the "new product" corporation, but proposal B is simpler.

Other proposals may be developed that would accomplish the desired result and would be more preferable from other viewpoints. The important thing is that the act be amended so that the taxpayer experiencing extraordinary growth in its business is not taxed oppressively on its normal profits.

I am offering our two proposals as exhibits. Exhibit 4 is our proposal A. Exhibit 5 is our proposal B.

GENERAL RELIEF PROVISION

An alternative to such a growth formula, if Congress should decide not to enact further specific relief provisions, would be the reenactment of a general relief provision similar to section 722 of the World War II excess-profits tax.

To eliminate the administrative difficulties which have greatly delayed the disposition of cases under that section, however, there should be written into the law statutory standards for qualification for relief and for measuring the scope of the relief to be allowed, similar to those of the proposed formula for extraordinary growth.

In the case of growing corporations, for example, the statutory standards for qualifications should include substantial growth in sales, plant facilities, and net income. Any taxpayer meeting all of these high standards should qualify for relief, at least presumptively. Administrators of the law would also be guided by these standards in granting relief to other taxpayers not able to meet them all.

Taxpayers evidencing extraordinary growth by meeting all the standards prescribed in the formula should be allowed a reasonable minimum reconstruction of normal earnings.

Such standards for qualification and for reconstruction should eliminate to a very great extent the administrative difficulties encountered under section 722.

EXHIBIT 1

WAR PRODUCTION RECORD OF FIBERGLAS CORP. IN WORLD WAR II

In realization of the close relationship of Fiberglas products to the war effort, Mr. Boeschenstein, at the November 27, 1940, meeting of the board of directors, proposed that the company's policy be to give priority to Government requirements for defense purposes and to provide at its own risk, insofar as possible, and as could then be foreseen, such manufacturing and storage facilities as might be needed to produce and supply insulation for combat ships. The board expressed its accord with that policy.

After the United States entered the war, Fiberglas products increasingly were engineered into war production applications, and at the height of the war some 93 percent of the corporation's production was being supplied for war purposes. (1945 annual report.)

The manufacture of fibrous glass was listed as an essential activity under items 20 and 22 of the War Manpower Commission release of March 25, 1943, and subsequent lists. Further, Conservation Order M-282, dated February 9, 1943, listed fibrous glass textiles as critical materials and required that they be allocated to claimant agencies by the War Production Board for approved end uses. At the end of the war these materials were still under allocation in accordance with WPB Scheduling Order M-293 of April 1, 1944.

The versatility and adaptability of Fiberglas products led to their use on a large scale by all branches of the Armed Forces. In all applications of military interest some combination of properties inherent in Fiberglas products provided characteristics that no other available material could offer to the same degree, or, a Fiberglas product was utilized to take the place of some material in short supply. High strength-weight ratio, low moisture pick-up and noninflammability were among the former. Use of Fiberglas cloth in place of aluminum to face hull insulation was an instance of the latter.

Fiberglas insulating wool, formerly used in domestic equipment and buildings, was diverted to newly fabricated forms—for bomber plant insulation and insulating board for combat and cargo vessels. Fiberglas yarns were diverted to such uses as parachute flare shades, wing liners for aircraft and reinforcement for plastic laminates. The added advantages of Fiberglas electrical insulation were of even greater value in their military applications.

Fiberglas became an essential component of military aircraft in some 96 applications, including electrical insulation for small motors, insulation of radio hook-up wire, aircraft ignition harnesses, insulation blankets, wing liners, and fuel cell covering.

By 1945, products available had increased to more than 100, supplied in some 5,000 variations of dimension, fabrication, packaging or density (1945 annual report).

WOOL PRODUCTS

Ship insulation

One of the most important properties required of materials used in the construction of United States naval ships is incombustibility, or fire safety. With respect to insulating materials, this requirement was met by Fiberglas.

As early as 1932, shortly after the first Fiberglas thermal insulation was produced, it was installed on horizontal surfaces in several Navy ships. The insulation performed so efficiently that it was adopted for all horizontal surfaces in living quarters and magazines, and for all refrigerator spaces, in all fighting craft designed after 1935. In 1939 the Navy adopted glass fiber material as thermal insulation throughout all its fighting ships.

When, after the United States entered the war, it became necessary to conserve aluminum and other lightweight materials, the Navy Department and the Fiberglas Corp. worked together to develop a glass fiber board faced with Fiberglas cloth which was used for both thermal insulation and interior finish on the Navy's fighting ships.

While the Navy was increasing its use of Fiberglas insulation, the same material was adopted by the merchant marine, and within 6 months after the United States declared war on the Axis Powers, 75 shipyards were using Fiberglas to insulate living quarters, refrigerated spaces, magazines, bulkheads, pipes, ventilating ducts, casings, and boiler uptakes.

Cloth-faced Navy board, in point of quantity, was the chief contribution of Fiberglas to the war effort. It was in reality a combination of two developments. The use of 9-pound density Fiberglas insulating wool, preformed for ready cutting and fitting in and about the hull of a ship, not only enabled the construction of military ships to be speeded immeasurably but greatly increased their capacity for stores and their cruising radii. The use of Fiberglas cloth as a facing for the hull insulation released great quantities of aluminum for other uses at a time when aluminum was in short supply: 180,301,100 square feet of hull insulation went to shipbuilders during the war. In popular terms this amount would cover a highway 20 feet wide from Boston to Kansas City, a distance of 1,420 miles, or fill a train of box cars 45 miles long—20,033,455 yards of glass cloth was used to surface the hull insulation. In addition to the foregoing, 112,234,000 square feet of Fiberglas thermal insulation in varying densities were supplied for use on shipboard; 224,780,584 feet of stripping and lagging tape were needed to finish the application, and 4,734,931 yards of lagging cloth were used to wrap insulated pipes. Twenty-five tons of glass thread were used to sew the lagging cloth (1945 annual report).

Superfine fiber

The superfine fiber was another product development of the war years. It became of importance to the Navy as a flotation filler which proved superior to kapok. During 1945 a program was developed which included building and equipping two plants in the Kansas City area. The Army Air Forces made available the North American Modification Center in Kansas City, Kans., and the surplus plant of the Aluminum Corp. of America, in Kansas City, Mo., was acquired.

Working as a team on this urgent program, the Navy, the War Production Board, the Reconstruction Finance Corporation, and Fiberglas overcame many problems. The Navy entered into a supply contract with Owens-Corning Fiberglas Corp. to produce the fibrous glass, the War Production Board placed the project near the top of its special military programs, machinery and equipment orders were placed and expedited, and the program was under way to produce a supply of buoyant material in sufficient volume to satisfy all Navy requirements for use in life preservers, commencing in January of 1946.

In a letter of July 17, 1945, from Acting Secretary of the Navy Hensel to Director John W. Snyder of the Reconstruction Finance Corporation, the Navy's need for Fiberglas "A" fiber, to serve as filler for life preservers and invasion jackets, was declared to be critical. And it was urged that the Reconstruction Finance Corporation should waive a technical objection to the proposal in view of the extreme urgency of the program.

When the war with Japan came to a successful conclusion in August of 1945, the Navy and the Reconstruction Finance Corporation moved immediately to cancel out this program, but with the understanding that Fiberglas would arrange to produce "A" type fibrous glass commercially for the Navy without Government facilities or financing.

This new material had already demonstrated its superiority over kapok because it was fire and mildew proof, had superior buoyancy qualities, could withstand repeated wetting and drying with little loss in efficiency and could be produced domestically in uniform quality without dependence of any nature upon far-removed and uncertain sources of supply. Thus through prior provision for the emergency by accumulation of a stockpile before the war and through careful planning and conservation, our kapok stocks served the Navy and other military claimants throughout World War II while other available materials were being investigated and tested until, born out of necessity, a new synthetic material was developed which proved so superior to the traditional kapok that now it has been adopted by the Navy as the standard of quality for buoyant material to be used in life preservers.[1]

Aircraft

Superfine or "A" fibers also were fabricated into blankets and used for thermal and acoustical insulation in military aircraft. The use of this product resulted in substantial savings of space and weight, and the insulation did not decompose under tropical conditions. Prior to VJ-day 6,550,463 square feet of this material were supplied for use in military planes.

XM-PF

Before the development of the "A" fiber, the need for a light-weight, form-retaining insulation was met by Fiberglas XM-PF insulation. This product had high sound-deadening properties for its weight and desirable form retaining characteristics. Of particular note is the fact that the material was fabricated from textile fibers remaining from other fabricating operations. Thus large quantities were made available with relatively small plant expansion: 13,523,203 square feet were supplied for military aircraft.

When available plant space at Newark proved inadequate for this operation, the corporation developed and placed in operation machinery for its production at the Kansas City plant of the Gustin-Bacon Co.

AE Board

AE or asphalt enclosed board was another important wartime product development. It consisted of high density PF wool covered with asphalt on all sides. AE Board was developed to insulate cold storage spaces and in view of the severe shortage of cork, was of great importance in the construction of vessels used for transporting food to the South Pacific areas.

[1] Lt. Comdr. A. H. Holden, USNR, Buoyant Materials for Navy Life Preservers in World War II; United States Naval Institute Proceedings, vol. 72, No. 524 (October 1946), pp. 1327–1330.

Bomber plants

Fiberglas PF insulating wool in board form was developed also into a roof deck insulation during the war years. It was a necessary feature in the construction of the all-steel assembly plant—essential to the assembly line production of large aircraft, and large quantities were used in constructing war plants. Thus, on the Bell bomber plant at Marietta, Ga., there were used 3,640,000 square feet. And in the Consolidated and Douglas bomber assembly plants at Forth Worth, Tex., and Tulsa, Okla., there was used a total of 19,400,000 board feet of Fiberglas insulation. The assembly building of each plant was 4,000 feet long, 320 feet wide and 60 feet high, but despite the enormous spans, the roof would carry a live load of 25 pounds per square foot and yet weighed less than 11 pounds per square foot above the trusses.

In addition to its use on the roof deck, 6-pound PF wool was used also to insulate the side walls of bomber plants, being applied prior to the corrugated metal sheeting.

The ceilings of the bomber plants were insulated with 1½-pound white wool, 3 inches thick and held in place by metal lath. Bonded mat was placed between the wool and the lath to keep any loose fibers from falling down.

The side walls also were insulated on the inside surface with white wool of 1½-pound density and 4-inch thickness compressed to three. This was covered with bonded mat and metal lath in the same manner as was done on the ceiling. Thus both thermal and acoustical insulation was provided for ceiling and side walls: 9,529,000 square feet of TW-F wool in rolls and batts were supplied for bomber-plant insulation.

Thermal insulation

The Army Ground and Air Forces used Fiberglas wool as a thermal insulation in cantonment buildings, portable shelters, refrigerators, portable food and water containers, troop kitchen cars and ammunition trucks.

Portable shelters for use by Army Air Force personnel in Arctic climates—shelters sufficiently light and compact to be transported by air—contained Fiberglas insulation in walls and sometimes in flooring, to cut the amount of fuel required to maintain livable temperatures. The Fiberglas insulation in a typical shelter weighed only about 200 pounds, yet it saved over 20,000 pounds in the weight of fuel required to be transported for such a shelter during a season: 3,452,425 square feet of Fiberglas insulating batts were supplied for such Army Air Corps Arctic shelters.

In addition to the newer products developed during the war, aircraft blankets surfaced with Fiberglas cloth and filled with Fiberglas wool were used to insulate military aircraft against cold and noise: 205,700 square feet of this material was supplied during the war.

Pipe covering

In many war plants Fiberglas pipe covering was used to insulate miles of piping through which flowed gas, steam, water, oil, and other fluids. In one ordnance plant in the Middle West more than 1,000,000 linear feet of Fiberglas pipe covering was used to insulate such pipelines. Among the plants supplied were Hercules Powder Co. at Hopewell, Va.; target-loading plant at Yorktown, Va.; torpedo-loading plant of the Navy Mine Depot at Yorktown, Va.; Plum Brook ordnance plant at Sandusky, Ohio; and Erie proving ground at Camp Perry, Ohio.

Sound stacks

Fiberglas wool in the form of blankets between perforated metal sheets is used in sound stacks at airfields throughout the United States. The testing of airplane engines requires that the sound-absorbing material be able to withstand the effects of lubricating oils, gasoline, water vapor, and the terrific wind velocities generated by the propellers.

YARNS AND FABRICS

Fiberglas yarns and fabrics had been developed commercially before the war, but during the emergency they were of great significance in providing materials of high military importance. Fiberglas cloths are strong, relatively thin, temperature-resistant fabrics woven of Fiberglas yarns. They do not shrink or swell with moisture changes; they cannot burn and are unaffected by most acids, corrosive vapors, and oils.

Reinforced plastics

Fiberglas cloth was used as a reinforcement for low-pressure plastic laminates to provide high-strength-weight ratio, high impact resistance and dimensional stability.

Panel board

Fiberglas cloth was used as a reinforcement for low-pressure plastic laminates to provide high-strength-weight ratio, high impact resistance and dimensional stability.

Panel board

During the war 5,804,204 yards of cloth were furnished to supply those characteristics to Navy panel board.

Doron

Another important use for the laminates occurred in the production of Doron, a new type of body armor made of Fiberglas ECC-165 cloth bonded with a plastic resin. The glass resin sheets were light, easily jettisoned, and, unlike steel, did not rust or corrode. They were easily fitted to a modified Navy life jacket and were adopted by the Navy to protect invasion forces from shrapnel while landing from barges.

Wing liner

Used with styrene-polyester thermosetting resins, Fiberglas cloths answered the wartime requirement for liners in the wings of aircraft to protect fuel cells from flowering metal caused by bullet punctures.

Radomes

The same combination of Fiberglas cloth and resin furnished housing for radar under the name Radomes.

Other uses

Medical kits for the Army Medical Corps and Army Air Corps also were made from glass-reinforced plastics and at the termination of the war it was contemplated that helmets, flak suits, and protective armor for planes would be made from the same material.

Coated cloths

Fiberglas cloths and yarns also had many wartime uses when made into fabrics coated with natural and synthetic rubbers, vinyl resins, and other coating compounds.

Flare shades

An essential part of each of the magnesium-charged flares which were used in the invasion of Europe was a shade or umbrella of Fiberglas-coated cloth. These shades served to protect the flare's chute from the intense heat and to shield the eyes of the bombardier from the glare of the light.

To produce the needed flare shades speedily, Fiberglas teamed with a score of other manufacturers whose locations ranged from Connecticut to California. Small fabricators also joined in to do special sewing and packaging. For this essential activity Fiberglas supplied 8,020,194 yards of cloth and 156 tons or 312,000 pounds of tying cord.

It is also worthy of mention that when the military need for flare shades had ended and a drastic cancellation of the program became necessary, Fiberglas worked out a plan whereby no termination claims were presented to the Government, a fact which was recognized officially by the War Department through an expression of appreciation.

Water tanks

Coated Fiberglas fabrics were used also to construct portable water tanks for use in tropical areas. The resistance of Fiberglas cloth to fungi and molds led to its use in place of cotton duck. Each tank was 12 feet in diameter, 5 feet high and had a capacity of 3,000 gallons. The initial order was for 300,000 yards of Fiberglas 164 cloth; Buna S was used to coat the first tanks and vinyl coatings were used later.

Other uses

Because of their resistance to heat, moisture, oils, and most acids, and because of their toughness and dimensional stability, coated Fiberglas cloths found wide application in the fabrication of ducts for the effective, safe distribution of air in aircraft.

Coated Fiberglas cloths also were used as aircraft battery covers and for covering machinery and equipment in military winterizing programs; in addition, these cloths were used as coverings for cots and berths in military air-transports, as fire wall gaskets, and during the war years the material was first used for industrial conveyor belts.

The dimensional stability of Fiberglas cloth was utilized in developing a gun-sight checking screen which saved many valubale moments in preparing fighting aircraft for combat. For the same reason Fiberglas cloths were used in making geodetic survey maps.

Cloths without coating

Fiberglas fabrics, without the coatings described above, also had many wartime uses.

In electrically heated diving suits worn by Navy divers to enable them to withstand the paralyzing cold encountered at great depths, the wires carrying the current were enclosed between layers of Fiberglas cloth. Fiberglas cloth—incombustible and heat resistant—was used so that should a wire break, a spark would not ignite any combustible material which would burn fiercely in the helium-oxygen gas, widely used in diving operations in place of compressed air.

Wire netting "garnished" with Fiberglas fibers and painted to blend with the terrain was used to comouflage possible bombing objectives in seacoast areas where there was required a material resistant to salt and dampness.

Lagging cloth, used in wrapping insulated pipes, was another product which Fiberglas Corp. furnished to the war effort in large quantities. It was particularly desirable because it was strong, firesafe, absorbed a minimum of paint, and resisted moisture and corrosion: 4,734,931 yards were supplied to shipbuilders and 534,436 yards to aircraft manufacturers. Great quantities also went into war production plants. To sew pipe lagging there were supplied 25 tons of lagging thread.

Tapes

Fiberglas yarns also were woven into stripping and lagging tapes used in finishing an application of insulation: 224,780,584 feet of this material were furnished to shipbuilders from Pearl Harbor to VJ-day.

Electrical insulation

Even prior to the war, Fiberglas cloths, tapes, and yarns had been developed into a highly efficient electrical insulation. The value of this insulation in the war program lay primarily in its resistance to the forces that always are at work seeking to break down the insulation. Chief of these are high temperatures and moisture. Further, the comparatively small space taken up by Fiberglas electrical insulations made it possible for skilled engineers to decrease the size and weight of motors and generators used in planes, on shipboard, and in tanks. Such small, lightweight motors operated under high temperatures, high overloads, and hard usage over long periods of time.

Overloads

An outstanding illustration of the worth of Fiberglas electrical insulation is found in the experience of Wilhite Woodworking Co. of Chicago. This concern, in war production for Ordnance, was able to use on its drill-press motors a 3-horsepower winding on a 1½-horsepower frame, and even then to overload in excess of 5 horsepower. As a result of the increased output of the presses and the elimination of motor failures, production was increased to such an extent that only one shift was used where two had been employed previously. To obtain the same results through the use of larger motors would have meant replacing the drill presses with larger and more expensive machinery.

Propeller pitch-change motor

One of the tiniest but at the same time most vital motors in a plane is the propeller pitch-change motor. Hidden in the propeller assembly, the motor has to be small enough to fit in the restricted space, yet powerful enough to change the pitch of a propeller that has gone dead, so the blades can be turned edgewise to the wind. These tiny motors were insulated with Fiberglas electrical insulation.

Ignition cable

Whenever and wherever humidity is high, electrical insulation is subject to the danger of moisture penetration. Moisture could so affect the electrical system of a fighter or bomber plane as to prevent a quick take-off. Using Fiberglas yarn, an ignition cable was developed which helped assure a quick take-off even though the plane had been subjected to conditions of severe and prolonged humidity.

Radio hook-up wire

Because Fiberglas yarn resists intense heat and will not support fungus growth, large amounts of radio hook-up wire for aircraft transmitters and receivers were insulated with the material.

Deck motors

Navy deck motors were equipped with Fiberglas insulation primarily because of its resistance to moisture and its ability to stand up under prolonged overloads.

Propulsion equipment

Propulsion equipment on Navy ships was largely Fiberglas insulated because of the reliability and stamina that could be built into such units by using glass insulation and suitable varnishes, thereby permitting severe overloads.

Cables

Several types of heat- and flame-resistant Navy cables were developed by using Fiberglas insulation. Armored cables were lightened and the amount of metal reduced by using wrappings of Fiberglas barrier tapes.

Fiberglas staple fibers also were used as cable filling.

Blood-plasma filter

Another wartime product of Fiberglas textiles, involving no great volume of production but of vital importance, was the tiny strip of tape, woven of glass fibers, employed as a filter in the tubing of the light, portable apparatus used to give blood-plasma transfusions—frequently just behind the front lines. The Fiberglas tape was used as the filter because the tape could be sterlized for repeated use, because it required no bulky housing, because the weave was close enough to strain out any undissolved particles the fluid might contain and, because, being glass, the fibers did not swell when wet, thus offering no impediment to the free passage of the fluid.

BONDED MAT

Fiberglas products in mat form also constituted a substantial contribution to the war effort.

Bomber plants

In bomber assembly plants, 4,520,000 square feet of bonded mat were used for light diffusion in "ferrosteel" construction. Bonded mat was used also to retain white wool in ceiling and side-wall applications.

Battery mat

Fiberglas battery retainer mats, whether used in land, sea, or aircraft, added to battery performance under gruelling conditions. In submarines the mats added to the cruising radius by lengthening the life of the battery; in tanks they enabled the batteries to withstand terrific jouncing without failure. In addition, battery mat was of real importance in civilian life due to the greatly increased reliance on replacement batteries and the need for increasing the life of all batteries during the war years.

Separators

Fiberglas battery separators, made from bonded mat, were developed during the wartime shortage of rubber from which such separators are normally made.

Other uses

Fiberglas in mat form was used also as a base in plastic laminations to produce high-frequency, low-electrical-loss parts for radio, radar, and other electronic equipment. Fiberglas mat (25 mil furfural bonded) was used to prevent the silica gel, contained in air driers, from sifting through the perforations in the cartridges. The mat had sufficient porosity to allow the passage of air while retaining its original shape. Such air driers were employed to keep war materials of all kinds free from rust, corrosion, mildew, or mold while in storage or during shipment.

AIR FILTERS

Fiberglas dust-stop air filters were developed originally in connection with forced warm air heating systems, but during the war air conditioning and cleaning systems, of which such filters are an integral part, became essential to efficient production of military supplies.

Eighty thousand dust-stop air filters comprised the original installation for the atomic bomb project at Oak Ridge, Tenn., and sixteen thousand replacements were needed every 6 weeks.

Other large installations were made in the paint spray buildings of bomber assembly plants.

In war plants of all kinds, Fiberglas air filters removed from the air tiny particles of dust that could ruin the accuracy of gun and bomb sights, shorten the life of engines and motors, or cause explosions. Telephone exchanges also had to be kept free of dust in order to operate efficiently.

In ordnance plants, the filters were employed to collect from the air particles of TNT and other explosive dusts created by manufacturing operations.

In plants manufacturing precision instruments and machine parts, Fiberglas filters were used to collect dusts created by grinding processes, thus eliminating a hazard to the products being manufactured and to the health of workers in the plant.

In addition, planes, tanks, trucks and other military equipment were equipped with Fiberglas air filters to prevent the admission of abrasive dusts to the carburetor or lubrication system.

The foregoing material illustrates to some extent the direct relationship of Fiberglas products to the military program of the Government. No less important to the war effort were the many significant industrial applications that helped increase output, diminish the breakdown or maintenance of electrical equipment, or conserved fuel and power. Mines, oil refineries, steel mills, railroad, bus transportation systems, and a host of other critical industries and services benefited through the contributions of these products.[3]

Exhibit 2

Owens-Corning Fiberglas Corp.—Statistics of facilities, assets, sales, and net income, 1945–50

	Number of plants	Unadjusted basis of facilities	Adjusted basis of facilities	Total assets	Net sales	Net income [1]
1940	1	$3,900,000	$2,700,000	$6,600,000	$9,600,000	$647,000
1945	2	8,400,000	3,200,000	30,400,000	46,000,000	5,300,000
1946	3	15,000,000	9,000,000	26,000,000	33,000,000	1,000,000
1947	4	21,400,000	14,000,000	31,000,000	41,000,000	1,000,000
1948	4	24,000,000	16,000,000	40,000,000	51,500,000	5,500,000
1949	5	32,000,000	22,000,000	45,000,000	49,000,000	3,700,000

Exhibit 3

NEED FOR ADDITIONAL RELIEF PROVISION IN THE EXCESS PROFITS TAX ACT TO AVOID EXCESSIVE TAXATION OF NORMAL EARNINGS OF CORPORATIONS DEMONSTRATING EXTRAORDINARY GROWTH—OWENS-CORNING FIBERGLAS CORPORATION—AN EXAMPLE

SUMMARY

1. During the base period 1946–49, we

Quadrupled our investment in plant. (The unadjusted basis of our plant facilities increased from $8,400,000 on January 1, 1946, to $32,000,000 on December 31, 1949.)

[3] H. D. Keiser, Maj. U. S. Army; American Institute of Mining and Metallurgical Engineers, Technical Publication No. 1598; New York Meeting, February, 1943.

Doubled our productive capacity. (Our peak World War II sales were $46,000,000 in 1944, excluding outside fabrication, utilizing our full capacity. On December 31, 1949, our facilities had an annual production potential of $100,000,000.)

Doubled our sales. (Nineteen hundred and forty-six sales were $33,000,000 compared with an annual rate of $68,000,000 for the first 6 months of 1950.)

Increased our earnings more than tenfold. (Our net income before taxes in 1946 and 1947 was $1,000,000 compared with an annual rate of $12,000,000 for the first 6 months of 1950.)

2. Our average base period net income was only $3,400,000. (The average of our three best base period years.)

3. By December 31, 1949, we reached an earnings level of more than $12,000,000. (Our actual earnings before taxes for the first 6 months of 1950, prior to the Korean outbreak, were $6,000,000.)

4. Our excess profits tax credit, however, will be only $6,000,000. (Under the amendment proposed by the Ways and Means Committee, the credit for base period earnings would be only $5,300,000 for 1951 and subsequent years.)

5. Without additional relief we will not only pay excess profits taxes on all earnings attributable to the defense program, but on 50 percent of our normal peacetime earnings, as well.

I. THE PROBLEM

The 1950 excess profits tax was intended to apply to corporate profits which were swollen by the increased tempo of the defense economy. Congress recognized, as it had in the World War II act, that its taxing provisions, no matter how carefully chosen, would result in excessive and discriminatory taxation on normal earnings as applied to many corporations. Instead of providing a general relief provision for these cases, similar to section 722 of the earlier statute, it prescribed rigid formulas for determining the amount of relief and inflexible standards in defining eligibility for relief.

When queried on the floor of the Senate concerning the absence of a section 722, Senator George said:

"The present bill approaches the same problem but undertakes to spell out relief for new corporations formed after the base period began, for depressed industries, for companies having abnormalities, and for other corporations which we thought were entitled to relief. *Whether the committee has gone far enough and whether those relief provisions will be altogether effective, of course, remains to be demonstrated or disproved in the administration of the act.*" [Italics ours.]

Owens-Corning Fiberglas Corp. is a striking example of the inadequacy of the relief provisions of the present law. They fail to eliminate excessive and discriminatory taxation on our normal earnings. We are deprived of profits which have resulted from growth in sales and productive capacity accomplished prior to, and which had no relation to, the Korean outbreak.

Our earning capacity in the postwar years was greatly diminished because of the dedication of our efforts to war production in World War II, and the consequent loss of position and opportunities in our civilian markets. Increased productive capacity of nonwartime character and revitalization of sales, production and research efforts for civilian markets were necessary before a reasonable level of earnings could be achieved. It was not until the first 6 months in 1950, prior to the Korean war, that the results appeared. Compared with the beginning of the base period, our sales level and productive capacity were doubled, and our earnings increased more than tenfold. Our investment in plant almost quadrupled, increasing during this postwar period from $8,400,000 to $32,000,000. As a result, during the 6 months preceding the Korean outbreak we reached an earnings rate in excess of $12,000,000 a year. Our excess-profits tax credit, under the most favorable relief provision, however, will be only $6,000,000.

Congress has therefore subjected to excess-profits taxes not only all of our earnings attributable to the defense program, but 50 percent of our normal peacetime earnings, as well.

We believe that the Congress did not intend to place a growing and expanding corporation under such a serious competitive disadvantage and subject its normal peacetime earnings to an excessive and discriminatory tax. Indeed, officials of the company realize that Congress sought earnestly to provide adequate relief for corporations experiencing this type of extraordinary growth.

Senator George on the floor in the closing debate on the bill with particular reference to the absence of a general relief provision such as section 722 confirms our belief:

"*Whether these formulas [the new relief formulas] will adequately meet these situations, of course the committee cannot say. We only express the hope that they will,* and we have taken the extraordinary step of providing for the rewriting of this bill by the end of December 1952 in order that we may meet the problems which, through experience, are then presented to us in a clearer light in the *very brief hearing* the committee was able to hold on this bill." [Italics ours.]

This memorandum has been prepared to demonstrate that the rigid formulas provided in the Excess Profits Tax Act of 1950 did not adequately meet these situations involving dynamic growth companies. It is submitted that additional relief provisions are necessary if Congress is to avoid an unintended inequity in this, and, no doubt, a good number of other cases in which either the rules of eligibility or the extent of the relief provided result in taxing as excess profits an undue and excessive percentage of normal earnings.

Such provisions need not await a rewriting of the bill at the end of December 1952. They should be provided now to meet the basic intent of Congress.

II. UNFAIRNESS OF THE 1950 EXCESS-PROFITS TAX LAW AS APPLIED TO OWENS-CORNING FIBERGLAS CORP.

The Excess Profits Tax Act of 1950 penalizes Fiberglas by subjecting normal profits to excess profits taxation. The relief provisions do not relieve this penalty. The new level of profits which we reached during the first 6 months of 1950 resulted from the expenditure of $23,000,000 [1] in plant expansion during the base period, and the plowing back of base period earnings into research, market development and personnel training. Our new profits were not war profits, but the result of carefully planned expansion.

Under the present law we cannot continue this policy of expansion; cannot even compete on equal terms with mature and well-established companies in our field whose growth in their peacetime markets was not interrupted by World War II, and who therefore did not have throughout the base period the many serious problems of expansion and market imbalance which we faced.[2]

The history of our growth clearly demonstrates the unfair effect of the present law upon us. Owens-Corning Fiberglas Corp. was organized in 1938. We were pioneers in the development of glass fibers, competing in the building and domestic appliance insulation and textile fields. Our principal products were home insulation, domestic appliance insulation, and air filters. We were just becoming established when the World War II preparedness program began. To make the maximum contribution to the war effort we abandoned our civilian products and converted almost entirely to war materials. As a result, we lost most of our newly created markets and newly found customers. Our extensive research projects designed to develop civilian uses for Fiberglas products were shelved for the duration and our research efforts were shifted to the development of materials for war. Throughout the entire war period more than 90 percent of our production was for war purposes, a great proportion of which had no carry-over into civilian markets.

When V-day came and our war contracts were canceled, our production facilities were completely out of balance with our civilian markets. We had expanded our production of textile fibers more than 700 percent to meet requirements of the Armed Forces for specialized products which had no counterpart in civilian markets. Throughout the war textiles represented 66 percent of our production. In the postwar economy, textiles fell abruptly to 20 percent of our production. We had been forced to withdraw almost entirely from our established home and appliance insulation markets because our one insulating-wool plant had been preempted for high-priority war uses. Thus 1946 found our company with a potential demand for insulation greatly in excess of the capacity of our one wool plant, but with two war-created plants equipped to produce textile fibers for which civilian demand was undeveloped except to a limited extent in the electrical-

---

[1] This new investment compares with total unadjusted basis of plant facilities at December 31, 1945, of $8,400,000, an increase of 275 percent.

[2] For example, one of our principal competitors in the insulation field, a large well-established company expanding at a far lesser rate than we were during the base period, paid excess profits taxes on only $7,800,000 of its 1950 income of $38,500,000. In other words, its credit amounted to 80 percent of its 1950 income, and only 20 percent was subjected to excess profits tax.

One of our principal textile competitors, which expanded very little during the base period, paid excess profits taxes on only $6,300,000 of its 1950 income of $22,300,000. Its credit thus amounted to 72 percent of its 1950 income, and only 28 percent was subject to excess profits tax.

Contrast these examples with our case. Our credit on the most favorable basis will be only $6,000,000 compared with 1950 income of $16,000,000. Our credit will thus be only 37½ percent of our 1950 income, leaving 62½ percent to excess profits tax. Unless additional relief is granted, we face the certain prospect of paying the maximum over-all tax for the duration of the emergency.

insulation field. In addition large Government surpluses of Fiberglas textiles more than saturated our meager textile market.

To meet the crisis which faced us, we turned all of our energies and resources to the construction of facilities to meet the rapidly expanding needs for house and appliance insulation and to build up our market position in these fields. During the years 1946 to 1949 we constructed two new plants and reconverted and rehabilitated three existing plants at a cost of more than $23,000,000.

We also instituted vigorous research and sales programs to develop markets which would absorb the capacity of our textile-fiber facilities. For the 4 years immediately following the war our textile capacity was four times our average textile sales. It was not until the last quarter of 1949 that the fruits of this broad expansion and development program began to be realized to any substantial degree.

During the entire period 1946 to 1949 our profits were seriously depressed by these efforts to expand our insulation production and our textile markets. Our costs were increased far above normal by—

(1) Losses sustained in developing and introducing new products;

(2) Abnormal costs of recruiting and training manufacturing personnel prior to the commencement of production of new facilities;

(3) High initial costs of operating new facilities; and

(4) The myriad of other shake-down problems necessarily involved in a program of such magnitude for the expansion of wool capacity, on the one hand, and in seeking outlets for surplus textile capacity, on the other.

By the end of 1949 the gradual development of many new textile markets indicated that for the first time since World War II our textile capacity could be operated at a profitable rate early in 1950. The expansion program to provide additional insulation capacity was nearly finished. Facilities having a production potential of more than $100,000,000 had been completed, and it was anticipated that a level of sales fully utilizing this capacity would be reached within 2 years. The first 6 months of 1950 bore out our expectations with record sales of $34,000,000 and earnings of $6,000,000. This potential annual level of income of $12,000,000 at the end of 1949 was in no way related to the war. These were normal 1950 earnings for a corporation which had attained a new level of growth. In fact, additional expansion of sales and profits beyond the $12,000,000 level was clearly indicated as the result of the growth of our facilities and markets by December 31, 1949.

The following tabulation shows the extent of our expansion program and its effect upon our sales and earnings:

	Number of plants	Unadjusted basis of facilities	Adjusted basis of facilities	Total assets	Net sales	Net income [1]
1940	1	$3,900,000	$2,700,000	$6,600,000	$6,600,000	$647,000
1945	2	8,400,000	3,200,000	30,400,000	46,000,000	5,300,000
1946	3	15,000,000	9,000,000	26,000,000	33,000,000	1,000,000
1947	4	21,400,000	14,000,000	34,000,000	41,000,000	1,000,000
1948	4	24,000,000	16,000,000	40,000,000	51,500,000	5,500,000
1949	5	32,000,000	22,000,000	45,000,000	49,000,000	3,700,000
1950 (first 6 months)	5			49,000,000	[2] 68,000,000	[2] 12,000,000
1950	5	34,000,000	23,500,000	59,000,000	78,000,000	16,000,000

[1] Before Federal income and excess-profits taxes.
[2] First 6 months annualized.

The normal earnings level of our corporation at the end of 1949 was thus in excess of $12,000,000. But let us see what credit is allowed us under the 1950 Excess Profits Tax Act. There are six applicable credit provisions.

(a) Inadequacy of the earnings credit (sec. 435 (d))

Our credit under this section would be only $4,000,000 as compared with our normal earnings of $12,000,000. This credit is based primarily upon the average net income of the three best years, 1946 to 1949. It obviously, therefore, does not reflect the new high level of earnings reached at the end of 1949 as the result of our broad expansion program.[3]

[3] For 1951 and subsequent years the credit attributable to base period earnings would be reduced from $4,000,000 to $3,500,000 under the amendment proposed by the Ways and Means Committee in the forthcoming Revenue Act of 1951. This amendment allows only 75 percent instead of 85 percent of the average net income of the three best base-period years.

(b) Inadequacy of the invested capital credit (sec. 436)

Our credit based on invested capital is even a poorer measure of normal earnings. It would be only $3,000,000 compared to normal earnings of $12,000,000. This credit works out to a return of only 7½ percent before taxes upon our equity and borrowed capital.[4] It goes without saying that such a return is entirely unrealistic for a dynamic young corporation creating broad new markets and demands.

(c) Inadequacy of t' growth formula (sec. 534 (e) (1) (B))

To qualify under this section we must fit the following three requirements designed primarily to afford relief to the television industry;

(i) Twice net sales for period January 1, 1950, to June 30, 1950, must be 150 percent or more of a'erage net sales for 1946 and 1947; and

(ii) Forty percent of t sales for 1950 must be attributable to products not generally available to public before January 1, 1946; and

(iii) Net sales of new products for 1949 must be 20 times such amount for 1946.

We qualify easily under test (i). But even though we have introduced many new products since January 1, 1946, and have greatly changed and improved others, there is some question whether we will meet (ii) and (iii). Much will depend upon the Treasury's interpretation of what constitutes a product not generally available to the public before January 1, 1946.

But even assuming we qualify under this section, what will be the measure of our relief? At best there will be a credit of only $7,000,000[5] only 58 percent of our normal earnings. In other words, $5,000,000 of our normal earnings will be subjected to excess-profits tax each year.

The defect in this section is that it assumes that both 1949 and 1950 were normal years. It does not provide relief for a corporation such as ours which did not attain its growth until the very end of the base period. We were still suffering growing pains in 1949. Construction of our fifth plant was completed during that year, and our new textile markets were just beginning to materialize. A credit based primarily on 1949 earnings, therefore, cannot possibly afford us a fair measure of relief.[6]

(d) Inadequacy of the relief provisions

Three of the relief provisions were intended to provide relief in situations such as ours; i. e., section 442, dealing with abnormalities during the base period; section 443, relating to changes in products; and section 444, relating to increases in capacity for production or operation. We meet the tests necessary to qualify under one or more of these sections. The tests will be discussed below. The relief afforded, however, is entirely inadequate because all of these sections have the same major defect as applied to our situation: the reconstructed credit is based upon the average rate of return realized by all corporations making up our industry.

Since our gross receipts for 1949 were entirely from the sale of products made of glass, it is assumed that our industry will be deemed to be the stone, clay, and glass industry[7] for which the base period rate of return has been tentatively

---

[4] A return of 7½ percent before taxes means only 4.35 percent after normal and surtax of 42 percent.

[5] See the following:

Forty percent of 1950 earnings	$6,400,000
Fifty percent of 1949 earnings	1,800,000
Total	8,200,000
Less 15 percent	1,230,000
Net	6,970,000

For 1951 and subsequent years the credit attributable to base-period earnings would be only $6,100,000 under the Ways and Means Committee amendment.

[6] We cannot qualify under another set of tests based upon payroll and gross receipts and applicable to corporations having assets of less than $20,000,000 on January 1, 1946 (sec. 435 (e) (1) (A)). The credit would be inadequate, even if we qualified, for the same reasons as in the case of sec. 435 (e) (1) (B).

[7] Our 1949 gross sales by product groups were approximately as follows:

Building materials	$14,000,000
Equipment and appliances	15,000,000
Transportation	5,000,000
Air conditioning	3,000,000
Battery and corrosion products	2,000,000
Industrial insulation	3,000,000
Textiles	6,000,000
Textile reinforcements	1,000,000
Total	49,000,000

announced as 16.5 percent before taxes.[8] The rate of return of this industry has little relation to our earning capacity. It is an industry made up of a heterogeneous group of businesses using widely different raw materials and manufacturing processes and supplying a wide variety of markets. The industry rate of return, therefore, is a conglomerate of returns on such widely different products as tombstones and sewer pipes, concrete and papier-mâché statuary. It could not possibly represent a fair return for us. Our normal rate of return before taxes is in excess of 25 percent. This rate of return was attained during the 6 months' period ending June 30, 1950. Our actual rate of return before taxes for the year 1950 was 27 percent. No relief provision using an industry rate of return such as that now provided can possibly provide us with a fair measure of normal earnings.[9]

1. *Abnormalities during base period (sec. 442).*—We may qualify under this section on the ground that our normal production was diminished because of the occurrence immediately prior to and during the base period of events unusual and peculiar in our experience; i. e., the necessity of converting from almost total war production to civilian production. Or we may qualify on the ground that our business was depressed because of temporary economic circumstances unusual in our experience. Here again much will depend upon the severity or liberality of the Treasury's interpretation of the statute.

The credit allowed, however, would be measured by our industry rate of return upon the average of our total assets as of the end of each year of the base period. Our credit would be only $5,000,000, or less than half our normal earnings.

2. *Change in products (sec. 443).*—To qualify under this section, 40 percent of a taxpayer's gross income or 33 percent of its net income during an excess-profits year must have been from new products introduced during one of the preceding 3 years which is a base period year. In addition, its net income for the taxable year must exceed 125 percent of its net income for the base-period years prior to the introduction of the new products.

We will clearly qualify under the latter requirements, since our net income will have increased more than tenfold since the beginning of the base period. Whether we will be deemed to have introduced sufficient new products will depend upon the Treasury's interpretation of the statute.

In any case, however, the credit allowed would be measured by our industry rate of return upon our total assets on December 31, 1949. This would amount to only $6,000,000,[10] half our normal earnings.

3. *Increase in capacity (sec. 444).*—A taxpayer qualifies under this section if during the years 1947 to 1949—

(i) As the result of additions and replacements, its capacity for production or operation on December 31, 1949, was 200 percent or more of such capacity on December 31, 1946, or

(ii) Such capacity on December 31, 1949, was 150 percent or more of such capacity on December 31, 1946, and the adjusted basis of its total facilities on December 31, 1949, was 150 percent or more of such basis on December 31, 1946; or

(iii) The unadjusted basis of such facilities on December 31, 1949, was 200 percent or more of such basis on December 31, 1946.

We undoubtedly qualify under one or more of these three alternative tests. But our credit will be measured by the base-period rate of return of our industry. Our credit would be only $6,000,000,[11] half our normal earnings.

III. PROPOSED ADDITIONAL RELIEF PROVISIONS

Our case is unusual but certainly not unique. There will be other corporations which have enjoyed extraordinary growth and reached a new level of sales and income at December 31, 1949. Such corporations are not protected by the relief provisions of the 1950 act. They should be entitled to a credit reflecting the new level of growth attained at the end of the base period.

Such a credit could be provided by several methods along the following pattern. It could be provided by a specific growth formula similar to that now applicable

[8] A return of 16.5 percent before taxes means only 7.92 percent after normal and surtax of 52 percent, the rate proposed for 1951 under the Ways and Means Committee amendment.

[9] The stone, clay, and glass products major group is made up of 9 subgroups, consisting of 29 separate industries. They include flat glass, pressed and blown glass, brick and tile products, sewer pipe, vitreous plumbing fixtures, pottery, concrete products, gypsum products, lime, mineral-wool products, cut stone products including tombstones, abrasives, and oven statuary and art goods made of plaster of Paris and papier-mâché.

[10] Only $5,300,000 for base-period earnings for 1951 and subsequent years under the Ways and Means Committee amendment.

[11] See footnote 10.

to the new-product corporation. No valid reason is apparent for providing a growth formula in the one situation and not in the other. Such a credit could also be provided by a general relief provision similar to old section 722.

A recommended formula which would grant the corporation experiencing extraordinary growth the same type of relief as is now afforded the new product corporation is as follows:

(a) *Specific relief formula for extraordinary growth*

Tests.—Taxpayer experienced extraordinary growth during the base period as evidenced by the fact that—

(1) Twice taxpayer's net sales for the period January 1, 1950, to June 30, 1950, is 50 percent or more in excess of the average for 1946 and 1947; and

(2) During 1946 to 1949 taxpayer (i) doubled its productive capacity, or (ii) increased its productive capacity by 50 percent or more and the adjusted basis of its facilities by 50 percent or more or (iii) doubled the unadjusted basis of its facilities; and

(3) Either (i) twice taxpayer's excess profits net income for January 1, 1950, to June 30, 1950, or (ii) its "weighted excess-profits net income" for its first excess-profits tax taxable year is 200 percent or more in excess of its average base-period net income.[12]

Credit.—Eighty-five percent of either (1) twice taxpayer's excess profits net income for January 1, 1950, to June 30, 1950, or (2) its "weighted excess-profits net income" [12] for its first excess-profits tax taxable year, at the taxpayer's election.

This formula is based on tests similar to those already adopted and could be made effective by simple amendments to section 435. Test (i) is the same as the sales test of the present growth formula for the new product corporation, section 435 (e) (1) (B) (i). Test (ii) is similar to the capacity tests of section 444. Test (iii) is similar to the income test of the change in products relief provision, section 443 (a) (3), but the percentage increase in income is made more stringent by increasing it from 25 to 200 percent.

Under this formula our credit would be $10,880,000,[13] a credit more nearly commensurate with our normal peacetime earnings level of $12,000,000.

A suggested draft of the basic amendments to section 435 to make this additional growth formula effective is set forth in the appendix.

(b) *General relief provision.*—An alternative to such a growth formula, if Congress should decide not to enact further specific relief provisions, would be the reenactment of a general relief provision similar to section 722 of the World War II excess-profits tax.

To eliminate the administrative difficulties which have greatly delayed the disposition of cases under that section, however, it is recommended that Congress review the rulings and policies of the Excess Profits Tax Council and enact detailed clarifications of its intent.

One of the primary lapses in section 722 has been the delay, both on the part of the taxpayer and the Government, in reaching a final administrative determination. Any re-enactment should require the filing of claims under the new provision within 1 year of the due date of the return for the year involved, thus requiring the taxpayer to act promptly.[14] It should also require a final administrative determination upon the claim within 1 year of its filing. Thus, if the taxpayer is not satisfied with the credit allowed, it can go promptly to the tax court. It must be recognized that an excess-profits tax is an emergency measure and, therefore, does not permit of processing in the normal course.

Most important, however, in order to reduce administrative judgment to a minimum, there should be written into the law statutory standards for qualification for relief and for measuring the scope of the relief to be allowed. In the case of growing corporations, for example, such statutory standards should include substantial growth in sales, plant facilities, and net income. They should be similar to the tests of the proposed formula for extraordinary growth. Any taxpayer meeting all of these high standards would qualify for relief, at least presumptively. Administrators of the law would also be guided by these standards in granting relief to other taxpayers not able to meet them all.

[12] "Weighted excess-profits net income" is 80 percent of the excess-profits net income for the calendar year 1950, and varying greater and lesser percentages in the case of fiscal years (sec. 435 (e) (2) (E)).

[13] See the following:

80 percent of 1950 earnings	$12,800,000
Less 15 percent	1,920,000
Total	10,880,000

[14] Or 1 year from the adoption of the provision, whichever is later.

The amendment should also provide that taxpayers who qualify and meet all the standards prescribed in the formula would be allowed the level of earnings actually attained during the first 6 months of 1950 as a reasonable minimum reconstruction of normal earnings. Excess profit taxes would then be imposed only on the earnings in excess of this amount. Taxpayers would be permitted to show that a greater level of earnings would have been reached had the changes in their business been made 2 years earlier, as under section 722.

Similar formulas should be prescribed to establish standards of qualification and scope of relief for the other changes in business encompassed by the section. Such standards for qualification and for reconstruction should eliminate to a very great extent the administrative difficulties encountered under section 722.

APPENDIX

PROPOSED AMENDMENT PROVIDING ADDITIONAL FORMULA FOR EXTRAORDINARY GROWTH

Section 435 (e) (1) should be amended by adding the following new subparagraph:

"or,

"(C) (i) the taxpayer's net sales for the period beginning January 1, 1950, and ending June 30, 1950, when multiplied by 2, equals or exceeds 150 percent of its average net sales for the calendar years 1946–47, as provided in subparagraph (B) (i); and

"(ii) the taxpayer during its base period made an addition or additions to its facilities or replaced all or a part of its existing facilities, and as a result of such additions or replacements:

"(I) its capacity for production or operation on the last day of its base period was 200 percent or more of its capacity for production or operation on the day prior to the beginning of its base period, or

"(II) its capacity for production or operation on the last day of its base period was 150 percent or more of its capacity for production or operation on the day prior to the beginning of its base period, and (B) the adjusted basis for determining gain upon sale or exchange of its total facilities on the last day of its base period was 150 percent or more of the adjusted basis for determining gain upon sale or exchange of its total facilities on the day prior to the beginning of its base period, or

"(III) the basis (unadjusted) for determining gain upon sale or exchange of its total facilities on the last day of its base period was 200 percent or more of the basis (unadjusted) for determining gain upon sale or exchange of its total facilities on the day prior to the beginning of its base period; and

"(iii) the taxpayer's (I) excess profits net income for the period beginning January 1, 1950, and ending June 30, 1950, multiplied by 2, or (II) the taxpayer's 'weighted excess profits net income' for its first excess-profits tax taxable year under this subchapter, determined as provided in paragraph (2) (E), equals or exceeds 300 percent of the taxpayer's average base period net income determined under subsection (d)."

Section 435 (e) (2) should be amended by adding the following new subparagraph:

"(H) In the case of a taxpayer who is entitled to the benefits of this subsection under paragraph (1) (C), the average base period net income determined under this subsection shall be either:

"(i) The taxpayer's excess profits net income for the period beginning January 1, 1950, and ending June 30, 1950, multiplied by 2, or

"(ii) The taxpayer's 'weighted excess profits net income' for its first excess profits tax taxable year under this subchapter, determined as provided in subparagraph (E);

whichever results in the lesser tax under this subchapter for the taxable year for which the tax under this subchapter is being computed."

Exhibit 4

Specific Relief Formula for Extraordinary Growth

PROPOSAL A

Tests.—Taxpayer experienced extraordinary growth during the base period as evidenced by the fact that—

(1) Twice taxpayer's net sales for the period January 1, 1950 to June 30, 1950 is 50 percent or more in excess of the average for 1946 and 1947; and

(2) During 1946 to 1949 taxpayer (i) doubled its productive capacity, or (ii) increased its productive capacity by 50 percent or more and the adjusted basis of its facilities by 50 percent or more, or (iii) doubled the unadjusted basis of its facilities; and

(3) Either (i) twice taxpayer's excess profits net income for January 1, 1950, to June 30, 1950, or (ii) its "weighted excess profits net income" for its first Excess Profits Tax taxable year, is 200 percent or more in excess of its average base period net income.[1]

Credit.—Eighty-five percent of taxpayer's excess profits net income for the period July 1, 1949 to June 30, 1950, such excess profits net income being the sum of:

(1) Taxpayer's "weighted excess profits net income" for the 6 months beginning January 1, 1950, and ending June 30, 1950; and

(2) A substitute excess profits net income for the 6 months beginning July 1, 1949, and ending December 31, 1949, computed by applying to the average of taxpayer's total assets at the end of each month during the period July 1, 1949, to December 31, 1949, its rate of return for the period January 1, 1950, to June 30, 1950.

Test (1) is the same as the sales test of the present growth formula for the new product corporation (sec. 435 (e) (1) (B) (i).) Test (2) is similar to the capacity tests of section 444. Test (3) is similar to the income test of the change in products relief provision, section 443 (a) (3), but the percentage increase in income is made more stringent by increasing it from 25 to 200 percent.

The credit under the present growth formula for the calendar year taxpayer is 40 percent of 1950 income plus 50 percent of 1949 income. The proposed credit is the same for the period January 1, 1950, to June 30, 1950. A substitute excess profits net income is necessary for the period July 1, 1949, to December 31, 1949, however, since 1949 would not ordinarily be a normal year for the taxpayer experiencing extraordinary growth. This substitute net income would be computed by multiplying the average of taxpayer's total assets at the end of each month during the period January 1, 1949, to December 31, 1949, by its rate of return upon total assets for the period January 1, 1950, to June 30, 1950. This rate of return would be determined by dividing taxpayer's "weighted excess profits net income" for the period January 1, 1950, to June 30, 1950, by the average of its total assets at the end of each month during such period.

APPENDIX

PROPOSAL A—PROPOSED AMENDMENT PROVIDING ADDITIONAL FORMULA FOR EXTRAORDINARY GROWTH

Section 435 (e) (1) should be amended by adding the following new subparagraph:

"or,

"(C) (i) the taxpayer's net sales for the period beginning January 1, 1950, and ending June 30, 1950, when multiplied by 2, equals or exceeds 150 per centum of its average net sales for the calendar years 1946–47, as provided in subparagraph (B) (i); and

"(ii) the taxpayer during its base period made an addition or additions to its facilities or replaced all or a part of its existing facilities, and as a result of such additions or replacements:

"(I) its capacity for production or operation on the last day of its base period was 200 per centum or more of its capacity for production or operation on the day prior to the beginning of its base period, or

"(II) (A) its capacity for production or operation on the last day of its base period was 150 per centum or more of its capacity for production or operation on the day prior to the beginning of its base period, and (B) the adjusted basis for determining gain upon sale or exchange of its

[1] "Weighted excess profits net income" for the calendar year 1950, is 80 percent of the excess profits net income, and varying greater and lesser percentages in the case of fiscal years (sec. 435 (e) (2) (E)).

total facilities on the last day of its base period was 150 per centum or more of the adjusted basis for determining gain upon sale or exchange of its total facilities on the day prior to the beginning of its base period, or

"(III) the basis (unadjusted) for determining gain upon sale or exchange of its total facilities on the last day of its base period was 200 per centum or more of the basis (unadjusted) for determining gain upon sale or exchange of its total facilities on the day prior to the beginning of its base period; and

"(iii) the taxpayer's (I) excess profits net income for the period beginning January 1, 1950, and ending June 30, 1950, multiplied by 2, or (II) the taxpayer's 'weighted excess profits net income' for its first excess-profits tax taxable year under this subchapter, determined as provided in paragraph (2) (E), equals or exceeds 300 per centum of the taxpayer's average base period net income determined under subsection (d)."

Section 435 (e) (2) should be amended by adding the following new subparagraph:

"(H) In the case of a taxpayer who is entitled to the benefits of this subsection under paragraph (1) (C), the average base period net income shall be computed as follows:

"(i) By determining in the manner provided by subparagraph (E), the excess profits net income for each of the 6 months in the period beginning January 1, 1950, and ending June 30, 1950.

"(ii) By computing the aggregate of the excess profits net income for each such month.

"(iii) By determining the average of taxpayer's total assets as of the end of each month during the period beginning January 1, 1950, and ending June 30, 1950.

"(iv) By dividing the amount ascertained under subparagraph (ii) by the amount ascertained under subparagraph (iii).

"(v) By determining the average of taxpayer's total assets as of the end of each month during the period beginning July 1, 1949, and ending December 31, 1949.

"(vi) By multiplying the amount determined under subparagraph (v) by the rate of return determined under subparagraph (iv).

"(vii) By adding to the amount ascertained under subparagraph (ii) the amount ascertained under subparagraph (vi)."

Exhibit 5

Specific Relief Formula for Extraordinary Growth

PROPOSAL B

Tests.—Taxpayer experienced extraordinary growth during the base period as evidenced by the fact that:

(1) Twice taxpayer's net sales for the period January 1, 1950, to June 30, 1950, is 50 percent or more in excess of the average for 1946 and 1947; and

(2) During 1946 to 1949 taxpayer (i) doubled its productive capacity, or (ii) increased its productive capacity by 50 percent or more and the adjusted basis of its facilities by 50 percent or more, or (iii) doubled the unadjusted basis of its facilities; and

(3) Either (i) twice taxpayer's excess profits net income for January 1, 1950, to June 30, 1950, or (ii) its "weighted excess profits net income" for its first excess profits tax taxable year, is 200 percent or more in excess of its average base period net income.[1]

Credit.—Eighty-five percent of either: (1) twice taxpayer's excess profits net income for January 1, 1950, to June 30, 1950, or (2) its "weighted excess profits net income"[1] for its first Excess Profits Tax taxable year, at the taxpayer's election.

This formula is based on tests similar to those already adopted, and could be made effective by simple amendments to section 435. Test (1) is the same as the sales test of the present growth formula for the new product corporation, sec. 435 (e) (1) (B) (i). Test (2) is similar to the capacity tests of section 444. Test (3) is similar to the income test of the change in products relief provision, section 443 (a) (3), but the percentage increase in income is made more stringent by increasing it from 25 to 200 percent.

---

[1] "Weighted excess profits net income" is 80 percent of the excess profits net income for the calendar year 1950, and varying greater and lesser percentages in the case of fiscal years (sec. 435 (e) (2) (E)).

APPENDIX

PROPOSAL B—PROPOSED AMENDMENT PROVIDING ADDITIONAL FORMULA FOR EXTRAORDINARY GROWTH

Section 435 (e) (1) should be amended by adding the following new subparagraph:

"or,

"(C) (i) the taxpayer's net sales for the period beginning January 1, 1950, and ending June 30, 1950, when multiplied by 2, equals or exceeds 150 per centum of its average net sales for the calendar years 1946–47, as provided in subparagraph (B) (i); and

"(ii) the taxpayer during its base period made an addition or additions to its facilities or replaced all or a part of its existing facilities, and as a result of such additions or replacements:

"(I) its capacity for production or operation on the last day of its base period was 200 per centum or more of its capacity for production or operation on the day prior to the beginning of its base period, or

"(II) (A) its capacity for production or operation on the last day of its base period was 150 per centum or more of its capacity for production or operation on the day prior to the beginning of its base period, and (B) the adjusted basis for determining gain upon sale or exchange of its total facilities on the last day of its base period was 150 per centum or more of the adjusted basis for determining gain upon sale or exchange of its total facilities on the day prior to the beginning of its base period, or

"(III) the basis (unadjusted) for determining gain upon sale or exchange of its total facilities on the last day of its base period was 200 per centum or more of the basis (unadjusted) for determining gain upon sale or exchange of its total facilities on the day prior to the beginning of its base period; and

"(iii) the taxpayer's (I) excess profits net income for the period beginning January 1, 1950, and ending June 30, 1950, multiplied by 2, or (II) the taxpayer's 'weighted excess profits net income' for its first excess profits tax taxable year under this subchapter, determined as provided in paragraph (2) (E), equals or exceeds 300 percent of the taxpayer's average base period net income determined under subsection (d)."

Section 435 (e) (2) should be amended by adding the following new subparagraph:

"(H) In the case of a taxpayer who is entitled to the benefits of this subsection under paragraph (1) (C), the average base period net income determined under this subsection shall be either—

"(i) The taxpayer's excess profits net income for the period beginning January 1, 1950, and ending June 30, 1950, multiplied by 2; or

"(ii) The taxpayer's 'weighted excess profits net income' for its first excess profits tax taxable year under this subchapter, determined as provided in subparagraph (E);

whichever results in the lesser tax under this subchapter for the taxable year for which the tax under this subchapter is being computed."

Senator BYRD. Mr. Seghers. (No response.)

Mr. Clarence J. Dixon.

Will you please identify yourself?

STATEMENT OF CLARENCE J. DIXON, CADILLAC, INC., HOLLYWOOD, CALIF.

Mr. DIXON. Mr. Chairman and gentlemen: My name is Clarence J. Dixon, Cadillac dealer, Hollywood, Calif.

Senator MILLIKIN. Senator Nixon stated his desire to be here, and was here for a while, but he was unavoidably detained. He has shown an interest in your testimony, and will be back.

Mr. DIXON. Thank you.

Gentlemen, first allow me to thank you for the opportunity to appear before this committee with what I feel is an honest and fair plea for relief from the present excess-profits-tax law.

In doing so, I do not want you to receive the impression this is strictly a personal or unusual problem, because I know there are many others facing similar situations, but probably not to the same extent as my case.

Over 35 years ago at the age of 16, I graduated from high school and immediately went to work as an errand boy for the Don Lee & Hillcrest Motor Co. in California. I was continually employed by them in various capacities until November 1, 1950. On that date, through a series of events, including the death of one of the principal owners, I was able to purchase for myself, mostly on borrowed money, the automobile franchise in Hollywood, which I managed for the former owners for many years.

It was, of course, something I had looked forward to all my life, as I am sure you can appreciate, and I was very happy with this new enterprise for about 2 months until I learned just how the excess-profits-tax bill, passed by the Congress, late in 1950, affected my operation.

I was under the impression that an excess profits tax law was in effect an instrument to prevent any business from making more profit in a period of emergency such as we now have, than would be the case in normal peacetimes and I, of course, assumed that, when taking over a going business, that had been in existence for years, I would naturally take over its normal tax base that the former owners would use, were they still in business.

You can appreciate the shock it was to me to learn that under the new law my profit base was reduced to a figure just a shade over 10 percent of what it would have been for the old owners.

Reduced to figures, the business under my management had established a base of $247,000 for the three average years from 1946 through 1949, whereas, my present base is $30,000, which, incidentally, is less than 1 percent of my average yearly sales.

I would like you to keep in mind that this condition exists while I am selling exactly the same products to the same customers, from the same location with the same personnel, under the same management that has existed for many years.

Senator MILLIKIN. Is yours an individual company, or a corporate business?

Mr. DIXON. It had, of necessity, to be a corporation, Senator.

Senator MILLIKIN. And your predecessor——

Mr. DIXON. Was a corporation.

I think I will cover the question you have in mind a little further along here.

The only change has been my name over the door in place of that of the original owners.

That may answer your question.

When purchasing this business, I was obliged to purchase assets rather than stock, due principally to the fact that the original corporation owned five stores, all of which were sold to five separate persons. In purchasing these assets, I also assumed all of the liabilities of the original firm; in fact, the only item that has been changed is the excess-profits-tax base.

I would like to add that the State of California recognized this condition to the extent that they passed on to me the unemployment insurance tax rate established by the original company, rather than make me establish a rate based on experience over a period of years.

One last item, and that is with reference to the actual tax rate under which I am operating.

Under the present law, as soon as I reach a profit figure of $30,000, any additional is taxed at the rate of 77 percent, which, added to our California tax rate of 4 percent, does not leave much out of the dollar for me to use to pay off the business.

By comparison, I would like to call your attention to the fact that other dealers who are my competitors, many of whom have been in business a comparatively short length of time, are operating under a 47 percent maximum tax, which, to me, does not make good sense.

Their tax, I think, is surely high enough, if not too high, particularly for an industry that cannot possibly be helped by war or emergency conditions, but rather, can be very seriously hurt if car production is further curtailed. If my reasoning is sound, and you will agree with it, I hope that something can and will be done in the new law that is now being considered that will correct what I believe to be a very major inequality.

Thank you.

Senator KERR. Is not your taxation under the present law limited to 60 percent of your profits?

Mr. DIXON. 62 percent, after you reach a certain figure, Senator.

Senator KERR. Pardon me?

Mr. DIXON. It has a maximum of 62 percent. But you have to reach that figure before it drops to the 62 percent.

Senator KERR. You are addressing yourself to the new law when you saw that the 77 percent would apply?

Mr. DIXON. No. As soon as we reach our normal tax credit of $30,000, any additional profits are taxed at the rate of 77 percent. When you reach a figure where the 77 percent is higher than a maximum 62 percent over-all, then you drop to the 62 percent.

Senator KERR. You mean 62 percent of your total profits?

Mr. DIXON. That is right.

But until you reach that point where the——

Senator KERR. But your over-all tax cannot be above 62 percent of your profits now?

Mr. DIXON. That is right.

Senator WILLIAMS. You are in the same classification now as a new corporation?

Mr. DIXON. Correct.

Senator BYRD. On part of the income you will pay more than 62 percent?

Mr. DIXON. That is right.

Senator BYRD. But the average over-all cannot be more than 62 percent?

Mr. DIXON. That is right.

Senator KERR. While he may pay a greater percent on part of it, there is another part of it that pays enough less percent that his over-all tax under the present law cannot exceed 62 percent of his entire profits.

Senator WILLIAMS. Do you not have an alternative proposal, instead of using your capital as a base, like a new industry, that you can take the profits that are normal to the industry, as an alternative proposal?

Is that not allowed, Mr. Stam? Cannot the average earnings that are normal to the industry be made applicable for a base?

Mr. STAM. That is a provision that would apply to a new corporation, where you can take the industry rate.

Senator WILLIAMS. That is his situation.

Mr. STAM. That would be his situation. But what he is concerned with is this: I think that he wants to take the base period experience of the company that he bought.

Senator WILLIAMS. Yes; I understand that.

Mr. STAM. That is his position, and I think that the problem there is that he bought the assets but did not buy the stock, and in addition to that the problem is, what sort of credit does the old company get? The old company was not dissolved, because he bought the assets.

The old company, of course, is entitled to its old credit, and in framing the excess profits tax last year one of the things that seemed to worry the committee, was whether or not there would be a double credit, that is, whether the old credit will get that credit and the new company get the credit.

And it is something that we were not able to work out in the limited time that we had the excess profits tax up. But there is a problem there as to whether both companies should get a duplicate credit.

Mr. DIXON. Mr. Stam, I might add there, in this particular case the old company cannot possibly use all of the credit, because there is one store left out of five, and he cannot possibly use it.

I mean, it is lying there going to waste, whereas, in my case and the three other stores that were sold under similar conditions, they are operating just as if they were brand new companies that had never been in business before.

From the standpoint of competition, of course, I think that you can see that we are in a very unfavorable position. We are operating with everything exactly the same as the man down the street, until we reach the point of Federal taxes.

When we reach that point, he has a distinct advantage over us.

Mr. STAM. That is right.

Senator MILLIKIN. Does your demand for Cadillacs exceed the supply?

Mr. DIXON. Yes; it does, Senator, fortunately.

Senator MILLIKIN. Do you engage in the second-hand business?

Mr. DIXON. Yes.

Senator MILLIKIN. Are you in the general servicing business, also?

Mr. DIXON. Yes, sir. My business has for the last 4 or 5 years averaged over $3,000,000 a year total sales, including service, parts, and new and used cars.

Now, I am operating under conditions where, when we reach the point of 1 percent of total sales, everything then immediately is excess profits.

Senator BYRD. Under this new bill, would you reach the 70-percent limit? Have you studied the provisions?

Mr. DIXON. I think so, Senator. I feel certain we would. Of course, our business is quite uncertain.

Senator KERR. The new bill does not change the credit. If just increases the rate.

Mr. DIXON. And it lowers the credit a bit, too, does it not?

Mr. STAM. It raises the over-all from 62 percent to 70 percent.

Senator BYRD. And you would be in the 70 percent?

Mr. DIXON. That is right, plus the California tax.

Senator KERR. The only change that would be in his situation would be that it would be worse.

Mr. DIXON. Definitely.

Senator KERR. And I presume that before this happened, he did not think it could get worse?

Mr. DIXON. I did not think last November 1 that this could happen, Senator, I can assure you.

Senator BYRD. I see.

Thank you very much, Mr. Dixon.

Mr. DIXON. Thank you, gentlemen.

Senator BYRD. Your full statement will be put into the record, Mr. Dixon.

Mr. DIXON. Thank you, sir.

(The prepared statement of Mr. Dixon is as follows:)

CLARENCE DIXON CADILLAC, INC.,
Hollywood, Calif., July 23, 1951.

The SENATE FINANCE COMMITTEE,
Senate Building, Washington, D. C.

GENTLEMEN: First allow me to thank you for the opportunity to appear before this committee with what I sincerely feel is an honest and fair plea for relief from the present excess-profits tax law. In doing so, I do not want you to receive the impression this is strictly a personal or unusual problem, because I know there are many others facing similar situations, but probably not to the same extent as my case.

Over 35 years ago, at the age of 16, I graduated from high school and immediately went to work as an errand boy for the Don Lee & Hillcrest Motor Co. in California. I was continually employed by them in various capacities until November 1, 1950. On that date, through a series of events, including the death of one of the principal owners, I was able to purchase for myself, mostly on borrowed money, the automobile franchise in Hollywood, which I managed for the former owners for many years. It was, of course, something I had looked forward to all my life, as I am sure you can appreciate, and I was very happy with this new enterprise for about 2 months until I learned just how the excess-profits-tax bill, passed by the Congress late in 1950, affected my operation.

I was under the impression that an excess-profits-tax law was in effect an instrument to prevent any business from making more profit in a period of emergency such as we now have than would be the case in normal peacetimes and I of course assumed that when taking over a going business that had been in existence for years, I would naturally take over its normal tax base that the former owners would use were they still in business. You can appreciate what a shock it was to me to learn that, under the new law, my profit base was reduced to a figure just a shade over 10 percent of what it would have been for the old owners. Reduced to figures, the business under my management had established a base of $247,000 for the three average years from 1946 through 1949, whereas my present base is $30,000, which, incidentally, is less than 1 percent of my average yearly sales. I would like you to keep in mind that this condition exists while I am selling exactly the same products to the same customers, from the same location, with the same personnel, under the same management that has existed for many years. The only change has been my name over the door in place of that of the original owners.

When purchasing this business, I was obliged to purchase assets rather than stock, due principally to the fact the original corporation owned five stores, all of which were sold to five separate persons. In purchasing these assets, I also assumed all of the liabilities of the original firm; in fact, the only item that has been changed is the excess-profits-tax base. I would like to add that the State of

California recognized this condition to the extent they passed on to me the unemployment insurance tax rate established by the original company, rather than make me establish a rate based on experience over a period of years.

One last item and that is with reference to the actual tax rate under which I am operating. Under the present law, as soon as I reach a profit figure of $30,000 any additional is taxed at the rate of 77 percent, which, added to our California tax rate of 4 percent, does not leave much left out of the dollar for me to use to pay off the business. By comparison, I would like to call your attention to the fact that other dealers who are my competitors, many of whom have been in business a comparatively short length of time, are operating under a 47 percent maximum tax, which to me does not make good sense. Their tax, I think, is surely high enough, if not too much so, particularly for an industry that cannot possibly be helped by war or emergency conditions, but rather can be very seriously hurt if car production is further curtailed. If my reasoning is sound and if you agree with it, I hope something can and will be done in the new law now being considered that will correct what I believe to be a very major inequality.

Respectfully submitted.

CLARENCE J. DIXON.

MEMORANDUM RE AMENDING THE EXCESS-PROFITS-TAX LAWS TO PROVIDE FOR THE TRANSFER OF AN EXCESS-PROFITS-TAX CREDIT BASED UPON INCOME (OR A PORTION THEREOF), BY ONE TAXPAYER TO ANOTHER, IN CONNECTION WITH THE TRANSFER OF SUBSTANTIALLY ALL (OR A SEVERABLE PORTION) OF THE ASSETS AND BUSINESS OF THE TRANSFEROR

The excess-profits-tax laws in effect from 1940 through 1945 made no general provision for the transfer of an excess-profits-tax credit based upon income (or of any part thereof) by one corporate taxpayer to another corporate taxpayer in connection with the transfer of the assets and business (or a severable portion thereof) of the former. They did, however, provide that an acquiring corporation might include in its excess-profits-tax credit based upon income, the earnings experience of the business taken over, in connection with transactions qualifying as tax-free reorganizations under section 112 of the Internal Revenue Code, under certain limiting conditions.

The Excess Profits Tax Act of 1950 continues the general plan of the earlier acts, and a new provision covers certain transactions in which only a part of the business of the predecessor unit is taken over. Eligible transactions involving the taking over of only part of a business are restricted to those of the type defined in Internal Revenue Code 112 (b) (5), namely, those in which "property is transferred to a corporation by one or more persons solely in exchange for stock and securities in such corporation, and immediately after the exchange such person or persons are in control of the corporation; * * *." (Sec. 112 (b) (4) transactions are likewise eligible, but since these involve exchanges of securities for securities in a reorganization, they probably are not of interest in connection with sales of part of the business.) It might be contended that Internal Revenue Code 461 (a) (1) (E), the 1950 provision for transactions described in section 112 (c) (5), can be used in typical cases of a sale of part of the business to permit the purchaser to make use of the earnings experience of the seller insofar as that experience is based upon, or allocated to, the assets sold. If the statutory provisions are applied literally it would for example be possible for a corporation to transfer all the properties of a branch operation to a new corporation in exchange for all the stock of the new corporation and immediately thereafter to sell the stock with the result that the new corporation would have an excess-profits-tax credit based upon the earnings experience of the branch or the portion of the earnings experience of the seller allocated to the branch. The possible barrier across this route is the rule engrafted in section 112 by the United States Supreme Court that a transaction to qualify under that section must involve a continuity of proprietary interest held by the transferor in the business of the transferee.

It is clear that the transaction described would qualify were it not for the immediate sale of the stock, such sale being made as part of the original plan. Whether the judicial rule referred to would be applied to deprive the transaction of its qualification upon the ground that the sale of the stock destroyed the continuity of interest is not certain from the quick examination of the cases and other writings on the subject. As a matter of statutory construction it seems that the continuity of interest rule should not apply to this particular subsection of section 112 inasmuch as this subsection contains its own definition of circumstances which must exist following the transfer, namely, that "immediately after the exchange" the transferor must own at least 80 percent of the voting stock and 80 percent of every other class of stock of the transferee. The subsections involved when the continuity of interest rule has been applied do not contain a similar provision.

Assuming that section 461 (a) (1) (E) cannot be used because of possible application of the continuity of interest rule, or for any other reason, or assuming a transaction already completed in which assets have been sold and a new corporation formed by the purchaser (rather than the reverse order outlined above), an amendment to the Internal Revenue Code would be required to give the transferee a portion of the earnings experience of the transferor.

The objective of the amendment would be to include among the definitions of acquiring corporations provided in section 461 (a) of the code any successor to the business, or a distinct part of the business of a corporation, partnership, or sole proprietorship. The problem of definition is to make sure that the purchaser is a genuine successor to the business rather than the purchaser merely of assets to be used in some other business. There is also the procedural problem of ascertaining the portion of the transferor's earnings experience which is to be transferred. This probably requires eligibility to be restricted to transactions in which the business transferred is either the entire business of the transferor (in which case one of the existing subsections of sec. 461 (a) may be applicable) or a clearly identifiable and severable portion of the business. The statute under consideration is so prolix (approximately 41,000 words in the Excess Profits Tax Act, of which over 9,000 are in part II devoted to acquiring corporations) that it is especially difficult to be sure that any suggested language adequately covers all possibilities while at the same time being sufficiently descriptive to minimize the necessity for the exercise of administrative discretion or judicial interpretation.

Recognizing, therefore, the need for careful consideration by many people, the following is suggested as an approach to the desired amendment:

To section 461 (a) (1), add a new subsection (F) so that, insofar as is pertinent, the definition of an acquiring corporation will read as follows:

"For the purposes of this part—

"(a) Acquiring corporation: The term 'acquiring corporation' means—

"(1) A corporation which has acquired—

* * * * *

"(F) Substantially all the properties 'used immediately prior to the acquisition,' (1) in the business of another corporation or partnership, or (2) in a severable portion of the business of another corporation or partnership, in a transaction not otherwise described in this subsection, for the purpose of continuing such business or such severable portion."

Other sections and subsections, including subsection 461 (f) (which includes in the term "partnership" a sole proprietorship), will then have to be amended to add reference to the new subsection 461 (a) (1) (F).

The definition of "component corporation" in section 461(b) should have added to it a new subsection (7) as follows:

"(7) In the case of a transaction specified in subsection (a) (1) (F), the partnership or corporation whose properties were acquired."

In this memorandum reference is made to "substantially all the properties" of the transferor, even though presumably the new subsection would not be used in the event of the transfer of substantially all the properties of the business for the reason that one of the existing subsections should be applicable. The language does no harm, however, and has certain advantages, in that it follows the form of existing subsection (E), which likewise presumably will be used only in transactions in which less than all the assets of the transferor are involved, and may possibly pick up some transactions not otherwise covered. The restriction to properties "used immediately prior to the acquisition" in the business of the transferor is intended to confine eligibility to those transactions in which there is an actual going business which is the subject of the transfer. The term "severable portion" has the disadvantage that it may require interpretation of the word "severable," but that does not seem likely to pose much of a problem since severability is something which should be capable of demonstration and the concept of severability is a necessary element of the concept of continuation of the business. The parenthetical phrase "in a transaction not otherwise described in this subsection," is copied from the existing subsection (E) and means that if a transaction qualifies under any other part of subsection 461 (a), or at least under any other part of 461 (a) (1), it will be handled under such other part and hence not subject to the many complicated rules which follow in later sections of the code governing the allocation of the earnings experience to the portion of the assets transferred. (All subsections of 461 (a), other than 461 (a) (1) (E) and the proposed new 461 (a) (1) (F), involve transfers of the entire assets and hence the entire earnings experience of the transferor.) The final phrase "for the purpose of continuing such business or such severable portion" is necessary to confine eligibility to those transactions in which there is a genuine succession of the business. The disadvantage of this phrase is that it requires a subjective test to determine "purpose." An objective test is always preferable but it is difficult to devise one to fit the circumstances. Actual continuation of the business without time limitation cannot be required because that would require, each year, a reexamination of the transferee's right to use its predecessor's earnings experience. Continuation of the business for a specified time is a possibility but leads to complications almost as serious as continuation of the business without time limit.

In view of the fact that the existing section 461 (a) (1) (E) includes, among eligible transactions, some transactions in which only part of the assets of the transferor are involved, it is not necessary, because of the proposed amendment enlarging eligibility provisions, to add anything further covering allocation of the earnings experience of the transferor. The existing statute provides the following methods of allocation of the transferor's earnings experience between the transferor and the transferee:

(1) In proportion to the value of the assets retained and the assets transferred.

(2) In proportion to the values of assets retained and transferred as agreed upon between parties with the approval of the Secretary of the Treasury.

(3) By allocating to the transferee the actual earnings experience of the particular assets transferred as agreed upon between the parties with the approval of the Secretary of the Treasury.

Draft of Proposed Amendment to Excess Profits Tax Act of 1950 Being Subchapter (D) of Chapter (1) of the Internal Revenue Code

Section 1. Section 461 (a) (1) of the Internal Revenue Code is amended by inserting after subsection (E) a new subsection (F) as follows:

"(F) Substantially all the properties used immediately prior to the acquisition, (1) in the business of another corporation or partnership, or (2) in a severable portion of the business of another corporation or partnership, in a transaction not otherwise described in this subsection for the purpose of continuing such business or such severable portion."

Sec. 2. Section 461 (b) of the Internal Revenue Code is amended by adding after subsection (6) a new subsection (7) as follows:

"(7) In the case of a transaction specified in subsection (a) (1) (F), the partnership or corporation whose properties were acquired."

Sec. 3. Sections 461 (c) (3), 461 (c) (4), and 461 (d) are amended by inserting after the words "subsection (a) (1) (E)" wherever such words appear, the following: "or subsection (a) (1) (F)."

Sec. 4. Section 461 (f) of the Internal Revenue Code is amended by inserting after the words "sections 461 (a) (1) (D)," the following: "461 (a) (1) (F)."

Sec. 5. Sections 462 (c) (1), 462 (c) (2), 462 (d) (1) (A), 462 (d) (1) (B), 462 (e) (1), 462 (e) (2), 462 (g) (2) (A), 462 (g) (2) (B), 462 (i), 463 (a) (1), 463 (a) (2), 463 (a) (3), 463 (a) (4), 463 (a) (5), 463 (a) (6), 463 (a) (8), 463 (a) (9), 463 (a) (10), 463 (a) (12), 464 (a), 464 (b) of the Internal Revenue Code are amended by inserting after the words "section 461 (a) (1) (E)" wherever they appear the following: "or section 461 (a) (1) (F)."

Sec. 6. The amendments made by this act shall be effective for taxable years ending after June 30, 1950.

Senator Byrd. Mr. Phil Hall, please.

Mr. Hall, will you please identify yourself.

STATEMENT OF PHIL HALL, PHIL HALL BUICK CO. HOLLYWOOD, CALIF.

Mr. HALL. I am Phil Hall of the Phil Hall Buick Co., Hollywood, Calif.

First, I wish to thank you for the opportunity of coming here.

Briefly, my problem is this: 28 years ago I started to work for the Howard Motor Co. in Hollywood, selling Buicks. Three years later I was made sales manager and 6 years after that manager, which position I held for 18 years, or until last August, when I was able to fulfill my lifetime ambition of becoming the Buick dealer in Hollywood, largely on borrowed capital, my personal interest being less than 25 percent.

Since that time, as you know, the excess-profits tax was enacted, which has seriously jeopardized my position. In saying this, I am fully aware of the emergency and the need for everyone to sacrifice from every standpoint, including, of course, the financial one.

But that is not my problem. Rather it is the problem of surviving in a competitive business when the excess-profits tax law gives most of my competitors a distinct trading advantage.

As you know, in the retail automobile business——

Senator KERR. Did you tell us where you were from, Mr. Hall?

Mr. HALL. Yes, sir, from Hollywood, Calif.

Senator KERR. Very well.

Mr. HALL. As you know, in the retail automobile business, used-car allowance is a very material factor, and it is clear that the most efficiently managed business is in the best trading position, provided, and this is most important, that his tax liability is relatively the same.

Conversely, recognizing that a dealer's tax liability is in the nature of an expense item, a dealer cannot possibly meet a competitor's used-car allowance if his taxes are relatively higher.

To be specific, the expenses of my business are based on so much per new car sold for heat, light, gas, telephone, rent, insurance, advertising, and so forth.

But when I come down to the item of Federal taxes, I am lost, and I cannot compete because they pay taxes on one basis, having been in business during the base period of 1946–49, and I pay taxes on another.

To further emphasize my point, this is a 33-year-old business, doing $4,500,000 gross annually. The present tax base is $52,000, which allows us——

Senator MILLIKIN. Did you buy the company or did you buy the assets?

Mr. HALL. I bought the assets, Senator Millikin.

Senator KERR. You are in the same position exactly as the man who was just ahead of you?

Mr. HALL. Yes, Senator, brought about by the same conditions, with the passing of Mr. Lee and Mr. Howard out there, at about the same time, and they broke up the distributorship so that we had a chance to have these dealerships after having worked there all our lives.

Senator BYRD. How much of an increase in taxes do you pay by reason of the excess-profits tax?

Mr. HALL. We pay about six times.

In other words, our base is about one-sixth of what it would be under our predecessor company.

Senator BYRD. I understand that. How much more in dollars do you pay than under the ordinary tax bill? In other words, what does the excess-profits tax cost you?

Mr. HALL. The difference between 47 and 62, as a maximum. So, it has an effect that we would be paying about half again as much.

Senator TAFT. Why half again as much?

Mr. HALL. The difference between 62 and 47 percent. I do not know the exact percentage that would be.

Senator TAFT. That is about a third again as much.

Mr. HALL. About a third, yes.

Senator BYRD. You are paying about $15,000 more taxes?

Senator KERR. How much of an increase—how much more taxes are you paying than the man would be paying if he were still operating?

Is that the question? That is what I want to know.

Senator MILLIKIN. If he has the same profit.

Senator KERR. Yes.

Mr. HALL. We will say if we had a $100,000 profit, we would pay $62,000 where he paid $47,000.

Senator KERR. I can figure that out.

Mr. HALL. That is the figure.

Senator BYRD. You are assuming that the other fellow has no excess-profits tax to pay?

Mr. HALL. The reason for that, of course, is during our base, 1946 through 1949, the earnings during this period now do not begin to come up with what the normal earnings were during that period—the base period.

Senator TAFT. What is your best formula under the bill?

Mr. HALL. Our best formula is the industry experience, but unfortunately——

Senator TAFT. Is that better than 12 percent on your investment?

Mr. HALL. Yes, sir. But unfortunately, that includes service stations, used-car operations, and businesses that perhaps were not as well managed as others.

Senator TAFT. And how is that figured out? Is that figured out by the Treasury?

Mr. HALL. Yes, sir.

Senator TAFT. Well, they give you that figure, is that right?

Mr. HALL. Yes, sir.

Senator TAFT. They give you the figure for what they say is your industry?

Mr. HALL. Yes, sir.

Senator TAFT. And they arbitrarily decided—I do not mean arbitrarily, but somebody has to decide—what shall be included in your industry?

Mr. HALL. That is right. They decided that there would be service stations and tire dealers and used-car dealers and then other franchises that perhaps were not as desirable.

Senator TAFT. Offhand, I should think that that would be a different classification from those who sell automobiles.

It is in the law itself. Mr. Stam points out that it is in the law itself. So we would have to change it.

Automobile repair services and garages, everything connected with automobiles, presumably is in one heading.

Mr. HALL. Yes, sir.

Senator BYRD. And under the new bill, the pending bill, you would probably pay 70 percent?

Mr. HALL. Yes, sir.

Senator TAFT. Of course, this is not quite necessarily so. Your own figures would throw everything you make into excess profits?

Mr. HALL. No; not that. You see, our business——

Senator TAFT. I mean, after all, you got 12 percent on what you put in, anyway, before the base?

Mr. HALL. Senator Taft, we are able to make a little over 1 percent on our gross sales at the present time. In other words, our tax base is $51,000 and our gross sales are $4,500,000. So you can see that that is slightly over 1 percent.

Senator TAFT. Your gross sales——

Mr. HALL. Annually; yes, sir.

Senator TAFT. What is the $51,000?

Mr. HALL. Our tax base, our excess-profits tax base.

Senator KERR. In other words, you begin to pay excess profits when you get above an earnings figure of $51,000?

Mr. HALL. Yes, sir.

At this particular time, as Clarence Dixon testified just before me, we pay at this moment 77 percent. Now, I know that as soon as you reach a maximum, you go back to 62 percent, after you go through that experience. But at this particular time, as our statement is set up, 77 percent comes off for the Federal and 4 percent for the California ta...

So, it is 81 percent, or a total of 19 cents out of each dollar is left.

Senator KERR. That is, above your base exemptions?

Mr. HALL. Yes, sir, because of course, we use that up the first part of the year. It is purely a psychological effect, but it is a little discouraging when it comes along.

Senator MILLIKIN. Is the California tax a flat tax?

Mr. HALL. Yes, sir.

Senator KERR. Do you not also get a deduction for that before you figure your Federal tax?

Mr. HALL. I am not a tax man, but I would be of the opinion that you would.

So, in effect, it would not be that high. I can see the point.

Senator BYRD. It is counted as an expense, the State tax.

Mr. HALL. May I continue?

Senator BYRD. Yes.

Mr. HALL. If we were allowed to use our predecessor tax base, it would be approximately $300,000.

Now, to check this amount from another angle, the figures recently released by the National Automobile Dealers Association show that in 1949——

Senator MILLIKIN. May I interrupt to ask, did you take over the whole business of your predecessor, as in the case of the preceding witness, or a part of the operation?

Mr. HALL. I took over the Hollywood operation. In the over-all predecessor company, there were about five dealers. But at the present time, there is no tax base being used, because that corporation was dissolved.

Senator TAFT. You say that he had a tax base of $300,000 a year. How did you get the business? I am sorry, I missed that. Did you buy it?

Mr. HALL. Yes, sir. I bought the assets, largely with borrowed money.

My personal interest was less than 25 percent.

Senator TAFT. For how much, for a business making $300,000 a year? I do not want to embarrass you.

Senator BYRD. He did not buy all the business.

Mr. HALL. No, I bought just one of the stores.

Senator BYRD. What percentage of the business did you buy?

Senator TAFT. Obviously, it is less than $400,000 for a business earning $300,000, because, otherwise, you would have a higher tax base than $51,000.

Senator MILLIKIN. Your point is that you want to be put in the same position as though you were the old business and continuing as the old business?

Mr. HALL. You see, Senator, in effect I established——

Senator MILLIKIN. Is that what you want to do?

Mr. HALL. Yes, sir.

I established the tax base, myself, because I managed the business during the base period and for 15 years before that.

Senator BYRD. What part of the business did you buy? What percentage?

Senator KERR. As I understand it, he bought a 25-percent interest in that one dealership.

Mr. HALL. Yes, sir.

Senator BYRD. You mean, when you bought it out?

Mr. HALL. Of the whole, it would represent about a fifth.

Senator KERR. But that one-fifth had been earning $300,000 a year, as I understand it?

Mr. HALL. That is correct.

I am going to speak about the National Automobile Dealers now.

In 1949, dealerships handling over 300 cars a year had an average earnings of 6.4 on gross sales b[illegible] taxes, and applying that formula to our business—in other wor[illegible]s is an average across the United States, the best of the worst and the worst of the best—we would have a tax base of $290,304. In other words, if we did an average job, that would be our tax base.

I have, of necessity, covered this from my standpoint, and the standpoint of all new retail automobile dealers and you can appreciate that the problem is much more far reaching. Actually, what I am pleading for is equality of treatment for all new businesses, in other words that new businesses forming an important part of our war and peacetime economy may be given the same opportunity to succeed as is given those businesses that are already established.

You know, when I was a little boy in Colorado, my folks took me to a stock show——

Senator MILLIKIN. What part of Colorado?

Mr. HALL. Denver.

Senator KERR. Did you know that the senior Republican member of this committee is from Colorado?

Mr. HALL. The fact of the matter is, I was not born very far from there, in Greeley.

Senator KERR. I think that is very important.

Senator MILLIKIN. It has a more important bearing than you might suspect.

Senator KERR. You do not have any relatives in Oklahoma?

Mr. HALL. As a matter of fact, my father passed on there.

The thing that impressed me most at this stock show was that there was a goat there operating a treadmill to churn butter, and the secret of the success of that goat was to put the hay just at the right place because if you put it too close, the goat ate it, and if you put it too far away, he lost interest and cut down.

So, you have to put the hay just in the right place, where the goat can't get it, and he keeps on working. At least that is the way I see it.

Senator MILLIKIN. You have posed the profound problem which always confronts this committee.

Mr. HALL. To sum it up briefly, gentlemen, we would like to have an amendment, Clarence Dixon and myself, if we could, that would make it possible for us to use our predecessor's tax base.

Senator BYRD. Thank you very much.

Mr. HALL. I appreciate very much having been allowed to come here.

Senator MILLIKIN. Let me ask you this. When you took over that business, you took over the business for better or worse? I mean, it had its own reputation, and I assume that there might have been liabilities involved in taking it over?

Mr. HALL. Yes, sir.

We took over all the liabilities. For instance, any cars, Buicks that had been sold in that area in the preceding several years that would have any service problems of any kind, we took on.

Senator MILLIKIN. It is not in substance as though you were starting a fresh business?

Mr. HALL. No, sir.

Senator MILLIKIN. Whether you liked it or not, you were in real importance the successor of the business that you bought out?

Mr. HALL. That is right. There is only one small technicality, the fact that we did not buy the stock.

Senator MILLIKIN. You were favored with its benefits and favored also with its liabilities?

Mr. HALL. That is right. And the State of California recognized our experience in establishing our rate for the unemployment insurance out there just as they did in Mr. Dixon's case.

Senator BYRD. Thank you very much, Mr. Hall.

Mr. HALL. Thank you.

(The following information was subsequently supplied for the record:)

PHIL HALL BUICK CO.,
Hollywood, Calif., July 25, 1951.

SENATE FINANCE COMMITTEE,
Senate Building, Washington, D. C.

GENTLEMEN: The attached is a summary of my report made today at the hearing on the excess-profits phase of the tax bill.

As mentioned at the hearing, I feel a major inequity exists, which I am sure you will recognize, and sincerely hope it will be corrected in the new bill now being considered. The solution may be a simple amendment to the present law, such as the one I have taken the liberty of preparing for your consideration. I respectfully submit it to you, with a detailed explanation covering the proposed changes.

I earnestly hope the committee will make a favorable report on this proposed amendment.

Respectfully yours,

PHIL HALL.

MEMORANDUM RE AMENDING THE EXCESS-PROFITS-TAX LAWS TO PROVIDE FOR THE TRANSFER OF AN EXCESS-PROFITS-TAX CREDIT BASED UPON INCOME (OR A PORTION THEREOF), BY ONE TAXPAYER TO ANOTHER, IN CONNECTION WITH THE TRANSFER OF SUBSTANTIALLY ALL (OR A SEVERABLE PORTION) OF THE ASSETS AND BUSINESS OF THE TRANSFEROR

The excess-profits-tax laws in effect from 1940 through 1945 made no general provision for the transfer of an excess-profits-tax credit based upon income (or of any part thereof) by one corporate taxpayer to another corporate taxpayer in connection with the transfer of the assets and business (or a severable portion thereof) of the former. They did, however, provide that an acquiring corporation might include in its excess-profits-tax credit based upon income, the earnings experience of the business taken over, in connection with transactions qualifying as tax-free reorganizations under section 112 of the Internal Revenue Code, under certain limiting conditions.

The Excess Profits Tax Act of 1950 continues the general plan of the earlier acts, and a new provision covers certain transactions in which only a part of the business of the predecessor unit is taken over. Eligible transactions involving the taking over of only part of a business are restricted to those of the type defined in Internal Revenue Code 112(b) (5), namely, those in which "property is transferred to a corporation by one or more persons solely in exchange for stock and securities in such corporation, and immediately after the exchange such person or persons are in control of the corporation; * * *." (Sec. 112(b) (4) transactions are likewise eligible, but since these involve exchanges of securities for securities in a reorganization, they probably are not of interest in connection with sales of part of the business.) It might be contended that Internal Revenue Code 461(a) (1) (E), the 1950 provision for transactions described in section 112(e) (5), can be used in typical cases of a sale of part of the business to permit the purchaser to make use of the earnings experience of the seller insofar as that experience is based upon, or allocated to, the assets sold. If the statutory provisions are applied literally it would for example be possible for a corporation to transfer all the properties of a branch operation to a new corporation in exchange for all the stock of the new corporation and immediately thereafter to sell the stock with the result that the new corporation would have an excess-profits-tax credit based upon the earnings experience of the branch or the portion of the earnings experience of the seller allocated to the branch. The possible barrier across this route is the rule engrafted in section 112 by the United States Supreme Court that a transaction to qualify under that section must involve a continuity of proprietary interest held by the transferor in the business of the transferee.

It is clear that the transaction described would qualify were it not for the immediate sale of the stock, such sale being made as part of the original plan. Whether the judicial rule referred to would be applied to deprive the transaction of its qualification upon the ground that the sale of the stock destroyed the continuity of interest is not certain from the quick examination of the cases and other writings on the subject. As a matter of statutory construction it seems that the continuity of interest rule should not apply to this particular subsection of section 112 inasmuch as this subsection contains its own definition of circumstances which must exist following the transfer, namely, that "immediately after the exchange" the transferor must own at least 80 percent of the voting stock and 80 percent of every other class of stock of the transferee. The subsections involved when the continuity of interest rule has been applied do not contain a similar provision.

Assuming that section 461 (a) (1) (E) cannot be used because of possible application of the continuity of interest rule, or for any other reason, or assuming a transaction already completed in which assets have been sold and a new corporation formed by the purchaser (rather than the reverse order outlined above), an amendment to the Internal Revenue Code would be required to give the transferee a portion of the earnings experience of the transferor.

The objective of the amendment would be to include among the definitions of acquiring corporations provided in section 461 (a) of the code any successor to the business, or a distinct part of the business of a corporation, partnership, or sole proprietorship. The problem of definition is to make sure that the purchaser is a genuine successor to the business rather than the purchaser merely of assets to be used in some other business. There is also the procedural problem of ascertaining the portion of the transferor's earnings experience which is to be transferred. This probably requires eligibility to be restricted to transactions in which the business transferred is either the entire business of the transferor (in which case one of the existing subsections of sec. 461 (a) may be applicable) or a clearly identifiable and severable portion of the business. The statute under consideration is so prolix (approximately 41,000 words in the Excess Profits Tax Act, of which over 9,000 are in part II devoted to acquiring corporations) that it is especially difficult to be sure that any suggested language adequately covers all possibilities while at the same time being sufficiently descriptive to minimize the necessity for the exercise of administrative discretion or judicial interpretation

Recognizing, therefore, the need for careful consideration by many people, the following is suggested as an approach to the desired amendment:

To section 461 (a) (1), add a new subsection (F) so that, insofar as is pertinent, the definition of an acquiring corporation will read as follows:

"For the purposes of this part—

"(a) Acquiring corporation: The term 'acquiring corporation' means—

"(1) A corporation which has acquired—

* * * * *

"(F) Substantially all the properties 'used immediately prior to the acquisition,' (1) in the business of another corporation or partnership, or (2) in a severable portion of the business of another corporation or partnership, in a transaction not otherwise described in this subsection, for the purpose of continuing such business or such severable portion."

Other sections and subsections, including subsection 461 (f) (which includes in the term "partnership" a sole proprietorship), will then have to be amended to add reference to the new subsection 461 (a) (1) (F).

The definition of "component corporation" in section 461 (b) shall have added to it a new subsection (7) as follows:

"(7) In the case of a transaction specified in subsection (a) (1) (F), the partnership or corporation whose properties were acquired."

In this memorandum reference is made to "substantially all the properties" of the transferor, even though presumably the new subsection would not be used in the event of the transfer of substantially all the properties of the business for the reason that one of the existing subsections should be applicable. The language does no harm, however, and has certain advantages, in that it follows the form of existing subsection (E), which likewise presumably will be used only in transactions in which less than all the assets of the transferor are involved, and may possibly pick up some transactions not otherwise covered. The restriction to properties "used immediately prior to the acquisition" in the business of the transferor is intended to confine eligibility to those transactions in which there is an actual going business which is the subject of the transfer. The term "severable portion" has the disadvantage that it may require interpretation of the word "severable," but that does not seem likely to pose much of a problem since severability is something which should be capable of demonstration and the concept of severability is a necessary element of the concept of continuation of the business. The parenthetical phrase "in a transaction not otherwise described in this subsection," is copied from the existing subsection (E) and means that if a transaction qualifies under any other part of subsection 461 (a), or at least under any other part of 461 (a) (1), it will be handled under such other part and hence not subject to the many complicated rules which follow in later sections of the code governing the allocation of the earnings experience to the portion of the assets transferred. (All subsections of 461 (a), other than 461 (a) (1) (E) and the proposed new 461 (a) (1) (F), involve transfers of the entire assets and hence the entire earnings experience of the transferor.) The final phrase "for the purpose of continuing such business or such severable portion" is necessary to confine eligibility to those transactions in which there is a genuine succession of the business. The disadvantage of this phrase is that it requires a subjective test to determine "purpose." An objective test is always preferable but it is difficult to devise one to fit the circumstances. Actual continuation of the business without time limitation cannot be required because that would require, each year, a reexamination of the transferee's right to use its predecessor's earnings experience.

Continuation of the business for a specified time is a possibility but leads to complications almost as serious as continuation of the business without time limit.

In view of the fact that the existing section 461 (a) (1) (E) includes, among eligible transactions, some transactions in which only part of the assets of the transferor are involved, it is not necessary, because of the proposed amendment enlarging eligibility provisions, to add anything further covering allocation of the earnings experience of the transferor. The existing statute provides the following methods of allocation of the transferor's earnings experience between the transferor and the transferee:

(1) In proportion to the value of the assets retained and the assets transferred.

(2) In proportion to the values of assets retained and transferred as agreed upon between parties with the approval of the Secretary of the Treasury.

(3) By allocating to the transferee the actual earnings experience of the particular assets transferred as agreed upon between the parties with the approval of the Secretary of the Treasury.

DRAFT OF PROPOSED AMENDMENT TO EXCESS PROFITS TAX ACT OF 1950 BEING SUBCHAPTER (D) OF CHAPTER (1) OF THE INTERNAL REVENUE CODE

SEC. 1. Section 461 (a) (1) of the Internal Revenue Code is amended by inserting after subsection (E) a new subsection (F) as follows:

"(F) Substantially all the properties used immediately prior to the acquisition, (1) in the business of another corporation or partnership, or (2) in a severable portion of the business of another corporation or partnership, in a transaction not otherwise described in this subsection, for the purpose of continuing such business or such severable portion."

SEC. 2. Section 461 (b) of the Internal Revenue Code is amended by adding after subsection (6) a new subsection (7) as follows:

"(7) In the case of a transaction specified in subsection (a) (1) (F), the partnership or corporation whose properties were acquired."

SEC. 3. Sections 461 (c) (3), 461 (c) (4), and 461 (d) are amended by inserting after the words "subsection (a) (1) (E)" wherever such words appear, the following: "or subsection (a) (1) (F)."

SEC. 4. Section 461 (f) of the Internal Revenue Code is amended by inserting after the words "sections 461 (a) (1) (D)," the following: "461 (a) (1) (F)."

SEC. 5. Sections 462 (c) (1), 462 (c) (2), 462 (d) (1) (A), 462 (d) (1) (B), 462 (e) (1), 462 (e) (2), 462 (g) (2) (A), 462 (g) (2) (B), 462 (i), 463 (a) (1), 463 (a) (2), 463 (a) (3), 463 (a) (4), 463 (a) (5), 463 (a) (6), 463 (a) (8), 463 (a) (9), 463 (a) (10), 463 (a) (12), 464 (a), 464 (b) of the Internal Revenue Code are amended by inserting after the words "section 461 (a) (1) (E)" wherever they appear the following: "or section 461 (a) (1) (F)."

SEC. 6. The amendments made by this act shall be effective for taxable years ending after June 30, 1950.

Senator BYRD. We will now hear from Senator Warren G. Magnuson, of Washington.

STATEMENT OF HON. WARREN G. MAGNUSON, UNITED STATES SENATOR FROM THE STATE OF WASHINGTON

Senator MAGNUSON. Mr. Chairman, I would like the record to show that Mr. Clarence D. Martin, Jr., is present here today. Dan is an old friend of mine from the State of Washington. He is involved in the same transaction Mr. Hall and Mr. Dixon have been outlining to you. He bought the Cadillac agency in Santa Monica, Calif., and like Mr. Dixon and Mr. Hall took over the assets of the business, which produce an excess-profits base, which was taken by someone else. He is left with the operating advantages, disadvantages, and liabilities of the identical concern operated by the former owners, but with an excess-profits base computed on the standard industry factor. This leaves him at a distinct disadvantage in competing with other agencies in his line of business.

There is a real inequity here that I hope your committee will consider and correct. Thank you, Mr. Chairman, for giving me the opportunity to make these brief remarks.

Senator BYRD. Thank you, Senator Magnuson. We are glad you could be with us.

Mr. Marvin K. Brown?

STATEMENT OF MARVIN K. BROWN, MARVIN K. BROWN CADILLAC-OLDSMOBILE, INC.

Mr. BROWN. Mr. Chairman and members of the Senate Finance Committee, I would like to express my appreciation for this opportunity to come to Washington, and I would like, also, to say that there is quite a similarity in the cases of Mr. Dixon, Mr. Hall, and myself, in that I also bought one of the businesses of the Don Lee Co.

Senator BYRD. You bought the San Diego business?

Mr. BROWN. Yes, sir.

As president and principal party in interest of Marvin K. Brown Cadillac-Oldsmobile, Inc., I wish to present to the Senate Finance Committee a brief résumé relative to my former position and its relation to this above-named corporation.

I have been in the employ of Don Lee, Inc., and its successors for approximately 23 years. These corporations have carried on the business of operating agencies for the sale and service of Cadillac and Oldsmobile automobiles throughout the State of California. among these agencies was the one located at 1302 First Avenue, San Diego, Calif.

For the past 10 years I had been in active management of this particular dealership. On November 1, 1949, I was made president and general manager of Don Lee Motors Corp., which operated, in addition to the San Diego agency, agencies located in Sherman Oaks, Calif., and Burlingame, Calif.

Don Lee Motors Corp. was liquidated August 31, 1950, as a result of the death of Thomas S. Lee, the sole stockholder; and the fact that I obtained the dealership in San Diego did not happen by chance, but rather by a gradual process of working toward some day obtaining this agency.

Throughout the years, both the Cadillac Motorcar Co. and the Oldsmobile division, through their executives, as well as other owners and directors of the Don Lee Co., had indicated that should there be a liquidation of this corporation, I would be in a position to qualify for it. Hence, this new corporation, now Marvin K. Brown Cadillac-Oldsmobile, Inc., is merely a continuance of the Don Lee branch, and is, in a sense, a new corporation in name only.

Thus, commencing with the 1st day of September 1950, I assumed the ownership of the San Diego agency, using the same assets, the same personnel, selling the same products, and generally conducting the same business in the same location, and under the same lease arrangements as its predecessor, Don Lee Motors Corp. There was no interruption of business, and Marvin K. Brown Cadillac-Oldsmobile, Inc., assumed their liabilities—such as new- and used-car warranties, service and repair warranties, time plan finance warranties, accounts receivable, and service contracts with customers.

The continuance of the operation is evidenced by the fact that the State of California recognized the assignment of the employees' insurance reserve so that the new company was allowed to enjoy the unemployment insurance of its predecessors. The city license was transferred on the theory that it was substantially the same organization.

It is reasonable to assume that under the circumstances that the profits realized from the operation of this agency since September 1, 1950, are essentially the same as would have been realized from the operation of this agency, had ownership remained in Don Lee Motors Corp.

The excess-profits-tax law, as it is presently worded, makes it impossible for this company to avail itself of the earning experience of Don Lee Motors Corp., and must instead, use the industry index rate. Thus, based upon the earning experience of the agency during the past years, Don Lee Motors Corp., had it continued to remain in existence, would have had a base of approximately $248,000 before its earnings would be subject to excess profits taxes.

Based upon the industry index rate, Marvin K. Brown, Inc. is entitled to earn, roughly, only $35,000, or approximately one-seventh, before the imposition of excess-profits taxes, notwithstanding the fact that it is engaged in identically the same position at the same location, using the same personnel, and assets, selling the same merchandise in the same manner as its predecessor.

In the area in which I am situated, namely San Diego County, whose population is about 500,000, I am the only dealer out of 32 that is affected by excess-profits taxes, due to the fact that they were operating during these past years—1946 through 1958—and established their base credits. I have been long established in business in San Diego in this particular dealership, as has been previously pointed out, and in addition, I have recently been made president of the San Diego Motor Car Dealers Association, and I mention this to show that I am not a stranger going into a new business but, rather, have been established in this area, and I am continuing on in the very same manner.

In acquiring the assets of this agency, I realized a dream and ambition which I had nourished for many years—to some day own my own business—the dream and ambition of every ambitious and energetic American.

I now find that I am penalized, and I am not permitted to earn as much money from the same business as the former owner would have earned, had he been able to continue to operate his own business.

Senator BYRD. You bought the entire business?

Mr. BROWN. I bought the assets of this business; yes.

Senator KERR. This was another one of the separate branches?

Mr. BROWN. This was one of the stores.

Senator BYRD. You speak of the previous base as being $248,000.

Mr. BROWN. That was the average three best out of four years, 1946 through 1949.

That is exactly the amount that they would have been entitled to earn before they were subject to excess profits.

Senator BYRD. For the part of that you bought?

Mr. BROWN. Pardon me?

Senator BYRD. For the part of the business that you bought?

Mr. BROWN. I bought the assets of the entire business of this agency, but this particular agency would have been allowed to earn $248,000 in a year before they would be subject to excess-profits taxes.

Senator BYRD. And your base is $35,000?

Mr. BROWN. Mine is $35,000, or one-seventh of theirs.

Senator BYRD. It is on a comparative basis?

Mr. BROWN. So, actually, had they been able to operate, they would not have had any excess-profits tax at all, but instead of that, I am in it for most of the year.

Senator KERR. Did the old corporation engage in activities other than the ones in which you are engaged in?

Mr. BROWN. They operated several stores in the State——

Senator KERR. No, I mean——

Mr. BROWN. No; no other activities. Just the automobile sales and service.

Senator KERR. The store where you bought the assets was doing the same business that you are with reference to the kind of business and the scope of the operations?

Mr. BROWN. Yes, Senator Kerr.

Senator KERR. That one branch had been earning, or did earn, an average of $248,000 a year for three of the four best years?

Mr. BROWN. Yes, in that one branch.

Senator KERR. In that one branch.

Mr. BROWN. In other words, that is the base amount that they would be entitled to.

Senator KERR. The package that you bought was the assets of that one branch?

Mr. BROWN. Of that one branch; correct.

In acquiring this agency, a large proportion of which is on borrowed capital, I made certain commitments and although I anticipated that taxes would be increased and that excess-profits taxes would be imposed, I never dreamed that I would not have the same advantages that the former owner would have had, had he continued in business.

Senator MILLIKIN. May I interrupt to ask when you bought the business?

Mr. BROWN. I bought the business on September 1, 1950.

In talking to you gentlemen today, I wish to leave with you the draft of a proposed amendment to the excess-profits-tax law to permit the transfer of an excess-profits-tax credit based upon income by one taxpayer to another in connection with the assets and business of the taxpayer, or a severable portion of such assets and business, and in this particular proposed amendment, only two provisions would require material amendments; and several other provisions will require only the insertion of reference numbers of the amendments being proposed with respect to the two provisions in question.

Hence, if favorable consideration is given this request, the mechanics of incorporating this amendment in the new tax bill should not be difficult and there will be no additional problem in administering the excess-profits-tax laws with respect to the taxpayers who would come within the proposed amendments.

Now, we have, Mr. Dixon, Mr. Hall, and myself, the same amendment that we would like to leave with you gentlemen, and would appreciate favorable consideration.

Senator BYRD. Thank you very much.

Senator TAFT. There again, you have several alternative bases; you have the base of the industry; do you also have a percentage on capital investment?

Mr. BROWN. No, Senator Taft.

I am forced to use the industry index rate.

Senator TAFT. Is that the best thing you can use?

Mr. BROWN. Yes.

Senator TAFT. Have you some alternatives that you can take?

Mr. BROWN. No. As I understand it, the industry rate works out approximately the same.

Senator BYRD. What percentage was the industry rate?

Mr. BROWN. Twenty-five percent was the industry rate worked out for automobile businesses, but as Mr. Hall mentioned, as we understood it at that time they did——

Senator TAFT. Twenty-five percent on what you paid for it?

Mr. BROWN. Now that part of it, I am not clear on. In other words, Mr. Stam can answer that.

Senator TAFT. Is that 25 percent of invested capital?

Mr. STAM. On the total assets.

Senator TAFT. Twenty-five percent on the total assets.

Mr. BROWN. Twenty-five percent on the total assets; yes. And I had exactly the same assets as Don Lee had. In other words, this amounts to a name change only, and I am asking for relief in that their base would have been seven times higher than mine, and I have exactly the same responsibilities, handling the same products, and so forth, as they. I am sure it was not the intent of Congress to impose an excess-profits-tax law for this type of business, where you are operating the same business exactly, rather than one starting from scratch, with a small amount of tools.

It has always been my impression that a person——

Senator TAFT. I think it was the intent of Congress, but I do not say it was the right intent. But I think we had up distinctly the question to consider whether we would allow the base of purchased assets.

So it is the fault of Congress that we must correct. I do not think you can blame the Department on that.

Mr. BROWN. We certainly appreciate that, Senator.

Senator MILLIKIN. When you made the purchase, you did not have fair notice of what might happen to you?

Mr. BROWN. No, sir.

Senator MILLIKIN. Let me remind you in that connection, that we had the first rumble of excess-profits tax on the floor of the Senate in August of last year.

Mr. BROWN. Right.

Senator MILLIKIN. But that which was proposed was so unacceptable that we decided to take more time and do the job later on. So, perhaps you could contend that even knowing about the August attempt to set up an excess-profits tax, you were entitled to consider that that was a false start, and that which followed would be different?

Mr. BROWN. Yes, sir.

If I may say just one thing: At the time I started in business, certainly we knew that this was up for consideration. At that time, if you will recall, in September of 1950, I think it was 42 or 47 percent, the surtax, the corporate tax, and then when we completed December, and on January 2, when this was passed, we were retroactive to July 1. So, in going back to July 1 as we closed the statements, that had a great effect on us, because what I entered in the business, I had the idea of around 43 or 47 percent as the corporate tax.

In addition to that, of course, we had the excess-profits tax, and my point is, really establishing a base where I could not be subject to it as soon. Truthfully, the former company would not have been subject to excess-profits tax at all this year, where I will be there probably three-quarters of the year.

Senator TAFT. Perhaps you can explain something that strikes me as curious in the underlying facts of these situations.

Why is it that a business earning $250,000 a year is sold for $250,000 in cash?

I mean, what is it in the automobile business that is so different from any other business?

In all these three cases, in effect, so far as I can make out, you people who acquired it, paid no more as a capital sum than the average earnings for 3 years from 1946 through 1949.

I am talking about newspapers. You buy these things on 6 times earnings or 10 times earnings. Why is an automobile agency of that sort any different?

Senator KERR. The owner does not have a fixed title to the franchise. He cannot transfer it. The Cadillac Motor Co. is the only one who can do it.

Senator TAFT. But what is the basis?

Mr. BROWN. I think I can answer that.

First of all, if you recall, the great years in the automobile business, the only years they have made any money, were 1946 through 1949, and you have the 4 best years probably to go on as a base credit for them. Previously, they struggled——

Senator TAFT. You mean, after the war, with the flood of new orders?

Mr. BROWN. Yes, sir. They were the big years, and all the automobile dealers had, of course, a good operating net profit. Then, of course, in the Cadillac franchises, or Oldsmobile, or any of the automobile franchises, there is no bonus for good will paid for them. They are simply handed over to the operator wherever he can qualify. So you are not buying the business——

Senator BYRD. On the certainty that you will get the thing?

Mr. BROWN. No. And when you buy one, you simply buy the assets of the business, whatever the inventory is.

Senator TAFT. And when you buy a radio station, you are not sure that you are going to keep that franchise, either?

Mr. BROWN. That is right.

Senator KERR. If the fellow does not die, he has no guaranty of being able to continue as the owner of a local automobile franchise?

Mr. BROWN. If he dies, he automatically loses the franchise.

Senator KERR. But, I say, if he does not die, he keeps it, subject to the will of the manufacturer?

Mr. BROWN. Right.

Senator KERR. So that he does not have any fixed asset like the owner of a newspaper, or something else?

Mr. BROWN. Right. He operates on a year-to-year basis, year-to-year franchise.

Senator BYRD. Thank you very much, Mr. Brown.

Mr. BROWN. Thank you, gentlemen, very much, indeed.

Senator MILLIKIN. Mr. Chairman, Senator Nixon is here. I wonder whether he wanted to say anything about the matter.

We have already indicated for the record that you are interested in this matter.

Senator NIXON. Just for the record, that indicates my interest. They gave the facts of the case to me, and I wanted to be here to hear their presentation before the committee.

Senator BYRD. Thank you, Senator.

Senator BYRD. Mr. George Lycn.

Will you identify yourself for the record, please, sir.

STATEMENT OF GEORGE W. LYON, JR., STAFF MEMBER, BANSLEY & KIENER, CERTIFIED PUBLIC ACCOUNTANTS, CHICAGO, ILL.

Mr. LYON. Mr. Chairman, and members of the committee, my name is George Lyon, Jr., a staff member of Bansley & Kiener, certified public accountants, of Chicago, Ill.

I am not here pleading for an expansion of the relief provisions of the present act, although at first glance our problem is somewhat akin to the problem of the three individuals who testified here this morning.

All I seek is the right to compute the normal base period earnings on the basis of actual earnings of a going business in the base period.

And I believe it can be done without changing the relief provisions of the excess profits tax in any degree whatsoever.

Senator KERR. All you seek is that they be made applicable to the new corporation that succeeds to the assets of the old one?

Mr. LYON. That is correct, but not through relief provisions of the excess profits tax law.

Senator KERR. So what you are seeking here is a provision which would cover such a situation?

Mr. LYON. Our situation is pretty clean-cut, since we took over everything that the other business had, the same location of the entire previous corporate entity, and all of the assets.

We did not take over a part in the break-up of a previously existing entity.

It seems perfectly clear from a reading of the present act that the earning histories of the retiring and continuing corporations were to be considered as one in computing an excess profits credit.

However, this right has been extended only to an acquiring corporation acquiring the business of the retiring corporation in a nontaxable reorganization.

I seek only the right to use the combined earning histories of the two corporations in situations where there is no duplication of earnings even though the succession is not the result of a nontaxable acquisition.

The situation in this case to which I refer can best be illustrated by a recitation of the facts in a case which clearly demonstrates a compelling distortion of normal earnings under the present act.

I refer to the case of West Side Buick, Inc., an automobile distributor in the Chicago area.

The principal stockholder of the predecessor corporation held the franchise from General Motors Corp. for the sale of Buick automobiles in a certain prescribed area in Chicago. This franchise was non-assignable and nontransferable hence had no value as a corporate asset.

When the holder of the franchise died in November 1947 General Motors issued a similar franchise late in the same month to Mr. Williams. Mr. Williams thereupon caused a corporation to be formed for the express purpose of acquiring th' business, trade name, location, and assets of the predecessor corporation which, by reason of the loss of the franchise was destined for liquidation, because of the death of the franchise holder.

The physical assets were purchased with new capital, the lease on the building was assumed and the business continued at the same address with the same employees and the same customers.

Senator MILLIKIN. But it was not the same corporation?

Mr. LYON. No, it was not.

The acquisition of the business in a nontaxable transaction was not feasible since the continuation of the business without interruption was essential to a practical transition of ownership of the business.

At that point, I might say that in view of the death of the principal shareholder, it would have required probate court approval to have effectively transferred this stock in order to work out a nontaxable reorganization, which was not expedient at the time.

This taxpayer, the present taxpayer, was in operation only 25 months in the base period. Had it acquired the business of its predecessor in a nontaxable transaction it would be able under the present act to use the base-period earnings of its predecessor in order to make up a full base period.

Let us look at this problem percentagewise with respect to the distortion between corporation A and corporation B, corporation A being the corporation that resorted to a nontaxable transaction, and corporation B being the corporation that was compelled to resort to a taxable acquisition. Both acquiring corporations were in business for a period of 25 months in the base period, and both of the predecessor corporations had been in business for more than 23 months prior to the date of acquisition by the continuing corporations, to make a full 48-month base period.

Senator MILLIKIN. This may not have any bearing on your problem, but how do you value a franchise of that kind when you get it?

Mr. LYON. The franchise has no value when it is gone.

Senator MILLIKIN. I understand that you get a new one. But how do you value that when you get it?

Mr. LYON. It has no value.

Senator MILLIKIN. Is it not set up on the books as of any value?

Mr. LYON. It is a personal contract between General Motors Corp. and the individual in the business.

Senator MILLIKIN. I understand the nature of it. I am just asking you, how do you set it up on the books?

Mr. LYON. It is not set up on the books.

Senator MILLIKIN. It is not set up on the books?

Mr. LYON. No, sir. It is something that is personal to the individual who is operating the business.

Under the present act corporation A is allowed to use the best three out of four of the combined base-period earnings, whereas corporation B is limited to twenty five thirty-sixths or only 69 percent of its actual earnings for the 25-month period, which is supposed to be normal earnings.

In computing the excess profits credit, corporation A is entitled to 85 percent of the combined earnings in 36 months of the base period, whereas corporation B is limited to 85 percent of 69 percent of its earnings in only 25 months of the base period.

When a new corporation is formed in the base period the earnings potential is an unknown quantity and for this reason it received separate treatment under the act, with right of election between averaging its own base-period earnings and resorting to a hypothetical earnings history to be determined on the basis of an industry percentage return on assets.

Obviously a new corporation having for its purpose the continuation of a going business was not to be treated as a new corporation as defined in the act. It is perfectly apparent that the intent was to accord all such continuing businesses the same treatment, and this because of the known normal earnings of the business as a going concern, irrespective of who the new owner is going to be.

Under the prior act all successor-continuing corporations that had acquired all or substantially all of the assets of its predecessor were entitled to use the earnings of such predecessor in the reconstruction of its base period net income, provided only there was no duplication of earnings.

Under the present act such use is allowed to most corporations and denied to others merely because of a deficiency in the statutory language. West Side Buick happens to fall in that group of corporations to which such use is denied, notwithstanding the fact that the circumstances under which it became a successor-continuing corporation are the same in all respects except only the method of acquisition and succession.

The facts and circumstances incident to such acquisition and succession are clearly within the broad band of intendment of the present act, but not within the letter.

In conclusion, I respectfully submit that it was not the legislative intent to discriminate against successor-continuing corporations solely on the ground of method of acquisition and succession.

With the permission of this committee, I should like to file as part of the record here, a more complete statement of the contentions which I so briefly touched upon here.

Senator BYRD. That will go in the record.

Senator MILLIKIN. I would like to ask you about the successor corporation. Let me ask the question that Senator Kerr asked a while ago. Does it carry on precisely the same operations as the preceding corporation?

Mr. LYON. Exactly the same.

Senator MILLIKIN. Do they have the same quarters?

Mr. LYON. The same quarters.

Senator MILLIKIN. Do they have the same facilities?

Mr. LYON. The same facilities.

Senator MILLIKIN. And generally the same customers?

Mr. LYON. The same customers.

Senator MILLIKIN. As far as you can determine?

Mr. LYON. Yes, sir. Some new ones come along.

Senator MILLIKIN. Did you assume the debts of the preceding organization?

Mr. LYON. As far as ordinary trade payables and receivables, those were not purchased, because the predecessor wanted to take care of those.

Senator MILLIKIN. And that I assume was reflected in the purchase price of the new business?

Mr. LYON. Assuming that there was no discount because of the death involved, I imagine it was just a cash transaction.

Senator MILLIKIN. It is perfectly obvious that had you been required to assume debts, you would have paid less for the business?

Mr. LYON. But we did not acquire the predecessor's receivables, either.

Senator MILLIKIN. I understand that, but what I want to point out is that had you acquired the debts, you would have paid less for the business?

Mr. LYON. That is right.

Senator TAFT. Mr. Lyon, let me ask you one question. Have you filed excess-profits-tax returns for 1950 under this law?

Mr. LYON. Under this law? Yes, for this particular taxpayer we have.

Senator TAFT. For this particular one. But in your business as an accountant, have you filed them for other persons?

Mr. LYON. We have prepared quite a number of excess-profits-tax returns for 1950.

Senator TAFT. For year ending December 31, 1950?

Mr. LYON. For December 31, 1950; right. We have some returns which we have been unable to prepare because of the absence of part II regulations.

Senator TAFT. I am wondering if there has been any difficulty in filing 1950 returns.

Mr. LYON. I might say this, Senator: We are still working on tax returns in our office that should have been filed on March 15.

Senator TAFT. I wondered how much information would be available to us.

Mr. LYON. The difficulty we find in our office is that, in order to build up the base periods and get all the necessary information, so much time is consumed in dusting off the old records and digging them out again. We put them away once, thinking the excess-profits tax was something akin to World War II and we would not have it again for some time. We were sort of taken by surprise again. Had we known, we would have kept a continuity in the record which would have simplified that.

Senator TAFT. You have gotten a lot of extensions in which to file; have you?

Mr. LYON. That is true. The collectors were very liberal.

Senator TAFT. Mr. Stam, how much information is available on the 1950 returns of excess-profits taxes? Has the Treasury been able to compute anything yet?

Mr. STAM. No; not yet. And that was one of the reasons why they suggested in the House that they might not be in a position to give the committee any information on any of the problems at this time, because the returns had not been filed, and they had not had a chance to study them. They filed tentative returns, but they got an extension to file the complete return.

Senator BYRD. What date was the excess-profits tax effective?

Mr. STAM. It was effective the beginning of this fiscal year. But they filed the tentative returns in March.

Senator BYRD. This is a fiscal-year company, I suppose.

Mr. LYON. That is not true—a calendar year.

Senator TAFT. But it covered the last 6 months of 1950.

Mr. LYON. Those returns would have been on March 15. Now, in addition to that, we have filed returns before the excess-profits tax law was passed, and we were required to go back and process those returns and file them over again. That, too, added to our delay in being able to comply with the filing requirements.

Senator MILLIKIN. When did your clients buy this business?

Mr. LYON. December 1 of 1947. They had 25 months in the base period up to December 31 of 1949.

Senator BYRD. Thank you very much.

Mr. LYON. Thank you.

(The paper submitted by Mr. Lyon follows:)

STATEMENT OF GEORGE W. LYON, JR.

My name is George W. Lyon, Jr., a staff member of Bansley & Kiener, certified public accountants, of Chicago, Ill.

My purpose in appearing before this committee is to point out the necessity of an amendment of the language of the present Excess Profits Tax Act to eliminate a discrimination between certain corporate groups in the reconstruction of its base-period net income.

I am not here pleading for an expansion of the relief provisions of the present act, but merely for the right to determine the base-period net earnings of a successor-continuing corporation on the basis of an actual earning history.

This right is now allowed to practically all successor-continuing corporations; but, unfortunately—and, I believe, inadvertently—denied to a certain small group of corporations merely because of a deficiency in the statutory language of the act.

My point can best be made by resort to a general discussion of the provision of the past and present acts and their application to the facts and circumstances incident to the acquisition and succession of one particular taxpayer which is, under the language of the present act, denied the right to use combined earnings of itself and its predecessor in computing the base-period net income in arriving at its excess-profits tax credit for any of the excess-profits tax years.

The name of this taxpayer is West Side Buick, Inc. The business of the predecessor was and of this taxpayer is that of an automobile agency under the terms of separate franchises obtained from General Motors Corp. of Detroit. The address of both corporations was and is northeast corner of Washington and Kilpatrick Avenue, Chicago, Ill. The predecessor corporation had been in business at this location for a period of more than 25 years prior to November 1947, and had built up an enviable reputation in the sale and servicing of Buick automobiles.

The business, the location, the employees, and the customers of this business are all of long standing in the community, and the only thing new about the business is the corporate entity under which it is operated. The present corporation was incorporated in the State of Illinois on December 1, 1947. Almost simultaneously, the corporation purchased substantially all of the physical assets of the predecessor corporation, whose president and principal shareholder had passed away in the month of November of 1947. At that time all of the employees of the predecessor corporation came over to the present corporation. In addition, the obligations of the predecessor corporation to those employees were assumed by the present corporation. The list of customers, service accounts, and other business contacts were likewise taken over by the present corporation. The only principal asset which was not purchased by the present corporation was the nontransferable, nonassignable dealer franchise from the General Motors Corp.

The Excess Profits Tax Act of 1950 fails to make any distinction between "new corporations" and "new businesses." When a new business is formed the earnings potential of that business is unknown, and provision is made in the excess-profits-tax law for the use of a hypothetical base-period earnings history to be determined on the basis of an industry percentage return on assets. This hypothetical earnings history is substituted for the unknown normal earnings potential of the new business. A "new business" is not synonymous with a "new corporation," however, and a distinction must be made between a new business and a new corporate entity which takes over an old-established business. In the case of the old-established business, the earnings history is known, and normal earnings for that business can be determined with reasonable certainty. Since the earnings potential is known, we have no unknown quantity to provide for as we do in the case of a new business. The actual earnings history of the business, irrespective of its owner, is the best criteria of normal earnings and much closer to reality than any hypothetical construction of normal earnings based upon industry-wide averages.

In the computation of the excess-profits credit under the income method, the present corporation is limited to the general average method, which is available to all corporations, or the relief provision for new corporations. The relief provision for new corporations, which permits an industry rate of return on assets to be substituted for the unknown average normal net income, does not yield an adequate credit representative of normal earnings. The largest credit this corporation presently has is computed under the general average method of determining normal earnings in spite of a distortion of actual normal earnings caused by the statutory formula.

The general average method of computing an excess-profits credit utilizes a minimum of 36 months determining an average base-period net income, which forms the basis of the credit. If the corporation has not been in existence for 36 months in the base period, the missing months are figured at zero in determing the average for the 36 months. The reason for this is found in the last sentence of section 435 (d) (1), which provides as follows: "The excess-profits net income for any month during no part of which the taxpayer was in existence shall be zero."

Generally, corporations are allowed to use the best 3-out-of-4 years in the base period as their average earnings for purposes of the excess-profits credit. It was obviously intended that any corporation's average base-period net income should be 100 percent or more of the corporation's average actual earnings in the base period. With the minimum requirement of 36 months and the substitution of zero for any month in which the corporation was not in existence, this corporation's actual earnings are arbitrarily unreasonably discounted in the process of determining the statutory average. The statutory formula under the general average method as applied to this corporation results in only 69 percent—25 months divided by 36 months—of its actual earnings in the base period being considered as the corporation's average base period net income.

While other taxpayers enjoy an excess-profits credit of 85 percent, more or less, of actual base-period earnings, this corporation's credit is limited to 59 percent—85 percent of 69 percent—of the corporation's actual base-period net income. A discount of approximately 15 percent of base-period earnings was extended in the 1950 act, but I do not believe it was ever intended that a corporation's actual base-period earnings should be discounted 41 percent in order to determine its excess-profits credit.

Measures of relief such as growth, increased capacity, or change in products or services are not available to this corporation since it was not in existence on the first day of its base-period; namely, January 1, 1946. The only alternative method of computing an excess-profits credit for this taxpayer is that accorded a "new corporation," under the provisions of section 445 of the present act, which permits the reconstruction of average base-period net income by way of an industry rate of return of assets.

Provision was made in the 1950 act for combining the earning histories of predecessor and successor corporations when nontaxable reorganizations are involved. These provisions are substantially similar to those contained in the World War II law. All the bases for relief under section 722 in the world War II law were carried over to the present law, but the method of reconstructing normal earnings for a corporation is now tied in with the corporation's industry under the present law rather than the tailor-made reconstruction which was based upon the particular corporation's actual earnings experience. Under section 722 of the prior act, the foundation or basis for a reconstruction was the actual experience of the successor corporation combined with the experience of its predecessor, irrespective of whether a taxable or a non-taxable reorganization was involved, provided only that there was no duplication of earnings. The starting point or foundation upon which any reconstruction was built was the actual experience of the combined entities for purpose of rounding out a full base period.

New corporate entities which are the successors to old-established businesses should have the right to have normal earnings determined by a combination of the experience of the present and predecessor entities, whether or not the present entities are the result of a taxable or a nontaxable acquisition of the old-established business, subject only to the nonduplication of earnings test. There is little practical difference between the acquisition of assets in a taxable as compared with a nontaxable reorganization. In either case it is, nevertheless, the same business, the same assets, and the same earnings potential which is acquired. The disparity and treatment in the Excess Profits Tax Act of 1950, however, between a taxable and a nontaxable acquisition of a business results in rank discrimination. This is not a situation in which there is involved any duplication of credit from the same earnings experience. This is purely and simply a case of one corporation buying a business and the predecessor corporation immediately liquidating and dissolving.

There is attached hereto a supplement which contains a proposal which would correct the distortion of normal earnings by permitting successor corporations resulting from taxable reorganization to combine their experience with that of their predecessors to round out a full base period from which to determine normal average base-period net earnings. The proposal would amend only the language of section 435 (d) (1) by inserting at the end of the second sentence thereof authority for combining the earnings of predecessor and successor corporations in situations where substantially all of the assets of a corporation are acquired in a transaction which does not constitute the taxpayer an acquiring corporation within the provisions of section 461. No expansion of the relief provisions under the excess-profits tax law is contemplated and none will be required. All that is necessary is a correction of a distortion of normal earnings which form the basis of an excess-profits credit in a situation involving a taxable reorganization during the base period.

The facts and circumstances incident to the acquisition of the business of this taxpayer's predecessor seem to bring this succession and continuation transaction clearly within the ambit of the broad intendment, but not quite within the letter, of the present act.

In conclusion, I respectfully submit that it was not the legislative intent to discriminate against successor-continuing corporations solely on the ground of the particular method of acquiring and succeeding to the business of the predecessor corporation.

Supplement to the Statement of George W. Lyon, Jr.

PROPOSED AMENDMENT TO THE EXCESS PROFITS TAX ACT OF 1950

SEC. 435. EXCESS-PROFITS CREDIT—BASED ON INCOME.—

* * * * * * *

"(d) AVERAGE BASE-PERIOD NET INCOME—GENERAL AVERAGE.—The average base-period net income determined under this subsection shall be determined as follows:

"(1) By computing the excess-profits net income for each month in the base period. The excess-profits net income for any month during any part of which the taxpayer was in existence shall be the excess-profits net income for the taxable year in which such month falls divided by the number of full calendar months in such year, but in no case shall the excess-profits net income for any month be less than zero. The excess-profits net income for any month during no part of which the taxpayer was in existence shall be zero."

Proposed amendment to section 435 (d) (1) by inserting at the end of the second sentence thereof the following:

"If the taxpayer commenced business during the base period as a result of the acquisition of substantially all of the assets of another corporation in a transaction which does not constitute the taxpayer an acquiring corporation within the provisions of section 461 and after the transaction such other corporation ceases business, in the alternative, the excess-profits net income for any month during the base period prior to the month in which the taxpayer commenced business may be the excess-profits net income of such other corporation for the taxable year in which such month falls divided by the number of full calendar months in such year preceding the month in which the taxpayer commenced business, but in no case shall the excess-profits net income for any month be less than zero."

The last sentence of section 435 (d) (1) should be amended by inserting as a prefix thereof, the following: "Except as hereinabove provided * * * ."

WEST SIDE BUICK, INC.

[The italicized portion indicates the insertion of the proposed amendment. There are no deletions involved]

Text of section 435 (d) (1) of Excess Profits Tax Act of 1950 after reflecting the proposed amendment:

"(d) AVERAGE BASE-PERIOD NET INCOME—GENERAL AVERAGE.—The average base-period net income determined under this subsection shall be determined as follows:

"(1) By computing the excess-profits net income for each month in the base period. The excess-profits net income for any month during any part of which the taxpayer was in existence shall be the excess-profits net income for the taxable year in which such month falls divided by the number of full calendar months in such year, but in no case shall the excess-profits net income for any month be less than zero. *If the taxpayer commenced business during the base period as a result of the acquisition of substantially all of the assets of another corporation in a transaction which does not constitute the taxpayer an acquiring corporation within the provisions of section 461 and after the transaction such other corporation ceases business, in the alternative, the excess-profits net income for any month during the base period prior to the month in which the taxpayer commenced business may be the excess-profits net income of such other corporation for the taxable year in which such month falls divided by the number of full calendar months in such year preceding the month in which the taxpayer commenced business, but in no case shall the excess-profits net income for any month be less than zero. Except as hereinabove provided,* the excess-profits net income for any month during no part of which the taxpayer was in existence shall be zero."

NOTES ON PROPOSED AMENDMENT TO SECTION 435 (D) (1) OF THE EXCESS PROFITS TAX ACT OF 1950

1. The amendment inserting the third sentence in section 435 (d) (1) is fashioned after the last sentence of section 35.722 (b) (4) of regulation 112.

2. It is necessary to insert the amendment as the third sentence of section 435 (d) (1) in order to preserve the position in the subsection of the present last sentence, since it is referred to as the "last sentence" in other sections of the act. For example, see section 462 (b) (2).

3. Second sentence of section 435 (d) (1) must be left intact as it is likewise referred to in other sections. For example, see section 435 (e) (2) (E).

Senator BYRD. The committee is recessed until 10 o'clock tomorrow morning.

(Thereupon, at 12 noon, the committee adjourned until 10 a. m. Thursday, July 26, 1951.)

REVENUE ACT OF 1951

THURSDAY, JULY 26, 1951

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
Washington, D. C.

The committee met, pursuant to recess, at 10 a. m. in room 312, Senate Office Building, Senator Clyde R. Hoey presiding.

Present: Senators Hoey, Connally, Byrd, Kerr, Millikin, Taft, Martin, and Williams.

Also present: Elizabeth B. Springer, chief clerk; Colin F. Stam, chief of staff, Joint Committee on Internal Revenue Taxation.

Senator HOEY. The committee will please come to order.

We have a large number of witnesses, and 10 minutes have been allotted to each witness, and the committee sincerely hopes that the witnesses will be able to stay within that limit.

Of course, in each instance the full statement can be put in the record. However, if they can confine their oral testimony to 10 minutes, it would be most agreeable to the committee.

Senator Connally has to leave in a few moments, and I am going to call out of order Mr. Eugene German to testify first.

Mr. German, will you come up, please.

Senator CONNALLY. Mr. Chairman, at the close of Mr. German's testimony, I ask unanimous consent to insert this memorandum in the record.

Senator HOEY. It will be done. Have a seat, Mr. German, please. Give your name and connection to the reporter, please.

STATEMENT OF EUGENE GERMAN, VICE PRESIDENT AND TREASURER, DUVAL SULPHUR & POTASH CO., HOUSTON, TEX.

Mr. GERMAN. My name is Eugene German. I am vice president and treasurer of Duval Sulphur & Potash Co., of Houston, Tex.

The Duval Sulphur & Potash Co. is engaged in the production and sale of crude sulfur from its sulfur mine at Orchard in Fort Bend County, Tex. The company is also engaged at present in developing a new potash mine near Carlsbad in Eddy County, N. Mex.

We are concerned about certain inequities in the Excess Profits Tax Act of 1950, particularly as applied to sulfur and potash.

Section 453 of the Internal Revenue Code provides generally for the exemption from excess-profits taxation of the income from excess output of certain minerals, as well as other natural resources.

Subparagraph (b) (1) of such section sets forth a general rule to the effect that the exemption is a portion of the excess output—which is defined as the output in the taxable year over the annual output during the years 1945–1949—but the amount of the exemption is dependent upon the percentage that the excess output exceeds certain percentages of the estimated recoverable reserve of this particular mineral then held by the owner of the property.

Subparagraph (b) (2) of section 453 sets forth an alternative rule with respect to a metal- or coal-mining property which provides for an exemption from excess-profits tax of the income from the excess output in the taxable year multiplied by one-half of the unit net income from such property for such year; this applies regardless of the then estimated recoverable reserve.

Also subparagraph (b) (4) of section 453 exempts one-third of the output of new mines extracting metals or coal. This exemption was also given to timber and natural-gas properties. There is no similar provision for the nonmetallic minerals.

The World War II excess-profits tax law contained in section 735 a partial exemption for coal and iron mines and timber properties not in operation during the base period; this was retained in the House version of the 1950 statute.

However, in the Senate this partial exemption was broadened to include all metallic mines and natural-gas properties, as stated in the committee report, "in order to provide a greater incentive for the opening up of new properties" and "in order to place them in a similar tax position with competitive properties in operation during the base period."

It is difficult to see why the present law should be restricted to coal and metal mines. What reason is there that the same incentive is not extended to new mines for such urgently needed nonmetallic minerals as sulfur and potash? How can such discrimination be justified? Why should metal and coal mines alone have the alternative computation of section 453 (b) (2)? Why should not a new sulfur or potash mine be placed in a "similar tax position with competitive properties in operation during the base period"?

The nonmetallic mines are now in a worse position than they were under the World War II law, for under the old law there was some possibility of relief under sections 721 and 722. Under the present law the failure to grant relief to nonmetallic mines in subparagraph (b) (4) of section 453 results in taxing the normal profit of new nonmetallic mines, a distinctly discriminatory treatment not only between industries but also against new mines in the same industry.

For such urgently needed minerals as sulfur and potash it would seem fair and equitable, as well as in the national interest, to provide the producers of sulfur and potash with "this greater incentive for the opening up of new properties" and in order to place them in a "similar tax position with competitive properties in operation during the base period."

Senator MILLIKIN. There is a serious shortage of sulfur, is there not?

Mr. GERMAN. That is right.

Therefore, section 453 should be amended by broadening subparagraphs (b) (2) and (b) (4) thereof to include all nonmetallic mines and thereby give them the same benefits as are now given to coal and metal mines.

Senator CONNALLY. Right there, is there any reason why that should not be done?

Mr. GERMAN. I know of none.

Senator CONNALLY. Otherwise there would be a discrimination against them.

Mr. GERMAN. Very plainly so, I think.

Senator CONNALLY. Go ahead.

Senator HOEY. Go ahead.

Mr. GERMAN. This could be accomplished by striking out the phrase "coal and metal mining" or "metal mining" in all places that said phrases appear in said subsections and inserting in lieu thereof the phrase "mineral property."

To illustrate the pressing need of the proposed amendment, Duval Sulphur & Potash Co. is now engaged in opening up a new potash mine near Carlsbad, N. Mex., to supply a part of the ever-increasing demand of the United States for this essential fertilizer material, and is also looking for new commercial deposits of sulfur.

The Southwest Potash Corp. is also engaged at present in developing a new potash mine in Eddy County, N. Mex., and the potash companies already producing in the New Mexico area have all expanded their mining facilities in recent years in an attempt to make the United States self-sufficient as regards potash.

The Texas Gulf Sulphur Co. has recently placed in operation a new sulfur mine at Moss Bluff dome in Liberty County, Tex., and is in process of opening another sulfur mine at Spindle Top dome near Beaumont, Tex.

Jefferson Lake Sulphur Co. has just started production of sulfur from a new mine at Starks dome in Louisiana.

Freeport Sulphur Co. is now in process of opening a new sulfur mine in south Louisiana at a location known as Bay St. Elaine dome.

It is not believed that the proposed amendment means any substantial loss of revenue to the Government. On the contrary, if the restrictions imposed by the present section 453 are removed, there will be not only the incentive to increase excess output of nonmetallic mines but also to explore and put into operation new mines. Quite probably this might occur to the extent that actually additional revenue would be received due to the enactment of the suggested amendment.

I am sure that you gentlemen will agree that the development of new deposits of potash and sulfur is essential to the continued welfare of this country. There are other nonmetallics which are also vitally needed in this country and for that reason as well as for the other reasons explained above we respectfully urge that section 453 (b) (2) and (b) (4) be amended to apply to all mineral properties.

Thank you.

Senator HOEY. Thank you, Mr. German.

Senator CONNALLY. Mr. Chairman, let me interrupt for a moment. I have to go pretty soon.

Senator HOEY. Senator Connally.

Senator CONNALLY. Our State and Louisiana produce more sulfur than probably all of the rest of the country combined, and we know how important that is to the general welfare of the United States and especially for defense purposes; is that not true?

Mr. GERMAN. That is right.

Senator CONNALLY. I say, is it not a fact that sulfur is essential in the defense preparedness effort?

Mr. GERMAN. Yes, sir; in very many industries.

Senator CONNALLY. So I hope the committee will give careful attention to the proposition that Mr. German has presented. I am very much interested in it because my State is so vitally concerned.

At this time I would like to ask that this be placed in the record.

Senator HOEY. That will be done.

(The memorandum dated July 26, 1951, is as follows:)

MEMORANDUM

JULY 26, 1951.

To the Chairman and Members of the Finance Committee of the Senate of the United States

GENTLEMEN: The following memorandum is submitted on behalf of Texas Gulf Sulfur Co., a producer of sulfur by the Frasch (or hot water) process in the State of Texas, and by recovery from sour natural gas in the State of Wyoming.

The subject of this memorandum is the proposal that section 453 of the Excess Profits Tax Act of 1950 be amended by including nonmetallic minerals within the provisions of subsections (b) (2) and (b) (4) thereof.

At the time the Excess Profits Tax Act of 1950 was under consideration by the Congress, it was generally felt desirable that the general relief provision, section 722,[1] be replaced by provisions containing more rigid tests. As stated in the House report:[2]

"(c) *General relief provisions of the bill.*—The bill provides automatic formulas for each of the most important types of cases which arose under the old section 722. The use of such formulas permit an objective computation of the exact amount of relief to be granted in each case, rather than leaving the extent of relief dependent upon an attempted analysis of all the varying factors of each case, with uncertainty and disparity among taxpayers the inevitable result. It is believed that the proposed approach to the determination of relief problems will avoid in large measure the difficulties of proof and the subjective determinations which characterized the administration of section 722 and will eliminate the delays which attended the provision of relief for hardship cases under the World War II law."

Under the World War II act a mining company which brought into production a new property in order to supply the increased demand for minerals, thus impairing its ore reserves, was entitled to relief from excess profits taxation under the provisions of section 721[3] or section 722. This type of relief is no longer available.

Another provision of the World War II law which was designed by the Congress to prevent injustices arising out of the depletion of new mines and the taxation of all the income therefrom at excess profits rates, was subsection (2) (4) of section 735. This subsection allowed the exclusion from excess profits tax of one-sixth of the[4] net income from coal, iron, and timber properties not in operation during the base period.

While nonmetallics (other than coal) were not included in this provision, this omission was of no great concern to them because of the relief afforded by sections 721 and 722, which although somewhat cumbersome to obtain, was clearly available. But the Congress, in enacting the Excess Profits Tax Act of 1950 eliminated the general relief provisions, and while broadening subsection (b) (4) of section 735 (sec. 453 of the 1950 act) by the inclusion of all metal mines, has left producers of nonmetallics (other than coal) with no protection against the rapid depletion of new mines and the taxation of the proceeds at the extremely high excess profits rates.

In connection with subsection (b) (4) this committee stated last year:[5]

"The World War II statute also contained a provision providing partial exemption for coal and iron mines and timber properties not in operation during the base period. One-sixth of the net income in the current taxable year of these properties was exempt from excess profits tax. The House bill continued this provision without change. Your committee's bill makes several changes in this

[1] Sec. 722 was the general relief provision relating to cases where the taxpayer could show that the tax would be "excessive or discriminatory" in absence of relief under that section.

[2] 1950, 2 I. R. B. 29, 40.

[3] Sec. 721 (a) (2) (C) applied to income resulting from exploration, discovery, etc. Regulations 112, sec. 35.721-7 gives as an example "income arising out of a unit of property such as an oil lease or other mineral property * * *."

[4] The Senate provided for the exclusion of one-half such net income, the House one-sixth, and in conference the Senate receded.

[5] 1950, 3 I. R. B 15, 37.

provision. The exemption from excess profits tax for properties coming under the provision is increased from one-sixth to one-third of the net income from such property *in order to provide a greater incentive for the opening up of new properties.*" [Emphasis supplied.]

The very desirable incentive for opening new mines (or more properly the partial removal of a very serious penalty against opening new mines) applies to nonmetallics with equal or greater force than to metals. There is no more vital mineral in the defense economy than sulfur, nor one whose current short supply creates a more critical problem in the defense of the free world. In this connection attention is called to hearings held February 20–23, 1951, before the Subcommittee on Fertilizer and Farm Machinery of the House Agriculture Committee and before the Subcommittee on Newsprint of the House Interstate and Foreign Commerce Committee on May 23, 1951, which deal with the seriousness of the world shortage of sulfur.

Subsection (b) (4) should, therefore, be amended by including nonmetallic minerals within the terms thereof.

Another serious inequality in section 453 is found in subsection (b) (2). Section 453, subsection (a) permits the exclusion of certain percentages of the excess output of mines (including sulfur and other nonmetallics). Because under this provision relief may not be had unless the output is highly excessive, and then only to a very limited extent, this provision is of little practical use in a great many cases. In recognition of this restricted application of subsection (a), subsection (b) (2) provides an alternative in the case of coal and metal mines; that is, the taxpayer at his option may choose to exclude from excess profits taxation one-half of the net income from excess output.

The same arguments apply for the extension of this subsection (b) (2) to nonmetallics as do those for the extension of (b) (4). There is no reason for this discrimination against nonmetallics, and it being desirable to stimulate the production of nonmetallic minerals, including sulfur, to the same extent as metals and coal, the inclusion of nonmetallic minerals under subsection (b) (2) of section 453 would remove to a considerable extent this present discrimination and consequent tax discouragement to their production.

In summary, we urge the inclusion of nonmetallic minerals within the provisions of subsections (b) (2) and (b) (4) of section 453 of the Excess Profits Tax Act of 1950, and suggest the following changes in these subsections to accomplish this purpose (deletions indicated by brackets, additions by italics):

"(2) MINES IN OPERATION DURING NORMAL PERIOD.—For any taxable year, the nontaxable income from exempt excess output of a [metal or coal mining] *mineral* property which was in operation during the normal period shall be an amount equal to the excess output of such property for such year multiplied by one-half of the unit net income from such property for such year, or an amount determined under paragraph (1), whichever the taxpayer elects in accordance with regulations prescribed by the Secretary.

* * * * * * *

"(4) MINES, TIMBER PROPERTIES, AND NATURAL GAS PROPERTIES NOT IN OPERATION DURING NORMAL PERIOD.—For any taxable year, the nontaxable income from exempt excess output of a [metal or coal mining] *mineral* property or a timber block or natural gas property, which was not in operation during the normal period, shall be an amount equal to one third of the net income for such taxable year (computed with the allowance for depletion) from the [metal or coal mining] *mineral* property, the timber block, or the natural gas property, as the case may be. For the purposes of the preceding sentence, a [metal mining] *mineral* property shall be deemed not to have been in operation during the normal period if, during the period it was in production during 1946, 1947, 1948, and 1949, the aggregate gross income derived therefrom was less than the aggregate of the deductions (allowed under sec. 23 without regard to any net operating loss deduction) attributable to such property during such period of production."

Senator HOEY. Mr. Paul V. McNutt. Be seated and give your name and connection to the reporter, please.

STATEMENT OF PAUL V. McNUTT, FORT WAYNE JOURNAL-GAZETTE

Mr. McNUTT. My name is Paul V. McNutt. I am an attorney at law with offices at 84 William Street, New York, and in the Barr Building, Washington, D. C. I am here representing the Fort Wayne Journal-Gazette as a principal and not as an attorney, being one of the three trustees holding a majority of the stock of that corporation, in which I have had a substantial interest now for over 17 years.

The matter presently before you is H. R. 4473, which has no relief provision dealing with average base period net income.

The problem which I present has to do with two or more corporations which consolidated a majority of their operational facilities after December 31, 1946, and prior to July 1, 1950.

Unless relief is given to the corporations, they will be subjected to an excessive and discriminatory tax not in keeping with the original declared purpose of excess profits tax provisions, which was to prevent the accumulation of excessive wartime profits.

The facts are these:

On March 13, 1950, the Fort Wayne Journal-Gazette, a morning newspaper, and the Fort Wayne News Sentinel, an evening newspaper, effected a consolidation of their mechanical, circulation, advertising, and accounting departments, but leaving the editorial departments of each newspaper as completely separate and independent as they were prior to the consolidation. Both newspapers have a combined daily circulation of approximately 150,000 subscribers, and the Fort Wayne Journal-Gazette, which publishes the only Sunday newspaper in Fort Wayne, has a Sunday circulation of approximately 85,000 subscribers.

The consolidation was brought about primarily in order to effect savings in operation which had become essential by reason of the gradually increasing cost of operation caused by increases in wages, increases in the cost of newsprint and other items which enter into the publication of newspapers.

The consolidation, as I have set forth, has resulted in substantial savings to each newspaper, and these savings are gradually being reflected in increased profits.

By reason of the fact that the consolidation occurred in 1950, the Excess Profits Tax Act of 1950 contains no provisions under which relief could be granted either of the newspapers by reason of these increased savings, and if these corporate corporations are to obtain the relief which they are clearly entitled to, it must be by an amendment to the act which will recognize such special situations.

A proposed amendment which will afford relief in such cases is submitted for your consideration, and because there is no section 459 in H. R. 4473, and only for that reason, such a section number could be used for this amendment. The important part of the amendment—and I ask leave of the committee to make it a part of the record, the whole amendment apart of the record, is——

Senator HOEY. Yes.

Mr. McNUTT. That the average base period net income determined under this section shall be computed as follows: By computing the aggregate excess profits net income for the total period following the month in which such consolidation occurred, and ending June 30, 1951.

Senator HOEY. The whole amendment may be inserted in the record.

Mr. McNUTT. Thank you.

(The amendment referred to follows:)

AVERAGE BASE PERIOD NET INCOME CHANGE IN OPERATIONS

(a) IN GENERAL.—In the case of any two or more corporations which consolidated a majority of their operational facilities after December 31, 1946, and prior to July 1, 1950, whether or not the corporations were also merged, the average base period net income determined under this section shall be the amount computed under subsection (b).

(b) AVERAGE BASE PERIOD NET INCOME.—The average base period net income determined under this section shall be computed as follows:

(1) By computing the aggregate excess profits net income for the total period following the month in which such consolidation occurred and ending June 30, 1951.

(2) By dividing the amount ascertained under paragraph (b) (1) by the number of calendar months included in said period.

(3) By multiplying the amount obtained under paragraph (b) (2) by twelve. The amount so ascertained shall be considered the average base period net income for the purpose of determining the excess profits tax.

Mr. McNUTT. Our accountant estimates that the net profits before taxes for 1951 will be $350,000.

Under the 1950 act the normal and surtax, at 47 percent, would be $164,500.

Also under the 1950 act for excess-profits-tax purposes our average earning base is estimated at $200,000.

Senator TAFT. Is that the two put together?

Mr. McNUTT. No; I am talking only of the Journal-Gazette, Senator.

Senator TAFT. You get an allowance for the paper that is consolidated with it.

Mr. McNUTT. I understand, but this is the actual net result flowing out of that.

This would leave the amount of $150,000 upon which it would be necessary to pay excess-profits tax at the rate of 30 percent or in the sum of $45,000. Thus, the present tax under the 1950 act would be $209,500.

Under the relief amendment which we are requesting, the average earning base would be $275,000 instead of $200,000 as it now is. Therefore the amendment which we request would increase the average earning base from $200,000 to $275,000, and would save this year the excess-profits tax upon $75,000 or the sum of $22,500. That is only for the Journal-Gazette.

For the News Sentinel, while I do not have the exact figures, the accountant has estimated that the excess-profits-tax saving of the News Sentinel under this new amendment would be approximately $50,000.

To put it briefly, gentlemen, here is the case of a consolidation being made in order to effect savings and savings are effected.

The corporations now are being punished in such a law as this, and there should be some provision for relief, such relief as the corporations are entitled to.

We recognize the necessity for paying taxes. Our point is the distribution of those taxes should be equitable, and there should be some provision for relief in those cases which indicate relief.

Thank you very much, gentlemen.

Senator HOEY. We are very glad to have you make this presentation.

Senator CONNALLY. Mr. Chairman, I want to ask whether Mr. Williams of the Monsanto Chemical Co. is present?

Mr. WILLIAMS. Yes, sir.

Senator CONNALLY. I cannot remain because I have got to attend a meeting of the Foreign Relations Committee, which is having a meeting this morning, and I am chairman. I have to be there, but I want to call attention to Mr. Williams and his testimony regarding the Monsanto Chemical Co.

Have you got a plant at Texas City?

Mr. WILLIAMS. Yes, sir.

Senator CONNALLY. This is the place—Texas City is the place—that had that great disaster when those ships exploded there in the port and 147, I believe it was, people were killed; is that correct?

Mr. WILLIAMS. Correct—147 of our people, Senator.

Senator CONNALLY. Yes: 147 of the Monsanto Chemical Co. people were killed, and their plant was thoroughly and wholly destroyed so that I ask the committee to hear Mr. Williams and give him careful attention with respect to the matters he presents in regard to a relief provision to cover cases of that kind.

Senator HOEY. We will be glad to hear him.

Would you like him to be called right now?

Senator CONNALLY. Would you like to come on right now?

Mr. WILLIAMS. Yes, sir.

Senator HOEY. All right, Mr. Williams.

Senator CONNALLY. I apologize for having to leave, Mr. Williams.

Mr. WILLIAMS. Thank you very much.

Senator CONNALLY. I have tried to give you a good hearing here. I think that the committee will pay careful consideration and attention to your statement.

Senator HOEY. Mr. Williams, give your name and identification for the record, please, sir.

STATEMENT OF FELIX N. WILLIAMS, VICE PRESIDENT AND DIRECTOR, MONSANTO CHEMICAL CO.

Mr. WILLIAMS. Mr. Chairman, and gentlemen, I am Felix N. Williams, vice president and director of Monsanto Chemical Co., and director of the Manufacturing Chemists Association.

You are good enough to let me discuss with you today a situation under the Excess Profits Tax Act which result in excessive and discriminatory taxes for each year of the present emergency upon those companies which, like Monsanto Chemical Co., suffered during the base period from a major catastrophe or disaster.

In the spring of 1947, Monsanto's Texas City, Tex., plant was producing styrene monomer (which I shall hereafter call "Styrene") at a constantly increased rate.

Styrene monomer is a chemical which I shall refer to from now on as "Styrene."

The styrene went not only into the peacetime synthetic rubber program; it was also polymerized there at the Texas City plant into polystyrene, a plastic, or shipped to Monsanto's polymerization facilities at Springfield, Mass., were it was like wise transformed into polystyrene and then sold to the rapidly growing plastics industry. The Springfield unit was completely dependent upon the Texas City plant for styrene, its basic raw material.

On April 16, 1947, a ship loading ammonium nitrate and other cargo at docks of the Texas City Terminal Railway, adjoining the Monsanto Texas City plant, caught fire and exploded violently. Some hours later another ship, having caught fire from debris of the first, likewise exploded. These two large explosions produced the Texas City disaster. It resulted in 560 deaths, over 1,000 personal injuries, and in excess of $100,000,000 of property damage. The Monsanto plant and inventories were completely destroyed and 147 of its trained personnel were killed. Others were injured, some permanently. The total measurable loss to Monsanto was approximately $50,000,000.

As a result of that catastrophe, Monsanto's styrene production was completely stopped and its polystyrene output very seriously curtailed.

The company, after a prodigious rebuilding effort, recommenced styrene production in a small way in its new Texas City plant in August 1948—16 months after the disaster. But the loss of Monsanto was staggering. It did not recover from the blow during the rest of its base period, ending December 31, 1949.

Senator CONNALLY. Mr. Chairman, I am going to have to go now on account of this other committee of which I am chairman, but I am very greatly interested in this witness and his testimony because of the tremendous tragedy that resulted in Texas City from these destructions, and the loss of life and the loss of property, and I commend the witness' testimony to the committee and hope that it will pay good attention.

Mr. WILLIAMS. Thank you, Senator.

Senator HOEY. You may proceed, sir.

Mr. WILLIAMS. Because of the Texas City plant's destruction, former polystyrene customers took all or a part of their styrene business elsewhere or built their own facilities.

At the time of the disaster, Monsanto produced 35 percent of the total styrene being manufactured in the United States.

As a result of the explosion its share of the national output dropped to 10 percent for the year 1947 and the year 1948. In 1949 with the Texas City plant back in full production, Monsanto was able to bring its production back to only 28 percent of the National output, but despite every possible effort did not approach its former position in the industry.

The story of the company's polystyrene production is the same, only worse. Not only did the disaster destroy the polystyrene unit at Texas City along with all the styrene facilities, it resulted also in a great curtailment of the company's completely dependent Springfield, Mass., polymerization operations. And those operations which continued were at greatly increased cost.

In order to attempt to reduce the extent of its loss from the disaster and to fill as many of its polystyrene sales commitments as possible until the Texas City plant was rebuilt and in operation again, Springfield was forced to purchase as much styrene as it could obtain in the open market here and in Canada at prices well above what it cost Monsanto to manufacture the material at Texas City. Yet even at higher prices it could not satisfy its requirements. The loss in gross profits to the company through the purchase of materials at these excessive costs amounted to more than $2,000,000 in 1947, and more than $1,250,000 in 1948.

But that is only the smaller part of the polystyrene loss. At the time of the Texas City disaster Monsanto manufactured approximately 58 percent of the total national annual rate of polystyrene about 115,000,000 pounds.

As a result of the disaster, however, the company's percentage of the total United States production dropped to 20 percent in 1948. After getting Texas City back into production Monsanto's share of the total produced rose to only 32 percent in 1949 or 26 percent short of the predisaster figure of 58 percent.

Senator KERR. What was the national output in 1949?

Mr. WILLIAMS. 1949 approximately 200,000,000 pounds.

Senator KERR. Then your total production was almost back to the other level.

Mr. WILLIAMS. That is right.

Our total production in 1949 was back up to the level of the disaster period but the industry had risen

Senator KERR. Your reduced percentage was due in part to the over-all production going forward so rapidly.

Mr. WILLIAMS. That is part of the case, sir. But had the disaster not occurred, we would have increased our production in keeping with the industry, and we feel it would have kept our total percentage participation at the level that it was at the time of the disaster, because at the time we were rebuilding this destroyed plant, our manpower would have been used in building additional facilities.

Senator KERR. Yes, sir.

Mr. WILLIAMS. It is certainly reasonable to assume that at the least Monsanto would have maintained its position in the styrene and polystyrene industries from the date of the disaster in 1947 through the balance of the base period years. Its normal styrene sales, without the catastrophe, would have totaled $36,750,000 for the years 1947 through 1949, instead of $20,250,000 which they actually were due to the disaster.

Monsanto's normal polystyrene sales for the same years likewise absent the catastrophe, would have been $69,700,000 rather than depressed actual sales of $40,500,000. In point of fact, polystyrene production has never caught up with the demand since it first became generally available to the public.

Senator MILLIKIN. I may have missed part of the testimony. What is polystyrene?

Mr. WILLIAMS. Polystyrene, sir, is a plastic material used in the plastics industry for injection molding, in the making of such items as refrigerator parts, radio cases, housewares and many, many other items. It is one of the newest and one of the most rapidly growing plastic materials.

Senator MILLIKIN. Thank you very much.

Mr. WILLIAMS. As a result of being an innocent victim of the worst industrial catastrophe in our country's history, Monsanto's net sales for the year 1947–49 averaged $150,000,000, $12,500,000 per year less than they would normally have been. Its net income before taxes averaged $26,850,000 for each of those three base period years instead of normal average net income of $33,000,000 had the disaster not occurred.

Monsanto's excess profits tax credit based on normal base period earnings, without the devastating effect of a catastrophe like Texas City would have been $31,500,000. However, the maximum credit of which the company can be certain under the present law will be only $26,000,000, or a loss of a base of $5,500,000.

Gentlemen, in the interest of saving your time I will not read the balance of my memorandum, but will summarize it by saying that it sets forth the reasons why the relief provisions are inadequate.

It also suggests a method by which the present law can be amended in order to grant appropriate relief.

Monsanto should pay, and is quite willing to pay its just share of the tax burden, but we believe you will agree that it is unfairly penalized by the present law.

Thank you very much.

Senator HOEY. Thank you very much, Mr. Williams. It is good to have had your testimony.

Your entire statement will be placed in the record at this point.

Mr. WILLIAMS. Thank you, sir.

(The prepared statement of Mr. Felix Williams is as follows:)

STATEMENT BY FELIX N. WILLIAMS, MONSANTO CHEMICAL CO.

Mr. Chairman and gentlemen, I am Felix N. Williams, vice president and director of Monsanto Chemical Co. and a director of the Manufacturing Chemists Association. You are good enough to let me discuss with you today a situation under the excess-profits tax law which results in excessive and discriminatory taxes for each year of the present emergency upon those companies which, like Monsanto Chemical Co., suffered during the base period from a major catastrophe or disaster.

In the spring of 1947, Monsanto's Texas City, Tex., plant was producing styrene monomer [1] (which I shall hereafter call styrene) at a constantly increasing rate. The styrene went not only into the peacetime synthetic rubber program; it was also polymerized there at the Texas City plant or shipped to Monsanto's other polymerization facility at Springfield, Mass., where it was likewise transformed into polystyrene and then sold to the rapidly growing plastics industry.[2] The Springfield unit was completely dependent upon the Texas City plant for styrene, its basic raw material.

On April 16, 1947, a ship loading ammonium nitrate and other cargo at docks of the Texas City Terminal Railway, adjoining the Monsanto Texas City plant, caught fire and exploded violently. Some hours later another ship, having caught fire from debris of the first, likewise exploded. These two large explosions produced the Texas City disaster. It resulted in 560 deaths, over 1,000 personal injuries, and in excess of $100,000,000 of property damage. The Monsanto plant and inventories were completely destroyed, and 147 of its trained personnel were killed. Others were injured, some permanently. The total measurable loss to Monsanto was approximately $50,000,000.

As a result of that catastrophe, Monsanto's styrene production was completely stopped and its polystyrene output very seriously curtailed. The company, after a prodigious rebuilding effort, recommended styrene production in a small way

[1] Styrene monomer is formed from ethylbenzene, a chemical produced from coal tar and petroleum derivatives.

[2] Polystyrene is a plastics product formed by polymerizing styrene monomer. Polymerization is the reaction in which two or more units of a substance combine with each other to form a product of new and different properties.

in its new Texas City plant in August 1948—16 months after the disaster. But the loss of Monsanto was staggering. It did not recover from the blow during the rest of its base period, ending December 31, 1949. Because of the Texas City plant's destruction, former polystyrene customers took all or a part of their styrene business elsewhere or built their own facilities.

Under the most favorable provision of the present law which the company is certain will apply, Monsanto's 1950 excess-profits tax credit will be only $26,000,000, less than half its $55,000,000 profits before taxes for 1950. The credit would have been at least $31,600,000 if the Texas City disaster had not occurred. Therefore, unless additional relief is provided, $5,500,000 of normal earnings will be subject to excess-profits taxes each year for the duration of the emergency.

At the time of the disaster, Monsanto produced 35 percent of the total annual rate of 368,000,000 pounds being manufactured in the United States. As a result of the explosion, its share of the national output dropped to 10 percent for the year 1947 and 1948. In 1949, with the Texas City plant back in full production, Monsanto was able to bring its production back to only 28 percent of the national output, but despite every possible effort did not approach its vormer position in the industry.

The story of the company's polystyrene production is the same, only worse. Not only did the disaster destroy the polystyrene unit at Texas City along with all the styrene facilities, it resulted also in a great curtailment of the company's completely dependent Springfield, Mass., polymerization operations. And those operations which continued were at greatly increased cost.

In order to attempt to reduce the extent of its loss from the disaster and to fill as many of its polystyrene sales commitments as possible until the Texas City plant was rebuilt and in operation again, Springfield was forced to purchase as much styrene as it could obtain in the open market here and in Canada at prices well above what it cost Monsanto to manufacture the material at Texas City. Yet even at higher prices it could not satisfy its requirements. The loss in gross profits to the company from such purchases was more than $2,000,000 in 1947, and more than $1,250,000 in 1948.

But that is only the smaller part of the polystyrene loss. At the time of the Texas City disaster Monsanto manufactured approximately 58 percent of the total national annual rate of polystyrene, about 115,000,000 pounds. As a result of the disaster, however, the company's percentage of the total United States production dropped to 29 percent in 1948. After getting Texas City back into production, Monsanto's share of the total produced rose to only 32 percent in 1949—or 26 percent short of the predisaster figure of 58 percent.

It is certainly reasonable to assume that at the least Monsanto would have maintained its position in the styrene and polystyrene industries from the date of the disaster in 1947 through the balance of the base period years. Its normal styrene sales, without the catastrophe, would have totaled $36,750,000 for the years 1947 through 1949, instead of $20,250,000 which they actually were due to the disaster. And its normal polystyrene sales for the same years, likewise absent the catastrophe, would have been $69,700,000 rather than depressed actual sales of $40,500,000. In point of fact, polystyrene production has never caught up with the demand since it first became generally available to the public.

As a result of being an innocent victim of the worst industrial catastrophe in our country's history, Monsanto's net sales for the years 1947–49 averaged $150,000,000, $12,500,000 per year less than they would normally have been. Its net income before taxes averaged $26,850,000 for each of those three base period years instead of normal average net income of $33,000,000 had the disaster not occurred.

Monsanto's excess-profits tax credit based on normal base period earnings, without the devastating effect of a catastrophe like Texas City, would have been $31,500,000. However, the maximum credit of which the company can be certain under the present law will be only $26,000,000—and under the recently passed House bill, Monsanto's credit for base period earnings would be reduced to $23,400,000 for 1951 and thereafter.

Monsanto might qualify under section 442, the relief provision dealing with "abnormalities" during the base period. However, we do not believe that a circumstance of such broad scope and far-reaching effect as a major catastrophe or disaster could have been intended by the Congress as being within the scope of this section. Section 442 gives relief to a taxpayer whose business is affected by situations unusual in its experience, but not so extremely unlikely to occur or so terribly devastating in the life of the average corporation as the Texas City catastrophe. The Ways and Means Committee report on the excess-profits tax bill gives a severe price war as an example of the kind of abnormality which would enable a taxpayer to use section 442. Possibly a serious shortage of materials might be such an abnormality also. The conferees' summary of H. R. 9827 cites physical interruptions to production, such as a fire, strike, or flood or other typically temporary abnormal situations. Nowhere does it appear that a major catastrophe of the magnitude and size of the Texas City disaster, which devastated a large part of the city, laid waste its industry, and caused property damage in excess of $100,000,000, was in the contemplation of Congress when it enacted section 442.

In any event, much will depend upon the severity or liberality of the Treasury Department's interpretation of that section. The taxpayer cannot be certain of needed relief.

Then, too, the credit allowed under section 442 would be measured by the chemical industry's rate of return (as promulgated by the Treasury) upon the average of Monsanto's total assets as of the end of each year of the base period. Such a credit would be unrealistic and penalizing: Monsanto has through the years maintained a higher rate of return than the average of the chemical industry. That same higher percent of income would also have existed during all of the base period years had the Texas City catastrophe not destroyed the company's plant and substantially reduced its over-all production and sales. A credit based on the customarily lower industry rate of return during any normal peacetime period would thus inevitably result in compounding the serious hurt which Monsanto suffered from the Texas City explosions.

Therefore, without additional relief for taxpayers suffering from major catastrophe or disaster, each year of the emergency Monsanto will not only pay excess-profits taxes on all earnings attributable to the defense program, but on at least $5,500,000 of its normal peacetime earnings as well.

To remedy such an inequitable and unintended situation, Monsanto urges the amendment of section 435 by adding a specific alternative average base period net income relief formula for use when a major catastrophe has materially affected the taxpayer's normal earnings during the base period.

The standards which the taxpayers suffering from disaster must meet in order to qualify for relief should be high. Thus, a corporation would be entitled to use the benefits of the proposed relief section only if all of the following three tests are met:

(1) A catastrophe or disaster wholly or substantially destroyed or rendered inoperative a production facility of the taxpayer having a tax basis equal to 15 percent or more of all the taxpayer's production facilities; and

(2) As a result for more than 12 months thereafter, taxpayer's normal production or operation was substantially interrupted and its earnings materially lessened; and

(3) Prior to the end of its base period, taxpayer replaced the destroyed or inoperative facility with one having at least the same tax basis.

Having met those requirements, the corporate taxpayer would then be entitled to include in its average base period net income computed under the present section 435 (d):

(1) The additional income which it would have earned had its plant not been destroyed and had it continued to manufacture and sell during the balance of the base period the same portion of the total national output as it had at the time of the catastrophe; and

(2) The taxpayer's unusual and nonrecurring expenses incurred for the purpose of decreasing or mitigating its loss of earnings due to the disaster.

In that way the pattern of the present law is followed. The principle of old section 722 is adopted, but its well-known pitfalls are avoided by spelling out tests for eligibility for relief and a specific formula for determining the amount of relief.

The memorandum which has been handed to you and which is being filed with the staff contains an appendix setting forth detailed language for the proposed amendment to section 435. An alternative to such a relief formula, if Congress should decide not to enact further specific relief provisions, would be the reenactment of a general relief provision similar to the old section 722. In such case, however, there should be written into the law specific statutory standards for qualification for relief and for measuring the scope of the relief to be allowed, in order to eliminate so much of the difficulty experienced under the administration of section 722. The memo which you have before you also contains detailed recommendations with respect to such a general relief provision.

Monsanto and every company like it which has suffered from a major catastrophe should pay and is willing to pay its fair share of the tax burden. However, no such company should be penalized with excessive and inequitable taxes resulting in serious additional economic and competitive disadvantages to it. That result will inevitably follow the application of the present Excess Profits Tax Act to corporations suffering very severe setbacks due to a major disaster. The Congress should, therefore, write into the law clear statutory standards for aiding such taxpayers. Otherwise, the earnest congressional desire to provide adequate relief for taxpayers experiencing unusual and depressing circumstances would be frustrated and a large share of such corporations' normal peacetime earnings will be subjected to an unintended and unjust tax burden.

Need for Excess Profits Tax Relief To Avoid Excessive Taxation of Corporations Suffering Major Catastrophe or Disaster

(Monsanto Chemical Co.)

SUMMARY

1. In April 1947, Monsanto's Texas City styrene production plant was completely destroyed and 145 of the company's trained personnel were killed when two nearby ships exploded causing the Texas City disaster, America's worst industrial catastrophe. The total measurable loss to Monsanto, an innocent victim, was approximately $50,000,000.

2. At the time of the disaster, Monsanto manufactured 35 percent of the total national production of styrene monomer, the basic ingredient for Buna S synthetic rubber and for polystyrene plastics and 58 percent of the total national output of polystyrene plastics for the rapidly expanding plastics-fabricating industry.

3. As a result of the explosions, Monsanto's proportion of the total national production dropped to 10 percent for styrene monomer and 29 percent for polystyrene.

4. Had the Texas City disaster not occurred, Monsanto's average base-period net income would have been $33,000,000; its excess-profits-tax credit $31,500,000.

5. However, its excess-profits-tax credit under the present law will be only $26,000,000. (Under the amendment proposed by the Ways and Means Committee, the credit for base-period earnings would be only $23,400,000 for 1951 and thereafter.)

6. Without additional relief for taxpayers suffering from major catastrophe or disaster, Monsanto will not only pay excess-profits taxes on all earnings attributable to the defense program, but on $5,500,000 of its normal peacetime earnings as well.

I. PROBLEM

The 1950 excess-profits tax was intended to apply to corporate profits which were swollen by the increased tempo of the war economy. Congress recognized, as it had in the World War II act, that its taxing provisions, no matter how carefully chosen, would result in excessive and discriminatory taxation as applied to many corporations. Instead of providing a general relief provision for these cases, similar to section 722 of the earlier statute, it prescribed rigid formulas for determining the amount of relief and inflexible standards in defining eligibility for relief.

When queried on the floor of the Senate concerning the absence of a section 722, Senator George said:

"The present bill approaches the same problem but undertakes to spell out relief for new corporations formed after the base period began, for depressed industries, for companies having abnormalities, and for other corporations which we thought were entitled to relief. Whether the committee has gone far enough and whether those relief provisions will be altogether effective, of course, remains to be demonstrated or disproved in the administration of the act."

Monsanto Chemical Co. is a striking example of the inadequacies of the present law's relief provisions. It was a victim of the Texas City disaster, the worst industrial catastrophe in American history. Yet, section 442, the section which is designed to give relief to taxpayers suffering from abnormalities in their business, fails to provide fair and adequate tax relief for Monsanto or others who have suffered a great calamity. It results in the imposition of excessive and discriminatory levies on corporations which are striving to overcome the devastating effects of an act of God or other major catastrophe.

In the spring of 1947, Monsanto's Texas City, Tex., plant was producing styrene monomer[1] (hereinafter called styrene) at a constantly increasing rate. The styrene went not only into the important peacetime synthetic-rubber program; it was also polymerized at the Texas City plant or shipped to Monsanto's other polymerization facility at Springfield, Mass., where it was likewise transformed into polystyrene and sold to the rapidly growing plastics industry.[2] The Springfield unit was completely dependent upon the Texas City plant for styrene, its basic raw material.

The Texas City Disaster

On April 16, 1947, two ships were loading ammonium nitrate and other cargo at docks of the Texas City Terminal Railway, adjoining the Monsanto Texas City plant. Monsanto had no interest in the ammonium nitrate, the ships or the docks. One of the ships caught fire and exploded violently. Some hours later the other ship, having caught fire from debris of the first, likewise exploded. These two large explosions produced the Texas City disaster. It resulted in 560 deaths, over 1,000 personal injuries, and in excess of $100,000,000 of property damage. The Monsanto plant and inventories were destroyed, and 145 of its trained personnel were killed. Others were injured, some permanently. The total measureable loss to Monsanto was approximately $50,000,000.

As a result of the Texas City disaster, Monsanto's styrene production was completely stopped and its polystyrene production very seriously curtailed. The company, after a prodigious rebuilding effort, recommenced styrene production in a small way in its new Texas City plant in August 1948—16 months after the catastrophe. But Monsanto's loss of position in the competitive markets was staggering. It has not yet recovered from the blow. Because of the Texas City plant's destruction, former polystyrene customers took all or a part of their styrene business elsewhere or built their own facilities. Despite an intense rebuilding program and energetic efforts to maintain production and sales of polystyrene in the Springfield plant of the company, Monsanto was unable to overcome the seriously deterring effects of the Texas City catastrophe during the balance of its excess-profits-tax base period ending December 31, 1949.

Under the most favorable provision of the present law which the company is certain will apply, Monsanto's 1950 excess-profits-tax credit will be only $26,000,000, less than half its $55,000,000 profits before taxes for 1950. The credit would have been $31,500,000 if the Texas City disaster had not occurred. Unless additional relief is provided, therefore, $5,500,000 of normal earnings will be subject to excess-profits taxes each year for the duration of the emergency.

Certainly Congress did not intend to place a corporation which has suffered from a catastrophe of major proportions under such serious additional economic and competitive disadvantages and subject such a large share of its normal peacetime earnings to an inequitable and unjust tax burden. In fact, it appears from the legislative history of the excess-profits-tax law that Congress desired and earnestly sought to provide adequate relief for taxpayers experiencing unusual and peculiarly depressing circumstances.

Senator George on the floor in the closing debate on the bill with particular reference to the absence of a general relief provision such as section 722 confirms our belief:

"Whether these formulas (the new relief formulas) will adequately meet these situations, of course the committee cannot say. We only express the hope that they will, and we have taken the extraordinary step of providing for the rewriting of this bill by the end of December 1952, in order that we may meet the problems which, through experience, are then presented to us in a clearer light in the very brief hearing the committee was able to hold on this bill."

This memorandum is submitted to demonstrate that the rigid and exclusive formulas provided in the Excess Profits Tax Act of 1950 do not adequately meet major catastrophe and disaster situations, which seriously affect the earnings of a corporate taxpayer. Additional relief provisions are required if Congress is to avoid an unintended inequity in this, and, no doubt, a good number of other cases were either the rules of eligibility or the extent of the relief provided result in taxing as excess profits an undue and excessive percentage of normal earnings.

Such provisions need not await a rewriting of the bill at the end of December 1952. They should be provided now to meet the basic intent and desire of Congress.

[1] Styrene monomer is formed from ethyl benzene, a chemical produced from coal tar and petroleum derivatives.

[2] Polystyrene is a plastics product formed by the polymerization of styrene monomer. Polymerization is the reaction in which two or more units of a substance combine with each other to form a product of new and different properties.

II. UNFAIRNESS OF THE 1950 EXCESS-PROFITS TAX LAW AS APPLIED TO MONSANTO CHEMICAL CO.

The extent of Monsanto's loss of earnings due to the Texas City disaster, and the failure of the present relief provisions to make adequate adjustment in the company's tax credit for the effects of the catastrophe, demonstrate conclusively the unfairness of the provisions of the present law. Normal earnings which Monsanto would have had in 1947, 1948, and 1949, had not its plant and personnel been lost in the disaster, are being treated as excessive: the resulting tax under the 1950 act is inequitable and unjust.

Styrene

The principal products which result from styrene, namely synthetic rubber and polystyrene plastics, have become generally available to the public anly since World War II. To meet constantly increasing demands for styrene and polystyrene, as well as for all of its other products, Monsanto invested more than $107,000,000 in buildings and equipment during the base period, more than doubling its plant and facilities. During the same period its sales rose from $86,000,000 to $160,000,000, an increase of 86 percent.

The styrene portion of its business, however, went in the opposite direction due to the Texas City disaster.

Prior to the explosions on April 16, 1947, Monsanto was producing at Texas City 35 percent of the total national production of styrene. The company's plant was rebuilt and put into limited operation in August 1948. Because of the disaster, Monsanto's share of the national production was only 11.8 percent in 1947, and only 10 percent in 1948. In 1949, its production amounted to 28 percent of the national total, but despite every possible effort did not approach its former position in the industry.

The following tabulation shows what happened to Monsanto's styrene production as a result of the disaster:

	Styrene monomer (in pounds)		Monsanto percent of national
	Total national production	Monsanto production	
First quarter 1947	92,000,000	32,000,000	35
Year 1947	311,000,000	37,000,000	11.8
Year 1948	377,000,000	37,500,000	10
Year 1949	390,500,000	110,000,000	28

Monsanto's actual styrene sales reacted accordingly. They are shown below in comparison with Monsanto's normal sales, had the catastrophe not destroyed the plant, based upon the reasonable assumption that the company would continue to obtain its pre-Texas City disaster share of the national market:

	Monsanto actual net sales	Monsanto normal net sales
First quarter 1947	[1] $2,500,000	2,500,000
Year 1947	3,000,000	7,500,000
Year 1948	4,250,000	9,250,000
Year 1949	13,000,000	20,000,000

[1] Monsanto's actual sales of styrene for the first quarter of 1947, when annualized, would result in sales of $10,000,000 for 1947, in contrast with actual sales of $3,000,000 for the year.

Polystyrene

The Texas City disaster destroyed not only Monsanto's styrene plant, but also its polymerization facilities at Texas City. In addition, the operation of its Springfield, Mass., polymerization facilities, which depended upon Texas City for its basic raw material, were greatly curtailed; those operations which continued were at greatly increased cost.

Monsanto is one of a highly competitive group of producers who vie for position as chief supplier in the rapidly expanding polystyrene plastics fabricating industry. In order, therefore, to attempt to reduce the extent of its loss from the disaster and to fill as many of its polystyrene sales commitments as possible until the Texas City plant was rebuilt and in operation, Springfield was forced to purchase styrene in the open market here and in Canada at prices well above what it cost Monsanto to manufacture the material at Texas City. The loss in gross profits to the company from this additional source was more than $2,000,000 in 1947, and more than $1,250,000 in 1948.

But that is only the smaller part of the polystyrene loss. At the time of the Texas City disaster, this country was producing polystyrene at the annual rate of about 115,000,000 pounds, and Monsanto was manufacturing approximately 58 percent of it. As a result of the disaster, however, the company's percentage of the total national production for the balance of 1947 dropped to 41.5 percent. It was only 29 percent in 1948. After getting Texas City back into production, Monsanto's share of the total produced rose to 32 percent in 1949—still a long way from the predisaster figure of 58 percent.

It is reasonable to assume that Monsanto would at the least have maintained its position in the polystyrene industry during the balance of the base period years. Its normal sales, absent the catastrophe, would have been as shown in the last column of the tabulation set forth below:

Styrene and styrene derivative polymers and copolymers for molding

	Total national production (pounds)	Monsanto production (pounds)	Monsanto percent of national	Monsanto loss in gross profits	Monsanto actual net sales	Monsanto normal net sales
First quarter 1947	22,000,000	12,700,000	58	....	$3,700,000	$3,700,000
Second to fourth quarters 1947	74,500,000	31,000,000	41.5	$2,000,000	8,300,000	12,500,000
Year 1947	96,300,000	41,600,000	43	2,000,000	12,000,000	16,200,000
Year 1948	145,300,000	42,800,000	29	5,200,000	12,500,000	25,000,000
Year 1949	179,400,000	58,300,000	32.5	6,000,000	16,000,000	28,500,000

The following table shows what the company's normal net sales and earnings during the base period would have been, had the company not been a victim of the Texas City catastrophe:

	Net sales		Net income (before taxes)	
	Actual	Normal	Actual	Normal
1946	$89,000,000	$89,000,000	$15,500,000	$15,500,000
1947	136,000,000	144,000,000	24,000,000	29,000,000
1948	153,500,000	170,500,000	28,500,000	36,000,000
1949	160,500,000	173,000,000	28,000,000	34,250,000
Average, 1947–49	150,000,000	162,500,000	26,850,000	33,000,000

But let us see what credit is allowed to Monsanto under the 1950 Excess Profits Tax Act.

(*a*) *Inadequacy of the earnings credit* (*sec. 435* (*d*))

This credit is based primarily upon the average net income of the best three of the base period years, 1946 to 1949. The credit which Monsanto would get under this section is only $26,000,000, as compared with a credit of $31,500,000 based on the average net income of the three best normal years in the base period, had the Texas City disaster not occurred.[3]

(*b*) *Inadequacy of the invested capital credit* (*sec. 436*)

Monsanto's credit based on invested capital is an even poorer measure of earnings. It would be only $11,000,000, despite the fact that the company's average base period net income for 1947 through 1949, had the Texas City catastrophe not occurred, would have been in excess of $33,000,000. The present invested capital credit amounts to a return of only 6 percent before taxes—and only 3.5 percent after normal and surtax of 42 percent—upon the company's

[3] For 1951 and subsequent years the credit attributable to base period earnings would be reduced from $26,000,000 to $23,400,000 under the amendment proposed by the Ways and Means Committee in the forthcoming Revenue Act of 1951. This amendment allows only 75 percent instead of 85 percent of the average net income of the three best base period years.

equity and borrowed capital. It goes without saying that such a low rate of return is entirely unrealistic for a dynamic chemical company creating new products and developing broad new markets and demands. It is also obvious that this method for determining the tax credit does not result in a fair and reasonable standard of normal earnings for the taxpayer who is experiencing any business growth.

(c) *Inadequacy of the relief provision based on abnormalities during base period (sec. 442)*

Monsanto might qualify under this section on the ground that its normal production, output or operation was interrupted or diminished because of the occurrence during its base period of an event unusual and peculiar in its experience, i. e., the Texas City disaster. Or it may qualify on the ground that its business was depressed because of temporary economic circumstances unusual in its experience, again resulting from the disaster. Certainly the abnormality affected Monsanto well in excess of 12 months.

However, we do not believe that a circumstance of such broad scope and far-reaching effect as a major catastrophe or disaster could have been intended by the Congress as being within the scope of this section when it enacted the 1950 excess profits tax law. Section 442 was designed to give relief to taxpayers whose business is affected by situations unusual in its experience, but not so extremely unlikely to occur or so terribly devastating in the life of the average corporation—or in a community's history—as the Texas City catastrophe. The House Ways and Means Committee report on the excess profits tax bill gives a severe price war as an example of the kind of abnormality which would enable a taxpayer to use section 442. Possibly a serious shortage of materials might be such an abnormality also. The conferees' summary of H. R. 9827 cites physical interruptions to production, such as a fire, strike, or flood or other typical temporary abnormal situations. Nowhere does it appear that a major catastrophe of the magnitude and size of the Texas City disaster, which devastated a large part of a city, laid waste its industry, including the Monsanto plant, killed 560 people, injured over 1,000 more and caused property damage in excess of $100,000,000, was in the contemplation of Congress when it enacted section 442 to give relief for abnormalities during base period.

In any event, much will depend upon the severity or liberality of the Treasury Department's interpretation of section 442. The taxpayer cannot be certain of needed relief.

Then, too, the credit allowed would be measured by the chemical industry's rate of return (as promulgated by the Treasury) upon the average of Monsanto's total assets as of the end of each year of the base period. The company's credit under this section would be only $28,500,000 as compared with normal average earnings before taxes of $33,000,000 for the years 1947 through 1949, had the catastrophe not destroyed Monsanto's Texas City plant. Certainly a credit of $28,500,000 would be most unrealistic and inadequate, even if the company were certain to obtain it. Such a base would result in an excessive and discriminatory excess-profits tax upon normal earnings of the taxpayer.

III. PROPOSED ADDITIONAL RELIEF PROVISIONS

The Monsanto case is unusual, but certainly not unique. There are other corporate victims of the Texas City disaster—and certainly many victims of other catastrophes. But, fortunately, disasters and catastrophes in America are as few in number as they are serious and far-reaching in their economic consequences upon the corporations which are unfortunate enough to have to bear the brunt of them. Such corporate taxpayers are not protected by the relief provisions of the 1950 act. In order not to prejudice them still further economically and competitively, they should be entitled to a credit or base reflecting their normal earnings during the base period, had the catastrophe or disaster not occurred.

Such a credit could be provided by the following pattern. It could also be provided by a general relief provision similar to old section 722.

A recommended formula which would grant a fair and just credit to a corporation, the victim of a catastrophe that seriously affected its earnings in the base period, is as follows:

(a) Specific alternative average base period net income relief formula based on major catastrophe

Tests.—A corporate taxpayer should be entitled to relief if—

(1) A production facility, having basis for gain or loss equal to 15 percent or more of all the taxpayer's production facilities, was wholly or substantially destroyed or rendered inoperative by a disaster or catastrophe; and

(2) As a result, for 12 months or more the taxpayer's normal production or operation was substantially interrupted or diminished and its earnings materially lessened; and

(3) Prior to the end of its base period, taxpayer replaced the destroyed or inoperative facility with one having at least as great a basis for gain or loss.

Credit.—Add to the average base period net income computed under section 435 (d) the sum of:

(1) Taxpayer's rate of return on the products manufactured in the destroyed or inoperative facility (expressed as a percent of their sales prices) times the difference between taxpayer's actual dollar sales of such products during the balance of the base period and the sales which it would have made if taxpayer had continued to produce and sell the same portion of the total national output as it had at the time of the disaster or catastrophe; and

(2). Taxpayer's loss of profits resulting from unusual expenses incurred as a result of the facility's destruction or being rendered inoperative and for the purpose of preventing still further loss of profits.

(b) General relief provision

An alternative to such a formula, if Congress should decide not to enact further specific relief provisions, would be the reenactment of a general relief provision similar to section 722 of the World War II excess-profits tax.

To eliminate the administrative difficulties which have greatly delayed the disposition of cases under that section, however, it is recommended that Congress review the rulings and policies of the excess-profits-tax council and enact detailed clarifications of its intent.

One of the primary lapses in section 722 has been the delay, both on the part of the taxpayer and the Government, in reaching a final administrative determination. Any reenactment should require the filing of claims under the new provision within 1 year of the due date of the return for the year involved, thus requiring the taxpayer to act promptly.[4] It should also require a final administrative determination upon the claim within 1 year of its filing. Thus, if the taxpayer is not satisfied with the credit allowed, it can go promptly to the Tax Court. It must be recognized that an excess-profits tax is an emergency measure and, therefore, does not permit of processing in the normal course.

Most important, however, in order to reduce administrative judgment to a minimum, there should be written into the law statutory standards for qualification for relief and for measuring the scope of the relief to be allowed. In the case of corporations which have suffered very severe set-backs due to a major catastrophe or disaster, for example, such statutory measurements should include tests to determine whether a substantial part of the corporation's productive facilities was affected, whether the destroyed or inoperative facility was replaced by one having at least the same cost basis, and the length of time the effect was felt by the corporation on both its operations and its earnings. The tests would be similar to those in the proposed alternative relief formula based on major catastrophe. Any taxpayer meeting all of these standards would qualify for relief, at least presumptively. Administrators of the law would also be guided by these standards in granting relief to other taxpayers not able to meet them all.

The amendment should also provide that the taxpayer who qualifies and meets all the standards prescribed in the catastrophe formula would be permitted to include in its average base period net income credit, the earnings which it would have had on its share of the total national production of those products made in the destroyed plant, had the catastrophe not occurred.

Likewise, statutory standards for unusual "growth" companies to meet for needed relief should also be spelled out in the amendment. For example, a company which, during the base period, more than doubled its plant facilities and increased its sales and its net income by more than 50 percent, has certainly evidenced extraordinary growth deserving of relief beyond any now provided in the present law.

---

[4] Or 1 year from the adoption of the provision, whichever is later.

Monsanto's plant more than doubled in value from January 1, 1946 ($70,000,000), to December 31, 1949 ($155,000,000). Despite the telling effect of the Texas City disaster, the company's net sales for 1950 ($200,000,000), duly discounted for the influence of the Korean War, exceeded by more than 100 percent its average net sales for the years 1945 and 1946 ($97,500,000). And again, despite the loss of its plant and some of its trained personnel in the explosions, Monsanto's net income for 1950 ($43,500,000), likewise discounted, was more than 50 percent above its average base period net income ($26,000,000).

Certainly, any general relief provision similar to section 722 should include help for a taxpayer whose extraordinary growth is established by showing that (*a*) during 1946 through 1949 it doubled the unadjusted basis of its plant and facilities; (*b*) twice its net sales for the period January 1 to June 30, 1950, was 50 percent or more above its average sales for 1945 and 1946; and (*c*) either (i) twice its excess-profits net income from January 1, 1950, to June 30, 1952, or (ii) its "weighted excess-profits net income" for its first excess-profits-tax taxable year, is 50 percent or more in excess of its average base period net income.

The credit for such remarkable growth should be based on the level of earnings reached at the end of the base period, as in the case of the "new product" relief section (sec. 435 (e)).

Thus the base for taxpayers who have reached such a new high level of sales and income at December 31, 1949, would be 85 percent of either (1) twice the taxpayer's excess-profits net income for the first 6 months of 1950, or (2) its "weighted excess-profits net income" for its first excess-profits-tax taxable year, at the taxpayer's election.

In both the major catastrophe and the extraordinary growth situations, the general relief provision would impose excess-profits taxes only on those earnings in excess of the fair and just reconstruction of normal earnings. Taxpayers would thus be permitted to show that a greater level of earnings would have been reached, as under section 722.

Similar formulas should be prescribed to establish standards of qualification and scope of relief for the other changes in business encompassed by the section. Such standards for qualification and for reconstruction should eliminate to a very great extent the administrative difficulties encountered under section 722.

APPENDIX

PROPOSED AMENDMENT PROVIDING RELIEF FROM MAJOR CATASTROPHE OR DISASTER

Section 435 should be amended by adding the following new subsection:

"(h) AVERAGE BASE PERIOD NET INCOME—ALTERNATIVE BASED ON MAJOR CATASTROPHE.

"(1) TAXPAYER TO WHICH SUBSECTION APPLIES—A taxpayer shall be entitled to the benefits of this subsection if the taxpayer commenced business before the beginning of its base period, and if—

"(A) During or immediately prior to the taxpayer's base period a production facility or facilities of the taxpayer, having an adjusted basis for determining gain or loss equal to or in excess of 15 per centum of the adjusted basis of all of taxpayer's production facilities, were wholly or substantially destroyed or rendered inoperative by disaster or catastrophe; and

"(B) As a result, for a period in excess of twelve months taxpayer's normal production, output or operation was substantially interrupted or diminished and its earnings were materially lessened; and

"(C) Prior to the end of taxpayer's base period, the construction or acquisition of a new facility or facilities for the production of the same product or products was commenced by the taxpayer, and the adjusted basis for determining gain or loss for such new facility or facilities was equal to or in excess of the adjusted basis of the former facility or facilities at the time of destruction or being rendered inoprative.

"(2) COMPUTATION.—The alternative average base period net income allowed under this subsection shall be determined as follows:

"(A) By computing (in the manner provided by the second sentence of subsection (d) (1)) the excess profits net income for each month in the base period.

"(B) By computing (in the manner provided by the second sentence of subsection (d) (1)) the 'additional excess profits net income' for each month in the base period commencing with the month in which the facility was destroyed or rendered inoperative. For the purposes of this subparagraph, the 'additional excess profits net income' shall be the sum of—

"(i) The taxpayer's normal net income from the sale or disposition of such product or products during the twelve months preceding the catastrophe, expressed as a percentage of the sales price of such product or products, multiplied by the difference between taxpayer's actual dollar sales during the balance of its base period and the dollar sales which it would have had during such period if taxpayer had continued to produce and sell the same proportion of the total national output of such product or products as it produced and sold at or shortly before the time of the disaster or catastrophe; and

"(ii) The taxpayer's unusual and nonrecurring costs and expenses incurred as a result of the facility's destruction or being rendered inoperative and for the purpose of decreasing or mitigating taxpayer's resultant loss of earnings.

"(C) By adding the amount ascertained under subparagraph (B) for each month to the amount ascertained under subparagraph (A) for the same month.

"(D) By computing (in the manner provided by subsection (d) (2)) the alternative average base period net income."

Senator HOEY. John W. Hanes.

Give your name and your connection.

STATEMENT OF JOHN W. HANES, PRESIDENT, ECUSTA PAPER CORP., ACCOMPANIED BY WALTER F. O'CONNELL, ACCOUNTANT

Mr. HANES. Mr. Chairman, and members of the committee, my name is John W. Hanes. I am president of Ecusta Paper Corp., Pisgah Forest, N. C., a wholly owned subsidiary of Olin Industries, Inc., of which I am vice president, and I appear before you today to point out a very serious inequity existing in the excess-profits-tax law of 1950 which I am convinced resulted from the shortness of time you had in which to adopt this important legislation.

The inequity is brought about by the relief provisions of the Excess Profits Tax Act.

Specifically, it affects companies which have invested capital in entirely new ventures. This inequity is of the gravest importance to the Ecusta Paper Corp.

Ecusta has been manufacturing cigarette paper since 1939. The company operated at full capacity until the middle of the year 1949. At that time production was curtailed because of the resumption of manufacture by foreign cigarette-paper manufacturers and the lack of dollar credits of the many of Ecusta's foreign customers. This created a pool of unemployed workers in Transylvania County, N. C., who were highly skilled and very desirous of obtaining employment.

Senator MILLIKIN. May I ask from what countries does this type of paper come?

Mr. HANES. This cigarette paper was originally made in France, Senator; until 1939 the largest portion of our cigarette paper came from France.

In that year we developed a method of using an American farm product, flax fiber, for the manufacture of pulp from which to manufacture cigarette paper, and since that time we brought the largest share of that cigarette-paper business to this country instead of France, as it was formerly.

Senator KERR. What market for the paper exists in the United States?

Mr. HANES. The market, the total market for cigarette paper, the largest market, of course, is in the United States. We manufacture in point of tonnage—it is very small compared to other paper manufacturers—the tonnage in this whole country of cigarette paper is somewhere in the neighborhood of 30,000 tons a year.

Senator KERR. Considerably over half of the world market is here; is it not?

Mr. HANES. I would assume so, of course, but I do not have that figure accurately in mind. I would assume that more than half of it is here.

As I said, we had quite a group of unemployed people at that part of North Carolina, due to our cut-back, and in an effort to fill this need, coupled with our desire to enter the cellophane field, the Ecusta expansion program became a reality.

In November 1949 we entered into a legally binding contract with du Pont to manufacture and sell cellophane. Negotiations for the contract commenced as early as October 1948 and, as soon thereafter as the mechanical details could be worked out, namely, March 1950, Ecusta commenced construction of a cellophane plant, involving a large investment, adjacent to its cigarette-paper plant.

The cellophane plant, to contain nine casting machines, was constructed under the guidance of du Pont engineers. The plant is at the present time almost complete and, in fact, about one-half of the machines are successfully producing cellophane. The production of cellophane at Ecusta is the culmination of long and carefully laid plans. The sale of cellophane to customers commenced in June of this year, 1951.

When we were arranging the financing of the investment in buildings and machinery, together with the necessary working capital, the corporate-tax rate was 38 percent, and none of us could foresee or even dreamed of another harsh and complicated excess-profits-tax law.

Section 443 of that law was enacted to provide relief for corporations which had made substantial changes in their products or their services during the base period. The relief in our case is necessary, for otherwise all earnings attributable to cellophane would automatically be taxed at the excess-profits-tax rate.

Certain specific gross receipts and net income tests are provided, which are designed to preclude routine or ordinary business changes from the benefits of the relief section.

These tests are reasonable and they do separate the normal change from the substantial change. Because of its cellophane operation, Ecusta will meet each and every one of the requirements for substantiality. However, section 443 now provides that the change in product must have occurred prior to the end of the taxpayer's base period.

The end of our base period is December 31, 1949. But we did not actually commence the manufacture and sale of cellophane until June 1951. Bear in mind, however, that we commenced negotiations for the cellophane contract in October 1948.

By November of 1949 the contract with du Pont had been executed and arrangements for financing had been completed. These carefully laid plans obviously were in no way related to an inflated economy brought about by the Korean invasion, which occurred on June 28, 1950, 7 months after our commitments were made. At the time of the Korean invasion we had invested more than $5 million in the cellophane venture. It is therefore clear that the entire project was conceived and was well on its way to reality before many of us knew anything about a country known as Korea. It appears that this is an instance, and there may be others, where American business has sought out new fields, invested substantial funds providing new jobs for many people, and under the present excess-profits tax law all earnings resulting from these new ventures will be subjected to excess profits taxes in addition to the high normal and surtaxes.

Gentlemen, that is unfair. And I am sure it was not your intention deliberately to penalize industry for being industrious.

As I understand the theory of the excess-profits tax, its purpose is to siphon off corporate earnings which result from a stimulated demand from the war effort or directly from sales of manufactured articles to the various military services.

None of us who have had business experience during World War I and World War II would take exception to the theory of the excess-profits tax in wartime.

However, caution must be exercised to distinguish between normal profits and war profits. It is my opinion—and I am sure fair minds will agree—that any venture conceived, arranged, and to a large extent actually carried out prior to the event of war—in this case June 28, 1950—should be treated differently from those ventures which are brought about as a result of the war or which are made possible and feasible from a business point of view because of a stimulated demand or a level of prosperity which is directly attributable to the war. Under present law Ecusta will not qualify for relief under section 443.

The cellophane plant of Ecusta required an investment of many millions of dollars. Based upon the 1949 tax rate of 38 percent, the return on the total investment should have been approximately 15 percent.

Senator TAFT. You mean before or after taxes?

Mr. HANES. That should be before taxes.

Senator KERR. There would not be any difference before taxes?

Mr. HANES. I beg your pardon, Senator; that would be 15 percent after taxes.

Senator KERR. After taxes?

Mr. HANES. Fifteen percent after taxes; that is right.

These are the figures which were projected by the company when it decided to enter into a contract with du Pont and invest a substantial amount of money in an entirely new venture.

Under the House bill now before you, however, the tax rate on the estimated cellophane earnings before taxes will not be 38 percent but will be 82 percent, making the return on the investment slightly under 5 percent—and again that is after taxes—while a return of 16.7 percent for this type of operation is recognized as normal by the Excess Profits Tax Act.

Senator TAFT. What choice do you have today? You have a choice of—your base can be 16.7 percent before taxes, is that it, before the excess-profits tax applies?

Mr. HANES. Generally the way this operates in this case is about as follows: Practically all of the earnings of cellophane, superimposed upon the earnings of cigarette paper, will be taxable at the maximum rate of 82 percent, and even under the House bill——

Senator TAFT. That cannot quite be, because you get an additional—at least 12 percent return on the additional capital that went into the cellophane——

Mr. HANES. In calculating our case——

Senator TAFT. Twelve percent and, in fact, you get more probably because of the type of business, 16.7. Is that where that 16.7 comes in?

Mr. HANES. That is the normal recognized under the normal excess-profits tax base for this industry that is the normal rate of return.

Senator TAFT. Then you do get, on this new business before the excess-profits tax begins, 16.7 percent on the money you put into it, is that right?

Mr. HANES. It does not work that way in our case, Senator, and I will tell you why.

Senator TAFT. Why not?

Mr. HANES. This is a highly technical accounting question in this case, and I have with me here an expert accountant who will be glad to explain that to you. I am sorry I cannot explain it adequately because it is such a highly technical question.

Senator TAFT. Well, it does not affect the argument you make particularly. I only am trying to see how the present law operates and what kind of relief it does give in this kind of a case. I am only curious to find that out.

Mr. HANES. Well, in our case, Senator, it does not give us any relief whatsoever.

Senator TAFT. It must give you relief. I cannot see what the——

Mr. HANES. If you would like our accountant, I would be glad to have him explain that to you.

Senator KERR. Let us have the accountant come up here and tell us why.

Senator TAFT. Tell us why you do not get the 16.7, at least.

Mr. HANES. Mr. O'Connell, would you explain that?

Senator TAFT. You figure on net 15 percent after taxes, so 16.7 percent before taxes would not be very——

Senator HOEY. Give your name, please.

Mr. O'CONNELL. Walter F. O'Connell, certified public accountant, Greensboro, N. C.

The capital used to construct the cellophane plant was contributed by the parent corporation of Ecusta. That provided Ecusta with a capital addition, but produces a capital reduction in the same amount for the parent corporation so that there is no increase in the excess-profits credit for the group.

Senator TAFT. Do you file a consolidated return?

Mr. O'CONNELL. No; we do not.

Senator TAFT. Then, so far as the Ecusta is concerned, you could get the other 16 percent or 12 percent?

Mr. O'CONNELL. No; the capital was not contributed; the capital was advanced as a deferred liability.

Senator KERR. Well, with reference to the operator, is it not borrowed capital or is it not invested capital?

Mr. O'CONNELL. It is mostly accumulated earnings and some borrowed capital which was borrowed prior to the end of the base period.

Senator KERR. It could not be earned capital by this corporation if you formed a corporation to do this job, could it?

Mr. O'CONNELL. It was earned by the parent or by the sub.

Senator HOEY. If it is earned by the parent, you do not get credit for it.

Mr. O'CONNELL. That is correct.

Senator TAFT. Well, it is earned by the subsidiary. The earnings that you are referring to here that you are paying these taxes on are earned by the subsidiary.

Mr. O'CONNELL. That is correct.

Senator TAFT. What you are saying is that the subsidiary does not get any allowance for money that is borrowed, but he does get some allowance. How much does it get?

Mr. O'CONNELL. Seven hundred and eighty thousand dollars on a $6½ million capital contribution, and the parent corporation suffers a $780,000 capital reduction because it is an increase in inadmissible assets to the parent.

Senator KERR. I would like to have Mr. Stam's reaction to that because I think that under the law the least they could get was 75 percent borrowed capital as though it were invested capital.

Senator TAFT. What is the parent company? Is it a holding company or an operating company?

Mr. O'CONNELL. It is an operating company.

Senator HOEY. Mr. Stam, what do you say about that?

Mr. STAM. I will have to look into the facts; but, of course, under the set-up of the excess-profits tax, you get 12 percent for additions to capital; that is, equity capital.

Mr. O'CONNELL. Accumulated after a certain date.

Mr. STAM. That is right. And, of course, on borrowed capital you get 75 percent.

Mr. O'CONNELL. On additional borrowed capital.

Mr. STAM. Yes.

Mr. O'CONNELL. That is right.

Senator KERR. On any borrowed capital, is it not, Mr. Stam?

Mr. O'CONNELL. On any borrowed capital; that is quite right.

The point here is that the money invested in the cellophane plant which will comprise the total assets of the cellophane operation, which operation is a part of the chemical industry, which should be allowed 16.7 percent credit on the total assets. Not on the net investment. That, you can readily see, is considerably greater than the 9-percent allowance on borrowed capital minus the interest adjustment.

Senator TAFT. 16.7 percent? I do not mean you—is that allowed for a new corporation? It is, is it not?

Mr. O'CONNELL. In the chemical industry?

Senator TAFT. If this were a new chemical corporation going into the cellophane business, they get 16.7——

Mr. O'CONNELL. On the total assets?

Senator TAFT. Total assets.

Mr. O'CONNELL. Whether or not it was borrowed or invested.

Mr. STAM. That is the base-period industry rate.

Mr. O'CONNELL. And the base-period rate is the ratio of net income before taxes to total assets?

Mr. STAM. Total assets.

Mr. O'CONNELL. Not to invested capital. The ratio of industry income to net investment, capital investment, net worth of this industry would, of course, be substantially more than 16.7 percent.

Senator TAFT. It would seem to us that Ecusta gets something. It seems to me they get 9 percent on the invested capital. There is some allowance for a base period. They are not left without a base altogether. You say in some way that is reflected by a reduction in the base of the parent company?

Mr. O'CONNELL. Yes, sir.

Senator TAFT. Why?

Mr. O'CONNELL. Because the parent corporation——

Senator TAFT. You have the same money you had before, and they have a historical basis that they operate on, presumably. I do not see why it affects them.

Mr. O'CONNELL. The parent corporation contributed $6½ million net to this new corporation.

Senator KERR. In what form?

Mr. O'CONNELL. Contributed capital.

Senator KERR. Did it buy common stock, preferred stock, debentures; or did it loan it the money?

Mr. O'CONNELL. It bought common stock.

Senator TAFT. For the cellophane thing or before that?

Mr. O'CONNELL. It bought the stock of the cigarette-paper plant and then added additional capital to it, which increased its investment in the subsidiary.

An increase in an investment in the stock of another company is an increase in inadmissible assets which results in a capital reduction.

Senator TAFT. Capital reduction; but, of course, if they are operating on a historical basis it does not affect them at all, if they are operating on a basis of historical earnings.

Mr. O'CONNELL. Oh, yes; it does. Yes; it does. The average earnings of the parent company are computed, and a credit is determined, and 12 percent of any increase in inadmissible assets after the commencement of the excess-profits tax period is a reduction of the earnings credit as well as——

Senator TAFT. Is that so, Mr. Stam?

Mr. STAM. Yes.

Senator TAFT. How does that work?

Mr. STAM. You see, the parent is giving up something.

Mr. O'CONNELL. Has a reduction.

Mr. STAM. So that they have their capital reduced.

Mr. O'CONNELL. So, therefore, the picture at Ecusta gives us the base-period earnings of the cigarette-paper operation plus a $780,000 capital addition; at the same time the parent corporation has its earnings credit minus $780,000, so that when you look at the group you have the cigarette-paper base-period earnings and the parent company base-period earnings. Now we have a brand-new operation and no excess-profits credit whatsoever. Also in this instance, because of the substantial credit allowed for cigarette paper, the cellophane profits added to regular income would not bring into play the over-all limitation. We will fall just beneath the over-all limitation so that every dollar of profit from our cellophane operation will be taxed at 82 percent.

Senator TAFT. Assume that you make the same money on the cigarette paper that you made before you gave up the foreign trade.

Mr. O'CONNELL. It would be substantially the same.

Mr. HANES. We have increased, Senator—I think it is fair to say it is not all cigarette paper. We have been manufacturing other types of paper.

Senator TAFT. What remedies do you propose?

Senator KERR. Senator, before you go to that, I would like to see if we can get a picture because I am like you, I do not understand it.

Senator TAFT. My mind is a little hazy. Perhaps if we can see what the remedy is, then we can see what we can do. I do not see how we are going to meet the situation that you suggest.

Mr. O'CONNELL. Here is the remedy, Senator. This change in product—and it is a change in product under the law because it meets these necessary tests, that is, that more than 40 percent of the gross receipts will result from the new product, and the excess-profits net income will be more than 125 percent of the base-period average.

However, the change was not made by the end of the base period, and our point is that we legally bound ourselves to make this change although the change did not become a reality until June 1951. But it was not something which resulted from the war; it was something that we commenced negotiations on——

Senator TAFT. What you want to get the advantage of is what finally results when you get this——

Mr. O'CONNELL. To allow us to pull back this change which occurred in June 1951, as though it occurred in our base period, and to allow us 16.7 percent of the total assets operating for Ecusta on cellophane and cigarette paper, give up our cigarette-paper earnings and have an entirely new credit.

Senator HOEY. And you ask that the contract relation date back to that period?

Mr. O'CONNELL. Yes, sir. A very definite commitment was entered into in November 1949, negotiations for which commenced 13 months earlier.

Mr. HANES. Senator, may I go back just 1 minute in answer to your question as to what would give us relief in this specific case? What would give us relief would be changing the date to the Korean War, which would adequately serve us, instead of making——

Senator TAFT. I know that. I want to see what the relief was that it would give you. It writes you into a class of new companies, considered entirely new, that get a brand-new credit based on industry earnings; which industry earnings, by the way?

Mr. O'CONNELL. Chemical—it would be chemical.

Senator TAFT. Cellophane and paper both, they are different.

Mr. O'CONNELL. Cellophane, when we are in full production, will comprise more than 50 percent of the gross receipts of the changed company.

Senator TAFT. So you want to have that 16.7 applied to the paper business as well as the——

Mr. O'CONNELL. Incidentally, the paper business.

Senator TAFT. Are the earnings more than that now?

Mr. O'CONNELL. It is earning more than that.

Senator TAFT. You mean the base is more than——

Mr. O'CONNELL. The base-period rate is 18.1 for paper.

Mr. HANES. 18.1 in paper.

Senator TAFT. Is that what you use now or are you using historical?

Mr. O'CONNELL. We are using our actual average earnings.

Senator KERR. Which is 18 percent.

Senator TAFT. Which is 18 percent or more.

Mr. O'CONNELL. It is more than 18 percent; 18.1 percent is the average for paper and pulp products.

Senator KERR. Let us get back to the capital structure of the new company for a minute.

Mr. O'CONNELL. Yes.

Senator KERR. What is it?

Mr. O'CONNELL. Ecusta is capitalized as follows: They had a million dollars in common stock. That stock was acquired——

Senator KERR. That is all right; that is immaterial. Let us get the capital structure.

Mr. O'CONNELL. They have $6½ million in net contributed capital—these are round figures, except——

Senator KERR. I thought you said the parent company bought stock with that $6 million?

Mr. O'CONNELL. No, sir. The parent company bought the million dollars par value common stock.

Senator KERR. For how much?

Mr. O'CONNELL. For $18 million. Then it contributed an additional $6½ million net to Ecusta so that Ecusta's balance sheet looked as follows: $1 million common stock, $6½ million contributed capital, and earned surplus of approximately $7 million.

Senator KERR. Is this the company that——

Mr. O'CONNELL. This is Ecusta.

Senator KERR. Are you not talking about the company that is to make the cellophane?

Mr. O'CONNELL. Yes, sir; the $6½ million capital which was contributed by the parent is a capital addition and provides Ecusta with an increase in credit of $780,000; but the $6½ million having been contributed after December 31, 1949, causes a capital reduction as far as the parent is concerned.

Senator KERR. I understand but let us get away from the parent. Let us stay with the company that is engaged in the new business.

Mr. O'CONNELL. Right.

Senator KERR. There is not any way that I can see that you would be unable to reflect in your capital structure upon which your credit is figured every dollar that has been invested in this new company insofar as that identity is concerned——

Mr. O'CONNELL. Well, sir——

Senator KERR. Is that correct?

Mr. O'CONNELL. I do not believe it is, sir. The accumulated——

Senator KERR. Is that not right, Mr. Stam?

Mr. STAM. That is right.

Mr. O'CONNELL. Accumulated earnings, Mr. Stam?

Senator KERR. Well, they are not accumulated earnings of this new company. They have to be invested capital so far as it is concerned. If it has got money that it has not earned, it has either got it by the issuance of stock or by borrowing it or by stealing it.

Mr. O'CONNELL. It borrowed it from the parent.

Senator KERR. Then it is borrowed capital.

Mr. O'CONNELL. It does not qualify as borrowed capital.

Senator KERR. If they borrowed it. There is no way for it to be borrowed capital if they did not qualify it.

Mr. O'CONNELL. It does not qualify; it is not evidenced by a note.

Senator KERR. That does not make any difference. The note does not create the debt; it just evidences it.

Mr. HANES. Under the law it says, Senator, it does not qualify, and I think that is correct. It does not qualify, and if it does qualify——

Senator KERR. I know it was the purpose of this committee to recognize borrowed capital.

Mr. O'CONNELL. Well, Senator, it is true that to the extent that any of the advances from the parent to the subsidiary which originated as outside borrowed capital, would provide some credit for the parent corporation.

Senator KERR. It provides 75 percent of the credit it would provide if it had issued stock for it.

Mr. O'CONNELL. Right.

Senator KERR. Now, this committee tried to fix it so that it would be a hundred percent, but that was changed in the conference.

Mr. O'CONNELL. Right. But in addition to the credit allowed on any outside additional borrowed capital, if this change had been actually made by December 31, 1949, rather than when it was made—committed to before that time, and consummated after that time—this company would be allowed a credit, we have estimated, of about $4,500,000 instead of $3,000,000 as it is now allowed.

Senator KERR. But the point about it was, as I understood this witness, he said that as it was, this company had no credit and that every dollar it earned was subject to excess-profits tax.

Mr. HANES. It has not any earnings.

Mr. O'CONNELL. It has a credit, and the cellophane earnings will be taxed at 28 percent.

Mr. HANES. I think you misunderstood me, Senator, in this respect: I just said that the cellophane earnings added to the paper earnings—the cellophane earnings addition would be taxed.

Senator KERR. You are getting into another phase of it; let us stay with this.

Mr. HANES. All right.

Senator KERR. This company has to have a credit base, in the first place, consistent with its capital structure, and consistent with over-all limitation of 62 percent, or I want to know how it is that it does not have it.

Mr. O'CONNELL. Well, Senator, for one thing, $6 million of the accumulated earnings of this particular company——

Senator KERR. How can this company have any accumulated earnings if it just started to sell?

Mr. HANES. No; it is not a separate company. You are confused.

Senator KERR. You said it was a subsidiary.

Mr. HANES. The cellophane was not a separate company.

Senator KERR. You said it was a subsidiary.

Mr. O'CONNELL. It is a subsidiary, but was organized in 1939 and had accumulated earnings at the end of 1949 of approximately $7 million, all of which is invested in the cellophane plant.

Another $6½ million net was contributed by the parent corporation.

Senator KERR. It was not contributed; it was either loaned or they bought stock.

Mr. O'CONNELL. Well, they contributed it, having previously loaned it.

Senator KERR. Mr. Stam, if this company, when it went into this new venture, had accumulated earnings of $7 million, would that be a part of its invested capital?

Mr. STAM. It would get credit for that amount if it was invested.

Mr. HANES. But the parent company would have it subtracted.

Mr. STAM. But the parent company would have it subtracted.

Mr. HANES. It would have it subtracted.

Senator KERR. It was not the purpose of the committee to have more than one credit.

Mr. HANES. In this case on the cellophane earnings we get no benefit at all from the additional earnings under this excess-profits-tax credit.

I think where you are being confused, Senator, if I may say so——

Senator KERR. I can tell you that you are going to have a big job on your hands if you are going to accurately delineate my own confusion. I would like for you to do that.

Mr. HANES. Maybe I can assist. I will try.

Senator KERR. Have you got this clearly over there?

Mr. HANES. No; and it is a confusing thing; that is the reason I have an accountant here. I am not an accountant, as you can plainly see.

I think, though, where we are off base here for a moment is that the Ecusta Paper Corp. is a subsidiary, as I said, at the first line of my statement, of Olin Industries, a wholly owned subsidiary of Olin Industries.

Now, Ecusta Paper Co. is a separate corporation organized under the laws of North Carolina.

The Ecusta Paper Corp., through its own accumulated earnings, through accumulated earnings of its parent, that is, Olin, and through borrowed money——

Senator KERR. Let us get back there, because you cannot say you did something through the accumulated earnings of its parent, because for it to do that that money had to change its identity from accumulated earnings of the parent to the loan money or borrowed money or invested money.

Mr. O'CONNELL. Invested money.

Mr. HANES. Just let us call it dollars, that is all right with me. That is fine.

Let us just say that the parent company and the subsidiary had a certain number of dollars.

They did not have enough dollars to build the cellophane plant, Ecusta dollars; which necessitated our borrowing the money from the Prudential Life Insurance Co.

Now, that subsidiary, Ecusta, owns both the cigarette-paper manufacturing and the cellophane manufacturing; it is not a separate corporation.

The cellophane is not a separate corporation; the cellophane is a part of Ecusta.

Senator KERR. All right.

Senator TAFT. Do you mean to say that this 6 million that Olin Industries gave Ecusta was borrowed from the insurance company?

Mr. HANES. No; I said that they got it from three sources. They got it from their own earnings, from their own cash assets, their own dollars.

Senator TAFT. Yes.

Mr. HAYNES. From Ecusta, from Olin, from the insurance company, and they were the dollars.

Senator TAFT. Did the insurance company loan directly to Ecusta, or the parent company?

Mr. HANES. To the parent company.

Senator TAFT. Then this parent company would not suffer this loss of 9 percent of the money they gave to Ecusta because they deduct from it what they got from—if they go out to borrow the money from the insurance company, they would not have a deduction in their base.

Mr. O'CONNELL. No, Senator; having borrowed the money from an outside source and being allowed the 12 percent, additional credit to the extent of 75 percent, despite that, had this change in product been a reality by December 31, 1949, we would have been allowed 16.7 percent, not 9 percent.

Senator TAFT. That is another question.

This thing started out with a claim that this 9 percent was entirely nullified by what the parent company had to give up, and I am suggesting that is not so if the parent company borrowed the money from the life insurance company.

Mr. HANES. Well, Senator, again as a——

Senator TAFT. They do not have a corresponding loss as against Ecusta.

Mr. O'CONNELL. Senator, to the extent that they contributed capital, they did have an offsetting loss in credit, is that not correct, Mr. Stam? Could not they balance against it the money they had to borrow in order to contribute the capital?

Mr. STAM. I think so.

Senator TAFT. I should think so. It means it is only—if you had had unused assets that you have now disposed of, but in this case you went out and borrowed the money to give Ecusta the $6 million.

Senator KERR. I think the question before us is different from what I first thought it was. When I first started here, I got the impression that they were a company without a base. As I now see it, they are a company with a 9-percent base, with reference to certain capital, instead of the 16 percent plus base with reference to all of its capital. I think that is the situation.

Senator TAFT. And a 20-percent base as to half of it.

Senator KERR. That is right.

Senator TAFT. That is in the paper business, and about a 9-percent base on what it got from the other, and you would be better off with 16.7 for everything.

Senator MILLIKIN. Mr. Chairman, I do not think that we can ransack the whole field of accounting theory at this hearing. I would like to find out briefly and succinctly what you are trying to do and why.

Mr. HANES. Well, Senator, the main purpose—the burden of my whole statement—narrows down to how to correct, and how to correct it is a very simple proposition in our case, and——

Senator MILLIKIN. Let me ask you this: Are you trying to get out of the category of a new company?

Mr. HANES. No; we are trying to get out of——

Senator MILLIKIN. What are you trying to get out of?

Mr. HANES. Senator, we want the date for determining whether or not the change in product or service was affected, we want that date extended to cover the period that it took us to get into the manufacture of cellophane.

Senator MILLIKIN. You are trying to get a more advantageous earning base?

Mr. HANES. Yes.

Senator MILLIKIN. Is that correct? That is the whole thing. Let us get that pegged, and let us not confuse that.

Mr. HANES. That is right.

Senator MILLIKIN. Now, on what theory do you want that base bettered?

Mr. HANES. For the purpose of determining whether or not a change in the products or services has been effected. Any substantial change which the taxpayer had made or was legally committed to make prior to June 30, 1950, shall be deemed to have been made prior to the last day of its base period.

Senator MILLIKIN. In other words, the legal commitment as——

Mr. HANES. That would solve our problem.

Senator MILLIKIN. Shall take the place of an actual operating base, is that correct?

Mr. HANES. That is correct.

Senator MILLIKIN. Under the circumstances that you have revealed here?

Mr. HANES. That is correct.

Senator TAFT. But the statement which I questioned is in your statement, and that is what I cannot understand now. You say, "Under the House bill before you now the tax rate on the estimated cellophane earnings before taxes would not be 38 percent but 82 percent, making the return on investment slightly under 5 percent." That is the thing that I think you would have difficulty in proving. That is the only question that I was raising in all of this discussion.

Mr. O'CONNELL. To the extent, Senator, that money borrowed from the life insurance company was used in the construction of the cellophane plant, which is by no means the entire cellophane investment—the accumulated earnings of Ecusta were about $7 million and there was a net capital contribution, not an advance, not a loan, of $6½ million.

We estimate the total cellophane cost with working capital would be $20 million.

Senator TAFT. I wonder if you would just, for my information, write me a letter explaining this sentence, how you support that.

Mr. O'CONNELL. I would be glad to.

Senator TAFT. All right.

Mr. HANES. I think, Senator, that if I may be allowed to insert in the record a more complete statement—I have one with me—I was trying to save time and get over a lot of these details, but I would like to give you and I will send to each member of the committee, and we will supplement it, Senator Taft, with a letter to each member of the committee, explaining and proving this statement, because I believe what I stated was an absolutely true fact, and we can support it, and if you will give us that opportunity, I am certain we can do it.

Senator HOEY. You may insert it in the record.

(The document referred to follows:)

ECUSTA PAPER CORP.,
Pisgah Forest, N. C., July 27, 1951.

Hon. ROBERT A. TAFT,
United States Senate, Washington, D. C.

MY DEAR SENATOR: I enclose herewith a letter addressed to you by our tax adviser, Walter F. O'Connell, and signed by him.

This letter comes to you in response to a statement made by you during my testimony before the Senate Finance Committee on July 26 to the effect that you did not see how it was possible that our cellophane earnings could be taxed at 82 percent.

I asked for and was granted the privilege of submitting a letter in explanation for the record. I sincerely hope this letter, Walter O'Connell's letter and my supplementary statement can be inserted in the record at the end of my testimony. This is highly desirable because I fear that there was some confusion left in the record on this point.

If Mr. O'Connell's letter and the brief do not completely answer all of your questions, I hope you will afford us the opportunity of discussing this matter further with you.

With kindest regards,

Faithfully yours,

JOHN W. HANES.

W. F. O'CONNELL & CO.,
Greensboro, N. C., July 27, 1951.

Hon. ROBERT A. TAFT,
Senate Office Building, Washington, D. C.

MY DEAR SENATOR: In the course of a statement made before the Senate Finance Committee on July 26, 1951, by John W. Hanes, president of Ecusta Paper Corp., Pisgah Forest, N. C., he stated as follows:

"Under the House bill now before you, however, the tax rate on the estimated cellophane earnings before taxes will not be 38 percent but will be 82 percent, making the return on the investment slightly under 5 percent, while a return of 16.7 percent for this type of operation is recognized as normal by the excess-profits-tax law."

You asked for an explanation of this statement. Because of the complexities of the facts and law involved and the shortness of time we were unable to satisfactorily explain it to you. You then requested that I write you a letter supporting the statement.

The excess-profits credit of Ecusta Paper Corp. is determined on the earnings basis. It is made up of 85 percent of its average base-period earnings (all from the cigarette paper operations) and 12 percent of a net capital addition of approximately $6½ million representing a net capital contribution from its parent.

In November 1949 Olin Industries, Inc., borrowed $20 million from Prudential Insurance Co. the proceeds of which were used to buy all of the Ecusta stock for $18 million. At that point under present law Olin suffered a loss in excess-profits credit because 75 percent of the $20 million loan less 75 percent of the interest adjustment is exceeded by the increase in inadmissible assets of $18 million.

The Ecusta cellophane plant was financed from—

(1) Funds representing prior years Ecusta profits.

(2) Funds representing prior years parent company profits which were:

(a) Contributed to the capital account of Ecusta in 1950, and

(b) Advanced on open deferred account to Ecusta during 1950 and 1951

The funds under item (1) in no way affect the excess profits credit of either company.

The funds under 2 (a) constitute a net capital addition to Ecusta since the contribution occurred after January 1, 1950. This net capital contribution approximated $6,500,000 and increased the Ecusta Co. credit by 12 percent thereof or $780,000. At the same time the contribution increased the inadmissible assets of the parent causing a capital reduction in the same amount so that excess-profits credit is simply switched from the parent to Ecusta. There is no increase in excess-profits credit for the group.

The funds advanced under 2 (b) do not qualify as borrowed capital of Ecusta as they are not evidenced by notes. If they were evidenced by notes they would qualify as borrowed capital of Ecusta but would constitute a capital reduction of the parent company in the same amount.

If the advances were converted into contributions to capital the effect would be the same as under 2 (a) above.

Since our credits were not increased in the aggregate by our investment in cellophane, all cellophane profits will be taxed at 82 percent.

In other words, Senator, our situation is similar to that of a single established company which invested its own funds (not new outside capital or outside loans) in a new product or an expansion. In such a case no additional excess-profits credit is allowed except under the relief sections (if it qualifies) so that all earnings of the new operation are taxed at 82 percent.

I trust that the above information together with the supplemental brief being submitted will satisfactorily answer your question.

Respectfully submitted,

W. F. O'CONNELL

SUPPLEMENTAL STATEMENT OF JOHN W. HANES, PRESIDENT OF ECUSTA PAPER CORP.

Ecusta Paper Corp. was organized in 1938 under the laws of the State of North Carolina and commenced the manufacture of cigarette paper from American raw materials in 1939. It has continuously manufactured cigarette paper until June of 1951 when it also commenced the manufacture of cellophane film under a license arrangement with E. I. du Pont de Nemours Co. When the volume of cigarette paper production declined in the middle of the year 1949 its then chief stockholders, Harry H. Straus, president of the company and John W. Hanes, director of the company, sought some means whereby employment could be found for those put out of work by the decline in production.

Olin Industries, Inc., has for many years been engaged in the manufacture of explosives, small arms and small arms ammunition. For many years commencing as early as 1929 Olin has expended substantial funds in research work in the cellulose field. During all of this time Olin was planning the manufacture of cellophane film under their own or other American or foreign patents. This cellulose development program culminated in negotiations with du Pont which commenced in October 1948. For the year following Olin and du Pont were in constant negotiation seeking an arrangement whereby Olin would be allowed to manufacture and sell cellophane under the du Pont patents. On November 4, 1949, Olin entered into a legally binding contract whereby it was granted the privilege of manufacturing and selling cellophane under the du Pont patents and du Pont agreed to construct for Olin an eight casting machine cellophane plant. Almost simultaneously, to be exact on November 28, 1949, Olin acquired from Straus and Hanes all of the stock of Ecusta and immediately commenced working out the mechanical details for the transfer of its license to Ecusta and the construction of the cellophane plant adjacent to the Ecusta cigarette paper plant in Pisgah Forest, N. C.

The Ecusta stock was acquired by Olin for the sole purpose of constructing a cellophane plant adjacent to the Ecusta cigarette paper plant. Ecusta had available excess power, land, and water facilities. By making use of these excess facilities it was possible for the cellophane plant to get into production approximately 1 year earlier with construction cost savings of several million dollars. Accordingly on February 11, 1950, the contract with du Pont was amended to provide for nine machines and immediately thereafter on March 6, 1950, both contracts (dated November 4, 1949, and February 17, 1950) were assigned by Olin to Ecusta. Prior to the working out of the details, however, it was known by Olin and Ecusta that the cellophane plant would be located at Pisgah Forest, N. C., and preliminary drawings, surveys, etc. were under way at Pisgah Forest. Construction actually commenced on April 3, 1950, and by June 30, 1950, Ecusta had invested approximately $5 million in the construction of the cellophane plant.

The excess-profits credit of Ecusta Paper Corp. is determined on the earnings basis. It is made up of 85 percent of its average base period earnings (all from the cigarette paper operations) and 12 percent of a net capital addition of approximately $6½ million representing a net capital contribution from its parent.

In November 1949, Olin borrowed $20 million from Prudential Insurance Co. the proceeds of which were used to buy all of the Ecusta stock for $18 million. At that point under present law Olin suffered a loss in excess-profits credit because 75 percent of the $20 million loan less 75 percent of the interest adjustment is exceeded by the increase in inadmissible assets of $18 million.

The Ecusta cellophane plant was financed from:—

(1) Funds representing prior years Ecusta profits

(2) Funds representing prior years parent company profits which were—

(a) Contributed to the capital account of Ecusta in 1950, and

(b) Advanced on open deferred account to Ecusta during 1950 and 1951.

The funds under item (1) in no way effect the excess profits credit of either company.

The funds under 2 (a) constitute a net capital addition to Ecusta since the contribution occurred after January 1, 1950. This net capital contribution approximated $6,500,000 and increased the Ecusta Co. credit by 12 percent thereof or $780,000. At the same time the contribution increased the inadmissible assets of the parent causing a capital reduction in the same amount so that excess profits credit is simply switched from the parent to Ecusta. There is no increase in excess profits credit for the group.

The funds advanced under 2(b) do not qualify as borrowed capital of Ecusta as they are not evidenced by notes. If they were evidenced by notes they would qualify as borrowed capital of Ecusta but would constitute a capital reduction of the parent company in the same amount.

If the advances were converted into contributions to capital the effect would be the same as under 2(a) above.

Since our credits were not increased in the aggregate by our investment in cellophane, all cellophane profits will be taxed at 82 percent.

In other words, our situation is similar to that of a single established company which invested its own funds (not new outside capital or outside loans) in a new product or an expansion. In such a case no additional excess profits credit is allowed except under the relief sections (if it quaiifies) so that all earnings of the new operation are taxed at 82 percent.

Section 443 of the Excess Profits Tax Act of 1950 is designed to provide relief for taxpayers who have changed their products so that the statutory base period earnings are abnormally low for the determination of an excess profits credit based on earnings. Relief from this type of abnormality was recognized by Congress under the World War II Excess Profits Tax Act, wherein section 722 provided relief for companies which changed the character of its business by way of a change in product or in certain other ways. In that act after exhaustive hearings a provision was included in section 722 (b) (4) whereby: "any change in the capacity for production or operation of the business consummated during any taxable year ending after December 31, 1939, as a result of a course of action to which the taxpayer was committed prior to January 1, 1940, * * * shall be deemed to be a change on December 31, 1939, in the character of the business * * *".

Under section 443 of the Excess Profits Tax Act of 1950 three tests must be met by a taxpayer in order to establish its eligibility to relief. These are:

(1) the change must have been consummated within the taxpayer's base period

(2) more than 40 percent of its gross income or 33 percent of its net income for the qualifying year must be attributable to the new product

(3) as a result of the change in product the excess profits net income for the qualifying year must exceed 125 percent of the average base period net income.

The sales of Ecusta Paper Corp. are approximately $16 million per annum. The average base period excess profits net income of Ecusta was slightly in excess of $3 million. The estimated excess profits net income of Ecusta during the taxable years will also be in slightly excess of $3 million. It is estimated that the cellophane plant will increase sales by $20 million and increase excess profits net income by slightly more than $5 million. Thus, Ecusta has substantially changed its product through the addition of cellophane.

From the figures set out above it is immediately clear that tests (2) and (3) will be definitely met by Ecusta. However, while the change in product was planned by the parent corporation as early as 21 years ago and while negotiations culminating in the present cellophane operation commenced in October of 1948, this change in product was not a reality on December 31, 1949. As section 443 now reads Ecusta would be denied any relief whatsoever. It was recognized in the drafting of the World War II excess profits tax law relief sections that changes in the character of a business were the result of long and careful planning. It was there recognized that commitments made to change the character of a business prior to December 31, 1939, might well not have been actually carried out until a year or more after that date. Intelligent businessmen add products, increase capacity and make other changes after the most careful scientific, engineering, financial and business surveys. It is inconceivable that products which by happenstance added subsequent to December 31, 1949, would be denied relief when in many cases legally binding commitments and in some instances the actual facilities necessary for production might well have been in existence by December 31, 1949. It is easily seen that the resulting inequity severely penalizes taxwise the very companies which should be encouraged because of the contribution they thereby make to the general prosperity of the country. Furthermore, it places the manufacturer of the new product in a position where it might be impossible to compete with the established manufacturer who has been making the product throughout the base period and who (assuming equal business ability) had earned the average return on investment of the entire industry.

It is recognized that some limitation must be placed on the extension of time within which changes in character should be recognized for relief purposes. The most realistic date for such a limitation would be June 28, 1950—the date of the Korean invasion. The Korean War came about so suddenly that even the day prior to June 28, 1950, may be described for relief purposes as a perfectly normal business day. Certainly the first 6 months of the year 1950 were normal business months in that business was not affected in any way by a war or defense economy. Since it is the theory of the excess profits tax law to siphon off excessive profits resulting from war business or a stimulated general business demand caused by the war, any period unaffected by the war can be described as normal and any change in the character of a business occurring or committed for during such normal period should be classified as a normal business change and thus be allowed to qualify for relief.

The change is particularly important to companies established in one field who enter an entirely new field. In such a situation the over-all limitation would not ordinarily apply and all of the earnings of the new product would be taxed at the suggested confiscatory rate of 82 percent. In the case of Ecusta the change which became a reality in June 1951, was planned as early as October 1948 and its parent corporation was legally committed to make the change on November 4, 1949, while the legally binding contract was assigned to Ecusta on March 6, 1950. All of Ecusta's anticipated cellophane profits will be taxed at 82 percent for the reasons set out above and because based upon the best possible present estimates the over-all tax limitation of 70 percent will provide no relief whatsoever. This places Ecusta in a position where it is virtually impossible for it's cellophane operation to survive in a competitive market where its competitors were manufacturing cellophane throughout the entire base period and therefore enjoy a fair and normal excess profits credit. Of course, this is a condition under which a business cannot survive and forms the basis for the request for the change in section 443.

In view of the fact that the identical problem was carefully studied by Congress when drafting the World War II Excess Profits Tax Act and since the Treasury Department in the administration of that act has had vast experience in applying the section the amendment could be patterned very closely on the committment section of section 722 (b) (4). It is therefore suggested that section 443 (a) (1) be amended by adding the following sentence at the end thereof: "For the purpose of determining whether or not a change in the products or services has been effected, any substantial change which the taxpayer had made or was legally committed to make prior to June 30, 1950, shall be deemed to have been made prior to the last day of its base period."

Senator TAFT. You see, it is not only a question of—we passed an amendment to meet your particular situation, and it turns out that that takes care of you, but we did not hit the particular thing that creates this kind of an inequity, if that is so. I do not think it is so, and that is what I am interested in.

Mr. O'CONNELL. I will be glad to do that.

Senator HOEY. You may put it in the record and also send it to the Senators.

Senator TAFT. I think if you get rid of this double company, and just have one company, here is a company that has a surplus, invests that surplus of its own in a new business, and maybe that company should have the same rights you are asking for, but under the present situation as I see it, they get no credit for the additional money because they had it already and the situation you are now striking at may not be at all fundamentally that it should be extended another year. Maybe we should solve the whole problem of new companies without this double corporate set-up that you have got. That is why I want to know just why this inequity occurs that you claim occurs under this sentence.

Mr. HANES. I believe you will find if you let us present this case to you by letter, that this amendment, the section of the law, the relief section now will effectvely stop corporations from expanding in new fields.

Now, I believe that that thing should be corrected, and I believe it is the will of this committee that it should be corrected.

Senator MILLIKIN. We have many facets of that same problem in the testimony here.

Mr. HANES. I am sure you do.

Senator MILLIKIN. I would like to suggest, of course, that you send the same letter to Mr. Stam——

Mr. HANES. Yes, sir.

Senator MILLIKIN. Because he will deal with the accounting practice that is involved.

Mr. HANES. Fine.

Senator MILLIKIN. And will be able to advise us on that, so that we do not have to take a course in accounting here.

Mr. HANES. That is right, sir. I assure you I will send to each member of the committee a copy, and I will send one directly to Mr. Stam.

Senator HOEY. Yes, sir.

Mr. HANES. Thank you, sir.

Senator HOEY. Thank you.

We were glad to have had you present.

North Carolina is a great producer and manufacturer of cigarettes, and we had to get all of our cigarette papers from France until Ecusta——

Senator TAFT. It also seems to be a producer of excess profits.

Senator HOEY. We are doing very well in that field but, of course, the industry in North Carolina and in the United States had to get all of the cigarette paper from France. Ecusta came into North Carolina and established a very magnificent plant, and it has been a remarkable success, and it is expanding into other fields.

We were glad to have Mr. Hanes and the other gentleman present.

Senator KERR. I would like to join the chairman in the remarks he made, and say to him that my effort in the matter was to get myself to where I could understand the problem, because I have never been of much value in solving a problem until I understood it.

Senator HOEY. I understand that fully. I am glad of the questioning. I think the letters will help clarify that.

Senator MARTIN. I think all of us want to encourage things of this kind.

Senator MILLIKIN. They have got the problem of bringing themselves under their own theory, and there has been so much confusion as to whether they have, and that, of course, leaves the question open and I do not think that we have a chance of solving that here.

The theory under which they proceed is perfectly simple. It is their burden to bring themselves under the theory.

Senator HOEY. Mr. William Cease, have a seat, please, and give your name and connection to the reporter.

STATEMENT OF WILLIAM W. CEASE, PRESIDENT, CEASE COMMISSARY SERVICE, INC.

Mr. CEASE. My name is William W. Cease, and I am president of the Cease Commissary Service, Inc., Dunkirk, N. Y.

Senator HOEY. All right, Mr. Cease; you may proceed.

Mr. CEASE. After the last gentleman who just appeared, I find myself not only confused but somewhat frightened.

I do not represent any large corporation that is able to borrow money from a parent corporation or even from the Equitable Life Insurance Co. I am a small-business man, and I am in the third largest retail business in this country. I run a restaurant, and we have to get our capital to expand from our earnings.

Senator MILLIKIN. What is your business?

Mr. CEASE. I provide food to workers in an industrial plant, and we are very happy—as a matter of fact, our goal is to make a 4 percent profit.

We do not have any capital structure as such, because the plants own the equipment within these factories, and they make the equipment available to us at no cost, and with no charge for utilities because it is the plant's desire that their workmen get food as cheaply as possible. That is the theory of it and that is the purpose of it, so that we do not have any capital structure as such to amount to anything on which you should seek any relief.

As I say here in my opening paragraph, I have become confused and frightened by our tax program and the effect it is having on the economy of our country.

I would like to amplify that by saying, "as it affects me and other little fellows like myself."

I was pretty well impressed that I was not to talk or take up over 10 minutes because you folks have got a lot of other important people to talk to, and I have prepared here a five-page memorandum, the reading time of which should be less than 10 minutes, and I am going to take a chance, the same as the gentlemen who preceded me, to waive that, and get just simply to the last page where I have these five points which I am trying to make.

Senator HOEY. The whole statement may be included in the record.

Mr. CEASE. I am very desirous that it will be, Senator Hoey.

Senator HOEY. Yes, sir.

Mr. CEASE. I request that it shall be.

Senator HOEY. That will be inserted in full.

Mr. CEASE. I am going to turn to the last page, and I will be very happy to answer any questions relative to these five points that you gentlemen see fit to question me about.

The first point that I am trying to make is that the ceiling on Federal income taxes should remain at 62 percent and not be increased.

My support of that is just the simple fact that we are finding it very dificult, if not impossible, to pay the 62 percent, and that is the sole basis of my recommendation that it should remain at 62 percent.

My second point is that the income credit should remain at 85 percent of base period earnings for those companies in a low income bracket, and that, too, sir, is based on my own experience, which I think reflects the experience of other small people such as myself.

Senator TAFT. I do not see why it does not apply to everybody, not only the small company.

Mr. CEASE. I am certainly not going to argue with you about that, Senator Taft.

Senator TAFT. It seems to me that it should apply to everybody.

Mr. CEASE. I am very happy to hear you say that.

My third point is that a company be allowed to adjust all its base period years and then exclude the lowest earning year.

I would like to amplify that a bit. The present law requires that you take your three highest years for your base period and then if you have any abnormalities, you adjust those 3 years, and I feel that this is not accomplishing what was intended, but just the reverse, because it could very well be that one of your lowest earning years would be due to strikes or abnormalities which this provision is supposed to help you eliminate.

In my own instance 1949 was one of our lowest earning years.

The Bell Aircraft Co., which is one of our major accounts, had a strike for approximately 4 months and we did not do any business. We had been planning for Bell Aircraft, and when we are forced to drop 1949 because it is a low earning year, we actually are forfeiting one of our best years if we adjusted it to the receipts that we would have taken in at that time had that plant not been closed down for 4 months.

I feel that all people should be permitted to adjust all of their years for abnormalities and then take the three best years.

Senator KERR. Can't you take any 3 years you want? You are not required to take the three highest, are you?

Mr. CEASE. Yes, sir; you are. May I ask this gentleman, Mr. Stam, who I believe is your expert?

Mr. STAM. You would take the three highest.

Senator KERR. But you are not required to.

Mr. CEASE. Yes, sir.

Mr. STAM. Yes, sir.

Mr. CEASE. And that is the point I think which is unfair.

Senator KERR. What you would like to do is to take any of the 3 years and adjust them in accordance with the formula of adjustment now in the law?

Mr. CEASE. That is in essence what I would like to accomplish, sir.

Senator KERR. All right.

Mr. CEASE. The fourth point that I would like to make is that the growth test in our experience and, I think it applies to little people and not to people who manufacture cellophane or television sets, that the growth test is too tough for a small, little business.

The growth test as it exists today gives you two alternatives:

(1) If your cash pay roll is increased 130 percent; (2) if your receipts have increased 150 percent. That 130 and 150 percent, to me, is a little confusing. It actually means, as I understand it, that you have to increase your payroll 30 percent or you have to increase your sales 50 percent, and we folks in the restaurant business, if we were to be able to increase our business a third in any one year, we would think we would be doing a grand job of increasing business.

We do not believe it normal growth to increase it 50 percent. The point that I am trying to make is that for corporations or companies in the relatively low income bracket, this growth test should be adjusted so that it is more equitable and more applicable to the actual conditions under which small business really works, and in my brief I recommend that the receipts test be reduced from 150 percent to 135 percent.

In other words, if we are smart enough to run our business and serve such good food that we increase our business a third, we are doing a darned good job, and to ask us to increase that business 50 percent is too tough. It is not reasonable, sir. Nor is it reasonable for the payroll test to be 130 percent. It should be 120 percent.

The fifth point—and I am trying to make five of them—deals with and is quite parallel to what the gentleman from the Ecusta Paper Co. is talking about.

We feel that a provision should be made to give relief to small companies with a heavy debt burden that was incurred during the base period. In other words, we understand that money must be raised to meet our Government's emergency program; we understand that, and we have no quarrel with it.

The Government has elected to say, "You must take 3 years out of that 4-year period for your base earnings," and then they say, 75 percent of it will be considered as normal earnings. On the remaining 25 percent, or the other quarter of your income, you pay an 82 percent tax. Gentlemen, if you borrow money to expand your business, you have to convince the bank that you are going to be able to pay it back, and the way you convince them that you are going to pay them back is to submit an earnings record, and then get your wife to sign the note or something, but you pay it back out of about a quarter of your profit.

In other words, to run a little business, you cannot very well plan to take more than a quarter of your earnings to pay off instalments on the new truck you bought or the new dishwasher you bought, and so forth. When one-quarter of these profits is going to be taxed 82 percent, you have only 18 percent left. Then you pay the State of New York—I operate in New York—4½ percent of this, and it does not leave you enough money to pay your indebtedness.

What I feel would be equitable, and particularly equitable to small corporations and small companies, was if you are going to take as a base of credit for excess-profits tax the earnings during a base period of years, that you should also take into consideration the liabilities that they incurred during those base period years.

Speaking for my own self and my own company, we planned an expansion back 5 years ago. We borrowed the money. We had no idea that this Korean situation was going to develop, or anything else. We borrowed the money and convinced the people that we were going to be able to pay it back out of our earnings.

Now, we are going to be unable to do so because one-quarter of our earnings are going to be subject to an excess-profits tax, according to the present program, of 82 percent. That is my statement; that is my story.

In my brief, I have requested, that corporations in the small brackets who incurred liabilities and established that they were going to start making payments in 1950 and future years, should at least be able to take the money that they have already promised somebody they are going to get that they be able to deduct this money before they start paying an excess-profits tax.

Senator HOEY. Thank you very much, Mr. Cease, for your appearance.

(The prepared statement of Mr. Cease follows:)

STATEMENT OF WILLIAM W. CEASE, PRESIDENT OF CEASE COMMISSARY SERVICE, INC., DUNKIRK, N. Y.

(1) As an average small-business man and an American citizen I have become confused and frightened by our Federal tax program and the effect it is having on the economy of our country.

(2) I have endeavored to analyze the proposed Revenue Act of 1951 as passed by the House of Representatives. Its proposal for tax increases makes it just about impossible for a small company such as ours to continue in business. I am referring to a company like ours which is owned privately by a few individuals and whose stock has no ready market. Our capital and credit, like those of thousands of other small corporations, are limited, and it is extremely difficult for us to acquire capital, whether by borrowing or by issuing equities, particularly in light of the proposed large tax increases. When, along with this overpowering tax burden, there is added the additional factors of credit curbs, price regulations, and other governmental controls, it is becoming increasingly difficult for a small operator to continue in business. Many may be forced to close shop. When the effect of these factors on our business multiplied by their effect on the thousands of other small corporations across the country is felt, the future of small business is not an optimistic one.

(3) Another difficult problem is the amount of cash that will be required during the first 6 months to pay 70 percent of our 1951 corporate taxes in quarterly installments of 35, 35, 15, and 15 percent in 1952. I am sure you will appreciate that earnings are not always represented by cash, but often, as in our case, it is represented by plant improvement, new equipment, inventory, and accounts receivable. In a small business such as ours, which has to meet obligations incurred during the base period years, for plant expansion and development, it is now and will be in the future well-nigh impossible to maintain both debt and tax payments. We simply will not have enough cash.

(4) There are so many features in the present tax laws, and in the proposed 1951 Revenue Act, particularly in regard to excess profits, which are inequitable to a small company, that I would like to call some of them to your attention, and to submit suggestions that will ease the huge tax burden on our class of corporation, and at the same time facilitate the Government collecting the necessary revenue required to meet the present emergency program.

(*a*) The over-all ceiling on normal tax, surtax, and excess-profits tax should certainly not be increased beyond 62 percent because this figure is already producing a crushing burden on small companies.

(*b*) Section 435 (e) of the Internal Revenue Code permits a corporation to use the so-called growth formula for computing its excess-profits tax credit if its payroll during the years 1948 and 1949 is 130 percent of its payroll during the years 1946 and 1947, or if its net sales during 1948 and 1949 are 150 percent of its net sales during 1946 and 1947. As it stands this relief provision for all practical purposes helps only the abnormal cases such as the television industry whose phenomenal growth is the marvel of this century. Average businesses just don't grow that fast—it takes longer for the ground work and expense of expansion to start paying off. The present tax law penalizes the average growing business by taking away the incentive to grow. Gentlemen, we as a Nation cannot afford to kill that incentive. As a practical proposition to help the average business, the payroll test should be reduced to 120 percent and the sales test to 135 percent.

(c) Section 435 (d) of the Internal Revenue Code states that in computing the average base period net income, only the net income of the three highest base-period years may be used as a basis. Before a corporation can adjust its base-period earnings to reflect abnormalities, it must eliminate the lowest base-period year. It seems to me that this treatment is exactly the opposite of what it should be, since the corporation's poorest year might be the result of the very abnormalities the effect of which it is intended to alleviate. In my opinion a small company should be allowed to use as its average base period the three best earning years after all adjustments.

(d) The excess-profits credit based on income should remain at 85 percent of average base-period net income, rather than be changed to the proposed 75 percent, if the average base-period net income is less than $100,000, so as not to penalize a small business confronted with the payment of a debt burden incurred prior to excess-profits tax years. With the proposed change, if a small business has earnings equivalent to its base-period average earnings, it will pay a tax of 82 percent on one-quarter of its earnings plus 52 percent on the other three-quarters of its earnings. If their current earnings are greater than the average base-period earnings they will pay an 82-percent tax on even more than one-quarter of all their earnings, plus 52 percent on the balance. This, gentlemen, leaves little out of which to pay the debt burden.

(e) Neither in the present nor in the proposed revenue act is there a tax-relief provision for small corporations who must retire by cash payment note issues, mortgages, and other long-term liabilities, incurred during the base period (January 1946 to June 1949, inclusive), where the maturity date on these obligations was determined prior to June 1949, requiring cash payments during 1950, 1951, and future years. As I have pointed out previously it is now and will be almost impossible for us to meet both our debt burden, which we incurred during the base-period years in order to expand our plant and production facilities, and the crushing tax burden.

We simply will not have enough cash. I propose, therefore, that the net income of corporations be exempt from excess-profits taxes on income used to pay long-term obligations to the extent of $50,000 in any one year, with $150,000 total exemption during a 5-year period (1950 to 1955, inclusive), or during the existence of the excess-profits tax, whichever is the shorter. The unused amount under $50,000 in any one year should be permitted to be carried forward to subsequent years in the 5-year period.

(5) To summarize I have endeavored to make these five points:

(1) That the ceiling on Federal income taxes should remain at 62 percent.

(2) That the income credit should remain at 85 percent of base period earnings for those companies in a low income-bracket.

(3) That a company be allowed to adjust all its base period years and then exclude the lowest earning year.

(4) That the growth test be reduced to 120 percent for payroll and 135 percent for sales.

(5) That provision should be made to provide relief for small companies with heavy debt burdens incurred during the base period.

The last point, gentlemen, I consider very important, as it seems both fair and wise that if the Government uses as a basis of credit on earned income an average income for a base period of years, it should also recognize the obligations of a small company to pay off indebtedness it incurred during those base period years, for the development and expansion of their business ,with the expectation of it being able to pay off this indebtedness from a higher income resulting from this expansion program, and provide for this in the Revenue Act.

(6) I appreciate your great interest in the problems of the existence and survival of small business in this country and I trust that you will see that consideration is given by your colleagues in the Senate to these tax problems which affect small business to a degree which calls for positive relief now if we are to remain in business.

Senator Hoey. There will be incorporated in the record a statement from Mr. Robert N. Miller, of the law firm of Miller & Chevalier, Washington, in lieu of his personal appearance, under date of July 24, 1951, and addressed to Senator George as chairman, along with his proposed amendment at the close of that statement.

(The letter referred to follows:)

MILLER & CHEVALIER,
Washington 5, July 24, 1951.

Hon. WALTER F. GEORGE,
Chairman, Committee on Finance,
Senate Office Building, Washington, D. C.

MY DEAR SENATOR GEORGE: One of my clients has requested me to call to the attention of your committee, a problem arising with respect to the excess profits tax, and to ask that it be considered in connection with the current revenue bill (H. R. 4473). The question is whether unused excess profits credit carry-overs and carry-backs survive statutory mergers and consolidations, and may be illustrated as follows:

In 1944, four affiliated companies ("the constituent companies"), so related by stock ownership as to qualify for filing consolidated income and excess profits tax returns in prior years, were merged into a fifth affiliated company ("the surviving corporation"), pursuant to sections 59 and 60 of the general corporation law of Delaware. Prior to the merger the constituent companies had paid excess profits taxes, but during that portion of 1944 following the merger and during the calendar year 1945 the surviving corporation had unused excess profits credits.

The Bureau of Internal Revenue will not allow such unused credits to be carried back with respect to taxable years prior to the date of the merger, apparently contending that the surviving corporation is not the same "taxpayer" as the constituent companies, and therefore not within the provisions of section 710 (c) (3) (A) of the Internal Revenue Code which allows such carry-backs and carry-overs to the "taxpayer."

This problem was passed upon by the Court of Appeals for the Second Circuit in *The Stanton Brewery, Inc.* v. *Commissioner* (176 F. 2d 573 (1949)). The court held that in a true statutory merger the surviving corporation was the same "taxpayer" as the constituent companies. While this case arose under the New York corporation law, the provisions of that law with respect to a statutory merger are substantially the same as those in the Delaware corporation law, and doubtless in the corporation laws of most other states.

Notwithstanding this decision of the Second Circuit, the current position of the Bureau of Internal Revenue apparently is that it will not permit any such unused credit to be carried back to constituent companies in any such merger. In taking this position, the Bureau seems to rely on *New Colonial Ice Co.* v. *Helvering* (292 U. S. 435 (1934)), although in that case there was no statutory merger. Rather, the new company issued stock to the old company in exchange for its assets and liabilities and the old company continued in existence for almost 2 years after the exchange, although transacting no business and having no income. The Supreme Court was apparently impressed by the fact that both the old and the new companies continued their separate existences after the exchange and this fact appears to be an important element in its decision.

In contrast to the factual situation involved in the Colonial Ice case, a statutory merger or consolidation under sections 59 and 60 of the Delaware corporation law, and probably under the corporation laws of most other States, results in a fusion of the corporate assets and liabilities. There is no separate transfer of title to the property from one corporation to another as in the transaction involved in the Colonial Ice case, or such as takes place in the liquidation of a subsidiary into a parent corporation. Rather, in a statutory merger the identities of the constituent companies are absorbed by the company surviving the merger, the constituent companies no longer have any separate existence and the surviving corporation acquires the assets and becomes bound by the liabilities of the constituent companies by operation of law. Ordinarily there is no change in the manner of carrying on the business and certainly no change from the standpoint of the customers and employees of the enterprise. Thus, there appears to be no logical reason why the unused excess-profits credit, which would have been the subject of appropriate carry-overs and carry-backs in the case of the constituent companies had the merger not occurred, should be denied simply because of their absorption by the surviving corporation. Also, the attitude of the Bureau of Internal Revenue on this matter seems inconsistent when compared with its attitude on excess pension contribution carry-overs, which it allows in the case of statutory mergers and consolidations (P. S. No. 62, dated May 5, 1950).

The enactment of the Excess Profits Tax Act of 1950 points up the importance of considering this problem of carry-overs and carry-backs in connection with statutory mergers.

Congress has recognized the desirability of allowing corporations to change their form of doing business by enacting the non-recognition provisions of the Internal Revenue Code. There is nothing in the provisions of the Code relating to carry-overs or carry-backs or in the legislative history which would indicate that Congress intended to penalize corporations which carried out a statutory merger. The effect of the Bureau's attitude, however, is to inflict a severe penalty, and to force the taxpayer to pay a substantial price taxwise for the greater efficiency of operating one corporation instead of several. We believe that Congress had no such intention and that this fact should be made clear by an amendment to the statute, retroactive to the enactment of the World War II excess-profits tax. If it is not, the Bureau will no doubt continue to adhere to the position which it unsuccessfully pressed in the Stanton case, resulting in considerable litigation in other circuits on the part of taxpayers who have carried out statutory mergers and consolidations not only under the old law but under the new law as well.

I am enclosing a draft of a proposal which we believe would solve this problem. If the substance of this proposal could be incorporated in H. R. 4473, it would serve to avoid litigation by clarifying an ambiguous situation in accordance with what we believe was the original intent of Congress.

We would appreciate it if you would make this letter a part of the record on H. R. 4473.

Respectfully,

ROBERT N. MILLER.

PROPOSED AMENDMENT

Effective with respect to taxable years ending after June 30, 1950, section 432 of the Excess Profits Tax Act of 1950 is hereby amended by adding thereto the following new subsection:

"(f) UNUSED EXCESS PROFITS CREDIT CARRY-BACK OR CARRY-OVER IN CASE OF A STATUTORY MERGER OR CONSOLIDATION.—In the case of a statutory merger or consolidation, the continuing corporation resulting from a merger or consolidation is the same 'taxpayer' within the meaning of that term as used in subparagraphs (1) and (2) of subsection (e) of this section as the merged or consolidated corporation or corporations."

SEC. 2. (a) Section 710 (c) of the Internal Revenue Code is hereby amended by adding thereto the following new subparagraph:

"(5) UNUSED EXCESS-PROFITS CREDIT CARRY-BACK OR CARRY-OVER IN CASE OF A STATUTORY MERGER OR CONSOLIDATION.—In the case of a statutory merger or consolidation, the continuing corporation resulting from a merger or consolidation is the same 'taxpayer' within the meaning of that term as used in subparagraphs (A) and (B) of subsection (c) (3) of this section as the merged or consolidated corporation or corporations."

(b) EFFECTIVE DATE.—The amendment made by this section shall be applicable to taxable years beginning after December 31, 1940.

(c) REFUNDS.—If refund or credit of any overpayment for any taxable year, to the extent resulting from the application of this section, is prevented on the date of the enactment of this Act or within one year from such date, by the operation of any law or rule of law (other than sec. 3761 of such code, relating to compromises), refund or credit of such overpayment may, nevertheless, be made or allowed if claim therefor is filed within one year from the date of the enactment of this Act.

Senator HOEY. Mr. Walter Truland. Give your name and connection to the reporter.

STATEMENT OF WALTER R. TRULAND, PRESIDENT, WALTER TRULAND CORP.

Mr. TRULAND. All right, sir. My name is Walter R. Truland, president of the Walter Truland Corp., of 1715 Lee Highway, Arlington, Va., and I am appearing in behalf of the governmental affairs committee of the National Electrical Contractors Association. This association has a membership of more than 3,100 electrical contractors throughout the United States and for 50 years it has been the representative of the electrical contracting industry which is responsible for the installation engineering of all types of electrical systems and equipment in factories, public buildings, defense establishments, commercial enterprises, and homes.

My purpose in being here is to call to the committee's attention the fact that in its first year of operation, the 1950 Federal excess profits tax law has shown itself to be a serious deterrent to the national-defense-production effort. It has resulted in such serious discrimination against a considerable segment of our industry as to demand immediate correction.

It is the experience of our industry that the excess profits tax law not only imposes serious inequities on our industry and upon individual companies within the industry but poses a definite threat to the efficient and expeditious execution of the defense-construction program. Furthermore, it tends to impair the freedom of opportunity the freedom of entry into the business of construction contracting.

Senator KERR. Are you boys who are already in it opposed to anything that will impair the freedom of others to get in there and compete with you?

Mr. TRULAND. Well, personally, the reason I have a personal interest in this is that our company was formed during the base period so we have no excess profits tax background. We must depend upon the industry-established percentages.

Senator KERR. I see.

Mr. TRULAND. This adverse effect results from the application of section 447 to the business of building construction. The most devastating effect of this law is on the newly-formed corporations and those organizations established or reorganized in the postwar period to handle the huge task of peacetime, and more recently, defense mobilization, building.

In accordance with that statute, the Bureau of Internal Revenue has established tentative base period yearly rates of return for various industries, including that of "Special trade contractors (contract construction)."

Electrical contractors apparently come within that classification and the tentative base period yearly rate of return for the base period, 1946–49, was published officially as 13.1 percent of invested capital.

Because the 13.1 percent determination did not appear to have any realistic relation to prevailing conditions in the industry, the National Electrical Contractors Association made a spot survey of contractor organizations of various sizes in all major geographical areas of the country. Object was to determine whether the tentative base period rate of return—the "normal" profit on invested capital—was in line with the 13.1 percent figure. This survey revealed such wide fluctuations such as to make us wonder on what basis the Treasury or whoever determined this 13.1 percent figure could have arrived at that figure or, in fact, any figure. We found that the rate of return ranged from 20 percent to 400 percent. Most of the returns were in the 30 to 80 percent bracket which suggests that perhaps 45 to 50 percent on invested capital for the electrical contracting industry would be a more logical and accurate finding.

The average profit (invested capital) for a large contractor in the Detroit industrial area that we surveyed for the 4-year base period was 86 percent. A contractor in the Ohio Valley industrial region reports an average return of 31 percent.

Senator TAFT. The truth is it has very little relation to the invested capital. It depends more on the personality of the people running the business than capital.

Mr. TRULAND. Yes, sir.

Senator TAFT. Is that not correct?

Mr. TRULAND. Yes, sir. That is the difficulty we find ourselves in.

Senator TAFT. The same thing was true about the automobile sales base yesterday.

Mr. TRULAND. Exactly. In exactly the same boat that they are.

Invested capital is important, it is relatively important to manufacturing industries and retail industries where you must have a store and have a lot of capital invested. That is the point we are planning to bring out here.

Among the others we surveyed was a contractor in the Rocky Mountain region who had an average rate of 64 percent. A southern contractor reports an average return in the base period of 87 percent. A Pacific coast contractor had an average return of 51 percent. A New York contractor reported an average profit of 22 percent, that is for the 4-year period.

From these typical reports from the survey it can readily be seen that the variation is too great to constitute any dependable and fair guide for the purpose of taxation.

Actually we feel that probably if the individual were given free rein for his ability sales would be the only fair method of determining what a fair profit would be.

The reason for this conclusion lies in a fundamental nature of the construction business. Unlike most other types of business, large amounts of capital are not required by the construction contractor to carry on even very large industrial building projects.

First, it is necessary that the circumstances and the conditions under which building construction is carried on be taken into account. Contract construction is something entirely unlike the conduct of a manufacturing or distributive operation conducted from a fixed location with more or less fixed and constant conditions. Our business is subject to wide variables of weather, duration of job, location, labor relations and supply, local regulation and many other factors.

Insofar as taxation is concerned, what we estimate to be anticipated profit today may, when the job is concluded 1, 2 or 3 years hence, well turn into a serious loss. What we might deem a fair estimate of profit for the current year may turn out to be much larger 1 or 2 years hence. Indeed, I find my company subject to excess-profits taxes on most of the business done months before Korea day.

The construction contractor is a combination of on-site manufacturing, and services, including highly skilled and trained professional services and management. The business is a terrific gamble. Those two conditions make unnecessary and, indeed, preclude the employment of any relatively large amounts of capital in the venture. The risks make substantial investment unattractive with the result that capital investment must, with very few exceptions, come from the profit structure of the organization. This tax makes the addition of capital for the business very difficult, and indeed, it makes it hard for us to accumulate the tools required for the efficient performances of our work.

Take the example of a recently-organized medium-sized electrical contracting firm with $200,000 in invested capital, and $50,000 would probably be a very high average. That is an above-normal figure of invested capital in the construction business. Assume that in the first 3 months of 1951 he made a profit of $25,000 which is approximately the "normal" rate of return allowed under the present regulation before excess profits are applied. Management has three options:

1. He continues to do business but if he makes any profit at all he would be able to keep not much more than 13 cents on every additional dollar earned.

That is, including State taxes.

2. He may stop working for the balance of the year.

3. He may seek ways to raise money and increase his invested capital base so that he may retain more of the profits earned.

Roughly, present corporate and excess-profits taxes take 77 percent of profits after the allowance for the "normal" rate of return of 13.1 percent in our industry. A 5 percent additional corporate tax increase is impending. State taxes siphon off 5 percent more, or a total of 87 percent of all income for this contractor after he makes $25,000. He may keep but 13 percent.

The risks and the wear and tear on management makes continuation of work under such incentive illogical. Logic indicates the alternative of stopping work. It so happens that electrical contractors are engaged in work of extremely vital importance to the defense and the civilian economy. If any large number of them retired for the remainder of the year, the result would be very serious. Neither myself nor any electrical contractor desires to "go fishing" for the rest of the year but we do hesitate to risk our business—which, indeed, we must risk every time we undertake an important contract, for the chance—if we are lucky—to make 13 cents on the dollar, and that is still in the corporation; we do not have our hands on it yet.

Application of the present law is definitely a deterrent to the entry of new firms into the contracting field. The hazards involved far outweigh the very narrowly limited profit possiblities. Thus, the excess-profits law strikes at the foundation of the Nation's asserted policy of free competitive enterprise with its cherished freedom of entry. The Bureau of Internal Revenue can effectively block free enterprise by discriminatory taxation to a greater degree than all of the schemes of monopolistic practice the Sherman and Clayton Acts attempt to prescribe.

It is our understanding that the excess-profit law's provisions would be observed by the Treasury and the Joint Committee on Internal Revenue Taxation during its first year and that corrections would be made then as deemed proper. We thank you for this opportunity to call attention to some basic points in the application of this law to the construction business.

We submit that this law, designed to siphon off excess war profits, is not doing that, but rather, is seriously impairing some important economic foundations to our defense effort. With the committee's permission, I would like to leave with you a more detailed analysis of the situation together with some suggestions for corrective amendments to section 447.

After we prepared this brief and the attendant one, we submitted it to the Mechanical Specialty Contracting Industries Liaison Committee. They represent the mechanical specialty contracting industries, the National Association of Master Plumbers, the Heating, Piping and Air Conditioning Contractors National Association, and after reviewing it, they have concurred in our opinion as regards that.

Now, in the aggregate we represent about 40 percent of the entire construction industry, doing some $5 billion worth of business a year, and having a quarter of a million skilled men working, and in that group, of course, there are about 10,000 heating contractors, 10,000 electrical contractors, and 25,000 thousand plumbing contractors.

We feel that it is a very serious matter. We certainly hope you will give it some serious consideration.

Senator HOEY. We will include the supplemental statement in the record.

Mr. TRULAND. Thank you.

Senator KERR. Does your supplemental statement include your recommended amendments?

Mr. TRULAND. It includes three recommended amendments which we feel if the Treasury followed, they would come up with a much higher figure than 13.1, and it would also take care of certain other conditions.

Senator HOEY. Thank you very much.

(The document referred to follows:)

SUPPLEMENTAL STATEMENT OF WALTER R. TRULAND OF THE NATIONAL ELECTRICAL CONTRACTORS ASSOCIATION

The application of section 447 of the 1950 Federal excess-profits-tax law has resulted in very serious discrimination against construction contractors, including electrical contractors, who have started in business immediately before or during the base period 1946–49 or since that time, or those who have suffered flood, fire, or other catastrophe or have had the misfortune to have business losses in the base period.

The law will not adversely affect many contractors for the reason that they were in business for a considerable period before the base period and enjoyed fairly good business and profit return during the 1946–49 period. But its effect on those not so fortunately situated is devastating and will, unless corrected promptly, force them to curtail their operations substantially or retire from business. Other than being grossly unfair to them, it would tend to keep their needed production facilities from making their contribution to defense mobilization.

An understanding of the nature of the construction contracting business is necessary to appreciate the serious effect of the arbitrary application of this tax to this industry. The industry operates subject to wide variations in duration of job, conditions, competitive conditions and fluctuations of costs. Major electrical work often involves a period of 2 or 3 years and what started out to be a good anticipated profit often ends up as a bad loss. In my own company we find ourselves subject to excess profits today on work actually undertaken and completed months before Korea, or before the enactment of this present law.

There is no determinable fair rate of return on a construction contract. The Bureau of Internal Revenue officially publishes a tentative base period rate of return for the electrical contracting industry as averaging 13.1 percent for the 1946–49 base period. This is based on the taxpayer's choice between equity invested capital (amount paid for capital stock, earned surplus and an addition for borrowed money), and historical invested capital.

NECA made a spot check of typical electrical contracting firms of various sizes representative of all geographical locations. This survey confirmed the conviction of those familiar with the business that construction contracting profits cannot realistically be related to invested capital. There are good and sound reasons for this.

One is that no large amount of capital is required to undertake and execute a construction job even of very large proportions. Very ew electrical contracting firms have invested capital of more than $150,000. The average is far below that. Those with invested capital exceeding $250,000 are rare. Yet these firms regularly and normally transact business to the extent of a million or more dollars a year. Research studies of the NECA Research Department develop the fact that it is not worth the risk and the management effort involved to perform this extremely specialized and technical operation at a profit of less than 20 percent on volume of business done. Very few achieve this happy objective, however. One reason for this is that since 1947 the electrical construction industry has been in a price war featuring below-cost bidding. It is perhaps true that of all construction contractors, electrical contractors do have the highest invested capital. Much of their capital is in tools, for good, modern tools and plenty of them are a necessity for the efficient and competitive operation of a highly-specialized electrical contracting operation.

Another consideration is that construction contracting is one of the riskiest of business ventures. No other business involves such major elements of gamble. Therefore, risk capital is not usually available. Rates of actual profit return and very high tax rates of recent years have made it difficult for a contractor to build up invested capital. Indeed, many find it difficult to provide themselves with adequate tools and equipment with which they can perform in an expeditious and economical manner.

The NECA spot check shows almost fantastic variations in profit relation to invested capital. Take my own company, formed October 1946. Naturally we had no base period. Our invested capital is low even though we have much larger than normal investments in tools. At the end of the first 6 months of 1951 we find that we have reached (or exceeded) the 13.1 percent rate of return on invested capital and face the prospect of having to pay taxes of 87 percent on every additional dollar of profit gained between now and December 31. That is a confiscatory tax. It effectively wipes out incentive. Indeed, it makes operation of such a business with its very large risks an act of folly. Prudence would dictate that I retire from operations for the balance of the year.

Relief in this instance would have to be in the form of a materially higher rate of return than the present 13.1 percent determination. The NECA survey indicates, if any conclusion can be drawn from the widely varying figures other than invested capital is not a realistic base to measure profits, that any normal profit finding on this base of less than 45 percent does not square with experience.

A midwestern contractor checked in the NECA survey did consistently an annual volume exceeding $2,000,000 in each of the four base period years. His profit was consistently uniform for these years. It happened that he had formed the business into a new corporation at the start of the base period and had very low invested capital. As the years progressed, he poured money into the invested capital structure, until on the final years of the base period he had five times as much invested as originally. The profit, related to invested capital ranged from 400 to 80 percent. Profit based on volume was fairly uniform at approximately 10 percent.

In summary, these are the areas where the excess-profit-tax law works against the interests of the individual contractor, the industry, and the public:

Industry.—The nature of the construction industry makes any attempt to apply any rate of return on invested capital lower than 45 percent unrealistic and not in accordance with the facts.

Company.—Application of the tentative rate established for the specialty contracting industries is highly discriminatory against newly formed companies or those formed just prior or during the base period (1946–49). They have no choice between equity invested capital and historical invested capital and thus are not allowed the opportunity of selecting an equitable base.

National defense.—Application of the present law tends to force relatively new companies to curtail or cease operations after accumulating the amount of profits permitted before the excess-profits provision is applied. This tends to slow down defense construction and possibly could have an adverse effect on the mobilization effort.

Freedom of entry.—The nature of the present law definitely restricts freedom of entry into the construction business because it limits possible return to a point inconsistent with the amounts necessary for the acquisition of capital and capital equipment. At a time when full mobilization of construction resources is necessary, we have a law that is working very definitely in the opposite direction and is, in fact, strongly monopolistic in tendency. As such it is contrary to our national policy of full competitive enterprise.

In an attempt to remove some of the discriminations from the newly formed construction contracting company, or one subjected to loss or catastrophe in the base period, the following amended language of section 447 is suggested:

"SEC. 447. INDUSTRY BASE PERIOD RATES OF RETURN.

"(a) BASE PERIOD YEARLY RATE OF RETURN.—The Secretary shall determine and proclaim for each industry classification in subsection (c) a rate of return (computed to the nearest thousandth) for each of the four years 1946 through 1949. The yearly rate of return for each industry classification shall be obtained by dividing the sum of the aggregate net income (computed without regard to the net operating loss deduction provided in sec. (s)) and the aggregate interest deduction shown on the income-tax returns filed by the corporations in such classification submitting balance sheets, by the aggregate total assets of such corporations as of the close of the taxable year for which such returns were filed. Such aggregate net income, interest deduction and total assets for each such year shall include the amounts reported on the income-tax returns for the calendar year and the amounts reported on returns for other taxable years the greater part of which falls in such calendar year. For the purpose of this subsection, returns which showed no net income shall be excluded by the Secretary in all computations required by this section. The determinations by the Secretary required under this section shall be made on the basis of returns of other corporations, computing all rates of return after giving effect to renegotiation of contracts.

"(b) BASE PERIOD RATE OF RETURN.—The Secretary shall determine and proclaim for each industry classification in subsection (c) a rate of return (computed to the nearest thousandth) for the four-year period 1946 through 1949. Such base-period rate of return for each industry classification shall be obtained by aggregating the net income and interest deduction (such amounts being determined as provided under subsection (a)) for each of the four years and dividing the total of the three highest years by the sum of the total assets (determined as provided under subsection (a)) for such three years.

"(c) INDUSTRY CLASSIFICATION.—For the purposes of this section, taxpayers shall be classified by industry in such manner as to group together all taxpayers whose principal source of revenue is from similar sources and shall be subclassified so as to group together those corporations with reasonable comparable volume of business and filing income-tax returns in the same collection district."

Senator HOEY. Mr. J. C. Griffin, treasurer, International Register Co.

STATEMENT OF J. C. GRIFFIN, TREASURER, INTERNATIONAL REGISTER CO.

Mr. GRIFFIN. My name is J. C. Griffin. I am treasurer of the International Register Co. at Chicago.

I represent a medium-sized organization that has been in existence since 1891. We happen to be one of those subject to the full impact of the ceiling of 62 percent under the present excess-profits law, or 70 percent if the House measure is adopted.

We will confine our discussion to three main subjects: (1) How a sound fiscal policy is affected by Federal taxes; (2) analysis of the House bill and why it does not contribute to a good fiscal policy, and (3) our suggestions for the new bill to be reported out of your committee.

(*a*) Fiscal policy: The greatest need for a sound fiscal policy is to control inflation. We consider inflation a far greater evil than higher taxes. Any tax program reported out of your committee should be designed to combat this primary evil before it gets completely out of hand. Inflation is not like a water faucet that can be turned on or off at will. Its control is the result of long-time tax, spending, and other policies which have a cumulative effect on our economy.

The control of inflation consists primarily of: (1) Reducing Federal spending; (2) sound credit controls; (3) encouragement of personal saving; (4) sound tax laws; and (5) long-range tax planning.

We must cut Government spending at least 6 billion before imposing any more taxes. There has been an attempt to cut Government spending but so far the cuts have fallen far below what is needed. We business executives are constantly being reminded that we should conserve manpower, cut unnecessary expenditures, keep down inventories, not buy beyond our requirements, and increase our operating efficiencies by agents of Uncle Sam and we agree that the advice is good and must be followed.

These sensible anti-inflation suggestions can only succeed, however, if the Federal Government itself takes the lead in putting them into practice. The Federal Government is the Nation's greatest consumer of goods and services. It is the largest employer of civilian manpower. The cost of running the Government is reflected in everything we buy.

Unfortunately, the Federal bureaucracy obviously does not want to play in the Nation's anti-inflation team.

Senator KERR. You understand that the jurisdiction of this committee is limited to the matter of taxation?

Mr. GRIFFIN. Yes, I understand. I want to make the point, that is all.

Senator KERR. I see.

Mr. GRIFFIN. Some of the stories of indiscriminate buying on the part of the Armed Forces seem almost too fantastic to believe. There has been an increase of 225,000 Government employees during the 4 months ended April 30, 1951. In fact, some Government agencies have openly admitted that they are "stockpiling" employees "against the needs of the future."

According to the Department of Labor index the cost of living has risen 84 percent since 1940. But the price of Federal Government, in terms of taxes imposed on the people, rose by well over 500 percent between fiscal years 1940 and 1950—before Korea. The present emergency has sent it soaring even higher.

The analysis prepared by your own distinguished committee member, Senator Harry F. Byrd, and printed in the Congressional Record, February 5, 1951, points the way to many savings that can be effected.

Federal spending can be cut by at least the 6 billion we have suggested and, we repeat, until this is accomplished your committee should adopt an attitude of no more tax raises until satisfactory cuts have been made in Government spending.

Another important contribution to inflation pressure is too much competition for available goods. Sound credit controls administered by the Federal Reserve Board has proven very effective in helping. We think there could be more encouragement on the part of the Government for personal savings. Another way that the available money can be siphoned off is by a sound taxing policy and that is where your committee comes into the picture.

To appraise the impact of taxes as they affect inflation you must take into account that the effect of income taxes on any business enterprise is entirely different than on an individual subject to withholding taxes.

The business enterprise, whether it be corporation, partnership, or individual, has the money available and can use its judgment whether it wants to spend more or keep the money and pay taxes.

When a business reaches the point where a high tax rate takes effect, the tendency is for them to relax on their expense controls. In fact, it is becoming a sign of good management for a business to spend more money for certain types of expenses which can be charged off after they have reached their high tax bracket. Such spending causes a further demand for goods which, in turn, causes inflation.

On the other hand, an individual has his taxes withheld from his wages. He has no option as he does not have the money which he can spend.

Whether we like it or not income taxes on individuals on a fixed income subject to withholding taxes are noninflationary while taxes on business when they are too high become inflationary and can reach the point of diminishing returns.

The far too prevalent idea of soak the corporations and the rich many times reacts to the detriment of the workingman you are trying to protect. To provide more jobs and create new business and thus raise the living standards of all our citizens, a certain part of the profits of industry must be plowed back into new facilities. When the over-all tax paid by a business is raised too high, it acts as a deterrent to expansion. High taxes also will keep new enterprises from starting up that would otherwise provide new jobs for the workingman. In other words the old adage, "Don't kill the goose that lays the golden egg," certainly applies to our tax structure.

Too much emphasis is now placed on obtaining revenue from income. More revenue should be obtained from so-called consumption or excise taxes which are noninflationary. To illustrate the advisability of such changes in our tax structure, just picture in your mind a prolonged recession or depression. With our present tax structure the Government revenues would fall far below the actual fixed expenses of the Government which would be disastrous with our present debt. On the other hand, if more emphasis is placed on consumption taxes, the revenue would be there even though it might be smaller due to decreased buying. There will not be too much impact on the lower-income brackets if such taxes are not put on food and food products. In our opinion the lower-income group would be far better off by paying these taxes than they would be if unsound fiscal policies promote further inflation.

In this connection, we would like to make the observation that price controls are not a cure for inflation and cannot be relied on to keep prices down indefinitely. Regardless of your ideas on price and wage controls you should view such controls objectively.

Senator KERR. Did you think the control bill was before this committee?

Mr. GRIFFIN. No, sir; I knew it was not.

We believe that controls are like damming a river. By building a large dam you can hold back the water for a while but unless the flow of water is controlled the reservoir back of the dam will become full and then the dam will have no effect on the flow of the river. Similarly, controls will help to hold back inflation but change in fundamental conditions alone will cure it. It is interesting to observe that business is being asked by OPS to roll back its prices. If the Federal Government would roll back the over-all cost of its nonmilitary activities to their 1948 level—which the Hoover Commission and others said was plenty high—it would deflate the price of Government about $4,000,000,000.

There is also a great need for a long-range tax planning. Such planning has been totally lacking. If private business was run on a similar month-to-month planning the enterprise would be doomed to positive failure. The Budget Bureau should be required to project their budget over at least 2 years so tax burdens can be determined far enough enough in advance to permit a tax bill to operate at least 1 year before it is amended.

(*b*) *Analysis of the House bill:* We have carefully studied the tax bill which has passed the House. In our opinion, the act further aggravates the serious imbalance which has developed in the Federal tax structure during the past 12 years.

We were against the passage of an excess-profits tax last fall; not because of the higher taxes it made us pay but because no way has yet been found to administer an excess-profits tax with fairness to all taxpayers. This act is so discriminatory and distributes the tax burden so unfairly that it should be repealed and replaced with a defense tax of a straight percentage of total earnings to compensate for the loss of revenue from its repeal.

To impartially appraise the House bill you must consider both what the bill does and what it fails to do. Before exploring these points we want to state clearly that we favor imposing whatever taxes are necessary to balance the budget but only after an adequate cut in Federal spending.

We think the bill is bad for the following reasons:

(1) It imposes very high excise taxes on some items which are likely to cause diminishing returns rather than larger revenues. We advocate a general excise tax on all items except food and the scaling down of excise tax on so-called luxuries to a more reasonable tax level.

(2) It raises individual taxes by 12½ percent. The original proposal of three percentage points increase will do far more to control inflation.

(3) The proposed increase in corporation normal and surtax rates to 52 percent is too high and should be limited to 50 percent.

(4) The proposed change in the excess-profits tax will only further aggravate an already bad situation brought about by the adoption of the excess-profits tax last fall.

(5) The retroactive provision on corporation taxes is not in accordance with our principles of fair play. It has become impossible for business to plan their financial policies when their plans are constantly upset by hidden tax liabilities. The Senate has traditionally opposed this principle and we hope it will continue to do so.

(6) The proposal to increase the over-all ceiling on all forms of corporation taxes from the present 62 percent to 70 percent is in our opinion the most objectionable provision in the entire bill and will do more to increase inflation pressure than any other provision. By all standards this over-all limitation should not be increased at this time.

In general, the House bill is unsound and risky. Taxes that are too high will destroy the incentive for individuals and corporations to earn more and to further expand their facilities at a time when we badly need more production. Its provisions are for the most part more inflationary than is safe for the economy. I leaves the Treasury's revenues too much at the mercy of fluctuations in the business cycle. Worse yet it contributes to a tendency to promote socialism through taxation which in our opinion is the most dangerous trend in our tax structure.

(c) The new bill: We recommend that no new tax bill be reported from your committee until a substantial cut has been made in Federal spending and your committee has had time to change the many objectionable features in the House bill.

We believe that the new bill should produce enough revenue to assure a balanced budget after deducting the savings in the budget. The over-all savings in the fiscal budget is what I refer to. We summarize below what we think the new bill should include.

1. Over-all limitation of 62 percent for corporation taxes.

2. Any increase voted for corporations be made effective the same time that is used for individuals. This should not be earlier than October 1, 1951.

3. Corporation normal tax and surtax be limited to 50 percent.

4. Individual taxes be increased by three percentage points instead of 12½ percent.

5. The excess-profits tax be repealed and replaced with a defense tax. If this is not done the present law should be left as it is.

6. Adopt a general excise tax on all commodities except foods and food products to produce a substantial part of the needed new revenue.

I thank you for the chance to present our views.

Senator HOEY. Thank you very much, Mr. Griffin.

Mr. F. G. Chambers.

Please have a seat.

STATEMENT OF FRANK G. CHAMBERS, TREASURER, MAGNA ENGINEERING CORP.

Mr. CHAMBERS. My name is Frank G. Chambers. My home and place of business are San Francisco, Calif. I am the treasurer of the Magna Engineering Corp. of that city.

Let me first thank the committee for the opportunity of appearing here. I know you have a long and difficult task and I shall take only a few minutes to present a common problem which must face thousands of young taxpayers in similar circumstances.

I wish to call your attention not so much to a case of a hardship under the excess-profits tax law, but rather an inequity in classification which I do not believe you gentlemen intended.

I refer to a result of the law which has the effect of classing all new growing businesses begun in the postwar period with companies whose earnings are abnormally high because of the impact of the Korean situation. Far from being helped by war conditions, our business has been substantially pinched by shortages of critical materials. Even with that impediment, however, we are proud to be part of a typical American success story which is traditionally part of our American way of life, but which we believe cannot be repeated unless the law is modified.

After my release from the Army in 1946, my brother, an investor-engineer, and I gambled our entire time, efforts, and savings on the soundness of an idea for a new multipurpose home workshop machine which we named the Shopsmith. We incorporated in August and made our first shipments November 17 of 1947.

The traditional Horatio Alger combination of risking our limited savings and a lot of hard work in a completely new business predicated on a new idea began to pay off. We actually started with $10,000 and a $20,000 loan. In 1947 with only 6 weeks of actual operation, our sales were $172,000.

Senator KERR. What is your business?

Mr. CHAMBERS. I beg your pardon, sir?

Senator KERR. What is your business?

Mr. CHAMBERS. We make a tool called the Shopsmith which is a woodworking tool which home craftsmen use in their basements.

Senator KERR. For what purpose?

Mr. CHAMBERS. It is a saw, a lathe, a sander, a drill press, a horizontal drilling machine, and a jigsaw.

Senator KERR. For the making of furniture?

Mr. CHAMBERS. Making of furniture or for men who are home craftsmen who like to panel their basements, who build boats, and who do anything in wood.

Senator KERR. Men or women?

Mr. CHAMBERS. Well, 95 percent of our customers are men.

(Discussion was continued off the record.)

Mr. CHAMBERS. In 1948 our sales were $3 million. In 1949 they rose to over $3,500,000, and in 1950 to over $5 million.

I might add that had it not been for Korea our sales would have approached $6 million.

Under the provisions of the existing law we find ourselves facing taxes which may be as high as 62 percent, possibly to be raised to 70 percent, and we are thus classed with businesses whose profits are swollen either directly or indirectly as a result of war conditions.

Gentlemen, we simply cannot exist, much less grow, under the impact of that type of taxation, for book profits to an expanding enterprise are never represented by cash dollars in the bank, but in inventories, plant, tooling, and receivables. We have never felt we were in a position to even consider paying a dividend.

I wish to emphasize that I am not appearing here to ask any special favor or preferential treatment. I sincerely believe that I am stating the case of young business. We are not even eligible for the benefits of the so-called growth formula because we were not in business on January 1, 1946.

My own reason for not being in business, as I stated, on that date must be typical of a multitude of new businesses.

I was an Army officer on General Somervell's staff.

The thought is inescapable that this law, providing relief as it does only for companies formed prior to January 1, 1946, is a direct blow at the veteran who survived the war in the hope of going home and starting a business. The great majority of releases from the military services did not take place until early in 1946, as you all know.

Few of us could foresee that a law would be passed 4 years later which would legislate ex post facto against our chances of developing and holding a successful business. We were soldiering in 1945 when, according to EPT, we should have been incorporating.

I do not believe that Congress intended the consequences of the arbitrary January 1, 1946, date line. I appreciate the fact that some base period experience is necessary in order reasonably to determine whether a company is undergoing normal growth, and I do not presume today to tell this committee what the minimum base period should be. Some growth companies with a fiscal year ending June 30 may use the base period July 1, 1949, to July 1, 1950, as their base period for excess profits tax purposes, so it is obvious that a short base period is possible.

But companies not formed before 1946 are not eligible to use even this 1-year period. It should not be too difficult to identify companies similar to our own which are founded - many by veterans - on the American concept of combining hard work and risk of capital to make a new idea pay off, and affording these companies equitable treatment and a chance to live and develop.

Finally, we do not believe it is the public interest to make it impossible for new successful businesses to grow and develop. A tax law is wrong if it tempts persons to sell out, take a capital gain, and go fishing.

We do not feel that anybody else knows our business as well as we do, and we want it to continue under our ownership and management.

This must likewise be true of a great many businesses similar to ours. I am certain that it was not the wish of Congress to discourage the effort and risk of developing new businesses, the very principle which has made America the greatest and strongest country in the world.

Our tax bill from Uncle Sam since we began operations in November of 1947 now totals over half a million dollars. New enterprises can thus be productive of substantial revenue if given a fair chance to prosper.

But unless there is relief from the deadly effect of the present excess-profits tax, I feel compelled to observe that the Treasury will not continue large collections from our business and similar companies, for the simple reason that we won't be in business. Our tax liability on December 31, 1950, exceeded our cash in the bank by $300,597.

Senator MILLIKIN. How would you get the money to pay off?

Mr. CHAMBERS. If sales continue, Senator, during this year, by borrowing from the bank. We have a credit line of a quarter of a million dollars now, and we can pay. If business dropped off, sir, we would be in dire straits.

Senator KERR. You would be sunk in the ditch, is that right?

Mr. CHAMBERS. That is right, sir.

Senator KERR. Have you got a suggestion as to how we could meet a situation like that?

Mr. CHAMBERS. Senator, I realize the problem has many facets, and I have not presumed to reduce to legislative language a solution of the problem.

In general terms, however, it would seem to me provision could be made for companies during the first, perhaps, 5 years of their existence to be exempt from excess-profits taxes, especially in the light of the fact that the surtax plus the normal tax will be 50 or 52 percent.

Certainly any company which was founded prior to Korea has a better chance under that provision than they are going to have under today's law to become tax-paying units.

There are, perhaps, other modifications and conditions which would be possible, such as if you invested those funds the amount of the excess-profits tax, in plant you would not pay excess-profits tax—I am sure the tax experts would have a better point of view than we do.

As a bare minimum, though, we feel that the present growth formula should be broadened to include us, and that a base period should be devised which would be equitable.

Senator KERR. Regardless of the fact that you did not start until after 1946?

Mr. CHAMBERS. That certainly is correct.

From a standpoint of potential revenue to the United States Treasury the effect of the present law is damaging, and shortsighted, in that it actually represents a long-term loss of revenue. Companies which have been formed in the last 4 or 5 years and are now beginning to succeed can double, treble, and quadruple their present size in the next 5 to 10 years if permitted to realize their normal growth potential.

Not only will this contribute to the Nation's industrial strength and create employment; it will place these companies in a position of paying, and being able to pay, normal taxes after they have attained their growth far in excess of the amount of so-called excess profits tax demanded of them now.

We appear here today, therefore, to ask that you make it possible for new business to continue to exist and develop, and to remove the ironic misfortune of being too successful to raise the cash to pay the resulting taxes; and too young to have access to the only relief provided by the law. We cannot thrive if we are to be classed and taxed as realizers of swollen war profits.

Senator HOEY. Thank you, Mr. Chambers, for your appearance and your statement.

Mr. CHAMBERS. Thank you.

Senator HOEY. Mr. Joseph C. White. Have a seat, Mr. White, and give your name and connections to the reporter, please, sir.

STATEMENT OF JOSEPH C. WHITE, REPRESENTING THE EQUITABLE OFFICE BUILDING CORP.

Mr. WHITE. My name is Joseph C. White. I am a New York City lawyer representing Howard S. Cullman, chairman of Equitable Office Building Corp., and I am speaking on behalf of that corporation, and I assume that my remarks will be applicable to similar controlled real-estate corporations.

In response to the suggestion in Senator Byrd's letter to Mr. Cullman, I am going to restrict my oral remarks to a mere outline of our position, and have submitted to the committee a brief but more extended statement.

Senator HOEY. Your full statement will appear in the record.

Mr. WHITE. Thank you, Senator.

I want to make it clear at the outset that I am not raising any question as to an increase in taxation in general, and I am not raising any question as to the imposition of an excess profits tax on profits due to the military and defense expenditures.

I only wish to submit for your consideration the situation of controlled real-estate corporations where, I believe that the present law imposes an excess-profits tax on profits which are not due to such governmental expenditures and, therefore, are not, in fact, excess profits.

The primary test presented by the act for determining what are excess profits is to take as normal earnings a percentage of the average earnings for the base period and to deem any profits in excess thereof to be excess profits subject to the tax.

But in our case, in the case of Equitable Office Building Corp., the earnings for the base period were subnormal for two reasons:

First, throughout the base period the corporation was subject to rent control;

Second, during the first half of the base period the corporation was still in reorganization under chapter 10 of the bankruptcy law.

The average earnings of the base period do not, therefore, give a fair basis for determining excess profits.

Moreover, in the case of corporations renting business property, as distinguished from residential property, the act distinctly discriminates against corporations operating in New York City which, I believe, is the only important area where rental of business property was controlled during the base period.

As a substitute for average base-period earnings, the act permits a corporation to take a credit based on a percentage of its capital, but this is a very hit-or-miss substitute for the determination of what are normal earnings, and the present act itself shows that such credit is not deemed to be an adequate substitute in the case of public utilities, the earnings of which were depressed during the period by governmental regulations, that is, regulations – they are granted relief under section 448, and we are merely asking that controlled real-estate corporations be granted relief similar in nature.

To indicate the type of relief which is worthy of the consideration of your committee, I have drafted and have also submitted to the committee, together with my statement, possible amendments to the act.

Thank you.

Senator HOEY. Thank you very much. We are very glad to have your statement. It will be put in the record.

Mr. WHITE. Thank you, Senator Hoey.

(The prepared statement of Mr. Joseph C. White, referred to, is as follows:)

STATEMENT OF JOSEPH C. WHITE ON BEHALF OF EQUITABLE OFFICE BUILDING CORP.

The purpose of this memorandum is to show that real-estate corporations which were subject to rent control during the base period are entitled to relief from the existing provisions of the Excess Profits Tax Act of 1950.

The Excess Profits Tax Act of 1950 imposes a tax of 30 percent on excess profits. Senate Report No. 2679, Eighty-first Congress, second session, page 3, states the purpose of the act as follows:

"Your committee conceives of this tax as primarily a tax on increased profits due to the outbreak of hostilities and to large military expenditures. This accounts for the primary emphasis upon the average-earnings base."

The average-earnings base so referred to is the average of annual profits for various periods during the four calendar years 1946 to 1949 known as the base period. Profits in excess of 85 percent of such average are deemed excess profits.

The Excess Profits Tax Act of 1950 is, therefore, designed to impose an additional tax on increased profits due to the outbreak of hostilities in Korea and to large military expenditures to be made; whereas, on the other hand, the increases in corporate normal tax and surtax provided by Congress are designed to levy a contribution to the defense effort from profits whether or not increased on account of the present emergency. This memorandum does not raise any question as to increased taxation except excess-profits taxes on profits which can be shown not to have been excess profits.

In general the base period was a prosperous period for corporations. Certain corporations and certain industries, however, could not take advantage of the prosperity of the base period and Congress, accordingly, has prescribed in the act relief for those corporations and industries such as, for example, regulated public utilities the income of which was subject to governmental limitation. Such relief, however, has not been extended to real-estate corporations owning and operating office buildings and multiple dwellings the earnings of which were restricted by limitations in the form of rent controls.

Federal rent controls were originally introduced by the Emergency Price Control Act of 1942 administered by the Office of Price Administration. The present controls are based on the Housing and Rent Act of 1947 as amended. Under the latter act controls were removed in many parts of the country during the base period but in others they were continued. Increases in maximum rent have taken place within narrow limits fixed by law but the old OPA rules which by and large are based upon the rent level of 1941 and 1942 continue to be the foundation of the maximum rent. Notwithstanding such increases as have occurred, rental income has not kept pace with the increased earnings which have occurred since 1942 in other industries.

If the average costs of living in the period 1921 to 1938 are indicated by the figure 100, the index of residential rents increased in the country as a whole from the end of World War II to the end of 1950 from 86.50 to 99.7, or by 13.2 points or about 15 percent, the cost of fuel and light rose from slightly over 100 to 130.9, and of all items from slightly over 115 to 161. See Real Estate Analyst, volume 19, No. 54; volume 20, No. 1. The cost of living in general increased from 115.5 to 155.7, or by 30.2 points or about 33 percent. See Real Estate Analyst, volume 20, No. 1.

The same result is shown by figures published by the Bureau of Labor Statistics.

It is thus apparent that owners of real estate did not share in the general prosperity. Since the foregoing figures included controlled and uncontrolled space they are weighted against the owners of controlled space since as a matter of common knowledge controlled space does not yield the same rent as uncontrolled.

In New York City rents from commercial and business property were also severely restricted under two State statutes enacted in January and March 1945. The basis of those restrictions are rentals existing on March 1, 1943, for commercial property and on June 1, 1944, for business property. Increases in such commercial and business rents have been from time to time under some circumstances permitted. At the present time the New York Supreme Court, which regulates the amount of increases, will not grant an increase of rent to yield a net return (computed before Federal tax on income) in excess of 8 percent of the fair market value of the property, which fair market value is prima facie deemed to be equal to the assessed valuation.

As a result of Federal and State control, the return from real-estate investments became uneven as between different geographical areas throughout the United States and also uneven within the different areas. The New York and Federal rent-control statutes provide for exemption for so-called new buildings and for space which became decontrolled under various circumstances. To illustrate the point: The cost of 1 square foot of uncontrolled space in New York City in buildings comparable to Equitable Office Building Corp. was in excess of $4.50 during the base period. During the same period Equitable Office Building Corp. was able to obtain on the average the following amounts for each square foot:

1946	$2.60
1947	2.94
1948	3.16
1949	3.47
1950	3.83

This divergence is a direct consequence of the New York rent controls. If those controls had not been in existence the price which Equitable Office Building would have obtained during the base period would have been at least $3.83 if not substantially more.

During all that period Equitable Office Building was practically fully rented. The occupancy percentage has increased only insignificantly from 98.2 in 1946 to 99.4 in 1950. With one or two exceptions none of the space was subject to long-term leases during the base period.

It is thus apparent that average earnings in the three best years during the base period do not represent a fair measure of normal profits. Moreover, as a consequence of the great depression, Equitable Office Building Corp. was compelled to avail itself of the reorganization provisions of chapter X of the Bankruptcy Act. In the years from 1937 to July 1950 the corporation was unable to pay any dividends to its stockholders. A plan of reorganization was finally consummated in December 1947 which, among other provisions, provided that old stockholders would have to subscribe to new shares of the corporation if they desired to retain their old investment.

The Excess Profits Tax Act provides as an alternative to the income credit a credit based upon invested capital but, in the case of real-estate corporations, the earnings of which were controlled during the base period, a return on capital which does not recognize the fair market value or reproduction cost of the property is not an adequate substitute for a credit based on income.

The base period generally was a period of high costs of construction and accordingly corporations owning structures erected prior to the base period are capitalized far below the true base-period value of their property. Moreover, they were heavily indebted and subject to high charges for interest and amortization. Their profits are limited by the amount of floor space they have to rent although the expenses for labor, maintenance, and taxes were increasing continuously. Thus in the case of Equitable Office Building Corp. operating expenses during the base period increased by nearly 60 percent from $1,048,000 to $1,600,000. For those reasons the credit provided by the invested-capital method is not representative of normal profits.

To sum up: The profits of the real-estate industry in controlled areas were held down well below the profits earned by uncontrolled industries with the exception of finance and insurance, which represent a special category. The average base-period rate of return of real estate as published by the Secretary of the Treasury under the provisions of section 447 of the Internal Revenue Code is 5.3 percent. Only railroads, transportation by air, and telecommunications received a lower rate of return; all other utilities enjoyed a higher rate. All those industries were given a special relief by section 448 of the Internal Revenue Code by being allowed to earn 6 or 7 percent on their equity and borrowed invested capital (plus the corporate normal tax and surtax) before becoming subject to excess-profits taxes.

As the report of this committee stated, this provision was appropriate "in view of the fact that the profits of these industries in the base-period years were held down well below the profits of uncontrolled industries."

Another purpose of Congress in providing the minimum credit was to establish "uniformity for purposes of determining income which should be subjected to excess-profits tax."

As mentioned before the rent-control laws provide for a regulation of rent by governmental bodies. In the case of the New York business and commercial rent-control laws the statute further provides for a narrow limit within which increases in rent can be obtained from such bodies.

Since the excess-profits tax is designed to tax increased earnings, resulting directly or indirectly from the defense effort, a base-period credit which does not take into account the limitation on earnings imposed during the base period by rent-control regulations will result in a tax upon earnings which are not due to the increased defense spending. Moreover, those corporations operating in decontrolled areas or leasing uncontrolled space in controlled areas are allowed to establish their credit on the basis of unrestricted earnings during the base period. This results in a discrimination not only as compared with other industries, but also within the same industry.

If on the other hand a real-estate corporation is allowed to earn a rate of 7 percent on its invested capital plus corporate normal tax and surtax, this differential will be eliminated and real-estate corporations will be given a fair basis for determining what are excess profits. Any profits attributable to rent increases during excess-profits-tax years which might be held attributable to the defense effort, will be subject to the excess-profits tax.

Corporations which undergo reorganizations under chapter X of the Bankruptcy Act are restricted in their operations by trustee management under the supervision of the court. Trustee management is by its nature reluctant to take risks. Consequently, earnings of corporations which were in reorganization during the base period are not representative of the earnings of similar industries. It is therefore suggested as a further relief that corporations in reorganization be given a 5-year period after consummation of the reorganization of freedom from excess-profits tax for rehabilitation under ownership management. This is a minimum period required to build up a financial status which will permit such corporations to compete on equal terms with nonreorganized businesses. It seems not in accordance with the purpose of the excess-profits tax to levy during that period an excess-profits tax which is based on inadequate prior earnings.

SEC. 448A. EXCESS PROFITS CREDIT CONTROLLED REAL ESTATE CORPORATION

(a) AMOUNT OF CREDIT. In the case of a controlled real estate corporation (as defined in subsection (c)), the excess profits credit for any taxable year computed under this section shall be the sum of the tax imposed by sections 13, 14, 15, and 141 (e), for such taxable year and the amount determined under subsection (b).

(b) COMPUTATION. The amount referred to in subsection (a) for any taxable year shall be determined as follows:

(1) by applying 7 per centum to the sum of the following:

(A) the adjusted invested capital for such taxable year, and

(B) the average borrowed capital for such taxable year as defined in section 439.

For the purposes of this paragraph the adjusted invested capital for any taxable year shall be the amount computed for such year under section 437 (b) (2) without reduction by the amount of the net new capital addition and without regard to section 437 (b) (2) (C).

(2) by reducing the amount ascertained under paragraph (1) by the deduction allowable for such year with respect to interest on indebtedness included in borrowed capital under section 439.

(3) by reducing the amount ascertained under paragraph (2) by the amount computed under section 440 (b) (relating to inadmissible assets).

(c) For the purposes of this subchapter the term "controlled real estate corporation" means (except as provided in subsection (d)) a corporation engaged as owner in fee or as lessee under a lease of real estate (improved or unimproved) with an original term of 30 years or more in the business of leasing space in buildings, but only if at least 80 per centum of its gross income during the taxable year is derived from rent and if during each year in the base period (as defined in section 435 (b))—

(A) 80 per centum or more of the available floor space was, under the Emergency Price Control Act of 1942, as amended, the Housing and Rent Act of 1947, as amended, or any law of the District of Columbia or any territory or possession of the United States, or of any State or political subdivision thereof,

(i) subject to rent ceilings, or

(ii) subject to restrictions on evictions, or

(iii) rented under leases entered into pursuant to any such law; and

(B) 80 per centum or more of its gross income (computed without regard to dividends and capital gains and losses) was derived from rents

The term "rent" as used in this section shall include income derived from rendering services and other income incidental to the business of lessors of buildings.

(d) CONSOLIDATED RETURNS OF CONTROLLED REAL ESTATE CORPORATIONS.—(1) For purposes of this section an includible corporation (as defined in section 141 (e)) shall not include any controlled real estate corporation which has made and filed a consent, applicable to the taxable year, to compute its excess profits credit without regard to this section. The consent shall be made and filed at such time and in such manner as may be prescribed by the Secretary. The consent shall be applicable to the taxable year for which filed and to each consecutive subsequent taxable year for which a consolidated return is filed.

(2) For purposes of computing its excess profits credit under this section, a common parent corporation shall be deemed a controlled real estate corporation if at least 80 percentum of its gross income (computed without regard to capital gains and losses) is derived directly or indirectly from controlled real estate corporations.

(3) Despite the provisions of paragraph (1) of this subsection, two or more controlled real estate corporations, each of which has made and filed a consent, applicable to the taxable year, to compute its excess profits credit under this section only, shall be considered an includible corporation for the purpose of the application of section 141 (d) to such controlled real estate corporation alone.

The consent shall be made and filed at such time and in such manner as may be prescribed by the Secretary. The consent shall be applicable to the taxable year for which filed and to each consecutive subsequent taxable year for which a consolidated return is filed.

CORPORATE REORGANIZATIONS UNDER CHAPTER X OF THE BANKRUPTCY ACT

(1) DEFINITIONS.—As used in this subsection—

(A) REORGANIZATION, PLAN OF REORGANIZATION.—The terms "reorganization" and "plan of reorganization" shall have the same meaning as in Chapter X of the National Bankruptcy Act as amended.

(B) REORGANIZED CORPORATIONS.—The term "reorganized corporation" means—

(i) a corporation with respect to which a plan of reorganization was consummated within the sixty-month period next preceding the end of its taxable year which ends with or within the calendar year 1950; and

(ii) a corporation which was organized pursuant to a plan of reorganization of another corporation consummated within the sixty-month period next preceding the end of the taxable year which ends with or within the calendar year 1950.

(2) EXEMPTION.—A reorganized corporation shall not be subject to the tax under this subchapter for a period of sixty months following the end of the month in which a plan or reorganization was consummated.

(3) ALTERNATIVE EXCESS PROFITS CREDIT.—After the expiration of the period provided in subparagraph (2) the excess profits credit based on income shall not be less than the excess profits net income of the reorganized corporation for the taxable year preceding its first taxable year under this subchapter.

Senator HOEY. Mr. Henry S. Moser, Allstate Insurance Co.

Please give your name and connection to the reporter, please, sir.

STATEMENT OF HENRY S. MOSER, GENERAL ATTORNEY, ALLSTATE INSURANCE CO.

Mr. MOSER. My name is Henry S. Moser, and I am general attorney for the Allstate Insurance Co., of Chicago, Ill.

The Allstate Insurance Co. is a stock casualty company. It was organized in 1931 and writes automobile insurance only.

All of its stock is owned by Sears, Roebuck & Co. Continuously since its organization it has sold insurance at 15 to 20 percent below manual rates.

By manual rates I mean those rates which are generally charged by the 107 companies that are members of the National Bureau of Casualty Underwriters.

It had a very rapid growth in premium income during its base period, as shown below:

1946	$15, 418, 000
1947	19, 908, 000
1948	31, 694, 000
1949	40, 906, 000

Notwithstanding the company's growth during the base period and notwithstanding the company's assets as of the beginning of the base period were less than $20,000,000, the present Excess Profits Tax Act denies to it the benefit of the growth formula by reason of the fact that it was a member of an affiliated group having assets at the beginning of the base period of more than $20,000,000. A factual study and analysis by Alfred M. Best & Co., insurance statisticians, a copy of which is attached to this statement, discloses that only eight other insurance affiliates are in the same situation. The denial of the growth formula to these nine insurance affiliated companies results in substantial hardship and inequity.

The inequity arises in the application of section 435 of the act prescribing the method of computing a taxpayer's excess-profit credit. When the section is applied to these nine insurance affiliates, it produces the following unintended and anomalous result. It requires such companies in effect, in computing their excess-profit credits, to average their respective earnings during their periods of growth, periods when their book earnings were understated or very much less than their true earnings, and to apply such credit or average of understated earnings in future years to book earnings which are grossly overstated.

This is occasioned by the following facts:

The insurance industry differs from almost all other industries in respect of treatment of prepaid expenses and deferment of income. In the insurance business prepaid expenses are large and their influence on taxable earnings is substantial. The State insurance regulatory bodies, with a view toward policyholders' protection and to insure the ulitmate in liquidity, properly require accounting methods whereby insurers are treated substantially as on a liquidation basis. Thus they refuse to recognize as assets prepaid expenses, including such substantial items as commissions to agents, advertising, State premium taxes, and so forth, and require their immediate write-off. On the other hand, they require premiums to be treated as a liability to be taken into income periodically over the term of the policy. Approximately 50 percent only of the premiums written in any calendar year is treated as earnings in that year; the remainder is earned in the succeeding calendar year. Thus, although nearly all of the expenses incurred in the sale and writing of policies must be charged off in the calendar year in which the policies are issued, only one-half of the premiums written during said year are treated as earnings in that year.

Writing off prepaid charges immediately and deferring 50 percent of premium income does not have, over a period of years, a substantial effect upon the normal tax or surtax of an insurance company. Assuming the tax rate does not decrease, the Government, though collecting from a growing insurance company less normal tax and surtax during the period of growth and higher taxes thereafter, collects, over a period of years, about the same aggregate amount as it would have collected had prepaid charges not been written off in the years they were disbursed and had premium incomes not been deferred.

However, it is a vastly different story with respect to excess-profits taxes. The effect of the State regulatory requirement upon insurance companies to write off prepaid charges and to defer 50 percent of premium income in relation to the Excess Profits Tax Act in the case of a growing company is—

1. To understate the earnings during a period of growth. When growth occurs during the base period, the base-period earnings are therefore understated;

2. To afford an inadequate excess-profits credit if computed under the general average earnings method;

3. To overstate the earnings when (*a*) the rate of growth is retarded, (*b*) growth ceases, or (*c*) when there is a decline in premium writings;

4. To require under the general average earnings method the application of an understated excess profits credit to overstated earnings when growth is retarded, ceases, or when premiums decline.

The above effects are illustrated in a hypothetical case in exhibit B, which is attached to my statement herewith.

It is to be noted that in this example the company, though having an increase of $7,600,000 in premiums during the last year of the base period as compared with the first year, had recorded earnings during the base period of only $710,000 by reason of writing off prepaid expenses and deferring approximately 50 percent of its premium income. Its excess-profits credit, on the general average earning method, was only $540,000. In the 3 years next following, however, when the rate of growth first became retarded, and later when premium income declined, the recorded earnings of the company soared to $975,000, $1,660,000, and $2,470,000, respectively.

The rate of growth during the base period of the nine insurance affiliates heretofore mentioned, taken as a group, to whom the growth formula was denied was as follows: 1947, 75.1 percent; 1948, 62.1 percent; 1949, 54.1 percent. The rate of growth of said companies in 1950, taken as a group, was only 16.1 percent. The inequity of limiting said companies to the general average earnings method of determining excess-profits credits, without benefit of the growth formula, and requiring them to apply an understated excess-profits credit to overstated earnings is apparent. An excess-profits credit determined under the invested-capital method in our case produces even a smaller credit than if computed under the general average earnings method. We believe this is true for each of the other eight affiliates involved.

The Congress for many years has recognized the fundamental differences between insurance and other industries and has provided by section 204 for the taxation of insurance companies in a manner different than that for industries generally. This difference in treatment, though adequate and proper with regard to normal and surtax problems, is inadequate to relieve the growing insurance affiliate from a gross inequity in the application of section 435. This inequity is peculiar to insurance affiliates. Noninsurance affiliates are not generally confronted with any problem of writing off substantial prepaid charges and deferring income. Consistency, it seems to us, requires a further implementation of the distinction in the computation of excess-profits credits between insurance affiliates and noninsurance affiliates.

Let me point out another inequity and discriminatory feature of the Excess Profits Tax Act as applied to nearly all of the nine companies heretofore mentioned. A stock fire or casualty company which had assets of less than $20,000,000 as of the beginning of the base period, if owned by a life-insurance company whose assets if added to the assets of its subsidiary were in excess of $20,000,000, is not denied the benefit of the growth formula. Likewise, a stock fire or casualty company with assets as of said date of less than $20,000,000 if owned by a mutual insurance company, whether fire, casualty, or life, is not denied the benefits of the growth formula regardless of the assets owned by such mutual company at the beginning of the base period. In our State alone, if the committee please, there are four, to our knowledge, stock fire and casualty companies with assets of less than $20,000,000 as of the beginning of the base year—the base period—that were owned by mutual companies whose assets far exceeded $20,000,000, and they are our competitors, and they get the benefit of the growth formula, but our company, because it is not owned by a mutual company or a life company, is denied that benefit.

Such stock fire and casualty companies may avail themselves of the benefits of the growth formula since they did not have the privilege of filing a consolidated return with their parent company. Section 141 provides that life companies may file consolidated returns only with other life companies, and that mutual companies may file such returns only with mutual companies.

Thus, merely because our company is a subsidiary of a group having assets in excess of $20,000,000 at the beginning of the base period, the benefit of the growth formula is denied to it. This is not true with respect to any subsidiary stock fire or casualty company of the John Doe Mutual Insurance Co. or the John Doe Life Insurance Co., irrespective of the amount of their aggregate assets.

In conclusion, it is respectfully submitted:

1. The Excess Profits Tax Act, in denying the benefits of the growth formula to certain insurance affiliates, singles out in its operation a few companies and subjects them to adverse treatment. It fails in that respect to create broad classifications generally considered equitable for tax purposes.

2. The act unfairly places insurance affiliates in the same category with noninsurance affiliates. It fails to recognize the distinct difference between such affiliates arising out of the insurance State regulatory requirements requiring, in the case of insurance companies, the immediate write-off of prepaid charges and the deferment of substantial portions of income.

3. The act, in relegating an insurance affiliate such as our company to the "general average earnings" method in computing its excess-profit credit, results in requiring the use of a grossly inadequate credit and in substantial hardship and inequity.

4. The act imposes upon stock fire and casualty affiliates not owned by mutual or life insurance companies discriminatory treatment—treatment wholly different than that applied to a stock fire or casualty insurance affiliates of mutual or life insurance companies.

5. The loss, if any, in taxes to the Government by legislative relief from the inequity and hardship heretofore described cannot be substantial. The denial of the growth-formula benefits to the nine companies afore-mentioned may, in fact, result in less tax revenue to the Government. Four of the nine companies have had growth, in part, because of economical operation and their sale over a period of years of insurance at rates considerably less than "manual rates." Increased tax burdens upon these four companies and resulting competitive disadvantages may make it difficult for them to continue to maintain their present premium differential. This may well result in less business—less profits—and less taxes.

Briefly, it seems to us we have been put in the wrong slot. We are put in a so-called slot of noninsurance affiliates whose accounting method is entirely different, who are not required to write off prepaid charges or defer income.

We have been taken out of the slot, it seems to us, where we should have been placed, in the same situation as the stock fire and casualty companies that are owned by mutual companies or owned by life companies.

What is the remedy? There are many. We have taken the liberty of suggesting one—the addition of a few words to section 435.

A draft of the amendment or amended section is attached to this statement.

Senator HOEY. That will be considered and put in the record.

Mr. MOSER. May my memorandum be filed and made a part of the record?

Senator HOEY. Yes, sir.

Mr. MOSER. Thank you, sir.

(The document referred to, Analysis of Domestic Stock Casualty and Fire Insurance Companies Doing Business in 1950, exhibit B mentioned in the statement, and exhibit C, a draft of the suggested amendment, follow:)

EXHIBIT A

Analysis of domestic stock casualty- and fire-insurance companies doing business in 1950 [1]

1. Total companies 477
2. Less companies with assets over $20,000,000 at beginning of base period 78

 Companies with assets under $20,000,000 at beginning of base period 399

3. Less nonaffiliated companies and companies affiliated in groups with assets less than $20,000,000 at beginning of base period 319

 Companies affiliated in groups with assets in excess of $20,000,000 at beginning of base period 80

4. Less:
 Companies not qualifying for growth formula by either increase in sales or payroll 36
 Companies whose excess-profits tax credit was larger under general average earnings or invested capital bases than under the growth formula 35
 71

5. Affiliated companies whose excess-profits credit would have been larger if the growth formula had not been denied them 9

2. Excess-profits credit (85 percent of 1) 540,000
3. Average base-period net income (alternative based on growth) 785,000
4. Excess-profits credit (85 percent of 3) 667,250

EXHIBIT C

SUGGESTED AMENDMENT TO SECTION 435 (e) (1) (A) (i) OF EXCESS PROFITS TAX ACT OF 1950

[New language shown by italics]

"(e) AVERAGE BASE-PERIOD NET INCOME—ALTERNATIVE BASED ON GROWTH—(1) TAXPAYERS TO WHICH SUBSECTION APPLIES.—A taxpayer shall be entitled to the benefits of this subsection if the taxpayer commenced business before the beginning of its base period, and if either—

"(A) (i) the total assets of the taxpayer as of the first day of its base period (when added to the total assets for such day of all corporations with which the taxpayer, *if other than a corporation taxable under section 204*, has the privilege under section 141 of filing a consolidated return for its first taxable year under this subchapter), determined under paragraph (3), did not exceed $20,000,000, and".

Senator HOEY. Our next witness is Mr. George Roberts of the American Bar Association.

Mr. Roberts, will you please have a seat, sir, and give us your name and connection, please.

STATEMENT OF GEORGE ROBERTS, CHAIRMAN, SPECIAL COMMITTEE ON RETIREMENT BENEFITS FOR LAWYERS, AMERICAN BAR ASSOCIATION

Mr. ROBERTS. My name is George Roberts. I have been a practicing lawyer since 1908, and I appear here as chairman of a special committee of the American Bar Association on retirement benefits for lawyers.

I am here to ask you to give consideration to a proposed amendment to the revenue bill in aid of voluntary savings for professional men and other taxpayers who are not covered by a corporate pension under section 165 of the code.

I believe that you, as lawyers, know that lawyers and other professional men are not included in these pension plans which are limited to corporations and for which the corporation gets a tax deduction with respect to its contributions.

I am here asking that this inequity be cured.

The board of governors of the American Bar Association passed the following preamble and resolution, which summarizes the proposition:

Whereas the present high levels of Federal taxation on earned income make it virtually impossible for professional persons and other recipients of earned income to provide for their retirement from their income; and

Whereas the problem of providing retirement benefits has, to a great extent, been solved by corporate employees by section 165 of the Internal Revenue Code; and

Whereas the need for such retirement benefits is equally great in the case of professional persons and other persons having earned income but not covered by a pension plan: Now, therefore, be it

Resolved, That the board of governors of the American Bar Association favors in principle amending the Internal Revenue Code so that taxpayers not covered by a pension plan qualified under section 165 of the code, may be encouraged by a tax credit, a tax deduction or other means to accumulate, out of current earned income, funds which would be available under appropriate regulations of the Treasury Department to provide retirement income for such taxpayers.

It happens that yesterday Senator Ives introduced in the Senate an amendment to the pending revenue bill, which would cover this question. He also introduced a statement which is in this morning's Congressional Record at page 9055, and I wish every member of this committee would read it because it is a much better statement than I have prepared. I now ask you to give consideration to Senator Ives' amendment, and to the explanation of it which is in this morning's Congressional Record.

The proposal, which is an amendment, would permit a taxpayer who was a member of a bona fide agricultural, labor, business, industrial, or professional association, to pay into a trust fund, forming part of a retirement plan set up by such an association, an amount in any one year not exceeding 10 percent of his earned income. In no event, however, is this to be more than $7,500 and for it he is to receive a deduction, for Federal income-tax purposes, for such amounts so paid in.

The trustee, which has to be a bank, a member of the Federal Reserve System, then manages these moneys as a common trust fund, placing them in investments legal for trust funds. On the man's retirement or death, the trustee pays it back pays back to each man what he put in, with the accumulations. It may be payed back either in a lump sum or in installments, and when he gets it back, the recipient has to pay an income tax in accordance with the then existing law.

It is true that in many cases this will mean that the tax will be remitted in a man's most productive years when his income-tax bracket may be higher than it will be in his later years when his earning power has diminished, or is nonexistent, and when his income may be lower.

This is true of doctors and lawyers; it is more true, of course, in the case of singers, ball players, and other people where age is more important than it is in the professions, but I think it is true that lawyers, doctors, accountants, almost everybody, go through a period of small earnings in the beginning, as you know doctors have to spend years, so do lawyers getting ready to practice and then they have a high income-producing period and then in the later years, particularly in the case of most lawyers who are practicing for themselves most lawyers are not, as I am, a member of a firm, they are individual practitioners and their incomes go down.

Senator TAFT. What is the advantage of permitting a deduction for payments into such a fund, and not permitting a deduction of payments in life-insurance companies?

Mr. ROBERTS. You say why shouldn't you?

Senator TAFT. Yes. You have had the life-insurance companies often before us, urging that a certain amount of life insurance should be deductible.

Mr. ROBERTS. Well, there is, I think, much to be said in favor of that, but——

Senator TAFT. This would require the association to set up a pension fund.

Mr. ROBERTS. Yes, sir. It requires some association to set up what is really a savings fund that is more than a pension fund. It is a savings fund which you cannot take out until you retire or die or are totally disabled. It differs from an ordinary pension fund in that an ordinary pension fund is one that provides that the owner is to receive X dollars every month.

These funds could not do that because they pay people back, who have paid in, plus any profits or accumulations that the fund has made or less any losses that the fund has sustained.

Senator TAFT. Are you familiar with the plan presented here to us at the beginning of the hearings of the 5-percent investment in a form of Government bonds?

Mr. ROBERTS. The so-called Salverson plan?

Senator TAFT. Was that submitted by the New York State Bar?

Mr. ROBERTS. No, sir. I think that was submitted by Mr. Salverson on his own behalf, but that plan has been considered and has been approved by many bar associations.

Others objected to it because, in the first place, it brings in this new idea of a special kind of Government security. Did he recommend 5 percent? I thought it was a bond of only 1 or 2 percent.

Senator TAFT. No; 5 percent of the income. The bond itself, I do not know whether that carried only 1 or 2 percent, but you have here 10 percent of the income.

Mr. ROBERTS. Yes; I have 10 percent.

Senator TAFT. He limited it to 5 percent of the income, and 10 percent is a little high, that is, if I think you are trying to make it parallel to other pension funds.

Mr. ROBERTS. That is what I am trying to do, Senator.

Senator TAFT. Those pension funds, as a rule, do not run over 5 or 6 percent at the outside. I think we Senators pay 6 percent.

Mr. ROBERTS. Well, I do not know about your pension.

Senator TAFT. I think that is about as high as anybody, unless the railroad people I do not think even the railroad people I do not think the railroad retirement fund runs over 6 percent 6½ percent, I think, for the men themselves.

Mr. ROBERTS. Of course, a great many of these corporation pension funds are made up of funds that are really put in by the stockholders for the benefit of the employees, and there are a hundred stockholders often to one employee. While this enables these professional people, in effect, to set up their own pension funds, there is nobody who takes the place of a stockholder. They have to put it up out of their own money.

Senator TAFT. Yes, sir.

I think the Government contributes an equal part in civil-service funds and also the railroad does in the 6 percent, too. In this case the man has to put it all up. He has no employer, so he pays himself, he has to put the whole amount up, himself, so I do not suppose 10 percent would be out of line with the general idea of the pension funds now current in industry.

Mr. ROBERTS. I think you will find that financially if you adopted this amendment there would still be a great edge in favor of being employed by a corporation as an officer or an employee, as compared with being out for yourself. This amendment, if adopted would tend, certainly, to equalize the burden.

Senator TAFT. The deductions for payments into the pension funds are quite elaborate. The regulations are quite elaborate as to the qualifications of that fund, and no doubt the Treasury, if you did anything of this sort, would want to impose some fairly strict restrictions on just how this fund could be managed.

Mr. ROBERTS. I would have no doubt that that would be true. I became interested in this problem several years ago because I talked to so many lawyers—young lawyers and young doctors and young architects. They really are most discouraged, and I have known several in our own office. I think we have had four people leave us within a fairly short period of time to go into a corporation. I asked them why, and they said, "We cannot save anything. If we go into this corporation, we will get into a pension fund."

I do not think the law ought to discourage young men from going into the professions and encourage them to go in as employees or officers in these corporations. The bigger the business, the better, because there are bigger pensions in big business.

Senator TAFT. Mr. Stam, do you have any comments?

You have been interested in this?

Mr. STAM. We have been very much interested in this particular plan, and I have talked to Mr. Roberts about it, and the problem, it would seem to me—the immediate problem before the committee would be the effect on the revenue of putting it right into effect, and I think that we talked, did we not, Mr. Roberts, about some idea of maybe having sort of a sliding scale where the deduction would not be as great for the first few years as for the last few, or something of that sort, so that the revenue lost would not be felt immediately; and in other words, to get the plan started, but not to feel the immediate effect on the revenue, and we would be glad to look into that angle of it.

Mr. ROBERTS. I want to get the thing started.

Let me point out one thing. This is an anti-inflationary measure.

We will all agree that inflation is our greatest domestic danger. One of the troubles is, according to the economists, there is too much money in the hands of consumers which will be spent for consumer goods, so they advocate increasing taxes just for the sake of taking money away.

They also advocate savings. If you can get people to save, that is the best possible way of reducing this inflationary gap.

President Truman, in his midyear economic report to Congress on Tuesday of this week, said, "voluntary saving is a part of a well-rounded anti-inflationary program."

This is true, and I know of no more effective way to encourage voluntary savings than this proposal to postpone from taxable income the amount of such savings under proper restrictions and limitations.

Senator HOEY. A great many State bar associations have become interested in this.

Mr. ROBERTS. I am sure you will find that very many State bar associations and county bar associations are interested; that the medical associations are interested; that the accountants organizations also are interested, and if I would have had time I would have taken this up with the various farmers' organizations because the farmers could come under this, too, the individual farmers, under their various associations, and a lot of others.

The societies of artists have communicated with me, and I am sure you will find that there is a very great interest in this. The substance of Senator Ives' bill came from bills introduced by Mr. Keogh and Mr. Reed, both members of the Ways and Means Committee, and they have been working with my committee and with the New York State Bar Association committee, of which Mr. Leslie M. Rapp is chairman, and the Association of the Bar of the City of New York, of which Mr. Roswell Magill is chairman.

Mr. Curt Pantzer of Indianapolis tells me that the Indiana Bar Association is very much interested in it. Mr. Pantzer, incidentally, is a member of the American Bar Committee.

I think you will find that there is tremendous interest in this among all professional men and other self-employed men.

Senator HOEY. Thank you very much.

Mr. ROBERTS. I hope you will give it serious consideration.

May I ask that our statement be printed, because I have not followed it very closely?

Senator HOEY. Yes.

(Mr. Roberts' prepared statement is as follows:)

STATEMENT OF GEORGE ROBERTS, CHAIRMAN, SPECIAL COMMITTEE OF AMERICAN BAR ASSOCIATION ON RETIREMENT BENEFITS FOR LAWYERS

My name is George Roberts. I have been a practicing lawyer since 1908 and am a member of the law firm of Winthrop, Stimson, Putnam & Roberts of New York City. I am chairman of a special committee of the American Bar Association on retirement benefits for lawyers.

I am here to ask you to give consideration to a proposed amendment to the revenue bill in aid of voluntary savings for professional men and other taxpayers not covered by a corporate pension plan under section 165 of the code. The basis of the proposal is to postpone from taxable income the amount of such savings, if made under an authorized plan. The objective is to lessen manifest tax inequities to lawyers, doctors, dentists, architects, accountants, actors, engineers and all others who depend for their livelihood on so-called earned income and are not the beneficiaries of a corporation pension plan.

My interest was aroused in this question by talks with young lawyers and other professional men who find it increasingly difficult to provide enough from savings to safeguard their retirement and to give their family any security on their death. The same type of young men with the same education who go into business receive protection by pension plans which are specifically authorized by section 165 of the Internal Revenue Code. Such pension plans are now practically universal in corporations of any size and they are favored by the law which permits tax deductions for the contributions made to such plans by the corporations.

No such tax deductions are given to self-employed, whether professional men or not, and as a result there has been a tendency on the part of young men who would like to be doctors, lawyers, architects or accountants, or who would like to enter some other profession, to give up the profession and go into business for the sake of the security afforded on retirement or death.

I submit, that from the standpoint of the country, this is not a healthy situation. We should encourage the professions and self-employment instead of discriminating against them.

The American Bar Association, and many State and local associations, have appointed committees to study this problem. The same has also been done by many medical associations and other associations of professional men.

The board of governors of the American Bar Association has passed the following preamble and resolution:

"Whereas the present high levels of Federal taxation on earned income make it virtually impossible for professional persons and other recipients of earned income to provide for their retirement from their income; and

"Whereas the problem of providing retirement benefits has to a great extent been solved for corporate employees by section 165 of the Internal Revenue Code; and

"Whereas the need for such retirement benefits is equally great in the case of professional persons and other persons having earned income but not covered by a pension plan: Now, therefore, be it

"*Resolved*, That the board of governors of the American Bar Association favors in principle amending the Internal Revenue Code so that taxpayers not covered by a pension plan qualified under section 165 of the code may be encouraged by a tax credit, a tax deduction or other means to accumulate, out of current earned income, funds which would be available under appropriate regulations of the Treasury Department to provide retirement income for such taxpayers."

Several bills have been introduced in the House of Representatives to help this situation. At the suggestion of our committee of the American Bar Association and of a similar committee of the New York State Bar Association, of which Mr. Leslie M. Rapp is chairman, and a committee of the association of the bar of the city of New York, of which Mr. Roswell Magill is chairman, House bills 4371 and 4373 were introduced on June 7 by Congressman Eugene J. Keogh and Congressman Daniel A. Reed, both members of the House Ways and Means Committee. Yesterday Senator Ives introduced an amendment to the pending revenue bill which embodies the substance of the above bills.

The proposal would permit a taxpayer who is a member of a bona fide agricultural, labor, business, industrial or professional association to pay into a trust fund forming part of a retirement plan set up by such an association, an amount in any one year not exceeding 10 percent of his earned income, but in no event more than $7,500, and to receive a deduction for Federal income tax purposes for such amount so paid in. The trustee managing such a trust, which has to be a bank which is a member of the Federal Reserve System, will then invest the amounts received by it in securities legal for trust funds. Upon retirement or death, the amount invested by the taxpayer, with accumulations, is paid back in accordance with the plan and these payments are then subject to tax under the Revenue Code.

In other words, this proposal is not a remission of tax but a postponement of tax. Of course, in many cases, this will mean that the tax will be remitted in a man's most productive years, when his income-tax bracket may be higher than it will be in his later years when his earning power has diminished or is nonexistent. At that time his income-tax bracket is presumably lower. This is particularly obvious in case of ball players, singers, and others whose earning power is greatly affected by age.

What we now ask is that this proposal be considered by you as an amendment to the revenue bill now pending before you.

If an amendment such as this is made to the code, it would not at all equalize the financial advantages of the professional man and self-employed as compared to the officers and employees of large corporations, but it would certainly tend in that direction and it would remove the discrimination now existing in favor of the corporate officers and employees.

Your committee is now considering a revenue bill which substantially increases individual income taxes and which gives no advantages to earned income over income from investments. In many cases these rates will make savings practically impossible. Is it not in the public interest that the hard-working individual who is on his own should be encouraged to save and to be independent in the good old American way? This is always important, but today it is particularly important. Everyone concedes that the great domestic danger today is inflation, and, if people can be encouraged to save, whatever money is so set aside is not available for expenditures on consumers' goods. The inflationary gap is to that extent lessened.

President Truman, in his midyear economic report to Congress on Tuesday of this week said: "Voluntary saving is an essential part of a well rounded anti-inflationary program." This is true and I know of no more effective way to encourage voluntary savings than the proposal to postpone from taxable income the amount of such savings. I urge your committee to give serious consideration to this problem.

Senator HOEY. This concludes the testimony of witnesses this morning.

In lieu of an appearance the Chair inserts in the record numerous statements and letters.

STATEMENT OF DAVID P. LIVINGSTON OF WASHINGTON, IOWA, AND ERNEST L. CAPPS OF LIBERTY, MO., ON BEHALF OF THE PURE BREED AND COMMERCIAL SWINE BREEDERS OF AMERICA

We are here today speaking in behalf of the swine industry. As a result of a joint meeting held on July 19, 1951, in Des Moines, Iowa, representatives of the National Swine Records Association, (representing 75,000 pure bred swine producers) and the Iowa Swine Producers Association (representing 192,000 pure bred and commercial swine producers), the following resolution was adopted to be communicated to the farm States congressional delegations:

"For Federal income-tax purposes—

"1. Sales of capital assets of all kinds are now taxable at 50 percent of the capital gain, provided said capital assets are held 6 months or more. H. R. 4473, section 117J (presently before the Senate Finance Committee, and which pertains to the sale of capital assets), has been amended to extend the holding period on livestock to 12 months before it could qualify for capital-gains treatment.

"2. The change of the holding period from 6 to 12 months on all livestock held for breeding, dairy, or draft purposes discriminates against some livestock producers and users.

"3. The adoption of this amendment would hamper the operation of both pure bred and commercial swine producers by creating new and arbitrary marketing practices to take any advantages of the provisions of this amendment. From an economic standpoint the general trend in breeding is to produce animals that will convert feed into pork at the lowest possible cost which, of course, means using the smallest amount of feed to produce 100 pounds of pork. The 12-month provision in this amendment would create a definite tendency to reverse this trend."

I quote section 306, "Sales of Livestock", of H. R. 4473, as follows:

"Effective with respect to taxable years beginning after December 31, 1950, section 117 (j) (1) is hereby amended by adding at the end thereof the following new sentence: 'Such term also includes livestock held by the taxpayer for draft, breeding, or dairy purposes for 12 months or more'."

This is the bill as it now stands in the Senate Finance Committee.

The Beef Cattle and Wool Growers Association have made the following suggested improvement in the above paragraph, as follows:

"SEC. 306. SALES OF LIVESTOCK.

"Section 117 (j) (1) is hereby amended by adding at the end thereof the following new sentence: 'Such term also includes livestock, *regardless of age*, held by the taxpayer for draft, breeding or dairy purposes, and held by him for twelve months or more *from the date of acquisition*.' The amendment made by this section shall be applicable with respect to taxable years beginning after December 31, 1941, except that the extension of the holding period from six to twelve months shall be applicable to taxable years beginning after December 31, 1950."

We concur in the recommendations of the changes submitted by the beef and wool people and take exception to only one provision. We recommend that the words "twelve months" be changed to "eight months" for the following reasons:

1. Any gilt or sow will normally farrow, raise and wean two litters of pigs in a period of 8 months. By that time she will be either a proven producer or definitely unprofitable for various reasons such as (a) size of litter, (b) milking qualities, (c) size and strength of pigs, (d) general growth of litter. (e) blemish on sow or disease.

If, for any, or several, of these reasons she should be culled, while she will have approximately doubled in value (which constitutes a capital gain) yet for efficient pork production she should be sold at once. Under the 12-month provision, as it now stands, a farmer would be required to carry a sow an additional 4 months, after weaning her second litter, in a barren condition or rebreed her. Thus, even though she was a poor producer, she would have to be carried up to farrowing time for a third litter before the 12-month period was up and probably produce a third unprofitable or questionable litter.

2. On the other hand, 8 months will furnish an incentive to cull closely (as is recommended by all colleges, breed associations and the Department of Agriculture), thus creating more pork and more net profit to individual producers who follow these good practices.

3. If you increase the net profits of individual hog farmers by efficiency then you automatically increase the tax revenue.

Thus, this recommendation, if followed, will:

1. Increase the efficiency of feed grains converted into pork.
2. Increase ultimately the tax revenue.

We, therefore, recommend that this change be made or that a law be passed to increase the gestation period of brood sows from 4 to 8 months.

To the Chairman and Members of the Finance Committee:

In behalf of the members of Local 589, UAW-CIO and the employees of Ronson Art Metal Works, Inc., located in Newark, N. J., and Stroudsburg, Pa., I wish to appeal to you to reconsider deleting the Retail Excise Tax Act, section 431, from the Revenue Act of 1951.

If this act is enacted and the excise tax is put on lighters, it will have a great effect upon our working people; whereby if the sales of the lighter industry drop, it means that many of our workers will be laid off. We cannot afford a lay-off, particularly in our plant, as there are many elderly workers who will be unable to secure employment in other plants because of their age.

I have been employed by the Ronson Co. for the past 24 years, and through experience I know that if the sales drop as they did in 1931, 1932, and 1933, we will again have to work 3 days a week and many employees will be laid off.

There are many lighters which are brought in from Europe and especially Japan, that are favored by the low tariff rates and low wages, and if this condition of importing foreign lighters into this great Nation of America continues, our citizens will be deprived of employment because of the great competition. There has also been a reduction in the tariff rates on lighters coming in from Austria. We already have reduced the working hours in the plant because of restricted Government orders on the use of critical materials.

I, therefore, now, in behalf of our workers, not only in the Ronson Co. but in all the lighter industry, appeal to the Finance Committee to reconsider the 20-percent retail excise tax and delete it from the Revenue Act of 1951.

I want to thank the committee for any consideration they may show to the workers of America.

JOSEPH A. DIMODICA, Jr.,
President, Local 589, UAW-CIO.

STATEMENT OF JOSEPH J. PUGH, ATTORNEY, NEW YORK CITY, ON BEHALF OF CORPORATE DEALERS IN MUNICIPAL BONDS

This statement is submitted on behalf of Adams, McEntee & Co., Inc.; Andrews & Wells, Inc.; Eldredge & Co., Inc.; George B. Gibbons & Co., Inc.; King, Quirk & Co., Inc.; W. H. Morton & Co., Inc.; Roosevelt & Cross, Inc.; and Chas. E. Weigold & Co., Inc.; all of New York City. These corporations are municipal bond dealers, i. e., they are in the business of purchasing municipal and other tax-exempt bonds and reselling them to their customers. Profits from their operations are, of course, subject to all corporate taxes, including excess-profits taxes. Because of a technical error in the Excess Profits Tax Act of 1950, municipal-bond dealers are effectively deprived of the use of the invested capital credit and, if the dealer was incorporated after 1945, it is deprived of the use of both the invested capital and the income credit.

The technical defect which results in the denial of excess profits credits to municipal bond dealers arises from the exclusion from their assets under the Excess Profits Tax Act of 1950 of all so-called tax-exempt securities. The treatment of tax-exempt securities as inadmissible assets is obviously correct for those taxpayers whose income from tax-exempt securities is not subject to excess profits tax. Municipal bond dealers, however, derive their income principally from sales of municipal bonds, which are not capital assets, and such income is fully subjected to excess profits taxation. Since inventories of municipal bonds frequently represent more than 90 percent of a municipal bond dealer's total assets, it is necessary to treat such securities as admissible rather than inadmissible assets in order to give these taxpayers any credit for excess profits tax purposes.

Municipal bond dealers, like all other taxpayers, should be subjected to excess profits tax only in respect of their excess profits, as determined under either the invested capital method or the income method. Where corporate stocks represent inventories in the hands of stock dealers, an exception to the general rule that corporate stocks are inadmissible assets appears in both the former excess profits tax law and in the 1950 act. There is no logical reason why municipal bonds held by dealers for sale to customers should not also be includible as admissible assets for the purpose of determining excess profits taxes.

Denial to municipal bond dealers of the use of their invested capital for excess profits tax purposes under the 1950 act seems to have been wholly unintentional. Under section 720 (d) of the former excess profits tax law, municipal bonds could be included in the invested capital of any taxpayer, provided the taxpayer agreed to include the income from the municipal bonds in taxable income. Under the former excess profits tax law, therefore, the municipal bond dealers had no problem. However, this provision was omitted from its corresponding section 440 of the 1950 act, because of the fact that the 12 percent credit on invested capital far exceeded any return on municipal bonds. The fact that the principal source of the municipal bond dealer's income is profits from dealing in the bonds, which profits are fully subjected to excess profits taxation, appears to have been overlooked.

Attached hereto is a suggested amendment to the Excess Profits Tax Act of 1950 which it is believed will adequately cure the defect here complained of. Inquiries directed to the joint committee, the Treasury Department, and the Bureau of Internal Revenue indicate no opposition to the retroactive adoption of such an amendment.

Draft of Amendments to Excess Profits Tax Law Relating to Inadmissible Assets of Municipal Bond Dealers

Add a new section 433 (a) (1) (R):

(R) Interest on certain government obligations.—If the taxpayer has for such year made the election provided for in section 440 (c), there shall be included an amount equal to the amount of interest on obligations held during the taxable year which are described in section 22 (b) (4), any part of the interest from which is excludible from gross income or allowable as a credit against net income, and which are not capital assets, reduced by the amount of interest paid or accrued during such year which is not allowed as a deduction under section 23 (b) and by the amount of the bond premium, amortizable under section 125, attributable to such obligations."

Add a new section 433 (b) (16):

"(16) Interest on certain government obligations.— If the taxpayer has for any taxable year with respect to which the tax imposed by this subchapter is applicable, made the election provided for in section 440 (c), there shall be included in determining the average base period net income applicable to such taxable year, an amount equal to the amount of interest on obligations held during the taxable year which are described in section 22 (b) (4), any part of the interest from which is excludible from gross income or allowable as a credit against net income, and which are not capital assets, reduced by the amount of interest paid or accrued during such year which is not allowed as a deduction under section 23 (b) and by the amount of the bond premium, amortizable under section 125, attributable to such obligations."

Add a new section 440 (c):

"(c) Treatment of government obligations as admissible assets.—The taxpayer may in its return for any taxable year elect to increase its excess profits net income for such taxable year by an amount equal to the amount of the interest on all obligations held during the taxable year which are described in section 22 (b) (4), any part of the interest from which is excludible from gross income or allowable as a credit against the net income, and which are not capital assets, reduced by the amount of interest paid or accrued during such year which is not allowed as a deduction under section 23 (b) and by the amount of the bond premium, amortizable under section 125, attributable to such obligations. If the taxpayer so elects, the term 'admissible assets' includes such obligations, and the term 'inadmissible assets' does not include such obligations, for the purpose of all determinations (including determinations relating to other taxable years) in connection with the computation of the tax imposed by this subchapter for such taxable year."

Statement of G. W. Hornsby, Chairman Committee on Taxation, Trust Division, Pennsylvania Bankers Association

The revenue bill of 1951 (H. R. 4473) includes a provision for a 20-percent withholding tax on dividends and interest.

At the convention of the Pennsylvania Bankers Association held at Atlantic City, June 5, 1951, the trust division passed a resolution to express its opposition to the proposed withholding. The following reasons are given to substantiate the opposition:

1. In Facts and Figures on Government Finance published by the Tax Foundation, it is stated that for the year 1947 dividends amounting to $8,365,202,000 were paid by corporations. The House Ways and Means Committee in its report dated June 18, 1951, estimates underreporting of dividends will be $1,100,000,000 for the year 1951. It seems incredible that such a large percentage of dividends escape taxation. It would appear that a large portion of the un-

reported dividends belong to individuals who by reason of their exemptions owe no tax and to charitable, religious, educational, etc., organizations which are not liable for tax.

2. Those persons with small incomes (mostly individuals past 65 years of age) who owe no tax would be penalized by having 20 percent of their income improperly withheld from them and would be compelled to wait a year to obtain a refund. With the present high cost of living this would impose a severe hardship on many of these persons. In many cases through inability to comprehend the law the tax withheld would never be recovered.

3. Exempt charitable, etc., organizations would also be penalized by being unnecessarily and improperly deprived of 20 percent of their income from trusts and investments. Under H. R. 4473 these organizations would be permitted to recover a portion of this amount during the year by taking credit for the improper income tax withholding against any liability for income and social security tax withheld from salaries of employees. In many cases, however, this would absorb only a small portion of the income tax primoperly withheld and the organization would be required to file claims quarterly to obtain a refund of the excess withholding. This could result in a restriction of activities on the part of many charitable, religious, educational, etc., organizations to the detriment of the public welfare.

4. Nonresident alien beneficiaries of trust accounts would suffer a 20-percent reduction of income despite the fact that by reason of treaties their tax rate might be considerably less than this (i. e., Canada, 15 percent; United Kingdom, interest, 0 percent; dividends, 15 percent). It could be said that the withholding of an excessive amount of tax which, presumably could not be recovered without a complicated procedure at some later date, actually constitutes a violation of the treaty. In many cases the nonresident alien beneficiary of the trust would be only one of a number of beneficiaries, the others being residents of the United States.

5. The same situation would arise in cases where securities owned by a nonresident alien are registered in the name of a nominee residing in the United States. The paying companies would probably insist on withholding the 20-percent tax to protect themselves.

6. It is proposed that the payor will remit the amounts withheld to the Bureau of Internal Revenue but the payor will not be required to report the amount withheld for each individual or to furnish receipts to such individuals. If this method is used the Bureau of Internal Revenue could not properly certify as to the amount of the credit or refund and as all types of dividends and interest are not covered under the bill the taxpayer would have no way of proving the proper withholding on the return.

7. In addition to the enormous cost to the Government of processing the credits and refunds of this withholding tax, all trustees would be forced to maintain additional records at tremendous cost in order to be able to advise each trust beneficiary of the amount of credit for tax withheld which each beneficiary would be able to claim as a credit in his individual return.

Senator HOEY. The committee will take a recess until 10 o'clock tomorrow morning.

(Whereupon, at 12:45 p. m., the committee recessed to reconvene at 10 a. m., Friday morning, July 27, 1951.)

REVENUE ACT OF 1951

FRIDAY, JULY 27, 1951

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
Washington, D. C.

The committee met, pursuant to recess, at 10 a. m. in room 312, Senate Office Building, Senator Harry F. Byrd presiding.

Present: Senators Byrd (presiding), Hoey, Kerr, Millikin, Taft, and Williams.

Also present: Elizabeth B. Springer, chief clerk; Colin F. Stam, chief of staff; and Russell M. Oran, Joint Committee on Internal Revenue Taxation.

Senator BYRD. Let the meeting come to order.

Mr. Fred Morrison. Mr. Morrison, you have been assigned 10 minutes.

STATEMENT OF FRED W. MORRISON, NATIONAL ASSOCIATION OF INVESTMENT COMPANIES

Mr. MORRISON. All right, sir. My name is Fred Morrison, and I live in Washington.

Senator BYRD. Go ahead.

Mr. MORRISON. Mr. Chairman, and members of the committee, my name is Fred Morrison. I appear before you on behalf of the National Association of Investment Companies. The member companies of this association are practically all of the registered investment companies in the United States.

Regulated investment companies are registered with the Securities and Exchange Commission and their shares are publicly held.

They have a diversified list of investments, in stocks and bonds, and they are subject to the tax provisions of supplement Q of the Internal Revenue Code.

They obtain their investment capital from the public sale of their shares and then invest their funds primarily in stocks and bonds of other companies.

They give to the investor the opportunity to combine his funds with those of others in order to obtain diversification of risk and experienced investment management, which he might not on his own otherwise be able to get. These companies have total assets of more than $3 billion, yet the average holdings of the average investor in them is under $3,000. They are, to a large extent, the little man's investment medium.

In order to place persons who invest through a regulated investment company as nearly as possible in the same position taxwise as persons who invest directly in the securities of the underlying companies that the investment companies invest in, supplement Q—sections 361 and 362—contains special tax provisions applicable to these companies and their shareholders.

This method of taxation was begun 15 years ago. It provides that if the regulated investment company distributes to its shareholders at least 90 percent of its ordinary income, that is, its income other than capital-gains income, the company then pays income tax only on any income which it does not distribute—only on the undistributed part of that income. In practice, the companies distribute all their ordinary income and the shareholders pay the tax on it when it is distributed to them as ordinary income to them.

Senator TAFT. It is kind of a cooperative investment company.

Mr. MORRISON. Hoping to get better brains than you have got yourself, yes, sir; yes, Senator. I am speaking from the point of view of the shareholders.

Long-term capital gains realized by the investment company, if retained by it, are taxed at the regular corporate capital-gains rate, presently 25 percent.

To the extent that the gains are currently distributed, the company pays no tax on them, but the shareholders include them in their individual tax returns as long-term capital gains and, therefore, shareholders pay that capital-gains tax.

The plan has worked well. However, recent experience shows that in one important respect the plan could be substantially improved, we think, and without any loss of revenue.

The problem arises out of this fact: the present law has the effect of forcing distribution of all realized capital gains. This occurs because under the existing law such gains, if retained by the company, would incur a 25-percent tax, a rate which is higher than the effective rate of tax which the large majority of shareholders themselves pay when the capital gains are distributed to them.

In addition, if the gains are retained by the company, the shareholder would have to pay an additional capital-gains tax with respect to such gains when he later sold his investment company stock, since being retained they would be reflected in the selling price of the stock, when he finally sells the stock.

The present practical necessity of distributing all capital gains tends to influence the investment company's policy, and it can have an adverse effect on the interest of their stockholders.

I think that is demonstrable. If a regulated company has large unrealized appreciation in its investments, substantial changes in its portfolio, that is selling one kind of security in order to put the investment into another—substantial changes in the portfolio deemed desirable by the management in the exercise of its best judgment may well have the effect of realizing a very large amount of capital gains.

As a practical matter, under existing law, these gains must be paid out to stockholders, and they must, therefore, become unavailable for reinvestment for their benefit.

A stockholder purchasing and holding shares of an investment company wishes to have his capital managed for him by that company and not in substantial measure returned to him. The management ought not to have to take into account the fact that capital gains, if unrealized, may be retained in the investment fund and are retained in the investment fund, but, as soon as realized, must be distributed to shareholders.

This problem has become particularly acute now because security values have risen over a pretty long period and there is a large amount of appreciation in the investment portfolios of these companies.

Senator TAFT. Can't you sell the stockholders the theory that they should reinvest these capital gains with you?

Mr. MORRISON. They do that to the best they can. I am coming to a little more direct discussion of that right now, Senator.

Senator TAFT. Your case almost looks to me like the farm cooperatives, I do not see much difference. They want to keep the surplus by issuing scrip certificates, pay no tax, and you want to keep the surplus——

Mr. MORRISON. And pay the tax. There is the one important difference, Senator. If they want to keep it without paying the tax, these companies wish to keep it and pay the tax.

Senator TAFT. Capital-gains tax?

Mr. MORRISON. Yes; and they do pay, their shareholders do pay, all the tax on their ordinary income, too, sir.

Senator WILLIAMS. Can't you keep it under the existing law if you pay your capital-gains tax?

Mr. MORRISON. Yes. But under the existing law if you distribute it, the company does not pay the capital-gains tax, the shareholder does. Under the existing law if the company retains it, it pays the capital-gains tax, and then when the shareholder sells his share in that company, if the company has been wisely managed and there is appreciation in its stock, he pays that tax over again.

Senator TAFT. Now you are suggesting that you do not want to pay the tax. You want to keep that surplus without paying the tax.

Mr. MORRISON. Oh, sir, keep it and pay the tax.

Senator TAFT. You can do that now.

Senator MILLIKIN. Let us hear his scheme; let us see what he has got.

Senator TAFT. All right.

Mr. MORRISON. Some of the open-end investment companies, that is, those companies which are under a legal obligation to buy back from the shareholders their stock, the shareholder's stock, at any time at approximately the current asset value of the stock, some of these open-end companies have endeavored to meet this troublesome problem by paying optional stock dividends to the extent of their long-term capital gains.

Under this optional stock dividend procedure, the stockholder receives a stock dividend unless within a specified time he makes a written election to take the cash equivalent.

These distributions, whether the shareholder elects to take cash or the stock, are taxable to him, to the shareholder, as long-term capital gains under section 115 (f) (2) of the code.

However, for a company having a large number of shareholders, the optional stock dividend method is cumbersome, is expensive, is unsatisfactory. Furthermore, closed-end investment companies, that is, investment companies which do not regularly buy back their shares from their stockholders, for various reasons, do not find it feasible to use the optional dividend method.

Senator MILLIKIN. Are these companies common-law trusts or corporations? Are they so-called Massachusetts-type trusts?

Mr. MORRISON. I think they are corporations—some, I think most.

Senator MILLIKIN. They are both?

Mr. MORRISON. I think that is right. I think they are not mostly Massachusetts-type trusts.

Therefore, the regulated investment companies respectfully request that the statute be amended so that the income tax results to the investment companies and their shareholders with respect to long-term capital gains will be the same whether such gains are distributed to the shareholders or retained by the companies.

They propose that this be done in the following manner:

(1) To meet the problem of the open-end companies—that on any day will buy back from me what investment I have in it, at the asset value of my stock in it—to meet the problem of the open-end companies by amending the statute to provide that where capital-gain dividends are distributed in the form of a stock dividend which the shareholder can redeem at any time for approximately its asset value, such a dividend shall be treated as taxable to the shareholder in the same manner as the present practice, as the optional stock dividend is now taxed to him under section 115 (f) (2) of the code.

Such a stock dividend is essentially the same as an optional stock dividend since immediately upon receipt of the stock the shareholder has the right to turn it into the company for cash at its asset value.

He can turn it in—he can turn in any other shares that he has in that company, any time he wishes for their asset value. That is one.

Senator MILLIKIN. You operate under a very widespread discount, do you not?

Mr. MORRISON. It varies, I think, Senator.

Senator MILLIKIN. It is rather wide; it is 6, 7 percent in many cases, is it not?

Mr. MORRISON. I am not good enough to differ with you, but I think that the discount is much less than that. The turn-in price is at its current asset value. I am not positive. I can ask, and I can tell you that in a moment.

The second amendment proposes to meet the problem of the closed-end companies by requiring a corporation, as at present, to pay over to the Treasury a 25-percent tax on long-term capital gains which the company retains, and by amendment of the code to require each person who is a stockholder in that company at the close of the taxable year to include in his return his share of the company's net long-term capital gains retained by the company, so retained, and to permit him, the shareholder, to take credit in his return for the 25-percent tax paid over by the company, and to increase the basis for his stock so as to reflect his share of the balance of the realized capital gains remaining in the company after the payment of the tax on it thereon.

Now, under these amendments the Treasury would collect the same taxes on realized capital gains of these companies, whether distributed or retained by them, as it now collects on gains which are distributed, and presently all gains almost always are distributed.

Since practically all capital gains are now distributed by the companies to the shareholders, the amendment would not result in loss of revenue. The only practical change would be this: That realized capital gains instead of having to be distributed currently in their entirety to shareholders as dividends, could be treained in whole or in part should such retention be deemed to be in the interest of the shareholders.

Senator WILLIAMS. When you distribute that now in cash to those shareholders, it is taxable to them as straight income.

Mr. MORRISON. A closed-end company, Lehman Corp., and others, they distribute their ordinary income and their long-term capital gains both in cash.

An open-end company that has the duty, when a shareholder asks it to do it, to redeem his stock in it at its asset value, it gives presently—most of them give presently—to their shareholders the choice on a long-term capital gain dividend to take it in cash or to take it in stock of the investment company.

Senator WILLIAMS. But the question is, when they take it in cash, it is taxable at the regular income-tax rates?

Mr. MORRISON. And when they take it in cash or in stock in the company it is taxable to the shareholder at the capital-gains rates.

Senator MILLIKIN. I suggest to you that a part of the problem involved is the legal relationship between the company and the stockholder or between the trustee and the beneficiary, and without going into it now and delaying this hearing by going into it, I believe it would be a good thing for you to add a supplemental memorandum stating which companies are corporations and which companies are—I call them—common-law trusts.

Mr. MORRISON. Yes, sir.

We will be pleased to do it.

Senator MILLIKIN. Because the legal relationship is somewhat different.

Mr. MORRISON. Yes, sir.

(The following memorandum was subsequently supplied for the record:)

MEMORANDUM SUPPLEMENTAL TO TESTIMONY OF FRED W. MORRISON

On July 27, 1951, Fred W. Morrison appeared before the Senate Finance Committee on behalf of the National Association of Investment Companies in support of proposed amendments to the Internal Revenue Code regarding capital gains realized by regulated investment companies.

At the hearings Senator Milliken inquired as to the number of regulated investment companies which are organized as corporations and the number which under State law are trusts. It was agreed that a mamorandum would be filed with the committee setting forth this information

The National Association of Investment Companies has in its membership 121 regulated investment companies, constituting substantially all the regulated investment companies in this country. Of the 121 companies, 102 companies are organized as corporations under the State laws (including one which is a joint-stock association) and 19 are trusts.

The legal status of the organization as a corporation or a trust under the State law has no effect upon the Federal income tax of the organization or of the shareholders or beneficiaries. This is because under section 3707 of the Internal Revenue Code the term "corporation" is defined to include an "association" and the term "shareholder" is defined to include "a member in an association." It has been well settled for many years under the regulations of the Treasury Department and court decisions that those investment companies which are organized as trusts under State laws constitute "associations" for Federal tax purposes and are taxable in the same manner as corporations. Furthermore, the holders of trust certificates are taxed in the same manner as shareholders of incorporated investment companies.

Accordingly, the amendments which were requested on behalf of the regulated investment companies at the hearings on July 27, 1951, would apply in the same manner and with the same effect whether they are organized as corporations or trusts under State law.

Senator TAFT. Mr. Morrison——

Mr. MORRISON. Yes, sir.

Senator TAFT. I think your plea is very logical, but do you not think it is much like what the farm cooperatives are trying to do? I cannot see any difference. In effect, you relieve the company of a tax on an accumulated surplus——

Mr. MORRISON. No, sir——

Senator TAFT (continuing). And pass the tax instead of that—substituting for that a lower tax for those stockholders who have a lower income where they do not get up to the 25 percent limit.

Mr. MORRISON. Senator, I do not believe I am saying that, sir.

Senator TAFT. You say you want them to require each person who is a stockholder at the close of the taxable year to include in his return his share of the company's net long-term capital gains so determined, and permit him to take credit on his return for the 25-percent tax paid by the company. In other words, the company pays it, and he gets it back if he has a less tax, when he pays his tax. The only tax paid on that capital gain is what he pays, and he can pay on that as ordinary income, and that will save him 10 percent at the ordinary rate instead of the 25-percent rate; is that not correct? Is that not what you want?

Mr. MORRISON. He has got that now, sir.

Senator TAFT. Is that not what you are asking for? Is that not what you are asking us to do?

Mr. MORRISON. No, sir.

Senator TAFT. Well, I cannot understand what you are asking then. Today, as I understand it, you pay a 25-percent tax on money retained on a capital gain, on money retained by you, and not distributed to the stockholders.

And the stockholders——

Mr. MORRISON. Senator Taft, that is hardly ever done.

Senator TAFT. I am not saying that it is done, but that is the effect, if you do it.

Mr. MORRISON. If you do it.

Senator TAFT. Yes, sir.

Mr. MORRISON. Yes.

Senator TAFT. You say that we want to be able to retain that, with the net result that the only tax paid on that capital gain is what is paid by the stockholders.

I think it is logical enough, assuming you are a cooperative investment company. I think that it is not unreasonable. I only say it is exactly what the farm cooperatives are asking us to do with respect to the distribution of stock representing retained surplus.

Senator MILLIKIN. That should not "discombobulate" you, because we have not determined that what the farm cooperatives are asking is either right or wrong.

Senator TAFT. No, but I am interested in the theory of what you are asking us to do.

Mr. MORRISON. I am a little hesitant—and this is said most respectfully—to debate this with you, but I do not think that I am saying——

Senator TAFT. I may misunderstand your proposal and that, I think, is important that we get it clear. What do you propose to do with retained surplus, the proceeds of capital gains?

Senator MILLIKIN. What do you propose that is different from what you are doing now?

Mr. MORRISON. I would like to see if I can say that to you.

Senator TAFT. Yes.

Mr. MORRISON. The way it works now on long-term capital gains is this: A company has a million dollars of long-term capital gains realized in this taxable year.

It distributes that million dollars to its shareholders. I say I have stock in the company whereby I get a $100 long-term capital-gain dividend from the company. I pay a tax on that. The company pays no tax ahead of me on it. That is the present plan.

Senator TAFT. That is right.

Mr. MORRISON. If my income rate is——

Senator TAFT. However, if the company—let us assume that the company does not distribute the million dollars.

Mr. MORRISON. That is what I am coming to.

Senator TAFT. Suppose they only distribute three-fourths of it, and keep $250,000, what do you pay now on that?

Mr. MORRISON. Well, the company would be in a terribly uncompetitive position if it kept it presently and paid a 25 percent capital-gains tax on it, you see.

Mr. STAM. It pays a capital gains-tax on it.

Mr. MORRISON. Then, when the individual gets it directly or indirectly, he pays another one, so that is a burdensome way for a company to operate today, sir. They pay out, in effect, on their long-term capital gains.

Senator MILLIKIN. What you are saying is that under the postulate of Senator Taft there would be a double capital gains, one by the company and one by the——

Mr. MORRISON. Yes, sir.

Senator MILLIKIN. Yes.

Senator TAFT. You pointed that out in your statement.

Mr. MORRISON. Now, the difference between the present plan and what I am asking for——

Senator MILLIKIN. What do you propose?

Mr. MORRISON. I would like to tell you and see if I cannot say it correctly. Instead of the million dollars in long-term capital gains being paid out by the investment trust, it retains it, and pays $250,000 of long-term capital gains tax on it, 25 percent. It sends me a notice that the amount of long-term capital gains from it, which I do not get but which I must pay tax on, is $100, setting me up as $100-dividend man out of this company this year, and it says, "We have paid for you $25 of that tax."

So the Government, the Treasury, collects in this retained capital gains 25 percent in the year in which the gains are realized. Under the present plan he gets 25 percent from me if I have enough income to be in the 25 percent long-term capital gains bracket.

Senator TAFT. You said if you were in the capital gains bracket. You said most of these stockholders were small stockholders paying less than 25 percent.

Mr. MORRISON. Yes, sir.

Senator TAFT. Then, in that case the Government gives up on that $250,000 you pay, in the refunds for the stockholder who, we will say, has to pay 15 percent, he can then charge himself with a tax of 15 percent, and he takes a credit for 25 percent that you have paid for him. He gets that back, or he gets a reduction in his general tax, so that the net result is that the only tax paid on that capital gain is the net tax paid by the stockholders, is that not correct. The company kind of collects at the source for the Government but, roughly speaking, the tax paid is the tax paid by the stockholder.

Mr. MORRISON. And that is the only tax that the Government now gets, too, sir.

Senator TAFT. Yes; I do not say that it does not.

Mr. MORRISON. Yes, sir.

Senator TAFT. The Government would get more than that if you kept it as it is today.

Mr. MORRISON. Oh, yes; but you could not run one of these companies for a long time and keep on keeping it without your competitors working on you, I think.

Senator TAFT. You want to keep the surplus that you have earned, and not have the company paying any tax on it, but the stockholders paying the tax on it, in effect, that surplus?

Mr. MORRISON. And giving a credit for it.

Senator TAFT. In effect, the surplus is assigned to them, and increases the value of their stock, and they pay a tax on the net capital gain presented by that increase. That is about what happens. I say personally I do not see why it is not exactly what the farm cooperatives are asking us to do in another field but I do not——

Senator MILLIKIN. Well, the surface difference is that these gentlemen propose to pay the tax in the first instance at the corporate level.

Senator TAFT. At the source.

Senator MILLIKIN. Which is something the cooperatives do not propose to do.

Senator TAFT. It might be a good thing for the co-ops to do.

Senator MILLIKIN. If they do, there is a dinstinction there.

Senator WILLIAMS. If I understand it, there is a lot of similarity between your proposal and that of the cooperatives but there is this difference: You are speaking about how it would affect a man who draws a $100 dividend from the corporation. Take a man who draws a $100,000 dividend, and we do have such men, if that goes through that distribution would be taxable at the capital gains rate of 25 percent, whereas at the present rate it would be taxable at the existing rate of $60,000 or $70,000.

Mr. MORRISON. Oh, no, sir; it would be taxable at the same rate.

Senator WILLIAMS. Is it not taxable if you distribute a $100,000 dividend today as income?

Mr. MORRISON. No, sir; at the capital gains rate.

Senator TAFT. Capital gains.

Senator WILLIAMS. Does it take the capital gains rate, even the cash distribution by your company?

Mr. MORRISON. A company sends the taxpayer, the stockholder, two kinds of dividends a year if it has earned them. One is the ordinary dividend and interest income, ordinary income on which these shareholders pay at ordinary rates, the way you are talking to me about. The capital gains dividend goes to him as a long-term capital gain, and he pays on it the way he would pay—the man with the $100,000 income from it would pay 25 percent, sir. He could not get out of it under the law. I am sure I am right.

Senator WILLIAMS. I am like Senator Taft: I do not understand what you are trying to change.

Mr. MORRISON. I think if it would be possible for me to take a minute more I can, I think, say it a little clearer than I did. Here is a company which has General Motors stock, bought a long time back, and it has a substantial appreciation in it. Stock prices are higher than they were in 1938 and 1939, let us say. It wants to change that investment and wants to realize the long-term capital gains for it and its shareholders. It does it.

Then if half of the receipts from selling the stock should happen to be gain, that gain is turned back to its shareholders under the present law, all of it, and it is dissipated from the investment fund capital of the company; that is, the investment company.

Senator MILLIKIN. Now, what do you want to do?

Mr. MORRISON. I want the company to have the right to keep it and pay the tax on it in the year in which the capital gain is realized.

Mr. STAM. As I understand you, you want the tax to be paid by the corporation or by the trust or whatever you call it——

Mr. MORRISON. Yes.

Mr. STAM. At the 25 percent rate; but you want the stockholder to include in his income his proportionate part of that capital gain just as if it had been distributed to him, and let him get the credit for the tax paid by the corporation at the 25 percent rate; is that your proposition?

Mr. MORRISON. That is right.

Senator MILLIKIN. How do you work this when you are in a loss period? What happens when you are in a loss period?

Mr. MORRISON. When that period comes, unfortunately I think that this question is not very important then.

Senator MILLIKIN. Well, but you still have——

Mr. MORRISON. There is no carry-back or carry-forward.

Senator MILLIKIN. You still would have a distribution of losses. Will the absorption of the losses be at the corporate level, or will the losses be passed on so that the stockholder may avail himself of the losses?

How are you going to handle your losses?

Mr. MORRISON. At the corporate level.

Senator MILLIKIN. Corporate level?

Mr. MORRISON. Corporate level.

Senator TAFT. Does the stockholder get a realized loss when you do have a loss?

Mr. MORRISON. No, sir.

Senator TAFT. He gets no net. If you have a net loss on capital gains——

Mr. MORRISON. No, sir.

Senator TAFT. Or capital losses during the year, the stockholder does not get any deduction.

Mr. MORRISON. That is correct; that is correct.

Senator BYRD. Thank you very much, Mr. Morrison.

Mr. MORRISON. Thank you, sir.

Senator BYRD. Mr. Henry Bodman. You have been assigned 10 minutes, sir.

STATEMENT OF HENRY T. BODMAN, GENERAL VICE PRESIDENT, NATIONAL BANK OF DETROIT

Mr. BODMAN. Mr. Chairman and members of the committee, my name is Henry T. Bodman. I am a general vice president of the National Bank of Detroit, Detroit, Mich., and I welcome the opportunity to appear before the committee on what we regard as an extremely important subject; namely, the impact of the excess-profits tax law of 1950 on certain types of banks in the banking system.

I believe that the problem can be covered in the shortest possible time by reference to three or four charts that I have brought with me and which I hope all of you can see.

The upper line on that top chart—I hope you can read it——

Senator TAFT. It is the same in the book——

Mr. BODMAN. Well, they are almost the same.

The upper line on the top chart shows the growth in deposits of all member banks of the Federal Reserve System for the period 1935 to 1950, and you can see there has been a tremendous growth in deposit liabilities.

The deposits, as you can see, have increased from $38 billion in 1935 to about $130 billion at the end of 1950.

At the same time the capital of the banks has increased from about $5 billion in 1935 to something under $10 billion in 1950.

The fact of the matter is that the deposits in that period have had an increase of about 240 percent, while the capital accounts have increased by something under 90 percent.

Senator MILLIKIN. Since the advent of the Federal Reserve System and the guaranty of deposits, does the old-time relationship between capital and deposits continue to exist?

Mr. BODMAN. I think it has deteriorated and I think mainly in recent years because for the country as a whole we have had an increase of about three times in the total money supply, if you added the currency in circulation to the deposits.

Senator TAFT. You say here that each dollar is protected by 13 cents, whereas the 1935 amount was 7½ cents, so it is just cut in half.

Mr. BODMAN. The cushion is much less, but I think the question of Senator Millikin is whether we need as much cushion as we used to.

Senator MILLIKIN. That is the point.

Mr. BODMAN. I think at the moment it can be debated, but I think it is also clear that the thing has deteriorated to a great extent.

Senator BYRD. What is that when you said that there was three times as much currency?

Mr. BODMAN. What I said was that the total currency and bank deposits of the country are about three times what they were before the war.

Senator BYRD. 1940?

Mr. BODMAN. Yes, sir.

Senator MILLIKIN. Your point is that despite the fact that credit is easier to get, bank credit is easier to get, through the operation of the Reserve System, and that some of the old relationship, the protective relationship, has been weakened by the guaranty of deposits, nevertheless, in some parts of the banking structure at least, there is not a sufficient relationship between capital and deposits; is that the point?

Mr. BODMAN. That is correct; and, of course, the FDIC does not protect the capital anyway.

Senator MILLIKIN. I understand, but the capital is protected in part by the guaranty of deposits.

Mr. BODMAN. I think only the deposits are protected by the guaranty, not the capital.

Senator MILLIKIN. Yes.

Mr. BODMAN. I think the main point is that over this period——

Senator MILLIKIN. But am I incorrect in this: That if you guarantee the deposits, do you not less the risk on the capital?

Mr. BODMAN. No, I do not think so, sir, because if a bank gets into trouble through making poor loans and is unable to pay off its deposits, the FDIC will come in and, perhaps, pay off all depositors' accounts up to $10,000; but the capital of the bank will be wiped out in the process, and the FDIC will take that over.

Senator MILLIKIN. I am glad to have you make that point.

Mr. BODMAN. Yes, sir.

Well, in this period we have had an increase in the ratio of deposits to capital from about 7½ to 1 back in 1935 to about 14 to 1 today, which indicates that over this period the banking system has far less capital in relation to its deposit liabilities than it had in the past.

The State banking departments, the FDIC, the Comptroller of the Currency, and the Federal Reserve System have all been aware of the implications of this situation, and of the fact that many banks badly need additional capital.

As shown by the next chart, need for additional capital is particularly acute in certain types of banks in fast-growing communities.

The upper chart shows the increase in deposits from the year 1940 to 1950 for member banks in certain selected cities.

In New York City, for example, we can see that the increase has been over this period of the last 10 years of about 44 percent. For all Reserve cities it has been about 159 percent; for Cleveland about 162 percent; for Atlanta, about 161 percent; for Denver, 197 percent; and for Detroit, about 197 percent.

I might add that those figures do not quite agree with what is in the book on account of the book being prepared in February before final Federal Reserve figures were available.

The point is that the increase in these deposits shown on the very first chart have not been uniform throughout the country.

The banks in fast-growing communities in the Middle West and South and West have had tremendous increases in deposit liabilities without a commensurate increase in capital. The result is that the ratio of deposits to capital in the same cities varies tremendously.

For example, in New York the ratio of deposits to capital is about 11 to 1, which means that the deposits are something under 10 percent of the total capital structure—I should say that the capital is something under 10 percent of total deposits.

In all Reserve cities, as a whole, the ratio of deposits to capital is about 15 to 1—15½ to 1; in the city of Cleveland, which has had a rapid growth in business activity and in deposits, a ratio of about 18½ to 1; in Atlanta, a ratio of 19.3 to 1; in Denver, a ratio of 18.7 to 1, and in Detroit, a ratio of nearly 22 to 1, which means that we have less than $5 of capital in our bank for every dollar of deposit liability, and if we were not investing largely in United States Government bonds that might be conceived by some people to be an undesirable situation.

The bottom chart—we have just completed that chart. The problem to be considered is that bank deposits flow readily to areas of growing economic importance as production increases and as population increases, but bank capital does not move so freely.

The result is that capital is low in relation to deposits in such centers, as compared with the rest of the country. Now, what is the effect of the excess-profits tax on banks in communities where there has been growth in economic activity, and in the deposits, and where bank capital is needed?

It can be demonstrated, but I will not take the time to do so, that most banks with deposits of less than a hundred million dollars will be largely or wholly exempt from the excess-profits tax.

Out of 14,000 banks in the country, some 98 percent fall in this category and are largely or wholly exempt from the excess-profits tax.

This means that only 200 or perhaps 300 banks, representing about 2 percent of all the banks in the country, will bear the full burden of the tax.

A tax so discriminatory as to single out 2 percent to pay nearly all the tax would seem highly inequitable in its impact.

Senator BYRD. Have you made an estimate of the total of that tax that these two or three hundred banks would pay?

Mr. BODMAN. No, sir; we have not. We have not a reliable estimate. We know, however, that in the last war the largest amount of excess-profits tax paid by the banking system in any one year was in the year 1945, and the amount was $11,000,000.

Senator TAFT. Mr. Bodman——

Mr. BODMAN. Yes, sir.

Senator TAFT (continuing). On what basis do banks pay excess-profits taxes? Is it entirely based on capital or based on earnings, on base-period earnings?

Mr. BODMAN. As a practical matter, we believe that almost no banks are able to use the average-earnings approach on account of the shift in the character of their assets as between the base period and today. As a consequence, all banks, or virtually all banks, will have to use the invested-capital method.

Senator TAFT. And on that they are allowed how much as a base?

Mr. BODMAN. They are allowed 12 percent on the first $5 million of capital, 10 percent on the second $5 million, 8 percent on the balance, with an adjustment for inadmissible assets that tend to reduce the capital credit.

So that, for any bank which has any substantial proportion of its capital credit at 8 percent, after deducting approximately 50 percent normal and surtax, the bank can keep about 4-percent return on its capital, and that return——

Senator TAFT. What is that statement?

Mr. BODMAN. Well, if a bank is of a size category that a substantial part of its capital credit is figured at 8 percent—we know that it is 12, 10, and 8—but, if you assume a substantial part of it, everything over $10 million is figured at 8 percent, from that you must deduct the normal and surtax of 47 percent—in round figures we call it 50—that leaves the bank a 4-percent return on its capital structure, approximately speaking, which is a very low return when you consider that to raise new stock, to sell new stock in a bank, you must frequently pay 5-percent interest cost in terms of the dividends divided by market price; so that it is unprofitable for some banks to raise new capital if the dividend that they have to pay is equal to 5 percent of the market value, when they can only earn 4 on a substantial part of their capital.

Senator MILLIKIN. It works a dilution; does it not?

Mr. BODMAN. It works a very heavy dilution.

Senator MILLIKIN. So far as the older stockholders are concerned?

Mr. BODMAN. Yes, sir.

Senator TAFT. The bank in which I have stock in Cincinnati just sold it on a 4-percent basis, however, sir.

Mr. BODMAN. There are very few banks that are able to do that. I would be interested in that case to know whether the stock of the bank was not a very substantial discount from its book value.

Senator TAFT. No.

Mr. BODMAN. Most banks are, because the earnings are low.

Senator TAFT. I cannot answer that question.

Senator MILLIKIN. Is the corollary of what you say that the larger the capital the better the base for the purpose of excess-profits tax?

Mr. BODMAN. The larger the capital—no; I do not think that follows necessarily. The larger the capital, the larger the proportion on which the credit is only 8 percent; so that is a penalty in that sense to have a large capital.

On the other hand, I think another thing may be said, and that is that banks most in need of capital—that is to say, those that have the largest capital in relation to their deposits—feel it most.

Senator TAFT. What is it, 12 percent on the first $5 million?

Mr. BODMAN. Twelve percent. Ten percent on the next $5 million.

Senator TAFT. And 8 percent on the balance.

Mr. BODMAN. Eight on the balance.

Senator HOEY. It is true that most bank stocks sell below their book value currently on the market.

Mr. BODMAN. That is true, and I think the average might be 20-to-25-percent discount, and in some cases, 50 percent.

Senator HOEY. Yes, sir.

Mr. BODMAN. Because of the low earning power of banks under present conditions and, as I might add, very much lower if the excess-profits tax stays as is.

Senator BYRD. Are those earnings improving? The interest rates are getting higher.

Mr. BODMAN. The earning power, I think, would be improving were it not for the much heavier taxes, but I know of a good many banks that will have impaired earnings this year at the very time when they need new earnings to build up their capital to protect their deposit liabilities.

Senator TAFT. Is there any credit on Government bonds?—a considerable percentage of Government bonds enjoy a tax-free status.

Mr. BODMAN. Yes, sir.

That is the reason that banks are not able to go on the average-earnings basis. The point is that partially tax exempt Government bonds were the only type of Government bond outstanding prior to 1941; so the banking system, to the extent in the old days that it owned Government bonds, perforce owned partially tax exempt Government bonds, which were exempt from normal taxes.

In the base period, income from partially tax exempt Government bonds is not counted as part of your base earnings. In the same period the partially tax exempt Government bonds to a great extent have been called or have matured, and new fully taxable bonds have been issued in their place, and even if you assume the same earnings to stockholders after Federal taxes you will pay an excess-profits tax by virtue of the fact that you are not allowed to count the same income in the base year as you are taxed on in the excess-profits tax.

Senator TAFT. Can you make a statement about the amount of partially exempt bonds that still remain?

Mr. BODMAN. Yes, sir.

Senator TAFT. What is that?

Mr. BODMAN. It was a tremendous item in most banks.

The volume of partially tax exempt bonds outstanding in 1941 was about $32 billion or $33 billion.

Today there are outstanding under $10 billion. The percentage of earning assets of all banks belonging to the Federal Reserve System which were invested in partially tax exempt Government bonds was in 1940 about 30 percent, and now it is of the order of 7 percent; so that has been a big shift which no allowance is made for in the excess-profits tax.

Senator TAFT. And that 7 percent is disappearing gradually?

Mr. BODMAN. Yes, sir. So, it will be down to $3½ billion in 1955 and in another few years they are all gone.

The suggestion that we have to make will automatically correct that problem without actually making it very complicated.

The point that I was trying to get over to you gentlemen was that here you have a tax that hits two or three hundred banks, or 2 percent of all the banks in the country, and the remaining 98 percent pay little if any tax.

In addition, and of the utmost importance, is the fact that the tax will hit hardest those banks among these two or three hundred which are in rapidly growing communities, such as we have looked at here and which are most in need of additional capital.

This condition has further significance when it is recognized that some of the largest banks in the country, including some of the larger New York City banks will be exempt from the tax by virtue of their abundant capital.

Statements to that effect were made by the managements of certain of these banks, large New York City banks, at their stockholders' meetings last January.

The apparent solution to the problem of intermediate-size banks in fast-growing communities which are hardest hit by the excess-profits tax would seem to be the raising of additional capital.

This would improve the position of such banks and would reduce their excess-profits taxes.

But new capital can be raised in only two ways: One, through retained earnings; two, through the sale of additional stock.

You can see from this chart that where bank capital is most needed the highest percentages of earnings have been retained and reinvested in the business, and we show here again that in New York City, where bank capital is relatively abundant, that banks retained 45 percent of their earnings.

The banks in all reserve cities, taken as a whole, retain 56 percent.

In the Cleveland Federal Reserve District, they retain 61½, about the same figure for the Atlanta district, a little higher for the Kansas City district, and a substantially higher figure for the Chicago district, if you eliminate Chicago from the figures.

Senator HOEY. You mentioned these two methods of increasing capital. Could you increase it by stock dividends where the surplus or earned profits are sufficient?

Mr. BODMAN. It would not give you any more effective capital. It would change the form of capital from surplus to capital stock, but you would not give your depositors any more protection.

Senator HOEY. It does not give the depositors any more, but does it have any effect on the tax?

Mr. BODMAN. No; it does not have any effect because you are able to count your capital surplus and undivided profits and reserves.

The other method of obtaining capital is through the sale of stock—I am sorry. I read the wrong line.

What we have just shown here is that banks in localities where capital is thinnest try to retain the biggest percentage of their earnings to build up their capital.

However, the reinvestment of earnings is not a full solution. The real problem is that earnings are not sufficient to create new capital at an adequate rate even though dividends are held down.

The second method of obtaining new capital is to sell additional stock. The next chart shows that the price of bank stocks has been, as Senator Hoey was indicating, substantially below book values per share in most years since 1940.

This chart—I do not know whether you can read the numbers—covers the years from about 1938 to 1950, and the zero line is where the red stops, and below here [indicating] is minus. The other is plus, indicating that where these lines which indicate the ratio of market price to book value are below the zero line they are in the red, and the bank stocks are selling at a discount from book value; where they are in the black, they are above, and this chart shows that the price of bank stocks has been substantially below their book values per share in most years since 1940. This is because earnings are too low to justify a higher market price.

If additional stock is offered, it must be at a price below book value; that is, below the value of the bank in liquidation.

The stockholders, frequently the smaller ones, not in a position to make additional investments, will find their equity diluted where banks raise new capital through the sale of additional stock at a price below book value, which is the only price available.

If this problem is to be squarely faced, it must be admitted, first, that certain banks are badly in need of additional capital and, second, that if the necessary capital is to be obtained the banking system must be allowed to earn a return sufficient to create additional capital from retained earnings or to permit the raising of new capital through the sale of stock by presenting to the general public an invsetment which is competitive in the capital markets.

The next chart shows—to which I refer, the bottom chart here—that the return on bank capital has been relatively low. It shows that for a group of manufacturing concerns you have had returns running from 8 to 16 percent, whereas uniformly the returns on bank capital are substantially lower, of the order of 50 percent.

Senator TAFT. Would that not be necessarily so, just offhand?

After all, they have got their assets in Government bonds, most of them?

Mr. BODMAN. Yes, but they do not like to have it.

Senator TAFT. You have a much greater security today in banks than you had before?

Mr. BODMAN. I am not so certain, Senator.

Senator TAFT. I mean the return on bank stocks has always been below manufacturing companies, way below, in all history, so far as that is concerned.

Mr. BODMAN. I think that, perhaps, is true.

Senator TAFT. Perhaps not in 1929?

Mr. BODMAN. I think, perhaps, that is true.

At the same time, here we have a situation where the typical bank stocks of a good bank are selling at 25 percent below the value of the bank, if you close it up and lock the doors and sell off its assets.

Senator TAFT. Well, I have stock in a company, a manufacturing company, where the same thing is true, and worse, and it is, in fact, selling now at about 50 percent of its book value.

Mr. BODMAN. I do not believe that is generally true in manufacturing.

Senator TAFT. Well, maybe it is not, but it is true——

Mr. BODMAN. Well, that is unfortunate.

Senator TAFT. Those are about the only two things I own, one in bank stock, and one in a manufacturing company, and the manufacturing company is selling further below the asset value than the bank stock.

It is a small manufacturing company; it is not on the big board.

That kind of stock is very likely to be below book value.

Mr. BODMAN. I do not think it is very likely, by which I mean, if you take the average for all industry, manufacturing and all banking, you will find that the stocks of manufacturing industries sell at substantial premiums above book values, and in a good many cases several times book value; whereas, in banks they sell at substantial discounts almost uniformly.

Senator TAFT. What I wondered about was whether you are objecting to the fact that the tax is based on the fact that some banks earn a bigger return on their capital——

Mr. BODMAN. Than others; that is correct.

Senator TAFT. That they earn a bigger return on their capital than the 8 percent, and——

Mr. BODMAN. That is 8 percent before normal and surtax, of course.

Senator TAFT. But, of course, that in a way is the theory of this excess-profits tax, that the excess does not mean just Korea, the Korean War, because we have no possible means of relating it to the Korean War.

Mr. BODMAN. That is right.

Senator TAFT. That means that if you earn more than a certain amount on your capital, that is excess; in fact, the law itself goes down to 85 percent, which eliminates some of the theory.

Mr. BODMAN. Yes, sir; that is right.

Senator TAFT. And I wondered how the bank situation—I wondered whether there was a legitimate objection to the tax simply on the ground that because some banks earn a bigger return on capital, therefore, they should not be subject to the tax. That is the very theory of the tax; because they earn a bigger return on capital they should be taxed. I do not say it is a sound theory, but it is one of the theories at least.

Mr. BODMAN. It is one of the accepted theories, at least.

I think if the problem is to be looked at in the light of what is proper for the stockholders, that is one thing. But I think the real problem is what is proper for the industry. The important thing is not the stockholders in this case; the important thing is what is going to happen to the banking industry.

Here we have——

Senator TAFT. Well, is it not an important thing that 50 percent of your 8 percent is taken by the normal tax?

Mr. BODMAN. That is right, and surtax together.

Senator TAFT. Surtax. Is that not the important thing, rather than the excess-profits tax?

Mr. BODMAN. Which leaves you 4 percent.

Senator TAFT. That is the bad thing.

Mr. BODMAN. That is bad.

Senator TAFT. And the difficulty of raising new capital occurs in every business and in every industry simply because of the tremendous burden of this tax, of the corporation tax?

Mr. BODMAN. But other industries are able to raise new capital fairly readily.

Senator TAFT. Well, we have the complaint constantly that they are not. The big ones, yes—the big ones that are on the Board—but the small manufacturing company does not have any ability to raise capital.

It has great difficulty in raising capital because of this tax; I mean, that is the reason.

Mr. BODMAN. That is the problem.

Senator TAFT. There is no doubt about that. It seems to me an almost inevitable result of the present system of corporate taxation, but I wondered why the banks have any special claim to being different from anybody else.

Mr. BODMAN. Only because—and I do not think that we should think about the bank as such in terms of their stockholders—I think that we should think about it as an essential industry. I think the banks, as such, the banking system needs additional capital and some banks need additional capital infinitely more strongly than others do. As we can see, some banks have a ratio of as much as 10 percent of capital—I mean have 10 percent of their deposits represented by capital and others have 5 percent, and that is much too low.

Senator TAFT. Do you not think banks can finance? This bank in which I am a director has just financed, has just sold new stock, without difficulty, I think, mostly to stockholders.

Mr. BODMAN. I think in a great many cases that stockholders will realize later that they wished that they had not approved the additional sale of those stocks at those prices, and if they do they will vote against such additional stock sales, and they have the right to decide.

It is the private citizen who has the right to decide whether he is going to invest his capital in the banking industry or in some other industry, and I think the problem here is one of getting adequate capital in the banking industry.

Senator MILLIKIN. The element of regulation is important here.

Mr. BODMAN. It is a big factor.

Senator MILLIKIN. It has an effect on your business, which is not present in other businesses and draws a distinction between the two.

Mr. BODMAN. It is an important distinction.

Senator TAFT. Because you are in the class of utilities rather than in the other class?

Mr. BODMAN. That is the exact recommendation we are coming to, and if you will let me proceed I plan not to take any more of your time.

Senator TAFT. Sure.

Mr. BODMAN. Banking is an essential industry. The problem presented here is not basically one of affording relief for bank stockholders, but one of permitting the industry or certain segments of it to have sufficient earnings so that the essential functions of banking can be performed with adequate protective capital.

As stated recently by the New York State superintendent of banks, a State official:

> Banking is so closely entwined with the public interest that any undermining of its strength is of direct concern not merely to the owners of the banks but to the public generally.

Now, in our study of this problem we have considered various measures that might be adopted to correct the inequities which I have tried to describe.

We can see that it is particularly important to afford relief to banks which need additional capital and have had a rapid growth in line with their communities.

We also realize that any relief provided cannot be such as to give a windfall to other taxpayers not confronted with similar problems.

As an approach, we believe there are logical grounds for considering the banking industry as a regulated industry, which is what we have just been talking about.

The excess-profits-tax law gives special treatment to the airlines, the public utilities, and the railroads on the ground that they are regulated industries.

We, as banks, are regulated in that the price of our principal product, bank credit, has long been regulated through the control of the Federal interest rate.

The character and quality of bank assets are subject to regulation, and the amount of reserves which must be maintained in the form of nonearning assets is prescribed by appropriate Federal and State authorities.

There are other regulations, direct and indirect, too numerous to mention.

On the theory that we are a regulated industry, we propose, for any member of the industry who can qualify, that a relief provision be written into the law to provide a third alternative method of filing excess-profits-tax returns.

Briefly, we suggest that any bank which can prove, first, that it needed additional capital in the base period and, second, that it earned a certain minimum rate of return on its capital in the base period, that if both these two tests are met, the bank be permitted to earn after normal and surtax, a certain rate of return before being subject to excess-profits taxes.

Specifically, it is proposed that to qualify for the relief provision, the bank must be one which did not have in the base years, on the average, total capital funds and reserves exceeding 6 percent of its deposits, and it must be one which earned at least 7 percent on its capital funds and reserves in the base period.

For banks which can meet these two tests, it is proposed that they be permitted to earn, after normal and surtax, 7 percent on their invested capital before being subject to excess-profits taxes.

These tests are highly restrictive, and only banks badly in need of relief and badly in need of capital can qualify. In fact, I may say that there are a number of banks badly in need of capital who still could not qualify.

I should say that there are a number of banks, if I can correct that, there are a great number of banks, very hard hit by the excess-profits tax, who could not qualify under these two tests, and the tests, perhaps, are too rigorous.

The percentages suggested, of course, are to some extent arbitrary. However, the 6-percent ratio of capital to deposits seems reasonable, and not too high, in that it is less than the average for all banks, and is the minimum ratio which qualifies bank stocks as legal investments for savings banks in the State of Massachusetts.

Senator BYRD. To what extent would your proposal reduce the revenue, as provided for in the House bill? Do you have any estimate?

Mr. BODMAN. Senator, we have made an estimate of that which, necessarily, had to be done by statistical means, because the facts are not otherwise available, and the statistical method makes some assumptions.

Under our proposal, the highest amount of loss of revenue that we can conceive is about $20,000,000, but we think a more probable figure would be $10,000,000, but I would like to emphasize that we do not have great confidence in these estimates.

The percentages suggested, of course, to some extent, are arbitrary. The 6-percent ratio of capital to deposits seems reasonable and not too high; in fact, it may be too low in that it is less than the ratio for the average of all banks, and is the minimum ratio which qualifies bank stocks as legal investments for savings banks in the State of Massachusetts.

In other words, the Massachusetts law says that any bank which does not have at least 6 percent as much in capital as in deposits is undercapitalized and is not a proper investment for a savings bank.

The 7-percent minimum required rate of return on invested capital in the base years is suggested in order to prevent banks with low earnings in the base years from obtaining a windfall by being relieved of excess-profits taxes if their earnings increase in the excess-profits-tax years.

I would like, with your permission and at the invitation of the committee, to file and have made a part of the record two documents, one a memorandum dated July 5, 1951, giving the details of a proposed amendment to the Internal Revenue Code, which would correct the situation as we see it, or partially correct it, and, second, a brochure entitled "The Excess Profits Tax Act of 1950 and the Banking System," dated February 15, 1951, prepared by the National Bank of Detroit, and on which the charts I have shown you are based.

I would like to point out one thing, that in adopting this theory of regulated industry so that a bank would be permitted to earn a rate of return on its capital after normal and surtax, in our case, in which we are paying a very substantial excess-profits tax for 1951, that it would not have the effect of eliminating our excess-profits tax by any means.

It would reduce it by about one-third.

Thank you, Senator Byrd, and members of the committee.

Senator BYRD. Thank you, sir.

Senator TAFT. You say this would not eliminate all banks?

Mr. BODMAN. No, sir.

Senator TAFT. What kind of a bank would not be eliminated? You said only 2 percent of the banks were going to be——

Mr. BODMAN. Taxed.

Senator TAFT. Taxed now.

Mr. BODMAN. That is right.

Senator TAFT. This would reduce it to what percent?

Mr. BODMAN. I do not know, Senator. The restrictions that—if I can just go back one little bit—this proposal that we have made, obviously is patterned after what was done for the airlines and utilities, and we think there are logical grounds for doing that.

However, to qualify for that special provision two tests must be met:

You must show that you had too little capital in the base years, and that you earned a minimum rate of return in the base years on your capital, the latter idea being for the purpose of preventing a bank which only made 4 percent in the base years from making 7 percent in the excess-profits years.

It is to screen those out.

The other test, the requirement that a bank cannot have in the base period had more than 6 percent of its deposits in capital, is a highly restrictive test because there are not many banks whose capital structures are as thin as that.

If the committee believes that steps should be taken to induce or encourage more capital in certain other kinds of banks, that proposal could be eased up a little bit or, so far as we are concerned as a bank, the test could be eliminated altogether.

The only reason that we put in those qualifications was that it was indicated to us by some of our experts that the amendment, or the proposal would have no chance of adoption if it opened the door for all banks.

Senator WILLIAMS. What percentage of the corporations, generally, pay excess-profits taxes?

Mr. BODMAN. Senator, I do not know. I think it is a higher percentage.

Senator TAFT. Of all corporations?

Senator WILLIAMS. All corporations.

Senator MILLIKIN. Mr. Stam, what is that figure?

Mr. STAM. What is the percentage of over-all corporations?

Mr. ORAN. I do not have it exactly, but certainly there were about three or four hundred thousand returns, and I would say about 50,000 or about one-sixth.

Mr. STAM. My recollection is that the latest figures ran between forty and fifty thousand, I believe.

Senator BYRD. Thank you, Mr. Bodman.

Your documents which you have requested be inserted in the record at this hearing, will be inserted at this point.

(The memorandum dated July 5, 1951, and the report dated February 15, 1951, follow:)

ALTERNATIVE CREDIT—SUGGESTION FOR AMENDMENT OF THE EXCESS PROFITS TAX ACT OF 1950 TO PROVIDE MORE EQUITABLE TREATMENT FOR COMMERCIAL BANKS MEETING CERTAIN CONDITIONS

SUGGESTION

Provide a minimum excess-profits tax-credit for commercial banks, as an alternative to the average earnings credit and the invested capital credit.

PRECEDENT FOR RELIEF

A report prepared by National Bank of Detroit entitled "The Excess Profits Tax Act of 1950 and the Banking System" shows that the act has created inequitable results and hardship in the case of certain types of commercial banks. An exception to the general rules as they relate to commercial banks is clearly necessary. The provisions in the act relating to reserve for bad debts and FDIC assessments give appropriate relief in these areas but do not correct the specific inequity described herein.

Earning assets of banks, principally loans and investments, are provided to a large extent by deposits and vary directly with the volume of deposits. However, the deposit liability of a bank does not qualify as borrowed capital, and, therefore, such deposits are not included in any manner in the invested capital of banks. Where the ratio of equity capital to deposits is lower than the general average, the invested capital credit is clearly an inadequate standard of normal earnings.

Because of the decreasing amount of partially taxable Federal securities outstanding and in bank portfolios, the average earnings method is also an inadequate standard of normal earnings in the case of many banks. Under the act the starting point for determining excess-profits net income is the "normal tax net income" which represents net taxable income reduced by partially taxable interest. As a result, interest received on partially taxable Federal securities is completely excluded from excess-profits net income in each year in the base period as well as in the taxable year. Because of the decreasing amount of partially taxable Federal securities outstanding, a larger proportion of a typical bank's net income is excluded in the base period years than in an excess-profits-tax year.

Need for special treatment in some industries was recognized in the act. Section 448 provides a minimum excess-profits tax credit as an alternative to the average earnings credit and the invested capital credit for taxpayers in certain specified types of regulated industries. In general, such alternative credit assures such a taxpayer that an excess-profits tax will not be imposed until after it earns a net return after income tax (normal tax and surtax) equal to 6 or 7 percent of its invested capital. There is a basis for providing banks with similar special treatment, since the commercial banking industry is subject to strict regulation by Federal and State authorities.

PROPOSED REMEDY

Provide a formula for relief for those commercial banks which need the relief most, namely:

(1) Banks which during the base period had a lower than average ratio of equity capital to deposits; and

(2) Banks which characteristically earned during the base period a rate of return on equity capital at least as great as is proposed to be allowed as the minimum rate of return before an excess-profits tax is imposed.

It is proposed that a minimum excess-profits credit be made available to commercial banks which meet certain tests designed to establish that the bank is entitled to relief. This credit would be an alternative to the average earnings credit and the invested capital credit for such taxpayers.

In general, this minimum credit would consist of the corporate normal tax and surtax payable by the bank for the taxable year in question, plus 7 percent of the sum of the equity capital, retained earnings, and borrowed capital, less interest payable on the borrowed capital. Equity capital and retained earnings of the banks entitled to avail themselves of this alternative credit would be reduced proportionately by the so-called inadmissible assets, but for that purpose partially taxable Federal securities would be treated in the same manner as admissible assets.

It is proposed that this minimum credit be made generally available to commercial banks and trust companies, a substantial part of the business of which consists of receiving deposits and making loans and discounts, but that it be limited to those banks which meet two tests, namely, a maximum ratio of equity capital to deposits, and a minimum rate of return during the base period.

With respect to the deposit ratio test, it is proposed that this relief provision be limited to those banks which had a ratio of equity capital to total deposit liability of not more than 6 percent, which ratio would thereby be lower than the average ratio for banks generally during the base period. It is proposed that this test be applied as of December 31, 1949, the call date nearest to the close of the base period. In case a bank, merely because of a temporary fluctuation in deposit liability, might not meet the test on that date, an alternative test is proposed, namely, where the ratio of equity capital to total deposit liability on each of the call dates, on which reports of conditions of all national banks were required by the Comptroller of the Currency, during the base period, averaged not more than 6 percent.

In addition to the deposit ratio test, it is proposed that in order for a bank to be entitled to relief it must also demonstrate that its rate of return on equity capital was 7 percent or more in at least three of the taxable years in its base period or averaged 7 percent or more during the entire base period. Because of this test it is necessary to limit the relief to a bank which commenced business before the beginning of its base period. Inasmuch as borrowed capital is not a significant factor in the case of banks generally, the rate of return test during the base period should be measured by equity capital only

In computing the rate of return on equity capital it is proposed that net income in the base period years be increased or decreased by the adjustments required by section 433 (b) which are ordinarily applicable to banks. For this purpose net income in the base period years will include partially taxable interest.

Inasmuch as the amount of partially taxable Federal securities outstanding is decreasing and is being replaced by fully taxable securities to a large extent, it is proposed that for the purpose of this relief section the term "inadmissible assets" should not include partially taxable federal securities. Consistent therewith, it is necessary to treat the interest income from such partially taxable Federal securities as equivalent to excess-profits net income subject to excess-profits tax. This is proposed to be accomplished by reducing the alternative excess-profits credit by the amount of such partially taxable interest which is actually included in net income for the year in which the minimum credit is used.

PROPOSED AMENDMENT

SEC. 459. EXCESS PROFITS CREDIT—COMMERCIAL BANKS

(a) AMOUNT OF CREDIT.—In the case of a commercial bank (as defined in subsection (c)), the excess profits credit for any taxable year computed under this section shall be the sum of the tax imposed by sections 13, 14, 15, and 141 (c), for such taxable year and the amount determined under subsection (b).

(b) COMPUTATION.—The amount referred to in subsection (a) for any taxable year shall be determined as follows—

(1) by applying 7 per centum to the sum of the following:

(A) the adjusted invested capital for such taxable year, computed under section 437 (b) (2) without reduction by the amount of the net new capital addition and without regard to section 437 (b) (2) (C), and

(B) the average borrowed capital for such taxable year as defined in section 439.

(2) by reducing the amount ascertained under paragraph (1) by the deduction allowable for such year with respect to interest on indebtedness included in borrowed capital under section 439.

(3) by reducing the amount ascertained after adjustment under paragraph (2) by the amount computed under section 440 (b) (relating to inadmissible assets).

(4) by reducing the amount ascertained after adjustment under paragraph (3) by the amount allowable for such year as a credit under section 26 (a).

(c) TAXPAYERS TO WHICH SECTION APPLIES.—For the purposes of this subchapter the term "commerical bank" means a bank or trust company incorporated and doing business under the laws of the United States (including laws relating to the District of Columbia), of any State, or of any Territory, a substantial part of the business of which consists of receiving deposits and making loans and discounts, and which is subject by law to supervision and examination by State, Territorial or Federal authority having supervision over banking institutions.

(1) A commercial bank (as defined in this subsection) shall be entitled to the benefits of this section if it commenced business before the beginning of its base period, and if—

(A) the ratio of its equity capital (as defined in section 437 (e), to its total deposit liability—

(i) on December 31, 1949, was not more than 6 per centum, or

(ii) on each of the call dates on which reports of condition of all national banks were required by the Comptroller of the Currency during the base period averaged not more than 6 per centum, and

(B) the rate of return on its equity capital (as defined in section 437 (e)).

(i) in at least three of the taxable years in its base period was 7 per centum or more, or

(ii) during the base period averaged 7 per centum or more.

(2) For the purpose of subsection (1) (B) the rate of return on equity capital shall be computed by determining the ratio of—

(A) net income for the taxable year reduced by the tax imposed by sections 13, 14, 15, and 141 (e) for such taxable year, to

(B) the adjusted invested capital for such taxable year computed under section 437 (b) (2) without reduction by the amount of the net new capital addition and without regard to section 437 (b) (2) (C), but reduced by the amount computed under section 440 (b) (relating to inadmissible assets).

(d) NET INCOME.—For the purposes of subsection (c) (2) (A) net income for any taxable year shall be the net income as defined in section 21 (a) as in effect for such taxable year, increased or decreased by the adjustments prescribed in paragraphs (1), (2), (6), (9), (12), and (13) of section 433 (b), and further increased by the deduction provided by section 23 (r) which shall not be allowed.

(e) INADMISSIBLE ASSETS.—For the purposes of subsections (b) (3) and (c) (2) (B), in computing the reduction to be made under section 440 (b), the term "inadmissible assets" means—

(1) Stock in corporations, except stock in a foreign personal holding company, and except stock which is not a capital asset; and

(2) Obligations described in section 22 (b) (4) the interest from which is wholly excludible from gross income.

* * * * * * *

SEC. 434. EXCESS PROFITS CREDIT—ALLOWANCE.

(e) SPECIAL RULE FOR COMERCIAL BANKS.—Notwithstanding subsection (a), in the case of a commercial bank (as defined in section 459) the excess-profits credit for any taxable year shall be an amount computed under section 435, section 436, or section 459, whichever results in the lesser tax under this subchapter for the taxable year for which the tax under this subchapter is being computed.

NOTE.—Additional provisions and cross references may be required to cover consolidated return requirements, acquiring corporations, etc.

THE EXCESS PROFITS TAX ACT OF 1950 AND THE BANKING SYSTEM

(Prepared by National Bank of Detroit)

INTRODUCTION

This report has been prepared in an effort to point up certain important effects on the banking system of the Excess Profits Tax Act of 1950. It does not deal with the merits or demerits of excess-profits taxes as such.

The report is concerned exclusively with certain circumstances surrounding the commercial banking business that make the application of the law inequitable and injurious to the banking system.

There are important differences between normal, everyday operations of a bank and the normal operations of most other types of business. Because the present excess-profits-tax law does not take effective account of these differences, it is believed that serious inequities, potentially harmful to the economy, will result.

It is our belief that the Congress may not have anticipated the results described in this report and that the Congress would have taken cognizance of them had time permitted a full presentation to the appropriate committees of the effect of this law.

BANK DEPOSITS HAVE GROWN MUCH FASTER THAN BANK CAPITAL

Bank capital, the equity that provides the element of protection for bank depositors, has not kept pace with the rapid increase in deposits during the past 10 years. State banking departments, the Federal Deposit Insurance Corporation, the Comptroller of the Currency and the Federal Reserve System have all been aware of this development.

The implications of this situation are that the banking system can ill afford another inflationary deposit expansion such as took place during and after World War II without seriously jeopardizing the position of the depositor, the stockholder, and finally the entire banking system and the type of economy it represents.

The charts on the opposite page depict the rapid growth in deposits, relative to capital, for all member banks of the Federal Reserve System, deposits of which comprise about 75 percent of the total bank deposits of the United States.

DEPOSITS AND CAPITAL--ALL MEMBER BANKS

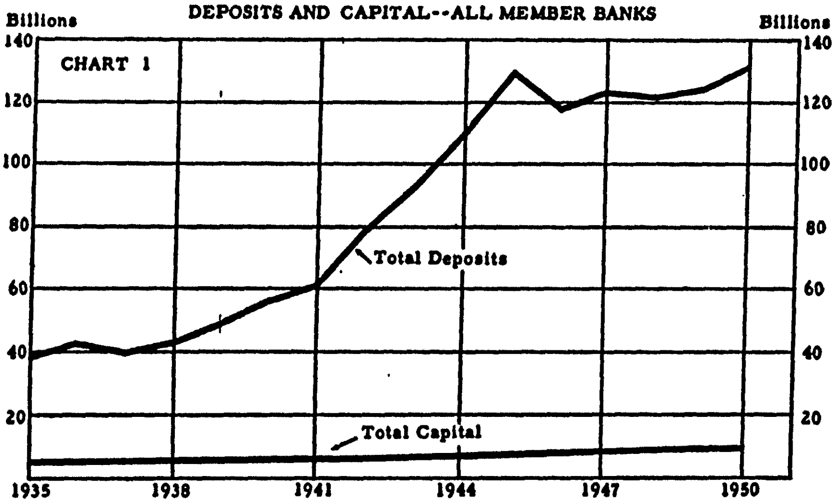

Chart 1, above, shows that from 1935 to 1950 the deposits of all member banks increased from about $38 billion to about $131 billion, an increase of over 240 percent.

In the same period the capital structure of all member banks increased from $5.1 billion to $9.7 billion, an increase of less than 90 percent.

(The temporary peak in deposits shown in 1945 resulted from an extraordinarily large Treasury fund balance created in anticipation of Treasury cash requirements which did not fully materialize.)

RATIO OF DEPOSITS TO CAPITAL--ALL MEMBER BANKS

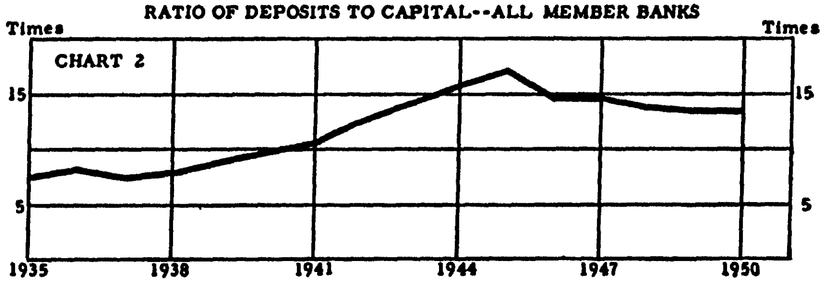

Chart 2, above, shows the trend of the ratio of deposit liabilities to capital for all member banks based on the figures in chart 1.

The rising ratio of deposits to capital reflects the decreasing size of the capital structure of the banking system in relation to the level of deposits supported thereby.

In 1935 each $1 of deposits was protected by more than 13 cents of bank capital; today only 7.5 cents of bank capital is available for the support of each $1 of deposit liability.

BANK CAPITAL SHORTAGES ARE NOT GEOGRAPHICALLY UNIFORM

Bank deposits are free to flow into areas of greatest economic activity as these areas expand their production and the volume of their transactions.

Bank capital, however, does not move freely from areas of redundant capital to areas where additional capital is needed.

Thus we find that certain of the older centers of economic activity, such as New York City, are holding a steadily declining proportion of the Nation's deposits and as a result they have an ample supply of bank capital, while the newer, more rapidly growing production centers are in need of additional capital. In other words, bank deposits have a higher degree of mobility than bank capital.

This phenomenon is illustrated by the charts on the opposite page.

PERCENT OF ALL MEMBER BANK DEPOSITS

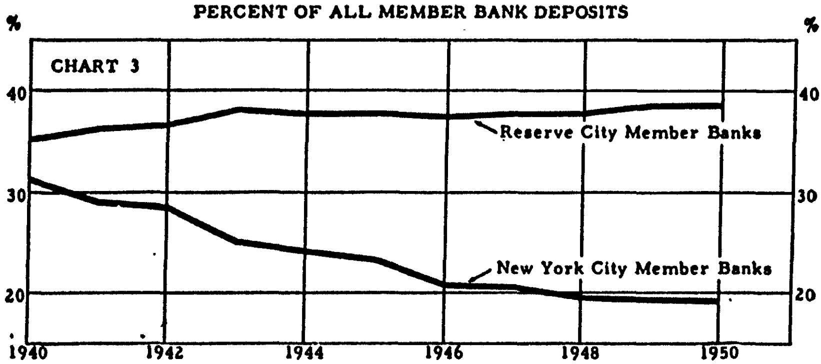

Chart 3 shows that member banks in New York City held nearly 32 percent of all member bank deposits in 1940 but now hold less than 20 percent of all such deposits.

Simultaneously, the percentage of all member bank deposits held by Reserve city member banks increased from about 35 percent in 1940 to nearly 39 percent in 1950.

So-called country member banks also increased their percentage of all member bank deposits substantially in this period.

RATIO OF DEPOSITS TO CAPITAL--NEW YORK AND RESERVE CITIES

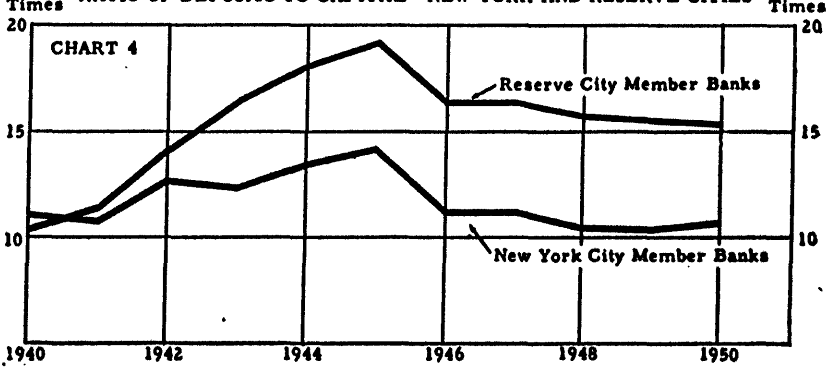

Chart 4 shows the ratio of deposits to capital—capital ratio—for Reserve city member banks and New York City member banks.

It can be seen that in 1940 the capital ratios for these two classes of banks were about the same. The subsequent shift in deposits has far out-run the shift in capital, with the result that the capital ratio for New York City member banks is now less than 11 to 1 compared with a ratio of over 15 to 1 for Reserve city member banks.

As will be shown on the following pages, the growth in deposits, when considered on the basis of individual cities, has created even more extreme capital ratios.

BANK CAPITAL SHORTAGES ARE EXTREME IN SOME AREAS

In many rapidly growing centers the increase in deposits has been considerably greater than the average for all Reserve cities.

The result of this more rapid growth in deposits is that capital ratios on the average are higher in such centers than elsewhere.

PERCENTAGE INCREASE IN DEPOSITS 1940-1950
MEMBER BANKS IN SELECTED CITIES

CHART 5

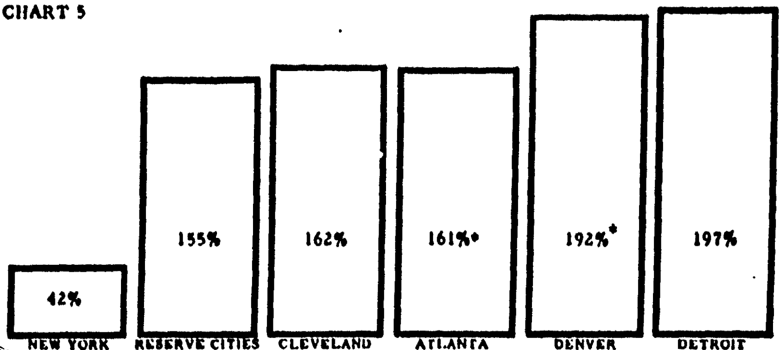

Chart 5 shows the change in deposits for member banks in selected localities in relation to the changes for member banks in New York City and all Reserve cities.

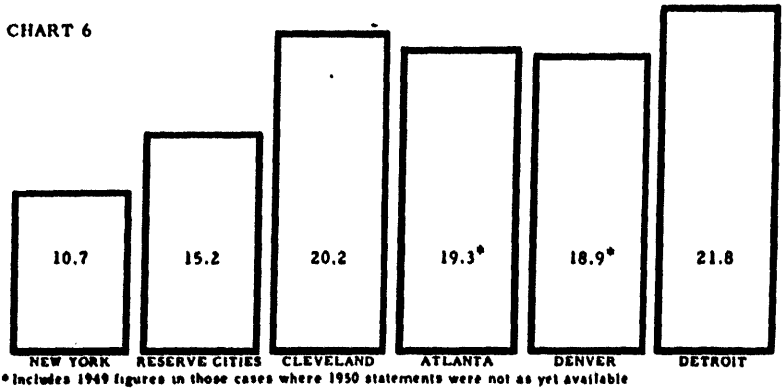
1950 RATIO OF DEPOSITS TO CAPITAL OF MEMBER BANKS IN SELECTED CITIES

CHART 6



* Includes 1949 figures in those cases where 1950 statements were not as yet available

Chart 6 shows the capital ratios of member banks in the same cities. It demonstrates that where deposits have increased most, capital ratios are least favorable. This is due to two factors:

First, capital ratios were generally unfavorable in these cities after the banking collapse of the early thirties and had not shown marked improvement by 1940;

second, bank capital in these places has not been obtained or created at a rate commensurate with the increase in bank deposits since 1940.

THE EXCESS PROFITS TAX WILL STRIKE HARDEST AT THOSE FEW BANKS MOST IN NEED OF CAPITAL

Table I on the opposite page shows that there are approximately 14,000 commercial banks in the United States consisting of 6,868 member banks of the Federal Reserve System and 7,264 banks which are not members.

The table also shows that 10,646 or 75.5 percent of the banks had deposits of under $5 million at the end of 1949; 3,305 or 23.2 percent had deposits of between $5 million and $100 million; and that only 181 or 1.3 percent had deposits of over $100 million. Only six banks with over $100 million in deposits were not members of the Federal Reserve System.

TABLE I.—*Distribution of banks by size groups on Dec. 31, 1949*

Type of banks	Total number	Number of banks with deposits—		
		Under $5,000,000	Between $5,000,000 and $100,000,000	Over $100,000,000
Federal Reserve members	6,868	4,267	2,426	175
Nonmember banks	7,264	6,379	879	6
Total all United States banks	14,132	10,646	3,305	181

It will be demonstrated below that approximately 98 percent of the 14,000 banks in the United States will not be subject to excess-profits tax to any significant degree. Generally speaking, this is accounted for by the $25,000 minimum excess-profits tax credit or by the higher rates of return (12 percent and 10 percent) allowed on the first $10 million of invested capital. The distribution of capital ratios is such that practically all of the banks with less than $100 million in deposits will get the benefit of these higher credits in computing their excess-profits tax.

This means that the remaining banks, numbering approximately 180, will be the only banks in the country which will be subject to excess-profits taxes to any important degree. The details supporting this statement are shown in table II, and are explained as follows:

The figures given in table II are for member banks only. Corresponding figures for nonmember banks are not available, but as mentioned above only six of these have deposits of over $100 million.

TABLE II.—*All member banks, 1949 earnings*

Deposit class	Number of banks	Total capital	Total pre-tax earnings	Average capital per bank	Average earnings per bank	Excess profits tax credit
$1,000,000 and under	507	$40,901,000	$4,204,000	$81,000	$8,000	$25,000
$1,000,000 to $2,000,000	1,368	187,349,000	22,408,000	137,000	16,000	25,000
$2,000,000 to $5,000,000	2,392	615,141,000	74,402,000	257,000	31,000	31,000
$5,000,000 to $10,000,000	1,241	640,452,000	70,437,000	516,000	62,000	62,000
$10,000,000 to $25,000,000	778	834,390,000	95,280,000	1,072,000	122,000	129,000
$25,000,000 to $50,000,000	267	594,619,000	64,795,000	2,227,000	243,000	267,000
$50,000,000 to $100,000,000	140	620,358,000	65,209,000	4,431,000	466,000	532,000
Over $100,000,000	175	5,621,150,000	554,110,000	32,121,000	3,166,000	2,870,000
Total	6,868	9,154,366,000	956,935,000			

It can be seen from table II that for all member banks with deposits under $100 million, the average earnings for each size group are no higher than the computed excess-profits-tax credit arrived at by applying the allowed rates of return to the average amount of capital. For banks with deposits of less than $2 million, the $25,000 minimum exemption will generally be greater than the earnings of a bank of this size.

It might appear from the law of normal distribution that where the excess-profits-tax credit is identical with the average earnings, one-half of the banks would pay some tax and the other half would pay no tax. There are, however, further considerations leading to the conclusion that few, if any, banks in such a size group would be subject to the tax. For example, the earnings shown in table II probably include income from tax-exempt and partially tax-exempt securities, capital gains, etc., which are exempt from excess-profits tax.[1]

With respect to the absence of corresponding figures on nonmember banks it should be pointed out that 87 percent of these banks are very small, having deposits of less than $5 million.

If the statistical integrity of this analysis is accepted, it seems clear that the excess-profits tax as now written impinges on a very small proportion of the Nation's banks * * * something of the order of 2 percent of the total number.

This circumstance does not lead to the conclusion that the law is just or equitable. It singles out a very few banks to bear the whole burden of the tax.

This conclusion has additional significance when it is considered that most of the largest banks in the country, namely, most of those in New York City, will be exempt from the tax by virtue of their abundant capital. Statements to this effect were made by the managements of many such banks at stockholders' meetings in January 1951.

The ultimate effect of the Excess Profits Tax Act of 1950, therefore, is to tax almost exclusively banks of intermediate size outside of New York City. These banks are those discussed in previous pages and characterized as being in rapidly growing centers where bank capital is needed.

In other words, the tax falls most heavily on those banks most in need of capital.

THE AVERAGE EARNINGS METHOD OFFERS NO SOLUTION TO BANKS AS IT DOES TO OTHER TYPES OF CORPORATIONS

Unlike other industries in which some companies will elect the average earnings base while others will compute their excess-profits-tax credit by the invested-capital method, it seems safe to assume that practically all banks will be forced to use the latter method.

This is not because banks are enjoying substantially higher earnings than in the base years, but is for the reason that under the law, banks are not permitted to include in their base year earnings, income from partially tax exempt Government bonds. This situation is described below:

In the normal course of business, banks have a substantial portion of their resources invested in United States Government securities.

Government securities issued prior to March 1, 1941, were partially tax exempt (exempt from Federal normal-income tax but subject to surtax), while those issued subsequently have been fully taxable. The amount of partially tax exempt bonds outstanding has been steadily declining because of maturities and redemptions.

Most banks had an important amount of income from partially tax exempt bonds during the base years, 1946–49, as defined under the present excess-profits-tax law. This income, exempt from excess-profits tax, may not be included in computing the excess-profits-tax credit under the average earnings method.

As the partially tax exempt bonds mature, the banks, perforce, replace them with fully taxable bonds thus subjecting a considerable amount and an increasing proportion of their income to normal tax and "excess" profits tax. In this process, however, there is no real gain in net earnings before excess-profits tax. There is merely a change in the tax status of an important part of the income received by banks.

The excess-profits-tax credit available to banks under the average earnings method is artificial, therefore, in relation to the total income of most banks and is not a practical, true, or equitable base for determining "excess" profits. Banks, in effect, have no alternative to the use of the invested capital method for computing their excess-profits-tax base. They differ from all other industries in this respect.

[1] This income would be offset in part by reduced EPT credits due to holdings of inadmissible assets. Table II does not exclude the exempt income or allow for the adjustments in the credits.

PARTIALLY TAX EXEMPT FEDERAL SECURITIES OUTSTANDING

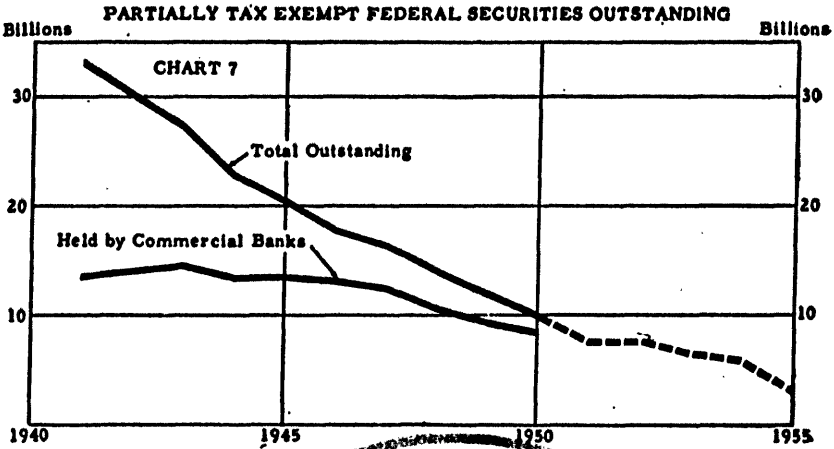


Chart 7 shows how the supply of partially tax exempt Federal securities has declined from more than $33 billion in 1941 to about $11 billion at the end of 1950.

The chart also shows how commercial bank holdings of this class of investment have been forced downward in recent years.

The projection of the total available supply indicates that within 5 years virtually all partially tax exempt Federal securities will be eliminated from bank portfolios.

% IMPORTANCE OF PARTIALLY TAX EXEMPT SECURITIES IN BANK PORTFOLIOS %

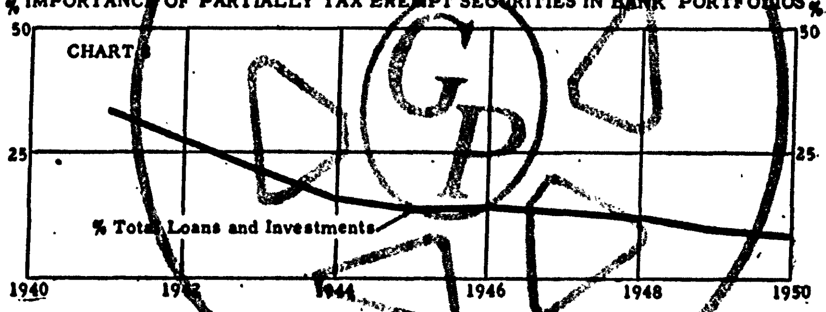

Chart 8 shows how the partially tax exempt bonds have declined in importance as a part of all bank loans and investments (earning assets).

In 1941 nearly 30 percent of all commercial bank earning assets consisted of partially tax exempt Federal securities (prior to 1941 all U. S. Treasury bonds were partially tax exempt). Today, the percentage stands at less than 7 percent.

By the end of 1951 it is likely that the amount of partially tax exempt Federal securities held by commercial banks will be less than one-half the amount held by these banks during the 1946–49 period and by the end of 1955 the amount is expected to be less than one-third the 1946–49 period.

BANKS CANNOT SOLVE THEIR PROBLEM BY RAISING MORE CAPITAL BECAUSE EARNINGS ARE ALREADY TOO SMALL TO ATTRACT NEW CAPITAL ON A REASONABLE BASIS

From the standpoint of the comparatively small number of banks in growing cities where capital is short in relation to deposits and which, accordingly, will generally be subject to heavy excess-profits taxes, it would seem that the solution would be for those banks to acquire additional capital. This would improve the position of such banks and at the same time afford important relief from excess-profits taxes.

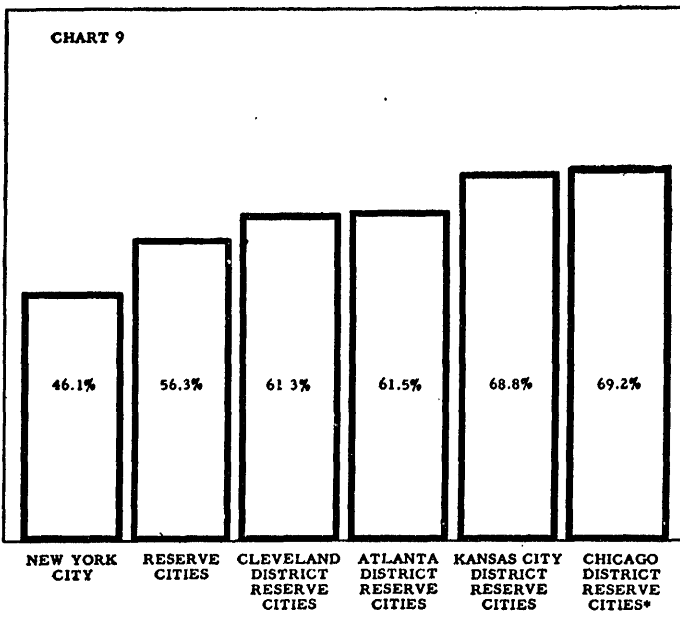
There are only two sources for the acquisition of additional capital for a bank. One of these is the reinvestment of earnings after the payment of dividends; the other is the sale of additional stock.

With respect to the first alternative, chart 9 shows that those areas most in need of additional bank capital have retained very substantial proportions of earnings. Dividends have been held to a minimum in order to provide additions to capital structures. To further restrict or curtail dividend payments is to make more remote the posssibility of acquiring additional capital through the sale of stock at any time in the future.

Chart 9 also shows that in the period 1941–49 New York City member banks retained only about 46 percent of their earnings. Member banks in all Reserve cities retained 56 percent of their earnings. Excluding the city of Chicago itself, banks in the Chicago Federal Reserve district retained nearly 70 percent.

It is clear, then, that banks needing additional capital have operated under extremely conservative dividend policies while those with ample capital paid out a more normal percentage of their earnings in dividends.

AVERAGE PERCENT OF EARNINGS RETAINED 1941-1949
MEMBER BANKS IN SELECTED AREAS



*Includes Detroit but not Chicago

With respect to the other alternative, namely, that of raising capital through the sale of additional stock, this avenue is not readily accessible because of the fact that bank stocks in general sell at substantial discounts from book value. This is true even in New York City, where a relatively large proportion of earnings are paid out in dividends. If rights to sbuscribe for additional stock are offered at a price that is below book value, those stockholders (frequently smaller holders) who are not eager and may not be in a position to make an additional investment will have their equity diluted in a manner which many would consider unfair.

Stated otherwise, it is frequently impossible to find a way to price new bank stocks that is at once attractive to shareholders and advantageous to the banks needing the capital.

If this problem is to be squarely faced, it must be admitted that certain banks are badly in need of additional capital and that if the necessary capital is to be obtained the banking system must be allowed sufficient earnings either to generate the required capital internally by means of retained earnings or to attract new capital by presenting an attractive competitive alternative for the investment of new funds in the capital markets.

The record of the past 15 years indicates that with extraordinary Federal control of interest rates and other operating conditions, banks have not been able to earn at a rate comparable to other types of business. Because of low earnings, banks generally have not been able to enter the money markets for new capital on a fair and reasonable basis and have not been able to retain sufficient earnings as an alternative.

RATIO OF MARKET TO BOOK VALUE

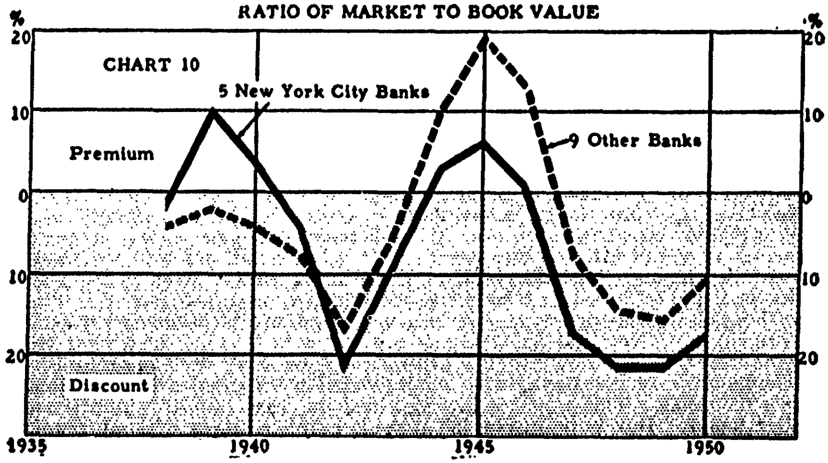


Chart 10 shows that, for the banks indicated, the average price of bank stocks has been substantially below the book values per share of such stocks in most years since 1940.

RETURN ON INVESTED CAPITAL
(3 year moving average)

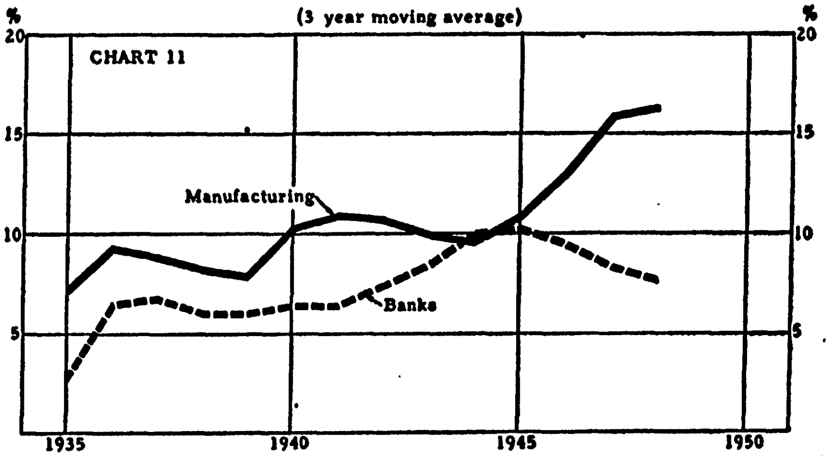

Chart 11 shows the return on invested capital for a group of 45 manufacturing industries and for all member banks for the period 1935 to 1949.

Over the 15-year period, the average rate of return earned by banks was approximately 65 percent of the average rate of return earned by the other industries.

From this it is clearly evident that the banking industry has not been a high-profit industry.

ADDITIONAL CONSIDERATIONS

Under the invested-capital method the 8-percent rate of return (before income taxes) allowed on capital in excess of $10 million does not permit many growing banks to earn amounts sufficient to create or attract new capital. The net return, after income taxes, becomes approximately 4 percent and with excess earnings taxed at 77 percent, great difficulty would be experienced by banks subject to excess-profits tax in earning as much as 5 percent net.

Banking is an essential industry. The problem presented here is not basically one of affording relief for bank stockholders but of permitting the industry, or certain affected segments of it, to have sufficient earnings so that the essential functions of banking for the over-all economy may be performed adequately and without strain. As stated recently by the New York State Superintendent of Banks:

"Banking is so closely entwined with the public interest that any undermining of its strength is of direct concern not merely to the owners of the banks but to the public generally."

In discussing the most recent of a long series of bank mergers, the American Banker editorially describes the acquisition by a large New York bank of a smaller independent bank as follows:

"The sale of the National Safety Bank by its principals reflects, of course, the current depressed condition of public investment interest in banks. Were banks in New York as attractive to investors as other investment opportunities, there would probably be a syndicate of individuals ready and eager to put up the millions that it would take to buy control of the bank and get into the banking business in this area. But costs are up and interest rates, even in the needle-trades area, are ceilinged to a level where banking runs a poor second to almost everything else investmentwise. Hence, in their desire to liquefy their estates, the principals of National Safety Bank are resorting to an arrangement which consists largely of the now familiar practice of liquidating their bank by sale of the assets to a bigger bank, with capital adequate to underwrite the smaller bank's liabilities. This practice has provided an escape for the proprietors of smaller banks. But only insofar as it adds earning assets without requiring proportionate increase in capital for the larger bank, does it offer even small relief for the unhealthy investment situation of the stocks of the larger banks."

The excess-profits-tax law gives special treatment to the airlines, the public utilities, and the railroads. It is understood that one of the underlying reasons for the special treatment afforded these industries is that their profits are already regulated by State or Federal authorities.

In a sense commercial banking is also a regulated industry. The price of its principal commodity, bank credit, has long been regulated by the Federal Reserve Board and the Treasury. The character and quality of commercial bank assets is subject to the scrutiny of such Federal authorities as the Comptroller of the Currency, the Federal Reserve Board, and the Federal Deposit Insurance Corporation, and by banking departments in every State.

The amount of reserves which must be maintained in the form of a nonearning asset is prescribed by the Federal Reserve Board in the case of member banks and by State authorities in the case of nonmember banks. Such authorities may and do instruct banks as to what assets must be charged off and as to the quality of investments which may be held. Regulations also prescribe the amount of money that may be loaned to any one borrower and the amount that may be invested in any one issue of securities.

It is thus clear that from many viewpoints the commercial banking industry may logically be regarded as a regulated industry. As such, there is a basis for providing banks with special treatment under the excess-profits-tax law.

Suggestions as to how the law might be amended to correct the conditions outlined in this report are available in a separate memorandum.

Senator BYRD. In lieu of an appearance the Chair inserts in the record a statement of Mr. Joseph L. Hull, general counsel of the Seismograph Service Corp., of Tulsa, Okla.

(The document referred to follows:)

SEISMOGRAPH SERVICE CORP.,
Tulsa, Okla., July 25, 1951.

SENATE FINANCE COMMITTEE,
United States Senate, Washington, D. C.

GENTLEMEN: We respectfully submit the enclosed statement with regard to section 123, revenue bill of 1951, H. R. 4473, for the consideration of the committee in connection with its study of current revenue legislation.

Yours very truly,

JOSEPH L. HULL, Jr.,
General Counsel.

STATEMENT OF JOSEPH L. HULL, JR., GENERAL COUNSEL, SEISMOGRAPH SERVICE CORP., TULSA, OKLA.

H. R. 4473, revenue bill of 1951, approved by the House of Representatives and now under consideration by the Senate, contains, in section 123 thereof, provisions drastically changing the existing tax policies relating to business enterprises carried on in certain corporate forms. The intended purpose of this statement is to bring to the attention of the committee certain inequities, discriminations, discrepancies, and hardships which, it is believed, may result from the application of section 123, H. R. 4473, if enacted.

Section 123, H. R. 4473, of the revenue bill of 1951 in general provides for the limitation of a group of affiliated corporations to one $25,000 surtax exemption and one $25,000 minimum excess-profits credit. The section amends section 26, Internal Revenue Code, which provides for certain credits of corporations by add-

[3] Published by the Board of Governors of the Federal Reserve System, 1943 edition.

ing the provision for limitation on surtax exemption. Although no specific $25,000 credit appears in section 26, Internal Revenue Code, section 15, providing for the imposition of the surtax on corporations, grants a $25,000 exemption. Section 121 of the bill now proposes to amend section 15 to grant an exemption only to the extent of that specified in the provisions of section 123. Therefore, although this statement is confined to the questions raised by section 123, the points of discussion are equally applicable to section 121 as it appears in the revenue bill.

The $25,000 general exemption to corporations under the surtax provisions first appeared in our revenue laws in the Revenue Act of 1950. Prior to that time and since the Revenue Act of 1941, a surtax had been imposed on a graduated scale upon incomes up to $25,000. The purpose of the flat exemption, as contained in the Revenue Act of 1950, is indicated by these words in the Senate report:

"A single exemption of the type in the bill best expresses the idea of a flat tax rate modified by a concession for small business. It is much simpler than a system of multiple exemptions and can be presented on the return form in a way which makes it easier for the taxpayer to compute the return."

The reason for the limiting provisions of section 123, as contained in the report of the Committee on Ways and Means, is stated as follows:

"Under existing law the $25,000 corporate surtax exemption and the $25,000 minimum credit under the excess-profits tax are available to each member of a group or chain of related corporations even though the degree of their association is sufficiently great so that they are virtually a single business enterprise. This treatment confers an unwarranted tax advantage on businesses carried out by means of a series of corporations, rather than a single corporation, and sets up an incentive for the artificial splitting up of corporations. This effect of the existing law is difficult to reconcile with the fact that the surtax exemption and the minimum credit were intended to confer tax advantages on small business. Therefore, section 123 of this bill reduces to one the number of surtax exemptions which may be claimed by a group of related corporations and limits the minimum excess-profits-tax credit to a single credit of $25,000 for the entire group."

It appears, therefore, that this House committee continues to sanction the $25,000 surtax exemption to corporations, but seeks simply to prevent the abuse of the exemption provision where the enjoyment thereof would be in contravention of the purposes for which the exemption is given. The House committee, however, assumes the position that a corporation which might otherwise be classified as a small business cannot be so classified when a member of an affiliated group of corporations; or, if a parent corporation; or, if a single subsidiary of a corporation; or, if controlled by an individual who controls one or more other corporations. We respectfully submit, in the following portions of this statement, points of consideration which we believe evidence a fallacy in the House committee's position, and which indicate the hardships and inequities which will result from the provisions of section 123 based upon such discriminatory views.

The provisions of section 123 require that any corporation which is a member of a controlled group on December 31 of any year shall be deemed a related corporation and subject to the limitation of its surtax exemption and minimum excess-profits credit. This would mean that all related corporations, regardless of when formed or acquired and for what purposes, existing on December 31, 1951, shall be subject to this limitation. Although these provisions are to be enacted for the expressed purpose of preventing abuses of the surtax exemption and excess-profits credit, no opportunity is provided for justification by the taxpayer of such actions taken in the prior formation or acquisition of related corporations. It is simply presumed that all such corporations are the result of artificial splitting up to avoid taxation. Thus, a so-called related corporation, organized or acquired for valid reasons and engaged in business of small proportions, shall be penalized by limitation of its exemption and credit for the sole reason that its outstanding stock is owned by another corporation, rather than individual stockholders. Similarly, this provision means that a corporation which may have operated for years relying to a certain extent upon the enjoyment of the surtax exemption, may suffer the imposition of added surtaxes for the taxable year by the purchase of its outstanding stock at any time during the year by an individual owning some other completely unrelated corporate enterprise, or by the purchase of its outstanding stock by a corporation engaged in some other unrelated business. Unless it can be said that the mere ownership of the outstanding interest in a corporation by another corporation, or by the owner of another corporation, enhances the competitive position of such corporations, surely it is evident that the penalty placed upon such corporation by the provisions in question might substantially affect its ability to compete with similar corporations not encompassed by such provisions.

Certain cases exist, and will arise in the future, where a separate corporate structure for the operation of an unrelated business is required, regardless of the tax consequences thereof. The formation of separate corporate entities in such cases is based upon valid business reasons or requirements, such as the need for separation of business ventures for accounting and financial purposes; the necessity to retain a certain corporation name for good will and competitive purposes; the requirements of certain State corporation laws that a corporation to be admitted may carry on but one business; and, most important, the limitation of liability which may be created for a new business venture. The latter purpose in forming a separate entity controlled by another corporation or by an individual controlling another corporation is probably the most important and prevalent of all. Many organizations, by reason of research and development, or energetic initiative, find themselves in a position to enter fields wholly unrelated to that in which they are primarily engaged. But the entry into such fields constitutes a new and sometimes hazardous business risk with many unknown liabilities which may arise. In the beginning stages of such ventures, any one liability—such as a patent infringement, a tort liability, or an innocent violation of the myriad of Government regulations providing multiple damages—could seriously affect the financial structure of the basic organization. The new venture, therefore, is carried on through a separate corporate entity in accordance with the sound judgment and customary business practices which have existed in this country throughout the years of its industrial growth. The section 123 in question now seeks to penalize the exercise of such judgment and the application of sound business practices, while professed to be intended to prevent abuse of the exemption and credit provisions. In most cases of existing related corporations, the limitation of exemption and credit would be received as an additional discriminatory increase in the already heavy corporate tax burden. In the cases where establishment of a new business is under consideration, certainly these limitations would be a substantial deterrent to such plans.

Faced with the peculiar situation of meeting the threat of inflation through expanded civilian production while shouldering the burden of rebuilding the military defenses of the free world, this country and its industrial component has accepted the challenge in the face of heavier tax burdens and increasing limitations on its freedom of action. The willingness of industry to meet the challenge must be nurtured and stimulated with the minimum of subsidy and privilege from the Government. It demands only that the burdens it must carry into this period be distributed and borne on an equitable basis, and, most important, that the right to compete in the market places be preserved and protected to the greatest extent commensurate with the public health, safety, and welfare. Legislative discrimination between competing business organizations based entirely upon the character of ownership is discrimination in its most despicable form. Except for classification of the nature of corporate organizations for specific and valid purposes, the tax laws of this country have never contained provisions which distinguish between corporate organizations for tax purposes solely on the basis of the character of ownership. The effect of such discrimination upon the initiative to create new business enterprises in the form of related corporations, so constituted for valid reasons, is one easily computed and simple to understand. For the sake of illustration, consider the following comparable situations:

The XY Corp. through research, develops a product which it believes can compete successfully in a wholly unrelated business. It has $100,000 to invest in the establishment of such business, which, for valid reasons, it feels requires a separate corporate organization. Assuming its earnings in this new business for the taxable year are $25,000, this new corporation will pay taxes (based on 1951 rates) as follows:

Normal tax at 25 percent	$6,250
Surtax at 22 percent	5,500
Excess-profits tax at 30 percent (assuming invested capital credit of $12,000)	3,900
Total	15,650

Meanwhile, John Doe, an individual owning no other corporate businesses, owns all of the stock of a corporation engaged in the business with which the above corporation intends to compete. Assuming John Doe's investment was

$100,000, and his corporate earnings $25,000 in the taxable year, his corporation will pay taxes (based on 1951 rates) as follows:

Normal tax at 25 percent	$6,250
Surtax	None
Excess-profits tax	None
Total	6,250

Obviously, the XY corporation will retain out of the earnings of its new corporation less than half of the amount which John Doe's corporation will retain. In addition, the XY corporation will be required to pay a tax of approximately 7 percent of the amount left if it should desire to receive the remaining earnings as a dividend. Also obviously, John Doe's corporation, earning twice as much after taxes as XY's subsidiary corporation out of the same amount of earnings before taxes, can undersell XY's subsidiary at any time it should desire. Certainly XY corporation, in its considerations to enter this new business under such circumstances, would have little desire to face competition of such type, where no amount of initiative and effort on the part of its personnel could overcome the competitive disadvantage imposed upon it by section 123.

More important in these times are the same facts when related to defense production. Many corporations, being urged to consider defense production and realizing the uncertainties incumbent in war contracts, including the retroactive operation of renegotiation, the unpredictability of longevity, the more restrictive labor provisions, and the frequent requirements of internal security, believe that a separate corporate organization is not only feasible but required in the ordinary exercise of sound business judgment. Having so concluded, they will be faced immediately with the problem illustrated by the examples above, wherein it is obvious that in open bidding they would be unable to compete. If contracts were obtained without competitive bidding, the cost of the product to the Government, reflecting the higher taxes, would be proportionately higher than that for which it could be furnished otherwise. Thus it appears that section 123 would be a deterrent to expansion and competition in defense production, which would result inevitably in higher costs to Government.

To this point, the matters urged in this statement have been discussed in behalf of those corporations and individuals who have acquired or will acquire related corporations for valid business purposes. It should not be inferred that the artificial split up is sanctioned in any degree. Tax legislation which would allow unrestrained, artificial splitting up of corporations solely for tax purposes would be as objectionable to such corporations and individuals as the section here under consideration. Such legislation would obviously afford a tax advantage to those willing to operate a single business through a number of related corporations and would therefore place the greater tax burden upon the corporations conducting similar businesses along customary lines of sound business practices. Again, the final effect would be upon the respective competitive efforts of the businesses so differently organized. It was not the intention of Congress in establishing the $25,000 exemption against surtax income that such split-ups should be encouraged. To the contrary, it was stated in the Senate report on the Revenue Act of 1950 that:

"Under this plan, the so-called 'notch-provisions' are eliminated. It is not intended, however, that the exemption of the first $25,000 of a corporation's surtax net income from the surtax shall be abused by the splitting up, directly or indirectly, of a business enterprise into two or more corporations or the forming of two or more corporations to carry on an integrated business enterprise. *It is believed that Sections 45 and 129 will prevent this form of tax avoidance.*" (Italics supplied.)

The sections 45 and 129 referred to gave unprecedented power to the taxing authorities to make adjustments in income, credit, deduction, and exemption calculations on the returns of all taxpayers where tax avoidance was evident. The mere existence of such provisions in the Revenue Code has been a powerful deterrent to the institution of many tax avoidance schemes which probably would have escaped discovery by revenue officials. It is submitted that there is no dearth of safeguards against the problem which Section 123 purports to resolve, but only perhaps a deficiency in the full and proper utilization of the methods of prevention now existing. If stronger preventive legislation is required, the sections referred to may be strengthened, leaving individual cases of tax avoidance to be dealt with on the basis of facts disclosed. The cure or the preventive should be the individual treatment provided in such Sections, not the mass amputations required by Section 123.

Special consideration should be given to the effect which section 123 will have upon the far-seeing policy instituted in support of this country's foreign trade as contained in the provisions for the Western Hemisphere Trade Corporations. In 1942, corporations engaged in business deriving 95 percent of their income from sales outside the United States and 90 percent from within the Western Hemisphere were afforded exemption from all surtaxes and excess profits taxes. After repeal of the excess profits tax provisions, the exemption from all surtaxes remained as a stimulant to foreign trade until the Revenue Act of 1950, at which time the special exemption was eliminated and a 33 percent credit against normal and surtax net income was substituted. In the Excess Profits Tax Act of 1950, these corporations were again exempted from such tax. Section 123, here under consideration, makes no provision for these corporations, thus bringing them within the limitations on surtax exemptions where they may be "related" corporations. Recalling the reasons given for the inclusion of section 123 in the tax bill, being the prevention of corporate split ups for tax avoidance, we call attention to a serious inconsistency. At the time preferential treatment was first offered Western Hemisphere corporations, there was widespread hesitancy with regard to the formation of subsidiary corporations to take advantage of the benefits allowed, chiefly in view of the provisions of section 45. Later, with the enactment of section 129, providing that tax savings effected by the acquisition of control of another corporation for the purpose of evasion or avoidance of Federal taxes should be denied, the feeling was strengthened that such action was thus effectively prohibited. Then, in 1945, the Bureau of Internal Revenue ruled that section 129 did not apply to Western Hemisphere Trade Corporations, stating that:

"In view of the foregoing, it is held that the creation of a new domestic corporation to carry on the business in the Western Hemisphere (other than in the United States) of an existing domestic corporation does not constitute tax avoidance within the meaning of section 129 of the code, even though the new corporation was created for the principal purpose of gaining the benefits provided by the first exception in section 15 (b) of the code and by section 727 (g) of the code" (I. T. 3757, 1945 Internal Revenue Bulletin No. 17).

Thus appears the inconsistency of the proposal of section 123, presupposing the formation of subsidiary corporations, including these Western Hemisphere corporations, to be tax avoidance schemes, while the authorities charged with enforcement of preventive laws expressly rule that in the case of such special corporations their formation for such purposes is sanctioned by law. No evidence has been offered to support the conclusion that the following statements, contained in the Bureau's ruling, are no longer true:

"The exemption provided by the first exception in section 15 (b) of the code was intended primarily to remove competitive disadvantages created by double taxation with respect to the income of domestic corporations doing business to a substantial degree in foreign countries. (S. Rept. No. 1631, 79th Cong., 2d sess. (C. B. 1942-2, 504, 532).) The purpose of the enactment of section 727 (g) of the code appears to have been similar in nature. It is not believed that Congress, in enacting section 129 of the code, had any intention of repealing or otherwise varying existing benefits provided by the first exception in section 15 (b) and by section 727 (g) of the code. It appears from the structure of sections 109 and 727 (g) of the code. and the apparent purpose thereof, that Congress sought to make this relief available to any domestic corporation, provided only that it could satisfy the gross income and other specific requirements of those sections of the code. The absence of any other restrictions or conditions relating to eligibility for such relief leads to the conclusion that the basic policy underlying those sections contemplates that they shall apply to any domestic corporation which can, for a particular taxable year, satisfy such conditions as are specifically set forth therein without regard to the time of, or the occasion for, the organization of such corporation."

It therefore seems that the failure to provide for the Western Hemisphere corporations in section 123 is either an oversight or is an unwarranted reversal of congressional policy toward organizations furthering our foreign trade.

In view of the discussion contained in the foregoing, it is respectfully submitted that the following suggestions should be considered:

1. Section 123, H. R. 4473, should be eliminated from the Revenue Act of 1951.
2. If not entirely eliminated, section 123 should be amended to apply only to related corporations becoming members of controlled groups after December 31, 1950.
3. If not entirely eliminated, section 123 should be further amended to exempt Western Hemisphere Trade Corporations from the provisions thereof.

Senator BYRD. In lieu of an appearance, the Chair inserts into the record a statement from Tubular Micrometer Co. of St. James, Minn.

(The document referred to follows:)

TUBULAR MICROMETER CO.,
St. James, Minn., July 24, 1951.

COMMITTEE ON FINANCE, UNITED STATES SENATE,
Senate Office Building, Washington, D. C.

GENTLEMEN: We herewith request consideration of a tax problem which threatens the very existence of this corporation unless some form of adjustment in the excess profits tax law can be made. Our increased volume requires additional capital and is a strain on our cash position yet the present tax structure does not leave us enough profit to carry this additional volume and continue to retire our indebtedness on the basis to which we have been committed.

We are the only metalworking industry in this county. Our products consist primarily of small hand tools for use by the machinist and tool and die makers. Among others, these consist of micrometers, vernier calipers, height gages, machinist squares, combination squares, and so forth, being primarily confined to the category of hand measuring tools.

Under the present scale of defense production, we have more business than we can use. Our products are accepted by the various branches of the Government services, being purchased primarily by the Navy Purchasing Office in Washington, who purchases this type of tool for all the armed services. At the present time, we are holding prime contracts of somewhat over $1½ million and subcontracts totaling a substantial amount.

Our operations during World War II were considerably smaller than during this emergency. Nevertheless, we operated at a satisfactory profit until technicalities in contract terminations in 1945 reflected a net loss of $44,000 in that year. The present base-period of 1946–49 shows the following figures for our operations.

Fiscal year ended	Net sales	Net profit before taxes	Net profit after taxes
Jan. 31, 1947 [1]	$149,971.03	$3,102.12	$1,483.87
Jan. 31, 1948	540,322.06	2,075.07	1,600.78
Jan. 31, 1949	489,347.27	1,814.75	1,208.39
Jan. 31, 1950	533,027.84	2,734.39	1,917.03

[1] This was a 3-month period for an adjustment in the fiscal year.

During 1950 our net sales had increased to the point where the operations rose above the break-even point and ended the year with a profit of approximately $63,000 on $827,000 in net sales. This profit, of course, was before income and excess profits taxes.

During the period from 1946 through 1949, our average employment was about 135 people. We now employ 325 people. Sales in 1951 should total between $1½ million and $2 million.

The principal reason for our sales being so low during the base period was due to the fact that the many thousands of our tools and those of our competitors were thrown onto the market at greatly reduced prices by those in the salvage business. The salvage operators operated at a considerable profit to our disadvantage, due to the fact that they had purchased these tools from the War Assets for 5 to 10 cents on the dollar, and resold them at 50 cents on the dollar. During this period we had hopes that eventually the surplus tools would be off the market and we would again be able to operate at a satisfactory profit when the present defense program and the resultant excess profits tax law came into effect.

Our present volume of business demands that we expand our facilities. Our operations in the base period so depleted our cash that a 5 year amortization on a certificate of necessity does not appear to be the answer, due to the fact that cash requirements would necessitate borrowing and would reflect an unbalanced financial condition. We would not hesitate to borrow, however, in order to meet this emergency and do our part, if there was some hope that taxes would not eliminate us and that there would not be a reoccurrence of the "dumping" process after the emergency is over. It seems that when there is an emergency, our products are in great demand. When there is no emergency, we are competing with Uncle Sam for a market which should belong to this industry. The nature of this business is such that it takes years for a proper tooling program and therefore, precludes the possibility of converting to other products unless we discontinue this type of business entirely.

The writers of the present law evidently intended that distressed industry groups were covered by the various provisions such as arriving at a base through a percentage of the dollar value of the assets of the company during the base period. Other methods and alternatives are available, none of which allow a base which should average out at a satisfactory investment in this type of business through the base period and the present period of inflation. It appears that only those companies which are already strong receive protection in the present theory. There are less than one-half dozen in this type of business whose products are acceptable to the Navy Purchasing Office. Our three major competitors are all over 75 years old and have substantial means that allow them satisfactory profits. We manufacture very high quality products which are in acute demand. Our operations are efficient and our costs very favorable in the light of competition.

Is there no relief? If there is none, what course should we pursue? If we limit our profits by spending heavily for advertising to establish a market after the present emergency has passed, we will not have bettered our financial standing to the point where new customers will have confidence in our products. Is it not possible for a business such as ours to pay a just tax, contribute to the defense effort, and still remain sound financially?

Will it be possible in considering the new tax legislation that those who draft the new tax bill may give some consideration to the businesses which are not in the grocery-store class but are in the medium to upper brackets of the small-business classes. Is it possible that an allowance could be made to exempt a greater portion from the excess-profits base so that indebtedness could be paid during the time when the products of a business of this type are in great demand so that the business will be able to withstand the shock of reconversion when the demand subsides?

Your consideration of our dilemma will undoubtedly be welcome by other businesses which have the same problem.

Sincerely yours,

HOWARD M. JAMES,
President, Tubular Micrometer Co.

Senator BYRD. In lieu of an appearance, the chair inserts in the record a statement from Arthur J. Packard, dated July 26, 1951.

(The statement referred to follows:)

STATEMENT OF ARTHUR J. PACKARD

Mr. Chairman and gentlemen of the committee, I am Arthur J. Packard, president of the Packard Hotels Co., with headquarters at the Curtis Hotel, Mount Vernon, Ohio. I own and operate a chain of small hotels in the State of Ohio. I appreciate the opportunity of entering this brief statement with you in connection with hearings on increases in the Federal revenue. I am addressing you as a member of the governmental affairs committee of the American Hotel Association.

We appreciate the difficult problem your committee faces in attempting to raise up to $10 billion in additional revenue to finance a defense program which will adequately equip us to meet any expected emergency. We do feel strongly, however, that all Government expenditures should be carefully screened with a view to the elimination of nonessential disbursements in this critical period.

Although sometimes regarded as the seventh largest industry in America, the hotel industry is made up primarily of small establishments. While our association represents the great preponderance of all hotel rooms in the Nation, 88 percent of our member properties have 100 rooms or less, and 72 percent of our member hotels have 50 rooms or less. The profits of these establishments depend on the ability and hard work of the operators much more than on the capital invested in the business. You will not want to enact a tax law which is so burdensome that it discourages initiative and enterprise.

Whether you ultimately favor increased personal and corporate tax schedules, or whether you elect to broaden the excise tax base, or impose additional manufacturers' or retail sales taxes, will be for you to determine after these lengthy hearings which you are currently conducting. To go too far to raise any of these levies excessively, however, is sure to impair initiative and risk capital and jeopardize efficiency of business.

Let me devote this brief statement to some of the problems peculiar to our industry, which we hope you may have in mind as you approach any type of increased levies.

RETROACTIVITY

The suggested retroactivity of the income-tax features of this tax bill to some date early in 1951 might well mean grave inequities to those elements of business which, like ours, are currently under price ceilings. All the sales of food and beverage, and all the services within our hotels, except for our flower shops, and except for room rates, are currently frozen to January 25 ceilings, or to a percentage mark-up, based on a year or two ago. When you consider that, according to the annual report of Horwath & Horwath, hotel earnings in 1950 were only 5.66 percent after income taxes, you will see that any retroactive tax levy could be extremely burdensome. Unlike many industries, our volume of business, nationally, has continued to decline ever since 1944, so we could be squeezed badly if any form of tax were increased unduly.

EXCISE TAXES

The hotel industry has long been subjected to more excise taxes than any other industry known to us. Also we are an industry which is a heavy consumer of items which carry excise taxes, such as silverware, light bulbs, kitchen equipment, commercial vacuum cleaners, and heating and refrigerating equipment. This has brought into being many irritating situations. Let me invite your attention to some of these.

We fail to understand the logic whereby the Congress, in 1946, repealed the 15 percent transportation tax on foreign travel, but continued the imposition of this levy on domestic travel. Travel from our northern, southern, eastern, and western boundaries in America is thus encouraged to foreign ports, and discouraged within the continental boundaries. I think the Congress should be consistent in this, and either restore the tax on foreign travel, or repeal the levy on domestic travel.

It is now proposed to increase the Federal levy on alcoholic beverages from $9 to $10.50 a gallon, and on beer from $8 to $9 a barrel, with commensurate increases on wines of about 12½ percent ad valorem. The June issue of Changing Times, the news magazine published by Kiplinger, in Washington, reports the fact that there is already more bootleg liquor being sold in the United States than the supply which is marketed through legal channels. Without any doubt, every increase in these levies encourages illegal manufacture and sale of alcoholic beverages, beer, and wine. This can take place not only on a highly organized level, but also on a very small scale by individuals who are tempted by the differential in price between legal and illegal liquor. Without doubt, the increases in taxes on alcoholic beverages proposed in the House bill would spell diminishing returns to the Federal Treasury, as well as contributing to the moral turpitude of employees in many lines of business.

Some of the principles above enunciated have been borne out in the cabaret tax, which still stands at 20 percent. When this levy was reduced from 30 percent, in 1944, the Federal income jumped substantially. At the same time, the 20 percent levy has encountered so much guest resistance that more than half of the dine-and-dance rooms in hotels have been obliged to discontinue entertainment, thereby causing unemployment of musicians, waiters, and so forth.

Also, the 10 percent tax on oil, gas, and electrical equipment, and refrigerators and air-conditioning equipment which a hotel buys for its kitchen or other parts of the house comprise a tax on the tools of this business. Unless or until a general manufacturers' tax is imposed on all manufactured goods, the present excises comprise a discriminatory type of levy, and will continue to be burdensome upon those businesses, such as ours, which are heavy consuming industries. Exempt lines of manufacturer's products enjoy favored economic position and opportunities, which is not consistent with the American philosophy.

Further, it is conservatively estimated that 10 to 25 percent of the time of the clerical staff in certain departments of a hotel is required for the handling of the records covering taxes on individual guest accounts, and for billing. An illuminating illustration comes from one hotel in Washington, D. C., which made 91,748 computations last year, involving the excise tax on communications alone. Further, there were 3,455 guest checks upon which the cabaret tax was applicable for a single month. This would mean approximately 41,460 such computations for a year. Incidentally, this particular hotel, which is a member of a chain operating in seven cities, shows that for 1949 local, State and Federal taxes accounted for total levies equivalent to $578.17 per room per year. Even this sum does not include liquor licenses, excise taxes, or local or State sales or use taxes. But even this sum means a tax overhead of $1.58 per guest room per day, regardless of whether the guest room is occupied or empty.

Not only is the burden of this computation excessive, but where a long list of employees works on records which involve tax calculations, we are constantly vulnerable since some innocent error may occur on the part of some one employee which can mean a tax liability upon the hotel. We know that whenever an error occurs in computing the tax on a guest's telephone and telegraph bill, and the proper amount is not collected from the guest at the time he checks out, the hotel is stuck.

SECTION 22 (B) (9) OF THE REVENUE CODE

There is now pending before your committee H. R. 2416, which would make permanent in the Revenue Code that provision which the Congress has renewed annually for the past 4 years. This section excludes from gross income, in the case of a corporation, the amount of income attributable to the discharge of indebtedness evidenced by a bond, debenture, note, certificate, or other evidence of indebtedness. In the event an amount is excluded from gross income under this provision, a reduction is made in the cost basis of the corporate property upon which depreciation is taken. Although this results in a mere postponement of tax liability, not an exemption, I believe that the Federal Government should continue to offer this small inducement to a corporation to reduce its outstanding indebtedness.

VIRGINIAN HOTEL CORP. CASE

Hotels generally have been deprived of a substantial amount of surplus capital credit during the past 6 years as a result of the 5 to 4 decision of the Supreme Court in the Virginian Hotel Corp. case (319 U. S. 523). Under that decision, whenever it is determined that depreciation has been taken at an excessive rate, and/or life of an asset extended, the adjusted basis of the asset is reduced by the excess depreciation taken even though the taxpayer received no tax benefit therefor.

For many years the hotel industry was guided entirely by the recommendations of the Bureau of Internal Revenue, as published in bulletin (F). But when the Commissioner departed from the principles set forth therein, and saw fit to disallow a recovery of excessive depreciation, even though taken innocently and erroneously, hotels, and other business establishments affected by such circumstances, were penalized. The position which the Commissioner has taken has the effect of allowing the taxpayer a high depreciation deduction when he has no income, and a smaller depreciation when he has income to be offset thereby. It is unfortunate that a taxpayer must reduce his fixed asset base period at all when he has no profits; but when the reduction is at a rate in excess of the rate subsequently determined as acceptable by the Treasury Department, an even greater hardship results.

This principle is present in hotels generally these days, because when originally built, most hotels elected to set up a 30- to 40-year useful life, for purposes of depreciation, in connection with income-tax returns. Now the Commissioner is coming along and extending the useful life of those properties, and thus bringing to light many instances when excessive depreciation was taken. The effect of H. R. 3168, which is currently before your committee, is to provide that the adjusted basis of property is to be reduced by excessive depreciation shown in a return only to the extent that such excessive depreciation resulted in a reduction in taxes. We hold that this is an eminently fair provision, and must be enacted if the inequities resulting from the Supreme Court decision, and from the Commissioner's departure from bulletin (F), are to be removed.

SUGGESTED AID TO SMALL BUSINESS

The hotel industry, as stated earlier, is essentially an industry consisting of many small units. According to the 1948 Census of Business, of the total number of hotels enumerated, 29,650 (about 88½ percent) have fewer than 100 rooms. Of the total number of hotels in the country, a little more than 5,000 are operated by corporations, and of these, more than 3,000 have fewer than 100 rooms. In other words, the hotel industry includes more than 3,000 small corporations owned and controlled by one, or not more than a few persons. These men operating small businesses should have the advantages and protection of operating their businesses as corporations, but often our income-tax laws make them pay a very heavy price for that privilege.

In order to protect these small corporations and avoid the dissolution of many of them, the hotel industry urges that the owners of any small corporation, if the number of such owners is not more than five, be given the right to file their income-tax returns as a partnership, under rules and regulations to be prescribed by the Commissioner of Internal Revenue with the approval of the Secretary of the Treasury. We think that this should be a permanent provision of the Internal Revenue Code.

Such a provision would not only give thousands of small-business men a protection which they can enjoy only at a heavy cost in taxes in many cases, but also would simplify the taxation of these small businesses. There would be no longer any questions arising as to the reasonableness of salaries drawn by such officers, the deductibility of charitable contributions made through their business bank accounts, nor would there be any question of whether the surplus accumulated in the business is reasonable or unreasonable.

This could be readily accomplished by amending the income-tax sections and the excess-profits tax sections of the Revenue Code.

CLOSING LOOPHOLES

May I next direct your attention to section 422 of the 1950 Revenue Act. We pay high tribute to your committee for including in last year's tax law a provision which taxes the unrelated business activities of certain tax-exempt groups.

The Secretary of the Treasury testified last year that 5 percent of gross retail sales in the country are now being transacted by tax-exempt establishments. We know that in our field there is a growing volume of food and beverage business being done by tax-exempt groups in direct competition with taxpaying hotels and restaurants. We do not propose that any tax-exempt establishment be barred from furnishing food and drink, or housing, to their own members. But at the moment some of those organizations openly bid for the patronage of large public groups, for profit, and we contend that they are thereby sacrificing their immunity, under the spirit of the tax laws.

Congress did require last year, for the first time, that those tax-exempt establishments coming under paragraphs 1, 6, 7, and 14 of section 101 of the code be made subject to the act. We have been working with the Division of Tax-Exempt Organizations of the Treasury Department subsequent to the passage of this act, and find that the new reporting forms which are now being developed will insure a reasonable degree of compliance by the affected organizations.

But we do respectfully suggest that the flat exemption now being accorded fraternal and social organizations under the code should be reviewed. If it is proper to cover under the Federal income-tax laws some tax-exempt organizations, we believe it is sound to cover all of them. As the Federal tax levy increases, percentagewise, a disproportionate volume of business can flow to those establishments which continue to enjoy an exemption. As an example, in some communities, fraternal and social clubs are the worst offenders, when it comes to catering to public groups, for profit, in the furnishing of lodging, luncheons, banquets, and other food and beverage services. And yet these groups are specifically exempt under the code.

The Bureau of Internal Revenue tells us that even though a fraternal organization is doing a substantial amount of public business, for profit, in competition with taxpaying establishments, the Treasury cannot assess that corporation. The only thing they can do is to come to that corporation, confront them with the evidence of these frequent public functions, and ask them to either terminate such practices or sacrifice their tax-exempt status. We contend that the Treasury is thus waiving prospective Federal revenue by continuing a specific exemption of such groups and permitting them to go right ahead engaging in profitable activities, through catering to the general public.

We do especially urge that a study be made of this situation, and that the second step be now taken toward exposing all tax-exempt organizations to Federal income tax when it is found that they are frequently engaging in the service of food or lodging to large public groups, entirely foreign to their own membership.

SECTION 123 OF H. R. 4473

This provision would attempt to limit a group of related corporations to a single surtax exemption and a single minimum excess-profits credit. Although it is conceivable that in some instances corporate groups are now able to reduce tax liabilities under existing statutes, adoption of this provision would disregard corporate entities and increase corporate taxes merely because their stockholders were also stockholders of other corporations.

It has been pointed out by Treasury spokesmen that adoption of this section would simplify administrative procedures in checking related corporate groups. In many cases these corporate groups may have been in existence for a long period of time, and it might easily prove highly inequitable to compel them to dissolve because of this new proposal.

As I emphasized earlier, the hotel industry is essentially an industry of small establishments. My own chain of hotels is a good illustration. I have seven hotels, located in six different cities in the State of Ohio. Each of these hotels is subject to vicissitudes of weather, general business conditions, acts of God, and the general whims of the traveling public. It is conceivable that in any given year some of the hotels might prove profitable, whereas others would lose money. I have felt that it would be eminently unwise to demand that any one or two hotels should carry the load for other establishments which went into the red. As a matter of fact, if one of my hotels should lose money consistently over a period of time, and if I could not devise methods by which it could be converted into a profitable operation, the sooner I could sell such an establishment the better. And, if such an establishment were incorporated separately, the sale of the property would be simplified.

Hotels are service establishments. It matters not what brick, steel, or mortar goes into a hotel building. Unless the establishment maintains a level of service that is pleasing to the patrons, it will not succeed. Providing that personal service is the everlasting test of good management. There is an old saying in our industry, "Two hotels, two headaches." There is no doubt in my mind but that the adoption of this section 123 of the House bill will discourage hotel men from venturing risk capital and undertaking the obligations involved in providing a high level of service in more than one establishment. It would certainly open the door, also, for other tax-evasion practices, thus defeating the purpose for which the amendment is designed.

There are certain advantages which come from owning and operating more than one establishment. These embrace group purchasing, specialized legal and accounting standards, training of key staff people to take over other establishments, and so forth. But these might be outweighed by the requirement that all such related groups be brought under a single corporate tent for tax purposes. I think clearly the proposal would retard business growth and expansion. And I conceive this to be out of step with the well-considered tax legislation normally enacted by your committee.

INCREASE ON TAX ON RETAIL LIQUOR DEALERS

Section 461 of H. R. 4473 proposes to increase the occupational tax on retail dealers in liquors from $27.50 to $50 a year. There appears to be no justification for such a substantial increase in tax. This tax has never been designed for revenue-producing purposes but is in the nature of a regulatory license, and the amount is obviously designed to cover expenses of administration only. The hotels having liquor licenses already pay heavy license fees to State authorities, and if the beverage industry is to contribute higher taxes to the Federal Government it will do so under the provisions of sections 451, 452, and 453, reference to which is made above. Even during World War II this occupational tax on retail dealers in liquor was increased only from $25 to $27.50, and there appears to be no justification for practically doubling the tax by raising it to $50 at this time.

Senator BYRD. In lieu of an appearance, the Chair inserts into the record at this point a letter dated July 24, 1951, from W. A. Mogensen of Avco Manufacturing Corp., together with a memorandum.

(The documents referred to follow:)

AVCO MANUFACTURING CORP.,
New York, N. Y., July 24, 1951.

Senator HARRY F. BYRD,
Acting Chairman, Senate Committee on Finance,
Washington, D. C.

DEAR SENATOR BYRD: As suggested in your letter of July 19, 1951, I wired you waiving the time allotted to me so as to expedite completion of the public hearings.

My request for appearance was to point out to the United States Senate

Finance Committee a provision of the present excess-profits-tax law which discriminates unfairly against companies such as Avco Manufacturing Corp., and gives certain other taxpayers an unfair advantage. I am submitting herewith for the committee's consideration a memorandum which describes the operation of this provision in some detail and contains the draft of a simple amendment to the law which removes the inequity and, at the same time, very much simplifies the law.

My company, Avco Manufacturing Corp., like many other taxpayers, computes its excess-profits credit on the average-income method. Under this method the taxpayer uses as the basic measure of normal profits 85 percent of the average income for the three best years in the base period. To this average income the taxpayer is allowed to add a credit for increases in capital during the last 2 years of the base period. An adjustment is also made for capital additions and reductions subsequent to the base period. In general, capital additions and reductions consist of changes, up or down, in paid-in capital, earned surplus, borrowed capital, and in so-called inadmissible assets; that is, investments in the stock of other companies.

The inequity is in the treatment of changes in inadmissible assets. In figuring the capital addition for the last 2 years in the base period, an increase in inadmissible assets is treated as a capital reduction, and a decrease in inadmissible assets is treated as a capital addition. However, in figuring post-base-period capital additions or reductions, changes in inadmissible assets are not specifically allowed as capital additions or reductions, but are given only the limited effect of offsetting other kinds of capital changes. This, I sincerely believe, is illogical, inconsistent, and inequitable.

Let me use the experience of my company, Avco Manufacturing Corp., as an illustration. At December 1, 1949, the beginning of our first excess-profits-tax year, we had inadmissible assets (stock investments in other companies) of some $10,500,000. During 1950 and early 1951 we sold practically all of our marketable stock investments aggregating some $12,000,000 to obtain additional working capital for our manufacturing business, as very substantial defense work has been superimposed on our normal civilian production. In other words, we sold assets which produced income exempt from excess-profits tax and invested the proceeds in manufacturing assets which are now producing income fully subject to excess-profits tax. Yet we are allowed no increase in our excess-profits credit, because the present law does not treat such post-base-period decreases in inadmissible assets as a capital addition. If we had retained our investments, and had borrowed the equivalent amount of our defense contract and other manufacturing requirements, we would have obtained an increase in our excess-profits credit. There is no good reason why sale of our inadmissible assets should not increase our excess-profits credit, particularly since we are using our own resources instead of burdening the national credit structure by unnecessary borrowings.

Furthermore, if we had sold our $12,000,000 of investments on November 30, 1949, or prior thereto, we would have been allowed a capital addition. This is because the law treats decreases in inadmissibles as capital additions during the base period but not during the taxable year. There is no logic whatever in treating a sale of inadmissibles in 1950 differently from a sale in 1949. If anything, the sale of inadmissibles in current years should be treated more favorably to the taxpayer, not less, especially where, as in my company's case, the effect of such a sale is to provide private working capital for the national-defense effort.

This and other inequities in the present provision regarding inadmissible assets are covered in the memorandum which I am submitting for your consideration. I might add that this memorandum has been considered by the Federal taxation committees of the American Institute of Accountants and of the New York State Society of Certified Public Accountants, and that the suggested amendment has received their full approval. I understand that this approval is covered in separate statements which they are submitting to your committee at these hearings.

The proposed amendment, which would greatly simplify Internal Revenue Code section 435 (g) merits, in our opinion, favorable consideration.

Sincerely yours,

AVCO MANUFACTURING CORP.
W. A. MOGENSEN,
Vice President and Treasurer.

NECESSITY FOR A TECHNICAL AMENDMENT OF THE 1950 EXCESS PROFITS TAX ACT TO AFFORD EQUITABLE TREATMENT TO TAXPAYERS HAVING CHANGES IN INADMISSIBLE ASSETS SUBSEQUENT TO THE BASE PERIOD

Under the 1950 Excess Profits Tax Act, in the case of a taxpayer computing its excess-profits credit under the income method, changes in inadmissible assets during the last 2 years of the base period are used in the computation of base-period capital additions and reductions and accordingly increase or decrease the excess-profits credit. However, under the act changes in inadmissible assets subsequent to the base period do not constitute capital additions or reductions (except to a very limited extent, i. e. reductions in inadmissibles are subtracted from capital reductions and increases in inadmissibles are subtracted from capital additions). There does not appear to be any logic or equity in the fact that post-base-period changes in inadmissibles are not to be considered as capital additions and reductions by themselves.

This provision of the present act adversely affects any taxpayer computing its excess-profits credit under the income method (and not having a capital reduction after December 31, 1949) if it had substantial investments in 1949 which it disposed of in 1950 or 1951 in order to obtain additional working capital to finance expanding manufacturing operations, including defense contracts. Such taxpayer's increased earnings resulting from the additional working capital employed in manufacturing operations are, under the present act, treated entirely as excess profits and taxed accordingly. This is for the reason that the taxpayer receives no additional excess-profits credit for the funds transferred from inadmissible assets, the income from which was exempt from excess-profits tax, to manufacturing operations, the income from which is subject to excess-profits tax. If the taxpayer obtained the additional working capital for manufacturing operations by sale of its own securities or by borrowings, it would otbain an increase in excess-profits credit. For such a taxpayer not to receive an additional excess-profits credit on additional working capital obtained from disposal of inadmissible assets is clearly inequitable and illogical. Conversely, a taxpayer which disposed of a portion of its operating assets in 1950 or 1951 and invested the proceeds in inadmissible assets suffers no reduction in excess-profits credit, even though its income subject to excess-profits tax has been substantially reduced by means of this transfer, and its excess-profits credit should, in equity, be reduced.

To illustrate the above in the form of a concrete example, assume that throughout the base period Company A and Company B were engaged in the same kind of business, had the same taxable net income from regular business operations, and had the same amount of business net assets which aggregated $1,000,000 for each company at December 31, 1949. Assume, however, that Company A also had $500,000 of stock investments. At January 1, 1950, the excess-profits credit based on income would be the same figure for each company, since the dividend earnings on Company A's stock investments do not enter into the computation of the credit. Assume that this excess-profits credit is $200,000 for each company. Now assume that on January 2, 1950, Company A sells its stock investments and uses the proceeds to buy $500,000 of additional business assets, and that Company B sells $500,000 of its business assets and uses the proceeds to purchase stock investments. Assume there were no capital additions or reductions for either company during the remainder of the year 1950. Under the present law the excess-profits credit of each company remains at $200,000. Company B will undoubtedly have no excess-profits tax liability for 1950, and will in fact have an unused excess-profits credit, since it has only half the amount of business assets which it had in the base period, and the dividend income from its stock investments is exempt from excess-profits tax. Company A will have a very large excess-profits tax, because its business assets have increased 50 percent with no corresponding increase in excess-profits credit. Company A, which has assumed new burdens of production, employment, and contribution to the national economy and defense, is penalized by the excess-profits tax, while Company B is rewarded with a tax exemption for relieving itself of those same burdens.

An additional inequity in this provision is that it applies only to the excess-profits credit under the income method. Under the invested-capital method all changes in inadmissible assets are fully reflected in the excess-profits credit. In the above example, Company A's invested-capital credit would be increased and Company B's invested-capital credit decreased, for the changes in inadmissible assets. The base-period income and invested capital provisions are therefore conflicting in this respect under the present law.

Attached is a draft of a proposed amendment to section 435 (g) of the Internal Revenue Code, which remedies the defects discussed above. The amendment provides that increases in inadmissible assets shall constitute capital reductions and decreases in inadmissible assets shall constitute capital additions. This is accomplished by the addition of two short sentences (sec. 435 (g) (3) (D) and sec. 435 (g) (4) (E) in the attached draft), and the deletion of a large amount of material which is superfluous, since these deleted provisions deal with special situations which are adequately covered by the proposed rule. The resulting simplicity of section 435 (g) is in itself an additional reason for adoption of the amendment as the present section 435 (g) and its effect on the regulations and excess-profits tax return form are unnecessarily complicated, confusing to taxpayers, and difficult of administration.

Draft of Proposed Amendment to I. R. C. Section 435 (g)

[Matter enclosed in black brackets indicates portion of existing law to be deleted by amendment; matter italicized indicates portions to be added by amendment]

(g) Net Capital Addition or Reduction

(1) Net capital addition.—The net capital addition for the taxable year shall, for the purposes of this section, be the excess, divided by the number of days in the taxable year, of the aggregate of the daily capital addition for each day of the taxable year over the aggregate of the daily capital reduction for each day of the taxable year. [If there is an increase in inadmissible assets for the taxable year, determined under paragraph (5), the net capital addition shall be the excess of the amount determined under the preceding sentence over

[(A) unless subparagraph (b) is applicable, the amount of such increase in inadmissible assets;

[(B) if the amount of such increase in inadmissible assets is in excess of the net capital addition determined without regard to this sentence and without regard to paragraph (3) (C), the amount of such increase in inadmissible assets minus 25 per centum of such excess.]

(2) Net capital reduction.—The net capital reduction for the taxable year shall, for the purposes of this section, be the excess divided by the number of days in the taxable year, of the aggregate of the daily capital reeduction for each day of the taxable year over the aggregate of the daily capital addition for each day of the taxable year. [If there is a decrease in inadmissible assets for the taxable year, determined under paragraph (5), the net capital reduction shall be the excess of the amount determined under the preceding sentence over

[(A) unless subparagraph (B) is applicable, the amount of such decrease in inadmissible assets,

[(B) if the amount of such decrease in inadmissible assets is in excess of the net capital reduction determined without regard to this sentence and without regard to paragraph (4) (C) and (E), the amount of such decrease in inadmissible assets minus 25 per centum of such excess.

(3) Daily capital addition.—The daily capital addition for any day of the taxable year shall, for the purposes of this section, be the sum of the following:

(A) The aggregate of the amounts of money and property paid in for stock, or as paid-in surplus, or as a contribution to capital, after the beginning of the taxable year and prior to such day.

(B) The amount, if any, by which the equity capital (as defined in section 437 (c)) at the beginning of the taxable year exceeds the equity capital at the beginning of the taxpayer's first taxable year under this subchapter.

(C) 75 per centum of the amount, if any, by which the average borrowed capital for the taxable year (as defined in section 439 (a)) exceeds the daily borrowed capital for the first day of the taxpayer's first taxable year under this subchapter.

(D) The decrease in inadmissible assets for such day, determined under paragraph (5).

(4) Daily capital reduction.—The daily capital reduction for any day of the taxable year shall, for the purposes of this section, be the sum of the following.

(A) Distribution to shareholders previously made during such taxable year which are not out of the earnings and profits of such taxable year; and

(B) The amount, if any, by which the amount of the equity capital (as defined in section 437 (c)) at the beginning of the taxpayer's first taxable year under this subchapter exceeds the amount of the equity capital at the beginning of the taxable year; and

(C) 75 per centum of the amount, if any, by which the daily borrowed capital (as determined under section 439 (b)) for the first day of the taxpayer's first taxable year under this subchapter exceeds the average borrowed capital for the taxable year; and

[(D) The amount determined under paragraph (6), relating to increase in certain inadmissible assets by a member of a controlled group; and]

[(E)] *(D)* 75 per centum of the amount determined under paragraph [(7)] *(6)*, relating to increase in loans to a member of a controlled group.

(E) The increase in inadmissible assets for such day, determined under paragraph (5).

(5) Definitions with respect to inadmissible assets.—For the purpose of this subsection—

[(A) Average inadmissible assets for the taxable year. The average inadmissible assets for any taxable year shall be the total of the daily amounts attributable to the inadmissible assets for such taxable year, determined under section 440 (b), divided by the number of days in such taxable year.]

[(B)] *(A)* ORIGINAL INADMISSIBLE ASSETS.—The term "original inadmissible assets" means the total of the inadmissible assets for the first day of the taxpayer's first taxable year under this subchapter, determined under section 440 (b).

[(C)] *(B)* INCREASE IN INADMISSIBLE ASSETS.—The term "increase in inadmissible assets" for any *day of the* taxable year means the excess of the [average] inadmissible assets for such *day* [taxable year] over the original inadmissible assets.

[(D)] *(C)* DECREASE IN INADMISSIBLE ASSETS.—The term "decrease in inadmissible assets" for any *day of the* taxable year means the excess of the original inadmissible assets over the [average] inadmissible asset for such [year] *day.*

(6) CONTROLLED GROUP.—If, on any day of the taxable year, the taxpayer and any one or more other corporations are members of the same controlled group, the amount added to the daily capital reduction under paragraph (4) (D) shall be whichever of the following amounts is the lesser:

[(A) The excess of the aggregate of the adjusted basis (for determining gain upon sale or exchange) of stock in such other corporation (or if more than one, in such other corporations) held by the taxpayer at the beginning of such day over the aggregate of the adjusted basis (for determining gain upon sale or exchange) of stock in such other corporation (or if more than one, in such other corporations) held by the taxpayer at the beginning of its first taxable year under this subchapter; or

[(B) The excess of the aggregate of the adjusted basis (for determining gain upon sale or exchange) of inadmissible assets held by the taxpayer at the beginning of such day, over the aggregate of the adjusted basis (for determining gain upon sale or exchange) of inadmissible assets held by the taxpayer at the beginning of its first taxable year under this subchapter.

The increase in inadmissible assets for the taxable year shall, for the purpose of paragraph (1), be determined by reducing the inadmissible assets for such day by the amount by which the daily capital reduction for such day is increased under this paragraph. As used in this paragraph, a controlled group means one or more chains of corporations connected through stock ownership with a common parent corporation if (i) more than 50 per centum of the total combined voting power of all classes of stock entitled to vote, or more than 50 per centum of the total value of shares of all classes of stock, of each of the corporations (except the common parent corporation) is owned directly by one or more of the other corporations and (ii) the common parent corporation owns directly more than 50 per centum of the total combined voting power of all classes of stock entitled to vote, or more than 50 per centum of the total value of the shares of all classes of stock, of at least one of the other corporations.]

[(7)] *(6)* LOANS TO MEMBERS OF A CONTROLLED GROUP.—If, on any day of the taxable year, the taxpayer and any one or more other corporations are members of the same controlled group, [as defined in paragraph (6)], the amount referred to in paragraph (4) [(E)] *(D)* shall be the excess of the amount of the indebtedness of such other corporation (or if more than one, such other corporations) to the taxpayer at the beginning of such day over the amount of the indebtedness by such other corporation (or if more than one, such other corporations) to the taxpayer at the beginning of such day over the amount of the indebtedness by such other corporation (or if more than one, such other corporations) to the taxpayer at the beginning of its first taxable year under this subchapter. For the purposes of this paragraph, the term "indebtedness" means indebtedness which constitutes daily borrowed capital, as defined in section 439 (b) (1), of such other corporation for such day.

As used in this paragraph, a controlled group means one or more chains of corporations connected through stock ownership with a common parent corporation if (i) more than 50 per centum of the total combined voting power of all classes of stock entitled to vote, or more than 50 per centum of the total value of shares of all classes of stock, of each of the corporations (except the common parent corporation) is owned directly by one or more of the other corporations and (ii) the common parent corporation owns directly more than 50 per centum of the total combined voting power of all classes of stock entitled to vote, or more than 50 per centum of the total value of the shares of all classes of stock, of at least one of the other corporations.

[(8)] (7) CROSS REFERENCE.—For special rules applicable to this subsection see section 441.

NOTE.—Cross references to portions section 435 (g) contained in other sections of the Code will also require change.

Senator BYRD. The Chair inserts into the record at this point a statement as requested by Senator Hill of Alabama, submitted by Stuart Hedden, president of Wesleyan University Press.

(The document referred to follows:)

STATEMENT OF STUART HEDDEN, PRESIDENT OF WESLEYAN UNIVERSITY PRESS

Wesleyan University Press has had an application for exemption from income taxation under the provisions of section 101 (6), Internal Revenue Code, pending before the Treasury Department for over a year. The Treasury is uncertain as to the intentions of Congress in title III of the Revenue Act of 1950 and this memorandum is submitted in the belief that a clear statement from the Senate Finance Committee to the Treasury with respect to this question will assist Wesleyan University Press in obtaining without litigation an exemption it believes it is entitled to under the law.

WESLEYAN UNIVERSITY

Wesleyan University, founded in 1831, has long been distinguished as one of the outstanding privately endowed liberal arts colleges of the country. Popularly known, together with Williams and Amherst, as one of the Little Three colleges of New England, it has for nearly a century and a quarter served the public welfare by maintaining with traditional integrity the highest academic standards. It is nonsectarian, and its alumni in peace and war have served their country and communities in teaching, in government, in the military services, in the pulpit, in the sciences, and in business. Woodrow Wilson taught there. President William Howard Taft and his Secretary of State, Elihu Root, participated in the inauguration of one of its Presidents. Wesleyan is proud of a distinguished tradition and submits that its determination of what is a related educational activity should not be lightly considered.

WESLEYAN UNIVERSITY PRESS

On September 9, 1949, Wesleyan University acquired by purchase under a 10-year installment contract with a down payment of $400,000 from its own funds, the entire outstanding capital stock of three closely interrelated and singly operated educational publishing enterprises, which were immediately dissolved and the assets of which were immediately vested in the Wesleyan University Press, Inc., a nonstock membership corporation formed under a provision of Connecticut law not available to mercantile or commercial corporations for profit. The Treasury found the price reasonable in approving the seller's application for a ruling that the sale constituted an installment capital gain.

The incorporators of Wesleyan University Press were all members of the Board of trustees of Wesleyan University and alumni of the college, as are the members of the board of trustees of Wesleyan University Press. The purposes of this corporation are set forth in article 2 of its articles of association, the dominant purpose being stated in article 2a "to conduct and carry on the work of the corporation, not for profit, but exclusively for charitable, scientific, literary, and/or educational purposes, including educational research." The purposes do not include engaging in a general publishing business. Such activities as are authorized are stated explicitly to be subject always to the provisions of articles 2a and 2c which expressly limits any publishing activity to educational publications. The articles of association further specify that no part of the net earnings or property of the corporation shall inure to the benefit of any individual or to the benefit of any corporation other than Wesleyan University; that in the event of dissolution, cessation of operations, or the like, all net assets of the corporation shall be distributed to Wesleyan University; and that the corporation shall not in any way engage in carrying on propaganda or in attempting to influence legislation. The bylaws specifically provide that no trustee of the press and no officer who is such a trustee shall receive any remuneration. A resolution of the board of trustees of the college provides that all successor trustees of the press must be nominated by the board of trustees of the college.

PUBLICATIONS OF WESLEYAN UNIVERSITY PRESS

All the publications of Wesleyan University Press are educational in the strictest sense of this term. The Press publishes a series of graded weekly periodicals (My Weekly Reader, Current Events, Current Science and Aviation, Our Times) for classroom use in elementary and high-school classes, together with teachers' aid papers to assist teachers in the proper use of these publications. It also publishes (to the extent of approximately 8 percent of its income) classroom text and work books, largely paper-bound and consumable. It publishes all the official publications of Wesleyan University, including its Alumni News, which is mailed free quarterly to over 8,000 alumni, and is embarking upon the publication of scholarly works of the Wesleyan faculty. It does no business whatsoever with the general public; all of its publications are sold directly and in bulk and delivered to classrooms or boards of education. It accepts no advertising, does not employ advertising agents (14 university presses do), does not sell to book stores or book jobbers, and in this sense does not compete in any way whatsoever in the normal channels of distribution of the publishing business. At the time of its acquisition by Wesleyan University, 75 percent of its income was derived from publications which had no competition whatsoever from private industry or otherwise, although since its acquisition by the university some slight competition has arisen in this field. Among its principal book publications are the Little Wonder Books, 90 titles edited on six distinct levels of reading difficulty. These are the only graded series of booklets interpreting the contemporary world to school children in language they can read for themselves. This feature was inaugurated in 1932 at the suggestion of Charles H. Judd, chairman of the College of Education of the University of Chicago (and incidentally a Wesleyan graduate). Dr. Judd thought this project was so important that educational foundations should subsidize it if necessary.

Another of the Press publications, the current events paper Our Times, is the outgrowth of Uncle Sam's Diary, founded by David Lawrence in 1931 and published by a nonprofit philanthropic organization known as the United States Society which was supported by substantial charitable donations from 1931 to 1937. It was published during part of this time by the School of Public Affairs of American University in Washington, D. C. Its then editor, Arthur S. Fleming, is presently Director of Manpower Mobilization under Mr. Charles E. Wilson. In 1937, at Mr. Fleming's initiative, Uncle Sam's Diary was merged with Our Times, then privately published by our predecessor. It, of course, lost its tax-free status at this time when its profits inured to private individuals, but now that it is published by Wesleyan University Press it and the other publications of which it is typical should clearly again be tax exempt.

WESLEYAN PRESS PUBLICATIONS WIDELY RECOGNIZED AS EDUCATIONAL

The Treasury itself has found Wesleyan Press publications to be educational. In a letter from the Commissioner of Internal Revenue to the Press dated May 16, 1950 (which denied the Press exemption under the then policy of denying all exemptions pending the enactment of the 1950 law), it was stated:

"Your activities consist of composing, compiling, editing, illustrating, printing, and publishing educational books, periodicals, and miscellaneous other materials instructional and educational in character. Your principal publications are books and weekly periodicals prepared in conformity with standards of leading educators, designed for distribution to teachers, pupils, and schools, and are used mainly in classroom work in the elementary schools."

Top-ranking educators have long recognized the importance of the educational services of publishers of current events papers. The following quotation is from Msgr. Frederick G. Hockwalt, director of education of the National Catholic Welfare Conference:

"Inasmuch as our form of government is predicated on the existence of an informed and intelligent electorate, interest in current problems must be fostered during the formative years. * * * The Commission believes that the classroom use of carefully edited current events periodicals * * * is essential to effective instruction in the social studies and to training for good citizenship."

Dr. Stanley Dimond, president of the National Council for the Social Studies says in the January 1949 issue of Social Education:

"One of the greatest gains of the past 25 years (in the schools) has been the increased attention given to the study of current affairs * * * adequate recognition has not been given in this country to those who have helped us by publishing current events materials for the schools."

Dr. Joy Elmer Morgan, editor of the National Education Association Journal, and Director of the Division of Publications of the National Education Association, in a statement before the House and Senate Committees on Postal Rates in 1949 said:

"Our schools are benefiting greatly by the use of periodicals designed for classroom use in current affairs and civic education, such as The American Observer, The Scholastic, American Education Press, and so on."

American Education Press is a predecessor of Wesleyan University Press. Dr. Morgan was urging special postal rates for these publications because of their educational value.

APPLICATION ON THE REVENUE ACT OF 1950

It is submitted that in passing the Revenue Act of 1950, Congress clearly intended to exempt from taxation income of such educational activities as university presses conduct. In presenting this act to their respective Houses, Senator George as Chairman of the Finance Committee of the Senate and Representative Doughton as Chairman of the Ways and Means Committee of the House, each specifically stated in commenting on what constituted a related activity, that the income of a university press in the usual case would be exempt. The Treasury has apparently found difficulty in interpreting this intention, partly it is believed because there is no such thing as a "usual" university press. The most comprehensive study of university presses ever made is a publication by Kerr published in 1949 under a grant from the Rockefeller Foundation. Kerr's second chapter is entitled "What Is a University Press?". His conclusion at the end of this chapter (p. 14 of his book) is: "But while large or small, African or Indian, an elephant resembles an elephant, a university press does not always resemble a university press. To paste up a composite picture of the latter would only produce a creature that does not really exist." In fact, Kerr found it impossible even to classify the interests of the university presses reviewed and had to list each separately. It is a fact that universities historically have established presses to carry out whatever interest the university in question considered appropriate. Some publish strictly scholarly works, some publish literary reviews scarcely distinguishable from such reviews as The Atlantic Monthly and Harpers magazine—The Kenyon Review, for example. Some publish popular novels. The mainstay of the Chicago University Press is the Bible. Loyola University Press publishes nothing but textbooks for use in Catholic elementary schools, high schools, and colleges. Harvard University Press offers a wide catalog of popular literature. North Carolina Press publishes such popular books as Eleanor of Aquataine. Many best sellers, fictional and otherwise, have been university press books. Hayek's The Road to Serfdom, of the Chicago University Press is an appropriate example. The fact is that the Wesleyan University Press is the only one in the country (possibly excepting Loyola) whose publications which are sold are used entirely by students in their classroom education.

The primary test of exemption under the 1950 Revenue Act is whether the activity is substantially related to the activity of the exempt institution. It is submitted that if a strictly educational publishing activity of a college is interpreted as not being related to the activities of the college, this act has accomplished an unintended revolution. Wesleyan University, with full consciousness of the obligations imposed upon her as a tax-exempt institution, acting with an integrity born of a long tradition, has determined that she can extend her activities, perform a necessary and useful function in the educational world, and enhance her educational prestige and opportunities through the educational publications of the Wesleyan University Press. (Wesleyan has refused to purchase, on a very attractive basis, the leading Educational Directory, which although clearly educational, is not in our view "related" to our interests.) Wesleyan believes, however, that our liberal arts colleges have concentrated on their relations with the graduate schools to the neglect and exclusion of the educational field at the precollege level and that she has a useful, proper, and related function to perform in this field. That she chose to do so through the acquisition of a profitable enterprise in this field is immaterial to the question of whether this activity is related. This fact simply creates and enlarges the opportunity for service. It is clear from affidavits on file with the Treasury, from men whose integrity is beyond question (the president of the university and several distinguished trustees), that had Wesleyan not believed the activities of the Press to be supplemental to the fundamental purposes of the university its board would never have sanctioned the acquisition, regardless of financial considerations.

President Butterfield's affidavit stated, for example:

"I believe that anything the college can do to strengthen general education at the precollege level, and particularly in these fields (current events, civics, reading training), is vitally important and is definitely a proper function of the college. (From the point of view of the contribution the college can make to its own enrolled students, such work is infinitely more important than adult extension programs, for example.) As an educator, I have no reservation in stating my conviction that such activities are definitely related to the educational aims and purposes of Wesleyan University."

A Wesleyan faculty committee headed by Dr. Schattschneider is being employed to bring the ideas of the history, political science, English, and economics departments to bear on the policies of the Press. The English department of the college, headed by Prof. Wilbert Snow (former Connecticut Governor), is greatly concerned over the poor reading habits and skills exhibited by college students and is working with the Press on plans to make a contribution toward the improvement of secondary-school reading habits. Special faculty editors are being selected as advisory editors for each Press publication.

Wesleyan's interest in precollege education is by no means new, and far antedates its acquisition of the Press. President Butterfield and Dean Eldredge both came to college work after teaching in secondary-school systems, and have long evinced an active interest, working in conjunction with the Connecticut Department of Education for many years antedating the acquisition of the Press in improving standards of elementary- and high-school teaching. They share with most college educators a growing concern about the inadequate preparation of students applying for college admission, and believe that the ever-increasingly evident inadequacies go right back to defects in elementary-school teaching and standards.

The importance of the relationship of the college and secondary schools has long been recognized, particularly in New England. Wesleyan has for many years been a member of the New England Association of Colleges and Secondary Schools. And Wesleyan men have long been leaders and innovators in the field of precollege education. In fact, any list of the 10 or 12 most prominent contributors to this branch of education over the last 25 years would certainly include at least 6 Wesleyan men—Thorndyke, Judd, Inglis, Dearborn, Buckingham, and Freeman.

No one has ever questioned the propriety of the Elementary School Journal, published by Chicago University Press.

The Revenue Act of 1950 represents the first attempt in the history of American education to task any income of our colleges. If Congress did not intend by this act to restrict colleges from activities which they in good faith deem to be related and appropriate, such as Wesleyan has embarked upon in the Wesleyan University Press, it is the belief of the undersigned that an informal clarification from the Senate Finance Committee to the Treasury in this matter would be helpful in seeing that the intention of the Congress is carried out without the necessity of long, expensive litigation.

Senator BYRD. Mr. John B. Poole.

Please be seated and identify yourself for the reporter, Mr. Poole.

STATEMENT OF JOHN B. POOLE, TELEVISION BROADCASTERS TAX COMMITTEE

Mr. POOLE. Thank you, sir.

My name is John B. Poole. I am a practicing lawyer in Detroit, Mich., and, more particularly, am an officer, director, and stockholder of the Fort Industry Co.

The Fort Industry Co. is the owner and licensee of television stations located at Detroit, Mich.; Toledo, Ohio; and Atlanta, Ga.

It is also the owner and licensee of seven standard radio stations located in the three cities named, and also at Wheeling, W. Va.; Miami, Fla.; Fairmont, W. Va.; and Cincinnati, Ohio.

My appearance before the Senate Finance Committee is as a member of and spokesman for the Television Broadcaster's Tax Committee, an industry-wide group organized by the National Association of Radio and Television Broadcasters, and representative of the television broadcasting industry.

The committee serves a single purpose, that of petitioning the Congress to relieve the serious and critical financial plight of the television broadcasters under application of the excess-profits-tax law of 1950.

Our industry problem is essentially this: In December of 1945 the Federal Communications Commission first authorized commercial telecasting. Accordingly, it was during the base-period years, 1946 through 1949, that the industry, the radio industry, developed and pioneered television.

The impact of losses from television upon those radio broadcasters who undertook television activities was such that it depressed base-period normal earnings from radio, so as to leave us in the position today that roughly 50 percent of all of our normal earnings derived from radio are now taxed, under the excess-profits tax, and 100 percent of our earnings, present and future, in television will similarly be taxed under the act.

In other words, the credit which we have before the imposition of the excess-profits tax is representative of only the loss experience we sustained in television.

Now, the averages published by the Secretary show a return on capital of 24.9 percent in 1946 for radio broadcasting. There was some television broadcasting undertaken initially as a matter of pioneering in 1946 but of a very limited nature.

The average return proclaimed by the Secretary, however, in 1949 had declined to 10.1 percent. This average tells only a part of the story in the sense that it reflects normal earnings from several hundred broadcasters who had not yet engaged in television.

As far as those companies are concerned, which had pioneered television, our losses in the year 1949 in television actually exceeded the income which had been derived from radio broadcasting during the same year.

The Federal Communications Commission was good enough to make available at our request through Haskins & Sells, public accountants in New York, the industry figures and they have been compiled and analyzed by Haskins & Sells for our use in presentation to this committee.

It shows roughly that in 1946, 85 companies in radio broadcasting derived taxable income, net taxable income, of $14,800,000.

In that year, 59 of those 85 companies lost $851,000 in their initial undertakings in television.

Passing over to 1949 those same 85 companies lost $13,500,000 in television, while earning $12,500,000 approximately in radio broadcasting.

The average for the 4 years shows that instead of having a normal industry average of approximately $14,000,000 for radio broadcasting without reference to anything from television, our losses were such that our base credit is approximately $7,800,000 on an industry-wide average basis.

Under the excess-profits-tax law there is no relief. The invested-capital method of returning 12 percent on the initial investment is wholly inadequate for radio and television in any event.

Our norm in 1946 for radio broadcasting was 24.9 percent. The industry average for the base-period years, depressed by television losses, is 15.8, I believe.

The reason for that, of course, is capital is but one of a number of equally important income-producing factors in radio and television broadcasting.

Talent personnel, creative personnel, writers are equally important factors, but are not shown on our balance sheet and are not capitalized. The relief provisions which, if certain other qualifications are fulfilled, would permit us to relate our situation to the industry average, throws us back to the 15.8 percent which in effect merely reflects the impact of losses upon normal television earnings and leaves us nowhere.

We should like to mention that all radio and television stations are licensed by the Federal Communications Commission and are subject to their regulation.

I think our experience, our loss experience in 1949 showing that those——

Senator TAFT. Not as to price.

Mr. POOLE. I beg your pardon?

Senator TAFT. Not as to the price of advertising or——

Mr. POOLE. No; as to program standards, as to any number of standards, relating to our operations and, of course, you understand, that no person can broadcast or telecast until a license is first secured from the Federal Communications Commission.

Senator MILLIKIN. The license itself is revocable?

Mr. POOLE. Yes, sir. The condition of the license of a television broadcaster is that initial operations must be conducted for a limited number of hours per day for not less than 5 days per week.

From a practical point of view, that meant that in undertaking television operations we started off on a full-time basis, even though for those of us who pioneered at the time television operations were undertaken, there were virtually no receiving sets on the market.

In our own company our first station was at Toledo, Ohio, and there were roughly 150 receiving sets in Toledo when we first went on the air.

At the end of 6 months I would judge there were approximately 5,000 sets.

Senator MILLIKIN. What do you want us to do?

Mr. POOLE. There has been prepared, Senator, and introduced by Senator Frear, a bill, S. 1861, which we heartily support, and submit will adequately restore to the television industry a normal base-period experience.

It permits a taxpayer which has derived 30 percent or more of its income from broadcasting and related television services in the month of December 1950 to compute the average base-period net income by multiplying the taxpayer's total assets as of December 31, 1949, and those assets understandably would include the investment in television at that date, by the ratio of income to assets in 1946.

In other words, we throw ourselves back to the year 1946, taking 1 year out of the base period as being most nearly representative of the experience we would have had during the base period had we not gone into television.

In other words, that is as close as we can tie to anything definite that would illustrate or typify the experience that we would have had in radio broadcasting.

Senator TAFT. You do not try to separate the earnings from television and radio; you simply take the net results in 1946 where television did not have much effect.

Mr. POOLE. Exactly. It would be impossible from an administrative point of view, we feel, to try to separate it, and the impact was so slight that the industry will very happily absorb that if this relief can be given to it because its plight is so very critical.

Now, we relate that ratio forward to those assets in December 1949. That means, in effect, that we are asking to be permitted the same rate of return in television in terms of relationship to assets, as we had derived ourselves in 1946 from radio broadcasting.

Senator TAFT. Is that on an individual basis?

Mr. POOLE. It is on an individual basis, Senator, or in the alternative, it permits the taxpayer to use the industry rate of return for the single year of 1946.

Senator TAFT. As far as a new company that started solely in the television business, he would have to do that.

Mr. POOLE. Yes, sir. That is why it was included in the amendment. Otherwise there would be no basis for it.

Senator TAFT. Do you give one of these companies the alternative of taking the industry basis instead of his own?

Mr. POOLE. Yes; whichever is the greater.

Senator TAFT. Where he was in the radio business in 1946?

Mr. POOLE. Yes, sir; the industry average or the individual experience, whichever is greater.

Senator TAFT. What would the industry average be?

Mr. POOLE. As tentatively proclaimed by the Secretary, it is 24.9 for 1946.

Senator TAFT. Instead of the 15 that you now have?

Mr. POOLE. The 15.8 which would reflect our television loss experience.

There is an additional proposed amendment which would relate to new corporations organized after December 1, 1946, and which similarly gives and accords to them the industry average of 24.9 in 1946.

That is our story very simply. I should like to emphasize and make clear this point: These amendments in no sense create an exemption for the television broadcasting industry, nor is any suggestion of an exemption involved.

It is merely a matter of restoring us to a base-period experience so that we will pay excess-profits taxes on a parity with those industries which had a normal experience during those years, and to permit us the same equity under the act as those companies were intended to have under normal experience.

Senator BYRD. Thank you very much, Mr. Poole. Would you care to have the balance of your statement inserted into the record?

Mr. POOLE. Yes, sir.

(The prepared statement is as follows:)

STATEMENT ON BEHALF OF TELEVISION BROADCASTER'S TAX COMMITTEE

Mr. Chairman and gentlemen of the committee, my name is John B. Poole. I am a practicing lawyer in Detroit, Mich., and, more particularly, am an officer, director, and stockholder of the Fort Industry Co. The Fort Industry Co. is the owner and licensee of three television stations located at Detroit, Mich., Toledo, Ohio, and Atlanta, Ga. It is also the owner and licensee of seven standard radio stations located in the three cities named, and also at Wheeling, W. Va., Miami, Fla., Fairmont, W. Va., and Cincinnati, Ohio.

My appearance before the Senate Finance Committee is as a member of and spokesman for, the Television Broadcaster's Tax Committee, an industry-wide group organized by the National Association of Radio and Television Broadcasters and representative of the television-broadcasting industry. The committee serves a single purpose—that of petitioning the Congress to relieve the very serious and critical financial plight of the television broadcasters under application of the Excess Profits Tax Act of 1950.

Our industry problem is essentially this. In December 1945, the Federal Communications Commission first authorized commercial television broadcasting. Hence it was during the base period years 1946–49, that the radio-broadcasting industry undertook to develop and pioneer television. Losses sustained in television during this period so depressed normal profits derived from radio broadcasting that the average industry rate of return, as proclaimed by the Secretary, declined from 24.9 percent in 1946 to 10.1 percent in 1949. Moreover, these averages tell but a part of the story, because they also reflect the rate of return achieved by several hundred radio broadcasters not yet involved in television operations, and which hence had normal earnings. The rate of return for those companies actually engaged in television broadcasting declined so sharply from 1946 forward as to result in an over-all industry loss for the year 1949. To illustrate specifically, the following tabulation shows a breakdown of net taxable income earned from radio broadcasting and likewise, losses sustained in television, for each individual year during the base period, by those companies actually engaged in both radio and television broadcasting, exclusive of networks and network-owned stations. These figures, at the request of our committee, were made available by the Federal Communications Commission, and delivered to Haskins & Sells of New York City, for analysis. The analysis was made by Haskins & Sells to insure the privacy of individual financial information and to insure also an accurate and impartial analysis for presentation to the Senate Finance Committee.

	Number of companies	Amount
1946:		
Television	59	[1] $851,000
Radio	85	14,869,000
		14,018,000
1947:		
Television	66	[1] 2,015,000
Radio	85	15,284,000
		13,269,000
1948:		
Television	71	[1] 8,556,000
Radio	85	13,895,000
		5,339,000
1949:		
Television	85	[1] 13,520,000
Radio	85	12,353,000
		[1] 1,167,000
Average—1946–49:		
Television		[1] 6,236,000
Radio		14,100,000
Total		7,864,000

[1] Indicates loss.

These figures graphically illustrate the plight of the independently owned television-broadcasting stations throughout the country. Eighty-five corporate owners and licensees of television stations at the close of 1949 had collectively lost $24,708,000 in the operation of television, while earning $57,568,000 from radio broadcasting. Television losses in 1949 exceeded in dollar amount the entire aggregate of earnings from radio broadcasting and this trend continued late into 1950. While we do not have available the exact industry loss experience in 1950, we do know, as a matter of general industry information, that very few television stations turned the corner and began making a profit until the late fall of 1950.

Under the Excess Profits Tax Act, it is contemplated that the best 3 years in the 1946–49 period will fairly be representative of normal profit experience. As the tabulation shows, average industry income from radio broadcasting for the 1946–49 base period would have been $14,100,000 had not television operations been undertaken. Because of television losses, however, average base period income was $7,864,000, and it is upon the basis of the best 3-year average of this depressed period that the credit for the excess-profits tax is computed. To reconstruct normal base period years for the 85 companies involved in television broadcasting, this average base period income would need be restored from $7,864,000 to $14,100,000. In addition, some reasonable rate of return should be available as a credit for present and future earnings from television. According to figures supplied by the Federal Communications Commission, the radio broadcasting industry by the end of 1949 had invested approximately $56,000,000 in plant and equipment for television. Some reasonable return upon this investment should also be available as a credit before application of the excess-profits tax.

An excess profits tax credit, based on the invested capital method, however, does not answer our problem. A return upon capital of 12 percent, while adequate for manufacturing industries, is wholly inadequate for service industries, such as radio and television broadcasting where capital is but one of a number of equally important income-producing factors. The 1946 rate of return for radio broadcasting is 24.9 percent; the industry average, even after the impact of television losses, is 15.8 percent. Talent personnel and creative writing, for example, in radio and television broadcasting, are factors equally important with capital in terms of income production. Such services are very expensive, competition is very keen, the hazards are great, and the rate of return historically has necessarily been high in the radio and television field. During the 24 years of the Fort Industry Co.'s experience, more than 73 percent of company profits have been ploughed back into the operation of the company to permit expanding and improved program service and to keep pace with technological developments. Even so, it was necessary that the company borrow $1,500,000 to undertake construction of three television stations and as of June 1, 1950, our total investment and operating losses in television exceeded $2,000,000.

Nor, unhappily, do any of the relief provisions in the act relieve our plight. The average industry rate of return, 15.8 percent, which may be availed of if other qualifying factors are fulfilled, merely reflects the loss-experience the industry has sustained in television. As to new corporations organized after January 1, 1946, the same is equally true. This depressed rate of return is wholly inadequate to meet the competitive necessities in the television industry and to recoup past losses. Already the industry stands on the threshhold of further technological developments in the art with a consequent need and requirement for replacement of equipment, involving very substantial requirements for additional capital investment. Under present provisions of the act, the maximum tax ceiling automatically becomes the normal tax rate for every television broadcaster. We know of no other industry so unhappily circumstanced.

It should be mentioned that all radio and television broadcasting facilities must be licensed by the Federal Communications Commission, and all broadcasting and telecasting activities are subject to applicable regulations of the Commission. It is a condition of the license that television operations from the very inception must be carried on a minimum number of hours per day, for not less than 5 days per week. Translated into practical terms, this means that television broadcasters must commence operations on a full-time basis and, it being a mandate of the license that the telecaster operate in the public interest, convenience, and necessity, it means also that the program content at the very inception must be of the highest possible level. This is true notwithstanding that for most of us when television operations were undertaken, the number of receiving sets in the market was so small as to be nominal. For those of us who pioneered, the first year and one-half was a period of extreme anxiety, wondering whether our program presentations would so captivate the public that receiving sets would be purchased in increasing quantities. It was of course at all times obvious that, until reasonable circulation in the market was achieved, profitable operation was impossible for the station. This hazard is peculiar to radio and television, and stems in part directly from the obligation imposed by the license. We mention this to explain the incredible record of losses which the industry has sustained. Prudent business judgment does not counsel the pinoeering of a new business on so full blown a scale as to permit losses to exceed profits realized from the basic business, as was the experience in television during the 1949 year. The industry makes no complaint of this circumstance. It is a matter of serious concern, however, that the hazard should not be compounded in terms of an inadequate credit against the imposition of excess-profits taxes.

To relieve this inequity, Senator Frear of Delaware has introduced S. 1861 which has been referred to this committee. Essentially, it is proposed that section 444 of the act be amended by adding a new subsection (h) which will permit any taxpayer, which derived during the month of December 1950 30 percent or more of its gross income from television broadcasting and related television services, to compute its average base period net income by multiplying the taxpayer's total assets as of December 31, 1949, by (1) the ratio which the taxpayer's excess profits net income for its last taxable year, ending on or before December 31, 1946, bears to its total assets on the last day of such taxable year, or (2) the taxpayer's industry rate of return for the year 1946 as proclaimed by the Secretary under section 447, whichever is greater. This accomplishes two things. It permits the radio-television broadcaster to use the rate of return which it realized in 1946 as being representative of normal profit experience in radio operations. By substituting the 1946 year in lieu of the best 3 years in the 1946–49 period as a norm, the impact of television losses is thus essentially eliminated. Secondly, it permits the taxpayer to relate the 1946 ratio or rate of return to assets on hand at December 31, 1949 (which, of course, includes all assets then used in television). The resulting dollar figure after multiplication, is the telecaster's average base period net income under the act. The applicable percent of this figure, as finally determined, in the current bill, will be the excess profits tax credit. For those corporations which had no radio experience and have engaged exclusively in television operations, the proposed amendments permit use of the radio industry rate of return of 24.9 percent proclaimed by the Secretary for the 1946 year. In other words, the amendments serve to put the radio broadcaster back to his 1946 rate of return upon capital as being representative of his normal earning experience in radio during base period years. In addition, it permits him to relate this rate of return forward to television operations.

It is further proposed that section 445 be amended by adding a new subsection (i), in respect of new corporations organized after January 1, 1946, to permit use of the industry rate of return of 24.9 percent, proclaimed by the secretary for the 1946 year. We feel that these proposals are entirely reasonable and approximate as close as may be, the base period experience which would have been realized by the radio broadcsating industry, had it not undertaken television operations. In addtion, it relates this experience to the new television industry.

Because these proposed amendments involved technical problems relating to the structure of the act, and because they necessarily result in some initial loss of revenue to the Government, representatives of our committee consulted with Mr. Colin F. Stam, chief of staff of the Joint Committee on Internal Revenue Taxation, and with certain members of his staff. We wish to emphasize that these proposed amendments in no sense constitute an exemption for the television industry under the act. They serve merely to provide a reasonable and equitable basis for computation of an excess profits tax credit. According to our best estimates, the loss of revenue which will result to the Treasury in 1951 under these amendments will approximate $3,000,000, certainly no more than $5,000,000 as a maximum. Every telecaster will, of course, pay an excess profits tax under these amendments, but, and this is all we seek—on a basis of parity with other industries having a normal base period experience upon which to compute the excess profits tax credit.

From the technical point of view, we believe the amendments are wholly consistent with both the philosophy and structure of the act. They are designed, and in application achieve, no more than reasonable and necessary relief to our industry. We ask no more than this—but unless this relief is forthcoming, the impact of excess profits taxes upon the television industry and its further and future development will be critically grave indeed.

Senator BYRD. Mr. Paul Gardner.

STATEMENT OF PAUL GARDNER, PRESIDENT, DeWALT, INC.

Mr. GARDNER. Mr. Chairman, and members of the Senate Finance Committee, my name is Paul Gardner. I am president of DeWalt, Inc., of Lancaster, Pa.

DeWalt, Inc., manufactures a machine such as you see along the wall there, and it does all types of work similar to this.

This is a piece of lattice work out of solid wood. This machine does a great variety of work to aid builders in building houses, furniture factories in manufacturing furniture, and for industrial plants, in crating and boxing, carpenter maintenance, pattern shops and production work.

My company is a wholly owned subsidiary of American Machine & Foundry Co., and the relationship between DeWalt and American Machine & Foundry Co. was created in the following manner:

Prior to 1949 another corporation, also called DeWalt, which was entirely independent of American Machine & Foundry had carried on the business now carried on by the present DeWalt.

In November 1949 the old DeWalt sold its entire business, including all its assets, to American Machinery & Foundry for stock and cash.

The old DeWalt proceeded to liquidate, as required by agreement with American Machine & Foundry, distributing the proceeds of the sale to its stockholders.

American Machine & Foundry immediately transferred everything which it had received in this sale to the present DeWalt, which had just been organized for the specific purpose of continuing this business.

The present DeWalt is now carrying on the same business, with the same assets, and under the direction of the same officers, using the same labor and the same salesmen and dealers as those of the old DeWalt prior to the sale.

The only changes brought about by this sale were that the stock is now held by a new owner and a new corporate charter was substituted for the old.

I am appearing to propose an amendment to section 461 (a) (1). This section permits the so-called acquiring corporation to use the earnings credit of the selling corporation for excess profits tax purposes but only if the transaction was nontaxable.

The transaction in which the old DeWalt sold its business to American Machine & Foundry was a taxable transaction and the taxes have been paid.

Under the present law, our new corporation has a credit for excess tax purposes of only $200,000 where the credit of the old DeWalt would have been $850,000. In other words, merely because the property was transferred for cash and stock and not solely for stock and because the transaction was taxable, about $650,000 of its normal profits will be taxed under the excess-profits-tax rates.

Senator MILLIKIN. Is the business the same?

Mr. GARDNER. The same identical business, the same facilities, the same product.

Senator MILLIKIN. No new activity?

Mr. GARDNER. I have been the president of it now continuously, for almost 25 years, both the old company and this company.

Senator MILLIKIN. Make the same product?

Mr. GARDNER. Same identical product. The product is right here.

Senator KERR. Where are your headquarters located?

Mr. GARDNER. My headquarters are Lancaster, Pa.

Senator MILLIKIN. The committee is familiar with that problem.

Mr. GARDNER. I see.

Well, in this case, as I understand it, the trend of the law from the House move to date, is to reduce the credit from 85 to 75 percent of normal earnings. In effect, if an amendment is not passed that will give new DeWalt the earnings base of old DeWalt, our credit will be reduced from 85 percent to less than 25 percent and it is a pretty discouraging thing to work out when you are trying to help stockholders who can only get half the price that they paid for their stock to get their money back.

Senator MILLIKIN. You want it carried forward to the base, and you want relief against the reduction proposed by the House?

Mr. GARDNER. I am especially interested in carrying forward the base period earnings I am willing to pay the rates that you gentlemen decide are appropriate for everybody, but I feel that I am going to have to pay more than those rates if no relief is given.

Senator MILLIKIN. I was going to ask if the gentleman has entered his full statement.

Mr. GARDNER. I am sorry; I do not have a statement to enter.

Senator MILLIKIN. The committee is familiar with the problem It has been raised by several other witnesses.

Mr. GARDNER. I see.

Senator KERR. What is the present law, Mr. Stam?

Mr. STAM. Well, I think you pointed out that under the present law you have to go through a nontaxable transaction.

Senator KERR. I could not tell whether his situation was one which was all right as the law now is, and would be put in jeopardy by the amendment, or whether it is not now all right, and needs an amendment, but a different one from that which the House put on.

Mr. STAM. Well, it is not all right under the present law.

Senator KERR. Yes.

Mr. STAM. He wants relief from it.

Senator KERR. And he would not be helped under the amendment?

Mr. STAM. He would not be helped under the amendment.

Senator KERR. In other words, it is a situation where the amendment prepared by the House would provide relief for others in identical positions with him except that theirs was a nontaxable transaction, and his is a taxable transaction.

Mr. STAM. Well, it really was not the House. The existing law provides relief only where there is a nontaxable transaction.

Senator KERR. I see.

Mr. STAM. And he is trying to get that changed.

Senator KERR. I thought he said there was an amendment coming over from the House putting him in jeopardy or failing to give him relief.

Mr. STAM. Well, it hits him a little harder when they reduce that 85 down to 75.

Senator KERR. I see.

Mr. GARDNER. I feel that the difference, to make it as clear as possible, is that we have had two corporations here; they are both identical. The only change—the business is identical—is the change in stockholders. That is all.

But because the change in stockholders was made with some stock and some cash instead of just stock, because of that technicality, we would, as I understand it, unless an amendment is made, lose the base-period earnings of the company that I have been head of now for some 25 years.

Senator MILLIKIN. Thank you very much, Mr. Gardner.

Senator MILLIKIN. The next witness is Mr. George E. Gregory.

Will you come forward, please, and give your name to the reporter.

STATEMENT OF GEORGE E. GREGORY, PRESIDENT, MORTON GREGORY CORP., LORAIN, OHIO

Mr. GREGORY. Mr. Chairman and members of the Senate Finance Committee, I am George E. Gregory. I am president of the Morton Gregory Corp. of Lorain, Ohio.

Senator KERR. Would you rather be seated, Mr. Gregory?

Mr. GREGORY. Yes, sir. Thank you.

May I first express my thanks for this opportunity to appear before you.

I want to discuss certain effects of the excess-profits-tax law of 1950 upon new, small and growing businesses and to make simple recommendations to correct, serious, yet unintentional inequities.

My company was organized in early 1948 with a capitalization of $556,250, all of which came from employees and close friends. Employment then was 110; now we employ 257 persons. You can see that we are, by definition, a small business.

But we are an aggressive small business. We are determined to grow and to prosper by our own efforts and ingenuity. Our principal business is the manufacture and sale of Nelson stud welding guns and studs. Nelson stud welding was a war-born process involving the split-second joining of a metal stud to a metal plate by means of arc welding. A tremendous amount of engineering and sales effort has been required to create peacetime markets for our products, in the face of established competitive methods.

Like many other small businesses, however, we are not afraid of competition, big or little, established or new. Nor are we afraid of adapting our operations to Government regulation and taxation necessary for defense—so long as these controls and taxes are equitable.

We submit that the present excess-profits-tax law is not equitable to many small businesses. This act requires that they—and we pay an excess-profits tax on earnings that are not excess but are, in reality, normal profits.

We discussed this problem with independent tax consultants and economists. We became convinced that many small businesses so important to the backbone of America—could be stifled by a tax burden, over and above that intended by Congress.

Convinced of this, we sought and, I believe, found two solutions—solutions that would remove inequities not only for ourselves but also for many other businesses. In other words, our proposals are not geared for one isolated hardship case. Nor are they intended to give small businesses a special privilege. Rather they would protect small enterprises from special injury by the very Government that spends millions to aid and encourage them.

The technical language and operation of these proposals are set forth in the brief which is attached to your copy of my statement.

I said that the present tax law requires us to pay excess-profits taxes on earnings that are in reality normal. Relief provisions of the act were designed to prevent normal earnings from being considered excess profits. These provisions allow a credit based on a "fair rate of return" on the "adjusted basis of assets."

However, a careful analysis shows that these provisions do not correct obvious inequities in situations such as ours. I should like to discuss the way both the "fair rate of return" and the "adjusted basis of assets" provisions fail to correct the inequities for many small businesses.

I must, of course, talk of my own company as an illustration, since it is the one with which I am most familiar. But I am sure that you will see how the same circumstances apply to numerous small concerns, probably some you know of yourselves.

On the matter of "fair rate of return." There is that situation in which a specialized small business is lumped with a group of mass output companies for the calculation of this "fair rate of return" on its assets. The act provides that earnings of our company be based on those of industries classified as groups 33 and 34 in the Standard Industrial Classification Manual. These groups are primary and fabricated metal producers. They comprise a heterogeneous array of companies with which ours has little in common—blast furnaces, foundries, rolling mills, safes and vaults, and plumbing fixtures. They produce standardized goods and, because of that, create little value in the process of manufacture.

Our business is a highly specialized field. We create a high value in manufacture because our products are individually tailored and engineered for each customer's application. Our products are not shelf goods and cannot be bought from catalogs. Each sale must be preceded by most detailed technical studies and analyses of the customer's problem. Our products are then engineered into specific uses.

This obviously results in a high value, added by manufacture. Authoritative studies show that the greater the value added by manufacture, the greater the margin of profit. We cite references to those proofs in our study made available to the staff of the Joint Committee on Internal Revenue Taxation.

From these studies, one basic conclusion can be drawn:

The fair rate of return permitted under EPT should be adjusted to provide for wide variances in the value added by the manufacturer.

How would this affect small business? As a rule, it is the small manufacturer who uses special skills, gives extra attention to details, makes specific designs for individual needs to sell his product, rather than utilizing a high degree of mechanization, uniformity, and large-scale operations of large enterprises. With this "tailored fitting" they can compete not only among themselves but with manufacturers operating on a larger but more impersonal scale.

These special techniques mean a relatively high "value added" for the output of small concerns. And society has shown its willingness to pay a fair price for the added contribution. It's as simple as the extra price you may pay for having a suit tailored to your individual measurements rather than buying one mass-produced on "dummy" models.

In justice, therefore, this unique contribution of small business should be recognized in determining for them a fair and reasonable rate of return on assets.

Senator MILLIKIN. Would you apply the same rule to tailors?

Mr. GREGORY. Well, I suppose you could; yes, sir.

Let me give you an example, Senator: The Treasury Department has ruled that 13.8 percent is a fair rate of return for companies in groups 33 and 34 with which our company is lumped. But the "value added" ratio of these groups is only 46.2 percent, while the comparable figure for our own company is 77.5 percent. Our studies show many other companies are in the same fix.

It is manifestly unfair and unjust to include our company and other small specialty businesses in with a motley array of standardized, mature industries which create relatively so much less value than we do.

This group 33 and 34 is a group of 10 percent of the industry in America.

As I have pointed out, the earnings rate should be proportionate to the value added by manufacture, but under present law, obviously we, and others like us, will find our allowable rate of return "cut down" to the rate of the standardized producer who adds considerably less value to his product. We will have earnings that should be "normal" taxed as "excess profits."

A suggested amendment providing an equitable adjustment of rate of return is included in our brief. It has the added advantage of simplicity in computation and administration.

Now I will turn to the problem of "adjusted basis of assets." Although this may not have quite the broad application of the first point, a glaring inequity does exist.

The act provides that normal earnings should be measured by a fair rate of return on the adjusted basis of our assets. And there, gentlemen, is the "catch." Our company's most valuable assets—our patents—have no book value.

Let me explain why. Morton Gregory Corp. was formed in 1948 and purchased the assets of the Nelson Stud Welding Business. As part of the purchase agreement, payment for patents, applications, trade-marks, and inventions is spread over 12 years. Payment is 2½ percent of the business done with a minimum annual payment of $25,000. At the time, this appeared eminently fair to seller and to buyer. But, as a result, these valuable assets—now being used to create earnings—taxable earnings, if you please—have no valuation when computing our "adjusted basis of assets."

Over the life of this agreement we expect to pay more than $2 million. If we had paid that amount in a lump sum——

Senator KERR. For those assets.

Mr. GREGORY. That is right, sir.

Senator KERR. Under which law you cannot give any value to in setting up your base if you use this adjusted basis of assets.

Mr. GREGORY. That is what I am talking about, Senator, yes.

If we had paid that amount in a lump sum, rather than on this deferred basis—and the deferred basis was the only thing I could afford at that time—these assets would be admitted in the computations required for tax purposes. You can easily see that unless the law is amended to permit a fair valuation of these assets, our company, and others with similar arrangements, will suffer from the accidental nature of a negotiation.

Senator KERR. In other words, if you do not seek specifically a provision that would let you use their estimated fair value but one which would permit you to use an accurate estimate of what they would actually cost you——

Mr. GREGORY. That is right, Senator, and we are proposing an amendment as part of this brief——

Senator KERR. Yes.

Mr. GREGORY. That will take care of that.

Now, as I say, we have a small company and we plan a rapid growth in the next 2 or 3 years. Like the other men have said, this expansion requires capital. Elimination of the two inequities which I have discussed will remove the unnecessary and unintentional limitations on our ability to secure capital and credit.

We do not seek special benefits. We seek only to see small business relieved of special injury.

Thank you for permitting me to appear before you.

I will present this for the record.

Senator MILLIKIN. The entire document will be made part of the record.

(The document referred to follows:)

INEQUITY OF EXCESS PROFITS TAX ACT OF 1950 ON NEW SMALL GROWING BUSINESS

(Submitted by Morton Gregory Corp., Lorain, Ohio)

SUMMARY

1. Morton Gregory Corp., formed in 1948 and employing 257 people, manufactures stud welding equipment.

2. The stud welding process was acquired from the patentee on terms which included 2½ percent of the gross income received for 12 years as the payment for patents, patent applications, trade-marks and inventions. This type of purchase agreement was completely overlooked in wording the 1950 statute.

3. The relief provisions of the Excess Profits Tax Act of 1950 are of no real benefit to this company.

4. The company's most valuable asset (its patents), for which it has paid and will pay substantial amounts, does not have an "adjusted basis," as defined by the Internal Revenue Code.

5. In determining the rate of return, the Bureau of Internal Revenue classifies the company with a motley array of unrelated industries whose value added by manufacture is 46.2 percent of the value shipped.

6. The stud-welding business, being of a highly specialized nature, requires great emphasis on technical assistance and engineering service to customers, and its value added by manufacture is consequently 77.5 percent.

7. A company with a high value added percentage tends to create more value in the process of manufacture than a company with a lower ratio and for that reason is entitled to a higher rate of return.

8. Under the present act and its so-called relief provisions, Morton Gregory Corp. will be required to pay excess profits taxes at the maximum rate on earnings which are in reality normal.

9. Unless relief can be given, the future growth of this small company is extremely doubtful because of the financing problem created by the Excess Profits Tax Act.

10. Amendments are suggested which will equitably face the realities of this problem and which will afford some relief from this extremely serious tax burden.

HISTORY

Morton Gregory Corp. was incorporated in January of 1948. Its principal business is the manufacture and sale of stud-welding guns, control mechanisms, parts and studs. Stud welding is a war-born process developed in 1940 whereby a metal stud is joined to a metal plate by means of arc welding. The gun holds the stud in place and, together with the control mechanism, determines the time and pressure necessary for a correct arc weld. The process being relatively new required a tremendous amount of engineering and sales effort to develop markets for the product.

Morton Gregory Corp. acquired its stud-welding business in 1948 from the patentee, Ted Nelson, for $484,100, plus 2¼ percent of the gross income received from the business for 12 years with a minimum annual guarantee of $25,000. The $484,100 covered inventories, plant, and equipment, while the 2¼ percent of the gross income covered patents, patent applications, trade-marks and inventions.

The development of markets and the creation of demand required a complete revitalization and reorganization of the company's commercial development program, the setting up of market research and sales programs, and particularly the institution of a program of engineering and development work, whereby the utility and economy of the Nelson stud-welding process could be demonstrated and sold to prospective customers. It should be emphasized that in meeting the competition in peacetime markets stud-welding equipment has not sold itself. Markets for the company's products have been created only by the most extensive sales efforts on the part of the company. The Nelson business is of a specialty type requiring a high, fixed overhead resulting from the large technical and engineering staff which must be employed in order to carry on the engineering service essential to selling. This engineering service means the task of educating potential users in what the Nelson process is and what it can do; the analysis of mechanical applications; the complete design and engineering of the end product and its methods of manufacture; the preparation of cost estimates; and the indoctrination in operating know-how.

The task of organizing and training to provide this engineering service, of market research to determine in what industries the potential market lay, of distribution analysis to find out through what channels potential customers bought, and of finding out how best to promote sales to these markets was time consuming and costly. In view of the fact that the stud-welding process was still new and unproven in peacetime there were no precedents upon which to judge the correctness of decisions made. As a consequence, for the 2 years from the spring of 1948 to the spring of 1950, the policies determined, methods employed and decisions rendered had to be to a large extent based on trial and error, cut and fit. The results began to show up in sales figures in the late spring of 1950. The 3 months of May, June, and July 1950 showed a sales gain of over 15 percent over the comparable months of 1949. These figures are pre-Korea, since the manufacturing cycle was at that time 4 to 6 weeks and July shipments would reflect pre-Korea orders.

Sales for the 4 months of January through April 1951, showed an increase of 84.6 percent over the corresponding period of 1950. This compares with an increase of 28.6 percent over the same period in the Federal Reserve Board Index of Durable Manufactures. In other words the company's growth was three times what might be expected to result from improved business conditions or from the defense effort. This increase in the company's sales over and above what may be expected as a result of the Korean War is actually the result of engineering Nelson stud welding into the products of industry and the 2 years of planning, organization, and sales development work which culminated in this result. That this is true is evidenced by the fact that as late as April 1951, only 23 percent of all orders received were defense rated. Shipments were, of course, considerably under this percentage figure.

EFFECT OF PRESENT TAX LAW, INCLUDING RELIEF PROVISIONS

Under the Excess Profits Tax Act of 1950 Morton Gregory Corp. will be required to pay taxes at the maximum rate prescribed under the act on profits which are substantially normal in that these earnings were anticipated as peacetime results from the commercial development program pursued by the company in the years 1948, 1949, and 1950.

The act attempts to provide for relief in cases such as this by allowing the taxpayer to use as a credit an amount based upon what is supposed to be a fair return on the "adjusted basis" of its assets as of the first day of its first excess-profits-tax year. The inequity of any such method of providing relief in the case of Morton Gregory Corp., however, is due to two very salient facts, namely:

1. Its most valuable asset (its patents), for which it has paid and will pay very substantial amounts, does not have an "adjusted basis," as defined by the Internal Revenue Code, which reflects the entire amount which has been paid and will be paid for these patents, and

2. The fair rate of return on its assets, as provided by the existing statute, is not in anywise indicative of a reasonable rate of return for a corporation in a business such as that engaged in by Morton Gregory Corp.

RECOMMENDED REMEDY WITH RESPECT TO "ADJUSTED BASIS" OF ASSETS

As has been previously stated when Morton Gregory Corp. purchased the assets of the business, payment for the patents, etc., was to be made over a period of 12 years at the rate of 2½ percent of the gross business done. Hence, this most valuable asset has no "adjusted basis" as that term is defined by the Internal Revenue Code. Based on actual business experiences since the commencement of business, it is now possible to place a fair valuation on these valuable assets, which have no "adjusted basis" under the code.

Therefore, the following proposed amendment to section 442 (f) of the Excess Profits Tax Act of 1950 is respectfully submitted.

"'Effective with respect to taxable years ending June 30, 1950, section 442 (f) of the Internal Revenue Code is hereby amended by adding thereto the following: "*Provided, however*, that if upon the date as to which the computation is made the taxpayer is the owner of as asset or assets (other than inadmissible assets) and the amount of the payment therefor or cost thereof, or any part, hereof, is contingent upon an event or events to take place after said date, then the adjusted basis of such property shall include an amount equal to the present value on said date of the anticipated payments, or the said asset or assets shall be taken into account at their fair market value, whichever is the high amount.'"

RECOMMENDED REMEDY WITH RESPECT TO INDUSTRY RATE OF RETURN

In determining the rate of return to be applied to the asset base, the Bureau of Internal Revenue is basing its determination upon the earnings of manufacturing companies classified in groups 33 and 34 of the Standard Industrial Manual. Group 33, primary metal products, and group 34, fabricated metal products, together comprise no less than 48 different industries making up 11.25 percent of the value added by all manufacturing in the United States. In other words, Morton Gregory Corp. is being compared with a segment of the manufacturing economy that is more than one-tenth of the total, compared with a motley array of industries that have no relation or a very remote relationship to the business of the company. It is submitted that use of such a comprehensive grouping of industries for rate of earnings determination is unfair and unrealistic, although under the present law it can be done.

The 1947 Census of Manufactures prepared by the Department of Commerce compiles the value added by manufacture for each standard industrial classification. The census defines the term as follows:

"Value added by manufacture is calculated by subtracting the cost of materials, supplies, containers, fuel, purchased electric energy, and contract work from the total value of shipments."

The census goes on to describe the significance of value added by manufacture as follows:

"In that it approximates the value created in the process of manufacture, value added provides the most satisfactory measure of the relative economic importance of given industries available in the census of manufacture."

It follows from the above statement by the Bureau of the Census, Department of Commerce, that an industry which has a high ratio of value added to value of shipments creates more value in the process of manufacture. Such an industry would be expected to earn more per dollar of sales or per dollar of assets than an industry with a low ratio of value added. The same reasoning applies to an individual company, for a company with a high value added ratio tends to create more value in the process of manufacture than a company with a lower ratio and for that reason is entitled to a higher rate of return.

In the case of group 33, primary metal products and group 34, fabricated metal products, the two groups used by the Bureau of Internal Revenue in computing the rate of return applicable to Morton Gregory Corp., the value added as a percentage of the value shipped is 40.2 percent.

In earlier paragraphs the highly specialized nature of the Nelson stud welding business was developed in some detail. It was pointed out that in the creation of markets where none had previously existed the company relied upon a technical and engineering approach. The result of this approach has been the creation of high value in the process of manufacture. In the fiscal year ended April 30, 1951, the ratio of value added by manufacture to value shipped was 77.5 percent.

It is submitted that to group Morton Gregory Corp. with its value added ratio of 77.5 percent with a heterogeneous grouping of the metal industries whose value added ratio is 40.2 percent is manifestly inappropriate and unjust. If the rate of return is related to value received, an assumption axiomatic in a competitive economy, certainly the base upon which the rate of return is computed should be adjusted to compensate for the higher value.

Therefore, the company respectfully submits the following amendment to section 447 (b) of the Excess Profits Tax Act of 1950:

"Effective with respect to taxable years ending after June 30, 1950, section 447 (b) of the Internal Revenue Code is hereby amended by adding thereto the following: 'Where the rate of the value added by manufacture (as defined in Statistics by Industry: Census of Manufactures: 1947, vol. II, p. 18) in the case of any taxpayer for its first taxable year under this title exceeds the average of the rate of such value added by manufacture of its industry classification as reflected by the 1947 Census of Manufactures by more than 10 percent, then the industry base period rate of return applicable to such taxpayer shall be increased in the same ratio as the said rate of value added by manufacture of such taxpayer for its first taxable year under this title bears to the said average of the rate of such value added by manufacture of such industry classification for 1947'."

Relevance of Value Added by Manufacture as a Measure of Value Created and Contribution to Society and as an Index of a Justifiable Rate of Return on Assets

(By Theodore N. Beckman, B. Sc., M. A., Ph. D., professor of business organization, The Ohio State University and consulting economist)

The concept of value added by manufacture has long been accepted by economists and statisticians as fundamentally valid and useful in the conduct of research in the social sciences. It is given concrete expression by the Bureau of the Census of the United States Department of Commerce by the following definition:

"Value added by manufacture is calculated by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy, and contract work from the total value of shipments." [1]

IMPORTANCE AS A MEASURE OF VALUE CREATED

That value added by manufacture is a significant measure of value created and hence of the economic contribution made to society can be gleaned from the following statement on this score made by the Bureau of the Census:

"In that it approximates the value created in the process of manufacture, *value added provides the most satisfactory measure of the relative importance of given industries* available in the Census of Manufactures." [2] [Emphasis supplied.]

[1] Census of Manufactures: 1947, vol. II, Statistics by Industry, U. S. Government Printing Office: Washington, 1949, p. 18.
[2] Ibid.

IMPORTANCE IN GAGING RATE OF RETURN

It follows, therefore, that an industry that has a high value added ratio (percentage of the value added to value of shipments or net sales) creates more value in the process of manufacture than one with a lower ratio. Such an industry would, therefore, be expected to earn more per dollar of sales, or in terms of any other base as per dollar of assets employed, than an industry with a lower value added ratio, so long as it is assumed that the rate of return is, in a fairly competitive economy, related to value received, which is almost axiomatic. The same reasoning applies to an individual company. A company with a high value added ratio, unless it is extremely inefficient and lack of competition makes such inefficiency possible, tends to create more value in the process of manufacture than a company with a lower ratio and, for that reason, should be entitled to a higher rate of return.

Expressions to that effect may be found in writings arising out of work in connection with the renegotiation law in effect during World War II, as can be seen from the following quotation taken from a most comprehensive study by a man with considerable experience with such work:

"Let us examine another group of factors considered in determining the profit rate to be allowed, namely, (1) complexity of production technique, (2) degree of integration, and (3) *value added by contractor.*" * * *

"A firm which mainly assembled and marketed components or materials purchased outside or furnished by the Government would normally receive a lower profit rate than one which *added more value through its own operations. This was one of the first factors considered in evolving an allowable profit rate.*" [3] [Emphasis supplied.]

In commenting on a given point in the Renegotiation Act of 1951, section 103, dealing with definitions, a leading service contains the following statement:

"The character of the contractor's business is an important consideration in the determination of excess profits, since manufacturing contributions varies with the nature of the product and the degree of skill and precision required by the work. The greater the manufacturing contribution of the contractor, the greater should be the margin of profit. A greater part of the ultimate value of the product is contributed by a contractor who performs a large proportion of the work directly than by one who merely assembles the product." * * * [4]

PROOF OF VALIDITY OF THE VALUE ADDED THEORY IN RELATION TO RATE OF RETURN

In order to test the validity of the basic theory that value added is a satisfactory measure of value created in the process of manufacture and the logical assumption that a higher rate of return should therefore accompany a higher value added ratio, pertinent data were collected with respect to certain industry classifications that are relevant to the specific company involved in the matter. In table 1 are presented the value of products shipped and the value added by manufacture for each of the 48 industries comprising the Standard Industrial Classification Major Industry Groups 33 and 34. As shown under Sources, the data for the table were obtained for the year 1947 from the census of manufactures and that is the only year of the base period 1946-49 for which such data are available.

It will be noted from the date in table 1 that the value added by manufacture for the year 1947 by all 48 industries making up major groups 33 and 34 was 46.18 percent and that these industries made up 11.25 percent of all manufacturing in the United States in terms of value added. According to the tentative rates of return promulgated by the Treasury Department for purposes of application under the excess-profits-tax law, the rate of return on assets for these groups for the same year (1947)was 15.4 percent.

Source: Census of Manufactures: 1947, volume II, Statistics by Industry, U. S. Government Printing Office, Washington: 1949, pages 529-635.

Since the value of products shipped is not given by the census for industry groups but only by individual industry classifications, it was necessary to prepare this tabulation in order to obtain a total for the industries covered under Groups 33 and 34 in appendix A (tentative rates of return) by the Bureau of Internal Revenue.

As the total value added by all manufacturing establishments in the United States in 1947 was $74,425,825,000, the industries covered in this tabulation represented 11.25 percent of all manufacturing in terms of value added ($8,373,205,000 divided by $74,425,825,000).

An attempt was then made to secure data on the screw machine products industry (Standard Industrial Classification 3495) of which the interested company is a member, but such data are not available on rates of return on assets. By personal contact, through a representative, with the Statistical Division of the Bureau of Internal Revenue in Washington and with the cooperation of its personnel it was possible to obtain the necessary data for a subdivision of Major Groups 33 ane 34, known as Industry Classification 349, in which belongs the screw machind products industry (3495). As the Bureau of Internal Revenue classification is somewhat different from that included in the Standard Industrial Classification Manual under the same number designation, the detailed composition of this industry classification as used by the Bureau of Internal Revenue is presented in table 2. By following closely this detailed composition of Industry 349 it was possible to compile data on value of shipments and value added, respectively, from the Census of Manufactures for the year 1947 for the identical parts of this industry classification. The results are presented in table 3, which show that the value added for Industry 349 was 54.15 percent compared with 46.18 percent for major groups 33 and 34, or 17.26 percent higher. If the comparison is made with the value added of Major Groups 33 and 34 exclusive of the industries covered by 349, which amounted to 41.66 percent, then the value added by Industry 349 was 29.98 percent higher (54.15 divided by 41.66, less 100).

TABLE 2.—*Excerpts from instructions for coding industrial activity, Statistical Division, Department of Internal Revenue—Major Groups 33 and 34—Iron, steel, and products*

349—OTHER IRON AND STEEL PRODUCTS (NOT FALLING WITHIN THE SUCCEEDING MAJOR GROUPS) INCLUDING METAL STAMPING, FOUNDRY, AND WIRE PRODUCTS

- Iron and steel foundry products:
  - Gray-iron and semisteel castings
  - Malleable-iron castings
  - Steel castings
  - Cast-iron pipe and fittings
- Wire products (made from purchased wire):
  - Wire drawing (from iron, steel, or nonferrous rods)
  - Nails and spikes
  - Wirework not elsewhere classified:
    - Animals traps
    - Barbed wire
    - Baskets and trays
    - Cable and wire, not insulated
    - Cages
    - Concrete-reinforcing wire
    - Fencing wire
    - Kitchen wire goods
    - Springs, wire (except complete bed springs)
    - Tire chains
    - Welding wire
    - Wire cloth and netting
- Metal stamping and coating:
  - Vitreous-enameled products:
    - Kitchen, household, and hospital utensils
    - Refrigerator, stove, and washing-machine parts
    - Table tops
  - Automobile stampings
  - Stamped and pressed metal products:
    - Bottle and jar crowns and screw caps (metal)
    - Bottle caps and tops (metal)
    - Cans, ash and garbage
    - Pails and pans
    - Perforated metal
    - Metal stamping and spinning combined (ferrous) for the trade
  - Enameling, japanning, and lacquering of metal products
  - Galvanizing and other coating:
    - Coating with aluminum, lead, zinc, etc.
    - Retinning cans and utensils
    - Rust-proofing on metals

Miscellaneous iron and steel products:
- Bolts, nuts, washers, and rivets:
  - Lock washers, plain washers
  - Turnbuckles and toggle bolts
- Iron and steel forgings (not made in rolling mills):
  - Anchors
  - Anvils
  - Axles
  - Car wheels
  - Chains (except bicycle and motorcycle drive chains)
  - Drop forgings
  - Forged parts for automotive equipment, machinery, and railway equipment
  - Frogs
  - Railway switches (forged)
- Wrought pipes, welded and heavy riveted: conduit, wrought welded
- Steel springs:
  - Coiled flat springs
  - Leaf springs
- Screw-machine products and wood screws: Screws (ferrous and nonferrous): Cap, set, wood
- Steel barrels, kegs, and drums: Cans (except tin cans) made of stamped and pressed metals
- Safes and vaults:
  - Safe-deposit boxes and chests
  - Locks (except time locks): Safe, vault
  - Vault doors and linings
- Iron and steel products, not elsewhere classified:
  - Boxes, metal (other than tin)
  - Cold-rolled strip and sheets
  - Annealing, heat treating, tempering, and hardening of steel for the trade

TABLE 3.—*Value of products shipped and value added by manufacture—United States: 1947—Bureau of Internal Revenue Industry Classification 349*

[In thousands of dollars]

Census of manufactures industry classification	Value of products shipped	Value added to manufacture
Steel foundries	$413,094	$267,214
Gray-iron foundries	1,172,671	732,647
Malleable iron foundries	184,400	121,661
Wire drawing	912,095	314,788
Nails and spikes	30,038	15,721
Wirework [1]	464,625	266,426
Vitreous-enameled products	74,382	45,116
Metal stampings	1,164,299	642,483
Enameling and lacquering	23,868	16,638
Galvanizing	27,111	15,296
Plating and polishing	176,492	125,388
Bolts, nuts, washers, and rivets	463,752	285,451
Iron and steel forgings (not made in rolling mills)	370,097	197,111
Welded and heavy riveted pipe	218,875	89,614
Steel springs	92,646	45,878
Screw machine products	220,542	143,853
Metal barrels, drums, and pails	173,060	64,119
Safes and vaults	29,216	19,434
Primary metal products [1]	339,663	138,642
Total	6,550,926	3,547,478
Value added, percent of value shipped		54.15
Value added, Industry 349 to value added, major groups 33 and 34: 54.15 ÷ 46.18 percent		117.26
Value added, Industry 349 to value added, major groups 33 and 34, exclusive of Industry 349: 54.15 ÷ 41.66 percent		129.98

[1] Not elsewhere classified.

Source: Basic data taken from Census of Manufactures: 1947, volume II, Statistics by Industry, U. S. Government Printing Office, Washington: 1949. Specific classifications chosen from the Census of Manufactures to correspond to subdivisions used by Bureau of Internal Revenue for its Industry Classification 349.

In line with the theory about value added and the assumption that a higher rate of return should accompany a higher value added ratio, it stands to reason that the rate of return in Industry 349 should be higher than for Major Groups 33 and 34. That such was actually the case is indicated by the data shown in table 4. From these data it will be noted that the sum of the aggregate net income before taxes and the aggregate interest deductions in 1947 amounted to $555,277,000 and the total assets at the end of the year aggregated $2,747,891,000, making a return on net assets of 20.21 percent ($555,277,000 divided by $2,747,891,000), compared with a net return for Major Groups 33 and 34 for the same year of only 15.4 percent. Thus the return on assets for Industry 349 was 31.21 percent higher than for Major Groups 33 and 34 (20.21 percent divided by 15.4 percent, less 100).

TABLE 4.—*Pertinent data bearing on rate of return on assets of industry classification 349 for the years 1946 and 1947*

	All returns		Returns with balance sheets	
	With net income	With no net income	With net income	With no net income
	1946			
Number of returns	2,848	1,100	2,787	1,021
Total assets [1]	1,960,185	424,020	1,960,185	424,020
Interest paid	5,647	2,544	5,534	2,482
Net income before taxes	357,755	[2](43,957)	354,459	[2](42,654)
Gross sales	3,042,499	475,285	3,015,728	467,000
Gross receipts from operation	19,804	4,035	19,708	3,805
	1947			
Number of returns	3,230	1,263	3,154	1,167
Total assets	2,615,567	132,324	2,615,567	132,324
Interest paid	9,140	1,509	9,073	1,464
Net income before taxes	562,466	[2](17,838)	557,966	[2](16,684)
Gross sales	4,524,720	197,108	4,491,414	191,907
Gross receipts from operation	25,479	3,809	24,961	3,643

[1] All figures except those which show number of returns are rounded to the thousands.
[2] Figures in parentheses connote a deficit.

Source: From the Washington Records of the Bureau of Internal Revenue.

There is every reason to believe that the rate of return was still higher for industry 3495 (screw machine products), which had in 1947 a value added ratio of 65.23 percent. The data presented herein, therefore, fully corroborate the theory concerning value added and the assumption underlying a rate of return, not only commensurate with the higher value added ratio but one that is progressively higher. Furthermore, and by the same token, they high light the unfairness and the inequity in applying to a company with a value added ratio of 77.5 percent a rate of return earned by an industry group having a value added ratio of only 46.18 percent.

APPLICATION OF VALUE-ADDED THEORY TO SPECIFIC COMPANIES

As previously noted, there are no data now in possession of the Bureau of Internal Revenue that would make feasible a computation of rates of return on assets for industries classified in the four-digit categories. Such data are available, however, for the three-digit classifications for the years 1946 and 1947 and will soon also be available for the year 1948 and probably in a few months also for the year 1949. It may thus be quite possible and practicable to compute the rates of return at least for the three-digit groups of industries. Until that is done, and perhaps regardless of that, it may be best to compute such rates of return for a specific company in the light of its own experience.

According to the data presented in table 5, during the third year of its operation when it presumably had attained a more or less level of normal operation in this regard (covering the fiscal year ended April 30, 1951), the Morton Gregory Corp. had a value-added ratio or percentage of 77.51. To apply to such a company a rate of return characteristic of a group of industries (major groups 33 and 34) with a value-added ratio of 46.18 percent borders on the ridiculous. To a lesser extent it is also objectionable to apply to it a rate of return characteristic of Industry 349 with a value-added ratio of only 54.15 percent.

TABLE 5.—*Value added by manufacture, Nelson Stud Welding Division only, Morton Gregory Corp. (fiscal years ending Apr. 30, 1949, 1950, 1951)*

	Amounts		Percent of Net sales
Fiscal year ending April 30, 1949:			
Net sales		$1,717,804	
Less—Sales of purchased products and ferrules		160,000	
		1,557,804	
Material and containers	$580,378		
Less—Cost of purchased products and ferrules	86,405		
	493,973		
Supplies	28,723		
Utilities	8,064		
		530,760	
Net value added by manufacture		1,027,044	65.93
Fiscal year ending April 30, 1950:			
Net sales		1,680,032	
Less—Sales of purchased products and ferrules		153,073	
		1,526,959	
Material and containers	492,318		
Less—Cost of purchased products and ferrules	95,450		
	396,868		
Supplies	30,865		
Utilities	8,285		
		436,018	
Net value added by manufacture		1,090,941	71.45
Fiscal year ending April 30, 1951:			
Net sales		2,475,208	
Less—Sales of purchased products and ferrules		291,831	
		2,183,377	
Materials and containers	596,710		
Less—Cost of purchased products and ferrules	172,751		
	423,965		
Supplies	62,245		
Utilities	9,743		
		490,953	
Net value added by manufacture		1,692,424	77.51

Source: Submitted per covering letter dated June 7, 1951 and signed R. J. Kilmer.

The logical and sound thing to do would be to apply to the company the rate-of-return characteristic of its own industry, which in this case is the screw machine products industry in the four-digit classification, or that of comparatives made up of companies similarly operating. In the absence of such data, the company's own experience in relation to that of major industry groups 33 and 34 offers the best practical solution. By the simple process of applying this relationship to the industry base-period rate through the use of a simple formula, the problem is solved. This formula is as follows:

$$\frac{\text{Value added by company}}{\text{Value added by groups 33 and 34}} \times \text{Rate of return for industry groups 33 and 34} = \text{Rate of return applicable to company.}$$

When this formula is translated by use of the necessary data, the results are as follows:

$$\frac{77.51 \text{ percent}}{46.18 \text{ percent}} = 167.84 \text{ percent} \times 13.8 \text{ percent}^{1} = 23.16 \text{ percent}$$

Application of this formula is not only sound in theory. It is also logical and is easily and readily administered to all companies that qualify for relief on grounds provided by the law as amended. That it results at the same time in fair and equitable treatment goes without question.

[1] 13.8 percent is the rate of return applicable to groups 33 and 34 as determined by the Treasury Department for use in computing excess profits.

SPECIAL SIGNIFICANCE OF VALUE-ADDED ADJUSTMENT TO SMALL BUSINESSES

As a rule, small manufacturing corporations engage in processes and operations that may not be susceptible to a very high degree of mechanization and large-scale operation and which require special skills, extra attention to detail, specific designs for individual customer needs, and products and service that are "tailor-fitted" to such needs in an engineering and production way. It is under such conditions that they can compete successfully among themselves and with manufacturers operating on a large scale. All of these spell a relatively high value-added ratio for such small concerns and society, through expressions in the open market, has shown its willingness to pay a fair price for this added contribution. In justice, therefore, this unique contribution of small businesses should be given recognition in determining for them a fair and reasonable rate of return for normal tax purposes. Such a return must necessarily be adequate to insure continued operation of these small businesses, so essential to our economic system. It is felt that application of the formula suggested above will do just that.

Senator MILLIKIN. Our next witness is Mr. Joseph McCloskey. Make yourself comfortable.

STATEMENT OF JOSEPH McCLOSKEY, ARROW FOOD DISTRIBUTORS, INC.

Mr. McCLOSKEY. My name is Joseph McCloskey. I am appearing as one of the organizers and secretary of Arrow Food Distributors, Inc.

The story of Arrow Food Distributors is the story of a really small growth corporation. I believe its story will convince you of the inequity of the provisions of the existing excess-profits-tax law to corportations in our situation.

Arrow Food Distributors is a Louisiana corporation domiciled in New Orleans. It is engaged in the wholesale distribution of frozen food products.

It was organized by seven honorably discharged veterans of World War II and began operations as of April 1, 1947.

It could not have been organized prior to January 1, 1946, because of the service obligations of the incorporators.

Its base period, therefore consists of only 33 instead of 48 months. In those 33 months, though, its growth record has been as follows:

In payroll an increase from $30,000 in the first 9 months of operation in 1947 to almost $110,000 for the 12 months of 1949, better than 3½ to 1.

By 1950 the payroll had gone up to $150,000, and it will approximate $165,000 this year.

I have broken down these figures on exhibit 1 which has been filed with you.

They show clearly that the payroll for the second half of the 33 months of operation was far in excess of 130 percent of the total payroll for the first half of the number of months in operation.

Turning to gross receipts, we find an increase from $384,000 in the first 9 months of operation in 1947 to $1,600,000 for 1949; 1950 gross receipts were $65,000 in excess of $2 million and 1951 gross receipts should approximate 2½ million.

I have also broken down those figures on exhibit 2. They show that we are here again far in excess of the percentage increase in gross receipts during the second half of our base period, which is the measure of a growing corporation.

Now, I have also previously furnished to each member of the committee a memorandum to which I attached a graph. I believe that this graph is a very good illustration of the fact that we are a growing corporation. It is with the blue memorandum there, Senator. It shows that in 1947 there was a growth, but a very gradual growth, during the organization period.

In 1948, 1949, and 1950, however, you can see what our growth experience was up until the time of the hostilities in Korea.

As the graph will show the outbreak of the Korean War had a very adverse effect on our business.

Senator MILLIKIN. How did that come about?

Mr. McCLOSKEY. The explanation for that, Senator, is that at that time consumers in general used their money to stock up on articles which were expected to be in short quantity, but because of limited freezer space, frozen foods were not among those articles, and because the money was channeled off in other directions, the frozen food business suffered a slump.

Senator MILLIKIN. I notice it runs up pretty rapidly.

Mr. McCLOSKEY. Well, it was only after that scare-buying period came to an end that we resumed our normal growth pattern.

We think that we are still going forward, as our 1950 and 1951 experience shows.

Senator KERR. Are you retail or wholesale?

Mr. McCLOSKEY. Wholesale distribution of frozen foods.

Senator KERR. Consisting of vegetables mainly?

Mr. McCLOSKEY. Vegetables, orange juice, chickens, waffles that you put in your toaster.

Senator KERR. You have not got any samples of your wares here, have you?

Mr. McCLOSKEY. No, sir, I do not have, Senator. I asked our president if he did not think we should bring some along. We think that our profits are certainly not in the language of the House report on the excess profits bill, higher than they would have been in the absence of hostilities and a large military budget.

On the contrary, because of this interference with our normal growth pattern, we earned $3,800 less in 1950 than we had in 1949, but nevertheless because the excess profits tax, as now written, prevents us from being recognized as a growing corporation, we are going to have to pay an excess profits tax for 1950 in an amount about equal to our loss in profits, and of course, that is going to be worse for 1951 and future years because for 1950 we compute only on a 6-month, rather than a 12-month basis.

We believe that we have met all the yardsticks set up for determining what is a growing corporation, except that we had not or were not in business prior to January 1, 1946. But when you remember that all seven of the incorporators of this concern were members of the armed services, it is pretty obvious we could not have organized prior to January 1, 1946.

So, as a net result, an organization which makes $3,800 less in 1950 because of military hostilities, has to pay an excess profits tax on almost the same amount, or a net difference in money for future development of a still expanding business, in the neighborhood of $7,500.

We feel that this is an unfair penalty to impose on seven honorably discharged veterans of World War II who were prevented from organizing prior to January 1, 1946, and who should be entitled to some time credit in the application of the excess-profits tax law.

We feel further that although the products handled by Arrow Food Distributors are technically not new products, the tremendous increase in the general distribution of frozen foods since the end of World War II, and the addition to the frozen food line of articles not previously packaged as frozen foods, are additional reasons why we should be treated as a growing corporation. Otherwise, we are not going to be able to stay in competition with the nonveterans whose businesses were organized prior to January 1, 1946, and who have reflected the same growth in the increase in the frozen food business.

The tax money they do not have to put out can be used directly in competition with us, and that is why we think that relief now rather than at a later date is so important.

We submit, therefore, that in view of the percentage increase in volume of sales and in payroll, which we have demonstrated, and also in view of the newness of the general distribution of frozen foods, the excess profits tax law should be amended to permit us to use the alternative method of determining our excess profits tax credit, which is allowed to growing corporations.

We have already furnished each member of the committee a full memorandum with respect to this, including a draft of a proposed amendment to accomplish the result. We earnestly invite your attention and thorough consideration of it.

Senator MILLIKIN. Thank you very much.

(The documents referred to follow:)

Payroll records, Arrow Food Distributors, Inc.

1947—9 months, Apr. 1–Dec. 31	$30,488
1948—First 6 months, Jan. 1–June 30	29,360
Second 6 months, July 1–Dec. 31	43,495
1949—First 6 months, Jan. 1–June 30	43,828
Second 6 months, July 1–Dec. 31	65,904

For the 33 months of business beginning April 1, 1947, and ending December 31, 1949, the corporation thus had a total payroll of $213,075.

For the first half of this period, i. e., for 16½ months beginning April 1, 1947, and ending August 15, 1948, the payroll amounted to $69,989.

For the second half, i. e., from August 16, 1948, to December 31, 1949, the payroll amounted to $143,086.

It is obvious, therefore, that the payroll for the second half of the 33 months during which the corporation has been in business was 130 percent of the total payroll for the first half of the total number of months during which it was engaged in business.

PAYROLL RECORDS SINCE 1949

1950—First 6 months, Jan. 1–June 30	$71,984
Second 6 months, July 1–Dec. 31	78,574
1951—First 6 months, Jan. 1–June 30	84,237

Gross receipts, Arrow Food Distributors, Inc.

1947—9 months, Apr. 1–Dec. 31	$394,307
1948—First 6 months, Jan. 1–June 30	471,471
Second 6 months, July 1–Dec. 31	623,355
1949—First 6 months, Jan. 1–June 30	792,678
Second 6 months, July 1–Dec. 31	893,718

For the first 33 months of business beginning April 1, 1947, and ending December 31, 1949, the corporation thus had gross receipts of $3,175,529.

For the first half of this period, i. e., for 16½ months beginning April 1, 1947, and ending August 15, 1948, the gross receipts amounted to $1,003,814.

For the second half, i. e., from August 16, 1948, to December 31, 1949, the gross receipts amounted to $2,171,715.

From the above it is obvious that the gross receipts for the second half of the 33 months during which the corporation has been in business was 150 percent of the total gross receipts for the first half of the total number of months during which it was engaged in business.

GROSS RECEIPTS SINCE 1949

1950—First 6 months, Jan. 1–June 30	$1, 018, 122
Second 6 months, July 1–Dec. 31	1, 017, 054
1951—First 6 months, Jan. 1–June 30	1, 250, 022

Memorandum Submitted by Arrow Food Distributors, Inc.

Arrow Food Distributors, Inc., was formed by seven veterans of World War II on April 8, 1947. The attached graph, (exhibit A), shows the continuous growth of the corporation in volume of sales. The yearly profit, before taxes, is set out as follows:

Nine months 1947, $487.01; year 1948, $24,015.18; year 1949, $50,070.18; year 1950, $47,101.84.

The graph establishes that far from profiting from the outbreak of the Korean War, the corporation suffered a distinct falling off from the ordinary pattern of growth which it had previously been evidencing, and did not begin its way back toward a continuance of this growth pattern until the beginning of 1951.

That is explained by the fact that, at the outbreak of the Korean War, consumers in general used their money to stock up on articles expected to be in short quantity thereafter. Because of the limited freezer space, however, frozen foods were not among the articles which were purchased in quantity at that time, and it was only after a return to more normal buying habits that this corporation, as shown on the attached graph, began to resume the steady growth pattern previously manifested.

The net profit figures for 1949 and 1950 illustrate further the inequity in applying the Excess Profits Tax Act of 1950, as now written, to this corporation.

In its report to the House on H. R. 9827, the Committee on Ways and Means declared:

"One of the main objectives in imposing an excess profits tax is to reach corporate profits which have been swollen by the increased tempo of the economy. An excess profits tax selects for additional tax those corporations whose profits are higher than they would have been in the absence of hostilities and a large military budget."

As will be noted from the attached graph and the net profit figures set out hereinabove, the profits of this corporation for the year 1950 were not "higher than they would have been in the absence of hostilities and a large military budget," but were, in fact, actually lower than they had been in the previous year.

The profits of this corporation are, therefore, those of one experiencing an unusually rapid growth in payroll and gross receipts which, if not due to the sale of a technically "new product," are unquestionably the result of tremendous increase since the end of World War II in the general distribution of frozen-food products and the addition to the line of frozen-food articles distributed during those years of many products not so formerly packaged and distributed.

However, because this corporation could not have been organized prior to January 1, 1946, because all of its incorporators were in the armed services, it could not take advantage of the alternative method of computing its average base period net income in determining its excess-profit-tax credit which is afforded growing corporations under the Excess Profits Tax Act of 1950.

Instead, it is relegated to the unsatisfactory alternative of determining this credit either on the basis of its income during the base period (during which there was no income for 12 months in 1946 and 3 months in 1947), or by use of the industry rate of return proclaimed by the Secretary of the Treasury for new corporations.

Under either alternative this corporation's excess-profits-tax credit will not exceed the minimum $25,000 credit allowed under the act. As a result, although it has a smaller net profit in 1950 than in 1949, it will be subjected to the imposition of an excess-profits tax on its 1950 operations. If its growth pattern continues it will be subjected to an even greater excess-profits tax in subsequent years.

On the other hand, as a growing corporation this corporation would be entitled to use its excess-profits net income for 1949 as its average base period net income in computing its excess-profits-tax credit, with the result that its excess-profits tax, if any, would be negligible.

It would thus seem apparent that the Excess Profits Tax Act of 1950, by providing to this corporation only the alternative relief given to new corporations, does not sufficiently take into account the unusually rapid growth, expansion, and development of the business of distributing frozen foods since the cessation of hostilities of World War II, and by its designation of January 1, 1946, as the date before which a corporation must have been in business in order to avail itself of the alternative relief permitted to growing corporations, unjustly penalizes corporations composed of veterans of World War II whose military service prevented them from incorporating a business prior to January 1, 1946.

It is therefore submitted that there is a hiatus in the Excess Profits Tax Act of 1950 as now written under which a technically new corporation, which has in fact the characteristics and meets the tests of a growing corporation, but cannot technically qualify as such because its members, all veterans of World War II, were not in a position, on account of their military and naval service, to begin business prior to January 1, 1946, is subjected to the payment of an excess-profits tax for 1950 on an amount of profit less than that earned in 1949.

A suggested amendment to the Excess Profits Tax Act of 1950, which would permit corporations such as Arrow Food Distributors, Inc., to avail themselves of the alternative relief provided to growing corporations, although technically a new corporation, is set out hereunder.

This proposed amendment continues in effect fundamental yardsticks for determination of the rate of growth required for use of the alternative basis for growing corporations now provided in the Excess Profits Tax Act of 1950. Its only effect is to permit a corporation composed of veterans who could not organize their business until after January 1, 1946, but who otherwise meet the test of a growing corporation, to use the alternative means provided to such corporations for computing their excess profits tax credit.

The proposed amendment is as follows:

1. Amend Section 435 (b) to read as follows:

"BASE PERIOD.—As used in this subchapter the term "base period" means the period beginning January 1, 1946, and ending December 31, 1949, except that (1) in the case of a taxpayer whose first taxable year under this subchapter was preceded by a taxable year which ended after December 31, 1949, and before April 1, 1950, and which began before January 1, 1950, the term "base period" means the period of 48 consecutive months ending with the close of such preceding taxable year; and (2) in the case of a taxpayer entitled to the benefits of subsection (ee) the term "base period" means the period of months beginning with the first day of the month on which the corporation commenced business, and ending with December 31, 1949."

2. Add to section 435 a new subsection reading as follows:

"(ee) AVERAGE BASE PERIOD NET INCOME—ALTERNATIVE BASED ON GROWTH

"(1) TAXPAYERS TO WHICH SUBSECTION APPLIES.—A taxpayer shall be entitled to the benefits of this subsection even though it did not commence business before January 1, 1946, if

"(A) (i) It began business prior to July 1, 1947; and

"(ii) Both at the time of its incorporation and at the close of its first taxable year under this subchapter, at least 70 per centum of its total outstanding voting stock was owned by veterans of any of the branches of the Army or naval services of World War II who were separated from said service under conditions other than dishonorable; and

"(iii) The total assets of the taxpayer as of December 31, 1949 (when added to the total assets for such day of all corporations with which the taxpayer has the privilege under section 141 of filing a consolidated return for its first taxable year under this subchapter), determined under paragraph (3), did not exceed 35,000,000; and

"(iv) The total payroll of the taxpayer (as determined under paragraph (e) (4)) for the last half of the total number of months during which it was in business prior to the beginning of its first taxable year under this subchapter is 130 per centum or more of its total payroll for the first half of the aforesaid total number of months, or the gross receipts of the taxpayer (as determined under paragraph (e) (5)) for the last half of the aforesaid total number of months is 150 per centum or more of its gross receipts for the first half thereof.

"(B) (i) The taxpayers' net sales for the period beginning January, 1 1950, and ending June 30, 1950, when multiplied by two, equals or exceeds 150 per centum of its average net sales for the first half of the total number of months during which it was in business prior to the beginning of its first taxable year under this subchapter; and

"(ii) 40 per centum or more of the taxpayers' net sales for the calendar year 1950 is attributable to a product, or class of products (including any article in which such product or class of products is the principal component, and including any article which is a component of such product or class of products), of a kind not generally available to the public at any time prior to January 1, 1946, and

"(iii) The amount of the taxpayer's net sales which is attributable to such products or class of products for the first 12 months during which the taxpayer was in business is 5 per centum or less of the amount of its net sales (as defined in paragraph (e) (B) (iii) so attributable for the 12 months immediately prior to the beginning of its first taxable year under this subchapter."

3. Amend the first sentence of section 435 (e) (2) to read as follows:

"The average base period net income determined under this subsection and subsection (ee) shall be determined as follows:"

4. Amend the first paragraph of section 435 (e) (2) (G) to read as follows:

"In the case of a taxpayer who is entitled to the benefits of this subsection or subsection (ee) only under paragraph (1) (B) and whose excess profits net income for the calendar year 1949 is not more than 25 percentum of its excess profits net income for the calendar year 1948, by computing—"

5. Amend the last paragraph of section 435 (e) (2) to read as follows:

"The average base period net income determined under this subsection or under subsection (ee) shall be the amount ascertained under subparagraph (C), (D), or (F), whichever is the highest, except that in the case of a taxpayer described in subparagraph (G) its average base period net income determined under this subsection shall be the amount ascertained under subparagraph (C), (D), (F), or (G) (ii), whichever is the highest."

6. Amend section 435 (e) (3), (4), and (5) to make them apply both to subsection (e) and subsection (ee).

Senator MILLIKIN. Our next witness is Felix Lapeyre. Will you please come forward and give your name and connection to the reporter.

STATEMENT OF FELIX LAPEYRE, REPRESENTING PEELERS, INC.

Mr. LAPEYRE. Senators, we have essentially a very acute, but simple problem which I believe we can present in a very short time. My client, Peelers, Inc., was incorporated in 1949 for the purpose of exploiting some patents on shrimp peeling machines. Formerly shrimp were peeled manually, and it was a very costly operation.

Senator KERR. You mean by hand?

Mr. LAPEYRE. By hand.

Senator KERR. Yes.

Mr. LAPEYRE. Now, you will note on the last three pages of the memorandum submitted photographs of these machines from which you may see that the machines are not something which were dreamed up overnight, but are a combination of inventive genius and engineering skill.

Senator MILLIKIN. Where do you operate your business?

Mr. LAPEYRE. We operate in the State of Louisiana, principally in the parishes of Terrebonne and Orleans, and Jefferson.

As a matter of fact, as I was saying, Senators, it took a period of approximately 6 years to develop the machines to the stage in which they now are.

There are three patents on the machines already issued and one further patent will shortly be—one further patent application will shortly be filed.

The way we handle these machines is this: We manufacture them, but we do not sell them. We lease them to the shrimp operators.

There are only two types of shrimp, as of now, which are peeled commercially. They are the canned shrimp, of course, and what is known in the industry as the cooked-peeled shrimp

The cooked-peeled shrimp are blanched, as we call it, which is a boiling operation for just a couple of minutes in a brine solution, and then the shrimp are placed into a large, what I would call, paint can.

Senator KERR. What?

Senator MILLIKIN. Paint can.

Mr. LAPEYRE. In a paint can. I mean, a can with a lid which flops down, but which is not hermetically sealed, and they are kept under refrigeration, and sold in that state. They are different from canned shrimp which are, of course, hermetically sealed, and processed inside the can.

Senator MILLIKIN. They are completely cooked?

Mr. LAPEYRE. That is right.

Senator MILLIKIN. You are just blanching these?

Mr. LAPEYRE. The cooked-peeled, are simply blanched.

Senator MILLIKIN. All right.

Mr. LAPEYRE. Those are the only two types of shrimp which are peeled before being commercially sold, and they are the types of shrimp which we peel on our machines.

As I said, we do not sell the machines, we lease them to various shrimp operators, at a rental which approximates $4 a barrel on the shrimp which are introduced into the machine.

Senator MILLIKIN. How much would it cost to do the job by hand?

Mr. LAPEYRE. It would cost in excess, I believe, of twice that amount when various other factors are taken into consideration, such as the mutilation and loss of shrimp meats by hand peeling, which is largely eliminated by the machine peeling.

As a matter of fact, I think the attractiveness of the machines is shown by their success.

In 1949 there were only token operations. We only had one pilot machine at that time. Our operations were practically nil.

But in 1950 we had in operation over the period of that year an average of 16.81 machines, which grossed a rental of approximately $9,000 per machine.

Senator KERR. Per year?

Mr. LAPEYRE. Per year. The net earnings for 1950 were $150,000.

Thus far in 1951, 28 machines have grossed a rental of a total of $151,000, with the big August-September season just coming on.

Now, this excess-profits-tax situation: We do not have any base period experience. Our capitalization is low, so we are relegated to the industry rate of return as the possible means of figuring our excess-profits-tax credit.

Now, we have created a new industry, and find ourselves placed into a classification which is entitled, "Miscellaneous Business Services," which, for all I know, may include some corporation for bootblacks, or something of that sort, which has a rate of return of 13.3 percent.

Actually we, in the year 1950 had a return of 85 percent on our combined invested and borrowed capital, so that you can see that to apply a return of 13.3 percent to a business which is actually earning 85 percent is, to say the least, not very realistic.

Senator KERR. And it was not a war profit.

Mr. LAPEYRE. It was not a war profit.

As a matter of fact, Senator, and I am very happy you brought that up, if anything, our experience is that our earnings now are less than they would have been in the base period for several reasons.

Senator KERR. First of all, there were a lot more shrimp.

Mr. LAPEYRE. There were a lot more shrimp.

Evidently you are familiar with the shrimp situation.

No. 2. We could have expanded more rapidly in that period because now we are faced with shortages of aluminum. Our machines are made largely of aluminum, and it is hard to get, so our experience has been that our expansion has been and probably will continue to be hampered in that regard.

Senator MILLIKIN. What do you want to do?

Mr. LAPEYRE. Well, the effect of the law as it presently stands, upon us, is that we are paying currently 62 percent, the ceiling tax, you see, upon our income.

Senator MILLIKIN. What do you propose?

Mr. LAPEYRE. If that is raised to 70 percent, we would be paying that. Feeling that the spirit of the excess-profits-tax law is to exempt from this additional tax all income which is not produced by the current inflationary trend due to the war emergency, we propose an exclusion from excess profits tax net income of income which is obtained by reason of patents on a patented article which was not available at the inception of the base period to the extent, however, only that such income has not been swollen by war contracts or by price increases since the particular article first became generally available.

Senator MILLIKIN. Are you familiar with this problem, Mr. Stam?

Mr. STAM. I had talked to the gentleman about his problem.

Senator KERR. What you say is that you really are entitled to have established that which would in actuality be a normal base for your business.

Mr. LAPEYRE. That is absolutely correct.

Now, late in the spring—last May, I prepared a memorandum and sent it to all the members of the House Ways and Means Committee and also to all the members of the Senate Finance Committee, and a copy to Mr. Stam.

At that time, I proposed a type of 722 approach whereby we would be thrown back into the economic conditions existing in the base period, and we would work it out on that fashion. I was told that Congress was not at all anxious, as a matter of fact, was rather bitterly opposed to, reenacting a 722 type of approach, which at least theoretically, is the just type of approach, but which has a lot of bugs in administration—it is very difficult of administration.

Senator KERR. What you are saying to us is that if you are going to be put into a miscellaneous classification you would like to see it one that would produce equity rather than inequity.

Mr. LAPEYRE. That is exactly it, Senator.

We are also in this very precarious position. We have borrowed the capital to manufacture these machines. That capital must be repaid out of earnings. Now if Uncle Sam comes in every time our machine lays a golden egg and snatches that egg away from us, we are going to find it very difficult to repay the money we have borrowed and have any return at all on the work and inventive genius which has been expended in the development of these machines.

Senator KERR. In other words, the situation is going to develop where either the fellow who furnishes the money from which you made the machines, or Uncle Sam is going to take it?

Mr. LAPEYRE. That is exactly it.

Now we thought of getting around the whole problem by liquidating and operating as a partnership, assuming personal, individual liability with respect to the heavy borrowed indebtedness of the corporation. The trouble there is that in an ordinary liquidation——

Senator KERR. The trouble there is that your liquidation would be a taxable transaction, and rather than getting relief you would just accelerate the process.

Mr. LAPEYRE. We would be putting a noose around our necks taxwise.

Senator KERR. I would not advise you to do that.

Mr. LAPEYRE. Unless we can liquidate under section 112 (b) (7) whereby we postpone the realization of a capital gain on the appreciation of capital, as I understand. The only trouble about that is that we must do it right now, we have got to do it pronto, and it is for that reason, Senator, ——

Senator KERR. I thought that provision was good for any part of 1951?

Mr. LAPEYRE. That is right. We have got to do it before the end of this year.

Senator KERR. Yes.

Mr. LAPEYRE. Unless the Senators and the Congress want to extend that provision for another year; we do not want to liquidate. We prefer the corporate form. It is a lot more convenient. The shareholders have minor children. If we are operating as a partnership the death of one of the partners is going to create complications. We do not want to go into a partnership. We are more than glad to pay the Government a reasonable tax for taking advantage of the corporate form. However, we cannot go on giving Uncle Sam practically everything. So if we do not have relief now, Senators, I do not mean next year or when a general revision of the excess-profits-tax law is considered, if we do not have relief now we are compelled to liquidate now, and that is our situation.

Senator MILLIKIN. I think you have made your point very clear.

Senator KERR. You surely have.

Mr. LAPEYRE. Thank you.

Senator MILLIKIN. Your statement will be put in the record.

(The prepared memorandum referred to is as follows:)

MEMORANDUM SUBMITTED ON BEHALF OF PEELERS, INC.

To the Honorable the Members of the Committee on Finance of the United States Senate:

Peelers, Inc., was formed on January 4, 1949, to exploit the invention of a shrimp peeling machine upon which one United States patent had already been granted and upon which two more patent applications had been filed, both of which have since been granted.

Since that time the corporation has developed an auxiliary shrimp-cleaning device for use with the machine and has, through the individual inventors, filed a patent application thereon.

The machines serve a very useful function in connection with shrimp which are peeled before processing as is done in the case of canned shrimp and cooked-peeled shrimp. They enable shrimp operators to conduct their business at a reduced cost and with greatly increased efficiency. Photographs of the machines are attached so that the members of the committee may see for themselves that the corporation's machines are not simple gadgets, but complex pieces of mechanism resulting from a combination of inventive genius and engineering skill.

The corporation constructs the machines (at a cost of approximately $6,000 each) and leases them to shrimp operators for a rental calculated to approximate $4 per barrel of raw unpeeled shrimp introduced into the machines.

Since it began business the corporation has constructed and leased 28 machines, all now equipped with the newly developed auxiliary cleaning device. Still in its growth period, the corporation must construct many more machines in order to supply all operators desiring to convert from the costly and wasteful manual peeling of shrimp to the economical and efficient mechanical operation.

The whole theory of the Excess Profit Tax is to impose the additional tax only upon corporate incomes which have become swollen by inflation and war-emergency profits. It is designed to supplement renegotiation as a means of taking excessive profit out of the war effort. Only secondarily is it a revenue measure because, if revenue were the primary concern, it could be more efficiently raised by further increases in the normal and surtax rates on corporations and individuals.

In the memorandum submitted to each member of the committee in May, it is shown that none of the profits of the corporation were due to the current inflation produced by the war emergency. We will not repeat the reasons set forth in the May memorandum in support of this statement, but direct the Senator's careful attention thereto.

It may be somewhat surprising to the committee to learn, however, that despite the care and effort of the Congress to incorporate complex relief provisions to exempt noninflation produced income from the additional tax, this corporation is actually subject to the present ceiling tax of 62 percent. How this result obtains will become clear as the pertinent provisions of the act are analyzed.

The corporation has a very low capitalization, having financed the construction of machines by means of borrowed capital, and, of course, has no base period earning history. Accordingly, it must rely upon the "relief" provided for new corporations by section 445 of the Internal Revenue Code.

This "relief" consists of an alternative computation of average base period net income by application of a fixed industry rate of return to the taxpayers' assets. The same relief is granted to five other categories of subnormal base period income.

As the Senators well know, the "industry rate of return" relief subdivides all business into 64 classifications for each of which the Secretary of the Treasury is required to fix tentative and final rates of return by averaging the rate of return of businesses within each classification as disclosed by income tax returns of businesses within each classification for the base years.

On its face, the "industry rate of return" theory gives at best only a crude approximation of the normal income producing capacity of any single taxpayer. It utterly ignores numerous variations in the nature of products or services within each classification. No account is taken of the differentials in size of the individual taxpayers nor of such material factors as advantageous geographical location, degree of risk and management efficiency. The theory makes no provision for intangible values, such as patents, brought in by the shareholders. By applying the average return of taxpayers within a group to all within the group, it patently penalizes the above-average business and confers a tax subsidy upon the below-average business. It places a premium upon inefficiency and mediocrity.

In the case of Peelers, Inc., the result obtained has the color of absurdity Having created a new industry, the corporation falls within no well-defined classification but is lumped into a catch-all classification entitled "Miscellaneous Business Services" for which the Secretary of the Treasury has proclaimed a tentative rate of return of 13.3 percent.

The corporation earned over $150,000 during the year 1950 on a combined invested and borrowed capital of $174,000, an actual return of over 85 percent. To apply a normal rate of 13.3 percent is manifestly unrealistic.

In view of the inadequacy of the industry rate of return in this instance, the corporation is subject to the ceiling tax of 62 percent, now raised in the House bill to 70 percent, in spite of the fact that none of its income represents war or inflation earnings. Handsome as the corporation's profits are, the shareholders are faced with the prospect of retaining only 30 cents out of every dollar earned. After providing for repayment of borrowed capital (which it is obligated to repay within 10 years) and for the future expansion of its operations, little or nothing of this 30 cents will remain for distribution as dividends. Yet, since the income-producing factor of the business is patent protection, the shareholders must make their profit during the limited life of the patents. Unless relief is forthcoming, the shareholders' profit will be small indeed.

Faced with this situation the shareholders of the corporation must either obtain prompt and complete statutory relief or liquidate the corporation and operate as a partnership, thus avoiding all corporate taxes.

The statutory relief must come now, not next year, because, in order to avoid a ruinous capital gains tax on liquidation by reason of the appreciation in value of the patent rights, the shareholders must take advantage of section 112 (b) (7) allowing postponement of the realization of the capital gain in event of a complete distribution of the corporation's assets within one calendar month of the year 1951.

It is to be observed that unfair and discriminatory taxation upon corporations inevitably induces businesses to avoid or shed the corporate form. Thus Government loses the corporate taxes it might otherwise collect. Even little geese, laying little golden eggs, should not be thoughtlessly slaughtered.

As will appear from the memorandum submitted to each member of the committee in May, the corporation felt that a reworking of the relief provisions of the act was indicated. It accordingly suggested the addition to the Excess Profits Tax Act of a modified "section 722" provision. I am informed by the committee's tax adviser, Mr. Colin Stam, however, that such a provision could not be considered at this time.

In accordance with Mr. Stam's suggestion, therefore, the corporation now proposes a more specific type of relief to serve as a stopgap until a more extensive revision of the act can be undertaken by the Congress. A copy of the proposed relief provision is attached hereto.

The relief proposed would exclude from excess profits tax net income, 85 percent of income derived from patented devices not available to the public at the inception of the base period to the extent that such income has not been swollen by war contracts or by inflationary price increases. Its technical merits can best be explained to the committee by Mr. Stam or by one of the committee's other technical experts.

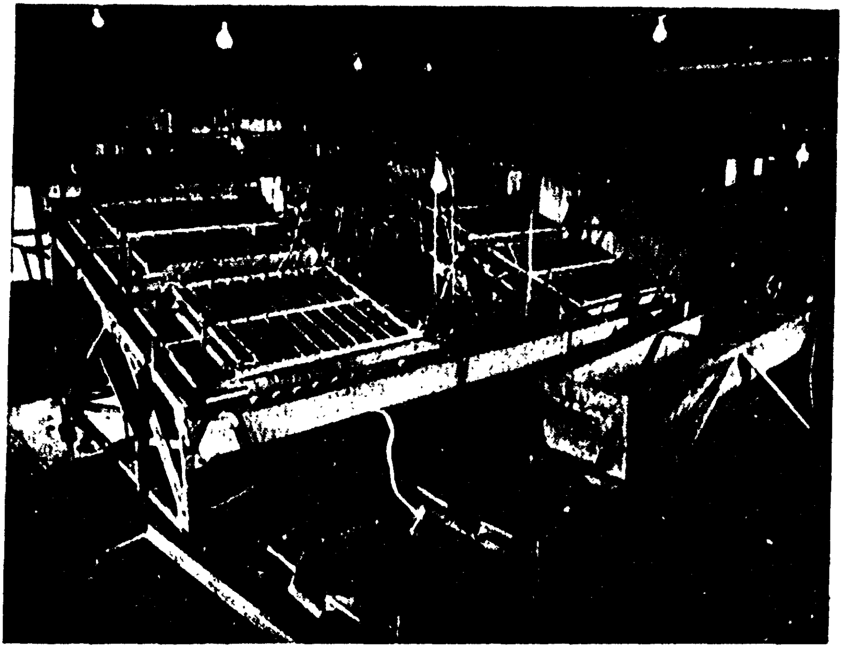
Although the proposed amendment obviously fails to equalize all the inequities inherent in the act, it is in keeping with the spirit of the law which is to exempt from the additional tax, corporate income which has not been produced by the current inflation. It provides relief to those corporations whose need for relief is most acute—corporations having no base period history whose income producing factor is patent protection with a limited life of 17 years. Its adoption is respectfully urged.

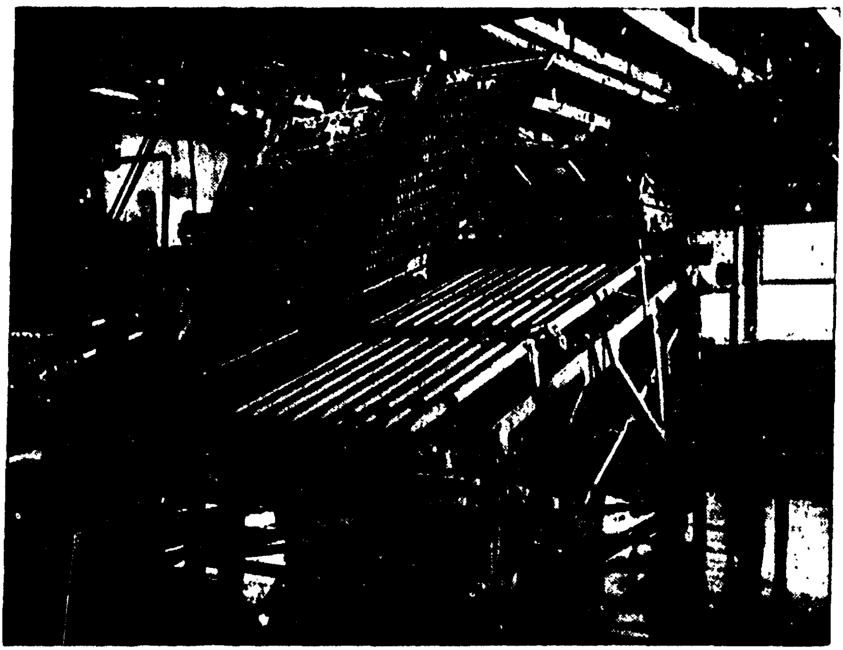
PROPOSED ACT

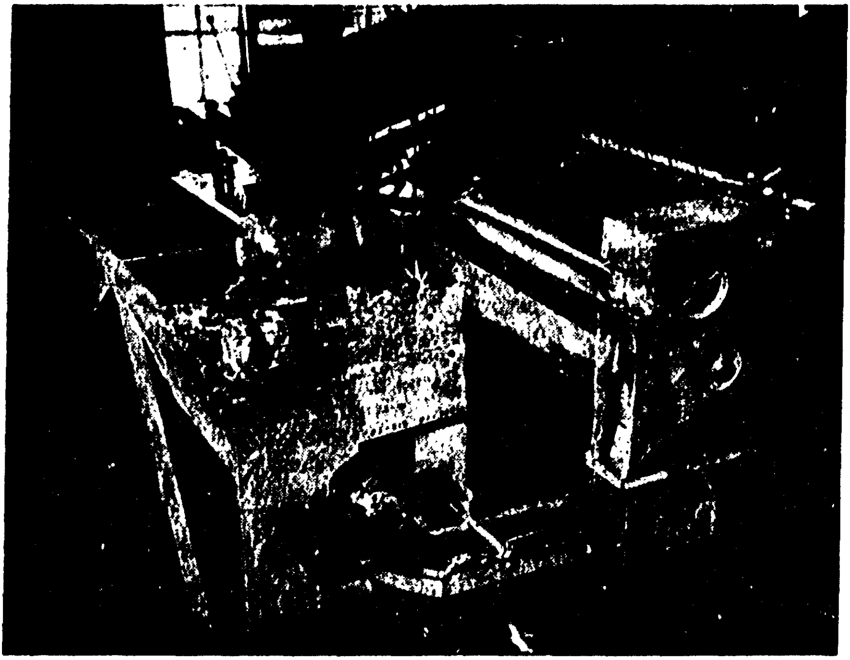
(a) Section 433 of the Internal Revenue Code is hereby amended to add the following sub-subparagraph (R) to subparagraph (1) of paragraph (a) of said section:

"(R) There may at the election of the taxpayer be excluded in computing the excess profits net income of any corporation 85 percent of the difference between (I) the total gross receipts (including damages collected under an award or by compromise on account of infringement) derived during any taxable year under this subchapter from sale or lease of a patented article or from performance of a service by use of a patented article, if such patented article or such service performed by use thereof is of a kind not generally available to the public at any time prior to January 1, 1946, and (II) the sum of: (i) such portion of such gross receipts as was received as a result of contracts or subcontracts of the taxpayer with the United States or any agency or instrumentality thereof; (ii) such portion of such gross receipts (exclusive of amounts received in the manner set forth in (i)), as was received as a result of any increase in the price, rental or other remuneration charged in connection with the sale or lease of such patented article or in connection with the performance of such service by use of such patented article, since the time such article or service was first made generally available; and (iii) such portion of any costs or deductions relating to such gross income allowable in determining the normal-tax net income for such taxable year as is proportionate to the ratio between the total of such gross receipts decreased by the amounts set forth in (i) and (ii) and the total of such gross receipts; provided that, should any corporation elect to receive the benefit of this exclusion for any taxable year under this subchapter, the excess profits credit of such corporation computed under section 434 for such taxable year shall be reduced to an amount proportionate to the ratio between the excess profits tax net income computed with benefit of the exclusion and the excess profits tax net income computed without benefit of the exclusion. The term "patented article" shall include articles designed and built substantially in accordance with an application for patent; provided that, if such application for patent be ultimately disallowed or abandoned, the tax liability of the taxpayer shall be recomputed without benefit of any exclusion based upon such application for patent."

(b) This amendment shall be effective as of the date of enactment of the Excess Profits Tax Act of 1950.







Senator MILLIKIN. Mr. Oxley?
Make yourself comfortable, Mr. Oxley.

STATEMENT OF JOHN T. OXLEY, PRESIDENT, TEXAS NATURAL GASOLINE CORP.

Mr. OXLEY. Mr. Chairman, and members of the Finance Committee, my name is John T. Oxley. I live and work in Tulsa, Okla. I am president of the Texas Natural Gasoline Corp., capitalized at $100,000 and organized in 1948.

We are a small, young business, processing natural gas, whereby we produce three principal products: Natural gasoline, butane, and propane. These products are derived from gas taken from producing oil or gas wells, which gas otherwise could not be utilized. Our equipment extracts the liquefiable hydrocarbons eliminating the water and sulfur, and producing usable fuels which otherwise would be lost as escaped gas.

Senator KERR. What you mean by that is that your equipment extracts natural gasoline, the liquid butane, and the liquid propane, and then eliminates the damaging refuse which is water and sulfur and you have left the residue of clean, highly valued natural gas.

Mr. OXLEY. Which is sold to the public utility company for use in the homes.

This gas was for a number of years vented into the air and wasted throughout the oil fields.

Let me make the point that while we process natural or casing-head gas, we are not manufacturers, nor oil producers. We have the depletion hazard in our business, to the extent that the petroleum reserves upon which we depend for our raw product are in the constant process of depletion, thus reducing the potential revenue of our plants, but we do not have the 27½ percent depletion allowance which applies to oil and gas producers, and which is necessary to the continued progress and growth of the oil industry.

Our tax position is exactly the same as that of a manufacturer of farm equipment or a processor of insecticides though our raw materials position is much less stable.

Senator KERR. That is because you have to locate your plant near the source of supply, which is constantly being depleted, and when gone, then you have to pick up the plant and move it rather than being able to get some more raw product and bring it to it.

Mr. OXLEY. Exactly right. The uncertainty of the reserves is a very great hazard in our business.

Senator MILLIKIN. I think it should be noted that the Senator, in addition to knowing about shrimp, also knows about the gas business.

Mr. OXLEY. Yes, sir; I appreciate that fact.

My company entered into this business at a time when prices of the products we process were at their peak. They have undergone a 35 percent reduction since then. I mention this to illustrate that we are not riding high on a lush and inflated market; on the contrary, we are still doing business and by hard work and what we hope is good management are making a profit in a market which has declined an average of 12 percent each year that we have been in business.

If I may be permitted one personal reference in this statement, let me state that my experience in the natural gasoline business has extended over the past 20 years, 17 of which were spent working for others. Three years ago I realized the great American dream to which I believe every ambitious young man is entitled—going into business for myself. It is my considered opinion that this country's future potential industrial greatness is directly dependent upon the continued presence of the opportunity for young men to realize this dream.

Our company, in spite of the market situation under which we have done business, has enjoyed moderate success, helped insofar as we could to increase the Nation's supply of fuel, given employment to several scores of people, and, incidentally, has produced at least its share of taxable revenue. The critical question for this organization now is whether under the tax situation created it shall be allowed to succeed or even remain in business.

Under the present excess profits tax law, our company is unable to retain enough of its normal earnings to continue to grow and expand or even hold its own, to say nothing of paying off indebtedness contracted prior to the enactment of the present excess profits tax law. It is axiomatic that a new business cannot remain static; we must either progress or fall by the wayside. This principle has already been recognized by the Congress in the enactment of the excess profits tax law last fall, when the growth company formula was evolved to give relief to companies which had not yet had the chance to undergo their normal growth period. Continued growth and expansion is vital to our business, since our processing operations must continue to expand to fresh sources of raw material when the supplies of casinghead gas decline in fields presently supplying our plants.

I would like to make two points. First, the revenue bill now under consideration by this committee proposes an increase in the maximum tax rates above the present limitation of 62 percent. It is generally conceded that any increase in the tax burden above this point would be economically unsound and dangerous, not only as it might affect any one company but as it affects our economy as a whole. My own company's financial structure affords a graphic demonstration of a normal situation for a young, growing company of its age in which the addition of a few more straws in the form of added taxation may well break the proverbial camel's back.

The other point is this: Why did Congress define a growth company as one incorporated prior to January 1, 1946? Why is growth relief denied a company which has all the characteristics of a growth company except incorporation prior to January 1, 1946?

Senator KERR. Mr. Chairman, I wish to join in asking the question, and one that I think the committee should have the information —

Senator MILLIKIN. Maybe Mr. Stam can enlighten us.

Mr. STAM. Well, the only point is that you have to have some period to measure growth, and where you start very late in the base period, and you are looking just at the base period, you do not have anything to measure the last part of the period with, you see, and if you were in business all during the base period you have the first part of the base period to measure with the last part to determine growth. That was the general thought, I think, back of it.

Mr. OXLEY. Mr. Stam, I would like to ask another question.

Suppose this situation may continue, the defense preparation, for another 8 or 10 years, as has been predicted by some of our authorities, what then about new corporations that are formed now in 1951 and 1952? Our problem is that we are having to compete with companies that have a very high base period when prices of our product were at their peak in the years 1946, 1947, and 1948.

I mentioned previously that after we got going in 1949 our prices dropped 35 percent.

Senator KERR. Your company has every characteristic that a growth company has or could have, except that it cannot qualify under the law in that it was not incorporated prior to January 1, 1946.

Mr. OXLEY. Right, Senator.

Senator KERR. Of course, there are bound to be hundreds, there are bound to be thousands, of others in this country in a similar situation, and in which there is no necessary connection or even actual connection with the war effort.

Senator MILLIKIN. I agree with the Senator.

Mr. STAM. You have had two cases here this morning already.

Senator KERR. We had one yesterday, which was a very dramatic one.

Senator MILLIKIN. When we considered the excess-profits tax matter, we considered the case, where neither this committee nor the House Ways and Means Committee here in Congress, in the time available to them, were able to figure out what would be an equitable formula, but you are certainly presenting an important problem to this committee.

Mr. OXLEY. Thank you, sir.

It cannot be presupposed that all companies formed after that date are "war babies" nor that their profits are automatically excessive, nor that their earnings are attributable to war preparations.

In fact, our prices will indicate that for our products. What is the difference between a growth company formed in December 1945 and one formed in February 1948 that relief should be granted to one and denied the other?

It surely cannot be a national policy to deny normal growth and expansion to any and all companies formed subsequent to a date 4½ years prior to the Korean outbreak, yet that is the practical effect of this law. My company is an example; the company has had only 3 years of operation, and its growth curve indicates that it is far from having reached the peak of its normal growth, yet it is subject to taxation at the maximum rates applicable to the largest companies in the land.

Under this tax structure, we cannot continue to do business nor expand at a rate sufficient to counteract our constantly depleting sources of supply without which we cannot hope to long survive, nor can we find venture capital to permit such expansion.

Sources of risk capital have said this to us, in so many words: "We feel that you know your business and we are willing to back your ability to make an adequate profit on additional investment, but under the present tax structure we see no way in which you can retire your present bank loans, to say nothing of repaying additional capital investment which your company needs."

The insolvency of new companies having any considerable indebtedness is almost certainly assured by the imposition of the present rate of taxation which was not contemplated by the companies nor their creditors at the time the obligations were incurred.

Today our company owes substantial sums which it borrowed in 1948 and 1949 to carry on and expand our business.

Senator MILLIKIN. Has it borrowed money since then?

Mr. OXLEY. We have borrowed some money since then, Senator, a small amount.

Senator MILLIKIN. I do not want to intrude into your business unnecessarily, but when did you borrow that money?

Mr. OXLEY. Practically all of our borrowing was completed before the fiscal year ended August 1950, or fiscal year end of 1950.

Senator MILLIKIN. Very well. And very little since then?

Mr. OXLEY. I believe none whatever; I believe that was the last. That is correct.

Senator MILLIKIN. Thank you.

Mr. OXLEY. These were sound loans, made by sound lending institutions, loans which we could repay out of earnings under the tax rates as they were when the loans were contracted.

Under the present excess profits tax law, we cannot retain enough out of earnings to amortize these obligations in any acceptable manner.

I suggest that the following relief would give new companies, which are necessary to the continued industrial health of our country, the chance every company deserves to survive and achieve its normal growth. I submit that this policy would be in harmony with the already voiced philosophy as expressed in the growth company provisions of the present law, from which new companies are now excluded.

1. Extension of the growth formula to companies which show, during their earnings experience, a growth curve comparable in rate of growth to the definitions contained in the present growth company provisions, regardless of their date of incorporation.

2. Permit the use, as a base period for computing excess profits tax credit, a company's best 12 months prior to each tax year, either actual earnings experience or a projected rate based on a partial year's experience of not less than 6 months.

3. Exempt from taxation at excess profits tax rates payments on indebtedness contracted prior to July 1, 1950, and after January 1, 1946.

4. Grant new companies a growth allowance of 20 percent of earnings during each of their first 5 years of operation, providing the sum thus exempt is spent on capital expansion or improvements.

Senator KERR. You mean whether purchased subsequent or prior?

Mr. OXLEY. Yes, sir.

Senator MILLIKIN. Let me ask you this: Suppose on the date that you went into business some man across the street went into exactly the same business and on the same scale, but he had sufficient capital to finance himself completely, whereas you had to borrow money. Does your formula work any kind of discrimination against him?

Mr. OXLEY. No, it would not—I believe not, Senator. He would be faced with realizing——

Senator KERR. He would receive the same benefit that you would.

Mr. OXLEY. That is right.

Senator KERR. Where you at the present time want to take the money that you make and can save from taxation to use to pay the banks back that loaned you the money to expand, that fellow would be reimbursing his capital account which he had drawn on to expand?

Mr. OXLEY. That is right, yes, sir.

Senator MILLIKIN. He would not be under the same pressure which might be destructive pressure, that you would be under.

Could he argue that "I fashioned my own affairs in a way where I escaped these pressures, and it is a competitive advantage to which I am entitled under the American system?" I am just playing devil's advocate here for a moment.

Mr. OXLEY. Yes, surely.

Senator MILLIKIN. It is, therefore, his argument, "I should continue to retain my advantage."

Mr. OXLEY. Well, Mr. Chairman, I might make this observation with respect to your statement. This is a fairly hazardous business. It is a fairly expensive business and requires a million dollars or more to build an average-sized plant.

Senator MILLIKIN. Yes, sir.

Mr. OXLEY. The average individual does not go around with a million dollars in his pocket to put in a gasoline plant. There are other investments that an individual having a million dollars would probably prefer investing in.

Senator MILLIKIN. In most cases if you found that kind of a situation you would find a long-established company, you would not find it in a new venture.

Mr. OXLEY. Yes; that is correct. You would find it with a company that had made their money previously before high tax rates, sir.

Senator KERR. The application of that principle, however, would fix it so that only he who had the necessary cash could go into business, and it would just close the door to the fellow who had everything else but capital, who had somebody who was willing to loan it to him, provided he was in a position to pay it out of what he made.

Mr. OXLEY. That is correct.

Senator MILLIKIN. If you want to be completely philosophical, it is not the function of the excess-profits-tax bill to iron out any competitive inequality, but I am not pursuing that. I have great sympathy for the predicament you find yourself in, and others who find themselves in similar predicaments.

Mr. OXLEY. Yes, sir.

However, that factor is important, Senator, to help prevent monopoly, and I would like to make a statement in that regard.

The trend of the present law is definitely toward monopoly and the absorption of small, new companies by larger, older ones. The larger, older companies with substantial earnings records have substantial base periods and correspondingly substantial allowable excess-profits-tax credits. However, small, new companies are subject to tax at the maximum rates, lacking earnings records to give them adequate base periods, and are thus unable to retain sufficient earnings to reinvest and expand to meet the demands of their normal growth.

This leaves them at the mercy of larger, older competitors and makes the inevitable trend toward monopoly and the absorption of small, new companies by larger, older ones.

Gentlemen, I cannot bring myself to believe that Congress consciously intended any such result. I appreciate the opportunity you have given me to appear before you.

Senator MILLIKIN. Thank you very much for your testimony.

Mr. OXLEY. Thank you.

Senator MILLIKIN. In lieu of an appearance, we have a letter here from Ralph W. Heninger which will be inserted in the record.

(The letter referred to follows:)

BETTY, BETTY, NEUMAN, HENINGER & VAN DER KAMP,
Davenport, Iowa, July 23, 1951.

Hon. HARRY F. BYRD,
Acting Chairman, Committee on Finance,
United States Senate, Washington, D. C.

DEAR SENATOR BYRD: Thank you for your letter of July 19 in reference to my appearance before the Committee on Finance in reference to H. R. 4473 and particularly as to the excess profits tax relief.

I would like very much to appear before the committee. So far as I know it would not be possible to consolidate my proposed testimony with that of any of the listed witnesses for the reason that I am not acquainted with any of the witnesses and neither do I know the nature of their testimony.

My appearance would be particularly directed to the excess-profits-tax provisions which, because of the inequitable provisions of the present law and the proposed amendment, produce undue hardship on the small businesses of our community.

The fact is that it is the newer corporations often formed by veterans who fought in the last war and who are now trying to get started in business that bear the brunt of the excess-profits tax. The older corporations with certain historical records do not suffer too severely.

The particular provision which will strike hard against the small business enterprise is section 123 of the revenue bill as introduced in the House. This provision proposes to limit the surtax exemption and the excess-profits tax exemption to only one corporation where different corporations are related to one another. It is understood that the Treasury Department argues that the existence of separate corporations in a related group contributes to tax avoidance. This is not true in most instances. The formation of separate corporations, where based on a sound business purpose, presents the opportunity for the small-business man to conduct his business in accordance with the directives necessitated by developing economy. It is only by making every business stand on its own feet that working capital can be procured from banks and individuals, and only by allowing a minimum credit to each business can the business grow, purchase machinery and equipment, and provide a service to its community.

In my opinion, section 123 accomplishes no useful purpose and should be completely eliminated.

Furthermore, I regard the section as entirely unnecessary. The Bureau of Internal Revenue has already the power under section 45 to do the very thing which section 123 of the proposed law seeks to do. In other words, by allocation of income under section 45 the Bureau could throw the income into the principal corporation and tax it and thus eliminate the exemptions where avoidance takes place.

To adopt section 123 will only cumulate law upon law rather than make use of existing powers already in the law.

I would like to elaborate on this further before the committee, but if no opportunity is possible I will appreciate your presenting this thought at the time of executive session.

Yours very truly,

RALPH U. HENINGER.

Senator MILLIKIN. Mr. D. J. Renkert. Make yourself comfortable, Mr. Renkert.

STATEMENT OF D. J. RENKERT, PRESIDENT, METROPOLITAN BRICK, INC.

Mr. RENKERT. Thank you, Mr. Chairman.

My name is D. J. Renkert. I am president of Metropolitan Brick, Inc., of Canton, Ohio.

I suggest a minor amendment to section 435 (e) of the Internal Revenue Code having to do with average base period net income based on the growth formula.

This is somewhat of a relief provision and, in part, provides that if the total payroll of the taxpayer for the last half of the base period years 1948 and 1949 is 130 percent or more of its total payroll for the first half of its base period years 1946 and 1947, then the average base period net income shall be computed under section 435 (e) (2) of the code.

This provision in my opinion was inserted in the code to grant relief to those corporations which were expanding and where the earnings for all four of the base period years did not represent the normal operation.

From 1945 to 1950, inclusive, my company spent $1,154,500 in carrying out its policy of modernization and expansion. I should say here that this company is rather a small company. Its annual sales vary from five to six million dollars a year.

Based on the present language of the statute, our percentage is 119.7 percent and not 130 percent, as required by the code.

However, we are being penalized because of a temporary operation carried on at our Cleveland plant. At the close of World War II the

Government was demanding that all building materials be produced as rapidly as possible. Actually the Government granted subsidies in order to get plants such as this one I am now referring to into production.

In cooperation with this effort of the Government our Cleveland plant was placed in operation on a temporary basis and produced common brick, which was not a part of our regular line of products, from December 1944 to the end of June 1947.

The plant was then totally wrecked, and only the land remains. Our expansion has been very substantial since we have spent over a million dollars in capital improvements in the last 5 years, but by including the temporary Cleveland operation in our total payroll, our percentage of increase is 119.7 percent instead of 130 percent.

With the Cleveland plant operation eliminated, which was entirely temporary, our percentage would be 130 percent.

This technicality makes a difference of $100,000 in our excess-profits tax base. In all other respects we comply with the growth formula set forth in the code. This is not a large corporation and, I submit that this inequity should be eliminated.

I have a written statement which I would like to have made a part of the record, which statement includes a suggested amendment.

Senator KERR. It will be put in the record in full.

(The amendment referred to is as follows:)

SUGGESTED AMENDMENT TO SECTION 435 OF THE INTERNAL REVENUE CODE

Metropolitan Brick, Inc., of Canton, Ohio, suggests an amendment to section 435 of the Internal Revenue Code so that corporations operating a plant only for a temporary period during the first half of the base period will not be prohibited from having its average base period net income computed under the growth formula as stated in section 435 (e).

The company operated a plant in Cleveland, Ohio, and not being an efficient operation was closed down on December 24, 1942. The company had no intention of resuming operations.

During World War II there was no opportunity to dispose of a brick plant and since the company's other plants were forced to close down or operate on a restricted basis it was not advisable to assume the expense of wrecking the plant during the war period.

At the close of World War II there was an urgent demand for clay products. The Government was demanding, because of the housing shortage, that all building materials be produced as rapidly as possible. Manpower had been lost by the brick industry due to the draft and higher wages paid in the war industries. Necessary machinery was hard to obtain and repairs had to be made.

In order to better serve the construction industry and comply with the Government's request for immediate full production the Cleveland plant was placed in operation on a temporary basis. It produced common brick which was not a part of our regular line from December 1944 to the end of June 1947. The plant was totally wrecked, only the land remains.

The company at the close of World War II embarked on a policy of modernization and expansion for the plants it meant to keep in regular production. During the period from 1945 to 1950, inclusive, the company spent $1,154,499.18 in carrying out this program. The Cleveland plant was not included in the program.

The Government offered subsidies to the brick industry to get idle plants and marginal plants into production. The taxpayer now finds itself in the poor position of having tried to cooperate with a Government effort that went to the extent of paying subsidies and now being penalized to the extent of $30,000 per year in excess profits taxes.

Section 435 (e) of the Internal Revenue Code precludes a taxpayer from obtaining the benefits of the growth formula unless the total payroll of the taxpayer for the last half of its base period (years 1948 and 1949) is 130 percent or more of its total payroll for the first half of its base period (years 1946 and 1947).

The taxpayer's percentage is 119.7 percent; whereas if the temporary operation of the Cleveland plant is eliminated, the percentage would be 136 percent.

Cleveland plant

	Net sales	Payroll	Excess profits tax net income
1944	$38,865.40	$12,842.27	[1] $13,260.00
1945	56,229.16	23,190.93	[1] 17,921.00
1946	459,466.18	184,700.66	[2] 86,790.00
1947	158,572.81	123,097.96	[1] 20,761.00
1948 [3]	68,900.21	25,458.71	[1] 7,514.00
1949 [3]	0	1,867.72	0

[1] Loss.
[2] Gain.
[3] The Cleveland plant ceased manufacturing operations in June 1947. There were subsequent sales made from inventory after production stopped and the payroll item consists of shipping labor, maintenance, and clerical services.

Permanent plants

	Net sales	Payroll	Excess profits tax net income
1946	$1,763,402.[illegible]	$956,442.23	$280,868.25
1947	2,072,330.31	1,090,239.43	204,065.74
1948	2,895,435.86	[illegible]	452,691.99
1949	3,021,378.50	[illegible]	507,136.92

CONCLUSION

It is suggested that the definition of total payroll (section 453 (e) (4)) be amended by adding after the word "employees" in the fourth line thereof the words "excluding the amount thereof paid or incurred in connection with a temporary operation". This would eliminate payroll from an operation that was known from the beginning to be temporary. The growth formula should apply only to the regular business carried on by the taxpayer.

Mr. RENKERT. Thank you, sir.

Senator KERR. I was necessarily out of the room. Is your situation one comparable to the man just on here, that it has to do with the date of your organization?

Mr. RENKERT. No. Our company was organized in 1902.

Senator MILLIKIN. His problem arises out of the pulling down of a plant that was put into temporary operation.

Mr. RENKERT. We had a plant that was idle and scheduled for demolition prior to the war and during the war period we could not do it; and in response to the Government's plea we did put it into temporary operation in the first 2 years of the base period.

Senator MILLIKIN. Thank you very much.

Mr. RENKERT. Thank you, sir.

Senator MILLIKIN. Mr. Philip L. Corson.

STATEMENT OF PHILIP L. CORSON, PRESIDENT, G. & W. H. CORSON, INC.

Mr. CORSON. Mr. Chairman, and gentlemen of the committee, my name is Philip L. Corson. I am president of G. & W. H. Corson, Inc., of Plymouth Meeting, Pa.

We manufacture lime, refractories, and limestone products from our quarry located near Philadelphia, Pa.

As a businessman I believe I appreciate the tremendous problem confronting this committee in its effort to raise the necessary revenues for the national defense requirements, and we are perfectly willing to bear whatever taxation must be imposed to preserve our American way of life.

My testimony will be brief and will be directed mainly to the excess-profits-tax law and particularly to a provision which I believe was unintentionally discriminatory to the producers of vital nonmetallic minerals.

Steel is the basic sinew of war and to meet the needs of a rapidly expanding steel industry, the development and production of high-grade metallurgical limestone must be greatly stepped up and expanded. Steel cannot be manufactured without limestone. There is no substitute for this basic material.

For every ton of steel manufactured, nearly one-half ton of limestone is required, and I pause because that is seldom appreciated, the fact that it takes one-half ton of limestone to make a ton of steel—either in the form of raw limestone, burned limestone, or dead burned dolomitic limestone. The function of the limestone is to remove the silica and alumina by forming a slag, which floats off when the iron is run out of the furnace. Again, when the iron is converted into steel in the open hearth, large quantities of either limestone or lime, or both, are used to further purify the steel by the removal of most of the remaining silica and alumina.

In addition, the walls and bottoms of the open hearth are protected by dolomitic limestone in either a raw or dead burned form. For efficient operation steel manufacturers require a pure limestone. Great strides in raising production have been made by using the highest grade limestone, and we believe that the discovery, development, and use of pure limestone deposits must not be overlooked since it is vital to any increase in our steel production.

Senator MILLIKIN. Does your proposal go to only that type of limestone?

Mr. CORSON. Yes, sir.

The bill before you, H. R. 4473, provides percentage depletion at the rate of 15 percent for chemical and metallurgical limestone and I want first to urge the approval of this section by your committee to remove a long-standing inequity and encourage the production of this mineral.

In the 1950 Excess Profits Tax Act, Congress included section 453 which was intended to give incentive to producers of minerals by exempting from this tax a proportion of any profits made on production increases during the defense or war period.

However, most mineral producers have never received this incentive due to an added provision which requires that the increased production must exceed 5 percent of the units in the deposit at the end of the taxable year or no tax exemption is allowed. How almost completely this added provision nullifies the intent of the section is shown by the following example:

If a producer increases his normal output of 300,000 tons per year to 400,000 he will receive no relief unless at the end of the year his deposit contains less than 1,900,000 tons. At this rate of production, this is less than a 5-year supply. Furthermore, any producer who engages in prospecting and development and is fortunate enough to discover additional deposits actually may be penalized in that the added number of recoverable units may disqualify him from any relief whatsoever.

Coal mines, metal mines, natural gas, and timber properties have been allowed a provision that exempts at least 50 percent of the profit on increased production from the excess-profits tax without reference to the number of recoverable units. This special provision was carried over from the World War II excess profits tax law, where it was originally included in recognition of the fact that although these producers in general possessed large reserves of recoverable units, those reserves would become increasingly difficult to exploit as exhaustion progressed.

Exactly the same situation prevails in the metallurgical and chemical limestone industry. It is also true of other urgently needed minerals such as sulfur, potash, and others.

The nonmetallic mines are now really in a worse position than they were under World War II law, for under the old law, there was some possibility of relief under sections 721 and 722. Under the present law, the failure to grant relief to nonmetallic mines in subparagraph (b) (4) results in taxing the normal profit of new nonmetallic mines, a distinctly discriminatory treatment, not only between industries but also against new mines in the same industry.

Therefore, section 453 should be amended by broadening subparagraphs (b) (2) and (b) (4) to include all nonmetallic mines and thereby give them the same benefits as are now given to coal and metal mines.

Senator MILLIKIN. Thank you very much. We will recess and meet at 10 o'clock Monday morning.

The Chair inserts various letters and statements in lieu of personal appearances at this point.

(The material referred to is as follows:)

STATEMENT RELATIVE TO NECESSITY FOR EXCESS PROFITS TAX RELIEF FOR TAXPAYERS UNDERTAKING NEW PRODUCTS OR SERVICES AND ABANDONING SUCH DURING BASE PERIOD

At the close of World War II during the reconversion period a number of manufacturers were seeking new products to augment their existing lines. In many instances the purpose of securing the new product was to relieve the company from dependence upon the economic events affecting a single industry and to permit the company, by diversification of its products, to cushion itself against an earnings depression attributable solely to that industry. There are two basic situations which occurred in this search for new products. The first is the case of corporation A which found a successful product which greatly augmented its income after an initial development period. The second is the case of corporation B which attempted to develop a new product but found that the new product could not be produced or marketed successfully, and consequently abandoned it. All of the factors necessary under section 443, Internal Revenue Code, being present, corporation A may secure relief under that section. Corporation B is, however, denied any relief whatsoever.

An example will illustrate the inequity of this situation: Two calendar year corporations, A and B, which were engaged in materially different types of production, commenced business prior to the beginning of their respective base periods. Early in 1947 each corporation adopted an entirely new line of product suitable to its own type of operation while continuing its established lines upon a profitable basis. Each corporation sustained losses in 1947, attributable to furnishing its new product, and substantial, although somewhat smaller, losses in 1948. Corporation A continued to market its new product in 1949 and subsequent years, and by concentrating on the new line, as contrasted with its established lines, made substantial earnings in the excess profits taxable years. B corporation, however, on December 31, 1948, determined that further production of its new product would be unprofitable and abandoned that venture. It continued to concentrate on its established lines and made substantial earnings in the excess profits taxable years. This excess profits net income for the pertinent taxable years may be indicated as follows:

	Annual average excess profits net income without regard to new line of products		Annual average excess profits net income or loss attributable to new product		Annual average excess profits net income	
	A	B	A	B	A	B
1946	$60,000	$60,000			$60,000	$60,000
1947	65,000	65,000	($75,000)	($75,000)	(10,000)	(10,000)
1948	70,000	70,000	(50,000)	(50,000)	20,000	20,000
1949	80,000	85,000	10,000		90,000	85,000
1950	85,000	135,000	45,000		130,000	135,000
1951	95,000	195,000	75,000		170,000	195,000

NOTE.—Figures in parentheses denote loss.

It is obvious that the average base period net income of both corporation A and corporation B, since it is affected by the substantial losses incurred in furnishing a new line of products, is an inadequate standard of normal earnings. Thus, while the need for remedial action is apparent in both cases, only corporation A may expect to secure relief in the taxable years 1950 and 1951 under the present provisions of the Internal Revenue Code. Corporation B, although it has been successful in its continued emphasis on its established lines, secures no relief whatsoever, despite the resulting inequity of the use of an excess profits credit predicated upon its base period experience.

It is our understanding that the underlying theory of present section 443 (a), Internal Revenue Code, is to provide relief where a corporation has introduced new products in its base period, substantially as this concept of change of product was developed under the World War II law with the exception that certain objective standards have been added. Relief is provided for companies meeting the requirements of section 443 (a) (1), (2), and (3) since their base period excess profits tax net income is not deemed to be representative of their potential earnings level by reason of the development or initiation of a new product or products. If relief were not granted, a hardship would be worked upon them at a later time when such potential earnings are realized and subject to the excess-profits tax.

The exact same need for relief exists in the case of companies whose base period income was not representative of potential earnings because their earnings were adversely affected by losses incurred in starting new products or initiating new services and abandoning such new products or services when it was finally found to be impossible to produce them successfully. Certainly any attempt to determine the average base period net income in the latter situation, without giving due consideration to the fact that the income for the base period has been reduced by losses that bear no relation to the business operations of the excess-profits tax taxable years, is inequitable and unjustly penalizes such companies for exploring new fields of endeavor.

The primary objective of this statement is to point out the existing inadequacy of the Excess Profits Tax Act in respect to the class of taxpayers illustrated by corporation B above. There are undoubtedly several methods by which this inequity may be corrected. It is recognized that any correction must be accomplished with the maintenance of an objective standard of application as well as proper limitations to avoid breaking down the underlying purpose of the act. Without attempting to define how the correction should be accomplished, it is sufficient to mention two methods. One method is by an amendment to section 443, Internal Revenue Code, which would establish a standard as to abandonment of a line of products and provide the same relief now granted only to those adopting and continuing a new line of products or services. The other method could accomplish a similar result through the addition of a subsection to section 433 (b) (9), Internal Revenue Code, providing that losses from operation and abandonment of new ventures would qualify as an abnormal deduction in relation to base period net income.

It is, therefore, respectfully urged that some type of relief is necessary for taxpayers instituting and subsequently abandoning a new line of products during the base period years.

Respectfully submitted.

BAKER, HOSTETLER & PATTERSON,
By S. D. L. JACKSON, Jr.

RAYTHEON MANUFACTURING CO.,
Waltham 54, Mass., July 27, 1951.

Hon. WALTER F. GEORGE,
The United States Senate,
Washington, D. C.

DEAR SIR: As one of the larger suppliers of electronic equipment to the armed services, we wish to urge your support of section 482 of the House revenue bill of 1951. The purpose of this section is to exempt sales to the United States of radio communication, detection, and navigation receivers from the manufacturer's excise tax. Raytheon now has upwards of $100,000,000 in defense contracts and employs over 14,000 people.

We understand that both the Department of Defense and the Treasury support this provision because, as explained below, it will aid the defense effort at no cost, and in fact at a saving to the Government.

Much of the electronic equipment being purchased by the armed services contains radio receiving elements on which the Government imposes a 10 percent manufacturer's excise tax. The burden of this tax is borne by the armed services which purchase the equipment. (Standard Government contract clauses contain a statement that all applicable taxes are included in the price.) Payment of this tax needlessly inflates costs and, therefore, the size of appropriations necessary to purchase a given quantity of equipments. Nothing beneficial to the Government, the public or anyone else results from imposition of this tax on Government purchases. The money is taken from one pocket of the Government (the armed services) and put into another (the Treasury). Nor is this transfer from one pocket of the Government to the other accomplished without considerable cost to the Government and serious waste in the defense effort.

The useless passing of these tax dollars around from the military to the contractors to the Treasury wastes a serious amount of engineering and accounting effort at the contractors' level and also wastes effort in the armed services, as well as in the Treasury Department.

The wasted engineering effort on the part of the manufacturers stems from the fact that many electronic equipments supplied to the armed services are partly taxable and partly nontaxable. While there is a tax on radio receiving sets, no tax is imposed on radio transmitting equipment. The radio receiving set tax applies to the radio receiving portion of combination transmitting and receiving equipments, radio direction finders and other electronic equipment. The Bureau of Internal Revenue takes the position that the part of such equipment that cannot be separated out as clearly nonreceiver portion is subject to the tax. The tax is computed on that portion of the manufacturer's price attributable to the taxable portion.

Thus, in order to compute the tax for inclusion in his bid, the contractor must have engineers and cost estimators break out the nonreceiver parts of such equipments. We have found that it takes an engineer as much as a week's time to break out the nontaxable portion of one such contract and estimate the tax for the bid. With the supply of engineers so critical throughout the electronics industry that they are on a 48 hour basis, this is a serious interference with the defense effort. Not only is engineering time diverted from production, but also the cost of this wasted engineering must increase the contract cost borne by the armed services.

The administrative expense of this tax both for the contractors and the armed services will be further increased as the result of redetermination and renegotiation. The problem of determining what part of the contract price is subject to tax will be immeasurably increased as the result of over-all renegotiation of a contractor's fully taxable, nontaxable, and partially taxable contracts; the resulting mixups for their contractors will be wasteful and costly for the armed services.

Recent legislative precedent for the governmental exemption is to be found in section 706 of the Second Supplemental Appropriation Act, 1951 (H. R. 9920) which enacted a similar exemption from the tax on small arms and ammunition as follows:

"None of the firearms, pistols, revolvers, shells, and cartridges purchased with funds appropriated for the military department by this or any other act shall be subject to any tax imposed on the sale or transfer of such articles."

We understand that the Radio-Television Manufacturers' Association is supporting a broader bill which would exempt all sales of this type of equipment, commercial as well as governmental. While we have no objection to this bill, we must point out that, unlike section 482, it does deprive the Government of revenue.

Sincerely yours,

C. F. ADAMS.

THE AMERICAN LEGION,
NATIONAL LEGISLATIVE COMMISSION,
Washington, D. C., July 20, 1951.

Hon. WALTER F. GEORGE,
Chairman, Senate Finance Committee,
Senate Office Building, Washington, D. C.

DEAR SENATOR GEORGE: Referring to H. R. 4473, same being a bill to provide revenue, I enclose copy of Resolution No. 101 adopted at the 1950 annual convention of the American Legion calling for the enactment of Federal legislation excluding all service pay received during wartime by noncommissioned personnel, and excluding up to $1,500 received by commissioned officers when computing their gross income for Federal income tax purposes for the year 1950 and up to the end of the current international emergency.

When the Senate Finance Committee takes H. R. 4473 under advisement, I respectfully request that consideration be given to incorporating therein a provision which would carry out the intent and purport of the attached resolution.

As you know, Senator McFarland recently introduced S. 1881, which calls for the elimination of compensation of members of the Armed Forces from their taxable income.

Thanking you for your courtesy in the matter, I am

Sincerely yours,

MILES D. KENNEDY, *Director.*

NONCOMMISSIONED MEN RECEIVE A $1,500 DEDUCTION FROM GROSS INCOME FOR FEDERAL INCOME TAX PURPOSES

Whereas the present Korean conflict with the United Nations has made it apparent that the United States must greatly enlarge its Armed Forces in order to defend itself from without and from within; and

Whereas an inducement must be given to many persons to enter the United States Armed Forces; and

Whereas the vast majority of those who will serve in the Armed Forces of the United States during the present emergency will receive appreciably less income than they would have received had they been allowed to follow their civilian pursuits: Now, therefore, be it

Resolved by the American Legion in convention assembled in Los Angeles, Calif., October 9–12, 1950, That we seek the enactment of a Federal law excluding all wartime active service pay for noncommissioned service and commissioned pay for active service to the extent of $1,500 from gross income for Federal income tax purposes for the year 1950 to the end of the present emergency for all Armed Forces personnel of the United States.

THE CLEVELAND CHAMBER OF COMMERCE,
Cleveland 14, Ohio, July 31, 1951.

Hon. WALTER F. GEORGE,
United States Senate, Washington, D. C.

DEAR SENATOR GEORGE: Enclosed is a copy of a report of the committee on Federal taxation of the Cleveland Chamber of Commerce dealing with H. R. 4473. It has been approved by the chamber's executive committee.

The committee believes that the tax rates proposed in the bill will discourage incentive, deter investment in business and encourage the very inflation that we are supposed to be attempting to combat. We are not convinced that taxes must be raised at this time in order to balance the budget for the 1952 fiscal year. If additional taxes are really needed for indispensable purposes we believe that they should be raised by a uniform excise tax levied at either the manufacturer's or retail level on all products except liquor, tobacco, and food, and by taxing presently tax-exempt organizations that compete with private business.

We favor the recognition of gain on the sale of a residence, exempting from corporate income tax venture capital companies, treating as deferred expenses development expenses of mines.

We oppose a withholding tax on dividends, interest, and royalties.

It is our opinion that with the exception of a few provisions the bill should be discarded and that the Senate Finance Committee should present a new bill.

Your consideration of our recommendations will be sincerely appreciated.

Sincerely yours,

CURTIS SMITH,
Executive Vice President.

REPORT ON THE PROPOSED REVENUE ACT OF 1951

To the Executive Committee of The Cleveland Chamber of Commerce

GENTLEMEN: Your committee has given consideration to H. R. 4473, known as the Revenue Act of 1951, recently passed by the House of Representatives and now being considered by the Senate Finance Committee.

It is the opinion of your committee that a more ill-advised tax bill has never before been reviewed by it. The bill would take from 52 to 70 percent of corporate income for taxes, with certain portions of such income taxable at as much as 82 percent. Individuals would pay taxes varying from 22⅛ to 94½ percent of taxable income with a maximum take equal to 90 percent of an individual's taxable income. Is it any wonder that the movement now underway to adopt a constitutional amendment limiting income taxes to a maximum of 25 percent gains ground every day? Ill-conceived as such a movement may be, taxpayers in desperation may figure it is the only way of stopping the constant round of spending and spending, taxing and taxing.

Tax rates such as proposed in the Revenue Act of 1951 discourage incentive, deter investments in business and encourage waste which stimulates the very inflation we are supposed to be attempting to combat. Corporations, being operated by human beings with human failings, are bound to spend money wastefully and extravagantly when 82 percent of the dollars they are spending would go for taxes if not spent. This naturally stimulates inflation. An individual with large income will not invest in business if 94½ percent of his income from business investments is taken away from him. He can secure more than five times as much retainable income for himself by investing in 2 percent nontaxable municipal bonds than he would secure under the proposed tax law from investments in corporate stocks yielding 7 percent. Obviously, business will lose the investment of his funds. When from 22⅛ to 94½ percent of an individual's net taxable income is taken for taxes, certainly incentive is dealt a blow, for the rewards for hard work will go mainly to the tax collector. The tax rates proposed in H. R. 4473 will surely strangle the goose that lays the golden tax egg, will eventually result in less rather than more taxes being realized, and should not be enacted except in the direst kind of emergency.

Your committee is not at all convinced that taxes must be raised at this time in order to balance the budget for the 1952 fiscal year. Budget expenditures for fiscal 1952 are estimated at approximately $68 billion, and authoritative estimates indicate that revenues under existing tax laws might well aggregate $62 billion to $63 billion. No one yet knows the full amount of revenue that will be derived as the result of the passage of the Revenue Act of 1950 and the Excess Profits Tax Act of 1950. This will be the first year in which the full burden of those acts will start to be felt. It would appear to be a reasonable certainty that considerably more revenue will be realized in fiscal 1952 than Treasury officials have admitted. If Congress would reduce unnecessary expenditures by as little as $5 billion, the chances are excellent that the budget would be balanced for fiscal 1952 without imposing upon the country's economy a third revenue-raising act within the space of one year.

Congress must face up to its responsibilities at some time and reduce nonessential spending. This committee has stated time and again and now reiterates that economy is the big responsibility of every Member of Congress. Waste and extravagance cannot be tolerated in any department of the Government, barring none. Specific recommendations for cuts in expenditures have been made to Congress on numerous occasions and by numerous organizations. Practically none of these have been placed in effect. We believe that the time has come for Congress to concentrate all of its energies on elimination of nonessential spending and reduction of less-essential spending. When that has been done, your committee believes that it can then be determined what, if any, additional taxes are really needed to cover absolutely essential costs.

H. R. 4473 proposes to raise $7.2 billion of new revenues, of which $2.8 billion would come from individuals, $2.8 billion from corporations, $1.2 billion from excise taxes, and the balance from changes in various provisions of existing revenue laws. If new revenues are needed to balance the budget, after Congress has done a real job of cutting nonessential expenditures, these new revenues should not come from increases in corporate or individual tax rates. As pointed out earlier in this report, excessive tax rates, reaching almost the point of complete confiscation, injure the economy of the country when it should be made strong, drive investment funds out of productive business investments and into nonproductive nontaxable securities, are inflationary in nature because of the waste they encourage, and may well result in less rather than more revenues by stifling individual and corporate incentive. We are therefore opposed to the proposed increases in corporate and individual tax rates. For the same reasons we oppose (1) reducing the percentage of average base-period net income used in determining the excess-profit tax credit, (2) increasing the ceiling on the amount of corporate income that may be taken by corporate and excess-profits tax rates, and (3) restricting corporations in a "controlled group" to one minimum excess-profits tax credit and one surtax exemption. (The alleged loophole to be closed by (3) can be closed under sections 45 and 129 of the present Internal Revenue Code.)

If additional taxes are really needed for indispensable purposes, this committee has previously recommended that they be raised by a uniform excise tax levied at either the manufacturer's or retail level on all products except liquor, tobacco, and food and by taxing presently tax-exempt organizations that compete with private business. Liquor and tobacco should be continued subject to excise taxes at higher rates than the proposed uniform tax.

If higher taxes are needed to arm and protect this country, then everybody receiving the benefits of that protection should share some portion of the cost thereof. There are still millions of people in this country who pay no income taxes, and there are still cooperatives and other nontaxable organizations that pay no income taxes even though they conduct large income-producing businesses in competition with taxable corporations. Congress must certainly consider whether these people and organizations are to continue tax-exempt even when the President asks for more revenues than were raised during World War II.

If one of the purposes of a new tax bill is to combat inflation, then certainly a uniform excise tax will accomplish this purpose better than any other type of tax. High income and excess-profits tax rates encourate spending, but excise taxes reduce the amount of money available for spending in relation to the amount of goods available. In times like these, therefore, an excise tax accomplishes the twofold purpose of being anti-inflationary and at the same time raising needed revenues.

Certain provisions of H. R. 4473, other than those dealing with increased tax rates, should also be dealt with in this report.

A few of these provisions should definitely be enacted in any new revenue act. These are:

1. The recognition of gain on the sale of a residence only to the extent that the proceeds exceed the cost of a new residence purchased within 1 year before or after the sale of the old residence. This takes care of a long-needed change in the tax treatment of this type of transaction.

2. Exempting from corporate income-tax venture capital companies which supply capital to corporations engaged principally in developing or exploiting new inventions, processes, or products where such companies distribute substantially all their income, including capital gains, to their stockholders. This provision properly places venture-capital companies in the same tax category as regulated investment companies.

3. Treating as deferred expenses development expenses of mines, after discovery of commercial quantities, and permitting deduction thereof ratably over the period during which the mineral is sold. This should stimulate the discovery and development of additional mineral facilities and provides for the proper method of deducting development expenditures.

4. Recognition as a true partner in family partnerships of a person owning a capital interest in a partnership in which capital is a material income-producing factor whether or not such interest is derived by purchase or gift. This provision should have been part of the income-tax law for many years, and Congress might well consider making the provision retroactive.

One provision of H. R. 4473 to which your committee is strongly opposed is the provision for a withholding tax of 20 percent on dividends, interest, and royalties. Congress was asked in 1950 to pass such a law in a particularly objectionable form and refused to do so. The proposed type of withholding, while not quite so objectionable, nevertheless has many serious defects. The proposal is for a gross withholding without any exemptions and without any report to the Treasury as to the person from whom the tax was withheld or to the stockholder whose dividend was diminished thereby. It would be necessary to every stockholder who actually owed no tax to file a claim for refund. In the meantime the Government would keep his money, and if he failed to file a refund claim through oversight or lack of knowledge he would lose 20 percent of his dividend. Tax-exempt charities would be deprived of 20 percent of their dividend income until refund claims were allowed. Since such claims would have to be filed every year, the practical effect would be to more or less permanently deprive them of that portion of their dividend income. Corporations owning stocks of other corporations are taxed only upon 15 percent of the dividends they receive. If 20 percent of their dividends were withheld, the amount withheld would amount to well over 150 percent of any tax they could conceivably owe on dividends received. The foregoing are just a few examples of the many defects in the proposed withholding plan. It should not become law.

The net result of your committee's consideration of H. R. 4473 is that, with the exception of a few provisions thereof, the bill should be discarded and that the Senate Finance Committee should present a new revenue bill, if any is actually needed after Congress has done a real job of pruning wasteful and unnecessary expenses.

Respectfully submitted.

COMMITTEE ON FEDERAL TAXATION,
E. G. HALTER, *Chairman.*

JULY 27, 1951.

WASHINGTON, D. C., *August 1, 1951.*

Hon. WALTER F. GEORGE,
Chairman, Senate Finance Committee,
Washington, D. C.:

Statements of some retail organizations to effect that they would accept retail sales tax in lieu of manufacturer's excise tax being widely misinterpreted to indicate that retailers favor sales taxes. As national organization representing men's-wear merchants, we do not see the need for either tax. Thousands of retailers, particularly small merchants in communities where there is city and State sales taxes, bitterly opposed to retail sales tax under any circumstances and we urge their views before your committee. Please see that this message of clarification and opposition to retail sales tax is brought to the attention of your committee.

LOUIS ROTHSCHILD,
Executive Director, National Association of Retail Clothiers and Furnishers.

THE GREYHOUND CORP.,
Chicago, Ill., July 23, 1951.

Hon. WALTER F. GEORGE,
Chairman, Senate Finance Committee,
Washington, D. C.

DEAR SIR: Your committee is currently considering the revenue bill of 1951 as contained in H. R. 4473. Section 123 of this bill provides that corporations that are members of a controlled group will be entitled to only one surtax exemption of $25,000 and only one minimum excess-profits credit of $25,000 for the group, instead of a surtax exemption and minimum credit of $25,000 for each corporation, as under the present law. This revision imposes an unwarranted penalty in cases where it is necessary for good and valid business reasons to maintain a number of corporate entities in a related group. The effect is to reduce a controlled group to a single corporation for tax purposes, and if this has to be done it would seem only equitable that the law should also be changed to permit the filing of consolidated returns without penalty.

Section 201 of the bill, which provides for withholding of income tax at source on dividends and interest, is also extremely undesirable, as it will result in a considerable increase in accounting and administration work. It is grossly unfair to require corporate taxpayers, already burdened with the responsibilities as well as the costs of acting as tax-collecting agents for the Government, to assume the additional work and expense of withholding income taxes from dividend and interest payments. If this method of collecting taxes is the most desirable one from an economic standpoint, the corporate-tax collectors should at least be reimbursed for all costs and expenses attributable to the task.

The bill on the whole provides for substantial increases in tax rates which we feel are unreasonable, unwarranted, and, in some cases, discriminatory.

We respectfully request that our views concerning sections 123 and 201 of H. R. 4473 be incorporated in the record of hearings now in progress before your committee.

Respectfully yours,

A. P. SLEDZ,
Vice President and Comptroller.

INKOGRAPH CO., INC.,
New York, N. Y., July 27, 1951.

Hon. WALTER F. GEORGE,
Senate Office Building,
Washington, D. C.

DEAR SENATOR: This letter is being written in order to bring to your attention the inequities that will occur should the Senate Finance Committee adopt that portion of tax bill which intends to place a manufacturer's excise tax on low-priced fountain pens.

No doubt the following facts have been called to your attention, and it is my desire merely to reiterate them and to stress the importance of these objections to the tax.

Statistics show that there are approximately 30,000,000 students in this country who use fountain pens, the same being a very important item to them in their school work.

It is also known that these students do not usually purchase such pens which are now subject to sales tax, because of the item being classified in the jewelry line; but they do purchase the lower-price pens, especially children who attend the elementary and high schools. In most cases, they would buy a pen which would cost them either $1 or $2. These children do not have any money of their own, but must obtain the price for these pens from their parents.

The manufacturer's tax of 20 percent would immediately make these children pay $2.40 for a $2 pen and $1.20 for the $1 pen. I do not believe it is the desire of your committee to burden these children or their parents with any additional costs for an item which is so essential to their daily needs.

Statistics also indicate that fountain pens are in considerable use amongst the military and governmental agencies. The soldiers in campaigns and in fields write letters to their parents, friends, and those close to them, using fountain pens. I do not believe it is the desire of your committee to compel these soldiers to pay more for a fountain pen which is needed by them.

Some time ago, the Government sponsored a letter-writing campaign asking American citizens to write to friends in foreign countries with the purpose of creating good will between our people and those of these other countries, all this writing to be done with fountain pens. We do not believe that the Government would want to make these people pay more for a writing instrument, especially when it is hoped that this letter writing will accomplish the purpose for which it was intended.

In conclusion, may I take the privilege of asking you to use your good offices toward eliminating this hardship tax, this manufacturer's excise tax, which would create such hardship on people who can least absorb additional expenses at the present time.

We have not written to any other members of your committee, and, therefore, would appreciate that these facts be called to their attention by you.

Respectfully yours,

A. L. KIEBEL, *Vice President.*

MEMORANDUM SUBMITTED BY MILES PENNYBACKER, PRESIDENT, NEW COUNCIL OF AMERICAN BUSINESS

When big business representatives plug for higher taxes, it's about time somebody began to look under the chips. The New Council of American Business is accustomed to looking under the chips, particularly under the blue chips. And we are not necessarily wrong in questioning their motives or their theories on taxes at this time just because a lot of Government, labor, farmer, consumer, and small business representatives have hopped on the band wagon with shouts of "balance the budget."

We suspect that big business is interested primarily in the removal of price and other direct controls. Naturally they are not averse to higher taxes on consumers if this can be used as an excuse for reducing direct controls.

No doubt others are sincere in their belief that the proposed new taxes will act as a brake against inflation. We question whether the additional taxes thus far proposed will act as such a brake. Here are our reasons:

1. The proposed increases in tax rates on individual income are too small to affect the price level. If we wanted to keep the price level down, we would have to increase taxes by such an enormous amount that the standard of living would drop to dangerous levels.

The President called for $4 billion a year increase in revenue from individual income taxes. The House bill provided for $2.8 billion increase in personal income taxes. Even the larger figure of $4 billion represents only little more than 1 percent of the gross national product (the total amount of goods and services supplied) and less than 2 percent of the total personal income. It is clear that, although the tax increase may be harsh for many individuals, from the over-all standpoint it can have only a minor effect on the general price level. This is especially true for the prices of all durable goods, and for most military supplies, where the inflationary trends are sure to be most pronounced.

Remember that not all of the money paid out in taxes will be a reduction in purchasing power and therefore an aid in the fight against inflation. The middle-income and upper-income people will reduce their savings, not their purchasing power, to pay these higher taxes. The lower-income people will have to cut down their buying to pay higher taxes; however, they will be reducing their purchases of items such as food and clothing, of which there is ample supply. (Look at what is happening these days in the textile, shoe, and other soft-goods lines.)

2. The contemplated increase in corporate income taxes will not materially affect business demand for plant and equipment and therefore will not reduce the pressure of demand for building materials and machinery. The corporations that do most of the business investing in this country have access to sources of funds; they don't rely on current income for business buying purposes. In addition, higher corporate taxes will stimulate higher prices, since in many lines of business the corporations will find it feasible to pass these higher tax payments on to the consumer.

To balance the budget temporarily may seem important. But it is more important to balance the budget, and retire the debt, over the longer period, say the next 10 to 20 years. If by blindly sticking to a budget-balancing policy today we contribute to a period of low incomes, low sales, and low profits in the near future we will not be helping the goal of a balanced budget over the longer term. This long-term goal can be achieved only by steps which will help to stabilize the economy when the rate of spending for armament is diminished.

A substantial rise in tax rates will reduce consumer savings, the savings we have to rely on for the purchase of homes, autos, and the like after the present emergency is over. New tax rates that destroy the consumer purchasing power after the present emergency—when we will have available the tremendous capacity now being built—will only lead to future budget deficits. Future budget deficits arising from depressed markets will—if we can judge from past experience—be larger and last longer than the contemplated deficit in the present emergency. On the other hand, a prolonged prosperity after the current emergency can be expected to produce many years of budget surpluses. Hence, balancing the budget today may not be the answer to an average balanced budget over the longer period ahead.

It is important to remember that Federal deficits are not synonymous with inflation. During the 1920's we had years of budget surpluses while in the depression we had deficits (not only during pump-priming years). Look at the more recent experience:

[In billions of dollars]

Calendar year	Federal cash receipts	Federal cash expenditures	Difference
1947	$44.3	$38.6	[1] 5.7
1948	44.9	36.9	[1] 8.0
1949	41.3	42.9	[2] 1.6

[1] Surplus.
[2] Deficit.

In 1948—a good business year—the Federal Government had an $8 billion cash surplus. In 1949, when production, sales, and profits were falling, there was over a billion dollars of Federal deficit. In the fiscal year just ended, a period of marked inflationary trends, we had a substantial surplus.

These figures show the shallow reasoning of those fiscal experts who intimate that the problem of inflation can be reduced to a mere problem of Federal deficits.

Inflation is a matter of over-all supply and demand. The theory behind increased taxes is that it reduces purchasing power and hence brings supply and demand into better balance. However, if taxes are to be an effective weapon to reduce demand, the rates will have to be much harsher than currently contemplated. And if they become harsh enough to reduce the inflationary danger, they will play havoc with the economy.

This is not to say that inflation is not a danger. It is a real danger. So much so, in our opinion, that we are willing to face the need for direct and effective controls on prices, on wages, and on materials. Let's not kid ourselves that loading more taxes on the low- and middle-income groups is the way to stop inflation. It will do nothing more than lower their standard of living, reduce their savings, and make the next recession more acute.

HECLA MINING CO.,
Wallace, Idaho, July 24, 1951.

Hon. WALTER F. GEORGE,
Chairman, Senate Finance Committee,
United States Senate,
Washington, D. C.

DEAR SENATOR GEORGE: We request that your committee give careful consideration to the following comments pertaining to present and proposed tax legislation affecting the metal-mining industry. Although our remarks are generally applicable to the metal-mining industry throughout the United States, our discussion is more or less confined to the effect of present and proposed tax legislation on metal mining in the Northwest States, where the deposits are usually deep-seated, and prospecting and exploration, prior to discovery, requires substantial cash outlays.

As comptroller and secretary-treasurer of the Hecla Mining Co. and consulting partner in the firm of Randall & Magnuson, certified public accountants, of Wallace, Idaho, I am familiar with the tax problems of the mining industry in Idaho. Our firm either prepares or supervises the preparation of a majority of the tax returns for mining companies in the Coeur d'Alene district, a very important producer of zinc, lead, and silver.

According to the 1950 annual yearbook published by the American Bureau of Metal Statistics, the State of Idaho lead all of the States in the production of zinc and silver, and was second in the production of lead. A comparison of Idaho production with total United States production is set forth as follows:

	Zinc	Lead	Silver
	Tons	*Tons*	*Ounces*
Total United States production	618,207	429,875	34,944,554
Total Idaho production	87,875	102,500	9,921,891
Percent of Idaho production to total	14.2	23.8	28.4

Ninety-five percent of the total production of metals in the State of Idaho is produced in the Coeur d'Alene mining district located in the panhandle of Idaho in the area immediately surrounding Wallace and Kellogg, Idaho.

Prospecting and exploration necessary for discovery of new ores bodies in the Coeur d'Alene district require heavy cash outlays, since the ore bodies occur at depth. It is not at all unusual to discover ore at a depth of from 2,000 to 3,000 feet below the surface. This, of course, requires huge expenditures for exploration through shaft sinking and lateral crosscuts, the expenditures for which, under present tax law, are not deductible as an ordinary, expense. The only possibility of recovery of these expenditures in event of failure to find commercial ore is through abandonment which, of course, seldom occurs, since management is reluctant to abandon properties upon which perhaps a million dollars or more of the stockholders money has been expended. There is always a possibility that additional exploration may encounter profitable ore bodies.

Our present tax laws must be amended promptly if we are to attract risk capital into prospecting and exploration ventures. Otherwise there will be very few new ore bodies discovered to replace known deposits being rapidly exhausted through accelerated production. Government officials recognized that the present emergency demands that something be done immediately to encourage the discovery of new mineral deposits, and yet many seem to oppose a very simple solution set forth as follows:

AMEND OUR PRESENT TAX LAWS TO PERMIT THE EXPENSING OF EXPENDITURES FOR PROSPECTING, EXPLORATION, AND DEVELOPMENT INCURRED PRIOR TO DISCOVERY

The right to expense prospecting and exploration costs before discovery would obviously be an inducement, under present high tax rates, for individuals and corporations to risk capital in the search for metals, provided such expenditures were deductible for tax purposes in the year in which incurred. Excessive tax rates, under the present tax law, do not leave either the corporation or the individual sufficient earnings after taxes to carry on the necessary prospecting and exploration required to discover new deposits. Certainly I cannot see how there can be any loss of revenue over the long pull. In fact, the discovery of new profitable deposits will mean added tax revenue. Our Government has embarked upon a policy of loaning or matching funds as an inducement. However, the industry in general frowns upon assistance from Government as a subsidy and would much prefer a deduction for tax purposes. Under the present law, even major companies with huge surpluses are reluctant to speculate with funds for exploration. Many small corporations presently unable to finance exploration and development of their own properties would be in a position to attract capital from larger corporations through leasing arrangements.

In order to accomplish the above, I urge that your committee act promptly upon the following recommendations:

Amend the present tax law to permit the expensing of expenditures for prospecting, exploration, and development incurred prior to the productive stage of the mine by adding the following new paragraph (D) at the end of section 23 (a) (1) of the Internal Revenue Code as a substitute for the first nine lines of paragraph (D) of section 302 (a) of the Revenue Act of 1951 (H. R. 4473), which is now under consideration by your committee:

"(D) In the case of mines and other natural deposits (except oil and gas wells) all expenditures (in excess of net receipts from any minerals produced before the mine has reached the production stage) incurred in prospecting, exploration, and development may be deducted as expense, either in the year incurred, or at the election of the taxpayer, deferred and ratably apportioned to the production directly related to such expenditures, and to the extent not previously so deducted by the taxpayer may be deducted in the year in which it is determined that there is no reasonable expectation of such production thereafter."

Other provisions of section 302 dealing with adjustment of the basis, depreciable property, etc., could then be incorporated into the above. Section 302 (c) must necessarily then refer to page 75, line 24, as to "prospecting, exploration, and development" instead of merely to "development."

I fully realize that some officials in the Treasury Department will contend that percentage depletion compensates for expenditures incurred in prospecting and exploration and will therefore oppose the above amendment. However, the facts do not bear out their contention. Statistics gathered by the Idaho Mining

Association for years 1930 through 1940, inclusive, reveal that total expenditures by the mining industry in Idaho during this period aggregated $220,000,000, as compared to total receipts from sales of ore amounting to $210,000,000. In other words, the mining industry in Idaho during this period expended $10,000,000 more for prospecting, exploration, development, and mining costs, taxes, construction, etc. (exclusive of depreciation and depletion), than was realized in the form of receipts from the sale of ore. We have no statistics subsequent to 1940. However, if expenditures for prospecting and exploration had not been made during the above period, we probably would have very little production in the State of Idaho at the present time.

SECTION 302 OF THE 1951 REVENUE BILL (H. R. 4473)

As stated previously, I firmly feel that section 302 (a) should be amended as suggested above to permit the expensing of prospecting, exploration, and development incurred prior to the discovery of ore. Section 302 of the 1951 revenue bill is unquestionably a step in the right direction, since it solves part of the problem in permitting a deduction for development expenditures subsequent to discovery and prior to the productive stage, which, under present law, must be capitalized and is recoverable only through depletion.

However, I have one or two criticisms of the proposed amendment. While such development expenditures may be expensed as a deferred operating cost, the amendment would require that the expense be allocated over the ores benefited through such expenditure as the units of produced ores or minerals benefited are sold. In the Coeur d'Alene district, I believe that this wording may actually curtail development of presently known ore bodies. Management will be very reluctant to expend advance funds for development if such funds cannot be expensed in the year of expenditure, for the reason that the future year in which an expense deduction may be taken might be a loss year in which no tax benefit will be derived.

It has been our policy, which has apparently met with Bureau approval, to expense what is commonly termed "normal development." This includes development between levels such as for skip pockets and crosscuts from the shaft and also shaft extensions in cases where such extensions merely maintain output.

We believe line 24, on page 74, pertaining to the above section, should be amended by inserting after the word "sold" the following: "or at the taxpayer's election in the year paid or incurred." If the taxpayer wishes to expense his entire development costs, I cannot see why there should be any objection, since, in any event, he gets the deduction only once.

We believe that the following sentence should be added to the end of paragraph (D):

"Expenditures to maintain production of an operating mine shall not be considered as expenditures for development within the meaning of this paragraph but shall be deductible as ordinary costs of operation in the year such expenditure are made."

One other amendment which we believe should be made to section 302 deals with receipts from minerals produced before the mine has reached the productive stage. Section 302 makes no provision and we believe the following wording should be added after our proposed amendment insofar as development prior to the productive stage is concerned:

"Before the mine has reached the productive stage, net receipts from any minerals produced shall be applied to reduce any then remaining balance of expenditures."

After making the above amendments, sec. 302(a) of the Revenue Act of 1951 will read as follows (proposed amendments underlined):

"SEC. 302. EXPENDITURES IN THE DEVELOPMENT OF MINES

SEC. 302 (a). DEDUCTION OF EXPENDITURES.—Section 23 (a) (1) (relating to deductions from gross income) is hereby amended by adding at the end thereof, the following new subparagraph:

"(D) Development of mines: Expenditures paid or incurred after December 31, 1950, in the development of a mine or other natural deposit (other than an oil or gas well), to the extent paid or incurred after the existence of ores or minerals in commercially marketable quantities has been disclosed, shall be deductible, on a ratable basis, as the units of produced ores or minerals benefited by such expenditures are sold *or at the taxpayer's election in the year paid or incurred. Before the mine has reached the productive stage the net receipts from any minerals produced shall be applied to reduce any then* *remaining balance of development expenditures. To the extent that such expenditures have not previously been so deducted by the taxpayer, they may be deducted in the year in which it is determined that there is no reasonable expectation of such productive stage.* Such expenditures, and the adjustments to basis provided in section 113 (b) (1) (J), shall not be taken into account in determining the adjusted basis of the property for the purpose of computing depletion under section 114. This subparagraph shall not apply to expenditures for the acquisition or improvement of property of a character which is subject to the allowance for depreciation provided in section 23 (l). For purposes of this subparagraph, allowances for depreciation shall be considered as expenditures. *Expenditures to maintain production of an operating mine shall not be considered as expenditures for development within the meaning of this paragraph but shall be deductible as ordinary costs of operation in the year such expenditures are made.*"

As stated previously, the proposed italicized amendments to section 302 above relate to expenditures for development incurred after discovery of ore in commercially marketable quantities. Of course section 302 does not take care of expenditures for prospecting and exploration incurred prior to the discovery of commercially marketable ore, and for that reason, we must again emphasize the necessity of making provision for a tax deduction for such expenditures, as suggested.

There are a number of other objectionable features to the Revenue Act of 1951 which warrant your consideration. For example, the proposal to reduce the present excess-profits-tax credit based on income from 85 to 75 percent is not justified. In fact, any reduction below 100 percent results in application of an excess-profits-tax rate to a portion of normal income which is obviously unfair. We urge that the present 85-percent allowance be increased to 100 percent.

The new bill also proposes that combined normal and surtaxes be increased to 52 percent. We believe the present 47-percent rate is excessive, especially when you consider that corporate income is now being taxed to the corporation and the portion retained after taxes by the corporation is taxed once more when distributed to the shareholders as a dividend.

Code section 131 (f) which grants a foreign tax credit only in the case of a majority owned foreign subsidiary is grossly unfair to the domestic corporation owning a minority interest in a foreign subsidiary. The ownership requirements should be reduced to a figure not in excess of 10 percent.

We urge that your committee give our comments careful consideration. We sincerely believe that the national emergency demands that our tax laws be amended in a manner similar to that set forth above in order to provide metals so necessary for the national safety.

Yours very truly,

HECLA MINING CO.,
L. J. RANDALL, *Comptroller.*

BAKER, BOTTS, ANDREWS & PARISH,
Houston, July 27, 1951.

Family partnerships, Revenue Act of 1951.

Mr. COLIN F. STAM,
Chief of Staff,
New House Office Building, Washington, D. C.

DEAR MR. STAM: As I have written you heretofore in reference to the treatment of family partnerships in the Revenue Acts of 1950 and 1951, I am writing in reference to the same subject as dealt with in section 313 of the revenue bill of 1951 as passed by the House.

In substance, in my opinion section 222 as contained in the revenue bill of 1950 as passed by the Senate is far simpler, clearer, and better all around than this section 313, and will make for far less litigation and at the same time will, as I have heretofore written you, be entirely fair to the Government. I would prefer section 222 as originally written, although I will suggest later in this letter a small change in one sentence.

SECTION 313 OF REVENUE BILL OF 1951

I appreciate very much your extended efforts to clear up this family-partnership muddle and the work that has gone into the preparation of section 313. However, from over 30 years' experience in tax matters and from a study of section 313 and many discussions of it with other lawyers and accountants, I believe we will have another flock of litigation over the meaning of certain provisions of section 313. I will discuss at the first certain technical objections and then take up the more fundamental ones:

1. The first sentence of section 191 as enacted by section 313 provides for the distribution of earnings in accordance with the partnership agreement and then makes an exception to the extent that the portion attributable to donated capital is proportionately greater than the share of the donor attributable to the donor's capital. The third sentence then provides that an interest purchased by one member of a family from another shall be considered to be created by gift and the fair market value of the purchased interest shall be considered to be donated capital.

You will note that the provision of fair market value is technically limited to a purchased interest and the fair-market-value provision does not in so many words apply to a donated interest. It was probably your intention to have the fair market value apply both to a donated interest and a purchased interest but there is this hiatus in the language. With this hiatus, there is no measure provided for determining what is the capital represented by an interest donated by a parent to a child. However, for the balance of this letter I will assume that the fair-market-value provision applies both to donated interest and purchased interest.

2. There is no provision in the section by which the amount of the donor's capital is to be determined. I can see all through this many difficulties with revenue agents, and it is with revenue agents that all tax cases originate. I can see now long and extended discussions as to what the donor's capital is in a partnership and what the fair market value of a child's donated or purchased interest is. This becomes particularly difficult where there is a partnership of long standing. For example, I have now up with the Government a partnership created on December 31, 1935, between three brothers, two wives, and 10 trusts. Each year there will come up the question of what the capital of the three brothers and their two wives amounted to on December 31, 1935, and the fair market value of the interests given those trusts on that day. As of what date is the donor's capital to be determined? As of what date is the fair market value of a donated or purchased interest to be determined? In this connection, if a partnership has increased in worth at the time an interest is sold or given to children, then the fair market value of the children's interest would be worth more than the amount of capital originally put into the partnership by the parent and in such case the interest of the children would be recognized in full. In other cases a partnership will not have as much assets as it had originally, either by distributions or losses. In such case the fair market value of the interest acquired by children will be less than the proportionate capital originally put in by the parent, and in that instance the interest of the children will not be recognized in full. I do not think that this result was intended.

3. Section 313 as now written will apply no matter how old the donee or purchaser of an interest may be. It applies to all dealings between spouses, ancestors, and lineal descendants and any trusts for such persons. A man is in a partnership with two others, and has two sons that are up in their forties. He wants them to come into the partnership to take his place gradually. He therefore sells them an interest. Here again we have all of the intricate questions of the donor's capital and the donated capital when if section 313 is not enacted these two grown men who happen to be sons of a partner would be readily admitted by the Government as bona fide partners.

There may be an answer to the foregoing questions, but, if section 313 is passed, I do not know what answers I could give to a revenue agent if he raised them in the examination of one of these family partnerships.

SECTION 222 OF REVENUE BILL OF 1950 PASSED BY SENATE

As I have heretofore written you, I think section 222 is fair to the Government and fair to the taxpayer, and it does not have the complicated questions that arise under section 313, or at least arise in my mind and that of others. I think section 222 can go far toward eliminating a great deal of needless litigation.

In connection with section 191 as proposed to be enacted by section 222, I would like to call your attention to the second sentence as now written which reads: "If it does not so reflect the proportionate value of services, a reasonable proportionate allowance for such services shall be attributed to the partners rendering such service."

If I may do so, I would suggest that this sentence be changed to read: "If it does not so reflect the proportionate value of services, a reasonable amount for such services shall be attributed to the partners rendering such services before the determination of the partnership income allocable to the partners according to the terms of the partnership agreement."

The only change of substance that this would make would be to change the words "a reasonable proportionate allowance" to "a reasonable amount." I can see difficulty in the words "a reasonable proportionate allowance." I think it was intended that there should be a definite monetary allowance to the partner rendering the service, but under the present words it seems to me that there would be allocated to such partner a percentage of the earnings which might vary very considerably from year to year. If this is changed as I suggest to "a reasonable amount," this would mean a definite amount in dollars that would represent reasonable compensation for the partner's services, and I do not doubt but that in practically all cases taxpayers and the Government agents could come to an agreement as to what would be a reasonable "salary" in dollars whereas they might have a great deal of difficulty in agreeing upon an additional percentage of earnings.

RETROACTIVE FEATURE

I think that any provision in the Revenue Act of 1951 should be made retroactive to January 1, 1939, just like the Senate provided in section 222. If this change is made applicable only from the passage of the Revenue Act of 1950, it will be years before it will have any actual effect in cleaning up tax cases. On the other hand, making it retroactive to 1939 will make it applicable to present pending cases and establish a definite rule by which those family partnerships can be measured and bring to a ready conclusion practically all of the pending cases, either in favor of the Government or the taxpayers.

As the revenue bill of 1951 is now pending before the Senate Finance Committee, I am sending a copy of this letter to Senator George and to Senator Connally.

I have through these many years recognized the great value of your services and those of your staff to both the House and Senate in preparing the various revenue bills, and as a citizen I want to express my gratitude to you.

Yours very sincerely,

HOMER L. BRUCE.

AMHERST H. WILDER CHARITY,
St. Paul, Minn., July 23, 1951.

Hon. WALTER F. GEORGE,
United States Senator, Washington, D. C.

DEAR SENATOR GEORGE: We are writing to you as a member of the Senate Finance Committee to ask your assistance in securing an amendment to the section of the Revenue Act of 1951 which provides for a 20-percent withholding tax on dividends, royalties and interest payments. It is our understanding that the act as passed by the House of Representatives provides that the withholding tax shall be deducted from all dividend, royalty, and interest payments, but that where such payments are withheld from tax-exempt organizations, such organizations would be permitted to claim credit for the withheld amounts as an offset against their liability for income and social-security taxes on wages paid their employees. If the amounts withheld exceed the organization's liability for taxes withheld from wages paid their employees, the organization will have to apply for a refund of the difference.

The Wilder Charity is an endowed foundation which operates a number of services in this community for the benefit of "the worthy poor, sick, aged, or otherwise needy." With the exception of miscellaneous operating receipts, its entire income is received in the form of interest and dividends. If this proposed provision were to become law it would not only greatly complicate our bookkeeping records but would also delay the receipt of a substantial percentage of our current income. Because the Wilder Charity receives practically its entire income in the form of interest and dividends, the amount of our withholding-tax and social-security-tax credits would be equal only to approximately 25 percent of the amount withheld by the Government under the proposed plan.

It seems to us that the proposed plan would be exceedingly difficult to administer and that it would greatly increase the bookkeeping and record-keeping costs of the Federal Government.

The Wilder Charity owns some Canadian securities. Apparently the Canadian Government follows the practice of withholding the tax on payments of dividends, royalties, and interest, but it permits charitable organizations to file a certificate of their tax-exempt status with the company or individual paying the dividends, royalties, or interest, and on the basis of that statement no deductions are made with respect to payments to charitable organizations. It seems to us that such a procedure is much easier to administer and of much less inconvenience to the charitable or nonprofit organization. We would greatly appreciate your assistance in making certain that a more easily administered procedure is provided for tax-exempt organizations than the one proposed by the House bill. We have found that the Canadian system operates very easily, with a minimum of difficulty and delay for all concerned.

Thank you.

Sincerely,

F. M. RARIG, Jr., *Executive Secretary.*

NATIONAL TOOL AND DIE MANUFACTURERS ASSOCIATION,
Cleveland, Ohio, July 25, 1951.

Hon. WALTER F. GEORGE,
Chairman, Senate Finance Committee,
United States Senate, Washington, D. C.

DEAR SENATOR GEORGE: It will be very much appreciated if you will see that the following brief statement regarding family partnerships is included in the record of the hearings which your committee is now holding on H. R. 4473.

Full recognition of family partnerships by the Bureau of Internal Revenue as regards the Federal income tax is highly important to many of the shop owners in the special tool and die industry. These shops are all small businesses which make the special tooling without which mass production is impossible.

They are operated by their owners, frequently with the help of various members of the family, in the office, on the road, or in the shop. Family partnerships are a natural consequence, and take various forms.

Before the Senate acts on H. R. 4473, we urge that section 313, family partnerships, be amended to provide for its application for tax years back to 1938, and to make it clear that any partnership that is valid under State law be so recognized for Federal tax purposes.

Since it became permissible for husband and wife in any State to split their incomes equally in computing their income taxes, the importance of the validity of husband and wife partnerships has of course become of less importance. But before this right was established by Congress, many such partnerships which had been recognized for tax purposes before the United States Supreme Court decisions in the Tower and Lusthaus cases, were denied the right of dividing their incomes in accordance with their partnership agreements, even though this privilege of splitting incomes was enjoyed by all married couples in community-property States. This inequitable action should now be rectified, and other family partnerships fully recognized.

Sincerely yours,

GEORGE S. EATON, *Executive Secretary.*

AMERICAN WATERWAYS OPERATORS, INC.,
Washington 4, D. C., July 24, 1951.

Hon. WALTER F. GEORGE,
Chairman, Committee on Finance,
United States Senate, Washington 25, D. C.

DEAR SENATOR GEORGE: Many members of this national association of the barge and towing-vessel industry who provide all types of domestic water transportation services on the inland rivers, intracoastal canals and waterways, the bays, sounds, and harbors of the Nation sincerely believe there is a serious inequity in section 448 of Public Law 909, Eighty-first Congress, the Excess Profits Tax Act of 1950, approved January 3, 1951.

Section 448 (c) (6) of the above-mentioned act permits the granting of a 6-percent credit—

"In the case of a corporation engaged in the furnishing or sale of transportation by common carrier by water, subject to the jurisdiction of the Interstate Commerce Commission under part III of the Interstate Commerce Act, or subject to the jurisdiction of the Federal Maritime Board under the Intercoastal Shipping Act, 1933"—

and section 448 (d) states that—

"For the purposes of this subchapter the term 'regulated public utility' means (except as provided in subsection (e)) a corporation described in subsection (c), but only if 80 per centum or more of its gross income (computed without regard to dividends and capital gains and losses) for the taxable year is derived from sources described in subsection (c)."

As a matter of practical operations on the inland waterways and in the harbors of the United States, nearly all water carriers engage in both "regulated" and "unregulated" traffic under the provisions of part III of the Interstate Commerce Act—the Transportation Act of 1940. This act provides specific exemptions applicable to the carriers by water of bulk commodities generally, including bulk petroleum products, operations in harbors and contiguous waters, and certain other services provided by water carriers and operators.

Under the language in the Excess Profits Tax Act of 1950, herein quoted, domestic water carriers and operators are denied the 6-percent credit unless 80 percent or more of their traffic by revenue volume is subject to regulation by the Interstate Commerce Act. It is believed that the equitableness of the situation would require that these carriers and operators be permitted to take the credit referred to in the proportion of their "regulated" to their "unregulated" traffic and thus revenue.

Under such an arrangement, if a water carrier derived 50 percent of his revenue in any taxable year from traffic subject to regulation and fixation of rates by the Interstate Commerce Commission or any other appropriate regulatory body, he should be entitled to take 50 percent of the 6-percent credit, rather than be denied all such credit because of the fact that his "regulated" revenue did not amount to 80 percent of his total revenue for any taxable year.

It is hoped that the Committee on Finance will give consideration to the alleviation of this inequity in the Excess Profits Tax Act of 1950 by appropriate amendment to H. R. 4473, the proposed Revenue Act of 1951, now before it. The undersigned will be pleased to submit facts in support of this suggested amendment at your request, and I await your advice thereon.

Sincerely yours,

CHESTER C. THOMPSON, *President*.

JULY 23, 1951.

HON. HARRY F. BYRD,

Senate Finance Committee,

Senate Office Building, Washington, D. C.

DEAR SIR: In accordance with your request when I visited with you in your office Wednesday, July 18, I am attaching herewith a presentation of the proposed amendment of the House tax bill permitting partnerships and proprietorships to take advantage of the corporate tax rates in their business operations.

This group has been a neglected and forgotten group taxwise. There is little record of their ever having been given tax consideration as a business group. They form the backbone of American industry and commerce and are the breeding grounds of much of the best that is in the American enterprise system. They should be put on a competitive basis with corporations taxwise and I hope that you and your associates in the Finance Committee will see fit to make this recommendation to the Senate.

This is a new subject in one sense but it has been considered by your tax advisers for many years and has been before the Ways and Means Committee in the past. I believe it would have been given a great deal of consideration in the recent deliberations of the Ways and Means Committee if these had not been somewhat involved. We have never had a more able Finance Committee than the one presently serving the Senate and they are fully qualified to pick up this "new" subject and pass judgment on it.

Very truly yours,

F. N. BARD.

JULY 23, 1951.

PROPOSED AMENDMENT TO THE HOUSE TAX BILL NOW BEFORE THE SENATE FINANCE COMMITTEE

Subject: Giving proprietors and partners the right to pay business taxes under the same tax schedule as corporations.

The following taxes are presently in force:

	Percent
Corporation tax rates:	
Normal tax	25
Surtax on net income over $25,000	22
Total	47
Excess profits tax on income above excess profits tax credit if any	30
Total	77
Over-all ceiling, 62 percent.	
Individual tax rates:	
Normal tax	3
Surtax at $12,000	40
Surtax at $200,000	88
Top total rate	91
Over-all ceiling, 87 percent.	

A business earning $12,000 a year operated by a proprietor pays the same tax as a corporation, if the proprietor has no other income. If he has other income his business and personal taxes are added together and the burden on his business is increased.

Above $12,000 area income the proprietor is at a progressive disadvantage. The corporation rate is 47 percent plus excess-profits taxes, if any, with an over-all ceiling of 62 percent. The individual proprietorship ceiling is 87 percent.

It is recognized that by court decisions and tax authorities that no man should be penalized taxwise for his selection of a method of doing business.

All tax laws are written around the individual and the corporation and proprietor's and partner's business enterprises and venture capital has not been the subject of tax legislation. They are the forgotten group.

No other group will be hurt by recognizing this forgotten group and treating them justly taxwise.

The revenue received from this group by the Federal Government should not be reduced. This group should be stimulated and the revenue increased. Reduction of taxes increased the revenue in Canada.

This subject of proprietor and partner taxes has been before the Ways and Means Committee of the House since 1945 and has been considered by the Joint Tax Committee of the House and Senate. It has been stated that the reason the Ways and Means Committee has taken no action was because there was no general revision of the tax laws and only a few specific so-called emergency cases were passed on. The justice of an equitable tax base for this group has never been questioned.

A bill, H. R. 4214, was introduced into the House by the Honorable Daniel Reed, of New York this year and a similar one was introduced by the same Congressman last year.

Copies of H. R. 4214 are attached herewith and also a copy of a proposed bill differing slightly from H. R. 4214 which it is suggested that the Senate Finance Committee adopt as an amendment to the House bill presently before them in preference to H. R. 4214 for the following reasons:

The proposed and preferred amendment differs from H. R. 4214 in leaving out the last paragraph of H. R. 4214. This paragraph provides for double taxation of proprietorship and partnership when these earnings are transferred from the business account of the partnership or proprietorship to the individual account, i. e., transferred from his venture capital to his investment capital.

This is not a fair, equitable, or desirable procedure for the following reasons:

(1) Congress and its tax advisers are seriously considering the elimination of double taxation of corporate dividends. It would be unwise and unfair to impose on proprietorships and partnerships a double taxation of their earnings when the principal has been condemned in corporations.

(2) If a partnership or proprietorship is required to pay an extra tax for the transfer of earnings from venture capital to investment capital there will be a tendency to keep the venture capital and not pay taxes on it. Tax experts

have stated that the operation of a proprietorship and partnership tax based under corporate rates was the only method known by which the accumulations of unnecessary capital was prevented. The retention of capital by corporations has been the subject of much legislation and many administrative rules and an undesirable feature of this kind should not be added to a proprietorship and partnership tax situation.

(3) If venture capital earnings are transferred promptly from venture capital to individual investment account, without tax, they will immediately increase the earning power of the individual which earnings will be subject to the individual tax rates with probably increased revenue to the Government.

Proprietorships and partnerships are penalized over corporations as follows:

(1) They are required to pay taxes a year in advance and sometimes in advance of the collection of the money providing the taxes.

(2) They have, at the risk of their business, their entire assets, including both investment and venture capital.

(3) They have no carry forward on losses or excess profits tax credits.

Proprietorship and partnership advantages:

(1) The right to do business in any State without a license or incorporation.

(2) Bookkeeping and legal simplicity.

(3) No board of directors.

(4) No minority interest.

(5) No double taxation of earnings.

(6) No undistributed earnings problem.

(7) The right to do business in a manner of their own choosing without being penalized (a truly American privilege).

(8) No personal holding-company problems.

A BILL To permit unincorporated businesses to be taxed as corporations

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Internal Revenue Code is amended by adding at the end of part I of subchapter B of chapter 1 the following new section:

"SEC. 16. ELECTION AS TO TAX TREATMENT OF NONCORPORATE BUSINESS ENTERPRISES

"(a) At the election of the taxpayer, any business enterprise operated by an individual, or by a partnership consisting of not more than ten individuals other than a nonresident alien or a foreign partnership may be treated for tax purposes as if such business enterprise were a corporation, subject to the conditions and limitations provided in this section. In the case of a partnership, each partner must concur in the election. The election provided in this subsection shall be exercised in accordance with such regulations as the Commissioner, with the approval of the Secretary, shall prescribe.

"(b) As used in this section, the term 'business enterprise' means an enterprise engaged in a trade or business, other than personal service.

"(c) In the case of any business enterprise as to which an election for corporation tax treatment has been made under subsection (a), the following taxes shall be levied, collected, and paid:

"(1) a tax on the normal-tax net income of such business enterprise, at the rates prescribed in section 13 (b) or 14 (b);

"(2) a tax on the corporation surtax net income of such business enterprise, at the rates prescribed in section 15;

"(3) a surtax on the undistributed section 102 net income of such business enterprise, at the rates prescribed in section 102.

"(d) There shall not be included in the gross income of a business enterprise any income includible in 'personal holding company income,' as defined in section 502; but any such income shall be treated as the income of the individual or individuals to whom it would be attributable if this section had not been enacted. The Commissioner, with the approval of the Secretary, shall by regulation prescribe such method of accounting as will be necessary in order to determine what items are to be excluded from the gross income of the business enterprise and treated as income of individuals under this subsection.

"(e) In computing the net income of any business enterprise as to which an election has been made under subsection (a), the following rules shall apply:

"(1) a reasonable deduction shall be allowed for salary or compensation to the sole proprietor or to any partner for personal services actually rendered;

"(2) the treatment of capital gains and losses shall be that applicable to corporations;

"(3) a deduction for charitable contributions equivalent to that allowed by section 23 (q) shall be allowed;

"(4) there shall be allowed as deductions only such items as are properly allocable to the operations of such enterprise.

EFFECTIVE DATE

SEC. 2. The provisions of section 1 shall apply to taxable years ending after December 31, 1950.

WINTHROP, STIMSON, PUTNAM & ROBERTS,
New York 5, N. Y., July 20, 1951.

HON. WALTER F. GEORGE,
Chairman, Senate Finance Committee,
Senate Office Building, Washington, D. C.

DEAR SENATOR GEORGE: Would your committee be willing to take under consideration at this time a technical change in the new tax bill for the purpose of remedying a serious inequity which might well arise in connection with the optional valuation of a decedent's estate under section 811 (j) of the Internal Revenue Code? It might well happen that subsequent to the filing of the return and after the period within which an election to adopt either the value at date of death or the value 1 year after death has expired, the value of the gross estate may be increased over the value shown in the return either by including property not shown in the return, e. g., property transferred in trust and claimed by the estate to be not taxable, or by increasing the value of property shown therein, with the result that if the estate is bound by its election to use the value 1 year after death, the total tax resulting might substantially absorb the entire estate, or, so encroach upon it as to work a great hardship on the beneficiaries of the estate.

In the so-called American Bar Association tax bill by Representatives Camp and Reed, H. R. 4775 and H. R. 4825, there is proposed an amendment which would do away with the inequitable results under the present law. A copy of that proposed amendment is enclosed.

I appreciate that the bill which has been under your consideration is one designed primarily to increase revenue, rather than to correct inequities. Nevertheless, there is danger of a real hardship being incurred by an estate which I know of if the amendment to which I have referred is not passed at this time.

I should add that in order to be of benefit the amendment would need to provide that it be applicable to all estates with respect to which the statutory period for filing of claims for refund has not expired at the date of enactment. If the amendment were made applicable only to estates of decedents dying after the passage of the amendment it would not help the situation which I have in mind.

Faithfully yours,

PERCY W. CRANE.

PROPOSED AMENDMENT TO SECTION 811 (j) OF THE INTERNAL REVENUE CODE RELATING TO THE OPTIONAL VALUATION OF ESTATES

OPTIONAL VALUATION

Section 811 (j) (relating to optional valuation of gross estate) is hereby amended by striking out the first sentence and inserting in lieu thereof the following:

"(j) OPTIONAL VALUATION.—If the executor so elects upon his return, the value of the gross estate shall be determined by valuing all the property included therein on the date of the decedent's death as of the date 1 year after the decedent's death. If, subsequent to the filing of the return, the value of the gross estate is increased over the value shown in the return either by including property not shown in the return or by increasing the value of property shown therein, the executor may elect whether the gross estate, as increased, shall be valued as of the date of death or pursuant to this subsection, and the executor shall have this election notwithstanding a prior election or failure to elect. However, (1) property included in the gross estate on the date of death and, within 1 year after the decedent's death, distributed by the executor (or, in the case of property included in the gross estate under subsection (c), (d), or (f) of this section, distributed by the trustee under the instrument of transfer), or sold, exchanged, or otherwise disposed of, shall be included at its value as of the time of such distribution, sale, exchange, or other disposition, whichever first occurs, instead of its value as of the date 1 year after the decedent's death, and (2) any interest or estate which is affected by mere lapse of time shall be included at its value as of the time of death (instead of the later date) with adjustment for any difference in its value as of the later date not due to mere lapse of time."

This amendment shall be applicable to all estates with respect to which the statutory period for filing a claim for refund of estate taxes shall not have expired at the date of the enactment hereof.

THE AMERICAN LEGION,
Indianapolis 6, Ind., July 30, 1951.

Hon. WALTER F. GEORGE,
Chairman, Senate Finance Committee,
Senate Office Building, Washington, D. C.

DEAR SENATOR: Since 1926 the American Legion has been very keenly interested in the promotion of baseball among the boys in the age group of 12 to 17 years. This was started as a part of the Legion's Americanism program, and has been continued each year.

We feel baseball has played a very important part in our program. It has also helped in correcting juvenile delinquency in many areas.

During 1950 a total of 16,456 teams were registered in our American Legion junior baseball program. Although many Legion teams were playing who were not officially registered in our headquarters office. We estimate 1 million boys participate in our baseball program annually.

In view of the effort the American Legion is making to interest the boys of ages 12 to 17 in baseball, it is our feeling that baseball equipment such as balls, bats, gloves, masks, body protectors, and leg guards should be removed from section 483 of H. R. 4473, which is now being considered by your committee.

We were unable to appear before your committee, and will appreciate it if this letter can be made a part of the record of the hearing.

Sincerely yours,

ERLE COCKE, Jr., *National Commander.*

THE AMERICAN GUERNSEY CATTLE CLUB,
Peterborough, N. H., July 27, 1951.

Senator WALTER F. GEORGE,
Chairman, Senate Finance Committee,
Senate Office Building, Washington, D. C.

DEAR SENATOR GEORGE: This organization is the American Guernsey Cattle Club, Peterborough, N. H., representing approximately 50,000 Guernsey cattle breeders in the United States.

The Senate Finance Committee, of which you are chairman, is considering the new Revenue Act of 1951, and we would like to direct ourselves briefly to one provision of the bill (H. R. 4473) as it was passed by the House. We refer to section 306 of the bill, which reads:

> "Effective with respect to taxable years beginning after December 31, 1950, section 117 (j) (1) is hereby amended by adding at the end thereof the following new sentence: 'Such term also includes livestock held by the taxpayer for draft, breeding, or dairy purposes for 12 months or more.'"

This provision is of vital interest to our members, as well as to the countless thousands of taxpayers in this country who have herds of animals used for draft, breeding, or dairy purposes.

Obviously, the intention of the provision is to make sure that the taxpayer shall receive a capital-gains treatment when he sells draft, breeding, or dairy livestock, with the requirement that in order to get such treatment, the livestock must have been "held by the taxpayer" for such purposes for 12 months or more.

You and your committee are undoubtedly familiar with the history of the taxability of sales of draft, breeding, or dairy animals. Without attempting to set forth the details, the Commissioner of Internal Revenue, for years, has been holding that sales of such animals result in ordinary income, notwithstanding the fact that the judicial decisions have been to the contrary. Your honorable committee, and the Congress, was most cognizant of this situation last year when it considered the insertion of a provision on this subject in the Revenue Act of 1950. However, for certain reasons, this was not done and we refer to the conference committee report (H. Rept. No. 3124, 81st Cong., 2d sess., p. 28) which said: "It is the hope of the conferees that, pending such study and further legislation, the Treasury Department will follow the decision of the Eighth Circuit Court in the Albright case (173 F. 2d 339)." The conferees had eliminated the proposed amendment because they did not want to amend section 117 (j) with regard to cattle to the exclusion of other livestock and, accordingly, felt that the matter on an over-all broad basis was deserving of further study.

Since then, the Treasury Department has come out with a new position set forth in Mim. 6660 (June 27, 1951), but in this ruling the Commissioner still has not gone as far as some of the court decisions.

Obviously, and especially in view of what happened last year, the intent behind section 306 of the pending revenue bill is to afford taxpayers certain benefits and to make sure that they receive them, notwithstanding what the position of the Commissioner may be.

However, we would like to point out to you that the language in the bill lacks clarity and could very well result in considerable litigation which would be costly to taxpayers, as well as the Government, and which might very well defeat the intent of this new legislative provision. While the language to be added to section 117 (j) refers to livestock "held by the taxpayer" for 12 months or more, there is no way of determining when such holding period begins. The report of the House committee accompanying this bill (H. Rept. No. 586, 82d Cong., 1st sess.) sheds no light on this at all. It states:

> Your committee believes that the term "livestock" in this new sentence should be given a broad, rather than a narrow, interpretation; and that the gains from sales of livestock should be computed in accordance with the method of livestock accounting used by the taxpayer and presently recognized by the Bureau of Internal Revenue.

To give you a specific example, let us refer to a bull which is owned by the owner of a dairy herd. The bull cannot be used for breeding until it is from 10 to 12 months old. When does a taxpayer begin to hold such an animal for breeding purposes? Once the bull calf is born in the taxpayer's herd the taxpayer begins holding it for breeding purposes.

The same is true with regard to a heifer calf. It would not be bred until about 18 months of age and would first drop a calf about 9 months thereafter. Yet, once the heifer is born in the taxpayer's herd, with the taxpayer not selling it but holding it in the herd, with the attendant expenses, taxpayer is holding such animal for dairy or breeding purposes.

By the same token, once a taxpayer obtains title to a bull or heifer that date should start his 12 months holding period.

In order to avoid confusion and considerable costly litigation in the future, and in keeping with the apparent intent behind this provision, it is requested that your honorable committee modify this language so as to make it crystal clear when the holding period begins.

Knowing how busy your committee is, with numerous witnesses requesting permission to appear before it, we are attempting to cooperate with you and are confining our request to the form of this letter. We trust you will be good enough to see to it that it receives the attention of yourself and your honorable committee. If you or your committee so desire, we would be glad to personally appear before it to discuss this particular subject at greater length.

Thanking you for your consideration.

Respectfully,

THE AMERICAN GUERNSEY CATTLE CLUB,
KARL B. MUSSER, *Secretary.*

(At 12:40 p. m. the committee recessed to reconvene at 10 a. m. Monday, July 30, 1951.)

REVENUE ACT OF 1951

MONDAY, JULY 30, 1951

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
Washington, D. C.

The committee met, pursuant to recess, at 10 a. m. in room 312 Senate Office Building, Senator Harry F. Byrd presiding.

Present: Senators Byrd, Kerr, Frear, Taft, Martin, and Williams.

Also present: Elizabeth B. Springer, chief clerk; Colin F. Stam, chief of staff, Joint Committee on Internal Revenue Taxation.

Senator BYRD. Let the meeting come to order.

In lieu of appearance there will be inserted in the record a letter from John W. Hardy, of the Virginia Alcoholic Beverage Control Board, Richmond, Va., and the statement of Karl F. Feller, president, International Union of United Brewery, Flour, Cereal, Soft Drink, and Distillery Workers of America, CIO.

(The material referred to follows:)

COMMONWEALTH OF VIRGINIA,
VIRGINIA ALCOHOLIC BEVERAGE CONTROL BOARD,
Richmond, Va., July 25, 1951.

Hon. HARRY F. BYRD,
Congress of the United States, Senate Building, Washington, D. C.

DEAR SENATOR: As president of the National Alcoholic Beverage Control Association and vice chairman of the Virginia Alcoholic Beverage Control Board, I am enclosing a copy of a resolution which was adopted at the annual meeting of the National Alcoholic Beverage Control Association held in New York City on October 4, 1950, which resolution was reiterated at a midyear meeting of the association held at White Sulphur Springs, W. Va., on May 2, 1951, relative to the matter of excise taxes on alcoholic beverages. This association is composed of 16 member States who have alcoholic beverage control laws similar to the laws of the State of Virginia. The members of the Virginia Board have had the privilege of meeting once or twice a year with the commissioners and administrators of the other commissions who are members of this association for the purpose of improving the administration and enforcement of laws pertaining to the sale of alcoholic beverages. I wish to say that these are earnest, honest, honorable men devoting their talents in a conscientious manner in an attempt to control the distribution of alcoholic beverages and to eliminate, as far as practical, illegal manufacture and traffic of such beverages. The members of this association, including the Virginia board, are opposed to any increase in Federal excise taxes on alcoholic beverages as expressed in the enclosed resolution.

We feel the Federal Government will make a grave error if any additional taxes are imposed on any alcoholic beverages. In our opinion any increase in taxes will contribute to an alarming increase in illegal manufacture and traffic in alcoholic beverages with a resultant increase in other types of crime. We believe that it would be necessary for the various States and the Alcohol Tax Unit to substantially increase their personnel at great expense to both the Federal and State Governments in an attempt to control illegal manufacture and traffic and there is great doubt in our minds that even with increased personnel, the illegal manufacture and traffic can be controlled satisfactorily.

We cannot agree with the philosophy of those who believe the illegal manufacture and traffic of alcoholic beverages which would be caused by additional Federal excise taxes would not create a serious crime problem for the enforcement agencies of the Federal and State governments.

We respectfully request your serious consideration of this matter, and we hope it will be your pleasure to vote and use your influence as a member of the Senate Finance Committee against the present proposed increase in excise taxes on alcoholic beverages.

We respectfully request that at the meeting of the Senate Finance Committee to be held in Washington next Monday you present this communication and the enclosed resolution and request that it be made a part of the record of the hearing to be conducted at that time relative to the matter of excise taxes on alcoholic beverages.

With kind personal regards,

Sincerely yours,

JOHN W. HARDY.

RESOLUTION

Whereas the present Federal excise tax rate on alcoholic beverages already bears two war tax increases, the first assessed under the Revenue Act of 1942 and the second assessed under the Revenue Act of 1948;

And whereas there has been an alarming increase in the illicit production of distilled spirits as reflected by the still-seizures statistics released by the Alcohol Tax Unit of the Treasury Department of the United States and which indicates that such illicit production continues to increase;

And whereas it is the opinion of the National Alcoholic Beverage Control Association that excessive excise taxes on distilled spirits are a major contributing factor to such illicit production:

And whereas such excessive taxes and consequent illicit production have a direct and an adverse influence on the revenue of the member States of this association, first by diverting the revenues which would normally accrue to the said member States from the sale of legal tax-paid distilled spirits, and secondly by adding to the enforcement costs consequent upon the illicit traffic in distilled spirits within the borders of the said member States: Now, therefore, be it

Resolved, That the National Alcoholic Beverage Control Association urges that there should be no further increase in the excise tax rates on alcoholic beverages; and it is further

Resolved, That the executive secretary of this association send a copy of this resolution to all of the members of the Ways and Means Committee of the House of Representatives and to all of the members of the Finance Committee of the Senate.

STATEMENT OF KARL F. FELLER, PRESIDENT, INTERNATIONAL UNION OF UNITED BREWERY, FLOUR, CEREAL, SOFT DRINK, AND DISTILLERY WORKERS OF AMERICA, CIO.

My name is Karl F. Feller and I reside at 3106 Manning Avenue, Cincinnati, Ohio. I am president of the International Union of United Brewery, Flour, Cereal, Soft Drink, and Distillery Workers of America affiliated with the Congress of Industrial Organizations. For the sake of brevity I will refer to it as the Brewery Workers Union.

The Brewery Workers Union, whose headquarters are at Cincinnati, Ohio, represents the overwhelming majority of the employees in the brewing industry in this country and a very substantial segment of the employees in the distilling industry. It also represents, among others, the employees in the yeast, malt, and other industries which are related to the alcoholic-beverage industries. It is on behalf of the approximate 75,000 employees whom we represent in these industries that I appear before you today to oppose the proposed increases in the excise taxes on beer and distilled spirits, H. R. 4473.

Since its foundation in 1886, the organization which I am proud to represent has dedicated itself to improving the living standards and working conditions of its members and of the workers of this country in general. As one of the pioneers of the American labor movement, the Brewery Workers Union has its roots deep in the American democratic tradition. Political and economic democracy are objectives for which our union has fought in the past and to which we have dedicated ourselves for the future. I mention these things to emphasize the statement that we recognize fully the seriousness of the present crisis on both the domestic and international fronts. We recognize the danger of totalitarianism to our democratic institutions and we also recognize the need for the raising of additional revenue to put a brake on the inflationary spiral and to defray the tremendous cost of our armaments program.

However, from the standpoint of the welfare of our members and the general welfare as well, the proposed increases in the excise taxes on alcoholic beverages are unfair, ill-advised, and shortsighted. It is questionable whether they will yield substantial additional revenues. On the other hand there seems little doubt that such tax levies will bring evils in their train which will far outweigh any additional revenues which they may produce.

It is well known that taxation of alcoholic beverages has often been used for the dual purpose of raising revenue and controlling consumption. The latter approach is, of course, the backdoor approach to national prohibition. I assume that the proposed levies are intended to produce additional revenue and are not being considered as a prohibition measure. I assume that this committee and this Congress are too well aware of the social catastrophe which is called the noble experiment to even contemplate its restoration. At the same time, it is only fair to point out that the fanatical forces of prohibition, which are ceaselessly active in our National and State capitals, view any increase in alcoholic-beverage taxes as a step toward prohibition. They realize the truth of the statement that "the power to tax is the power to destroy." Those who would destroy the alcoholic-beverage industry will enthusiastically support any proposal which will place a crippling burden upon the already overtaxed beer and liquor industries. We submit that this committee in its deliberations should disregard completely any control or prohibition arguments or consideratons. This committee and this Congress have no mandate to reintroduce national prohibition. They are concerned only with a revenue measure, intended solely to increase our Goverment's income in time of serious national emergency. It is from that standpoint alone that I propose to discuss these proposed taxes (H. R. 4473).

At the very outset the attention of the committee is called to the fact that the wartime excise taxes on alcoholic beverages which were imposed during World War II are still in effect although they were intended to be only for the duration of the emergency. It is now proposed that a further wartime tax be superimposed on the existing one. I suggest to the committee that this process is similar to the imposition of an additional excess-profits tax on corporations on top of those which were imposed during World War II. Such a proposal would be denounced as obviously unfair and confiscatory. It does not become any fairer because this proposal is leveled solely at alcoholic beverages. It is still a case of one emergency wartime tax on top of another.

We protest, in particular, any additional tax on beer. To place this additional burden on an already overburdened beverage may well place it beyond the reach of the public and destroy the industry. It is commonly said that beer is the workingman's drink, and this is largely true. But the size of the beer glass has been shrinking in recent years and its price has been rising. The tax burden on beer is fantastically heavy. Starting with a Federal tax of $5 per barrel in the postprohibition period, the impost was raised until it reached its present rate of $8 per barrel in 1944. But this is only the beginning. Every State and the District of Columbia levy a tax on the manufacture or sale of beer. On December 1, 1950, these State taxes ranged from 62 cents per barrel in California to $14.40 in South Carolina. State taxes average more than $2 per barrel. In addition, there are other local taxes, Federal and State license and permit fees for breweries, wholesalers, and retailers. All of these are, of course, in addition to such general taxes as Federal and State corporation income taxes and other taxes of general application. In many States proposals are now under consideration for increasing State taxes on beer. The theory seems to be that there is no limit to the tax burden that can be placed on beer. We submit that the saturation point is here and that the time has come to call a halt. We are not dealing with a luxury item. Beer is a beverage for the masses, not to be treated in the same manner as expensive jewelry or expensive furs or perfumes. It is a beverage that the American worker has the right to enjoy. It must not be placed outside his reach through excessive taxation.

There is evidence that we have reached the point of diminishing returns in regard to beer taxes. The combination of Federal and State taxes seems to be reducing beer consumption. Thus, since 1947 there has been a steady and substantial decline in Federal revenue from taxes on beer as shown by the following table compiled from reports of the Bureau of Internal Revenue:

1947	$702,988,868
1948	685,170,475
1949	674,010,638
1950	662,004,017

It is plain that in a period of economic prosperity and increased consumer income the Federal tax yield from beer has been declining. This picture is not one which justifies an increased tax burden on beer. The increased tax under consideration may very well result in less revenue.

It is commonly stated, and I sincerely believe, that this increased tax will drive scores of small breweries out of business and hasten the pronounced trend in the industry toward concentration and monopoly. The small breweries in this country were looking forward to a reduction in the excise tax on beer last year, with anticipation and hope. Not only has that hope been crushed, but it is now proposed to lay an even greater burden upon them. Many will not survive it.

We submit that any tax program which has such undesirable consequences should be scrutinized very closely. It places an unfair and excessive burden upon a staple, workingman's beverage; it places an unfair and excessive burden upon one American industry; it will lower consumption, produce reduced revenues, and aid in the destruction of small business. There is a point beyond which beer cannot be taxed and that point has been reached. An industry which is now one of our greatest revenue-producers may well be placed in jeopardy by such a tax program.

We turn now to the proposed increased taxes on distilled spirits. Some of the things which I have said about beer taxes are applicable to distilled spirits as well, especially the matter of pyramiding one emergency wartime excise tax on another. However, we ask you to consider what seems to us to be the most serious problem in this connection, namely, the probability of the return of many of the worst evils of the prohibition era in the event that these added taxes are imposed. We could spend a great deal of time arguing and debating statistics. This would serve no useful purpose, because the problem may be posed in very simple, common-sense terms. H. R. 4473 proposes to increase the tax on distilled spirits from $9 to $10.50 per proof gallon. On top of this $10.50 per proof gallon tax we have the multiplicity of State taxes which averaged about $1.48 per tax gallon in 1949, plus Federal, State, and local taxes and license and permit fees. There is a strong trend among State and local governments to increase existing taxes on alcoholic beverages. There is a stern warning in these facts which may be stated in the following terms: When taxes force retail prices above a certain level the bootlegging of alcohol on which no tax has been paid becomes attractive to lawless elements. Let us not delude ourselves. As soon as even a slight tax is imposed there is an incentive to evade the tax. The higher the tax, the greater the incentive.. The existing $9 tax plus the numerous State and local taxes already provide a tremendous incentive for lawbreaking. Increase that tax by $1.50 and you are inviting moonshining, bootlegging, and organized crime on a national scale.

It is estimated by the Licensed Beverage Industries, Inc., based on data of the Alcohol Tax Unit, Treasury Department and reports of the various states, that in 1949: 8,008 stills were seized by Federal agents and 10,876 by State and local authorities, for a total of 18,884 seizures. It is also estimated by the same source that these stills had a daily capacity of over a half-million gallons, or more than 100,000 gallons per day above the average daily production of the legally licensed distillers. These figures are impressive, but they do not tell the worst of our fears of what may happen if this additional tax should be placed on distilled spirits. We solemnly warn that taxes at that level will surely herald the return of the mobster, the racketeer, and the hijacker to our national scene; of the bootlegger and the speakeasy; with all their attendant evils. It would be an invitation to organized crime on a national scale.

We submit that these proposed increases of the taxes on beer and distilled spirits should be rejected. The existing wartime emergency taxes on these products are high enough. We commend to this committee the tax program recommended by the Congress of Industrial Organizations, which will yield adequate revenue to the Government and place the burden upon those elements in our economy which are best able to pay it. Let us not impose taxes which may well undermine the brewing industry, place the worker's beverage beyond his reach or encourage large scale violations of the law and organized crime, taxes which are so high as to make it likely that they will produce no additional substantial revenue. It is probable that a very large part of any additional revenue that these taxes might yield would be expended for law enforcement in a futile attempt to cope with the lawlessness which excessively high excise taxes invite.

Senator BYRD. In lieu of appearance there will be inserted in the record a statement from Mr. Frank Ludwick, counsel for the Bottle Fermented Champagne Producers, Inc.

(The letter referred to follows:)

BOTTLE FERMENTED CHAMPAGNE PRODUCERS, INC.,
Washington, D. C., July 25, 1951.

SENATE FINANCE COMMITTEE,
United States Senate,
Washington, D. C.

GENTLEMEN: The Bottle Fermented Champagne Producers, Inc., a trade association composed of producers of fermented-in-the-bottle champagne in the United States, is a signatory of the brief filed with your honorable committee by the Wine Conference of America representing the wine industry as a whole.

Since we know of no commodity so discriminated against taxwise as champagne we desire to file this supplemental brief with a prayer for an equitable adjustment of the excise tax on champagne.

Champagne is simply a light table wine which has undergone a second fermentation which does not change the alcoholic content from that of the original light table wine but which produces a carbon dioxide gas causing the wine to sparkle and effervesce when opened.

It is a recognized fact that the American public prefers carbonated drinks whether they be nonalcoholic or moderately alcoholic.

The only possible reason for the excessive and discriminatory tax on champagne is that it has erroneously been considered to be a luxury item. The only reason it may be so considered is because of the excessive tax. The tax proposed on table wine of the same alcoholic content as champagne in H. R. 4473, now being considered by your honorable committee, amounts to 17 cents per gallon as compared with what amounts to a tax of $3.40 per gallon on champagne.

Mr. Frank Schoonmaker, a wine importer and an author of books on wines, appearing before the Committee on Agriculture of the House of Representatives in the Eighty-first Congress, on this subject said:

"All of us in America are aware that our eating and drinking habits are not those of European countries. America's club, so to speak, is the soda fountain, not the cafe. Coca-Cola has acquired a popularity which even seems to frighten some of our good friends in France. We have ginger-ale and seven-up, sarsaparilla, and beer. Some of these drinks are sweet, and some are not, and they have all sorts of different flavors.

"What do they have in common?

"One thing, gentlemen, they are carbonated. Apparently Americans like bubbles. Americans get bubbles every time they open a bottle of a soft drink. They get bubbles every day across the soda fountain. If you ask for a glass of beer in England, you get a brew that has no sparkle at all, but you could not sell that kind of beer in the United States. We like bubbles; we like drinks that sparkle. Ordinarily this innocent liking for sparkling beverages does not involve us in taxation. The bubble, like air, is free. Congress does not tax ice-cream sodas because they are carbonated, or Coca-Cola because it sparkles, but what a man pays in the way of Federal taxes on a whisky and soda is no higher than the tax that he pays on a whisky and water. Why, then, do we have a major discrimination against sparkling wine? The other products that I have mentioned, excellent as they may be, are not farm products. Why deny to the farmer, the grape farmer, the wine producer, a right to put a few bubbles in the wine he makes? Our national laws, since the repeal of prohibition, tax alcohol, not bubbles. Do you not think that we might stop discriminating against the only alcoholic beverage which is a farm product, and give the farmer a chance to put untaxed bubbles, a sparkle without a tax, in his wine to make it more salable and more acceptable to the general public?

"Champagne the world over gets a lot of publicity. And actually the very word 'Champagne' has somehow become synonymous with luxury and high living. But let us not forget that not so many years ago, tea and coffee and oranges and lemons were also products restricted to the very wealthy. Today they are on practically every table in the United States. They would not be if they had been prohibitively taxed.

"American sparkling wine, or champagne if you prefer to call it that, can too, take its honorable place on America's dinner table, particularly America's festive dinner table. The American sparkling wine industry is in its infancy. It is hardly even in its infancy—it scarcely exists. I venture to say that 90 percent of Americans have never tasted sparkling wine. Those that have seem to like it, but in 1949 we consumed just about one tablespoon of sparkling wine per capita.

"Through an altogether excessive and unreasonable tax on sparkling wine, and in order to produce less that $5,000,000 in internal revenue taxes, the Government has effectively prevented the expansion of what is potentially a major industry—an agricultural industry—which could, if properly and fairly taxed, yield many times $5,000,000. All of the sparkling wine now consumed in America can be produced by something like 20,000 acres of vines, and I can personally assure you that the farmers that grow and cultivate these vines are not having any too easy a time, and are not very happy. I suggest that if you give them a break as far as Federal taxes are concerned within 3 or 4 or 5 years you may well see a million or two million acres under similar vines, and the farmers doing very well indeed.

* * * * * * *

"Third, I believe that a certain amount of careful study will convince you, gentlemen, that a reduction of the tax on sparkling wine will produce more revenue rather than less revenue, and, at the same time, make a major contribution to the prosperity of American agriculture."

Consumption of champagne in France in 1950 amounted to an average of a half bottle per person or one-tenth of a gallon. The consumption of all sparkling wines in the United States in 1950 amounted to about one one-hundredth of a gallon per person (this includes United States and foreign produced champagne). On the basis of population in the United States if each person consumed one-half bottle of champagne as they did in France in 1950 sales would have amounted to about 6,050,000 cases per year as compared with 714,000 cases. Even allowing for the difference in the customs of the two countries it must be admitted that the tax element is important. The United States taxes champagne at the present time $3 per gallon as compared with the French tax of 8 cents per gallon.

As a result of the last discussion of import duties at the Torquay, England, tariff conference the duty on champagne valued under $6 per gallon was reduced from $3 per gallon to $1.50 per gallon as had been previously done for champagne valued over $6 per gallon.

The attached table shows that United States champagne is not keeping pace with the growth of sales of all classes of United States produced wine. On the other hand, French champagne sales have increased in proportion to all foreign wine sales apparently at the expense of United States champagne producers. Many United States champagne producers have already been forced out of business as will most of those remaining unless the tax is reduced sufficiently to permit an increased consumption of the product.

In addition to the exorbitant excise tax on champagne the method of levying the tax is likewise unscientific and unfair. Extended research has failed to determine why the half-pint unit was selected as the taxable unit for champagne as opposed to the 1-gallon unit for most other alcoholic beverages. Whatever reason, if any, which may have existed for its justification at the time of its adoption the reason no longer exists. Champagne is universally packaged in one-fifth gallon bottles or fractions thereof and the tax therefore could readily be determined on a gallonage basis. Levying on a half-pint unit basis it results in a tax in excess of what the Congress evidently intended by reason of the fact that the half-pint units cannot be adjusted to the traditional champagne package, impossible to change in the face of French champagne competition. So the present tax of 15 cents per half-pint unit reduced to a gallonage basis theoretically amounts to $2.40 whereas actually it amounts to $3. Sixty cents is therefore paid on champagne that simply does not exist. We submit this is unscientific, unfair, and discriminatory.

Because of the ad valorem of champagne compared with table wines, resulting from the increased cost of the second fermentation, a higher tax should probably be imposed upon champagne. It should be somewhere in the neighborhood of that imposed upon dessert wine (67 cents per gallon) by the proposed legislation. At most it should certainly not exceed the present theoretical tax of $2.40 and the tax should be imposed on the same honest taxable unit applicable to other wines and distilled spirits.

Respectfully submitted.

BOTTLE FERMENTED CHAMPAGNE PRODUCERS, INC.,

Senator BYRD. In lieu of appearance there will be inserted in the record a statement from Mr. Jacob Rock on behalf of the Beauty and Barber All-Industry Legislative Council.

(The document referred to follows:)

STATEMENT OF JACOB ROCK ON BEHALF OF BEAUTY AND BARBER ALL-INDUSTRY LEGISLATIVE COUNCIL

My name is Jacob Rock. I am the Washington representative of the Beauty and Barber All-Industry Legislative Council, a group consisting of officials of organizations representing all segments of the beauty and barber industry—shopowners, supply wholesalers, and manufacturers.

The beauty and barber industry supports section 432 (b) of H. R. 4473 the Revenue Act of 1951, amending the provisions of section 2402 (b) of the Internal Revenue Code, and urges the Committee on Finance to retain it in the tax legislation to be reported to the Senate.

Section 432 (b) of H. R. 4473 provides beauty and barber shops with the relief they so desperately need from the burdensome procedural provision resulting from the Federal retailers' excise tax on bulk toilet preparations used by beauty and barber shops in rendering services.

Beauty and barber shops want to pay their just share of the increased taxes needed to support mobilization. However, they join other industries, affected by excise tax hardships, in stating that if excise taxes must remain on the statute books for an indefinite time, then it is imperative that the glaring inequities and unreasonable hardships created by these taxes be adjusted by Congress now. We feel that the necessity for raising additional revenue must not be used as an excuse for not levying excise taxes equitably and fairly especially since excise taxation now appears to be a permanent fixture in our tax structure.

The Committee on Ways and Means which has carefully considered excise-tax inequities and hardships on three occasions in the past 5 years recognized the injury occasioned to the beauty and barber industry by the discriminatory, burdensome procedure which must be followed in connection with the tax on bulk cosmetics used in rendering services when it incorporated section 432 (b) in the Revenue Act of 1951. Hon. Robert L. Doughton, chairman of the Committee on Ways and Means, made this statement on the floor of the House of Representatives regarding the provision granting relief to beauty and barber shops from the tax on bulk cosmetics used in rendering services:

"This bill was carefully considered and unanimously reported out by the Committee on Ways and Means. After full consideration, it was decided that it is a meritorious bill."

Most of the members of the Committee on Finance are familiar with the facts of the hardship imposed on the beauty and barber industry by procedural provisions of the tax on bulk cosmetics used in rendering services. A statement was filed with your committee on this subject in July 1950 during the consideration by it of the 1950 tax bill. Moreover, a complete statement on the hardship suffered by the beauty and barber industry as a result of the tax on bulk cosmetics is set forth in the report of the hearings before the Committee on Ways and Means on revenue revision of 1951, in part 3, at pages 2529 to 2533. Accordingly, and in order to conserve your valuable time, I will summarize, instead of fully developing at this point, the reasons why the beauty- and barber-shop industry should be accorded relief, as provided in section 432 (b) of H. R. 4473, the Revenue Act of 1951, from the procedural provisions of the retailers' excise tax on bulk cosmetics used in rendering services:

1. This retailers' excise tax is harmful to beauty and barber shops since it places an undue burden on such shops selling cosmetics by requiring them to furnish each supply dealer with a frightening certificate of purchase for resale and has caused many shops to refrain from selling cosmetics thereby causing them to lose income they normally would derive from such sales. This requirement is not imposed on other retailers of cosmetics.

2. This tax represents the taxing of business-cost items and adds to the operating costs of beauty and barber shops. The major portion of shop revenue is derived from rendering services, and cosmetics are part of the operator's tools. This tax is a levy on the tools of persons earning a living with their hands.

3. If section 432(b) of H.R. 4473, the Revenue Act of 1951 is enacted, there will be no apparent loss of revenue to the Government. It is estimated that about $3 million is collected annually as a result of this tax. The apparent loss of this small amount would be more than offset by the increased tax yield from retail sales by beauty and barber shops in a broadened retail market. Moreover, an increased income-tax yield would also follow reduced business costs and enlarged volume of sales at retail by beauty and barber shops.

4. This tax is difficult to administer since some beauty and barber shops are both users and resellers of cosmetics. A realistic enforcement of the law would cost the Government an amount entirely out of proportion to the small amount of revenue it receives from the tax on professionally used cosmetics.

5. The procedural requirements for the certificate of purchase for resale imposed by the Bureau in connection with this tax, place beauty and barber shops at a competitive disadvantage with other retailers of cosmetics since it requires such shops to pay the 20-percent tax to the wholesaler if the certificate is not furnished whereas other retailers of cosmetics are not required to furnish their wholesaler with such certificates or pay the tax in lieu thereof.

6. This tax places an undue burden on small beauty and barber shops since the Bureau regulations require considerable, complicated record-keeping which requires the expenditure of time and energy by small-shop owners and frequently adds to their expense due to the necessity for employing accountants or attorneys.

I wish to emphasize that section 432 (b) of H. R. 4473, the Revenue Act of 1951, does not exempt retail sales of toilet preparations or cosmetics by beauty and barber shops. The resale of cosmetics at retail by beauty and barber shops will continue to be taxable, as under present law, under the provisions of section 432 (b) of the proposed Revenue Act of 1951 and we are in complete agreement with that provision.

Reference is made to House Report No. 586 of the Committee on Ways and Means accompanying H. R. 4473, the Revenue Act of 1951, particularly the following portion (p. 51) giving its reasons for affording beauty and barber shops relief from the provisions of the excise tax on bulk cosmetics intended for use in rendering services:

"The second change exempts toilet preparations purchased by barber shops and beauty parlors for use in these establishments. Under present law these items are subject to tax at the time they are purchased by a barber shop or beauty parlor. However, toilet preparations purchased by a barber shop or beauty parlor for resale to customers are not taxable until sold to the ultimate user. To distinguish from the purchases for resale made by the barber shop or beauty parlor from the purchases for their own use, the establishment is required to file a certificate if no tax is paid at the time of purchase indicating that the items will not be used in the establishment. Such certificates are not presently required in the case of tax-paid purchases for use in the establishment. This difference in treatment has resulted in considerable confusion among the barber shop and beauty parlor operators. Moreover, the taxing of the items used in the establishment itself represents the taxing of business cost items. The bill eliminates these problems by repealing the tax on toilet preparations purchased by barber shops, beauty parlors, and similar establishments if intended for use in such establishments."

We desire to amplify, for the benefit of new members of the committee, some of the above reasons why the tax relief requested should be granted. Beauty and barber shops are treated differently from other retailers of cosmetics under existing law and regulations due to the fact that such shops are normally both consumers and retailers of cosmetics. This discriminatory treatment has caused many shops to refrain from retailing cosmetics, thereby causing them to lose income they would normally derive from such retail sales. Section 2402 (a) of the Internal Revenue Code imposes a 20-percent tax on all retail sales of cosmetics to consumers. Under Buerau regulations, department stores, drug stores, etc., selling cosmetics to the public are required to collect the tax, keep records, report and pay the taxes collected to the Government monthly—and nothing more. All this is also required of a beauty or barber shop selling cosmetics plus something else which is not required of other retailers. When a beauty shop sells cosmetics, the Bureau regulations require the beauty-shop owner to sign and deliver a certificate of purchase for resale to each wholesaler from whom she buys cosmetics intended for resale or else pay the 20-percent excise tax. No other retailer of cosmetics is required to furnishe the wholesaler with a certificate and no other retailer is required to pay to the wholesaler the 20-percent tax if such certificate is not furnished.

The Bureau's reason for requiring the beauty- or barber-shop owner to either furnish a certificate to the wholesaler or pay the tax when buying cosmetics for resale arises from the fact that the 1942 Revenue Act makes a distinction between sales of cosmetics to beauty or barber shops for use in their operation and sales to such shops for resale. A sale of cosmetics for use in a beauty or barber shop is considered in section 2402 (b) as a retail sale and the beauty-shop owner when making purchases of cosmetics for us must pay the wholesaler the 20-percent tax. On the other hand, the 1942 act considers a sale by the wholesaler to the beauty shop of cosmetics purchased for resale as a wholesale transaction and not as a taxable retail sale unless the shop subsequently uses the cosmetics and then what was originally a wholesale transaction becomes a taxabe retail sale. Although a shop pays no tax when purchasing cosmetics for resale it does collect and pay a tax when it sells the goods.

The Internal Revenue Bureau ruled that the 1942 act amended section 2402 (b) so as to continue to tax those sales of cosmetics to beauty or barber shops which are for use in their operation but to exempt from the tax cosmetics sold to such shops for resale by wholesalers. The Bureau held that the question of whether a cosmetic is sold to a shop for use or resale is dependent upon the intent of the beauty-shop owner making the purchase. Thus, the Bureau ruled that Congress, through the 1942 amendment created a tax exemption on cosmetics sold to beauty or barber shops for resale but held that the shop owner buying the cosmetics for resale must express, in a certificate of purchase for resale, that the cosmetics are purchased for resale in order to be exempt from the payment of the tax to the wholesaler supplier and that she will be liable for the 20 percent tax if resold or used.

I have tried to briefly explain the complicated provisions of the law and regulations dealing with the tax on cosmetics as it affects beauty and barber shops. The regulation contains further provisions requiring wholesaler suppliers and beauty- or barber-shop owners who resell cosmetics to keep and maintain complicated records. However, I would only confuse efforts to understand this complicated situation by endeavoring to explain such requirements.

I call to the attention of the new members of the committee that the beauty and barber industry, while large in numbers, is composed of many small, individually owned shops manned, in many cases, by only one person. Consider the plight of the small shop owner confronted with signing the frightening certificate of purchase for resale provided for by the regulation of the Internal Revenue Bureau. Not possessing legal talents, is it any wonder that many beauty- and barber-shop owners threw up their hands when they were confronted with the necessity of signing the frightening certificates and maintaining the records required by the Bureau's regulation and decided not to sell toiletries and cosmetics if it meant signing the certificate?

Because of the expert knowledge of the sciences of cosmetology and barbering and care of the hair and skin possessed by beauty- and barber-shop operators they are better equipped than the usual retail clerk in guiding customers in the use of toilet preparations and cosmetics, and beauty and barber shops should be the normal and natural outlets for sales of these items. However, campaigns by the industry's associations and trade publications to stimulate and increase retail selling by beauty and barber shops have been ineffective due to the resistance of shopowners to signing the frightening certificates of purchase for resale and the record-keeping requirements of the tax law. As a result, we have found there has been a decline in the number of shops retailing cosmetics. Recent Census Bureau figures show that of the 74,407 beauty shops reporting, 3,405, or less than 5 percent, stated that they sold toiletries and cosmetics at retail—and this showing for an establishment which is the natural and logical outlet for cosmetics distribution to the public.

Shops who have refrained from selling toiletries and cosmetics as a result of the harsh procedural requirements of the tax law have lost vitally needed income they would normally derive from such sales which they need to supplement their income from the services they render. A recent Census Bureau report states there are 8,574 fewer beauty shops and 26,005 fewer barber shops now than there were in 1939. Instead of growing the industry has shrunk in numbers of establishments. This can be traced to the procedural requirements of the present tax law. During a period of recession, there is a considerable falling off in the revenue shops receive from rendering services. Industry leaders realize that shops need the additional revenue they can obtain from retail sales to supplement their incomes from services if they are to survive.

The future economic health of beauty and barber shops depends on their ability to supplement their income from services with revenue from retail sales of cosmetics. Unless the industry is granted the tax relief provided for in section 482 (b) of H. R. 4473, the revenue Act of 1951, the deterrent to retail selling by shops will remain as long as shops are required to sign the obnoxious certificates and the industry will continue to be stunted in its growth.

Industry representatives have made tireless but futile efforts to have the Treasury Department eliminate the harsh certificate of purchase for resale through administrative action. They were told, in effect, that only congressional approval of legislation of the type provided for in section 482 (b) of the proposed Revenue Act of 1951 will eliminate the burdensome procedure imposed on beauty and barber shops.

We respectfully urge the Committee on Finance to grant beauty and barber shops the relief provided in section 482 (b) of H. R. 4473 from the harmful and burdensome procedure resulting from the tax on bulk cosmetics used in rendering services by maintaining in its proposed 1951 tax bill section 482 (b) of the Revenue Act of 1951. We repeat that our industry wants to pay its just share of the increased taxes needed to support the mobilization effort. However, we feel that the necessity of raising additional taxes must not be used as an excuse for continuing harsh and discriminatory excise taxes in a permanent tax structure.

Senator BYRD. In lieu of an appearance there will be inserted into the record at this point a statement from the National Sporting Goods Association by Mr. E. R. Vandervoort of Lansing, Mich.

(The document referred to follows:)

NATIONAL SPORTING GOODS ASSOCIATION,
Chicago, Ill., July 26, 1951.

Hon. WALTER F. GEORGE,
Chairman, Senate Finance Committee,
Senate Office Building, Washington, D. C.

DEAR SENATOR: The National Sporting Good Association, on behalf of its dealer members, appreciates this opportunity to present its views on the excise tax bill to your committee. Because of the time limitation on testimony, we would very much appreciate your placing this letter in the record of your committee hearings.

In March representatives of this association testified before the House Ways and Means Committee during their hearings on the excise tax bill.

We respectfully urged at that time that the excise tax on athletic equipment be removed, since the majority of these items are used by schools, which are are not subject to the tax as political subdivisions.

In our testimony, we pointed out that athletic equipment purchased by schools was subject to exemption, and that the effort involved in processing tax-exemption certificates placed a heavy, expensive burden on sporting-goods dealers throughout the country, and that the Government realized little or no revenue from this tax.

The complete removal of the 10-percent excise tax on such articles as golf clubs, golf balls, golf bags, tennis and badminton equipment, fishing tackle, guns and ammunition, and so forth was not requested by the National Sporting Goods Association in its testimony before the House committee, since the need of the Federal Government for additional revenue in the face of increasing budgets is realized.

As passed last month by the House of Representatives, H. R. 4473, section 488, repeals the excise tax on certain sporting goods, and increases from 10 to 15 percent the tax rate on other items.

We respectfully request that your committee recommend the removal of the excise tax on sporting goods and athletic equipment primarily used by schools and children.

However, H. R. 4473 failed to carry provisions for the removal of the excise tax on baseball equipment. Since this type of equipment is used mainly by schools, colleges, and youngsters throughout the Nation, the National Sporting Goods Association, speaking for sporting-goods dealers in the United States, requests that your committee favorably consider the removal of the excise tax on baseball equipment.

In pressing our request for the removal of excise taxes on certain articles of athletic equipment predominantly used for school sports and other articles predominantly used by children, we would like to present our reasons for this request.

Public schools and all tax-supported bodies can, under terms of the present law, claim exemption of the excise tax on athletic equipment. The National Sporting Goods Association has received a number of complaints from private and parochial schools in regard to the discriminatory nature of this provision of the law. Teams from private and parochial schools compete daily in athletic contests with public schools. They use the same equipment for the same purpose, yet one school is able to purchase the articles tax-free, while the other school must pay the excise tax.

The burden on sporting-goods dealers of executing tax-exemption certificates as required by the law on purchases by not only the Nation's 29,000 public high schools and 170,000 public grade schools, but also by boards of education, and city, park, and recreational departments, is oppressive.

Since the majority of these orders are for small quantities, the clerical expense incurred in the proper preparation of these exemption certificates is frequently larger than the amount of the allowed tax exemption.

The many small retailers in our association certainly cannot afford to absorb the tax allowance, and each claim must be processed as it is filed.

The expense of processing these tax-exemption certificates produces in most cases a considerable reduction in net profit. This reduction in profit, in turn, reduces the amount of income tax paid to the Federal Government.

The amount of the additional clerical expense required to process these exemption certificates is the exact amount of the income reduction of the individual sporting-goods dealer which would be subject to Federal income taxes.

Surveys made in Indiana recently have indicated that the cost to the average dealer of processing tax-exemption certificates on athletic equipment used by schools and other tax-supported institutions ranges from $1,000 to $5,000 a year, based on his volume of business.

When you multiply this figure by the approximately 4,000 athletic equipment retailers in the United States, the total minimum cost every year for dealers to process these certificates is $1 million. In addition, the athletic equipment manufacturers must bear a similar expense in administering these certificates.

A large loss in Federal income tax thus results from this considerable loss in profit and increase in expenses on the part of both sporting-goods dealers and manufacturers.

The National Sporting Goods Association would like to take this opportunity of emphasizing that the foregoing all concerns a tax which furnishes very little revenue to the Federal Government, since the majority of the tax is subject to exemption.

We further would appreciate your considering favorably our urgent request that H. R. 4473, as passed last month by the House of Representatives, be amended to maintain the present excise-tax rate on the remaining sporting-goods items at 10 percent, rather than the suggested rate of 15 percent.

In testifying in 1950 and 1951 before the House Ways and Means Committee, the National Sporting Goods Association did not recommend the removal of the excise tax on golf, tennis, and badminton equipment, fishing tackle, and guns and ammunition.

Since we are a small industry, we do not feel that the excise tax on these items can fairly be raised to 15 percent unless a general excise tax of this percentage is levied on other products.

In summary, we respectfully request the committee to:

1. Amend section 483 of H. R. 4473 to eliminate the excise tax on baseballs and baseball equipment, since such equipment is predominantly used by youngsters and in the Nation's school system.

2. Allow the excise tax on articles other than athletic equipment, listed in section 3406 (a) (1), 1941 Revenue Act, to remain at the present rate of 10 percent, rather than raising the rate to 15 percent as proposed in the bill passed by the House of Representatives.

Respectfully submitted,

NATIONAL SPORTING GOODS ASSOCIATION,
By E. R. VAN DEUSEN, *President.*
By G. MARVIN SHUTT, *Secretary.*

Senator BYRD. In lieu of appearance there will be inserted into the record a statement on behalf of Butler Bros.

(The document referred to follows:)

MEMORANDUM OF THE EFFECT PRODUCED BY THE EXCESS PROFITS TAX ACT OF 1950 ON BUTLER BROS., AN ILLINOIS CORPORATION

The purpose of this memorandum is to show that Butler Bros. improved earnings in 1950 and prospects for improved earnings in 1951 and beyond, relative to earnings during the years 1946-49 and relative to capital employed, are due principally to internal factors of management rather than to stimulation by the national defense program; that the application of the excess-profits tax rates to such improved earnings is inequitable and unjust, and contrary to the spirit of the Excess Profits Tax Act of 1950, and contrary to the intent of Congress in enacting that act; and that Butler Bros. is therefore justly entitled to equitable relief from such excess-profits tax.

THE COMPANY AND EARLY HISTORY

Butler Bros. is a national distributor of merchandise at wholesale. Its principal business is to service the merchandise needs of small independent merchants throughout the country. This is done through five large distributing warehouses, strategically located in Baltimore, Chicago, Minneapolis, St. Louis, and Dallas. It also services independent floor-covering retailers through branches in these five cities and New York City, Philadelphia, and San Francisco.

The company was organized in 1877 and incorporated in 1887. It had a good record of growth and earnings until the twenties, when growth stopped and earnings receded.

In the early thirties the company launched a program of cooperative development with privately owned small retail stores. These stores were franchised as distributor stores, or then called voluntary chain stores, under the names Ben Franklin (variety stores) and Federated (junior department stores). For various reasons, largely internal to the company, this program gathered momentum but slowly in the thirties and was seriously impeded during the war years, as mentioned later.

At about the same time, the company founded its own chain of retail stores through its subsidiary, The Scott-Burr Stores Corp. This subsidiary operates 164 retail variety and department stores throughout the country. It is a separate taxpayer with different operating and tax problems, and for that reason further reference to it is omitted from this memorandum.

It was intended that the techniques of successful retail-store operation tested by the company in its own stores would form a foundation of permanence for the independent retail merchants serviced by the company.

During the thirties the company developed and maintained at substantial cost to itself a large field organization to assist the small independent merchants to operate their franchised stores competitively and at satisfactory profit to themselves. This was done to foster their own growth, and to help them meet successfully the chain store competition that was then making its principal growth.

Through this means it was expected that a lasting cooperative relationship between the company and its independent merchant customers would be evolved. The expectation was that this would bear fruit sometime in the future in more sales, better customer relations, reduced selling and operating costs, and finally, in improved profits.

MORE RECENT DEVELOPMENTS

The so-called war years 1941-46 were a period of improved prosperity for the company (relative to its earnings of the thirties), as shown in the following tabulation from its tax returns (after agent's adjustments, with 000 omitted):

[000 omitted]

Year	Net sales	Taxable income	Rate of return on total assets
			Percent
1938	$67,075	$494	1.66
1939	71,551	1,301	3.94
1940	72,664	767	2.31
1941	94,320	3,060	9.10
1942	105,181	4,471	11.21
1943	105,437	3,751	9.17
1944	98,070	3,578	8.07
1945	101,078	4,714	10.45
1946	139,453	5,552	11.60

These same years, 1941-46, had a negative effect on the company's franchised-store program. They were characterized by a sellers' market. This, and the war-induced turbulence in business and national affairs generally, acted to alter the company's longer-range objectives. Aggressive competition and other factors normally present in the economic atmosphere did not operate in these years with their usual force to restrain business expansion and experimentation. Fed by the success of most new ventures at that time, expansion into new and different fields of endeavor became a dominant philosophy in the company's planning.

During the years 1941-46, and more particularly in the latter part of this period, the company expanded its interests to include manufacturing, a new type of franchised stores, new methods of operation, much wider selections of goods and price ranges, including entirely new lines of merchandise in which the company had little or no merchandising background, and other ventures not directly in the field of the company's experience.

Characteristically, the expansion into these new fields of endeavor added very greatly to the company's fixed and overhead costs. This expansion required substantial investment in merchandise lines and activities in which the company had no sales history or operating experience to guide it. Inventories and merchandise commitments necessarily were extended heavily, and by the end of 1946 had become badly unbalanced.

In this situation, the company was confronted early in 1947 with a return to more normal patterns of merchandise distribution throughout the country. Its inventory was unbalanced and greatly inflated. Much of it was in goods introduced during the war that had become unmarketable through its normal prewar channels. Its cost structure was greatly excessive in relation to its normally expectable volume. It had not established a competitive position in the newer fields it had invaded sufficient to develop and hold adequate sales volume to carry this cost burden.

The high operating costs and fixed expenses that stemmed from the expansion program just described, coupled with loss of volume and precipitous markdowns on merchandise, developed large losses beginning almost immediately in 1947.

New management was brought into the company about mid-1947 to stop these losses and to develop improved earning power. However, in the three following years 1947-49, the company showed taxable net losses of almost $5,500,000. Excluding a profit of $900,000 on the sale of real properties, the loss from operations during this 3-year period was nearly $6,500,000.

About the middle of 1949 the company's top management was changed again. With this change, substantially every one of the company's top executives had been replaced since mid-1947.

At this point in the company's history it was perfectly plain that immediate reversal of losses and an early and satisfactory return on investment was required, or that dissolution of the company was in prospect. The company simply could not survive the huge losses that were draining off its working capital—at a time when virtually all other businesses were earning peak profits.

A detailed and searching analysis was undertaken immediately by the company's management to determine if continued employment of the company's funds in the wholesale business was justified, or if immediate liquidation was necessary to prevent further dissipation of capital. This analysis penetrated the markets and customers served by the company, the items of merchandise carried, and the costs of distribution, profit opportunity, future growth possibilities, and economic permanence of wholesaling as a method of merchandise distribution in this country.

If it had not been so before, this analysis made it perfectly plain that general wholesaling on a national scale of a general line of merchandise to a general group of customers, such as the company had undertaken in past years, has no future.

It was equally plain that wholesaling, far from fading as was commonly believed, is virile and growing, and that there was and is a demonstrable need and an economically sound place for the wholesaler in this country's scheme of merchandise distribution.

Through this study a business formula was evolved that, in the judgment of the company's management and board of directors, would enable the company's management to stop the losses and develop an earning power relative to capital employed at least equal to the average of successful merchandising companies.

Consequently, late in 1949 the company's management launched a program of reorganization and concentration that still is proceeding. The effect of this program on the company's 1950 earnings, and its future potential earning power, is perhaps best described in the following paragraphs extracted from the statement of the company's president, Mr. B. R. Prall, to the shareholders at the annual meeting, April 26, 1951.

"Two years ago the question was asked persistently, by ourselves and by others who knew this company, as to why we continued in the wholesale business. Losses had mounted for 3 years and evidence was lacking of any real opportunity for profit and growth in wholesale.

"Without a clear answer to this question we could not formulate a sound program for the profitable employment of the company's capital. We, therefore, studied the wholesale maket exhaustively, and analyzed the opportunities for profit in that market for a company like ours.

"The evidence we gathered showed us that important changes had taken place in the character of wholesale distribution over a long period of years, and that Butler Bros. had not adjusted to these changes.

"It was perfectly plain that there was no longer an opportunity for satisfactory profit in a scheme of distribution that called for offering a general line of wholesale merchandise to a general list of customers on a national scale. In other words, the wholesale business as Butler Bros. had been accustomed to conduct it in past years had no future. We simply could not be as we had been—all things to all people—and earn a satisfactory profit.

"We had the choice then to reorganize our wholesale division promptly and completely to earn a satisfactory return on investment, or to withdraw from the wholesale business. This was a difficult choice to make, and one that called for real intestinal fortitude on the part of your management and board of directors.

"Our market analysis showed us clearly that wholesaling as such, far from being dead or dying, was a virile business with an economically sound place in the scheme of merchandise distribution.

"It retold us some vital things about our company that had become obscured—that Butler Bros. is a highly respected and valuable name in the trade; that we have a large body of franchised and other cooperative customers who look to us as a principal source of supply, and who buy in sufficient volume for satisfactory profit; that by concentrating on serving these customers and by eliminating the many fringe items and activities that had become ingrown, we could cut our merchandise lines and investment, and therefore our exposure to risk, in half; that by so doing we might temporarily lose sales volume, but would greatly improve our chance of profit.

"Most of all, this study told us that satisfactory profit in our kind of wholesale business required a two-fisted competitive capacity, with higher efficiency and much lower operating costs than anything the company had achieved up to that time.

"Careful and requiring analysis of the facts gathered convinced us that there was, and there is today, a quite satisfactory opportunity for profit and growth in our wholesale division. There remained the need to demonstrate that we in Butler Bros. could realize on that opportunity. If not, there could no longer be any possible justification for continuing the company in the wholesale business.

"In wholesale, therefore, we had two very pressing requirements. We had to stop the company's losses quickly, then hold the line long enough to prove what we believed was a formula for lasting profit and growth.

"As I told you at our last shareholders' meeting, we picked the Baltimore house as our testing ground. From the profit standpoint, this house had been our poorest operation with the most pressing need for corrective action. Pursuing the route indicated by our study, we reorganized this house to serve only franchised stores, and other variety merchants who look upon the company as a principal source of supply. We reduced the customer list by three-fourths. We reduced by two-thirds the number of different merchandise items stocked, the space used, the personnel employed, and the investment required.

"These moves cut Baltimore's 1950 sales nearly in half. But they made it possible for the house to earn the best profit return on investment of all operating divisions of the company. From being the poorest profit house, Baltimore evolved in 1 year into the best profit house, proportionate to sales and investment. The sharp sales declines that resulted from the 1950 curtailments have now given way to sales gains that in the 1951 first quarter greatly exceed any other house.

"Baltimore's results to date have proved to our satisfaction the formula for profit and growth in our wholesale division. This formula is now in operation in our Dallas house and is currently being installed in other locations. It requires simplified and economical warehouse operation, efficient utilization of space and manpower, shorter and highly competitive merchandise lines, serving fewer and better customers who will work fully with us on a cooperative basis.

"The evolution of this program has taken nearly 2 years and is not yet completed. In 1950, compared to 1948, total wholesale sales decreased by almost 28 percent. In the same period wholesale expenses were decreased by over 80 percent. On an annual basis this is an expense reduction of $7,834,000. It was accompanied by a markdown reduction of $3,250,000. Also in this period, wholesale customers were reduced from 27,000 to under 10,000 and merchandise items stocked from 80,000 to less than 15,000.

"On the other hand, the number of franchised stores served grew from 1,901 to 2,128 and the proportion of our company's wholesale business represented by these stores increased from 44 percent in 1948 to 60 percent in 1950."

It is normal and natural that the full effect of these improvements in the company's operations would not become evident immediately. However, it is important to proper appraisal of the company's situation under the Excess Profits Tax Act of 1950 to recognize that the steps taken and the results achieved in 1950, were almost entirely pre-Korea. This is especially true of the improvement in markdown and expense control, as shown in the following table (000 omitted). (The results for the years ended June 30, 1949, and June 30, 1950, are shown merely to emphasize the pre-Korea timing of these improvements.)

[000 omitted]

Year ended	Net sales	Markdowns		Operating expense		Taxable income	Percent of return on total assets
		Amount	Percent	Amount	Percent		
Dec. 31, 1946	$138,433	$2,042	1.5	$20,802	15.0	$5,552	11.60
Dec. 31, 1947	112,624	6,560	5.8	20,632	18.3	−5,445	−12.19
Dec. 31, 1948	126,949	4,297	3.4	19,846	15.6	−388	−.16
June 30, 1949 [1]	111,931	5,352	4.8	17,760	15.9	−1,425	−3.42
Dec. 31, 1949	96,715	3,270	3.4	15,003	15.5	345	1.14
June 30, 1950 [1]	90,978	1,686	1.9	12,618	13.9	2,228	5.90
Dec. 31, 1950 [1]	90,819	881	1.0	11,326	12.5	5,039	12.76

[1] Per books.

There is no doubt that general economic conditions in 1950 were favorable to the company's operations. However, they were almost equally favorable in 1947, 1948, and 1949, when the company's operations produced a pretax loss of nearly $6,500,000 for the 3 years.

The conclusion is logical and proper that the 1950 improvement in the company's earnings, and the anticipated future earnings improvement, have been due principally to factors internal to the company, and hardly at all to external economic factors stimulated by the Korean War.

APPLICATION OF THE EXCESS-PROFITS TAX

Based on the foregoing paragraphs, it is submitted that Butler Bros. has no normal pattern of past earnings that can be used as the basis of measuring excess profits for the purpose of equitable taxation within the spirit of the 1950 act.

Under the Excess Profits Tax Act of 1950 the efforts of the company's management and board of directors to restore the company's earning power sufficiently to permit it to remain in business, and to perform a neded service to independent retail merchants, will be penalized for their success.

The "average earnings" method of computing the excess-profits tax credit, based on earnings in the base period years 1946-49, is clearly inapplicable to the company.

The alternative offered by the Excess Profits Tax Act of 1950 of computing the excess-profits-tax credit by formula related to invested capital also is clearly inapplicable, and inequitable if applied to this company. The inequity of this formula in situations similar in principle to that of the company, as just described, was recognized by the tax draftsmen and by the Congress, and to a degree provided for in various relief provisions of the act.

Through consultation it appears that the act as written, and the regulations issued by the Commissioner of Internal Revenue, do not afford the company direct access to a suitable relief provision. It did not experience the substantial change in products or services apparently required by section 443 to apply for relief thereunder. There was no such increase in capacity or production as contemplated by section 444. It is not a new corporation as defined by section 445. The wholesale industry is not one of the depressed industries determined by the Secretary of the Treasury under the provisions of section 446. Relief sections 448, 449, 450, 453, 455 are specific industry relief provisions and as such inapplicable to the company. Section 442 (a) (1) does not apply and the World War II Excess Profits Tax Act decisions relating to the relief provided by section 442 (a) (2) indicate that by interpretation, this section does not apply to the circumstances in the company's experience.

The foreclosure of the company's access to suitable relief provisions of the Excess Profits Tax Act of 1950 imposes an unjust and inequitable tax burden on the company. This inequity should be remedied to give the company direct access to suitable relief provisions similar to those offered in section 442 (d) pertaining to abnormalities during base period, new corporation section 445 (b) or section 443 (b) (for changes in products or services) of the present act, if necessary by modification of the language of the act itself.

Senator BYRD. In lieu of appearance, there will be inserted into the record a statement from Mr. Arthur B. Hyman of the New York bar.

(The document referred to follows:)

MEMORANDUM TO THE SENATE FINANCE COMMITTEE ON THE NEED FOR REVISION OF THE INTERNAL REVENUE CODE

(Submitted by Arthur B. Hyman of the New York bar)

To the Senate Finance Committee:

We passed from emergency to crisis and back again, and it seems that we shall never have an opportunity to consider taxation in an atmosphere conducive to the creation of a sound system. Pressure, real or fancied, is in no small degree responsible for the crazy-quilt we call an Internal Revenue Code. The uncertainties which have been created by legislation in a field in which certainty should be the prime objective are appalling. The code, which no layman and few lawyers can read with any reasonable degree of understanding, and a judicial disregard of legal principles when taxation is involved, have created absolute chaos.

In connection with the consideration of the Revenue Act of 1948, we appeared before the Ways and Means Committee and orally and in a memorandum presented our views on this subject. We did not, in the oral presentation, have the opportunity to get very far beyond a discussion of the Dobson rule, which to the great relief of taxpayers, their counsel and the courts has been abrogated. Changes were also made in the "contemplation of death" provisions of the estate tax law. Much more progress is needed and it is not in the direction of "loophole" closing which Treasury officials emphasize ad nauseum. In the memorandum above referred to we pointed out a number of changes which appeared to us to merit consideration and which we shall discuss hereafter.

Responsibility for the maintenance of our great Government and our traditional way of life lies in the hands of those to whom leadership has been entrusted. The greatest danger that confronts us is not from without but from within. Profligate spending and overburdensome taxation are more deadly that the armed might of the Soviet. Thrift, which in past ages was not viewed with disfavor even in the conduct of public affairs, seems in this generation to represent an outworn philosophy. Money is spent with an abandon that would be terrifying to a people whose senses had not been dulled by habit. Unfortunately, they will not awaken until they find the foundations of their Government rocking from the impact of unsound fiscal policy.

In a democracy such as ours, we must have enlightened leadership. Warnings from men in positions of importance, business, finance and public administration have been sounded. Those who have been vested with the responsibility of managing the affairs of the bigest business on earth seem to have an idea that that business can be successfully managed and operated without regard to the principles which are vital to the perpetuation of any other business organization.

It is not difficult, of course, to understand the mental processes that lead to increased personnel in Government service, or to appropriations for projects which are unnecessary or which we cannot afford, but the time comes when we cannot indulge ourselves in such extravagances. If, unfortunately, we are called upon to make vast expenditures which we cannot with safety avoid, the most obvious action on the part of the administration would appear to be to curtail to the point of austerity all expenditures for other purposes.

Some 2 years ago a respected member of the Senate, in addressing a group of businessmen, remarked that the Congress could not make very much progress on the tax bill then under consideration until it knew how much money the Government intended to spend. We thought he had the cart before the horse, and expressed the view that the Congress should determine how much we can afford to spend and limit the administration accordingly.

Waste of public funds is an evil which we have become accustomed to, and concerning which we have been too complacent. We cannot afford the luxury any longer. The Congress is confronted with the necessity of raising fantastic sums of money by taxation. There are minimum requirements that must be met. There are economies of large proportions that can be effected in the operating expenses of the Government, and there are many things for which expenditures and appropriations are requested that either should never be granted or should be deferred.

The burden which our economy will have to bear in the coming year will probably not be alleviated in the very near future. Not a single dollar should be raised that is not of vital necessity.

Not only should the Congress concern itself with the financial burden that must necessarily be imposed upon us, it should also concern itself seriously with the manner in which it is imposed, and that subject requires a more extended discussion.

CAPITAL GAINS TAX

Whenever the occasion arises for consideration of a new tax bill, the subject of capital gains taxes obtrudes itself, and it will continue to be a subject of controversy until it receives more realistic treatment. It has been viewed primarily from a political standpoint and never upon its merits. Those who are for it look with disfavor upon the escape from taxation of a profit realized on the sale of property, disregarding the logic of the matter. They support their position by shouting "Wall Street," as if all such profits were realized by the bankers and brokers who operate in that maligned district. We are sure that they know that the capital gains tax affects all business transactions and, unless they are very ignorant, that trading in securities represents an activity indulged in by millions of our citizens. Something more than demagogic outpouring should be required to support the tax.

As long as a consideration of the subject is had in an atmosphere of pressure, it is perhaps too much to expect that a logical and practical view of it will be taken. This committee knows better than most, that the capital gains tax would be totally unproductive if it were imposed without distortion, that is to say, if gains and losses were treated with equal consideration, which they should be in the interests of principle and good conscience. On the other hand, the present method of treating capital gains and losses is harmful to the economy. Profits will not be taken if the consequence is a substantially smaller amount to reinvest in another capital asset. This is so even though good judgment suggests the propriety of taking a profit. Volume of trading is immeasurably reduced. Venture capital is restricted in movement from one field of enterprise to another. The taxpayer is frozen to his investment. These are statements of fact and not of argument.

Just as in business, a small margin of profit and a large turn-over are preferable to a large margin and a small turn-over, so it is through the whole economic system, and the rule applies as well to the Government which could enhance its revenue by encouraging capital transactions.

We can speak with some authority on this subject, for we are constantly being presented with the problem of whether property should be disposed of in the face of the attendant burdensome tax. An illustration points up the problem. A taxpayer recently bought 100 shares of Chicago, Rock Island & Pacific preferred at 47. It is quoted above 90 and is looked upon as a sound security. The taxpayer, however, would like to take the profit and switch into another security. For the privilege of doing that, however, he must pay a tax of over $1,000, and therefore if he should purchase 100 shares of another security it will have to advance more than 10 points before he is in the position he enjoyed before the sale; and the security he purchases may turn out not to be as good as the one he sold. The answer is that the taxpayer won't sell, and neither would you, and neither would we.

Multiply the illustration by the hundreds of thousands, perhaps millions, that are thwarted by a burdensome tax on profits and you will have some idea not only of its evil effect on the economy but of its failure to produce revenue in sufficient proportions to justify continued existence.

In our view, the capital gains tax should be eliminated from our system of taxation. There is no good in it, and if Great Britain and Canada can get along without it, we certainly can. However, realizing that the political courage necessary to bring about such an important change is not to be expected, we address our argument toward a better and more productive capital gains tax.

The Secretary of the Treasury has proposed an increase in the capital gains tax to 37½ percent. This is obviously a maneuver. He has too much intelligence to believe that an increase in the tax will increase the revenue. It is obvious, therefore, that his purpose is to forestall the arguments that will be made in support of the elimination or reduction of the tax. It is to be noted that he has sold the idea of an increase to the Ways and Means Committee. If he succeeds in the House or Senate in holding the tax to 25 percent he will have accomplished his purpose of preventing reduction and will have achieved a victory, but it will be a pyrrhic victory, for it will deprive the Government of increased revenues which can be achieved only by the reduction of the tax.

We have made an investigation of business done on the stock exchange during the last 25 years to ascertain whether our views have any support in the statistics. Apparently they have.

1925–33

In the period from 1925 to 1934 the volume of trades on the New York Stock Exchange was high. The capital gains rates were relatively low, that is, 12½ percent of the full amount of the gain.

1934–37

In 1934 the method of taxing capital gains was changed. That change remained in the law until January 1, 1938. Capital gains were taxed at regular normal and surtax rates but the percentage of capital gains which had to be included in income for tax purposes varied with the time that the asset was held.

An asset held for less than 1 year received no advantageous treatment. Eighty percent of the gain on an asset held for more than 1 year but less than 2 years was recognized; 60 percent of the gain on an asset held for more than 2 years but less than 5 years; 40 percent of the gain on an asset held for more than 5 years but less than 10 years; and 30 percent of the gain on an asset held for more than 10 years.

However, because the percentage of gain which had to be included was to be taxed at regular normal and surtax rates, the effective tax on capital gains was substantially increased. Thus, after January 1, 1934, in the case of a capital asset held for more than 2 years but less than 5 years, in which case 60 percent of the gain was recognized, effective normal and surtax rates went as high as 63 percent. For a taxpayer in that bracket the effective tax on such a capital gain would be 37.8 percent, or three times as much as it had been under prior law. Similarly, for a taxpayer in that surtax bracket who held a capital asset from 5 to 10 years, the effective tax on such gain would be 25.2 percent, or twice as much as theretofore. And in the case of a capital asset held more than 10 years, a taxpayer in the top bracket would have to pay an effective tax of 18.9 percent on the gain from the sale of such an asset.

In the case of taxpayer whose surtax net income was between $20,000 and 22,000, the total normal and surtax rate would be approximately 19 percent. For such a taxpayer who sold a capital asset held for more than 10 years, the effective tax on the gain was only 5.7 percent; for an asset held between 5 and 10 years the effective tax was 7.6 percent; for an asset held between 2 and 5 years the effective rate was 11.4 percent; for an asset held between 1 and 2 years the effective rate was 15.2 percent and for an asset held for 1 year or less the effective rate was 19 percent.

It can therefore be said that as a result of the Revenue Act of 1934 the effective tax on capital gains where income exceeded $40,000 per annum was very substantially increased.

It is therefore interesting to note that in 1934 the volume of trading on the New York Stock Exchange was slightly less than one-half of amount it had been in 1933 although personal income increased to $53,000,000 in 1934 from its low of $40,000,000 in 1933. Indeed the level of trading in 1933, 654,000,000 shares has never been reached since then.

The surtax rates were slightly increased in 1936 and remained constant until 1939. The increases affected only surtax net incomes exceeding $50,000, at which point the increase was only 1 percent and gradually rose until the increase totaled 16 percent on surtax net incomes exceeding $5,000,000.

In 1936 the volume of trading exceeded that for the previous year by 115,000,000 shares but the act did not become effective until the end of June. Volume declined to 409,000,000 shares in 1937.

1938–41

Effective January 1, 1938, the capital gains provisions were changed. Capital assets held for more than 18 months and less than 24 months were taxed by including 66⅔ percent of the gain in income and subjecting such gain to regular normal and surtax rates. Fifty percent of the gain on the sale of capital assets held for more than 24 months was recognized and subjected to regular normal and surtax rates. However, maximum effective tax on capital gains was set at 30 percent.

In 1938 the volume of trade declined 112,000,000 shares from the previous year and declined steadily thereafter until 1942. Personal income declined to $68,000,000 from $74,000,000 in 1937.

Between 1937 and 1940 there was no change in normal and surtax rates.

The Revenue Act of 1940 increased surtax rates on incomes between $8,000 and $100,000 per year, the maximum increase being 18 percent on surtax net incomes between approximately $50,000 and $60,000. In 1940 volume of trading decreased from 262,000,000 shares in the previous year to 207,000,000 shares.

In 1941 the surtax rates were again substantitally increased on surtax net income between $6,000 and $500,000. In that year the volume of trading declined to 170,000,000 shares.

1942 to present

In 1942 the capital-gains provisions were once again changed to provide that 50 percent of the gain on assets held for more than 6 months would be recognized and taxed at a maximum rate of 50 percent. In that same year, normal taxes were increased from 4 to 6 percent and surtax rates were once again substantitally increased. In 1942 the volume of trade reached its lowest level in the history of the stock exchange and declined to 125,000,000 shares. In 1942, personal income rose to $122,700,000,000, its highest point in over 12 years.

The capital-gains provisions have remained without change since 1942. The normal tax rate was decreased to 3 percent in 1944 and has remained at that point thereafter. However, the surtax rates were again substantitally increased in 1944. That year there was a slight decline (115,000,000 shares).

In 1945 surtax rates were decreased. In that year trading increased by 114,000,000 shares.

Though there have been no substantial changes in the capital-gains provision of the tax laws or the tax rates since 1945, the volume of trading has fluctuated between a high of 377,000,000 shares to a low of 253,000,000 shares in 1947.

Conclusion

As is indicated above, and as can be observed by examining table A ("Volume of trading in the New York Stock Exchange between 1925 and 1950") and table B ("Summary of the capital-gains provisions of the tax laws between 1921 and the present"), submitted herewith, an increase in the effective tax on capital gains usually was followed by a decrease in the volume of trading. The increase in the effective tax on capital gains has been brought about by either a change in the method of taxing capital gains (for instance, by taxing capital gains at regular rates rather than at one low set rate); by varying the percentage of gain which is recognized, depending on the holding period of the particular asset; by changing the regular normal and surtax rates; or by changing the maximum effective tax rate on capital gains.

These tables also lend support to the argument that a change in the holding period required for advantageous treatment of capital gains does not appear to affect the volume of trading very markedly.

During the same period covered by these figures the volume of all business in the United States has increased fantastically.

It is significant that trading on the exchanges has been relatively stagnant during the period of our greatest business expansion and of our highest personal incomes.

Of course, throughout the years the volume of trading has been substantially affected by other factors but we believe their impact was not comparable, if at all significant, to that of high taxes.

If there is any virtue at all in the views we have expressed, it would seem to follow that a very much lower rate of taxation on capital gains would produce a very much greater revenue, not only in that form of taxes but also in transfer taxes. We urge a 10-percent flat rate and the elimination of the element of time as a criterion of liability. A capital asset is a capital asset whether held for 1 day, 1 month, or 1 year. Today the profit realized on the sale of a capital asset is ordinary income; tomorrow it is a capital gain. Today it may be taxed perhaps at 75 percent of the profit realized; tomorrow at 25 percent. There just isn't any sense to it. The argument that profits earned in capital transactions during the first 6 months are speculative while those earned a day or two later are profits from investments is utterly untenable. The difference between speculation and investment cannot be determined by any such standard. Inherent in the act of every purchase is the hope of enhancement. If a substantial enhancement should take place within 6 months after purchase and is realized by a sale, the profit is no more to be placed in the speculative category than if it had been taken in the second, third, or tenth year.

If the low flat rate is unacceptable, we again propose the adoption of a method previously in use, that is, a descending rate of tax spread over a period of years. We suggest tentatively 15 percent during the first year of holding, 12½ percent during the second year, 10 percent during the third to the fifth years, inclusive, and 5 percent thereafter.

We urge the adoption of one or the other of the above suggestions, if only for the purpose of ascertaining the truth of the matter. Common sense tells us that such a procedure will open the channels of trade and vastly multiply transactions. Such an objective should be eagerly sought. But it is important also to know what effect it would have upon the revenue, and we will never know it until we make the experiment. We have everything to gain and nothing to lose, and if the result does not prove the soundness of the change, the problem of restoring the old rate is not insoluble.

It may be argued that a low rate of tax on capital gains will encourage speculation, but that is the very essence of our free-enterprise system. It permeates everything that we do. If those who fear it have in mind what we witnessed in the late twenties and early thirties, the answer is that we now have safeguards which will effectually prevent such a debacle. Large margin requirements will effectually serve to keep people out of the stock market who have no business in it. It is not a gambling room. It is a market place where legitimate business is transacted in the same way as it is transacted on real estate and commodity exchanges.

We make the foregoing recommendations for the purpose of bettering a bad situation. We do not wish to be understood as favoring a capital-gains tax in any form. Capital gains are not income despite judicial fiat to the contrary.

SALES TAX

Some years ago we urged the adoption of a system of taxation based primarily upon income and sales. Working in combination, these two methods, together with other regular and well-established sources, could be counted upon under all circumstances to raise whatever sums might be needed to finance the operations of the Federal Government. Having two primary methods of raising revenue, both of them reasonably flexible, would enable us to dispense with or reduce many other imposts, and under less necessitous circumstances renounce for the benefit of the States such sources of revenue as estates and gifts. Taxation at a reasonable rate on sales to ultimate consumers would be highly productive and easily administered. Another advantage from a fiscal standpoint would be constant flow of funds into the Treasury. No doubt some complications will be encountered as they always are, but they present no difficulty comparable to those experienced in the development of income and excess-profits taxation.

Proponents of the sales tax have always been and will continue to be met with the specious argument that such a tax imposes an inequitable burden upon those in the lower income brackets. The argument is really absurd. The man with ten times the income of another will, generally speaking, spend at least ten times as much as that other in the purchase of commodities subject to tax. In so doing, he will contribute at least ten times as much to the cost of Government. The assertion that the obligation to contribute toward the cost of Government should be based upon ability to pay is completely satisfied by the graduated levies on incomes, estates, and gifts.

The claim that the imposition of a general sales tax would meet with substantial resistance is certainly not valid. People are not so lacking in intelligence as to be unaware of the fact that they are paying a tax upon almost everything they buy and upon almost everything they do. Those in the lower brackets are being heavily taxed as a result of the imposts already laid. The general sales tax would, in fact, lighten their burden rather than increase it. It is foolish to pretend that the excise taxes are being paid only by those in the middle and upper brackets. Poor and rich alike are contributing vast sums in the form of excise taxes which are nothing more than sales taxes under different titles. In the last analysis too, the common sense of the American people can be counted up to appreciate and approve any system of taxation which is simple in operation and not discriminatory or oppressive.

In discussing the subject, one of the members of the House Ways and Means Committee predicted that we would shortly be faced wth the necessity of resorting to sales taxes to meet our needs. We were very close to its adoption not so long ago. Strong opposition was mustered against it, and an unwarranted fear of public reaction defeated it. We think that the people will now be for it and that the time is ripe for its enactment as a permanent part of our system.

The National Association of Manufacturers has come out in support of a substantial manufacturers' tax rather than a sales tax. We hope that this spirit of cooperation will not lead the committee to make a bad choice. Such a tax involves complications not present in a tax to the ultimate consumer. It would probably lead to pyramiding of prices, each manufacturer adding a bit, with the consumer an innocent victim. At the consumers' level, the tax can be added and collected separately just once. No tax of any character should be imposed up to that point. The consumer then knows the price of the article which he desires to purchase and what the tax will be.

The simplicity of collection would seem to be its best endorsement.

REVISIONS

In the memorandum submitted to the Ways and Means Committee in connection with the Revenue Act of 1948, we pleaded for taxation based upon fundamental principles of law, instead of in contravention of them. We inveighed against taxation by distortion. We asked that taxes be assessed upon the basis of reality and not speculation. Among other things, we suggested the following consistent pattern: The taxation of the income of trusts to the recipient of that income, without regard to whether the trust is revocable or irrevocable and regardless of the rights reserved concerning the future disposition of income; the imposition of gift taxes on transfers in trust, whether irrevocable or otherwise, and without regard to any reserved power to revest title in the donor or the settlor. It seems to us that it should be unnecessary to argue the propriety of taxing one who receives income from property conveyed rather than to attribute it to someone else in an unseemly pursuit of revenue, and had the opportunity presented itself before the errors were made, we do not doubt that such an argument, if made, would have prevailed. Under pressure of the Treasury Department, provisions were adopted without realization that we were paying a high price for a small achievement.

Trouble began when the Supreme Court evolved the conception that one might be in receipt of income through some moral or spiritual satisfaction. (See *Wells* v. *Commissioner*, 289 U. S. 670.) It increased with *Helvering* v. *Clifford*, 309 U. S. 331. We find no fault with that decision but a misunderstanding of its import led to an appalling raid by the Treasury Department on all of the taxpayers who had created trusts.

Clifford created a trust for a period of 5 years during which he retained practically complete control, and at the end of which the corpus reverted to him. In effect, the trust had no substance and the Supreme Court, for all practical purposes, treated it in that light. Any other view of that decision would impute to the Court a departure from the fundamental principle that when a settlor conveys legal title to trust property, the income being payable to another, whether it be for life or for a shorter period, he is parting with the ownership of the property and with the right to receive the income.

At the same session of the Court, it had for consideration the case of *Helvering* v. *Wood* (309 U. S. 344), in which a trust, similar in many respects to that involved in the Clifford case, was presented. In that case the Government relied upon section 166 of the Internal Revenue Code for authority to subject the income to taxation in the hands of the settlor. The Court held that it was not so taxable under that section and refused to permit the Government to switch its position and to attempt to include it under section 22. In that case it said that Congress had confined section 166 to trusts where there was a power to revest and that when the 1934 act was before the House Committee, the Congress rejected the recommendation of the Treasury that income from short-term trusts (of the character involved in both the Clifford and Wood cases) be taxable to the creator, but adopted its recommendation to tax him with the income of revocable trusts.

Note that in spite of the congressional adherence to principle, the Supreme Court found it possible to use the dragnet of section 22 to justify the impost in the Clifford case. Thus the trust in *Helvering* v. *Wood, supra*, if attacked under section 22 might have met the same fate as that in *Helvering* v. *Clifford* and this in spite of the Court's observation that the Congress had resused to subject it to a tax upon the recommendation of the Treasury Department.

So taxpayers who had drawn trust agreements over periods of years based on legal concepts which were supposed to have been well established (*May* v. *Heiner* (281 U. S. 238)) found themselves in quite a mess and in some cases they were absolutely powerless to protect themselves against judge made ex post facto law.

The limits of this memorandum do not permit an analysis of the cases that followed. They present a picture of the efforts of the Government to bring various trusts within the ambit of *Helvering* v. *Clifford* and of counsel for the taxpayers to escape its condemnation. We think the decisions in favor of the Government in practically all of the cases so decided were completely unjustified and resulted from a misconception of the decision in that case. However, what we wish to emphasize is that a tax law that is so uncertain in its application that a taxpayer unwittingly subjects himself to serious burdens, some of which he cannot escape by subsequent action, is intolerable and indefensible.

The discussion of the Clifford case points up another aspect of trust income. A distinction is made between a revocable and an irrevocable trust. We know that fundamentally the right of revocation reserved in the trust instrument is of no consequence unless it is exercised. Therefore, if the settlor creates a trust revocable only by him during his lifetime and he dies without having revoked the trust, every disposition made under it stands as if the right of revocation had never been contained in the instrument.

Many people have created trust agreements reserving that right not for any ulterior purpose but merely as an anchor to windward, that is to say, against the danger always existing, even though remote, of an economic disaster. The income under such a trust would legally belong to the beneficiaries. The legal principle governing the disposition of the income could not be stretched by the wildest imagination to tax that income to the settlor. However, it seemed heinous to the Commissioner of Internal Revenue, especially after tax rates began to take greater and greater sums out of the pockets of the people, that such income should be taxed at a lower rate than it would be if the settlor had retained it.

So the Congress was prevailed upon to adopt the indefensible scheme of taxing to the settlor income he had given away merely because he reserved the power to reclaim it at some time in the future; and yet so far as the disposition of the income was concerned it was not different in the case of the revocable trust than it would have been had the right of revocation not been reserved. We no longer concern ourselves with taxing people upon incomes received but spread the net to include incomes they might have received.

Under the head of revocable trusts, section 166 includes one where the power to revest in the grantor title to any part of the corpus of the trust, is vested in any person not having a substantial adverse interest in the disposition of such part of the corpus or the income therefrom. Under that provision the word "substantial" has been held to have economic significance and that therefore a trustee or a number of trustees authorized to terminate a trust and revest the corpus in the grantor, have no such adverse interest. This view, we believe first enunciated in the Tax Court, was entirely unjustified since the trustees are under a legal obligation to the beneficiaries and accountable to them for mismanagement or for an improper termination of the trust, contrary to their interests.

Thus, though no right of revocation is reserved to the settlor, he is nevertheless taxable on the income from the trust though that income goes to others and he alone has no power to divert it. The trustees certainly have an adverse interest to the grantor even though it may not be a pecuniary one. That theory might have been demolished in the *Stuart* case (317 U. S. 154, *supra*). No doubt should be left upon that score.

We think that under the law of every State in the United States a trustee is accountable to the beneficiaries and that in that sense he has an interest adverse to the settlor. In order to clarify this section and to prevent any further litigation under it, we suggest that it be made clear, either by excepting the trustee from the category or by providing that the adverse interest need not be pecuniary. As a matter of fact, we think that if the Congress had intended a pecuniary interest it would have said so. Many considerations far more potent than personal pecuniary advantage might control the action not only of a trustee but of any other person in whom the right of termination might be vested. Certainly the parent of a beneficiary under a trust agreement would have a powerful motive for refusing to terminate a trust if vested with that power, although such parent might have no interest whatever in the corpus of income of the trust.

What we have said about revocable trusts applies in some respects to section 167. It taxes to the grantor such part of the income of a trust as:

"(a) (1) is, or in the discretion of the grantor or of any persons not having a substantial adverse interest in the disposition of such part of the income may be, held or accumulated for future distribution to the grantor; or

"(2) may, in the discretion of the grantor or of any person not having a substantial adverse interest in the disposition of such part of the income, be distributed to the grantor; or

"(3) is, or in the discretion of the grantor or of any person not having a substantial adverse interest in the disposition of such part of the income may be, applied to the payment of premiums upon policies of insurance on the life of the grantor (except policies of insurance irrevocably payable for the purposes and in the manner specified in section 23 (o), relating to the so-called charitable contribution deduction)."

Obviously if the income of the trust is or in the discretion of the grantor may be held or accumulated for future distribution to himself or be distributed to him currently or applied to premiums upon policies of insurance on his life, it should be taxed to him because such a trust would have no substance and would come within the condemnation which we think was the true intent of *Helvering v. Clifford*.

A different situation is created, however, when such disposition is subjected to the discretion of someone else. The purpose of this, as we have suggested in relation to revocable trusts, is to prevent the same result by prohibiting the use of a dummy and if it be made clear that an adverse interest need not be pecuniary but may be implied in the obligation to or interest in the welfare of others of the person in whom the power is vested, this section would be less objectionable. The fact that income may be diverted under certain circumstances to certain purposes, where the possibility is remote and has never become a reality, should not subject it to taxation in the hands of the grantor. It should be so subjected only in the years in which the possibility becomes reality.

No stronger argument on the subject could be offered than that furnished by subdivision (c), an amendment made by the Congress to except from the broad play of the statute the income of such a trust to the extent actually applied at the discretion of any person, the trustee or the grantor acting as trustee or cotrustee, to the support and maintenance of a dependent.

An inconsistency is to be noted here. It is not easy to perceive a distinction between the case of income which may be applied to the maintenance, education, and support of a dependent and the income that may be applied to the payment of insurance premiums. Yet the actuality is made the criterion in the one case and the possibility the criterion in the other.

This discussion must not be taken as a recommendation for revision or amendment of section 167 though it may be helpful if a broader objective is not attainable. We are sponsors for the basic principle that taxation should be founded upon established legal concepts and not upon their disregard and distortion. We propose the taxation of actual as distinguished from theoretical income and upon the one who receives it in fact; not through spiritual satisfaction.

Such procedure was once thought to involve a strong doubt of validity on constitutional grounds (*Lewellyn* v. *Frick*, 268 U. S. 238) and while that obstacle may have been removed by subsequent decisions there is no justification for the maintenance of such a system. We have no moral right to prevent the dispersion of one's income or principal and since we do not and cannot prevent the making of an absolute gift of the principal and a dispersion of the income in that manner there is not the slightest excuse for taxing to a settlor the income upon property which he has given away through the medium of a trust. The fact that the settlor retains the right to revoke the trust should have no bearing whatever upon the taxability of the income unless and until the right of revocation is exercised and the property or the income actually reverts to him.

In the same category we put taxation upon the settlor of income of a trust which he has established for the maintenance, support, and education of his minor children. If the parent is economically placed so that he is able to create a trust that will insure the maintenance, support, and education of his dependents and he is willing to isolate a sufficient part of his principal to accomplish this result, depriving himself of the enjoyment of it, why should we tax to him the income from it? Justification of this has been found in the theory that the income is being applied to the discharge of the settlor's legal obligations. That was the theory adopted by the Supreme Court in *Burnett* v. *Wells* (289 U. S. 670) and that is what we are inveighing against. It results not in the taxation of realized income which is the fundamental basis of such taxation but from a conception that one has no right to dispose of one's property as one sees fit because the Government thereby derives less revenue than it would have had he not made such disposition. It is said that such measures are for the protection of the revenue. Sound taxation will require no such measures.

In that category also are trusts created for the purpose of paying premiums on policies of insurance. Involved in such a trust is no legal obligation. We tax the income to the settlor because by means of the trust he satisfies a moral obligation. In other cases we tax him upon the theory of economic satisfaction—whatever that may mean.

In a recent case in the second circuit, *Commissioner* v. *Newman* (159 F. (2d) 848), the Court upheld a tax on income to the trustee of a trust made by his wife for the benefit of her minor children because he had the power to revoke, alter or amend, or to free any part of the principal and return it to the settlor. It is not clear whether the court's reason for such a decision was that it was a "family affair" such as was condemned in the Clifford case, or because it thought that it had possibilities for tax avoidance which it was its duty to circumvent. Judge Learned Hand's dissenting opinion is a defense of first principles. He said:

"Finally, if I understand the Commissioner, he wishes us to consider that these deeds may have been a preliminary step in a reprehensible scheme to lessen the wife's income taxes. There is not the faintest ground for imputing any such purpose to the parties at bar; and, if there were, it ought not to count. Over and over again courts have said that there is nothing sinister in so arranging one's affairs as to keep taxes as low as possible. Everybody does so, rich or poor; and all do right, for nobody owes any public duty to pay more than the law demands: taxes are enforced exactions, not voluntary contributions. To demand more in the name of morals is mere cant."

Applying the doctrines stemming from *Helvering* v. *Clifford* (309 U. S. 331), The United States Tax Court holds a wife taxable under section 22 (a) of the Internal Revenue Code on the income from a trust established by her husband for his life with the wife as sole trustee, having complete discretion to distribute the income to herself or her husband in accordance with their respective needs, regardless of how the income was distributed .

Judge Disney, dissenting for himself and five other judges, said:

"The majority opinion definitely goes much further than any case so far in extending taxation to one not the grantor of a trust. It was to just such cases as this, in my view, that the court, in *Kohnstamm* v. *Pedrick* (153 F. 2d, 506), referred when, commenting on extensions of *Helvering* v. *Clifford*, it said: '* * * The test is impalpable enough at best; but if it is to be continually refined by successive distinctions, each trifling in itself, we shall end in a morass from which there will be no escape; and the spate of decisions already poured upon us will be the earnest of eventual utter confusion'" (*Eleanor M. Funk*, 7 T. C. No. 102).

All these things emphasize the point that we have no reliable standard for the taxation of income. In a certain era we paid for not producing; we tax now for not receiving or retaining and the lengths that we have gone to are fantastic and many times shameful. It is not meet that a great government should raise revenue by methods which keep it constantly at war with its citizens and frequently subject it to scorn and contempt. Rather than to continue such a system let us, if necessary, raise the rates of taxation on the actual receipt of income. In order to accomplish this we must and should eliminate all provisions having as their objective the taxation to one of income which actually goes to another.

We take the same position in regard to gift and estate taxes. A gift tax is passed; the rate is fixed at approximately three-quarters of the estate tax, apparently for the purpose of encouraging the making of gifts, and then Congress could not resist the temptation of subjecting to estate taxes transfers which either were or might well have been taxed once and for all when they were made. What on earth is it that seems to make it impossible for us to pursue a simple, sensible course in such matters? Property in the hands of a decedent at the moment of his death should be taxed to his estate, and under no circumstances should there be included in that estate property which he has conveyed during his lifetime.

The imposing provisions of title III of the act of 1932 are as follows:

"(a) For the calendar year 1932 and each calendar year thereafter, a tax * * * shall be imposed upon the transfer during such calendar year by any individual, resident or nonresident, of property by gift.

"(b) The tax shall apply whether the transfer is in trust or otherwise, whether the gift is direct or indirect, and whether the property is real or personal, tangible or intangible * * *

"(c) The tax shall not apply to a transfer of property in trust where the power to revest in the donor title to such property is vested in the donor, either alone or in conjunction with any person not having a substantial adverse interest in the disposition of such property or income therefrom * * *."

The tax applies whether the gift is in trust or otherwise, direct or indirect, with the exception of a transfer in trust where title to the property conveyed is vested in the donor alone or in conjunction with any other person not having a substantial adverse interest in the disposition of the property or the income therefrom. The exception ties the gift tax in with the tax on income from revocable trusts; that is to say, it takes out of the category of gifts those trusts in which the income is taxable to the donor or settlor and this at least was logical if not necessary. However, we repeat the observations made in connection with income tax on revocable trusts, namely, that a transfer of legal title with the benefits that naturally flow from it is a gift notwithstanding that the trust may some day be terminated. A gift in trust should be taxed as such whether it is revocable or irrevocable and the income from it should be taxed to the beneficiary as we have heretofore urged in our discussion of income from revocable trusts.

If the right of revocation is exercised and the property finds its way back into the hands of the settlor and there remains, it will be subjected to estate taxes at that time and provision can be made for whatever adjustments appear desirable. We also repeat what we said before in this connection, that is: that one making a gift in trust may have every intention of having the property irrevocably vest. Nevertheless, fear of economic reverses or of family eruptions may dictate the wisdom of not making an absolute gift at that time. He is quite willing to make a gift in trust and to pay the gift tax on it. Why should he not be encouraged to do that?

As a matter of fact when the act of 1932 was passed there was much talk to the point that the section would encourage gifts and thus increase the current revenue to the Government. It seems however that the preaching and the practice are at variance. Indeed this variance is emphasized in section 811 (*d*) of the code where it is provided that there shall be included in the gross estate of every decedent:

"(e) Any interest of which the decedent has at any time made a transfer, in trust or otherwise, where the enjoyment thereof was subject at the date of his death to any change through the exercise of a power by the decedent alone or by the decedent in conjunction with any other person, to alter, amend, revoke, or terminate * * *."

The variance is further emphasized by the provision authorizing a credit for a portion of the gift taxes paid if the Commissioner subsequently determines that the money which he took for gift taxes was erroneously collected and that the property upon which the gift tax was paid should be included in the estate of the taxpayer.

The gift and estate tax provisions are said to be complementary to each other, that is to say: to create a logical whole. Under the Gift Tax Act however a transfer in trust of property under which the settlor receives the income for life is fully taxable if an irrevocable trust. There could be no possible argument that would serve to destroy the finality of the gift even though the life estate was reserved (*May* v. *Henier*, 281 U. S. 238, supra).

However, note the provisions of section 811 of the code which taxes as a transfer in contemplation of or to take effect at death, even so complete a transfer as that referred to "to the extent of any interest therein of which decedent has at any time made a transfer by trust or otherwise under which he has retained for his life * * * (1) the possession or enjoyment of or the right to the income from the property or the right, either alone or in conjunction with any other person, to designate the persons who shall posses or enjoy the property or the income therefrom."

Here we have an absolute transfer taxable as a gift under section 1000 and also taxable as a part of a decedent's estate at his death though obviously it did not pass by his death and he was absolutely powerless after the date of the establishment of the trust to alter its destiny.

It is to be observed that that section dealt originally with transfers made in contemplation of death and what in legal conception constituted contemplation of death was very well known to the legal profession. It was of some importance to the "protection of the revenue" that the tax which would be imposed upon the property of anyone passing at his death be not defeated by eleventh-hour transfers but the policy of attrition adopted by the Government in a short time placed the conception to which we have referred in a rather parlous position. It made an effort and it succeeded in many instances, to extend the theory to situations that some years ago would have met short shrift in our courts. Under its contentions and arguments any provision which had for its objective benefits to one's survivors bore that aspect.

To illustrate: Transfers in contemplation of death were deemed to be those made under the influence of imminent or at least near term dissolution. It was often argued that transfers made by people of advanced years were made in contemplation of death but this argument was almost universally rejected and such contemplation ascribed only to people in ill health or subject to conditions impelling them to prepare for it. In a most general sense, of course, everybody contemplates death but as it has been truly said, although remotely death is contemplated, transfers are often made in contemplation of life rather than death.

In the matter of *United States* v. *Wells* (283 U. S. 102) the court held that the words "contemplation of death" meant in relation to taxable transfers, that the thought of death is the imminent cause of the transfer. From certain language in the case, the idea crystallized that the word "motive" best defined the criterion. It was held that the motive to escape or reduce taxes that would otherwise be payable at death made the transfer includable in the estate. With this as a criterion, it will readily be perceived that most any transfer made during life can, by a slight stretch of imagination, be brought within the category.

In the *Estate of Paul Garrett* (8 T. C. No. 59, the decedent, in November of 1923, created a trust consisting of life insurance policies and income producing securities, the income of which was to be used for the maintenance of the life insurance policies. He died in 1940, nearly 17 years after the creation of the trust. The insurance policies and the securities from the income of which the premiums were paid, were held to be includible in the gross estate. There is a strong dissenting opinion which it is unnecessary to discuss but it is clear that Garrett did not create the trust in contemplation of death in the sense generally understood. Anyone at any age distributing property to his children might be said to be doing so in contemplation of death since he is giving it to them during his lifetime rather than waiting for dissolution.

These various sections have filled the courts with endless litigation in which fine-spun distinctions are drawn including one as farfetched as that property given away in trust is to be included in the estate of a donor if he had even the possibility of a reverter (*Helvering* v. *Hallock*, 309 U. S. 106). The authority of that case should not have lasted any longer than it took Congress to take note of it but it still stands. The Supreme Court sidestepped the doctrine of stare decisis and disregarded fundamental principles governing trusts and trust property in order to subject the property to taxation. Here again we have taxation by what we have previously called judge made ex post facto law.

In a recent case the court of appeals found it necessary to reverse a decision based upon *Helvering* v. *Hallock* where the possibility was so remote as to be about a thousand-to-one shot in any man's book (*Commissioner* v. *Estate of Singer*, C. C. A. 2, 161 F. 2d 15).

According to Mark Twain, when Eve presented Adam with an apple from the Tree of Knowledge, he said it was against his principles to eat it but he had found out that principles were of no force unless one is well fed, and he was hungry. We have about reached the same stage, that is: where principles are of no force when the tax collector calls.

At a time when we had no gift tax there was some justification for the inclusion in the estate of a decedent of property which he had transferred in contemplation of death. But contemplation of death meant something far different at the time of the adoption of those provisions than it means today. In the act of 1948, the Congress did something helpful by the amendment which excluded from the category transfers made more than 3 years prior to death, but that was only a half measure or less than that. As long as we have a gift tax, we do not need to include in the estate of a decedent transfers of any kind, even though made in contemplation of death. What purpose can possibly be served by involving the Government and its citizens in never-ending litigation on this subject?

What is the purpose of the gift tax? Obviously to implement the estate tax in such a manner that property, which is no longer in the estate of decedent because of transfers made during his lifetime, does not escape the burden of the tax. Why the "ifs" and the "ands" and the "buts"? If the Congress is not satisfied with the rate of tax on gifts, raise the rate to a parity with estate taxes. We are sure such action would deter the making of gifts, but it serves the purpose of preventing the loss of revenue, which the Congress was prepared to accept when it fixed the rate of tax on gifts. On the other hand, if Congress desires to encourage the making of gifts so that revenues can be presently realized, tax the gift when it is made, no matter in what form made that is to say without regard to revocability or reserved income or powers of diversion. If the property finds its way back into the estate of the settlor, it will become taxable at death, and provision should be made for a proper credit for the tax already paid. It would thus be unnecessary to tax to an estate property that was not in it at the time of death. With this change there will be eliminated also provisions dealing with contributions from donees.

. If we maintain a differential between gift and estate taxes, which has obvious advantages, the elimination of the contemplation of death provisions would make possible eleventh-hour gifts at the lower rate of tax. Consideration should therefore be given to the choice of equalizing gift and estate taxes in such instances.

If neither of these alternatives is acceptable, then by all means return to the conception of gifts made in contemplation of death before it became distorted by the pressure from a crusading tax collector, aided and abetted by a complacent judiciary, and include in the estate of a decedent only property transferred in the belief in imminent or near term dissolution. To implement this, provision should be made reducing to one year the period during which transfers are presumed to be made in contemplation of death.

We have suggested that all transfers, whether in trust or otherwise and whether revocable or irrevocable, be taxed; that all such transfers be excluded from the estate of the settlor or donor at death. In order words, let property that actually passes a death be taxed to the estate, not property that is included in the estate only through legal acrobatics and distortions. This of course has the disadvantage of simplicity which seems to be abhorrent but it accords with fundamentals which every person can understand, that is: that property belonging to a decedent at the time of his death is taxable as such and that which he has parted with in life is taxable under the provisions of the Gift Tax Act. Let us not be concerned in taxation with the fact that it might have come back to him but with the reality whether it did or not.

It is difficult in the present state of the law to determine what the real purpose of Congress was, that is: whether it desired to encourage gifts inter vivos and current revenue, or to discourage them so that larger revenues might ultimately be obtained through estate taxes. If the former objective is more desirable, we can achieve the results through the suggestions we have made. Certainly by their adoption, we shall create a sound pattern, thoroughly simple in its embraces and easily understood by all who are concerned.

BASIS FOR GAIN OR LOSS

We call attention to the inequitable treatment of gain or loss realized in the case of property acquired by gift inter vivos in contrast to acquisition by death. In the former cases the basis is declared to be the same as it would be in the hands of the donor or of the last preceding owner by whom it was not acquired by gift. In the latter it is the fair market value at the time of the acquisition.

In view of the fact that a transfer by gift is taxable in the same manner and upon the same theory as a transfer by death, there would seem to be no sound basis for the differentiation. It is not resolved by the fact that the tax on the transfer by gift is somewhat less than upon death. The property comes into the hands of the recipient in precisely the same way in both cases. The increment which accrues in the hands of him from whom the transfer emanated, has been subjected to the burden provided by law. The basis for determination of gain or loss should be the value of the property at the time of the transfer in both cases. We think the failure to treat both alike must have arisen from the fact that for considerable periods during the incidence of the Estate Tax Act there was no impost on transfer of property by gift. This inequity should be eradicated in the manner suggested.

WASH SALES

The present act as well as others that preceded it, provide for the exclusion of losses on the sale of securities in all cases where within a period of 30 days before or after the sale or disposition of such securities the taxpayer had acquired or has entered into a contract to acquire substantially similar stock or securities. We earnestly recommend the elimination of this provision. It represents another of the numerous efforts which the Internal Revenue Code reflects to distort the effect of perfecty normal transactions.

A gain or loss results from the sale or other disposition of a capital asset. Once such disposition is made, the gain or loss automatically results. One is not permitted to take the loss until then. We cannot understand why one should not be permitted to take the ordinary means available, and indeed required, for the establishment of a loss, nor why in order to establish it he must of necessity give up his position in a security, depressed at the moment but in the future value of which he has confidence.

Repurchasing it merely places him in a position where upon a future disposition of the security he uses the lower basis, that is, the repurchase price, for the purpose of determining future gain or loss. Such proceeding is permitted in the case of gains. By this operation the Government is not injured. On the other hand, the provision is utterly futile as a means to the end apparently desired for a taxpayer may accomplish the same result by simultaneous purchase of other securities. Thus all that the Government accomplishes is to drive him out of his position in the security which he preferred. What possible advantage this is to the Government is quite beyond our perception. Since he is permitted to realize gains, despite immediate repurchase, he should likewise be permitted to establish losses in the same manner.

The present act goes much beyond this. It denies the loss from sales or exchanges of property, directly or indirectly, between members of a family.

When the proposed extension of the restriction on wash sales was before the committee, it said:

"Many instances have been brought to light where transactions have taken place for the sole purpose of taking a loss for income-tax purposes. It is believed that the recommendation of the subcommittee if followed will effectually close this opportunity for tax avoidance. Experience shows that the practice of creating losses through transactions between members of a family and close corporations has been frequently utilized for avoiding the income tax. It is believed that the proposed change will operate to close this loophole of tax avoidance" (H. Rept. 704, 73d Cong., 2d sess., p. 23).

Was there really any loophole that needed to be closed? In order to take a loss a sale had to be made. Having the loss on paper, one has the right to take the action necessary to its realization. What earthly difference does it make to the Government or to the revenue whether Mrs. Jones purchases a security which Mr. Jones had held or it is purchased by someone else?

Under the laws of practically every State in the United States, husband and wife are free to contract in all respects, to own, hold, and dispose of property as if they were single. Why should this conception be distorted because taxation is involved? These distortions have been our besetting sin from the very beginning.

We do not doubt that Congress intended by the extension of the restriction to cover interfamily transactions as such and until recently purchase through the stock exchange of securities of the same corporations sold through the stock exchange by a spouse of the purchaser, was not held to be within the condemnation of this provision.

However, in recent cases of *Commissioner* v. *August Kohn* (158 Fed. (2d) 32, 4th circuit) and *Commissioner* v. *McWilliams* (158 Fed. (2d) 637, 6th circuit) the court of appeals reversing the United States Tax Court construed the word "indirectly" to cover such a transaction. In other words, that such separate purchase and sale constitute a sale between members of a family.

Certiorari was granted in the McWilliams case and the Supreme Court has affirmed.

Once again we are brought face to face with the uncertainties in which our taxpayers have become enmeshed. Normal transactions on the stock exchanges not in terms falling within the restrictions of section 24 (b) are held to be within it by construction. A taxpayer indulging in the approved method of establishing a loss and confronted with the advisability of doing so to offset gains, finds himself again the victim of taxation by judicial decree rather than by statute, at least by statute which is not susceptible of misunderstanding.

We urge the Congress to eliminate the entire provision dealing with family relationships but if that suggestion is not acceptable, to make it clear that transactions conducted in the normal course of business through the market places are not within the ban.

Notice should also be taken of the consequences of the decision of the Supreme Court. When the decision of the court of appeals came down, we inquired of the Bureau of Internal Revenue what basis would be attributed to the securities in the hands of the purchasing spouse since the statute made no provision for it. The Bureau declined to take a position. Thus the loss actually sustained by the selling spouse will have no recognition since there is no provision that the basis of the stock in the hands of the selling spouse shall be the same as in the hands of the purchasing spouse and we doubt seriously whether the Bureau is authorized to take any different position on the subject.

Should neither suggestion be acceptable, it will obviously be necessary to provide that in cases where such losses are not recognized, the stock shall retain the same basis as it had in the hands of the selling spouse. The very necessity of doing this forcibly demonstrates the artificiality of the whole business. If transactions were given their normal implications and taxation based upon them, we would have no occasion for such controversies and our citizens would not be continually victimized.

SECTION 45

While on the subject of so-called loopholes, we desire to direct the attention of the committee to section 45, Internal Revenue Code, because it points up what we have said about having tax laws that are definite and certain and leave no room for doubt concerning the liabilities that are imposed. Taxation should be by law and not by man. In section 45 that theory is more or less demolished.

It vests in the Commissioner of Internal Revenue power and authority in case of two or more organizations, trades or business (whether or not incorporated, whether or not organized in the United States and whether or not affiliated, owned, or controlled, directly or indirectly, by the same interests), to distribute, apportion, or allocate gross income; deductions, credits, or allowances between or among them if he determines that such action is necessary to prevent evasion of taxes or clearly to reflect the income of any of them.

Under that provision the sky is the limit and liabilities are at the whim and caprice of an administrative officer. We must have a yardstick for taxation. We have adequate provisions to cover fraud and other unlawful practices. Provisions of such character are the result of a misconception of the relations of government and its citizens. They are evidence of a trend away from our conception of those relations and a tendency toward despotism.

It is to be noted that the section does not establish any rules of practice or condemn intercompany business transactions of particular character but vests in the Commissioner of Internal Revenue unlimited and unrestricted power to increase the liability of the various affiliated businesses in such manner as he may see fit. It is all left to his determination and the committee will appreciate that that determination will be final unless entirely arbitrary.

Such an allocation was made by the Commissioner in Southern College of Optometry, Inc., Prentice Hall, T. C. Memorandum, Decision 47,070, Docket 10,556, and was disallowed in that case. Nothing short of the most flagrant abuse by the Commissioner of his power will entitle the taxpayer to relief and he will be exercising his power and authority whenever the notion strikes him. Our taxpayers ought not be asked to rely on his good judgment and discretion for determination of their liabilities. We urge that this section 45 be repealed.

SECTION 102

It will be noted that throughout this memorandum we have emphasized the importance of simplicity and of a system of taxation logical in all its impositions and faithful to fundamental principles. Punishment for violations of our laws is proper; punitive taxation has no justification and is abhorrent.

An example of this is to be found in section 102. Not only is it wholly punitive but the crime for which the punishment is inflicted is not and perhaps cannot be defined in terms so certain that the taxpayer may be conscious beforehand of its commission. That section provides for the imposition (in addition to all other taxes imposed by the act) of a penalty equal to the sum of 27½ percent of the amount of undistributed net income not in excess of $100,000, plus 38½ percent of the undistributed net income in excess of $100,000. That penalty is imposed on "every corporation other than personal holding companies if formed or availed of for the purpose of preventing the imposition of the surtax upon its shareholders * * * through the medium of permitting earnings or profits to accumulate instead of being divided or distributed." It is then provided that the "fact that the earnings or profits of a corporation are permitted to accumulate beyond the reasonable needs of the business shall be determinative of the purpose to avoid surtax upon shareholders unless the corporation by the clear preponderance of the evidence shall prove to the contrary." Let every man be adjudged guilty unless his innocence is clearly proven. Nice going for Government but not quite in accord with American tradition.

Nowhere in the Penal Code will there be found a crime made so by the determination of the judiciary, yet this is as much a penal statute, indeed more so, than one which imposes a fine for failure to file a return or for filing a false and fraudulent return. It must be borne in mind that this statute is not confined in its operation to investment companies. It embraces ordinary business corporations and it challenges them, at their peril, to retain their earnings or any substantial part of them for insurance of their stability and the expansion of their business.

The statute creates a presumption against them based upon the accumulation of profits beyond the reasonable needs of the business but what are the reasonable needs of a business and who is the best judge of them? Those questions are not left for them to determine. Honest and sincere though the executives of those corporations may be, it avails them nothing. A judge sitting in the Tax Court who may know as little about their business as a pig knows about Sunday, determines those questions for them and the statute pulls the props from under them by imposing upon them the obligation to satisfy the judge by a clear preponderance of the evidence that the purpose was not to avoid a surtax on the shareholders.

Suppose A, B, and C organize a corporation for the purpose of conducting a retail business. They start with a capital of $150,000 and one store. At the end of their first fiscal year they have gained $50,000 on which appropriate taxes have been paid. Obviously their purpose in embarking on the venture was to make profits and to reinvest them for the purpose of making additional profits. They hope to have other stores. We presume there is no objection to that. The economic wealth of this country has been achieved through the pyramiding of earnings which have been plowed back year after year for the upbuilding, expansion and security of business. This has always been one of the primary objectives of our economy. It is not assisted by compulsory distribution of earnings. On the contrary, our efforts in that direction are thereby frustrated.

We suppose it is not the purpose of a taxing statute to compel the relinquishment of the corporate form of transacting business but that is precisely what the statute accomplishes regardless of its purpose, that is: It induces the adoption of the partnership form of business though the corporate form would be far more desirable and much more advisable from all other standpoints. Furthermore it has led to an epidemic of corporate dissolutions with great resultant expense to taxpayers.

Not the least of the evils of such legislation is that its victims are small-business men operating in corporate form. It is absolutely powerless against big business indeed it is aimed directly at the small one. Taxation based upon ability to convince a judge of one's integrity of purpose partakes of the nature of trial by ordeal.

The statute is vicious. Its purpose is to force the declaration of dividends. It is not a commendable way to raise revenue and we have no right to resort to such methods unless they are absolutely necessary for that purpose. The fact that the section has been held constitutional as a means of "protecting the revenue" certainly is not justification for its enactment. The phrase is very convenient but in this setting it carries no conviction. The declaration of dividends is a matter within the sound discretion of the board of directors of a corporation. Neither the stockholders nor the Government can compel distribution. It is a contradiction in terms to say that a measure is for the protection of the revenue when such revenue accrues only by force of the so-called protective measure. It does not protect revenue. It creates it and does so by blackmail.

It would be well to look at the genesis of this section. In early days of income taxes corporations were taxed on their earnings, as they are now, but dividends in the hands of the shareholders were exempt upon the very proper theory that the same dollar should not be taxed twice. As long as this sound view of the matter prevailed there was no need for section 102 but under the pressure of need, the Congress closed its eyes to the inequity of double taxation on corporate earnings. With the removal of the exemption, the temptation to withhold the declaration of dividends was apparent.

If the Congress hearkens to the overwhelming demand for the restoration of the exemption, section 102 will go with it. Whether the exemption stays or falls, section 102 should be repealed.

ALLOCATION OF INCOME

Section 107 deals with earnings and permits a taxpayer to spread over the years in which services are rendered the amount received in one year, provided the amount received in that year is at least 80 percent of the total compensation for the services involved. We recommend that this section be liberalized to include interest and dividends which have been in default for a period of years.

It is tragic enough for those who are dependent upon such income to have been deprived of it through adverse conditions affecting corporations whose securities they hold. It is doubly so to be compelled to pay a rate perhaps two or three times greater upon receipt of this accumulated income than if it had been received ratably over the period. We think persons in that category deserve consideration and that the section should be liberalized to include them.

CORPORATE LIQUIDATIONS AND SALE OF ASSETS BY STOCKHOLDERS

This is an appropriate time to call attention to another example of taxation by judicial decree which ignores the legal standards by which such matters should be judged. We refer to those cases in which corporations have liquidated, distributed their assets to their stockholders, or to trustees for the stockholders, who in turn have sold the same to a purchaser. Some years ago the Treasury Departmentment took occasion to point out to the taxpayers at large that by this means double taxation could be avoided; that is to say, the tax upon the sale of the assets by the corporation and upon the distribution to the stockholders. However, not so long afterward the Commission proposed a deficiency in the tax upon a corporation where such a transaction was involved. It was sufficient for him that such a sale was in contemplation, or that negotiations had been opened for such a sale by the corporation before the liquidation took place, and that being sufficient for the Commissioner, it was also sufficient for the Tax Court and the appellate courts.

It was eminently proper for the stockholders to have liquidated, and as receivers of the assets to have entered into a contract for their sale, and thus to avoid having the same transaction taxed twice. The legal status of those steps is perfectly clear. Upon liquidation the stockholders became the legal owners of its assets and they alone had the right to enter into a contract for their sale at the time the contract was entered into, and they alone could convey the title, and theirs were the proceeds of the sale. Here we have the tax assessed upon a corporation and again upon the stockholders because they adopted normal legal means of avoiding that very thing, a course which had been recommended to them by the Bureau of Internal Revenue.

Many cases of similar character have received the attention of the courts. A reference to two of them will be enlightening. In *Acampo Winery & Distilleries, Inc.*, v. *Com. V. R.*, (7 T. C., No. 75) the Tax Court declined to sustain the Commissioner proposing to assess a tax against the corporation upon a sale by its stockholders of assets distributed to them in liquidation. The court held that the sale was by the stockholders and not by them in behalf of or as a step in a corporate transaction.

In *Wichita Terminal Elevator Co.*, (6 T. C. 1158), a tax against the corporation upon a sale by stockholders was upheld and the decision of the Tax Court sustained by a 2-to-1 decision of the Circuit Court of Appeals for the Tenth Circuit. (May 12, 1947, C. C. A., par. 9253.) The feature distinguishing the two cases is simply that in the latter case negotiations were first initiated by the president of the company prior to dissolution and transfer of its assets to a trustee in liquidation and his sale of the assets on behalf of the stockholders. Upon so small a distinction does tax liability, or worse yet, double tax liability, rest.

The language of the prevailing opinion forcefully reflects the attitude which puts taxation in the realm of the lottery:

"The transaction as a whole was cast in the form of conveyances of the properties of the corporation to Powell, as a liquidating dividend, dissolution of the corporation, and conveyances of the properties to the ultimate purchaser. The formal documents were molded in that pattern. The naked legal title passed from the corporation to Powell, and from Powell to the ultimate purchaser. And Powell was designated or referred to as agent for the former stockholders of the corporation. But in a case of this kind involving questions of liability for income taxes, the form of the transaction is not necessarily conclusive. The formal written documents are not always inflexibly binding. *Helvering* v. *Lazarus & Co.* (308 U. S. 252) (39-2 U. S. T. C., par. 9793). *Income taxes cannot be avoided by methods, devices, anticipatory arrangements, or contracts which merely give ill-founded complexion to the reality of a transaction in its relation to tax liability. Lucas* v. *Earl* (281 U. S. 111) (2 U. S. T. C., par. 496). *Griffiths* v. *Commissioner* (308 U. S. 355) (40-1 U. S. T. C. par. 9123). (Italics supplied.)

"The corporation was effectively dissolved for ordinary purposes under State law. And in some instances a corporation may distribute its assets among its shareholders as a liquidating dividend and not be subject to income tax on the gain when the property is subsequently sold by the former stockholders. *Commissioner* v. *Falcon Co.* (127 Fed. (2d) 277) (42-1 U. S. T. C., par 9403). But in determining the question of tax liability, a transaction of that kind should be scrutinized with care. *Tazewell Electric Light & Power Co.* v. *Strother* (84 Fed. (2d) 327) (36-2 U. S. T. C., par. 9351)."

Here is the challenge. It is unmistakable and unavoidable. Are we to adhere to the principle enunciated by Judge Holmes and oft repeated that one not only has the privilege but the duty as well to reduce or avoid taxes, so long as the means adopted are lawful or repudiate it for one that offers nothing but uncertainty and injustice from the tax standpoint? It is no answer to say that uncertainty and injustice are possible in all litigation, for in taxation the goal should be to set standards which make the results of any transaction reasonably certain and the avoidance of the necessity of resort to the courts for definition and determination.

The position of the taxpayer is precarious indeed that rests upon such flimsy differentiations of like situations. The sale in each was made by the stockholders. In each they dissolved their corporations and took over their assets in liquidation in order to avoid double taxation. Their methods were in accordance with legal procedure and effective for their purposes. They had the right to do precisely what they did. And the difference in their liabilities turned upon the dogmatic determination of the Commissioner, the assumption of its correctness by the Tax Court and the assumption of the Tax Court's infallibility by the circuit court of appeals under the drive of the Dobson case.

Taxation of income is beyond doubt one of the soundest methods for raising revenue. We thought when we amended the Constitution to permit it that it was also one of the simplest forms of taxation. The Supreme Court gave us reassurance when it defined capital as the tree, and income the fruit thereof. What has since evolved from this simple conception is a complete distortion of the system we set out to establish which has well-nigh destroyed the good that was inherent in it. No method of taxation can be sound in which the liability of the taxpayer rests upon judicial determinations rather than legislative standards. We must quit giving lip service to the conception that a man has a right to channel his transactions in such manner as to avoid or reduce his taxes so long as he does so by means which the law allows and then tax him as if by so doing he had been guilty of an offense called tax avoidance.

EXEMPTION OF INSURANCE FROM CLAIMS FOR TAXES

Enlightened States consider the claims of widows and orphans to be paramount to those of all creditors. We believe a large majority, if not all of the States of the United States exempt from the claims of creditors and seizure by them or by their representatives, of the cash surrender value and the proceeds of life-insurance policies. The Government of the United States has failed to join them in this highly desirable and benevolent policy. While it has recognized the propriety of the exemption in the bankruptcy statutes it has failed to extend this recognition to process for the collection of taxes.

Man's first obligation is the protection of his family. The primary means, and in many cases the only means available, is through life insurance. It should be and has been made generally throughout the United States untouchable except for those for whose benefit it is intended. The Government of the United States reserves the right for the "protection of the revenue" to destroy wholly and completely the protection of the family and to make public charges of the wife and children of decedent tax debtors, for the United States is not bound by the exemptions contained in the State statutes.

Our position in this respect is a reflection upon our morality. We should provide for recognition of the exemptions granted by the laws of the State of residence of the taxpayer or, if deemed more desirable, adopt a Federal statute granting uniform exemption to all taxpayers. It is unseemly for the Government of the United States to seize for the satisfaction of its debts, assets which have been made immune by the States even to their own obligations.

PROCESS OF GARNISHMENT

In most States of the United States debts may be satisfied by levies upon salaries and wages through the process known as garnishment. The levies, however, are in most cases limited to 10 percent of the salary of the debtor. Two considerations are implicit in this procedure. One that the salary or wage earner must be permitted to retain the proceeds of his labor or else become a public charge and if he is a man of family carry the members of that family with him. Furthermore he would have no reason to continue at work if his entire compensation could be applied to the payment of a debt.

These fundamental considerations have not yet been adopted by the Federal Government. It alone claims the right to take the entire salary or compensation of a wage earner in satisfaction of a claim for taxes. In practice, the collectors refrain from doing this but since the Federal Government holds itself beyond the pale of State exemptions and restrictions, the power is there and it has been used upon occasion.

We do not think this is an arguable matter. The mere presentation of the situation, it seems to us, should be sufficient to call for recognition in regard to garnishment of the rules that prevail in the State of a taxpayer's residence.

DISCHARGE OF TAX LIABILITY IN BANKRUPTCY

One next suggestion is that liability for taxes be made dischargeable in bankruptcy. The Bankruptcy Act is designed for the rehabilitation of debtors. Freedom from debt is accorded in consideration of the surrender by the bankrupt of his property for distribution to his creditors. The United States is entitled to preference above all others in such distributions. Nevertheless, although he has delivered up all his possessions, he cannot free himself from the claim of the sovereign. The very purpose of the Bankruptcy Act is thwarted by the failure of Congress to subject liability for taxes to discharge in the same manner as all other debts, for discharge in bankruptcy is of no avail to a debtor if he must remain subject to the most onerous debt of all. The right to preference on distribution is all that the United States should demand. Exception, of course, should be made in cases of failure to file returns and in cases of false and fraudulent returns.

INSURANCE PAYABLE TO THE UNITED STATES

The burden of taxes on estates for substantial proportions is increased by the necessity of converting the assets of such estates into cash for the purpose of meeting the tax liability. Thus in the very high brackets estates are not only seriously depleted by the tax but may be further depleted by forced liquidation. Assuming that we still adhere to the American tradition of taxation for revenue only and that estate taxes will be substantially reduced as rapidly as the necessities of the Government will permit, our objective should be to alleviate the impact of whatever taxes are imposed.

It has been suggested that these objectives may to a limited extent be reached by permitting taxpayers to acquire policies of insurance payable either to the appropriate Collector of Internal Revenue or to a trustee upon an express trust to pay over the proceeds to such collector, such proceeds to be exempt from estate taxes to the extent of the actual tax liability. The adoption of this proposal will result in facilitating the collection by the Government of the taxes as well as cushioning their impact upon the estate.

It is a common occurrence that substantially all or at least a great proportion of the assets of a decedent's estate are represented by investments in business that are closely held. The effect of the enforcement of the obligation for taxes in accordance with the letter of the law would be devastating. The situation presently must be met by indulgence on the part of the collectors of internal revenue.

The argument might be raised that the proposal makes it possible for a taxpayer to exempt a substantial part of his estate by payment of premiums which might otherwise constitute a part of his estate at death, but there is no assurance that such sums will survive life's vicissitudes any more than there is assurance that ordinary life insurance policies will not be forfeited or encumbered to the full extent of their loan values. The use of premiums for the purchase of insurance which cannot be availed of for any other purpose than the creation of a fund to defray an obligation to the Government insures against their dispersion and creates a value desirable both from the taxpayer's and the Government's point of view. In any event, it seems that the objective is worth whatever incidental sacrifice may be entailed.

STATUTE OF LIMITATIONS

The general limitation prescribed in section 275 of the IRC for the assessment of taxes is 3 years. In case of false or fraudulent returns or failure to file returns, assessment may be made at any time. The time for collection after assessment is 6 years. These provisions are fair to taxpayer and Government.

In the Revenue Act of 1934 several amendments were made. We direct attention to subdivision (c) of section 275, which extends the period for assessment to 5 years in cases where the taxpayer omits from his gross income an amount properly includible therein which is in excess of 25 percent of the amount of gross income stated in the return.

Either the 3-year period of limitation is a proper one or it is not, and the criterion of this is not to be found in the extent of the error which has been made. If returns are examined by the Bureau of Internal Revenue in due course, omissions from a return will be discovered whether they are large or small, except in the case of false or fraudulent returns where no limitation whatever is prescribed. The omission of so substantial a portion of gross income will, except in case of fraud, be the result of a well-grounded and well-justified belief that what has been omitted is not income, or at least not taxable income, and that it is within those categories will be known only after a tribunal of competent jurisdictions has passed upon it.

The section seems to have no other purpose or justification than to give the Commissioner of Internal Revenue an escape from the consequences of his own negligence. The size of the error is hardly a proper criterion by which to measure the propriety of statutes of repose. It would be as logical to suggest a sliding scale of limitation based upon the size of the error. We suggest that subsection (c) be repealed.

The same observations apply to subdivisions (d) and (e), in which the statute of limitations is extended to 7 years in cases involving stockholders' shares in foreign personal holding companies and personal service corporations.

OUR ARCHAIC SYSTEM OF TAX ASSESSMENT AND COLLECTION

The collectors of internal revenue are appointed by the Government. Their status is somewhat anomalous. They appear to be independent entities at one moment and representatives of the Government at another.

Returns are filed with the collectors. The liability of a taxpayer is charged against the collector in whose office the return is filed. He becomes a debtor of the United States. He operates independently and the Treasury Department disclaims any right to interfere with him in the performance of his duty. If he fails to effect collection, he must file an application to the Treasury to abate his liability to the extent of such failure and presumably is expected to furnish adequate reason for his failure to do so in order to obtain relief. He may be sued by a taxpayer for recovery of taxes erroneously collected and in the event of recovery the judgment becomes an obligation of the United States provided the court in which the action is tried issues a certificate of probable cause.

After assessment, further proceedings or negotiations frequently ensue. During their pendency a request of the Commissioner for forbearance meets with the information that that is a matter between the taxpayer and the pursuing collector. The latters feels his responsibility; he will forbear if the Commissioner requests it, which the Commissioner will not do. The taxpayer may after agonizing efforts obtain the indulgence he seeks, but he will have a very unhappy experience of buck passing in the meantime.

This procedure has been in effect without fundamental change for more than 75 years. Suggestions for its simplification seem hardly to be necessary since they ought to be obvious. The conception of a debtor and creditor relationship between the United States and the various collectors of internal revenue and their separate and independent status which obtains only in theory and at convenience savors of childhood fantasy.

The United States is the creditor. The Commissioner of Internal Revenue is chargeable as its agent with the duty of assessing and collecting the tax. The collectors of internal revenue should be his agents for that purpose and all the red tape incident to the present procedure should be eliminated.

We direct attention to the provisions for the recovery of overpayments of taxes. The United States Tax Court has jurisdiction to determine whether an overpayment has been made in a year in which a deficiency is asserted. Though the court is held in very high esteem, its authority in relation to overpayment goes no further.

The Government is very jealous of its sovereign rights. It vests jurisdiction of suits for the recovery of taxes primarily in the Court of Claims but accords the right to a taxpayer to bring suits against the United States for such recoveries in a district court of the United States provided the amount involved does not exceed $10,000 (or the collector to whom the taxes were paid is dead or out of office). Here comes the anomaly. The collector, being theoretically an independent entity being charged with an erroneous and illegal collection, may be sued in the district court for any sum. When judgment is recovered against him the United States assumes the obligation upon a certificate of probable cause.

If the suggestions for simplification of the relations between the United States and the collectors are followed, suits against the collectors would naturally fall. The question would then present itself whether the limitation of suits against the United States in the district courts should be continued or be raised to a very substantial degree. It is desirable of courts to make local courts available to taxpayers but the limitation to $10,000 hardly reflects confidence in our courts which the Government should be the first to profess. A system which limits a suit against the United States to $10,000 in the district court and subjects it to liability for millions in a suit against the collectors, requires correction.

IN CONCLUSION

Viewing the excessive rates of taxation on incomes, gifts, and on the estates of deceased persons, on capital gains, the double taxation of corporate earnings, the effect of provisions such as section 102, we cannot but perceive that any economic progress we may make will have to be accomplished in the face of almost insurmountable obstacles; and, as we have endeavored to demonstrate, the complications and inequities of the taxing statutes are not the least of its infirmities. We must raise the money needed for the support and maintenance of the Government. We do not have to do it oppressively, nor for political purposes, nor in pursuit of idealogies, and we can do it by simple legislation that everyone who runs may read. The last is the consummation devoutly to be wished.

	More than 24 months	50		
1942 to present	More than 6 months	50	do	50 percent of gain included in income.

Senator BYRD. The first witness this morning is Mr. John W. Caffey.

Senator MARTIN. Mr. Chairman, I would like to state that Senator Millikin is not well and cannot be here on this side of the committee.

I will have to leave myself because I must testify before two committees this morning, and I feel this is one of the very important things confronting us, because we will probably get into the question of law enforcement and things like that.

We do not want to get back to the days of the eighteenth amendment, so I think it is very important. I want to say this to you, Mr. Chairman, that it is my intention to very carefully read the testimony, and I know the other members will, and I am sorry that we do not have the representation here this morning.

Senator BYRD. We understand your situation; we are sorry you will not be here. If you can get back, we will be glad to have you here.

Senator MARTIN. I will get back if I possibly can, but I have got to appear before two committees this morning. I think a lot of folks do not realize the conflicts that come along. I asked to testify before a couple of committees this morning, and, of course, I have got to be present, so if you will excuse me I will try to get back, but I am not sure.

Senator BYRD. Mr. Caffey, counsel, Wine Conference of America.

STATEMENT OF JOHN W. CAFFEY, COUNSEL, WINE CONFERENCE OF AMERICA

Mr. CAFFEY. My name is John W. Caffey. I am a lawyer, with offices at 1523 L Street.

Out of deference to the chairman's request, the wine industry is filing their prepared statement.

Senator BYRD. Thank you very much, Mr. Caffey.

Mr. CAFFEY. If there are questions that any of the members wish to ask, I will try to undertake to answer them.

Senator BYRD. Thank you. There are none. You may insert your statement into the record.

(The prepared statement of John W. Caffey referred to follows:)

STATEMENT ON BEHALF OF THE AMERICAN GRAPE AND WINE INDUSTRY

The American wine industry, consisting of 158,000 grape growers in 44 States, and 800 bonded wineries, most of which are family owned and operated, produces a beverage of moderation and temperance for home consumption; and although this basically agricultural industry is still in its infancy in America, it always has evidenced a willingness to contribute, in the form of taxation, its share of the ever-expanding cost of maintaining and defending our form of government.

This attitude was made clear by the grape and wine industry witnesses who appeared before the Committee on Ways and Means, in protest against original Treasury Department proposals that excise taxes on wine be increased up to 233⅓ percent over the present rates.

We attach hereto (exhibit No. 1) the statement of Mr. Harry Baccigaluppi, former president of the wine industries insitute, setting for that committee the economic background of the Nation's grape and wine industry. This statement points out the disastrous effects of the proposed rates upon the grape and wine industry, particularly in view of the Treasury Department's own decision, T. D. 5829, issued February 22, 1951, which officially classified the wine industry as one of the only eight depressed industries (and the only agricultural industry) entitled to special consideration for excess profits tax treatment for the taxable years ending after June 30, 1950. Furthermore, the Treasury experts and technical staff estimated that the recommended increases, if enacted into law, would result in a decrease in wine consumption variously stated from 15 percent to 25 percent.

The immediate impact of the increases originally proposed, upon the grape farmers throughout the Nation, reached such proportions that there were few Members of the Congress who were not literally besieged with protests and appeals for assistance. These farmers and their allied associates in business, who for years had labored in their vineyards with the thought that they were approaching a new day, well knew the catastrophic effect on their hopes and aspirations if the Treasury's recommendations were enacted into law.

So strong and sincere were the protestations, that the California delegation in the House of Representatives, numbering 23, and representing a State which produces about 85 percent of all of the wine in America, and having about one-third of its total acreage in fruits and nuts, filed with the Committee on Ways and Means a resolution unanimously expostulating the Treasury's recommendation and appealing for fair and equitable treatment (exhibit No. 2). Several members of this delegation also appeared in person before the committee in further presenting their views. In addition, two distinguished Congressmen from the State of New York vigorously pleaded for a nondiscriminating tax on wine. The American Farm Bureau Federation, the California Department of Agricultural, and other organizations joined in the demonstrations. The California General Assembly unanimously passed a resolution memorializing the Congress to refuse to enact the proposed discriminatory tax on wine (exhibit No. 3). Many editors, including Collier's magazine (see April 14, 1951, issue, p. 80) (exhibit No. 4) took occasion to severely criticize the Treasury recommendation for wine taxes. A complete list of the grape and wine industry witnesses appearing personally before the Committee on Ways and Means is attached hereto (exhibit No. 5).

The Committee on Ways and Means made a sane approach to this subject matter and undoubtedly made a complete and thorough study of the Treasury's proposals and of the end result upon the wine industry, as is evidenced by the language employed by the committee in its report to the Congress on H. R. 4473 (see Record p. 40), to which your attention is specifically, but respectfully, directed. The committee flatly rejected the Treasury's proposals and adopted for wine an average over-all increase of about 12½ percent. The following is quoted from that committee's report to the Congress.

"Your committee deemed it appropriate to make only a moderate increase in the case of taxes on wines because of the importance of wines to the grape-growing industry. Between one-third and one-half of the total grape crop is customarily absorbed by wine. The demand for wine, therefore, also has an important effect on the prices which can be obtained by producers of raisins and fresh grapes, the two other important uses of grapes. Moreover, in view of the fact that it has been necessary for the Department of Agriculture at times since the end of World War II to support the price of raisins, it would appear inappropriate for your committee to make a substantial increase in the tax on wine which might have the effect of requiring further price supports. In addition, it should be pointed out that wine consumption in the United States relative to consumption of other forms of alcoholic beverages is relatively low when compared to relationships generally established abroad. Moreover, the wine industry is one of the few industries which has been classified under the excess-profits tax as a depressed industry."

In addition, the minority report attached to the committee report, among other things, states, at the bottom of page 150:

"* * * excise taxes on items now taxed have reached their limit."

We feel that the committee originating this bill did not arrive at its conclusions until it had exhausted all sources of available information as to what a fair and just tax on wine ought to be as related to other items on which excise taxes are levied. This conclusion was, of course, based on the information available to it at that time.

Subsequently, however, on July 10, 1951, the Department of Agriculture released its preliminary annual estimate of the grape crop which reflects an estimated yield this year of 3,270,700 tons of grapes—an all-time high (4.8 percent increase over the record year of 1946). This agriculture report forecasts for us a potential surplus of grapes and decline in values and in returns to farmers and wineries similar to that experienced by our industry in 1947-49, following the surpluses created by the 1946 crop. The same situation again confronts us as that which lead the Treasury Department to find us a "depressed industry" in its Treasury Decision No. 5820 referred to in the report of the Committee on Ways and Means.

Furthermore, wine sales so far this year, under existing tax rates, have experienced a sharp decline compared with sales for the same period last year - a drop of 10 percent. This means more carry-over inventory to be added to the forthcoming surplus crop this fall.

Thus we find ourselves in a peculiar position in that, as late as the end of June of this year, the industry felt that it could accept the increased excise taxes provided in H. R. 4473 without greatly disturbing its financial and economic structure; whereas now, only a month later, we are compelled to ask the Senate Finance Committee to delete from the tax revision bill any increase in excise taxes on wine because of the pertinent and appropriate reasons heretofore cited. We are not "blowing hot and cold" and are exceedingly reluctant to ask the Senate for this relief from an adverse condition which was heretofore unpredictable; but this is further proof of the constantly perilous and aleatory position of the wine industry.

It should be borne in mind that grape growing, like the growing of peaches, apples, and other tree fruits, is a strangely unique and hazardous farming venture, because it is not subject to annual crop rotation to offset surpluses and shortages.

It requires 5 or 6 years for vine plantings to come into maturity and productivity and once a vineyard is started, there is no opportunity to supplant it with another crop without suffering the loss of the total original investment. When the cotton, grain, tobacco, potato, or peanut producer experiences a year of bumper or surplus crops, he can readily adjust planting in the light of the carry-over or shortage resulting from the previous crop. Not true with the vineyardist. When he puts his labor and earnings in the ground, he, of necessity, lives with the result for many, many years to come and necessarily has to gamble with climatic conditions and other acts of providence which he is utterly helpless to control. Furthermore, much of the land planted to grapes is not suitable for any other cash crop.

The wine industry, under normal conditions, provides a continuing market outlet for about 50 percent of all the grapes grown in the United States. Indeed, the wineries are really the stabilizer for the nation's 158,000 grape growers, employing some 350,000 people with a total investment of approximately $575,000,000. 95 percent of all bonded wineries have their own vineyards and only a small percentage of the total wine production in this country is controlled by large corporations. Even these depend on widespread purchases from grape growers.

The present tax rate on table and dessert wine represents from $24 to $48 per ton of grapes depending on the tax grade, in direct Federal excise taxes, while the average return to growers from grapes during the last 4 years was only about $38 per ton. Thus we find that, like the tobacco farmer, the grape grower's return is only about the same amount the Federal Government extracts in excise taxes.

Moreover, wine represents only about 5 percent of the consumer dollar spent for alcoholic beverages, and is the least stable and the least profitable alcohol beverage industry. Consumption of wine is less per capita than other alcoholic beverages and, as a comparatively new American industry, it must undergo further reasonable development and expansion if the grape industry is to move its surplus crops and service.

With reference to the tax imposed on champagne and other sparkling wines, which have been unjustly taxed as "the rich man's drink," we respectfully petition the committee to (a) reduce the presently existing champagne rates to a more proportionate figure, and (b) that the champagne tax be levied on a gallonage basis as in the case of other types of wine in lieu of the existing ½-pint unit basis. This latter proposal would cost the Treasury nothing and remove a needless burden imposed on champagne producers. Actually the Treasury is collecting more tax dollars on champagne than the law itself contemplates for the reason that the tax is levied on ½-pint units when champagne is packaged in 1/20th, 1/10th and 1/5th gallon containers. Adjustment of this inequity is long overdue.

Respectfully submitted, this 30th day of July, 1951.

WINE CONFERENCE OF AMERICA[1]
By: GREYTON H. TAYLOR, *Chairman*,
JOHN W. CAFFEY, *Counsel*.

EXHIBIT 1

STATEMENT OF HARRY BACCIGALUPPI BEFORE THE COMMITTEE ON WAYS AND MEANS, MARCH 12, 1951, WITH REGARD TO PROPOSED WINE EXCISE TAXES

My name is Harry Baccigaluppi. I am president of the California Grape Products Co., a medium-sized winery at Delano, Calif. We have grapes of our own, and regularly crush grapes for our neighbors who have vineyards in that area.

I am speaking today not only for myself and our growers, but also for the rest of the winegrowers in California. I happen to have served two terms as president of the Wine Institute, which is the trade association for the California wineries, and our members have asked me to express their views with mine.

In addition, I should like to point out that the Wine Institute is a member of the Wine Conference of America. The conference is a national group composed of 19 wine associations from all of the principal wine-producing and wine-marketing areas in the United States.

I naturally will speak primarily from my own California experience. Mr. Greyton Taylor, the chairman of the Wine Conference, who will address you a little later, is from Hammondsport, N. Y., in the Finger Lakes district. He will address you from the point of view of the wine-growing industry in States other than California.

All of us, from all over the country, are affected quite similarly by the proposed taxes, and the witnesses you will hear today represent the unanimous view of all persons in this country engaged in growing grapes and other fruits for wine, in producing wine, or in bottling wine for market.

II

We all realize that there is a serious need for additional revenue, and I doubt very much whether we should have appeared before you today if the Treasury's proposals for increased wine excises had borne any reasonable relationship to the economics of growing grapes for wine, and preparing the wine for market and selling it. We must necessarily look at our position from a long-range point of view, for we feel that the imposition of these new taxes, on top of the already substantial so-called temporary rates established in 1944, is going to be with us for a long time to come.

The Treasury has proposed to you the following rates:

Table wine: 50 cents per gallon; a 233-percent increase over the present rate of 15 cents per gallon.

---

[1] The Wine Conference of America is the official national organization representing the grape growers and the producers and distributors of wine. It comprises the various State and sectional grape and wine industry associations, representing 98 percent of the movement of all wine in the United States, a list of which follows:

American Wine Association, 292 Madison Avenue, New York, N. Y.
Associated Vintners of the Middle West, 33 North LaSalle Street, Chicago 1, Ill.
Bottle Fermented Champagne Producers, Inc., 901 Barr Building, Washington, D. C.
Council Bluffs Grape Growers Association, 900 South Seventh Street, Council Bluffs, Iowa
Finger Lakes Wine Growers Association, Naples, N. Y.
Maryland Institute of Wine & Spirits Distributors, Inc., Suite 600, Hearst Tower Building, Baltimore, Md.
Michigan Wine Institute, 460 South Kalamazoo Street, Paw Paw, Mich.
National Association of Alcoholic Beverage Importers, Inc., room 700, National Press Building, Washington, D. C.
Wine Association of Pennsylvania, Post Office Box 6790, Philadelphia, Pa.
National Wine Association, care of Monarch Wine Co., Brooklyn, N. Y.
Ohio Grape Growers & Vintners, Post Office Box 595, Sandusky, Ohio
Ohio Grape Growers Institute, 31734 Lake Road, Avon Lake, Ohio
Ohio Wine Dealers Association, 53 St. Clair Avenue, Cleveland, Ohio
North Carolina Association of Wine Control, Apartment 4–A, Carolina Hotel, Raleigh, N. C.
Texas Wine Association, Brown Building, Austin, Tex.
Vermouth Institute, 601 West Twenty-sixth Street, New York, N. Y.
Washington Wine Council, 9117 East Marginal Way, Seattle, Wash.
Wine Distributors of Northern California, 814 Montgomery Street, San Francisco 11, Calif.
Wine Institute, 717 Market Street, San Francisco 3, Calif.

Dessert wine: $1.50 per gallon; a 150-percent increase over the present rate of 60 cents per gallon.

Sparkling wine: $4.40 per gallon; a 47-percent increase over the present rate of $3 per gallon.

Carbonated wine: $3 per gallon; a 50-percent increase over the present rate of $2 per gallon.

I think this Treasury proposal can be illustrated another way. During this last calendar year excise taxes yielded $72 million from the 140 million gallons of American and foreign wines consumed in the United States. The Treasury has stated to you that, under its proposed rates, it will collect $170 million in wine excises, which is an over-all increase of 135 percent in the tax bill for wine. This means a weighted average of about $1.20-per-gallon tax on all the various kinds of wine now moving to market as compared to the present over-all weighted average of 51-cents-per-gallon tax.

The Treasury's proposals have greatly alarmed growers and vintners all over the country. To explain why we are so alarmed may take explanation of a kind that does not often arise before the Committee on Ways and Means.

I believe I am correct in stating that wine and tobacco are the only agricultural industries subject to an excise tax for revenue purposes. Substantial excise taxes raise special problems with respect to any industry of an agricultural nature. The Treasury's proposals will require going into our agricultural economy in some detail, but we shall try to be as brief as possible in getting the principal facts before you.

III

To give a proper perspective to our problem, I think I ought to point out, first, that winegrowing is definitely not big business in this country. It is primarily small business, not only as an industry, but also with respect to the individual persons or firms engaged in it.

The Department of Commerce has published estimates of the number of dollars the consumer pays for alcoholic beverages, and their figures show that, in the last few years, consumers have been willing to pay only about $500 million annually for all wines (California, eastern, and imported). This was during a period when consumers bought a maximum quantity of wine, culminating in the 1950 consumption figure of 140 million gallons.

Nevertheless, this expenditure was only about 5 percent of the total amount spent for all alcoholic beverages. The consumption of wine is only slightly over nine-tenths of a gallon per capita which is also less than that for any other beverage. From these figures it is quite obvious that winegrowing is not a big industry.

Next, within the industry itself there is a tremendous number of sharply competing units. There are over 800 bonded wineries spread through 20 States, on top of which there are approximately 500 wholesalers, who bottle wine brought in bulk from grape-growing areas to areas of local distribution. These 1,300 units take practically every form of known business organization—individuals, partnerships, and farm cooperatives, as well as stock corporations that are usually family-owned. Some produce wine from their own grapes, others buy grapes to add to the supply from their own vineyards, others produce wine on contract either with local growers or with purchasers of wine from other areas. On the average, however, about 50 percent of the grapes crushed for wine are crushed by the owners of the vineyards where they are grown.

According to the 1947 census of manufactures, the average employment in the 418 winery firms analyzed was only 20 employees per firm.

The United States wine industry, with only 5 percent of the alcoholic-beverage business, is not only a relatively small business in itself, but the entire business that we now have must be divided many ways among a tremendous number of competing units.

IV

I have said that about 50 percent of the grapes crushed for wine are crushed by the owners of the vineyards where the grapes are grown.

It is also a fact that about 50 percent of all grapes grown and moved to market are moved to market in the form of wine.

The total customary outlets for grapes are either fresh shipment (in which form the crop is perishable), or in some nonperishable or semiperishable state such as dried fruit, or wine, or grape juice, or jams, jellies, and preserves.

These different outlets for grapes are utilized by the farmer as supply and demand may dictate. In many cases it is possible for the farmer to select all or several of these outlets for his crop as he may think most advisable. In other cases, individual farmers might be confined to a single one of these market outlets because of the particular varieties of grapes they grow or the locality in which they are grown. But the net effect on the industry as a whole has been that any impediment to the movement of grapes, into any single outlet, will cause an oversupply of grapes in the other possible outlets, with parallel reductions in returns to growers from all outlets.

For example, in our State of California, next to grapes for crushing into wine the drying of grapes into raisins is a principal outlet for the farmer's grapes. If an impediment is placed on the movement of grapes into wine, then an excess of grapes will be moved for drying into raisins, with resulting lowered returns to farmers for their crop, and the lowered returns in the wine field will be reflected in comparably lower returns in the raisin outlet. In the Eastern States, where the climate is not suitable for drying, a comparable outlet is found in processing grapes into grape juice or into jams, jellies, and preserves. Here, too, any impediment to the wine outlet for grapes is bound to have an adverse effect on farmers attempting to supply the other processing outlets mentioned.

The assistant Director of the California State Department of Agriculture, Mr. W. C. Jacobson, will follow me and explain to you this relationship between the various outlets for grapes in more detail, but I should like at this point to emphasize that a tax on any single outlet for grapes that becomes an impediment to the movement of grapes into that outlet, becomes in fact a tax on every other outlet for grapes even though these other outlets are not mentioned in the tax bill. Thus, a tax on wine is also a tax on raisins and on grape juice, unless it is set at a level which can be fully absorbed by wine purchasers.

V

The next thing I should like to point out is the very wide fluctuations from year to year between supply and demand, because, like other farm crops, we cannot control growing conditions and thus cannot control supply from year to year.

At the vineyard level you find variations due to weather and to other factors that cause substantial variations in the tonnage of grapes. In recent years the yield of grapes in California has ranged from about 2,300,000 tons to 2,800,000 tons, which is a variation of approximately 10 percent up or down from the average. This is a fluctuation which, I believe, would be considered normal over a long-term period. This 10-percent fluctuation represents 500,000 tons of grapes which, when translated into wine, means a possible variation of 50 million gallons, or more than one-third of the present demand for wine in this country.

In the wine outlet, a normal variation under current conditions would be about 300,000 tons, equal to about 30 million gallons of wine or about 20 percent of the current demand for wine. Under abnormal conditions this variation has reached as high as 500,000 tons of grapes. These fluctuations in the available supply of grapes for wine cause sharp annual variations in returns to growers from the wine outlet. Since 1934, wine has returned to California grape growers an average of 70 percent of parity. In giving you this figure of 70 percent, I am leaving out the abnormal years of 1942 through 1946 when the Government went into the market for abnormally large quantities of dried fruit for lend-lease and the Marshall plan, with the result that there were nowhere near enough grapes to satisfy the normal demand for wine.

This 70-percent figure is not an official published figure for grapes crushed for wine but has been calculated from the data available for parity values for grapes for all purposes.

The exact figure itself is not important, whether it be somewhat higher or somewhat lower than 70 percent. The important fact is that in arriving at this 70-percent average, since 1934, there were sharp variations from year to year ranging as low as 50 percent of parity and as high as 98 percent of parity. This is roughly a variation in returns from plus 33⅓ percent to minus 33⅓ percent from the average.

The point I wish to stress particularly to the committee is that over a long-term period the business of growing grapes for wine, and producing wine, is one in which we must expect very substantial variations in returns in order to arrive at the average level of return which our particular business involves. Incidentally, I believe that you will find that an average long-term return of 70-percent parity is not a particularly high level of return for an agricultural industry.

A very striking illustration of the low end of these fluctuations occurred just recently. On February 2 of this year, the Treasury Department issued Treasury Decision 5820 announcing that eight industry groups had been determined to be "depressed industry" groups for excess-profits-tax purposes. Wine making was the only food or food-products industry group contained in the list. This determination was made for the years 1946 through 1949.

What had happened was that an oversupply of grapes had been made into wine from the 1946 crop, and this had depressed the wine market very sharply in the spring of 1947. This depressed condition continued until last spring, when supply finally began to adjust itself to demand. This last fall, growers received $61.15 for their grapes, but in the crop years 1947, 1948, and 1949, they received only $29.80, $30.30, and $26.80, respectively, which was barely above estimated cost of production.

The points I want to make to the committee are—

(a) That, in our industry, there is no control over supply in relation to demand.

(b) That we go through periods of substantial depression, and

(c) That these depressed conditions exist alike for both the growers and the vintners.

Incidentally, I am somewhat puzzled as to how the Treasury Department managed to draw the conclusion that an industry, which had been so thoroughly depressed for several years running, could suddenly become the source of 135 percent more excise revenue than it is now providing.

VI

I have tried to give the committee a picture of how the wine industry normally operates and of its extremely close connection with grape growing.

I should like now to revert to the Treasury's tax proposals.

The first noticeable thing is that their estimate of increased yield of revenue from the new rates is substantially lower, percentagewise, than the percentage increase in the rates themselves. They estimate that the present rates, if continued, would bring in $80 million a year (although they have actually only collected $72 million this last year) and then they estimate that the new rates would bring in an additional $90 million. This is an estimated revenue increase of 112 percent, but the percentage increase of the new rates, on a weighted average basis for the various kinds of wine, is about 170 percent. In other words, a rate increase of 170 percent is expected to increase revenues by only 112 percent.

Obviously, the Treasury anticipates that its proposed rates will cause a definite reduction in volume of wines to be sold in the future. They have not given a specific estimate of what this reduction would be, but, using different methods of calculating, they apparently anticipate a decline in volume of about 15 to 20 percent.

Using the more conservative figure, a decline of 15 percent in consumption would mean a reduction of over 20 million gallons from present sales. This is the equivalent of loss in market outlet for 200,000 tons of grapes and a loss of grower income of about $12 million a year at present grape prices, or 15 percent less grower income from wine. In addition, this extra tonnage of grapes would become surplus, depressing the values of all grapes and further lowering grower income.

VII

The thought I should like too leave with the Coommittee is that its past tax policy with respect to wine has been fair and equitable. At the time of repeal of prohibition there was practically no wine industry. The old wine industry had almost been destroyed and had to be rebuilt from the bottom. Per capita consumption of wine in the middle thirties was almost neglible. Through our own efforts in improving wine standards and technical methods of production, in encouraging improved grape plantings, and in educating the public to know what the varius kinds of wine are and how they are properly used, we have managed to more than double the consumption of wine and push the per capita consumption to almost 1 gallon. By the standards of other wine-producing countries, where per capita consumption may range anywhere from 10 to 80 gallons, this is a ridiculously low figure. Nevertheless, it represents slow progress in building an industry where there was no industry before, and which most people doubted could ever be reestablished. It has opened up to cultivation farm lands that in many cases were not suitable for other crops. It has directly or indirectly, in its own small way, helped to improve the general economy of the country by directly or indirectly providing a living for thousands upon thousands of people.

In the past, we have gone through stages of depression which have sometimes been quite serious and the one which started in the spring of 1947, which I referred to a moment ago, was a pretty bad one.

We feel that your past excise-tax policies have recognized the nature of our industry and have made allowance for its economic problems. During the depression of the last 4 years, the present excise rates were a little tough to handle at times. I cannot prove this statistically, but I know from my own experience that the market for a good percentage of the wine we moved during that period was such that at least some portion of those excise taxes were paid out of the pockets of the growers and the vintners.

I know also that many of the smaller-business units, in both the producing and bottling end of the business, are finding some difficulty under the present tax structure; the proposed increases would result, in my opinion, in the eventual elimination of the major portion of the smaller units, most of which are family businesses, because they could not meet the additional financial burdens which the proposed tax increases would place on them.

I believe you can understand why the Treasury's tax proposals have alarmed us so.

I feel sure that we can count on continuing to receive fair and equitable consideration from this committee.

Thank you very much.

EXHIBIT 2

RESOLUTION

To the Honorable Robert L. Doughton, Chairman, and Members of the House Committee on Ways and Means:

Whereas the growing of grapes, berries, and fruits for wine production is an important part of California's agricultural economy, the State having 500,000 acres of bearing grapes, 383 bonded wineries, and an average annual grape crop of 2,703,000 tons, returning to farmers an annual average of $137,927,000; and

Whereas the Treasury Department's recommendation for increased excise taxes on wine amount to an increase over and above the present taxation of 150 percent to 233⅓ percent, far in excess of the recommended increase on any other item included in the list and which increase amounts to $50 a ton on grapes for table wines and $72 a ton on grapes for dessert wine; and

Whereas the proposed increase of wine taxes would result in (1) reducing consumption of wines; (2) reducing the income of grape growers; (3) depleting instead of increasing revenue to the Federal Government; (4) dislocating the economic and market balance of the grape industry; (5) demoralizing market outlets for table and raisin grapes; and (6) piling up unsalable surpluses of all types of grapes; and

Whereas these tax increases, if enacted, would place wine in a luxury category and out of the reach of middle- and low-income groups now constituting 80 percent of the wine market; and

Whereas the heretofore well-established and recognized basis for taxing wine as a strictly agricultural product has been deemed to be fair and just and no plausible reason appears for changing this historic concept; and

Whereas the California wine industry is willing to carry its share of the tax burden but can find no justifiable reason for the disproportionate and inequitable proposal advanced by the Treasury Department: Now, therefore, be it

Resolved, That the Agricultural Subcommittee of the California congressional delegation goes on record as opposing the unfair, discriminatory, confiscatory, and excessive increase in Federal excise taxes on wines proposed by the Treasury Department; and be it further

Resolved, That copies of this resolution be transmitted to the House of Representatives Committee on Ways and Means.

Approved.

Agricultural Subcommittee of the California delegation: Jack Z. Anderson, Ernest K. Bramblett, Hubert B. Scudder, Leroy Johnson, Thomas H. Werdel, Allan Oakley Hunter, Clair Engle, John Phillips, John J. Allen, Jr., George P. Miller.

The foregoing resolution has been adopted by the Agriculture Committee of the California delegation in Congress, and was submitted to the full California delegation in Congress and formally approved at a meeting of said delegation held on Thursday, March 8, 1951.

Harry R. Sheppard, Clinton D. McKinnon, Carl Hinshaw, Chet Holifield, Franck R. Havenner, John F. Shelley, Norris Poulson, Patrick J. Hillings, Gordon L. McDonough.

EXHIBIT 3

[S. J. Res. No. 14, introduced by Senators Dorsey, Burns, Roy Cunningham, Abshire, Hoffman, Hatfield, and Donnelly, March 12, 1951]

SENATE JOINT RESOLUTION NO. 14, RELATIVE TO MEMORIALIZING CONGRESS, PROTESTING THE PROPOSED INCREASED TAX ON WINE

Whereas it has been proposed that the Congress of the United States increase the Federal tax on table wines from 15 cents to 50 cents a gallon and on dessert wines from 60 cents to $1.50 a gallon; and

Whereas the growing of grapes, raisins, and wines is a key part of this State's economy and the most important division of the great California fruit-growing industry, alone providing employment for 111,000 workers and returning over $150,000,000 to growers in 1950; and

Whereas the grape and wine industry has been placed in danger of economic ruin by these recommendations to Congress that the excise tax on table and dessert wines be so increased by 150 to 233 percent, increases far exceeding those proposed for other beverages; and

Whereas this would mean an increase in the Federal tax burden on grapes from the present $24 to $48 per ton to the prohibitive figures of $80 to $120 a ton; and

Whereas this would be far out of proportion to the taxes borne by other farm commodities and much the heaviest tax burden ever placed on any American farm product; and

Whereas these tax increases, if enacted, would place wine in a luxury category and out of the reach of middle- and low-income groups now constituting 80 percent of the wine market and would completely disrupt orderly marketing of wine and destroy the largest single commercial outlet for grapes; and

Whereas such increases by destroying the grape and wine industry's ability to survive economically would lead to diminishing returns and not contribute to the national welfare but rather eliminate an important present source of Federal tax revenues: Now, therefore, be it

Resolved by the Senate and Assembly of the State of California (jointly), That the Congress of the United States is hereby respectfully memorialized to refuse enactment of the proposed discriminatory and excessive increase in Federal taxes on wines that would be so disastrous to agriculture in this State, and that would fail to accomplish the intended purpose of increasing the national revenue; and be it further

Resolved, That the secretary of the senate is hereby directed to transmit copies of this resolution to the President and Vice President of the United States, to the Speaker of the House of Representatives, and to each Senator and Representative from California in the Congress of the United States.

Exhibit 4

[Editorial appearing in Collier's magazine, April 14, 1951, issue, p. 80]

* * * And Speaking of Taxes

Another of Mr. Snyder's suggestions for raising revenue is a "whopping" increase in the tax on wine—233 percent on table wine and 150 percent on the dessert variety. This also strikes us as being short-sighted.

The big market for domestic wine is in the middle- and low-income groups. This proposed tax might remove store-bought wine from these families' budgets. But it is a safe, and we hope not too cynical, assumption that it wouldn't remove wine from all their tables. It seems likely that there would be a big increase in home production, not only on the farm but in city kitchens and cellars. Thus a revival of this prohibition-era custom might result in less revenue from wine taxes than the Government is getting now. And that's hardly the way to finance a pay-as-you-go defense program.

Exhibit 5

List of witnesses who appeared before the House Committee on Ways and Means on March 12, 1951, on behalf of the American Grape and Wine Industry:

	House Hearings Record, Page No.
(1) Mr. Harry Baccigaluppi, president, California Grape Products Co., Delano, Calif.; former president of Wine Institute (trade association for the California wineries); speaking on behalf of the wine growers of California	2042
(2) Mr. Matt Triggs, assistant director, Washington office, American Farm Bureau Federation, speaking on behalf of the American Farm Bureau Federation	2128
(3) Mr. W. C. Jacobsen, representing the California director of agriculture and the California State Board of Agriculture, in the first appearances of these agencies before the Committee on Ways and Means	2130
(4) Mr. Greyton H. Taylor, managing partner, Taylor Wine Co., Hammondsport, N. Y., chairman of Wine Conference of America, a national group composed of 10 wine associations from all of the principal producing and wine-marketing areas in the United States. Speaking on behalf of the Wine Conference of America and the Bottle Fermented Champagne Producers, Inc	2145
(5) Mr. William J. Wagoner, grower of wine grapes in the Livermore Valley of Alameda County, Calif.; speaking for thousands of other growers of wine-variety grapes	2177
(6) Mr. Freeman Mills, grape grower from Lodi in the San Joaquin Valley of California; speaking on behalf of thousands of other growers of table-variety grapes	2182
(7) Mr. A. Setrakian, president of California Grape Growers Council; speaking on behalf of growers of raisin-variety grapes	2190
(8) Mr. Walter K. Hines, vice president of California Grape Growers Council and general manager of Sun-Maid Raisin Growers of California, Fresno, Calif.; speaking on behalf of raisin-grape growers and raisin producers	2198
(9) Hon. Leroy Johnson, Representative, Congress, State of California	2577
(10) Hon. Hubert B. Scudder, Representative, Congress, State of California	2016
(11) Hon. Thomas H. Werdel, Representative, Congress, State of California	2039

Senator Byrd. Mr. Clinton M. Hester.

Mr. Hester, you have 10 minutes.

STATEMENT OF CLINTON M. HESTER, WASHINGTON COUNSEL, UNITED STATES BREWERS FOUNDATION

Mr. HESTER. Mr. Chairman and members of the Senate Finance Committee, my name is Clinton M. Hester. I am an attorney located in the Shoreham Building, this city. We appear here today as Washington attorney for the United States Brewers Foundation, 21 East Fortieth Street, New York City.

Our client, the United States Brewers Foundation, is a trade association representing the interests of the brewing industry of this country. It is the second oldest trade association in the United States and has been in continuous operation since 1862.

Of the approximately 400 breweries in the United States its membership includes about 200 brewers who sell approximately 85 percent of the beer produced in the United States.

We presented at length before the House Ways and Means Committee on March 12 our views on the recommendation of the Secretary of the Treasury that the tax on beer be increased from $8 to $12 per barrel. On March 21 we testified concerning loss of excise-tax revenue to the Government which would result from the order issued by the National Production Authority on January 26, 1951, restricting the use of tin cans for packaging beer.

Beer produces annually nearly $700 million in Federal excise taxes or enough revenue in 1 year to pay the entire expenses of the Congress of the United States for 10 years. Beer also produces nearly $200 million each year in State excise taxes, which revenue is used in many States to pay old-age pensions and teachers' salaries.

The proposal of the Secretary of the Treasury would require beer to produce annually in excise taxes in excess of $1 billion or to pay to the Federal Government in excise taxes approximately one-seventieth of the Federal budget of more than $71 billion recommended by the President for the fiscal year commencing July 1, 1951.

The Secretary opposes both a Federal sales tax because it would have to be paid by those least able to pay such a tax; and an excise tax on food, rent, and clothing because they are necessities of life.

In all deference to the Secretary of the Treasury, beer falls within the group of commodities upon which he considers excise taxes should not be imposed. The beer excise tax is an indirect Federal sales tax on a commodity which is one of the necessities of life.

Beer is a food beverage which plays a vital part in American life. Beer is consumed in the homes of two-thirds of the families in the United States. It is an essential food item in the daily diet of the workingman in the heavy industries such as the steel industry.

In World War II the War Labor Board ruled that beer is essential to public morale in times of great national stress.

Beer also aids military morale. Because of this fact, Secretary of War Stimson and Secretary of the Navy Knox during World War II successfully opposed the enactment of legislation which would have prohibited the sale of beer on military reservations.

The brewing industry is an industry essential to our national defense.

Continued tax increases are fast making beer a luxury item and placing it beyond the reach of the workingman, to whom it is an essential food beverage. This is well demonstrated by the fact that within eight blocks of this committee room the average bottle of beer, which only a few years ago sold for from 10 to 15 cents a bottle, now retails from 25 to 40 cents.

Until 1940 beer sales kept pace with consumer disposable income. In 1940, however, Congress increased the excise tax on beer $1, then added a temporary wartime increase of $1 in 1942, and another temporary wartime increase of $1 in 1944. Although consumer disposable income has risen nearly 50 percent since 1944, beer sales have increased only about 5 percent. In fact, beer sales are lower now than they were in 1947, 1948, 1949, and 1950.

When Congress increased the beer excise tax in 1940, there were 684 breweries operating in the United States. Since then more than a third of those breweries have been compelled to go out of business. Many of them were small breweries. Their failure was due in no small measure to high Federal and State excise taxes.

We respectfully submit that the point of diminishing returns in the taxation of beer was reached long ago.

Beer is the only user of tin cans which produces any substantial amount of excise-tax revenue. We estimate that aready the National Production Authority can-curtailment order M-25, issued on January 26, 1951, has cost the Federal Government millions of dollars in beer excise taxes. If the present restrictions on the use of tin cans for beer are continued, the Federal Government will lose millions more in beer excise taxes.

Senator KERR. Let me ask you a question there. Is it your judgment that the restrictions on the use of tin cans has been more detrimental to your business than the excessive taxes of which you talk?

Mr. HESTER. Excessive taxes? I am talking about the excise tax.

Senator KERR. Well, you are taking a position that it is high enough; are you not?

Mr. HESTER. Yes; that is right. That is right.

Senator KERR. When it gets higher than it should be, that is excessive.

Mr. HESTER. That is right.

Senator KERR. I asked you if you thought the restriction on the availability of tin was hurting you as much or more than the taxes that you say are too high.

Mr. HESTER. Well, they are both hurting, but the reason I am bringing this tin-can situation up—I tell that in the next paragraph here—is so that the members of this committee will be acquainted with the situation and you will see what the House Ways and Means Committee did.

Senator KERR. Did you understand my question?

Mr. HESTER. Sir?

Senator KERR. Did you understand my question?

Mr. HESTER. I thought I did.

Senator KERR. I asked you which one you thought was hurting the most. If you do not want to answer, it is all right.

Mr. HESTER. I have not given that any consideration, Senator. I would have to think about that, sir.

Senator KERR. You would not have an opinion offhand?

Mr. HESTER. No; I would not.

Senator KERR. All right.

Mr. HESTER. No; I would not.

Senator KERR. You just are complaining about both of them?

Mr. HESTER. No; we are not complaining about the tin-can situation.

Senator KERR. Then you are talking about both of them?

Mr. HESTER. We are bringing it to your attention.

Senator KERR. All right. You are against both of them?

Mr. HESTER. No; we are not against the tin-can restrictions at all; no. If you will let me finish this, I think you will see——

Senator KERR. I am going to let you finish it. It is entirely up to you whether you want to answer the question. I am trying to get informtaion. That is what you are here for.

Mr. HESTER. Wait, just a minute. Let us not have a misunderstanding about this. I have been appearing before this committee for years, and this is the first time I have had the pleasure of appearing before you.

Do not misunderstand me. I am not refusing to answer your question. You have asked me a difficult question. If you pin me down to it, give me time to consider it. The reason we brought the tin-can situation up was that we are in favor of Government restrictions, but you will see later on in our testimony what we are pointing out is this: That the Government defense agencies are paying no attention to the excise-tax problem in determining how many tin cans shall go to each industry. There are 293 products that are restricted in the use of tin cans, and there are only about 5 of them that bear any excise taxes at all, and beer is the real substantial producer, and yet it has the lowest classification.

Senator KERR. Well, that is fine. You go right ahead with your statement. I was just trying to get information. There may be witnesses after a while who will help me.

Senator BYRD. It will reduce the tax return?

Mr. HESTER. It has already done so. We are just calling it to your attention. We are in favor of Government restrictions.

Senator BYRD. Go ahead with your testimony.

Mr. HESTER. The House Ways and Means Committee was concerned lest defense agencies ignore the revenue angle in issuing curtailment orders. Accordingly, on April 3, 1951, the committee adopted a resolution expressing it to be the sense of the committee that in order to protect the revenue the National Production Authority should not issue any order curtailing the production or distribution of products upon which Federal excise taxes are imposed without consultation with the Treasury Department.

We believe that the facts indicate that the Government agencies concerned have given the revenue angle little, if any, consideration.

In 1950 approximately 20 percent of all beer sales were in cans. For the third quarter of 1951 NPA has allowed brewers a quota of 70 percent of the number of cans that they were using in the third quarter of 1950.

However, brewers are not receiving this quota from the can companies. In fact, the latter are only able to supply brewers approximately 45 percent of the number of cans they received in the third quarter of 1950. In other words, brewers this summer are receiving less than half the cans they received last summer.

In view of the importance to you, the Congress, and the American taxpayers in obtaining the additional revenues necessary to finance our expanded national defense, may we express the hope that the Senate Finance Committee will adopt a resolution similar to that adopted by the House Ways and Means Committee. We believe that the adoption of such a resolution would cause Government agencies to become more tax-conscious in the issuance of orders which affect Government revenues.

If the committee should have any hesitancy in adopting such a resolution, perhaps the committee might be willing to consider the advisability of requesting Mr. Carroll E. Mealey, Deputy Commissioner in charge of the Alcohol Tax Unit of the Bureau of Internal Revenue, to obtain first-hand information as to the effect of the can-curtailment order upon beer excise-tax revenue.

Mr. Mealey could report the results of his investigation to the committee when it is considering the tax bill in executive session.

In 1941 you agreed with our position before this committee that the point of diminishing returns in beer excise taxation had been reached.

You therefore declined to accept the Treasury's recommendation for an increase in the beer excise tax at that time. In the interest of our national defense during World War II we accepted a temporary increase of $1 in 1942 and another temporary increase of $1 in 1944. The 1942 temporary wartime increase has since been made permanent and the 1944 temporary wartime increase is also still in effect.

On the question of diminishing returns—and at this point we would like to incorporate by reference our testimony before the House Ways and Means Committee and the Senate Finance Committee on the revenue revision of 1941. That is only by reference, Mr. Chairman. This testimony will indicate that the brewing industry accepted the $1 increase in the excise tax in 1940 to help meet the cost of national defense.

Then it was discovered that the $1 increase brought the law of diminishing returns into operation. This $1 increased tax was imposed on July 1, 1940. In the first 6 months of 1940 beer sales increased 1 percent, but in the last 6 months of 1940, after the imposition of the $1 increase, beer sales decreased 4.2 percent as compared with the corresponding period of 1939. This, despite the fact that for the year 1940 consumer disposable income was $74,300,000,000, which was an 8-percent increase over the year 1939. This was also a 15-percent increase over the previous 5-year average of $64,600,000,000 in consumer disposal income.

Since 1940 consumer disposal income has increased about 300 percent, while beer sales have increased only about 33⅓ percent, or slightly more than 10 percent of the increase in consumer disposable income. Since experience has always indicated that the sales of mass-consumed commodities follow consumer disposable income, it seems to follow clearly that this committee reached the correct conclusion in finding in 1941 that the law of diminishing returns had become applicable in the matter of beer excise taxation, and accordingly had declined to approve a Treasury recommendation for an increase in the beer excise tax in that year. In view of the tremendous lag in beer sales since 1940, it is quite evident that the law of diminishing returns is even more applicable today than it was at that time.

We know that you have a difficult task ahead of you to raise the tremendous amount of revenue needed for national defense. The brewing industry now, as in the past, is willing to bear its fair share of any necessary increase in taxes. However, we submit that it is not reasonable to unduly burden beer—a basic item in the workingman's daily diet. The brewing industry, represented here at the moment by the United States Brewers Foundation, suggests that corporate and even individual income taxes should be further increased rather than to compel the workingman to pay more in taxes for his beer and thus carry a disproportionate share of the tax burden—a burden which should be borne equally by all taxpayers.

Thank you.

Senator BYRD. Thank you very much, Mr. Hester.

Mr. HESTER. Thank you, sir.

(A prepared statement, subsequently submitted by Mr. Hester, reads as follows:)

STATEMENT OF CLINTON M. HESTER, WASHINGTON COUNSEL, UNITED STATES BREWERS FOUNDATION

Mr. Chairman and members of the Senate Finance Committee, my name is Clinton M. Hester. I am an attorney located in the Shoreham Building, this city. We appear here to day as Washington attorney for the United States Brewers Foundation, 21 East Fortieth Street, New York City. It has been our pleasure and honor to have appeared occasionally before this distinguished committee for almost 20 years, first as a representative of the Federal Government and then for many years as an attorney in private practice.

Our client the United States Brewers Foundation, is a trade association representing the interests of the brewing industry of this country. It is the second oldest trade association in the United States and has been in continuous operation since 1862.

Of the approximately 400 breweries in the United States, its membership includes about 200 brewers who sell approximately 85 percent of the beer produced in the United States.

We presented at length before the House Ways and Means Committee on March 12 our views on the recommendation of the Secretary of the Treasury that the tax on beer be increased from $8 to $12 per barrel. On March 21 we testified concerning the loss of excise-tax revenue to the Government which would result from the order issued by the National Production Authority on January 26, 1951, restricting the use of tin cans for packaging beer.

We wish to thank you for permitting us to present our views to you personally, especially when you have had requests from such a large number of persons who desire to appear in person before your committee. In deference to the wishes of the committee, we shall summarize our oral testimony and incorporate by reference our prior testimony before the House Ways and Means Committee.

We shall necessarily be compelled because of the time limit to state mainly conclusions; but we should like to emphasize that these conclusions are supported in detail in our testimony before the House Ways and Means Committee.

Beer produces annually nearly $700 million in Federal excise taxes, or enough revenue in 1 year to pay the entire expenses of the Congress of the United States for 10 years. Beer also produces nearly $200 million each year in State excise taxes, which revenue is used in many States to pay old-age pensions and teachers' salaries.

The proposal of the Secretary of the Treasury would require beer to produce annually in excise taxes in excess of $1,000,000,000, or to pay to the Federal Government in excise taxes approximately one-seventieth of the Federal budget of more than $71,000,000,000 recommended by the President for the fiscal year commencing July 1, 1951.

The Secretary opposes both a Federal sales tax because it would have to be paid by those least able to pay such a tax; and an excise tax on food, rent, and clothing because they are necessities of life.

In all deference to the Secretary of the Treasury, beer falls within the group of commodities upon which he considers excise taxes should not be imposed. The beer excise tax is an indirect Federal sales tax on a commodity which is one of the necessities of life.

Beer is a food beverage which plays a vital part in American life. Beer is consumed in the homes of two-thirds of the families in the United States. It is an essential food item in the daily diet of the workingman in the heavy industries such as the steel industry.

The founding fathers, and many of our Presidents, Washington, Jefferson, and Madison, to name just a few, encouraged the production of beer in the United States in the interest of public morale. For the same reason, President Franklin D. Roosevelt in March 1933, recommended to the Congress, even before the repeal of the eighteenth amendment, that it enact legislation to permit the sale and manufacture of 3.2-percent beer.

In World War II the War Labor Board ruled that beer is essential to public morale in times of great national stress.

Beer also aids military morale. Because of this fact, Secretary of War Stimson and Secretary of the Navy Knox during World War II, sucessfully opposed the enactment of legislation which would have prohibited the sale of beer on military reservations.

The brewing industry is an industry essential to our national defense.

Continued tax increases are fast making beer a luxury item and placing it beyond the reach of the workingman to whom it is an essential food beverage. This is well demonstrated by the fact that within eight blocks of this committee room the average bottle of beer, which only a few years ago sold for from 10 to 15 cents a bottle, now retails for from 25 to 40 cents.

Until 1940 beer sales kept pace with consumer disposable income. In 1940, however, Congress increased the excise tax on beer $1, then added a temporary wartime increase of $1 in 1942, and another temporary wartime increase of $1 in 1944. Although consumer disposable income has risen nearly 50 percent since 1944, beer sales have increased only about 5 percent. In fact, beer sales are lower now than they were in 1947, 1948, 1949, and 1950.

When Congress increased the beer excise tax in 1940 there were 684 breweries operating in the United States. Since then more than a third of those breweries have been compelled to go out of business. Many of them were small breweries. Their failure was due in no small measure to high Federal and State excise taxes.

We respectfully submit that the point of diminishing returns in the taxation of beer was reached long ago.

Georgia and South Carolina are examples of the operation of the law of diminishing returns in the excise taxation of beer. The per capita consumption of beer in those States is less than 5 gallons compared to a national average of about 17 gallons per capita and an average of 25 to 27 gallons in low-tax States like Wisconsin and Michigan. Due to declining beer sales Georgia recently reduced its tax of $9 per barrel to $4.50 per barrel of beer. South Carolina only a year ago increased its beer tax from $9 per barrel to $13.95 per barrel. Because of the rapid decline in the past year in beer sales due to the higher tax South Carolina recently reduced and restored the beer tax to the previous rate of $9 per barrel.

Beer is the only user of tin cans which produces any substantial amount of excise tax revenue. We estimate that already the National Production Authority can curtailment order M-25 issued on January 26, 1951, has cost the Federal Government millions of dollars in beer excise taxes. If the present restrictions on the use of tin cans for beer are continued the Federal Government will lose millions more in beer excise taxes.

The House Ways and Means Committee was concerned lest defense agencies ignore the revenue angle in issuing curtailment orders. Accordingly, on April 3, 1951, the committee adopted a resolution expressing it to be the sense of the committee that in order to protect the revenue the National Production Authority should not issue any order curtailing the production or distribution of products upon which Federal excise taxes are imposed without consultation with the Treasury Department.

We believe that the facts indicate that the Government agencies concerned have given the revenue angle little, if any, consideration. Of the approximately 293 products packaged in tin cans and restricted in the use of tin cans by NPA order M-25, only a few of these products produce any excise tax revenue and none comparable to the revenue produced by beer. Of the entire 203 products, beer is among the 37 products which are given the very lowest classification. So we cannot escape from the conclusion that the revenue aspect has not received adequate attention.

In 1950 approximately 20 percent of all beer sales were in cans. For the third quarter of 1951 NPA has allowed brewers a quota of 70 percent of the number of cans that they were using in the third quarter of 1950. However, brewers are not receiving this quota from the can companies. In fact, the latter are only able to supply brewers approximately 45 percent of the number of cans they received in the third quarter of 1950. In other words brewers this summer are receiving less than half the cans they received last summer.

There is further evidence that the can-curtailment order has seriously affected excise taxes. In January of this year beer sales were increasing due to the tremendous increase of consumer disposable income. Beer excise-tax revenue to the Federal Government in January of this year was approximately $2,400,000 more than it was in January 1950. But since the issuance of the can-curtailment order on January 26 beer sales, instead of increasing above those of 1950, have decreased. In fact, in June of this year beer sales decreased approximately 6 percent below the sales in June of 1950—a loss in revenue of $4 million. If this percentage decrease continues through the third quarter, the Government will lose an additional $16 million.

Now that we are in the peak of the beer season we expect a much greater decrease in beer sales. This decline is expected notwithstanding the fact that bottle manufacturers are now able to supply some bottles, over and above the number used by the industry in the third quarter of 1950, but not in sufficient quantity to substantially offset the can-curtailment order. But even if bottles were available in sufficient numbers brewers would still be faced with a serious, expensive, and time-consuming conversion problem in resuming the bottling of beer to replace their former can-beer business.

On the other hand, if beer sales had increased during 1951, as could have been reasonably expected in view of the tremendous increase in consumer disposable income, the Government would have received additional millions in excise taxes. To illustrate, if beer sales, following the issuance of NPA order M-25 on January 26, 1951, had increased as little as 2½ percent, or one-half of the percentage increase of beer sales in January 1951 over January 1950, the Government would have received by the end of the third quarter on September 30, 1951, an additional $10 million.

It is, therefore, reasonable to assume that the can-curtailment order has cost and will cost the Federal Government through the third quarter of 1951 a minimum of $30,000,000 in beer excise taxes. And if the 6-percent decrease in beer sales in June continues at the expected accelerated rates during the third quarter, the loss in beer excise-tax revenue to the Federal Government may approximate $50 million.

In view of the importance to you, the Congress, and the American taxpayers in obtaining the additional revenues necessary to finance our expanded national defense, may we express the hope that the Senate Finance Committee will adopt a resolution similar to that adopted by the House Ways and Means Committee. We believe that the adoption of such a resolution would cause Government agencies to become more tax-conscious in the issuance of orders which affect Government revenues.

If the committee should have any hesitancy in adopting such a resolution, perhaps the committee might be willing to consider the advisability of requesting Mr. Carroll E. Mealey, Deputy Commissioner in charge of the Alcohol Tax Unit of the Bureau of Internal Revenue to obtain first-hand information as to the effect of the can-curtailment order upon beer excise-tax revenue. Mr. Mealey supervises under Treasury Department regulations the operations of all breweries. To assist him he has district supervisors and field agents conveniently located near breweries throughout the United States. Mr. Mealey can use these assistants to obtain personally from each brewery precisely the effect the can-curtailment order has had on the operations of the brewery. Mr. Mealey could report the results of his investigation to the committee when it is considering the tax bill in executive session.

In 1941 you agreed with our position before this committee that the point of diminishing returns in beer excise taxation had been reached. You, therefore, declined to accept the Treasury's recommendations for an increase in the beer excise tax at that time. In the interest of our national defense during World War II we accepted a temporary increase of $1 in 1942 and another temporary increase of $1 in 1944. The 1942 temporary wartime increase has since been made permanent, and the 1944 temporary wartime increase is also still in effect.

On this question and at this point we would like to incorporate by reference our testimony before the House Ways and Means Committee and the Senate Finance Committee on the revenue revision of 1941. This testimony indicates that the brewing industry accepted the $1 increase in the excise tax in 1940 to help meet the costs of national defense. Then it was discovered that the $1 increase brought the law of diminishing returns into operation. This $1 increase tax was imposed on July 1, 1940. In the first 6 months of 1940 beer sales increased 1 percent but in the last 6 months of 1940 after the imposition of the $1 increase beer sales decreased 4.2 percent as compared with the corresponding period of 1939. This despite the fact that for the year 1940 consumer disposable income was $74,300,000,000 which was an 8-percent increase over the year 1939. This was also a 15-percent increase over the previous 5 year average of $64,000,000,000 in consumer disposable income.

According to the trend of the previous 5 years beer sales should have increased approximately 15 percent over the 5-year average beer sales of 50,610,000 barrels to about 58,217,000 barrels. In other words, despite this marked increase in income paid to persons in 1940 due to national defense activities, beer consumption in 1940 remained about at the previous 5-year average and was actually less than in 1939 by 1.8 percent.

Since 1940 consumer disposable income has increased about 300 percent while beer sales have increased only about 33⅓ percent or slightly more than 10 percent of the increase in consumer disposable income. Since experience has always indicated that when excise taxes are at the proper rate, the sales of mass consumed commodities follow consumer disposable income, it seems to follow clearly that this committee reached the correct conclusion in finding in 1941 that the law of diminishing returns had become applicable in the matter of beer excise taxation; and accordingly had declined to approve a Treasury recommendation for an increase in the beer excise tax in that year. In view of the tremendous lag in beer sales since 1940 it is quite evident that the law of diminishing returns is even more applicable today than it was at that time.

It is true that tin and steel are needed for defense but tax revenue is also needed. We do not ask for any special consideration for beer. We think though you gentlemen will be interested, as was the House Ways and Means Committee, in seeing to it that the excise-tax revenue is not unduly curtailed in the interest of providing tin cans for use by industries who pay no excise taxes whatsoever.

We know that you have a difficult task ahead of you to raise the tremendous amount of revenue needed for national defense. The brewing industry now, as in the past, is willing to bear its fair share of any necessary increase in taxes. However, we submit that it is not reasonable to unduly burden beer, a basic item in the workingman's daily diet. The brewing industry, represented here at the moment by the United States Brewers Foundation, suggests that corporate and even individual income taxes should be further increased rather than to compel the workingman to pay more in taxes for his beer and thus carry a disproportionate share of the tax burden; a burden which should be borne equally by all taxpayers.

So, in conclusion, let us repeat if we may that beer is a mass-consumed food beverage, essential to the working man particularly in the heavy industries and essential to public and military morale especially in times like the present of great national stress; that any increase in the tax will be an indirect retail sales tax which will fall most heavily on the low-income group; that the two wartime emergency increases of $1 each, which we voluntarily agreed to accept in the interest of our national defense, are still in effect; and that the law of diminishing returns in beer excise taxation is even more applicable today than it was when this committee found it to be so in 1941.

Thank you.

Senator BYRD. Our next witness is Mr. Heymsfeld.

Mr. Heymsfeld, the Chair understands that you are going to make a more elaborate presentation than some of the other witnesses. That being the case, we will allow you 20 minutes.

STATEMENT OF RALPH T. HEYMSFELD, GENERAL COUNSEL AND DIRECTOR, SCHENLEY INDUSTRIES, INC., AND VICE PRESIDENT, DISTILLED SPIRITS INSTITUTE

Mr. HEYMSFELD. Thank you, sir.

My name is Ralph T. Heymsfeld. I am general counsel and a director of Schenley Industries, Inc. I am a vice president of the Distilled Spirits Institute, and appear here today representing the institute. The Distilled Spirits Institute is a trade association whose members constitute over 85 percent of the distilled spirits industry.

We, in the last 5 or 6 weeks, have attempted to summarize a vast mass of statistical and factual data which we think would be significant to a consideration of this case, and it comes to about 17 pages.

Now in view of the pressures which we understand are on the committee, I will not endeavor to read the statement in full, but simply to point out what we consider are the most significant parts of the statement although, as I have said, the statement itself is a distillation of a large amount of material, and we hope it will all receive the attention of the committee.

Since the time when the Treasury first advocated the increase in Federal tax, the official estimates of revenue collections——

Senator BYRD. Do you want inserted into the record what you omit?

Mr. HEYMSFELD. Yes, sir. I have handed it to the reporter.

Since the time when the Treasury first advocated the increase in Federal tax, the official estimates of revenue collections on distilled spirits have consistently declined, and I would like to call attention to the table which we have on the first page of our statement, which indicates that the Treasury, on February 5, estimated that $1,750,000,000 of revenue would be derived by the $9 rate.

The Ways and Means Committee, on June 18, came down to $1,650,000,000 and, on June 28, the Treasury came down to $1,565,000,000.

On June 18, the Ways and Means Committee estimated that at the $10.50 rate, the return in revenue would be $1,828,000,000. The Treasury cut this estimate, on June 28, by $108,000,000.

It is interesting to note that the Treasury estimate of what the $10.50 rate will produce, that is, a total of $1,720,000,000 happens to be $30 million below its February estimate of what would be produced at the lower present rate of tax.

It is apparent that the Treasury, since February, has substantially reduced its estimates of the amount of money which the American people will spend for legally distilled spirits. It has revised its estimates downward, notwithstanding an increase of $3,412,000,000 in the Treasury's estimate of disposable personal income.

I think that is significant because, as I shall come to in a moment, the Ways and Means Committee anticipates that because of increases in disposable personal income we can anticipate very substantial increases in distilled-spirits consumption. That, I may say, is the Ways and Means Committee's attitude on this tax, and a good deal of material which is in this statement is intended to show why in our judgment that is not so. It is not so historically and it is not so in the light of the present situation.

Senator KERR. Is it your position that the actual consumption has been far less than the estimated consumption?

Mr. HEYMSFELD. Yes, sir. The actual consumption has been less than the estimated consumption and, as a matter of fact, in the last 3 months, the Treasury receipts show a decline of $81,000,000 as we show by a table on page 4 of this statement.

Senator KERR. Is it your position that that decreased consumption has been caused by increased taxes?

Mr. HEYMSFELD. Yes, sir. It is our position that since 1946, when the bootlegger was again able to go back into business—in 1946 the bootlegger was rather seriously restricted——

Senator KERR. You do not think it might have been because the folks might have gotten smart and quit buying?

Mr. HEYMSFELD. No, sir. We think they bought illegal liquor.

Senator KERR. You think they are buying more over-all, but less taxable?

Mr. HEYMSFELD. We think that is right, and the figures show that conclusively.

The figures of still seizures, the figures of drops in tax revenue, all in the face of the rise of disposable income, figures which show the increase in the capacity of the stills which are in business—and we know that the bootlegger is a pretty smart businessman, and he would not be operating stills that size or operating with that many stills unless he thought he had a market for his product.

When we make something in the legal industry we put it away because we expect that possibly 4 years from now or 5 years from now or 6 years from now there is a market.

Well, it may be that under certain conditions an industry over-produces, but the bootlegger sells his stuff right off the still, and he is not producing the stuff, Senator, unless he knows that he has got a market for it, and, therefore, the size of this bootleg operation, the production end of it, to us is not only an indication of the amount of illegal activity which is going on in this country, but is an indication to us of what the bootlegger, our competitor and the Government's competitor estimates that market is.

He is producing for a market, and when they have all these stills operating, it is because they think they can dispose of the stuff.

But the significant thing is that in 1946, when bootlegging was restricted because the bootlegger could not get sugar, because he could not get copper, when the Government enforcement agents were working with OPA on sugar controls, because it was recognized—and correctly—that that was a means of controlling the illegal production of liquor and still seizures in that year were about a third of what they were between 1939 and 1940, it is an interesting thing that in that year Treasury tax collections reached their peak.

Since that time the bootlegger has been able to get his sugar, he has been able to get copper, he has been able to set up the stills which we referred to—there are 5 or 6 pages of it in this statement, and there could be 50—he has been able to set up these stills, get the raw material to operate them, and while all that has been going on Treasury receipts have been dropping.

Now, to us there is only one conclusion to be drawn from that set of facts.

Senator KERR. That is that the bootlegger is doing more business.

Mr. HEYMSFELD. Yes, sir; the bootlegger is doing substantially more business; that is cutting into tax revenues. It is cutting into

Federal revenues and it is cutting into State revenues, and both, of course, are serious problems.

I would like to refer again to this drop of $81,000,000 which is referred to on page 4 of our statement.

If you will compare the tax collections in April, May, and June of 1951, that is, the current year, with the tax collections of the same 3 months of 1950, there is a drop in Federal revenues of $81,000,000 in those 3 months.

Now, what does that indicate? To us it indicates several things: It indicates, first, that we were correct in saying to the Ways and Means Committee, as we did——

Senator BYRD. I am sorry; I have been called into the Foreign Relations Committee for a few minutes, as acting chairman of that committee. Senator Russell is away.

Senator Williams, will you take the chair until Senator Kerr returns? I will be back in a few minutes.

Senator WILLIAMS (presiding). Go right ahead.

Mr. HEYMSFELD. Senator, I was addressing myself to the table on page 4 of this statement, which shows that in the last 3 months of the current fiscal year—that is, the months of April, May, and June 1951—Treasury collections from distilled spirits dropped $81,000,000. The exact figure is $80,983,591.

That indicates a serious situation, we think, not only for the Treasury but for the industry, and, more importantly, it indicates that we were correct when we told the Ways and Means Committee that the Treasury estimates of what could be derived from this industry by increasing the tax rate were more than a little bit optimistic.

In April tax collections dropped from $76,000,000, a decrease of $29,000,000 from the previous year.

In May they dropped from $110,000,000 to $90,000,000, a decrease of $20,000,000; in June they dropped from $121,000,000 to $90,000,000, a decrease of $31,000,000.

Now, the House report refers to the 1950 consumption of 190,000,000 wine-gallons and uses that as an indication of the fact that because of an increasing rate of consumption in the industry the industry can stand a tax increase without serious effect on its business or on Federal revenues.

Now, the actual fact is that a very substantial portion of those 190,000,000 gallons did not go to the consumer; it went into inventories, because everyone was afraid of a tax increase—they were afraid of possible limitations on production.

In consequence of that, wholesalers, retailers, the State stores, and even the consumer put a little bit extra away, and now we see a devastating effect of that on the revenue collections.

You will note, sir, that the 3 months that we have selected are pre-Korean months. In other words, these are not the months that show this expansion in sales. April, May, and June of 1950 were pre-Korean months.

We also compare those months with 1949, as you might say, a control figure. If you compare 1950 with 1949 you will see that 1950 was running about like 1949.

There was nothing unusual about 1950. But 1951 is very unusual, and we think should give a lot of pause to those who are giving consideration to the possibility that because of all this increased spending there is going to be a vast increase in expenditures for legal liquor.

Senator KERR (presiding). There has been no increase in the tax from 1949 to 1951?

Mr. HEYMSFELD. No, sir. The point that we make, sir, is that the drop which is taking place in 1951 indicates that you cannot give consideration to the 1950 figures in estimating what the American public is going to buy—spend for legally distilled spirits.

Senator WILLIAMS. Do you have those same figures in a comparison for the months of July, August, and September?

Mr. HEYMSFELD. No, sir. We are in the month of July now, and August and September lie ahead, but I may say this, Senator——

Senator WILLIAMS. I mean for last year.

Mr. HEYMSFELD. Yes, in July, August, and September last year as I recall it, there was rather an expansion. We think that in July, August, and September of this year we are going to be possibly even more below last year's figures than we were in April, May, and June 1950.

Senator WILLIAMS. I was wondering as to how much of this April, May, and June might have been a reflection of the advanced buying?

Mr. HEYMSFELD. Well, actually it was not 1950, Senator, because this was pre-Korea.

Senator KERR. He is talking about what happened after June 1950.

Senator WILLIAMS. After June 1950.

Mr. HEYMSFELD. That is exactly the point. In other words, when the Treasury came before the Ways and Means Committee in February and advocated an increase in the tax on distilled spirits, they said, "Look at what it has done; look at what has been happening," and they made these large estimates of what might be sold in the way of legal liquor.

Now, they based those estimates on what happened after Korea.

We said at that time that you cannot count on that. That is what we told the Ways and Means Committee, "You cannot count on this increase," and now the chicks are coming home.

Senator KERR. Do you have a record of what the increase was in July, August, and September of 1950?

Mr. HEYMSFELD. Oh, yes.

Senator KERR. Will you give that to the committee?

Mr. HEYMSFELD. Yes, sir; we will.

(The following was later supplied for the record:)

Federal excise tax collections on distilled spirits, July 1950, $150,034,731; August 1950, $228,569,843; September 1950, $151,800,414.

Senator KERR. Can you give it to us now offhand?

Mr. HEYMSFELD. Well, in the calendar year 1950 tax payments went up, I believe—and I would like to correct this if I am wrong—to about 180,000,000 gallons of tax-paid liquor, which, as you will notice, is a rather substantial increase over the fiscal years 1948, 1949, and 1950 rate.

In 1948, 1949, and 1950 the tax payments were only around 158,000,000 gallons.

Senator KERR. You referred to 150,000,000 wine gallons. Is that a measurement or does that mean of wine or does that mean of all spirits?

Mr. HEYMSFELD. That is a method of measurement. In other words, that is one of the difficult things about this subject, Senator, and that is why it is so hard to put it in a short compass.

There are a lot of technical expressions. Now, when you compute tax gallons you normally mean proof gallons.

A tax is levied on a gallon of alcohol at 100 proof.

Senator KERR. In other words, this tax of $9 a gallon is not on four quart bottles of the finished product?

Mr. HEYMSFELD. It might be, sir.

If you take bottled-in-bond whisky, which is sold 100 proof, the tax actually comes to $9 on those four bottles. It comes to $27 on a case of 12 bottles.

Senator KERR. I see.

If it is other than a 100-proof whisky, then what about it?

Mr. HEYMSFELD. Well, then, the tax per bottle might be——

Senator KERR. More or less.

Mr. HEYMSFELD. It might be in the case you put, except for the addition of the rectification tax of 30 cents a gallon, which is imposed upon blended liquor, and I would say that generally speaking most of the liquor which is sold below a hundred proof is blended liquor and, therefore, subject not only to the $9 tax, but to the 30-cent rectification tax.

As a matter of fact, the Government averages not $9 a gallon, but averages about $9.35 at the present rates for every gallon of liquor which is sold.

Senator KERR. On every gallon by volume?

Mr. HEYMSFELD. No, sir; on every gallon by proof.

Senator KERR. Well, that is all right.

Maybe a continuation of that would only add to my confusion. [Laughter.]

Mr. HEYMSFELD. It is a little on the esoteric side.

Senator KERR. Senator Williams has just called attention to the fact that probably you could not have two members of the committee who would know less about what you are talking about. [Laughter.]

Mr. HEYMSFELD. Well, maybe for the purpose of this being educational, that is a very desirable thing for the industry.

Senator KERR. You could answer my question by just telling me what the $9 is on. It is on that part of the bottle that is a hundred-proof alcohol, or otherwise?

Mr. HEYMSFELD. Well, may I answer your question this way: If you take a bottle of whisky which we sell for $2.50, there is——

Senator KERR. A gallon?

Mr. HEYMSFELD. No, a fifth of whisky, which we sell for, let us say, $2.50, there is $1.63 of tax on that which the Federal Government gets.

Senator KERR. $2.50. Of that $2.50, $1.63 goes——

Mr. HEYMSFELD. Goes to the Federal Government now in tax. We gets 87 cents.

Senator KERR. That is on the average, you are saying?

Mr. HEYMSFELD. That is right, sir.

If you think of a case of 12 bottles, the Federal Government gets in full the proceeds of the sale of 8 of those bottles. They get that net; out of the remaining 4 bottles we have to pay all of the costs of manufacture, State manufacturing taxes, grain, labor, bottles, transportation, that must come out of the remaining 4 bottles.

In other words, the Federal Government now gets, you might say, the gross receipts of the sale of 8 of those 12 bottles, on an average.

Senator KERR. You see, what I started in to find out was what a wine gallon was.

Mr. HEYMSFELD. If you took a gallon measure and filled it without regard to the proof of the product, that would be a wine gallon; in other words, it is a measure.

Senator KERR. Does that mean a gallon by volume?

Mr. HEYMSFELD. Yes, sir.

Senator KERR. Does that mean a gallon by volume?

Mr. HEYMSFELD. Yes, sir; without the proof.

Senator KERR. That is all right.

Mr. HEYMSFELD. I am sorry if I led you astray—I mean far afield. I did not lead you astray, Senator. [Laughter.]

Now, the House report deals with the present situation as though we were back in 1946, and we have in our statement our reasons for thinking that the situation is not at all like 1946.

We have seen that already in this drop that has taken place in the last 3 months in Federal revenue collections. We know that there is not going to be the same shortage in either liquor or soft goods or consumer durables, and we have the word of the Council of Economic Advisers on that subject, and we quote the Council of Economic Advisers which says that what might happen is we may get cut back to 1949 levels.

Well, 1949 levels were not 1946 levels and, as a matter of fact, they feel that because of increasing steel production we might, within some period of time even get back to what they call normal demand levels.

Now, none of this takes account of existing inventory position in all industries which will take up any slack. Also we do not see any comparable increase in purchasing power. We know that real purchasing power has dropped, whereas, in 1946, as compared with the years previous to that, real purchasing power had risen.

But most important of all, and as I said before, and I will not spend too much time on it now, in 1946 you had this real limitation on bootlegging and it was not a law-enforcement limitation alone. It was law enforcement and actual shortage of raw materials.

The bootlegger simply could not operate because he could not get the materials to operate with; and on page 5 of our statement we show that the Commissioner of Internal Revenue, as is stated there, recognizes that fact, and he said in 1949 that the upward trend in internal revenue liquor law violations, as reflected by enforcement statistics was first observed in December 1947, following the abandonment of sugar rationing in June of that year, and he said substantially the same thing in 1950 in his report.

(Senator Byrd assumed the chair.)

What is the significance of that? It again indicates that this drop in legal consumption went hand in hand with an increase in illegal production.

Back in 1933 when the Congress first gave consideration to liquor taxes, they appointed an interdepartmenetal committee to consider the whole problem. It was recognized that there would be many problems.

That interdepartmental committee went into two things, which we think are of great significance at the present time because we think that the gentlemen had considerable provision in what they said.

It was a Government agency that went into the thing very thoroughly, and if you will look back at that report made in 1933 and compare it with what we have today, you can see that they drew a pretty good blueprint of what was going to happen.

Now the first thing they said was that unless you got your tax in order you would bring back the consumption of illegal liquor, and they recommended at that time a $2 tax.

The other thing that they said was—and I refer to it later in this statement—that unless the States and the Federal Government got together on some sensible basis and worked out a joint program of taxation, that the States and the Federal Government, each racing for the maximum amount of revenue from the distilled spirits industry, would hurt the cause of the other.

The House estimates that if you raise the tax from $9 to $10.50 you will get roughly 10,000,000 gallons less consumption.

The Treasury estimated about the same, although it is an interesting thing that if you compare the Ways and Means Committee estimate of what the $9 tax will produce with the Treasury estimate of what the $10.50 tax will produce, you will find a difference of 19,000,000 gallons.

Now the 19,000,000 gallons of drop in sales would very substantially reduce the return to the Federal Government, but more importantly than that, the States would lose revenue on 19,000,000 gallons of legal liquor in addition to having all of the additional enforcement problems which they have to carry.

Senator BYRD. In other words, you would get less revenue with the increased tax; is that your contention?

Mr. HEYMSFELD. Well, the Government departments do not quite get to that point, except if you take the Treasury's estimate of February 5 last year and compare it with the present Treasury estimate, you will find that exactly so. In other words, in February last they said they would get $1,750,000,000 at the $9 rate, and on June 28 they said $1,720,000,000 at the increased rate——

Senator BYRD. Your table on page 4 would indicate a decline. Was that due to the increased tax—on page 4?

Mr. HEYMSFELD. No, sir. That was due to the fact that when people did their buying in the 1950–51 period they were buying because they were afraid of a tax increase. It shows that your 1950–51 figures are not a reliable gage of what consumption should be.

We think that the reliable gage is to take 1948, 1949, and 1950.

Senator BYRD. In other words, it will bring in more revenue, but it is less than the Treasury estimate; is that what you mean?

Mr. HEYMSFELD. Actually, sir, if you should drop from 183,000,000 gallons, which the Ways and Means Committee says you will sell at the $9 rate, if the increase in tax drops us back to what we were actually selling in 1947, 1948, and 1949, there will be a loss of $67,000,000 in revenue.

The Federal Government will get $17,000,000 less and the States will get roughly $50,000,000 less in revenue, and we do not think that is an improbable set of circumstances because we know when we come to sell those 158,000,000 gallons that we were selling the consumer in those 3 years, at the $9 tax, that the consumer is going to have to pay $300,000,000 more for those 158,000,000 gallons than they paid in 1948, 1949, and 1950. Even give us a little credit for the increase in disposable income contrary to what the facts show, and let us say that bootlegging is kept under more control than what we think it can be, even on that basis, if we take the Ways and Means Committee estimate that we can sell 183,000,000 gallons at the $9 rate, and put against that what we can sell at $10.50, and use as a reliable figure what the past has shown to be reliable, even taking account of the $300,000,000 of extra cost, you get $17,000,000 less revenue for the Federal Government, and you get $50,000,000 less revenue for the States. Therefore, this is a very serious problem, not only for the Federal Government and for the industry, but it is a very serious problem for the States, because the States have only one out; the only thing that they can do is increase their tax.

Now, as they increase their tax, they get more enforcement problems, the Federal Government gets more enforcement problems, and there is just no end in sight.

Recently a Senate committee reported out S. 1146. The Committee on Expenditures in the Executive Departments reported out S. 1146, which is a bill intended to create a bipartisan commission which is supposed to go exactly into this problem, and in our view no greater service could be rendered to the Federal Government or the State governments or the industry than to go into that problem seriously, because you must consider, sir, that the increase which is now proposed by the Federal Government is about equal to the average rate of tax which the States charge. In other words, the States have shown a little bit of restraint. Their average is about $1.63. Now, we are talking about adding $1.50 at the Federal level. In other words, we are talking about doubling in effect every State tax in the Nation.

In order to achieve a little objectivity about it, suppose instead of thinking about the Federal tax, we sat here and considered what would happen if every State in the United States doubled its tax, its present tax, and we said to ourselves, What is likely to happen? I think we would only come to one conclusion about it, and that is, that more and more people would be driven out of the purchase of legal liquor and would have to begin buying the bootleg stuff.

Let us look at this bootlegging picture a little bit, because—I have gotten as far as page 13, sir—in this situation, we in the industry, know, and we think the figures prove it, that you have got just as much bootlegging today as you had during prohibition.

That is a serious statement and should not be made lightly. How do we prove it? If you look at the top of page 13, in 1931 and 1932, the Federal Government was seizing 22,000 stills a year.

Now, it just happens that last year the States and the Federal Government together seized about 19,000 stills. Let us discount that to make it easy for ourselves, and let us just take the still seizures by the Federal Government alone. They were 9,000 in number, but how many agents did they have—888 agents?

Now, during prohibition they had 2,212 in 1931, and 2,300 in 1932. In other words, during prohibition the agents were seizing stills at about a rate of 10 a man. At the present time the 888 agents are seizing at a rate, we might say, of 11 a man.

Senator KERR. If they could obtain a few more hundred, then the rate per man would continue.

Mr. HEYMSFELD. There is just no question about it. If they increased the number of agents they would increase the still seizures because these fellows are right back in business. I mean, every year you see your seizure rate going up and up and up and, as I said before, these fellows are not going into this business for the sake of law evasion, they go into this business because there is a market for their product.

If you looked at an industry and you said that that industry has this and this capacity, in this case the bootleg capacity which is 200,000 gallons a day, in excess of the daily production of the legal industry.

Now, let us think of these bootleggers as businessmen, and they have set up a production capacity, and we are talking only of the stills which are seized that we know about.

Senator BYRD. Do they actually produce that much? They may have the capacity to produce it, but——

Mr. HEYMSFELD. Well, sir, there is this amount of guesswork: We do not know how many stills are actually in operation. During prohibition, General Andrews said there were 10 in operation for every 1 seized, but we say just let us take the stills which we have seized and let us see what those stills would have produced in a single day.

When these fellows set up these stills they have got an investment; they have got an investment in copper, they have got an investment in stills, and they have an investment in bribing, possibly, and all the other things that go with illegal activity.

Why do they go into this operation? They go into it because they are going to make money out of it; let us assume that they go into it because they expect to stay in operation for 30 days, which is a very modest estimate, because you have only 888 agents around the United States, and I think any self-respecting bootlegger could expect, if he did the thing cleverly enough, that he should be able to stay in operation some amount of time, but if you just take the actual capacity of the stills which were seized, you have got 200,000 gallons a day more than what the legal industry produced.

I come back to a point that I made before, the bootlegger is producing that not just simply for the sake of law evasion; that is his market research on the subject. He knows he has got a market for that quantity of stuff.

Senator BYRD. Is it your opinion that the bootleggers produce more distilled spirits than all the manufacturing, the legalized manufacturing——

Mr. HEYMSFELD. It is my opinion, sir, that based on these figures that I have collected here, it is entirely possible that the bootlegger is producing more today than the legal rate of sales of the industry.

I do not want to confuse it with production because, as I explained before, we produce for sale a number of years ahead, but there is certainly that possibility at the present time.

Senator BYRD. He produces as much as the consumption from the legalized manufacture?

Mr. HEYMSFELD. Yes, sir.

Senator TAFT. How is it marketed?

Mr. HEYMSFELD. Well, I wish some of the enforcement people would answer that, because our information must of necessity be based on hearsay and on what we read in the newspapers, but there are a number of methods of marketing.

It is a big-scale operation. Trucks are used. Part of it is sold in speak-easies. We understand that the stuff is ordered around industrial plants.

If you will look, Senator, at page 15, Federal officials in April 1949 estimated that in Philadelphia "as a daily average about 5,000 gallons of 180-proof alcohol is being manufactured in the Philadelphia metropolitan area."

Now that is a business of $125,000 a day, just in Philadelphia, and it comes—we did a little arithmetic—here to $15 per capita.

Senator BYRD. What does the bootlegger sell his liquor for?

Mr. HEYMSFELD. Well, that is covered in this statement. The Federal officials, as quoted in the Philadelphia Enquirer say that the bootlegger who pays $25 for a 5-gallon can of alcohol can cut that four times and get 160 pints at a dollar a pint or better a pint, and make a seven-times profit.

Now, we have got this former Federal enforcement agent in Nashville, Tenn., who incidentally—that is on page 15—said that there were a thousand persons engaged in the moonshine-liquor traffic in Nashville, and he said there were several more thousand employed part time. In other words, this illegal industry furnishes full-time employment for a thousand people, says this man, around Nashville, and part-time employment for several thousand more.

That is more employment, I think, than we furnish in that area. He said that the cost of a half pint of straight legal wihsky is roughly equivalent to the cost per gallon of straight moonshine of the cheapest grade. In other words, you can buy a gallon of illicit stuff for the price that you have to pay for a half pint of legally distilled liquor which pays its taxes, and pays its employees, and does the things that any decent industry would be doing in the operation of its business.

Senator KERR. What does the half pint of straight legal whisky on the average sell for?

Mr. HEYMSFELD. Well, a half pint of straight legal whisky, I would say about a dollar. I would like to correct that if I am wrong.

Senator KERR. Well, it sells that $2 a pint, about $4 a quart.

Mr. HEYMSFELD. I think that is about right.

Senator KERR. Now, then, if that statement is correct, then it is roughly equivalent to his cost per gallon of straight moonshine.

That means straight moonshine is selling at roughly a dollar a gallon.

Mr. HEYMSFELD. That is right, sir, down in Tennessee.

Senator KERR. Down here you indicated it is selling for a dollar a pint.

Mr. HEYMSFELD. Well, apparently in Philadeplhia the cost of doing business is a little higher.

Senator KERR. It would be a lot higher.

Mr. HEYMSFELD. Or possibly——

Senator KERR. If they are selling it by the pint in Philadelphia for what you get a gallon of it for in Tennessee, I would say they are selling it a lot higher, wouldn't you?

Mr. HEYMSFELD. Well, Senator——

Senator KERR. That would be eight times as high.

Mr. HEYMSFELD. Well, Senator, I think that the difference is not quite that much, because he figures $25 for a 5-gallon can of alcohol, which he then cuts four times. That would mean that he would get for his 5 gallons—he would wind up with 20 gallons, which he would sell for $25.

In other words, he does not give the fellow 90- or 100-proof whisky, as we do. That would mean that he would be getting 20 gallons which he would sell for $25, so the differential is a dollar plus in the case of Philadelphia as against a dollar in Tennessee.

I do not know whether there is a kind of a national syndicate which sets these prices, but I am glad you point that out because there is a closer relationship between those prices than I first thought when I saw these figures.

Senator KERR. Then Palmore was talking about one thing, and the Philadelphia Enquirer was talking about another?

Mr. HEYMSFELD. Well, Palmore is talking about Tennessee.

Senator KERR. Evidently he was talking about the product which is taken and cut, rather than the product after it is offered for sale.

Mr. HEYMSFELD. I think they are both talking about the same thing. I would not try to guess, because I have not spoken to the people concerned, but Palmore says a gallon of straight moonshine sells in Tennessee at about a dollar a gallon and if you figure out here what price the bootlegger in Philadelphia sells a wine gallon, to get back to the thing we were defining before——

Senator KERR. I wish you would stay off that.

Mr. HEYMSFELD. For something over a dollar a gallon. In other words, he winds up with 20 wine gallons for $25, which is a little over a dollar a gallon.

Senator KERR. Well, the Enquirer is talking about alcohol: He said $25 for a 5-gallon can of alcohol.

Mr. HEYMSFELD. That is right, sir, which he then cuts four times before he sells it.

Senator KERR. This fellow here is talking about straight moonshine.

Mr. HEYMSFELD. That is right. I do not know what the proof of what passes for straight moonshine is in Tennessee.

Senator KERR. Well, it is not straight alcohol.

Mr. HEYMSFELD. That is right. And that is why there is some comparison between these figures.

Now, this rate of tax, we feel, has been responsible for the situation that we confront. We feel that we are entering the area, not only of diminishing tax returns, as I tried to show in the early part of my statement, but we are entering the era of prohibition, and just to get another definition on the record, by prohibition, we mean prohibition on legal sale.

We do not mean prohibition on consumption, because there is no such thing that has ever been known in this country. Eighteen years after repeal, purchasers of small and modest means have already been deprived of the benefit of repeal, and we have entered the area of prohibition by taxation.

Now, England accomplished that job. They did it over a period of about 12 years. In 1920 they got the tax up to a point where everybody but the very wealthy class was driven out of the market for distilled spirits.

Senator BYRD. What was the tax in England? What is it now?

Mr. HEYMSFELD. Well, the tax that accomplished that in England was a tax of 72 shillings and 6 pence, which came to $12.88 at the then rate of exchange.

Then, as a result of imposing that tax, they reduced their consumption down to 0.29 gallon per capita, which was one-half of the 1920 rate, and that was accomplished in a 12-year period.

Now, the present consumption of 0.25 gallon per capita is just what we had in legal consumption in this country during prohibition.

Senator KERR. Wait a minute.

Mr. HEYMSFELD. Sir?

Senator KERR. You say during prohibition we had an average consumption of 2.59 gallons of legal——

Mr. HEYMSFELD. That is right, by medicinal permit, and then we had a vast consumption of illegal. I am indicating what 0.259 means. It is about the per capita consumption; that is, what we sold under medicinal permits.

Senator KERR. So, 2.59 means an average per capita consumption?

Mr. HEYMSFELD. That is not quite right.

Sentator KERR. That is an interesting observation. The average consumption is 2.59 gallons?

Mr. HEYMSFELD. No, sir.

Senator KERR. And that means an average consumption is a third of a gallon.

Mr. HEYMSFELD. No, sir. 0.259 gallon; in other words, 0.259.

Senator TAFT. Twenty-six one-hundredths?

Mr. HEYMSFELD. Right. It is roughly twenty-six one-hundredths.

Senator TAFT. It is a little more than a fourth——

Mr. HEYMSFELD. Just slightly more than a fourth of a gallon per capita.

Senator BYRD. When you speak of per capita, you include everything, women and children?

Mr. HEYMSFELD. Yes, sir. Not that they consume that, but here we have to have some population to measure these figures against. I mean you can draw your figures on the basis of population of over 21 or any other basis. We took this as a general rule.

Senator TAFT. There are people who take quite a bit.

Senator BYRD. What is the consumption in the United States?

Mr. HEYMSFELD. In the United States it is something over a gallon per capita which is what it was in 1910, about 1910, in England.

Senator BYRD. And a fourth of a gallon during prohibition by the prescription liquors.

Mr. HEYMSFELD. Yes, sir.

Now, it dropped a little below that in some years, but there was at least 1 year in which I recall the consumption, the legal consumption, was just about that.

In other words, they have achieved prohibition in England, but prohibition for whom? Not prohibition for everybody, because they still derive a revenue from the sale of distilled spirits. Now, we know who is buying there. It is the very wealthy class, and that is exactly what is being accomplished in this country, that people of lower income, just as the Interdepartmental Committee said in 1933 would happen, and just as the Commissioner of Internal Revenue said in 1949 and 1950 is happening in this country, that through these taxes people of low incomes are being driven to the bootlegger. That is where they are taking this business to, because they can get a gallon of liquor there for the same price that they would have to pay for a half pint of legal liquor brought through the legal channels.

Senator KERR. I do not understand that at all. You say that the bootlegger sells his stuff for a dollar a pint, is that right?

Mr. HEYMSFELD. No, sir; a dollar a gallon.

Senator KERR. You said he paid a dollar a gallon, that is what you said. You said the bootlegger paid a dollar a gallon, and that he cut it so many times and sold it for a dollar a pint and that, therefore, made a profit of 700 percent, is not that what you told us a while ago?

Mr. HEYMSFELD. I am afraid under this feeling of time pressure, Senator, I have moved a little bit fast. We have two places that we were drawing comparisons about, and both of them were based, so far as I am concerned, on hearsay, although the source of the hearsay is set forth in the statement.

Senator KERR. You set forth here——

Mr. HEYMSFELD. We were comparing Tennessee, a statement by an enforcement officer in Nashville, Tenn.

Senator KERR. All right. Here is the Philadelphia Enquirer that you quoted, and you do quote——

Mr. HEYMSFELD. That is right.

Senator KERR. The bootlegger who pays $25 for a 5-gallon can of alcohol.

Mr. HEYMSFELD. That is right, cuts it four times.

Senator KERR. Now that is $5 a gallon that he pays.

Mr. HEYMSFELD. Then he cuts it four times.

Senator KERR. Let us take it step by step.

Mr. HEYMSFELD. That is right, sir.

Senator KERR. The bootlegger pays $5 a gallon——

Mr. HEYMSFELD. That is right.

Senator KERR. For the straight alcohol.

Mr. HEYMSFELD. But the gallon he purchases, is not the gallon he sells.

When he comes to sell those gallons have become 20 gallons, and that is what that statement said. He cuts it four times; in fact, it has become 25 gallons under one interpretation.

Senator KERR. If he cuts it, as this says, four times.

Mr. HEYMSFELD. Well, he gets at least 20 and it may be 25; I do not know.

Senator KERR. You mean if he cuts it four times that may mean five times?

Mr. HEYMSFELD. No, sir.

Senator KERR. I am just taking your quotation.

Mr. HEYMSFELD. He cuts it four times.

Senator KERR. Let us just stop right there.

Mr. HEYMSFELD. What I say is the statement that he cuts it four times is a little ambiguous.

Senator KERR. You say the bootlegger cut it.

Mr. HEYMSFELD. That is right. It might mean that he cuts it either to 20 or 25, but we will take the lower figure. He cuts it to 20 gallons.

Senator TAFT. Let us wait a minute. It seems you are confused. Who does he pay? He pays another bootlegger, presumably the one who makes it.

Senator KERR. The still operator.

Senator TAFT. He pays the still operator.

Mr. HEYMSFELD. That is right.

Senator TAFT. And he pays a dollar a gallon for it.

Senator KERR. No; he pays $5.

Senator TAFT. Wait a minute. You say it costs—what does it cost him, to begin with?

Mr. HEYMSFELD. According to his statement, Senator——

Senator TAFT. I do not care about his statement. What does it cost to make a gallon of whisky? He can make it for a dollar a can, can he not?

Mr. HEYMSFELD. Yes, sir.

Senator TAFT. Anyone with a still can make it for a dollar a gallon, can he not?

Mr. HEYMSFELD. Yes, sir; presumably.

Senator TAFT. And presumably he makes a profit when he sells it to the bootlegger—the distributor—who cuts it.

Mr. HEYMSFELD. That is right.

Senator TAFT. And the distributor cuts it, usually, or does the original still owner?

Mr. HEYMSFELD. Apparently in Philadelphia he does, or did in 1949.

Senator TAFT. He pays $25; he pays somebody for it?

Mr. HEYMSFELD. That is right. We will say that he pays that to the still operator. He pays him $25 for 5 gallons. When he sells it the 5 grow to 20 by the addition of water.

Senator BYRD. The market varies over the country, does it not?

Mr. HEYMSFELD. Oh, yes.

Senator BYRD. Some places they pay more, much more for it.

Mr. HEYMSFELD. That is right.

Senator TAFT. You take a quart, for which you pay $3.65 or $4. Of that quart, $2.25 is taxed, is it not, a straight tax?

Mr. HEYMSFELD. Roughly, that is right, sir.

Senator TAFT. That may be an accumulated profit on the tax.

Mr. HEYMSFELD. That is right.

Senator TAFT. But of it $2.25 is a tax, so that in selling a quart, at least he saves $2.25.

Mr. HEYMSFELD. Of that there is no doubt.

Senator TAFT. He can sell it at all the same margins that the legitimate dealer gets, for $1.40 a quart, or something of that sort.

Mr. HEYMSFELD. Well, we have a figure of $10.57, a very conservative estimate of his saving.

Senator TAFT. $10.57 on what?

Mr. HEYMSFELD. A gallon.

Senator TAFT. A gallon?

Mr. HEYMSFELD. That is what he saves on tax alone.

Senator TAFT. On tax alone. I do not see what difference it makes. The only question I have is whether it is any worse with respect to $12 than it is with $9. You have now already reached a point where the only thing you can do about it is by enforcement anyway.

Mr. HEYMSFELD. We think there is a great deal to be done about it.

Senator TAFT. That is what it appears like to me.

Mr. HEYMSFELD. Keeping your tax in line, because every student of the subject has agreed that is one method of doing it, because what happens is this——

Senator TAFT. You mean he makes such a tremendous profit on $9 that he can make an equal profit on $12. The only thing you can reduce the market for legitimate liquor—some of the people who do not buy it, will do without, and some people will buy bootleg liquor.

Mr. HEYMSFELD. That is it exactly. Every time you reduce the price it is not only a question of the bootlegger's profit, but it is a question of how many more people drop off from the legal into the illegal market, just like under classic economics there is a point at which manufacturers stop producing.

Senator TAFT. If you raised the price and stopped the bootlegging, you still will cut the consumption, and presumably at some point you will actually cut the tax.

Mr. HEYMSFELD. Yes; and we estimate that if—I do not know whether you were here——

Senator TAFT. So that fewer people will buy it, apart from this bootleg question?

Mr. HEYMSFELD. We estimated—and I will repeat this point, if I may—if we succeed in this tax increase, with the $300,000,000 of extra cost which the public would have to pay because of the increase in tax, if as a result of that tax increase we dropped the market from the 183,000,000 gallons which the Ways and Means Committee estimate at $9—if we drop that back to the actual level of the legal market that we had in 1947, 1948, 1949, and 1950, the Government would lose tax in the amount of $17,000,000 a year and the States would lose about $50,000,000 a year.

I would like to take just 1 minute, if I may, sir, to talk of that State tax situation, showing how that operates.

Senator KERR. I would like to ask just one question, if I may, if the Senator is through.

Senator TAFT. Sure.

Senator KERR. I just want to call attention to the fact in your statement—and I am very much interested in your problem—but I want to call attention to the fact that your statement is that this has brought about a situation where the consumer pays as much for a half pint of legal whiskey as he does for a gallon moonshine, and that is not substantiated by the statement, because your statement here indicates he pays a dollar a pint for this bootleg whiskey—that is in the quotation that you give from the Philadelphia Inquirer——

Mr. HEYMSFELD. That is right.

Senator KERR. That the consumer pays a dollar a pint——

Mr. HEYMSFELD. That is right.

Senator KERR. For the moonshine.

Mr. HEYMSFELD. That is right.

Senator KERR. According to your statement, he would not pay any more than a dollar for a half pint of legal whiskey.

Mr. HEYMSFELD. Well, Senator, I am willing to——

Senator KERR. Therefore your conclusion that he pays as much for a half pint of legal whiskey as he does for a gallon of moonshine is inaccurate or the statement is inaccurate.

Mr. HEYMSFELD. No; I was quoting the relationship of a half pint to a gallon. I was quoting Mr. Palmore who said that in Tennessee the cost of a half pint of straight legal whisky—I do not want to appear before this committee as an expert on what it costs a bootlegger to make whisky—I mean, we have got to get this information by hearsay—apparently the costs vary sectionally.

Senator KERR. Yes, but Palmore, if he points out that a half pint of straight legal whisky is roughly equivalent to the cost per gallon of straight moonshine——

Mr. HEYMSFELD. Yes, sir.

Senator KERR. Then what he is doing is saying that the retail price of a half pint of whisky to the consumer is the same as the production cost of a gallon of the cheapest grade of moonshine whisky to the still operator who makes it. He cannot be comparing the cost to the consumer.

Senator TAFT. Won't the cost to the consumer be whatever the traffic will bear?

Senator BYRD. It will vary throughout the country.

Senator TAFT. Whatever the price of legal liquor is, they will sell it under the price of legal liquor, and take the profit.

Senator BYRD. It the hazards are there, if the agents are active; the price of it would depend on a number of things.

Mr. HEYMSFELD. There is no doubt it.

Senator BYRD. There is no standard at all.

Mr. HEYMSFELD. No; but actually the fact that bootleg whiskey is being sold indicates that it enjoys a very substantial price advantage.

Senator BYRD. If you have a prohibition agent active and he is arresting people , and putting them in the penitentiary and all that, then the price of bootleg liquor should go up. But where they are careless about it and not doing anything, and the risk is less probable, then it would be less; is that not correct?

Mr. HEYMSFELD. That is exactly right.

But Westbury, Long Island, Senator, which I happen to know, is not in the mountains, because it is just a few miles from home——

Senator BYRD. The point I am making, there is no standard price at all of bootleg liquor.

Mr. HEYMSFELD. That is right. Here is a 2,500-gallon still seized in Long Island, an operation which used seven vats, each 8 feet wide and 14 feet deep. We figured out that was larger than the smallest legal distillery operating in the industry. That is seven vats, each 8 feet wide and 14 feet deep.

In answer to your question as to how long these fellows operate, the agent says these stills had been operating for months, but the neighbors said they had been smelling what they thought was wine for home use since last summer, which would make it an operation of almost a year, and that still was operating right in Long Island, just outside New York City.

That is not a small mountain still.

I would like to take one moment on this question of costs, and then I will have finished, and I am appreciative of the time I have gotten.

Both the Ways and Means Committee and the Treasury estimate that this tax can be passed on to the consumer without mark-up.

Now, gentlemen, any estimates which are made on that basis cannot be correct.

Senator BYRD. You are speaking of the dollar and a half extra tax?

Mr. HEYMSFELD. That is right. You take the State of Pennsylvania, for example, where the State operates its own liquor stores, in that State a $1.50 tax increase becomes $2.44 by the time it reaches the the consumer, and that is a State operation.

In Vermont, a $1.50 increase becomes $2.10, and we have listed in a footnote on page 6 what these mark-ups are in these various States.

Now, similarly in the industry——

Senator BYRD. Is that because the States add an additional tax?

Senator TAFT. Yes, sir.

Mr. HEYMSFELD. Yes.

They add what they call a mark-up, and these States make $5 a gallon when they sell it, and to get back to the other point, that is the amount of their loss on every gallon that was not sold on the increase in the tax.

Senator TAFT. What is Ohio; do you have it?

Mr. HEYMSFELD. Yes, sir.

Ohio is 42.85 percent.

Senator TAFT. Mark-up, you mean?

Mr. HEYMSFELD. Yes, sir; just under 43 percent.

Senator TAFT. How do you mean?

Mr. HEYMSFELD. That is——

Senator TAFT. A $1.50 increase in tax will be $2.25?

Mr. HEYMSFELD. That is right; something under Pennsylvania.

Senator BYRD. What about Virginia?

Mr. HEYMSFELD. Virginia, 40 percent.

You see, that is what happens in one-third of the Nation in monopoly States.

Senator BYRD. That 40 percent pyramids on the tax.

Mr. HEYMSFELD. That is right, sir; that pyramids on the tax and, therefore, when you come to estimate how much the people are going to spend and then translate that into gallons, you cannot just take the amount of this tax.

You have got to take the amount of the tax plus this mark-up; in other words, you cannot estimate that the fellow is going to have to spend $1.50 a gallon extra.

In Pennsylvania he spends $2.44 more per gallon.

Senator BYRD. In Virginia the State operates its own stores.

Mr. HEYMSFELD. That is right, sir; as they do in Pennsylvania.

Senator BYRD. And that $1.50 tax would be a 40 percent mark-up?

Mr. HEYMSFELD. That is right, according to the present law.

Now, when you get to these private license States you will find that in six of them they actually have put laws on the books defining what the mark-up must be.

In other words, while you have got a private industry operating, the mark-up is fixed by statute.

Senator BYRD. Let me get this straight. In other words, the Federal tax is included in the cost of the product; it is added to the cost of the product, and the mark-up is on the total?

Mr. HEYMSFELD. That is right.

Senator BYRD. Does every State in the Union do that, or not?

Mr. HEYMSFELD. Here is how it breaks down. There are these 17 monopoly States. Then there are six States which have a mark-up which is prescribed by law. In other words, the same results substantially are accomplished. But beyond that, and as I think will appear from the testimony of later witnesses, this industry, which took on the 1944 war tax without a mark-up, because they thought it was a temporary emergency measure, has been facing steadily increased costs, and to expect that they will carry this tax increase without mark-up is just to consign a percentage of that industry to bankruptcy.

Now you have got sales taxes in 31 States, and they are levied on a percentage basis, so you have got an automatic increase in cost.

We made a rough guess on page 7 of this statement that the cost of a $10.50 tax on 158,000,000 gallons would be $300,000,000.

In other words, if we found that much extra purchasing power in the consumer, $300,000,000 extra and sold him what we sold him in 1948, 1949, and 1950, we would lose, as against the Ways and Means Committee estimate of 183,000,000 gallons which they say we can sell at the $9 rate, we would lose $17,000,000 of excise revenue to the Federal Government—I will not mention the corporate and personal income taxes—and then the States would lose on that number of gallons we estimate, roughly, $50,000,000 as we view this situation.

Senator BYRD. There would be purchase resistance because of the price increase.

Mr. HEYMSFELD. That is correct, sir.

So, as we estimated, there are $67,000,000 in revenue lost, without taking into account the increased enforcement problems which the tax will create.

Senator KERR. Mr. Chairman, I would like to introduce into the record at this point a table put in the record in the hearings before the Committee on Ways and Means of the House and found at page 533, which is an exhibit from the Alcohol Tax Unit, Bureau of Internal Revenue, February 21, 1951, showing the mash seizures in the first, second, third, and fourth supervisory districts during the 12-month periods before and after each of the increases in the tax rate on distilled spirits beginning 1938, and which shows that the mash seizures in those four districts have decreased from 1,647,968 gallons in 1938 to 289,521 gallons in 1944–45.

(The document referred to follows:)

Mash seizures in the first, second, third, and fourth supervisory districts during the 12-month periods before and after each of the increases in the tax rate on distilled spirits beginning with 1938

[Gallons]

Supervisory district	Increase in rate from $2 to $2.25 on July 1, 1938		Increase in rate from $2.25 to $3 on July 1, 1940		Increase in rate from $3 to $4 on Oct. 1, 1941		Increase in rate from $4 to $6 on Nov. 1, 1942		Increase in rate from $6 to $9 on Apr. 1, 1944	
	Mash seized July 1, 1937–June 30, 1938	Mash seized July 1, 1938–June 30, 1939	Mash seized July 1, 1939–June 30, 1940	Mash seized July 1, 1940–June 30, 1941	Mash seized Oct. 1, 1940–Sept. 30, 1941	Mash seized Oct. 1, 1941–Sept. 30, 1942	Mash seized Nov. 1, 1941–Oct. 31, 1942	Mash seized Nov. 1, 1942–Oct. 31, 1943	Mash seized Apr. 1, 1943–Mar. 31, 1944	Mash seized Apr. 1, 1944–Mar. 31, 1945

Source: Alcohol Tax Unit, Bureau of Internal Revenue, Feb. 21, 1951.

Mr. HEYMSFELD. May we have permission, Senator, to carry those figures up to date because those figures go from 1944 to 1945?

Senator KERR. Yes.

Senator BYRD. I think the figures should show the number of prohibition agents.

Mr. HEYMSFELD. We would like permission to file it if you would like to have it.

(The information referred to follows:)

In answer to inquiry by Senator Byrd, Mr. Dwight E. Avis, Assistant Deputy Commissioner, Alcohol Tax Unit, Bureau of Internal Revenue, advised that there were 850 investigators in the Alcohol Tax Unit at present time.

Mr. HEYMSFELD. I submit my complete statement for the record.

Senator BYRD. Your statement will be put in the record.

Mr. HEYMSFELD. Thank you, sir.

(The prepared statement follows:)

STATEMENT OF RALPH T. HEYMSFELD, GENERAL COUNSEL, DIRECTOR, SCHENLEY INDUSTRIES, INC., AND VICE PRESIDENT, DISTILLED SPIRITS INSTITUTE

My name is Ralph T. Heymsfeld. I am general counsel and a director of Schenley Industries, Inc. I am a vice president of the Distilled Spirits Institute and appear here today representing the institute. The Distilled Spirits Institute is a trade association whose members constitute over 85 percent of the distilled-spirits industry.

H. R. 4473 proposes an increase to $10.50 in the tax on distilled spirits. This would add $1.50 a gallon to the $9 war tax enacted in 1944. How much, if any, additional revenues will this produce?

THE DECREASING OFFICIAL REVENUE ESTIMATES

Since the time when the Treasury first advocated the increase in the Federal tax, the official estimates of revenue collections on distilled spirits have consistently declined. These are the estimates:

	Estimated revenue	Estimated tax-paid gallons
	At $9	
Treasury (Feb. 5)	$1,750,000,000	194,000,000
Ways and Means Committee (June 18)	1,650,000,000	183,000,000
Treasury (June 28)	1,565,000,000	174,000,000
	At $10.50	
Ways and Means Committee (June 18)	$1,828,000,000	174,000,000
Treasury (June 28)	1,720,000,000	164,000,000

The Ways and Means Committee now estimates $178,000,000 of additional revenues. The Treasury now estimates $155,000,000.

Treasury estimates are that 174,000,000 gallons would be tax-paid at the existing rate and produce $1,565,000,000 of revenue. Under the increased rate, the Treasury estimates 164,000,000 gallons would be tax-paid and produce $1,720,000,000 of revenue.

If we compare this estimate of June 28 with the statement of the Treasury before the Ways and Means Committee on February 5 last, we find that at that time the Treasury estimated that 194,000,000 gallons would be sold under the $9 rate and would produce $1,750,000,000 in Federal revenues—$30,000,000 more than is now estimated for the $10.50 rate.

It is apparent that since February, when it first advocated an increase in the Federal tax, the Treasury has substantially reduced its estimates of the amount of money which the American people will spend for legally distilled spirits. It has revised its estimates downward, notwithstanding an increase of $3,412,000,000 in its estimate of disposable personal income.

The staff of the Ways and Means Committee reduced the original Treasury estimate of sales at the $9 rate by about 11,000,000 gallons and used a figure of

183,000,000 gallons. Now the later Treasury estimate of 174,000,000 gallons has brought the Treasury Department 9,000,000 gallons below the Ways and Means Committee staff.

Both the Treasury and the Ways and Means Committee agree that a tax increase will decrease legal sales. The Ways and Means Committee staff expects that at the $10.50 rate 174,000,000 gallons would be tax-paid; however, the Treasury experts believe that only 164,000,000 gallons would be tax-paid. The difference between the Ways and Means Committee forecast of sales at the $9 rate and the Treasury estimate of sales at the $10.50 rate is 19,000,000 gallons.

The Ways and Means Committee report of June 18 says that the tax increase will not seriously affect the consumption level of liquor because:

"The acceleration of the defense program presents the likelihood that income levels again will rise and consumers again will have to cut down their purchases of durable goods."

This is the main assumption upon which the tax increase is proposed. There is one collateral assumption, that the—

"Financial incentive for illicit operations resulting from the tax increase * * * is likely to be more than offset by a tightening of the labor supply available for these operations and by higher incomes on the part of consumers, which will decrease the importance of the price differential between tax-paid and non-tax-paid liquor."

Of course, if these assumptions were correct, the tax yield would rise substantially without raising the rates. The House estimate of $1,050,000,000 at the $9 rate would, if attained, be an increase of $229,000,000 over the 1950 return—such an increase without increase in rate ought to be highly satisfactory.

THE INDUSTRY'S REVENUE ANALYSIS

The House report deals, at best, with transitory conditions which cannot be the basis for long-range tax policy. It compares the situation with 1946. That too was a temporary situation which soon came to an end and we saw the effects of the $9 tax in the 1948, 1949, and 1950 period when legal sales dropped 30 million gallons per year and Federal revenues dropped $332,000,000 a year.

In the 1933 report of the interdepartmental committee on distilled spirits, it is shown from a review of the preprohibition experience that there is "a marked variation in per capita consumption with changes in general business conditions, and this movement varied from 1.5 gallons in prosperous years to 1 gallon in years of depression."

In 1948 through 1950, under the $9 wartime tax, expenditures for legal spirits did not keep pace with the rise in disposable personal income.

Disposable personal income rose from $158.9 billion in 1946 to $202.7 billion in 1950, but distilled-spirits expenditures did not rise with the increase. The amount spent on distilled spirits in 1946 was 3.18 percent of disposable personal income, but in the following years the ratio dropped each year, even in the year 1950, as follows:

	Percent
1947	2.69
1948	2.07
1949	1.95
1950	1.91

Moreover, we in the industry think the situation differs markedly from 1946:

1. The increased tax payments after Korea, referred to in the House report, are not persuasive because they did not mean an equal increase in consumer purchases, but resulted from scare increases in inventory position. A comparison of the tax collections from distilled spirits for the last quarter of fiscal 1951 with the same quarter of the two previous years clearly reveals this:

Federal tax collections: Distilled spirits excise

	1949	1950	1951	Decrease 1950-51	Percent loss 1950-51
April	$100,272,321	$105,150,140	$76,107,674	$29,042,466	27
May	107,146,468	110,812,047	90,369,597	20,442,450	18
June	107,110,012	121,298,675	89,800,000	31,498,675	25

3 months decline (1950-51) $80,983,591.

The House report refers to the 1950 consumption of 190,000,000 wine gallons. The actual tax collections for the last fiscal quarter show conclusively that the 1950 results did not represent consumption, but increases in inventory position which are now reflected in offsetting decreases in tax revenues.

2. We see no shortage comparable to 1946 in liquors, soft goods, or consumer durables.

The Midyear Economic Report by the Council of Economic Advisers points out that the reduction this year of scarce metals will not reduce consumer durable-goods production more than 30 to 40 percent of the first half of 1950 rate and would permit output near the levels of 1949 (pp. 94 and 95). Expansion of finished steel output in the next few years would, according to the report, "support continued economic growth, residential and public construction on at least as large a scale as in 1950, and the satisfaction of normal demands for consumer durable goods" (p. 84). During the first half of 1951 an excess of inventories developed at the retail level in consumer durable goods particularly (p. 104).

3. We see no comparable increase in real purchasing power.

The Ways and Means report was issued in June. According to the July report on Economic Indicators of the Council of Economic Advisers, issued July 11, disposable personal income in the first quarter of 1951 showed a drop, in terms of 1950 prices, from the last 6 months of 1950. Although dollar income went up, real purchasing power went down. (July report on Economic Indicators, p. 20.)

4. Bootlegging was much more restricted in the year 1946 because of shortages of sugar, copper, and other materials. Only 6,041 stills were seized by the Federal Government in that year and the daily producing capacity of illicit stills seized during the 1946–47 period, was less than one-third of the comparable 1939–40 period.

The report of the Commissioner of Internal Revenue for 1946 says:

"Throughout the fiscal year investigators of the Alcohol Tax Unit and the Office of Price Administration devoted much of their time to the joint program, looking toward the enforcement of sugar-rationing regulations, and the prevention or detection of diversions of sugar into illicit channels or into the black market generally. This program was recognized by the Bureau as the best means, so long as sugar remained under rationing control, of preventing moonshiners from obtaining sugar and is offering an opportunity to disclose incomes received illegally by black-market operators and not reported for income-tax purposes."

Six thousand and fifty-three illicit stills were seized during 1947. Sugar rationing was discontinued at midnight June 11, 1947.

The 1949 report of the Commissioner of Internal Revenue says:

"During the fiscal year 1949, violations of the internal revenue liquor laws, as reflected by enforcement statistics, continued to increase.

"This upward trend was first observed in December 1947, following the abandonment of sugar rationing in June of the same year."

The 1950 report of the Commissioner of Internal Revenue says:

"During the fiscal year 1950 violations of the internal revenue liquor laws, as reflected by enforcement statistics, continued to increase. This upward trend was first observed in December 1947 following the abandonment of sugar rationing in June of the same year. The increase in violations has been confined principally to the Southern States and a few metropolitan areas on the east coast. The underlying reason for the large volume of violations in the Southern States is the preponderance of low-income groups which furnish the demand for cheap spirits, coupled with the fact that more than 40 percent of the population is located in local option counties where tax-paid liquor is not readily available."

The House bill proposes:

(1) The largest tax increase for the alcoholic beverage already carrying the highest rate.

(2) The largest tax increase on the product most subject to large-scale illegal substitution.

We must expect, therefore, some shifts from distilled spirits purchases to purchases of other beverages, as well as greatly increased sales of bootleg liquor.

The Interdepartmental Committee report of 1933 said:

"As prices increase, only the higher-income groups could continue to consume the same quantity, while the lower-income groups would consume less of the legalized product and increase their consumption of wines and illegal liquor."

The House estimates that at the $10.50 tax rate consumption will drop 5 percent, from 183,000,000 gallons to 174,000,000 gallons. Suppose that as a result of the tax increase tax-paid consumption is reduced by 15 percent? A 15-percent reduction would mean that the Federal Government would gain no additional excise revenue from the tax increase, it would lose corporate and personal-income taxes, and the States would lose revenues on 25,000,000 gallons.

Is that a remote possibility? We do not think it is. A 15-percent drop would bring us back to a level of 158,000,000 tax-gallons, which is just about the 1948, 1949, and 1950 rate of sales. If we consider that the added tax costs would make consumer prices substantially higher than the 1948-50 prices, the 158,000,000-gallon figure is on the hopeful side.

The Treasury Department and the House Ways and Means Committee estimates are based on the assumption that the added Federal tax cost can be passed on to the consumer without mark-up. That is not a realistic assumption.

In the State of Pennsylvania, for example, there is a mark-up of 48 percent on the State's delivered cost and there is also a 10-percent emergency tax. A $1.50 increase in tax automatically becomes an increase of $2.44 a gallon to the consumer buying in Pennsylvania.

In the State of Vermont a $1.50 increase in the Federal tax likewise means an automatic increase of $2.10 per gallon at the consumer level.

In these and other monopoly States there is an automatic mark-up on the increase in Federal tax cost.[1]

During the OPA period from 1942 to 1946 when the Office of Price Administration ruled that monopoly States could not take a mark-up on the war-excise rates, several of these States imposed State emergency war taxes. After price controls ended most of these States canceled the State war emergency taxes and marked up all of the Federal tax increases on distilled spirits.

In the license States trade mark-ups are an economic necessity and are now required by law in six States.

Arkansas	By law (amended 1951): Wholesaler must mark up 13 percent; retailer, 30 percent.
Georgia	By regulation: Wholesaler, 14 percent; retailer, 33⅓ percent.
Kentucky	By law: Wholesaler, 15 percent; retailer, 33⅓ percent.
New Mexico	By law: Wholesaler, 17.5 to 18.04 percent; retailer, 33⅓ percent.
Rhode Island	By regulation: Wholesaler, 15 percent.
South Carolina	By law: Wholesaler, 25 percent.

Thirty-one States levy a percentage general sales tax applicable to distilled spirits, and an increase in Federal tax cost is automatically reflected by a further increase in sales price.

The added consumer cost of a $10.50 tax would be over $300,000,000 on 158,000,000 gallons.

We are left, therefore, with this conclusion: If the added cost to the consumer of a $10.50 tax, together with the increase in illegal sales caused legal sales to drop, from 183,000,000 gallons estimated at the $9 rate to the sales level that we had from June 1, 1947, through June 30, 1950, the Federal Government would gain absolutely nothing in added revenues. But the States would lose millions of needed revenues.

THE LOSS TO THE STATES

Neither the Treasury nor the Ways and Means Committee report makes any reference to the effect of a tax increase on the large State revenues from distilled spirits.

---

[1] Here is a list of the monopoly State mark-ups:

Alabama	40 percent, then additional 10 percent.
Iowa	40 percent; Iowa Liquor Control Board has legislative authority to establish prices so as to return up to 65 percent gross profit.
Michigan	46 percent.
Oregon	44 percent.
Pennsylvania	48 percent, then additional 10 percent.
Utah	55 percent, then additional 6 percent.
Vermont	40 percent.
Washington	54 percent.
Idaho	63 percent.
Maine	61 percent.
Montana	53 percent, then additional 8 percent.
New Hampshire	40 percent.
North Carolina	50 percent, then additional 8½ percent.
Ohio	42.85 percent.
Virginia	40 percent.
West Virginia	60 percent.
Wyoming	17.6 percent (wholesale monopoly).

In 17 States which have State stores, sales of distilled spirits result in an average of $5 per gallon of gross revenue.

In the State of Vermont, for example, in addition to the mark-up of 40 percent on the State's delivered cost there is added a State excise tax of $3.60 a gallon, making the gross revenues to the State $5.26 a gallon.

In Pennsylvania the State averages $6.10 per gallon.

In the States of Ohio and Virginia the gross return is $3.87 per gallon.

In the remaining States, in which distilled spirits are sold by licensed dealers, the State and local governments collected in 1950 an estimated $300,000,000 of tax revenue from the sale of 131,000,000 tax gallons of distilled spirits, for an average yield of $2.20 per gallon. Excise tax collections averaged $1.48 per gallon and sales taxes $0.15 a gallon.

All of these 28 States impose gallonage taxes, and 17 of these States impose additional general sales taxes which are applicable on the retail selling price of liquor. In addition there are city sales taxes in such cities as Los Angeles, San Francisco, New York, Chattanooga, Baltimore, Atlanta, and Savannah.

Of the total $300,000,000, $194,000,000 was derived from excise taxes and $18,000,000 from sales taxes, and the rest was license fees and miscellaneous taxes in local license fees and local taxes. There were $6,200,000 in miscellaneous taxes.

Thus, the 17 monopoly States would average a loss of $5 for each unsold gallon, and the private license States would lose $1.63 per gallon in sales and excise taxes. Reduced sales volume will drive some wholesalers and retail outlets out of business, affecting license fees, which will increase the loss to above $1.63 a gallon.

THE NEED FOR FEDERAL-STATE COORDINATION

The present Federal tax has had precisely this hurtful effect of depressing consumption and reducing State revenues since 1946. There has, therefore, been continuous pressure in the States to make up the lost revenue by increasing tax rates. This in turn reduces consumption and affects Federal revenues adversely.

In 1949, for example, 23 States and the District of Columbia considered increases in taxes on distilled spirits. Six increases were effected: in the District of Columbia, Florida, Georgia, Massachusetts, Minnesota, and North Dakota.

In 1950 Texas increased its taxes.

In 1951, stimulated, we believe, by the proposal to increase Federal taxes, 21 States considered increases, and in 11 States increases have already been adopted.

Arkansas	Additional 3-percent tax on alcoholic beverage retail sales, making the total 5 percent.
Idaho	Increased the retail price of alcoholic liquor slightly.
Nebraska	Increased the tax from $1 to $1.20 a gallon.
New Mexico	Increased the tax by 10 cents a gallon from $1.20 to $1.30.
Pennsylvania	Made a 10-percent emergency tax permanent.
Rhode Island	Increased the tax by 50 cents a gallon from $1 to $1.50.
West Virginia	Passed a law requiring the State liquor authority to increase the retail price of liquor sold in State stores sufficient to provide $1,600,000 for a veterans' bonus.

Maine, Georgia, South Carolina, and South Dakota have increased their sales taxes.

All of these actions have taken place since the Secretary of the Treasury's proposal to increase the Federal tax. There are other measures pending in legislatures still in session.

In its report to the Secretary of the Treasury on the eve of repeal, the Interdepartmental Committee pointed out that "the coordination of State and Federal taxation of alcoholic beverages" was one of the important problems to be faced postrepeal.

On this the committee said:

"PART IV. THE PROBLEM OF STATE TAXATION

"Control of the price of basic alcoholic liquors to the ultimate consumer by control of the tax burden is not a matter within the exclusive province of the Federal Government. The problem includes a consideration of the coordination of State and Federal taxation. The most careful Federal program can be dislocated by an uncoordinated system of State taxation superimposed upon the Federal system. In the pre-prohibition period the States as a matter of policy did not attempt to tax alcoholic beverages per se, but limited themselves to occupational taxes on its manufacture and sale. These taxes were not generally high enough to have any substantial effect on the price of alcoholic beverages to the ultimate consumer.

"It is to be anticipated, however, that the present need of the States for new sources of revenue will lead to State taxation of alcoholic beverages per se. It is clear that an effort should be made, therefore, to coordinate State and Federal liquor taxation on some basis equitable to both, which will permit the formulation and administration of a reasonably uniform and orderly taxing system."

The special committee of the Congress appointed in 1947 to study State-Federal tax relations recommended as to liquor taxes "the continuation and extension of that general forebearance and due regard for each other's taxes that the Federal Government and the States should practice at all times."

The States, which, under the Constitution, have the responsibility for controlling sale and distribution, have not in any instance attempted to use the taxing power for a prohibitory purpose. State taxation has been solely for revenue—and, although high in some cases, it has in no case come near the extraordinary Federal level. In fact, the proposed Federal increase is in itself almost as high as the average rate of all present State taxation—in other words, the proposed increase is tantamount to doubling the present State rates.

We feel that more revenue will be created by ending the uneconomic race to increase rates which is now going on between the Federal Government, the States, and the municipalities.

On July 12th last the Committee on Expenditures in the Executive Departments reported favorably on a bill (Senate 1146) for the establishment of a temporary Bipartisan National Commission on Inter-governmental relations. One of the duties of this Commission is to submit to the Congress specific recommendations concerning the fiscal relations among the National, State, and local Governments, giving particular attention to "revenue sources and means of reducing or eliminating intergovernmental tax competition."

Senate 1146 proposes a commission that will "go beyond the purely study stage and propose an active program." We believe that the adoption of such a program is of greatest importance to the maintenance of the high level of Federal, State and, local revenues from the distilled-spirits industry.

PROHIBITION BY TAXATION

In 1933 the American people voted the repeal of prohibition. They did so because they wanted to buy distilled spirits of good quality, lawfully, and at reasonable prices. They did so because they wanted to wipe out the bootlegger, whose illegal activities were menacing our entire system of law observance and law enforcement. What is the situation in 1951?

A bottle of whisky which the distiller sells for $2.50 returns $1.63 of tax to the Federal Government and 87 cents to the distiller. Out of this 87 cents the distiller must, of course, pay the cost of grain, bottles, labor, State manufacturing taxes, and other costs, including all corporate taxes. The tax at the distiller's level is equivalent to 200 percent of the distiller's gross sales price. By the time the liquor reaches the consumer, State and local taxes have been added. Federal and State taxes on a case of 12 quarts of 100-proof bonded whisky come to $31.89.

Out of the sale of a case of 12 bottles by the distiller, the Federal Government gets net the entire sales price of 8 of the bottles and the distiller out of the remaining 4 bottles must pay all of the cost of manufacture of the 12. The rate of tax is about 1,000 percent on production costs of the newly distilled product in bulk.

The tax of $9 a gallon is equivalent to a tax of $45 per bushel on each bushel of grain used.

There is no other commodity in lawful commerce carrying such a tax burden.

Eighteen years after repeal, purchasers of small and modest means have been deprived of the benefits of repeal and we have entered the area of prohibition by taxation.

In England, prohibition by taxation was achieved for all but the wealthy in a period of 12 years after 1920.

In 1901 the British tax was 11 shillings per imperial gallon. Consumption was 45,889,000 British proof gallons of whisky, or a per capita consumption of 1.53 gallons.[8]

From 1900 through 1915 the tax was increased twice to 14 shillings 9 pence ($2.62 per United States proof gallon) and consumption dropped 30 percent to below 1 gallon per capita.

The tax was raised to 30 shillings in 1918, to 50 shillings in 1919, and in 1920 to 72 shillings 6 pence ($12.88 per United States proof gallon at then rates of exchange). By 1933, under the $12.88 tax, consumption was down to 0.29 gallons per capita, less than one-half the 1920 rate.

Through high taxation, the consumption of distilled spirits in Britain at the present time has become limited to the very wealthy class. The present tax rate is 210 shillings 10 pence, and present consumption in England (0.25 gallon per capita), is below the 1921 legal rate in the United States (0.34 gallon per capita) while prohibition was in effect and while the only lawful distribution was through permits for medicinal use.

Are we to have a similar history in this country?

In January 1934, a rate of $2 per gallon was imposed by the Congress, following joint hearings before the Ways and Means Committee and the Senate Finance Committee.

The Interdepartmental Committee had been created to study the tax situation, among others, because it was recognized that "the price of legal liquor to the ultimate consumer in the post repeal period" would be a "principal factor in determining the success or failure of the general efforts to eliminate the illegal industry."

The tax agreed upon by the Congress to accomplish this result and to obtain maximum revenues was $2 per gallon. State taxes levied at the same time averaged 66 cents per gallon, making a total of $2.66.

Today State and Federal taxes have risen to an average of $11.57 a gallon: $9.37 of Federal tax and $2.20 of State tax.

BOOTLEGGING AT PROHIBITION LEVELS

Bootlegging today is on a scale comparable to bootlegging at the time of repeal, when the Congress decided that a $2 tax rate was necessary in order to eliminate the illegal industry.

In 1931 and 1932 prohibition Government agents (2,212 in 1931 and 2,300 in 1932) were seizing about 22,000 stills annually, about 10 per man. In 1934, following repeal and the adoption of the $2 tax rate, still seizures dropped to 9,869.

Last year, 1950, Federal and State officials seized 19,644 stills. Federal agents (about 888 in number) seized about 10,000 stills—about 11 per man. The stills seized had a daily producing capacity of 677,000 gallons—about 200,000 gallons a day in excess of the daily production of the legal industry.

The Alcohol Tax Unit reports that in March, April, and May of this year its agents seized 2,918 stills with a daily capacity of 89,701 gallons. For the same 3 months of 1950, ATU agents seized 2,906 stills, with a total daily capacity of 85,489 gallons.

Enforcement agents have been picking up illegal stills at a rate of better than 53 a day. The number of the stills has gone up, and the capacity of the illegal stills has gone up too.

Year after year still seizures grow, even though the number of enforcement agents has gone down. The seizure rate would be even higher if there were more agents operating. Are there 2 stills operating for each one seized—or 5? or 10? No one knows. When General Andrews was Prohibition Commissioner he assumed that for every still that was put out of business by the Government there were at least 10 more that were not discovered.

Both the Federal Government and the States are losing vast sums of money in legal excises. Enforcement is breaking down, and bringing corruption and

[8] All per capita consumption figures are United States proof gallons.

racketeering in its wake. We have achieved a kind of prohibition by taxation, and with it have brought back the bootlegging typical of prohibition.

We can go from State to State for examples.

Georgia is an outstanding example of how high taxes result in bootlegging and lost revenues.

In 1945, the State raised the liquor tax from $1.20 to $4 a gallon.

Georgia revenues dropped from $13.6 million to $10.8 million. The next year they dropped to $9.4 million.

Then in 1949, to offset falling revenues, the tax was raised again—from $4 to $5 per gallon.

But, by the end of 1950, revenues had fallen 55 percent, while seizures of illegal stills in Georgia by Federal agents alone increased 45 percent, from 1,865 to 1,964.

Finally, on April 2 last, on the recommendation of the revenue commissioner, there was a drastic tax reduction from $5 to $2 a gallon.

The results of the tax reduction are striking. Department of Commerce figures show that in April 1951 Georgia had an increase of 92 percent in sales over the previous month, and in May there was an increase of 40 percent over April.

Stamp sales in Georgia in May 1951 were $110,172 as against $83,363 in May of 1950, and were $208,000 in June 1951 as against $123,000 in June 1950.

In Florida, the State beverage department destroyed 1,283 illicit whisky stills in the 1949–50 period. It was estimated that, if stills destroyed had operated for 1 year and their products had been sold, they would have defrauded the State of $30,000,000 in liquor taxes.

Notwithstanding these enforcement efforts, a criminal-court judge sitting in Jacksonville, Fla., said from the bench a few weeks ago:

"Bootlegging in Jacksonville has become big business again. It is robbing the State and Federal Government of millions in taxes and depriving the aged, the blind, and dependent people of a part of their livelihood. Bootlegging is rumored to have joined forces with certain law-enforcement officials who are conveniently elsewhere when trucks loaded to capacity slip into the city to unload their filthy products from the swamps. * * *"

"We saw during prohibition how corrupt officials at first merely closed their eyes to the manufacture and sale of whisky. As rivals made war on each other, murder was overlooked. Jacksonville is closer to a return to these conditions than most of us realize," the judge continued.

"The loss to Florida's State treasury runs into millions each year."

Between 1936 and 1947 the tax burden in South Carolina jumped 840 percent. In the latter year there was imposed a special gross-profits tax. Legal sales dropped from 1,241,163 cases in 1940 to 652,500 cases in 1950.

The July 6, 1951, issue of the Charleston News and Courier points out that, whereas over-all South Carolina tax revenues from all sources hit a record high of over $94 million in the last fiscal year—

"The only thing that's fallen off heavily since 1940 has been liquor-tax rates—these were getting close to $13,00,000 a year when a gross-profits tax put on in 1947 cut them to the present $9,500,000."

The Nashville Tennessean of July 10 reported the State alcohol-tax division as saying that over a thousand persons were engaged in the moonshine liquor traffic in Nashville, Tenn., and several thousand more were employed part time. The director, J. S. Palmore, who happened to be one of the oldest Federal Alcohol Tax agents in point of service in the country when he joined the Tennessee division 8 years ago, is quoted as saying that "people who have consumed no moonshine liquor since prohibition days are drinking it again."

Palmore pointed out that the cost of a half pint of straight legal whisky is roughly equivalent to the cost per gallon of straight moonshine of the cheapest grade. "That gives an idea," he said, "of the tremendous economic factor involved in the switch-over from legal to still-made beverages."

During the calendar year 1950 investigators of the Alcohol Division of the State of Tennessee participated in the seizure of 705 illicit distilleries—yet, the above report is made as of July 1951. On May 23 it was reported that an electric still was seized in Tennessee which was using TVA power.

In Philadelphia, Federal officials estimated in April 1949 (Philadelphia Inquirer of April 6, 1949) that "as a daily average about 5,000 gallons of 180-proof alcohol is being manufactured in the Philadelphia metropolitan area." The "smoke" is cut 4 to 1 to obtain 32 pints, which retail for about $1 apiece. The officials estimated that bootleggers were doing a $125,000-a-day business. If that is true, it amounts to $15 per capita per year. We quote from the Philadelphia Inquirer: "'The bootlegger who pays $25 for a 5-gallon can of alcohol can cut that four times, and get 160 pints at a dollar or better a pint, and make a seven times profit,' the Federal agents said. The reason why they extract such prices is the heavy taxes levied on legal whisky by both State and Federal Governments, it was explained."

Illegal distilling is not confined to any particular area. Mr. Dwight Avis, Deputy Commissioner in charge of enforcement, testifying before the Ways and Means Committee on February 19, said:

"We are particularly concerned about those metropolitan areas because that is where we once had a tremendous traffic since repeal, as a matter of fact, clear up to 1939. There you have a more or less gallon-per-gallon displacement of tax-paid spirits. We are tremendously concerned about that problem. We are tremendously concerned that we do not re-create that problem."

Since that time there has been a continuation of large still seizures in metropolitan areas.

On April 8 a 325-gallon still was found in Westbury, Long Island. In Maryland, a 400-gallon still was seized near Baltimore on May 19. A 300-gallon still was seized in Mount Vernon, N. Y., on May 24. About 2 weeks ago, a 2,500-gallon still was seized, operating in a camouflaged chicken house in suburban New York. Agents said the still had been operating for several months. Neighbors said they had been smelling what they thought was wine for home use since last summer. The operation used seven vats, each 8 feet wide and 14 feet deep.

Large-scale metropolitan area bootlegging is carried on by highly organized, well-financed criminal groups. Chairman John F. O'Connell, New York State Liquor Authority, last week told the Chiefs of Police of New York State: "The facts available indicate that larger stills are being set up nearer to large urban centers of population."

In June representatives of eight mid-Atlantic States (New York, New Jersey, Massachusetts, Rhode Island, Delaware, Connecticut, Maryland, and Pennsylvania), and the city of Baltimore, met to discuss the great increase in bootlegging in the metropolitan and industrial areas of those States.

Following the meeting, Chairman Stayer, of Delaware, issued a statement in which he said that members of the committee "expressed concern over indications that racketeers and criminal syndicates may be entering into the manufacture and sale of illegally produced, non-tax-paid alcohol and distilled spirits."

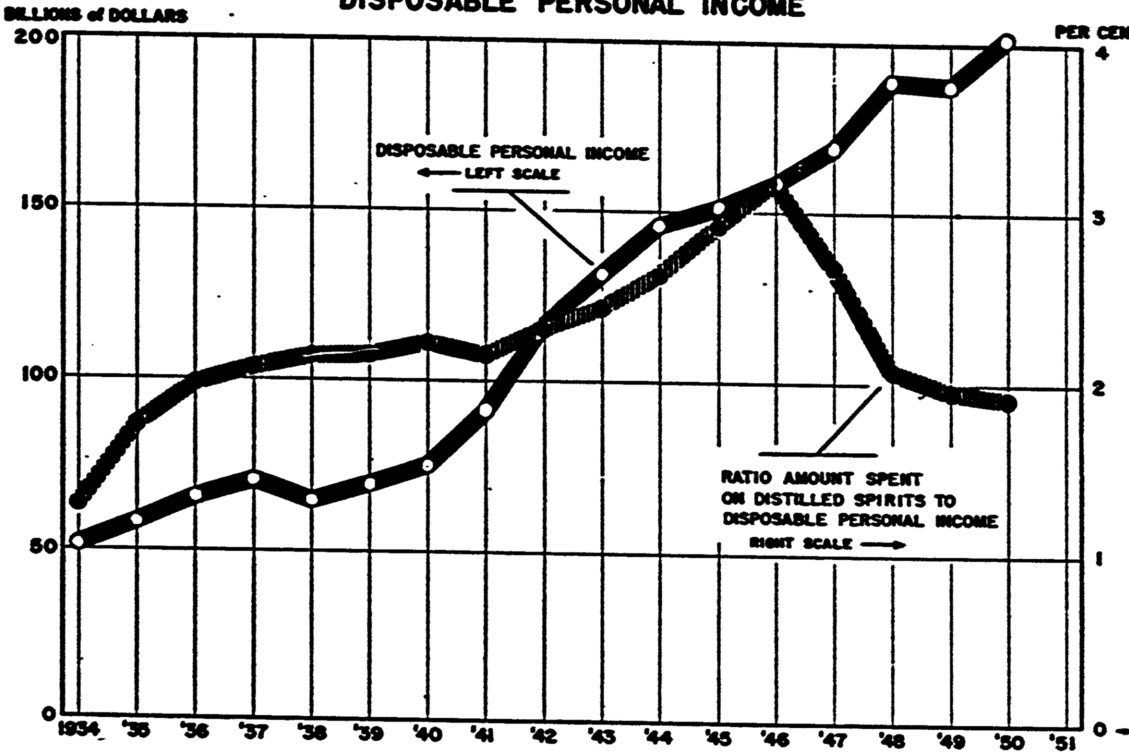
The Ways and Means Committee report recognizes that a tax increase will furnish increased financial incentive for illicit operations, but indicates that this is likely "to be more than offset by tightening of the labor supply available for these operations and by higher incomes on the part of consumers which will decrease the importance of the price differential between tax-paid and non-tax-paid liquor."

We cannot agree with this analysis, having in mind the increasing amount of bootlegging created by the existing tax differential of $11.57 a gallon.

We cannot determine how many persons are engaged in the illegal traffic. But we believe it strains the imagination to assume that an improved labor market will, as the House report suggests, create a manpower shortage for the bootlegger when it is considered that the bootleggers' enormous profits justify paying wage scales—not subject to wage stabilization—in excess of any which any legal industry could pay.

The answer to the bootleg problem lies in increased funds for enforcement. It also lies in a saner level of excise taxation. And the combination of better enforcement and sensible rates will in the long run produce maximum revenues for the Federal Government and for the States.

RATIO OF DISTILLED SPIRITS EXPENDITURES TO DISPOSABLE PERSONAL INCOME



(The following information was later supplied for the record:)

America's Biggest Tax Leak Getting Bigger—A Special Study

(Prepared by Licensed Beverage Industries, Inc., New York, N. Y.)

FOREWORD

This is the second edition of a special survey of illegal distilling in the United States, made by Licensed Beverage Industries, Inc. It is based on facts and figures furnished by Federal, State, and local government enforcement officials.

LBI wishes to express its deep appreciation for the help received from ATU investigators, State enforcement officials, local sheriffs and police.

The individual questionnaires and other factual material from which the illegal distilling figures in this survey were compiled are available for inspection at LBI's offices.

ONE QUIZZ QUESTION YOU CAN'T ANSWER

Question. Which American industry has the largest number of manufacturing enterprises? Automobile manufacturers? Steel companies? Airplane manufacturers? Electric appliance makers?

Answer. Unfortunately, it is illegal distilling—a business operated outside the law.

In 1950, according to Federal, State, and local government seizure figures, 10,644 illegal stills were picked up.[1] Even assuming that this figure represented all the stills in existence—and it certainly didn't—it means that the number of illegal stills in operation in that year was larger than the total units for any other manufacturing industry in the country. The 10,644 illegal stills seized is a larger total than the total units in the saw mill industry, which had the largest number of components of any American manufacturing group, according to the Bureau of Census—10,223 units. Commercial printing, with 11,032 businesses ranked next. The bottled soft drinks, women's dress and metal working machinery industries had an aggregate total of only 14,280 manufacturing enterprises.

(By the way, the number of legally licensed producers of tax-paid distilled spirits were 240, according to the Bureau of Census, including 127 licensed distillers of whisky and 119 fruit distillers producing rum and brandy. There were more than 80 times as many illegal distillers in 1950.)

Illegal distilling is a little bit out of place because, of course, it is a criminal industry operating outside the law. What makes it doubly unfortunate is that it happens to be one which contains more energetic manufacturers than any other American industry—every one of them is a criminal who belongs in jail. Every one of them is cheating governments out of untold sums of tax money every year.

And that brings up another point.

The business is dangerous; enforcement agents search the operators out unceasingly. But illegal stills keep going back into business—more of them every year. Therefore, it must follow that there is a tremendous profit incentive in this criminal operation. No crook is going to set up a business if he doesn't feel pretty certain that he is going to get more than his investment back.

Since 1946 (the end of World War II) there has been a sharp upward spiral in the number of illegal stills seized.

In those 5 years the average size of the individual stills has been increasing.

Since 1946, illegal distilling has been spreading increasingly into the States north of the Potomac—in and around large metropolitan areas.

Illegal distilling is no longer a hillbilly, amateur operation.

High taxes on legal liquor put the price out of the reach of many average Americans. This is one of the major reasons for setting up this operation in a big way—because it is one of the most profitable criminal operations in the country today.

Let's look at the facts.

---

[1] In this study, State and local figures are reported on a calendar-year basis and Federal figures on a fiscal-year basis. 1950 calendar figures of the Federal ATU are not yet broken down by State. Hence the necessity for employing fiscal-year figures on Federal ATU seizures. The difference is slight—10,030 for the fiscal year against 10,200 Federal seizures in the calendar year.

ILLEGAL STILL SEIZURES ARE GOING UP

In 1950, a grand total of 19,644 known illegal stills were seized by Federal, State, and local enforcement officials.

In 1949, the first time in which a Nation-wide survey was conducted by LBI, the known illegal still seizure total was 18,884.

In the past 2 years, in other words, enforcement agents in this country have been picking up illegal stills at the rate of better than 53 a day. They have uncovered nearly 40,000 criminal manufacturing enterprises engaged in the illegal production of liquor.

These figures are conservative—for two reasons:

First, the total number cannot be determined because there is no official census of illegal distilleries. We can go only by the stills actually seized by enforcement agents.

Second, the figures in this survey are incomplete because in many States the local authorities who share substantially in the task of enforcement, do not report their activities to any central agency.

LBI does not have total Federal, State, and local figures for any year prior to 1949. But the Federal figures which do go back are meaningful. Seizures of illegal stills by Federal agents alone have skyrocketed 58 percent since 1946, from more than 6,000 to more than 10,000 in five brief years.

(Refer to table I in appendix.)

DID YOU SAY 20,000?

That's what we said.

During 1950, the LBI survey reveals, Federal agents seized 10,030 illegal stills. (See note of page 8.) State and local authorities seized a minimum of 9,614 illegal stills. Those two totals represent those seizures made independently—the Federal total, in other words, includes no seizures reported by State and local authorities and the State and local total includes no seizures reported by Federal authorities.

Those two figures add up to the alarming sum of 19,644 illegal stills seized during 1950.

This total does not, as we mentioned previously, even purport to be all-inclusive. Only five States were surveyed on a county-by-county basis: North Carolina, South Carolina, Tennessee, Mississippi, and Oklahoma.

In none of those States did all the counties return the survey questionnaire.

The explanatory text that accompanies table II explains in detail our reason for thinking the 1950 figure of 19,644 is conservative. After you have read it, we think you will agree.

(Table II in the appendix gives the individual State-by-State figures.)

OUTPUT CAPACITY GROWING FASTER THAN NUMBER OF UNITS

Number is one thing but size is still another.

The number of stills seized each year since the end of World War II has been zooming. The producing capacity of the stills has been climbing even faster.

Take the Federal figures alone (on the average, about half the still seizure total). Since 1946 the number of illegal stills seized by Federal agents has gone up 58 percent. During that same calendar period, the daily producing capacity of those illegal stills has gone up 80 percent. During the first 9 months of the fiscal year ending June 30, 1951, the daily producing capacity of the illegal stills seized (again, by Federal agents only) went up almost 16 percent over the same months of the fiscal year 1950; during that same time the number of stills seized went up 2.2 percent.

The expression "daily producing capacity" means just that. Federal agents always try to make a check, when they seize an illegal still, of how many gallons of illegal liquor that particular still is capable of producing on a daily basis. Many State and local authorities do the same thing. Hence, we can get some idea of how much illegal, tax-dodging liquor criminal operators are equipped to turn out on a daily basis. This amounts to 677,170 proof gallons. (LBI makes no claim that all these stills operate every day.)

That capacity figure is 109,103 gallons larger than the total amount of legal, tax-paid whisky actually produced daily by the legally licensed distillers during 1950.

THE STILLS ARE GETTING BIGGER ALL THE TIME

The fact that capacity is growing at a faster rate than the number of illegal stills actually seized means only one thing: That the average individual still is getting bigger.

This means that the illegal distilling industry is digging in, consolidating into higher-capacity units which make possible the mass production of illegal liquor for large markets.

Another significant measure of this trend is found in the value of property (chiefly stills, automobiles, and trucks) reported as seized by Federal agents alone. The value of such property seized during the first 9 months of fiscal 1951 was 24 percent above the value of property seized during the same period of fiscal 1950 (and 35.8 percent above the value of property seized in 1939–40 when a fair number of illegal distilling syndicates were still operating in this country).

The average still seized last year had a daily producing capacity of about 34 gallons. The State average actually ranged from a low of about 10 to a high of about 277 gallons. The Federal average, for the country as a whole, was 30 gallons; the year before it was 28 gallons, and the year before that 27 gallons. In almost all instances, however, where individual State and county figures were available, the State and county averages were higher than the Federal average.

Many of the stills seized north of the Potomac run in the neighborhood of 500–1,500 gallons daily capacity, and there have been press reports of some as high as 3,000-gallon capacity.

In arriving at total producing capacity, LBI used State and local figures where they were available. But they were available in only seven instances, so that in all others LBI used the Federal average for the Federal supervisory district in which the State was located.

This, then, is another instance of where the capacity total of more than 677,000 gallons per day is underestimated. There is no question but that if it had been possible to secure capacity figures for each still seized by State or local agents, the United States total would have been dramatically higher.

(A detailed explanation of the capacity figures will be found in exhibit II in the appendix. It is well worth reading.)

LOT OF ILLEGAL LIQUOR—LOT OF LOST TAXES

Now, 677,179 gallons per day is a lot of illegal liquor. That is also a lot of lost revenue for Federal, State, and local governments. Every single day that all of the 19,644 seized illegal stills operated at capacity, Federal and State Governments were cheated of more than $7 million in excise taxes alone.

At the present time the Federal Government's excise tax on legally produced spirits is $9; the average State government has an excise tax of $1.48.[1] The combined excise-tax rate alone thus averages $10.48. And that is how much is lost in excise taxes by Federal and State Governments each time a gallon of illegal liquor is produced. Multiply that by the daily producing capacity of 677,170 proof gallons and you get $7,096,836 in lost excise revenue for each day that all of these illegal stills operated at capacity.

Once again LBI makes no claims that all these stills operate daily. It does claim, however, that the tax loss is tremendous.

Naturally, no one actually knows how much illegal liquor is produced and consumed, but with 19,644 stills being seized annually it must be a lot. The alcohol tax unit in Pennsylvania was quoted as saying that illegal operators in the city of Philadelphia were doing a business of $125,000 a day—or over $40,000,000 a year.[2]

Vance Packard, writing in the September 1950 issue of the American magazine, estimated that just one North Carolina County (Wilkes) was producing 500,000 gallons of illegal liquor a year—amounting to $2,000,000 at producer prices.

A release in the Nashville (Tenn.) Tennessean of February 9, 1951, indicates that the 705 stills seized by the State alcohol tax division in collaboration with ATU agents last year, saved the State some $5,248,000 at the daily production rate of 22,877 gallons for these stills.

Sellers of illegal liquor in Alabama are gypping taxpayers of that State out of an estimated $5,000,000 per year, according to a statement given the Mont-

[1] This does not include other State taxes on distilled spirits. Such as sales taxes and license fees.

[2] Source: Philadelphia Inquirer, April 6, 1949.

gomery (Ala.) Advertiser, December 6, 1950, by the head of the Federal Alcohol Tax Unit in Montgomery. At the same time he told this newspaper that the 38 ATU investigators in Alabama were saving the Government at least $1,300,000 in revenue losses each year. These losses, he said, were prevented by seizure of illegal whisky and mash.

WHERE IS ALL THIS GOING ON?

Illegal distilling more and more is becoming a big-time operation, a big-city operation—as well as a big-money operation.

The figures in the appendix of this booklet show that the largest proportion of illegal stills is seized in the States below the Potomac. To assume from those figures, however, that illegal distilling is largely a southern problem is erroneous.

A joint meeting of the liquor administrators for the open-sales States of Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, and the city of Baltimore was held in New York early in June. This group of States (with the exception of a monopoly-sales State, Pennsylvania, which was an invited participant) formed the eastern regional committee of the National Conference of State Liquor Administrators. The chairman, Col. Edgar S. Stayer, of Delaware, in a press statement following the meeting, said that members of the committee "expressed concern over indications that racketeers and criminal syndicates may be entering into the manufacture and sale of illegally produced, non-tax-paid alcohol and distilled spirits." State liquor administrators, according to the release, "agreed that there is need of cooperative steps to arrest the trend toward the illicit liquor traffic in this area (the States in the northeastern region above-named)."

Colonel Stayer expressed the view that "although the suppression of the illicit traffic is primarily the responsibility of the law-enforcement agencies of the several States and the Federal Government, it is the duty of the ABC (alcohol beverage control) agencies to take every reasonable precaution to prevent the illicit traffic from penetrating the legitimate taxpaying alcoholic beverage industry and thus undermining the control systems."

During the last few years an ever-increasing number of illegal-still seizures has been made in northern metropolitan areas—in particular, in the New York-New Jersey-Connecticut-Pennsylvania area.

In point of fact, the number of State and local seizures in the northeastern States has increased by 61.5 percent between 1949 and 1950, while the grand total of Federal and State seizures in these States has gone up by 46 percent.

More importantly, many of the illegal stills found in this area are high-column professional units capable of producing from 500 to 1,500 gallons of 180–190 proof alcohol per day—the equivalent of 900 to 2,800 gallons of illegal liquor when cut for sale.

In brief, these are big-business operations of the size commonly found during prohibition days. Significantly, too, as Mr. Erwin Hock, director of New Jersey's Division of Alcoholic Beverage Control, recently pointed out before the House Ways and Means Committee:

"In some of the arrests that we made in connection with the stills, we have recognized some of our friends, you might say, from early repeal days and even prohibition days, who are going back into business."

Recent press reports further suggest that illegal stills in the upper tier of Southern States are beginning to market their products not only in States farther south, but to some degree in urban centers to the north. Seizures of illegal liquor produced in Virginia and North Carolina have been made in Washington, D. C., and in Maryland cities. In turn, New Jersey operators were recently arrested at their stills in Maryland.

PROFITS OFFSET THE RISK FACTORS

Only the stupidest type of illegal operator would embark on a career if he knew that he was almost certainly going to be picked up before financial returns made it thoroughly worth while.

In the Northeastern States, illegal stills representing an investment of from $20,000 to $50,000 have been seized with increasing frequency during the past year—a sharp contrast to the crude equipment of old-fashioned backwoods stills which can be set up at a cost of a few hundred dollars.

Examine the montage of clippings on pages 16 and 17 and notice two significant things: First, that most of them give every evidence of being "big time" operations; the second, that most of them are in areas outside the "deep South."

You will notice, too, that even in the traditional stronghold of "moonshining" in the South, the stills are getting bigger all the time. In the States south of the Potomac, an increasing number of modern "submarine" stills, representing investments of $2,000 to $10,000 are being seized.

Not even a complete fool is going to risk up to $50,000 in any sort of proposition unless the chances are better than even that he is going to come out well ahead of the game. How many days of operation are required for the average still before the investment is realized and before the illegal profits start mounting up? Nobody really knows.

Obviously, the incentive is tremendous.

THE INCENTIVE? PROFITS!

The illegal distiller has a definite business objective: Profits. Unlike legitimate business, however, his profits are magnified by the fact that he pays no taxes. And it is the continued excessive level of taxes on legal liquor in the postwar period—taxes amounting to 10 times the cost of production—which have prompted the illegal distiller to make a come-back.

How did this come about?

As we all know, some small amount of illegal distilling has been carried on in the mountain regions of the East since Colonial times. In most cases, however, this activity has had little or no significance; most illegal liquor was produced for home or "neighborhood" consumption.

On at least three previous occasions in United States history, however, illegal distilling activity precipitated by injudicious tax policies reached proportions which resulted in a complete breakdown of Federal, State, and local regulations surrounding the manufacture and sale of legal liquor.

The first of these occasions was the ill-fated effort of the Federal Government to impose increasing amounts of tax on the manufacture of spirits from 1791 to 1801 (the Whisky Rebellion), which culminated in the repeal of the tax.

The second instance occurred in the Civil War, when distilled spirits taxes of $0.60 per gallon imposed in 1864 were raised successively to $1.50 later in the same year and to $2 per gallon in January 1865—bringing the tax between 8 and 12 times the production cost of $0.17 to $0.25 per gallon.

Federal revenue collections from distilled spirits at the $2 rate for the period 1865-68 fell off by over 20 percent from collections at the $0.60 tax level of 1864—despite the great increase in the rate itself. Only when Congress reduced the tax rate at the close of the year 1868, to $0.50 per gallon—with an eye solely to reducing the tax-free advantage of the illegal producer—did illegal distilling diminish and revenue returns rise.

In the first fiscal year of the new $0.50 per gallon tax, revenues rose by $20 million over those for 1868 at the $2 tax.

The adoption of the eighteenth (prohibition) amendment in 1919 resulted in the third wave of country-wide illegal distilling. Large-scale, syndicate-type illegal distilling got under way within a year to fill the unprecedented vacuum between supplies and the actual existing consumer demand for spirituous liquors. The racketeers of the prohibition era succeeded in producing and distributing an all-time record output of so-called whisky averaging around 170,000,000 gallons annually, according to the Warburton report. As a result, Government agents at the prohibition peak were seizing around 25,000 stills annually in an effort to enforce an unenforceable law.

These illegal operations continued well after the repeal amendment was passed in 1933. In the first place, although the repeal amendment was ratified by the necessary 36 States by the close of 1933, it was not until 1936 that all but three States actually set up the machinery for legal sale within their borders. Moreover, the legal industry, which had been in enforced idleness for 13 years, required about 5 years in which to build up stocks of properly aged whisky to meet consumer demand.

These factors left the racketeers of the prohibition era a substantial, if steadily declining, market for illegal liquor until the very late thirties.

Public groups and legislators of the early repeal period were determined to keep taxes on legal spirits at reasonable levels so that the newly reinstated legal industry would be able to compete with the well-entrenched illegal industry.

The joint report of the House Ways and Means Committee and the Senate Finance Committee in 1933 stated that price competition must be facilitated by "keeping the tax burden on liquor comparatively low to permit the legal industry to offer more severe competition to the illegal competitor."

A study group sponsored by John D. Rockefeller warned in a report entitled "Toward Liquor Control," by Raymond D. Fosdick and Albert L. Scott:

"The temptation to load on to the liquor trade all our governmental deficits should be resisted at all costs, for high taxes will produce high prices and will thus make inevitable the continuance of the moonshiner, the bootlegger, and the whole system of corruption."

Thus prior to World War II, Federal excise rates on distilled spirits had been increased with much caution, rising gradually from $1.10 per gallon at repeal to $3 per gallon by 1940 and to $4 a gallon in 1941.

Then, in 1942, the Federal Government increased the excise rate to $6 per gallon. In 1944, a second emergency wartime tax (still in effect) imposed a rate of $9 per gallon bringing the Federal excise tax alone up to over eight times the cost of production.

Moreover, between 1941 and 1950, the burden of all State and local taxes (including excise taxes, sales taxes, license fees, and other levies) on distilled spirits continued to rise.

The total Federal, State, and local tax burden (excise and all other liquor taxes) had gone up in this period from $5.98 to $11.72, a 96 percent increase—10 times the cost of production.

Prices of legal whisky have risen accordingly reflecting only these increased taxes. At the present time, a $3.75 bottle of blended whisky selling in the average States carries a combined Federal, State, and local tax burden of $2.10, more than half the total selling price.

All these factors have occasioned America's fourth major wave of illegal distilling activity.

ALL THIS ADDS UP TO

Increasing illegal distilling means that Federal, State, and local governments are being defrauded of vast amounts of tax revenue.

It means that the average taxpayer is being forced to foot the bill for taxes which the non-tax-paying producer and consumer are avoiding.

And, even more important, it means that liquor law enforcement in scores of communities is breaking down, and that a host of social problems which characterized the prohibition era are again in our midst.

Indicative of the revenues being lost, Federal excise receipts from distilled spirits taxes declined by 25.8 percent between 1946 and 1949 as illegal distilling surged upwards. How much of this loss in legal tax-paid consumption occurred because of divergence of consumer demand to illegal spirits can never be proven; the fact remains that this decline in legal sales occurred despite the maintenance of record levels of personal disposable income in this country (increase of 104 percent over 1941), and despite the fact that the number of persons of legal drinking age increased by 11.7 percent during this period.

At the end of 1950, despite a mild increase in purchases of legal spirits following the Korean War, actual consumer buying of legal distilled spirits was still 22 percent below 1946 levels, although disposable consumer income was 32 percent above 1946 levels, and the number of persons of legal drinking age was 7 percent above 1946.

Thus for the fourth time in United States history, consumer resistance to national policy affecting distilled spirits is creating a multitude of problems which affect us all.

The dangers and evils inherent in a thriving illegal distilling industry are by no means limited to the ability of these criminals to dodge their responsibilites as tax-paying citizens.

Illegal liquor operators, like any other criminals, operate with a complete lack of responsibility to the customer, to society, or to government.

Much illegal liquor is produced under the world's most insanitary conditions. As will be noted from the clippings on page 26 (opposite), illegal still-mash odors have been camouflaged by dog kennels, chicken yards, rotting meat and other devices. Hogs, rats, and vermin have been found buried in vats of mash. Runs of liquor may be made through rusty pipes.

Bottling is frequently done with utter disregard for sterilization of used bottles which may have passed through dump yards, garbage cans, and so forth.

By-the-drink sales in abandoned shacks, gasoline stations, disreputable pool halls and other locales are made without regard to any sanitation standards. Illegal retailers have been known to dilute illegal liquor with shellac thinner and other poisonous denatured alcohol products.

Thus illegal operators knowingly risk both life and limb even of their customers. Operating out of the bounds of the tight and strictly enforced regulations which insure the sanitary, safe, and orderly production and distribution of legal spirits, they know no restraints as to the quality of raw materials used in their product, as to sanitation, maintenance of an orderly place of business, or as to restrictions on sale to minors or unfit persons.

These are a few of the conditions which the illegal distilling industry is creating in our communities. Will it be allowed to spread?

APPENDIX

TABLE I.—*Number and daily producing capacity of illegal stills seized by Federal Alcohol Tax Unit investigators (exclusive of State and local government seizures), fiscal and calendar years 1946–50, inclusive*

Year	Federal illegal still seizures		Daily producing capacity	
	Fiscal years	Calendar years	Fiscal years	Calendar years
			Gallons	*Gallons*
1946	6,041		172,420	
1946		6,461		164,470
1947	6,053		149,964	
1947		6,028		150,914
1948	6,757		173,087	
1948		7,551		200,811
1949	8,006		224,858	
1949		8,551		240,450
1950	10,030		287,800	
1950		10,206		307,782

NOTE.—These data relate only to seizures made by the Federal Alcohol Tax Unit. They do not include seizures made by State and local authorities.

EXHIBIT I. NOTES ON ILLEGAL STILL SEIZURES MADE IN 1950

These figures consist of Federal still seizures for the fiscal year 1950—the only annual period in which State-by-State totals were released—and of calendar year 1950 seizures reported by State and local governments. It should be noted that the resulting total is highly conservative, since total United States Federal seizures for the calendar year were in fact somewhat higher than those for the fiscal year.

It should also be pointed out that Federal seizure totals cover all raids made by Federal authorities plus all seizures made with the assistance of State or local authorities.

State seizure totals include only those seizures made independently of the Federal Alcohol Tax Unit. Local seizure data, where collected, includes only those seizures made by local authorities independently of either State or Federal authorities.

The actual total of illegal still seizures made by county officials in North Carolina is undoubtedly much higher than the total of 1,772 stills, reported here. The true 1950 total is estimated at a minimum of between 2,600 and 3,500 units, which in turn would increase the grand total of known Federal, State, and local seizures to between 20,410 and 21,300 units, rather than the 19,644 reported by Licensed Beverage Institute.

The 1949 still seizure total reported to Licensed Beverage Institute by the North Carolina ABC Board from its survey of local enforcement officials (who are solely responsible for enforcement in such cases in North Carolina) was 5,496 units. ABC officials estimated last year that about 10 percent of these cases had been made with the assistance of Federal agents and were therefore reported in Federal totals. Accordingly, Licensed Beverage Institute reported the North Carolina total last year as 4,946 units seized independently of Federal officials.

Subsequent detailed evaluation of the data obtained from the Board last year indicate that this total, with minor exceptions, was substantially correct.

This year, because the State ABC Board was unable to undertake a second study, Licensed Beverage Institute made its own survey of seizures made by county officials independently of the Federal Alcohol Tax Unit.

Replies were received from only 76 out of 100 countries, in contrast to 87 counties reporting to the ABC Board last year. Moreover, in 11 of the 76 counties reporting, local sheriffs who had taken office as of December 1, 1950 were unable to obtain records of activities of the previous sheriffs. Thus a total of 85 counties did not report, or could not report still seizure totals. Many of these counties had still seizure totals of 100 or more units last year.

If the number of stills seized in these 85 countries is estimated at the average number of seizures for those counties reporting in 1950, an additional 816 units should be included in 1950 figures, making a total of 2,588 seizures. This was the procedure used by the Board last year in estimating seizures for the 18 counties not reporting.

If, in turn, the 1949 seizure totals reported by 22 of these 85 counties are used as the basis for estimating their seizures for 1950, an additional 1,722 units would have been included, making a grand total of 3,494 units.

Press-clipping data and information gleaned from other sources indicate that even this estimate is probably conservative.

TABLE 11.—*Illegal stills seized in 1950 by Federal, State, and local authorities*

EXHIBIT II. NOTES ON DAILY PRODUCING CAPACITY OF ILLEGAL STILLS

At a conservative estimate, the aggregate daily producing capacity of the known illegal distilling industry in 1950 was 677,179 proof gallons per day.

This figure is 199,193 gallons more than the average of 477,986 gallons of whisky which were produced by the legal industry each day last year; it is 249,650 gallons more than the daily average of 427,529 gallons of aged whisky which the legal industry bottled for sale last year.

In arriving at this estimate, it should be noted that the figures shown include 287,869 gallons estimated by the Federal Government as the daily producing capacity of the 10,030 stills which its agents seized in fiscal 1950 (in calendar 1950 the aggregate capacity of stills seized by Federal agents was even greater, 307,782 gallons to be precise).

It also includes 209,798 gallons as the capacity of stills seized by State authorities, independently of the Federal Alcohol Tax Unit during calendar 1950. This figure was arrived at by multiplying the average daily producing capacity for all stills seized, as reported by State authorities, by the number of stills seized, wherever such figures are available. Where average capacity for State seizures were not available, capacity has been estimated at the average capacity for the Federal ATU supervisory district in which the particular States were located.

Additionally, the figure includes 179,512 gallons as the capacity of stills seized by local authorities independently of either the Federal Alcohol Tax Unit or of State enforcement authorities. In the case of Mississippi and Oklahoma, data from the individual localities was so scattered that the average capacity for the tenth and eleventh ATU supervisory districts in which these States are located was used in computing capacity of local seizures.

In the case of South Carolina, an average reported capacity of 50 gallons per day obtained from county authorities and verified as reasonable by State authorities was used in the computation. In the case of Tennessee and North Carolina, figures representing (1) the average capacity of 33.4 gallons for stills taken by Federal and State authorities together in calendar year 1950 and (2) the average for the ATU supervisory district were used.

However, the still capacities reported by local officials in both Tennessee and North Carolina are substantially higher than the figures used. Data considered reliable from Tennessee counties indicated an average capacity of 62 gallons; data from North Carolina counties suggested an average capacity of 68 gallons.

Similarly the 100-gallon per still average shown by South Carolina for its seizures, and the 50-gallon average shown up on county seizures is much higher than the Federal 20-gallon average for the supervisory district in which South Carolina is located.

Data obtained from State sources in the Northern States also indicate a substantially higher average per still than that shown by Federal authorities.

Occasionally, the ATU is unable to make an investigation and report on the exact capacity of a seized still. This is particularly true where fire, explosion, or other circumstances have resulted in the detection of a still—as has happened on several occasions in the last year, especially in the North. Where accurate measurements cannot be made, the ATU does not report a producing capacity even though the still enters into the Federal total. Thus it is not too surprising to find that still seizures minus capacities are reported by the ATU in quite a number of areas. This means, however, that the average producing capacity per still is bound to be indicated as lower than it should because the produdcing capacity of part of all stills seized is divided by all seizures to obtain an average.

TABLE III.—*Average daily producing capacity for illegal still seized by Federal, State, and local authorities, 1950*

[Unless otherwise indicated, capacities are those reported by the Federal Alcohol Tax Unit in the supervisory districts in which these States are located]

Senator BYRD. The next witness will be Mr. Feldman.

STATEMENT OF NORMAN FELDMAN, GENERAL MANAGER, FEDERAL WINE & LIQUOR CO.

Mr. FELDMAN. Mr. Chairman and gentlemen, I deeply appreciate the opportunity to appear before this distinguished committee.

My name is Norman Feldman. I am a resident of South Orange, N. J. I operate the Federal Wine & Liquor Co. in Jersey City, N. J., dealers in wholesale wine and liquor. I appear here today as a wholesale liquor dealer and also as chairman of the board of the Wine and Spirits Wholesalers of America, a national trade association.

The approximately 470 members of WSWA represent a large majority of the substantial wholesale liquor firms doing business in the 29 free-enterprise States and the District of Columbia.

We wholesalers play a vital role in the chain of production, distribution, sales, and tax collection for distilled spirits. What hurts our business also hurts the retailers and, of course, eventually affects the tax revenues of the Federal, State, and local governments.

While I have a personal interest in being heard, I assure you, gentlemen, that I am very conscious of the pressing revenue problem faced by the Congress. I have kept this in mind in analyzing that aspect of the Government's liquor-tax proposal which affects the wholesaler.

It is apparent to anyone that both the House Committee on Ways and Means and the Senate Committee on Finance are deeply concerned to find every reasonable source of additional revenue without unduly hurting the individual citizen, and in particular without hurting American business, which, after all, must operate on a sound basis and at high speed if necessary taxes are to be obtained.

Any increase in the Federal tax rate on distilled spirits is bound to have a depressing influence on sales of this key revenue-raising product. Already growing consumer resistance to high-tax liquor since the end of World War II is apparent. While sales of most other items of merchandise are up, liquor sales have dropped.

In estimating the revenue return under the proposed tax increase, the Government has made an assumption that is very much open to question. It has assumed that Federal tax receipts for the period since July 1950 provide an accurate base from which to project estimates of future consumption. This is erroneous because it covers the early months of the Korean War, when liquor wholesalers and retailers, anticipating shortages, stockpiled. A lot of liquor on which the tax was paid during this period is still in warehouses and storerooms.

Any estimate of future consumption based on the Korean period tax receipts is incorrect because it does not reflect actual sales to consumers. For the most accurate gage available of consumer purchasing we should look at the sales figures of the monopoly States, which reflect the national consumer purchasing pattern. Their figures show that from July 1950, through May 1951—when Federal excise receipts were up 24.7 percent over the previous year—actual monopoly State sales were up only 12.3 percent. Even that moderate percentage gain reflected a substantial amount of stockpiling by consumers and trade buyers such as taverns, restaurants, and hotels.

The present Federal tax of $9 per gallon on legal distilled spirits is the highest in our history and has been pegged at an emergency war rate since 1941. There is ample reason to believe that the imposition of any additional tax would accelerate illegal distilling and push Federal revenues perilously close to or beyond the point of diminishing returns.

Treasury witnesses before the House Ways and Means Committee and your committee have said frankly that the Government anticipates a falling-off in consumer purchasing of legal distilled spirits if the Government proposal for an increased tax is adopted. Treasury spokesmen anticipate a drop of some 6 percent. This estimated decline is an understatement. The decline in fact, would be much sharper. Experience indicates that a decline in consumption of tax-paid liquor is inevitably accompanied by an increase in the sale of tax-evading liquor. State and Federal records show that under the present $9 per gallon tax, illegal distilling has sharply increased in recent years. Illegal still seizures climbed 58 percent from 1946 to 1950.

President Truman's economic report, just submitted to Congress, contains the following reference to the liquor industry under the heading "Recent Trends and Their Significance—The Emergence of a Defense Economy."

I quote from the President's report:

> However, some industries have been operating at less than capacity levels because of the market situation. Large inventories, and in some cases reduced demand, appear to explain recent drops in output in a number of industries, notably textiles, shoes, and liquor.

It would seem to me that no further evidence would be required to show that liquor sales have fallen off than the statement of President Truman himself.

The liquor tax is not an anti-inflation tax. It is a revenue tax. Evidence pointed out to the House Ways and Means Committee by this industry demonstrates that the Federal Government will receive at most only a negligible amount of additional revenue but more probably substantially less revenue as the increased price of legal distilled spirits drives consumer purchasing out of legal liquor channels and into illegal avenues.

The distilled spirits wholesaler today is operating on a profit margin that has diminished dangerously in the past 5 years.

It may come as a surprise to the members of this committee that the retail price of distilled spirits in this country has not increased since 1943 except by the amount of tax which has been imposed by Federal and State Government.

Senator TAFT. What happened to the price?

Mr. FELDMAN. I beg your pardon?

Senator TAFT. Are there figures showing the average price of liquor since the $9 tax was imposed?

Mr. FELDMAN. Since the tax was imposed there has been an increase—in fact, before the $9 tax, in 1943, a year before the present $9 rate became effective, that became effective April 1, 1944, and the industry has not raised its price because we feel that the price today is too high for the product that we offer the American consumer.

The American consumer cannot afford to pay today's price, so we in turn, even though we have had the latitude under that period when OPA came off and the present period when OPS came on, even though during that period there was ample opportunity for wholesalers and retailers to raise their price, we did not raise the price.

Instead we pressed that the Government remember its pledge in giving us that $3 additional in 1944 and reduce the tax by $3.

Senator TAFT. I never understood that to be a pledge. I never made any pledge.

Mr. FELDMAN. The word may be a little too strong, Senator. I was simply referring to the fact——

Senator TAFT. It was imposed as a war tax and never taken off, but I do not remember any pledge.

What occurs to me is that the average income has increased 25 to 30 percent, the average income of families and purchasers, since 1943, and the price of everything else has gone up.

Mr. FELDMAN. That is true, sir. The price of everything else has gone up, as I explained here, 50 percent, but our sales in the distilled-spirits industry have been declining since 1946; whereas other commodities have been going up in sales.

During all this time costs of doing business have mounted steadily—labor, rent, transportation, etc.

The wholesaler has not increased his price to a more realistic level because consumer resistance to liquor prices suggested that any increase would have occasioned an even more pronounced falling-off in sales. During the same period of time, however, the cost-of-living index—based on consumers' retail purchases—has moved up 50 percent.

That is a figure of the Bureau of Labor Statistics.

A tax increase would further discourage consumer purchasing, increase the wholesaler's cost of doing business, and shrink his profit margin even further.

It is important to bear in mind just how prepayment of an excise tax on liquor affects every branch of the industry—distiller, wholesaler, retailer alike. The tax must first be advanced by the distiller before the whisky is withdrawn from bond for bottling. Then in turn it must be prepaid by the wholesaler and then the retailer before the consumer who buys it ultimately pays the tax. An average period of 6 months passes from the time of withdrawing the whisky for bottling until the consumer buys it. Actually, the prepayment of an added $1.50-per-gallon tax would amount to a 10-percent additional capitalization for all wholesalers.

From these facts, Mr. Chairman, it appears that any increase in the tax on distilled spirits would do more harm than good. Any increase in the tax would bring about an increase in bootlegging and all the lawlessness that goes with it. Because of this tax-dodging competition, together with growing consumer resistance, legal sales would fall further and anticipated revenue would not be forthcoming.

Furthermore, the resulting prohibitive price would deny the product to the average citizen. And lastly, great damage would be inflicted on the legal liquor industry.

For these reasons, we hope that the committee will not adopt the proposed increase.

Senator BYRD. Thank you very much, Mr. Feldman.

Senator KERR. Mr. Chairman, at this point I would like to read into the record a part of the statement of Mr. Carroll E. Mealey, Deputy Commissioner, Alcohol Tax Unit, Bureau of Internal Revenue, before the House Ways and Means Committee on Monday, February 19, 1951, as follows:

My own views about liquor excises may be stated very simply. Such taxes will be reflected in increased prices to consumers who with their expanded purchasing power will continue to consume a large volume of liquor. Let me make one point clear—the liquor industry does not pay these taxes, although they do act in some respects as the collecting agency. Liquor price changes following every tax increase are sufficient proof that the consumer, not the producer, pays these taxes.

The total cost of liquors to the American public has been variously estimated. The Department of Commerce has estimated the liquor bill to be in excess of $8 billion a year. I am convinced that with prospective shortages in consumer *goods the American public would pay an additional $700 million if the taxes were increased as proposed, and that the Federal Government could add that much to its tax income.*

Now I understand that there is considerable concern over an anticipated increase in bootlegging as a result of the proposed $12 rate on distilled spirits.

Let us not forget that the Government must have revenue and that the tax yield can be increased by more than $700 million through the suggested rate changes. There is no question but that non-tax-paid liquor competes with tax-paid spirits in the low-income market. Consequently, any substantial increase in liquor taxes increases the law violator's competitive margin and furnishes the violator an additional incentive to defraud the revenue.

The non-tax-paid liquor traffic, like all criminal enterprises which have as their objective the profit motive, is strictly a police problem. Through effective policing and prosecution it can be reduced and controlled and in certain areas virtually eliminated. Just how effective the unit's enforcement effort has been in suppressing the non-tax-paid liquor traffic and in increasing and protecting the revenue is reflected by the fact that gallons of mash seized at illicit distilleries which is the best measure of enforcement progress, decreased from 21,800,000,000 gallons for the fiscal year 1935 to 4,800,000 gallons for the fiscal year 1950, or by 78 percent.

During the same period of time, tax-paid withdrawals of domestic and imported spirits increased from 82,558,000 proof gallons to 157 million proof gallons or by 90 percent.

This result was accomplished despite an increase in the excise rate on distilled spirits from $2 to $9 a proof gallon during the same period of time.

Senator BYRD. Mr. McGinn.

STATEMENT OF EMMETT McGINN, REPRESENTING THE NATIONAL LICENSED BEVERAGE ASSOCIATION

Mr. McGINN. My name is Emmett McGinn, representing the National Licensed Beverage Association.

Mr. Chairman, and gentlemen of the committee, I live in Philadelphia, Pa., where I own and operate a retail establishment selling food and alcoholic beverages for consumption on the premises.

My appearance is on behalf of the National Licensed Beverage Association, a national trade group of owners of restaurants and taverns selling alcoholic beverages. Appended to my statement is a list of the local and State associations affiliated with the National Licensed Beverage Association.

I speak for that segment of the alcoholic beverage industry which composed of the greatest number of individual licensees, each of whom owns and operates his business not as an investment but as a means of livelihood for himself and family. It is my purpose to explain the effect of increased alcoholic beverage excise taxes upon my business and the business of approximately 160,000 licensed retailers who are small-business men like myself.

We are the tax collectors for the Federal Government as regards excise taxes on alcoholic beverages. As such, we are in direct contact with the taxpayers who are our customers, and we are the first to feel the impact of buyer resistance to the taxes. Our margin is small, so we must depend on volume sales for our profit. Any threat to this volume is a threat to our existence.

Today, for every dollar taken in, the average well-run restaurant or tavern pays out 50 cents for food and beverages, 30 cents for wages and 15 cents for such operating costs as rent, repairs, replacement, laundry, insurance, business taxes and advertising. The 5 cents that is left to us we share with the Federal and State Governments in income taxes.

Since 1946, our share of the 5 cents, and the Government's share as well, has been threatened by a decreasing volume of sales. This decline has been recognized by the Federal Government in its regulation of our prices, as we are the only industry which has thus far been given a price yardstick based upon our food and beverage cost per dollar of sales.

I would like to cite two principal causes for this decline: First, it is consumer resistance to high-taxed beverages. Ounce for ounce, alcoholic beverages cost more in an on-premises establishment than in one making sales by the package because of our high labor, equipment overhead cost. The tax-conscious consumer is buying by the bottle for home consumption and he is not buying as much of that legal liquor as he once did. During the war years, restaurants and taverns sold 65 to 70 percent of all distilled spirits, and now we sell only 30 to 35 percent.

The second cause of our decline in sales volume concerns the price advantage which has been given to the illegal product. To most people, illegal manufacture or moonshining connotes a backwoods operation for local consumption. However, to me it means an entirely different matter because these operations are taking customers from the tavern industry in my city and elsewhere. In my official capacity with our association in Philadelphia, I receive requests from members to report speak-easy operations to the police. These requests have become so frequent that I asked our police department about the volume of such operations. During the first 6 months of this year, our police made 532 seizures of illegal liquor.

In 17 of those seizures, no arrests were made because the individuals concerned were not apprehended. But in 515 of the seizures, arrests varying from 1 to 20 persons were made. These all involved illegal retail pouring spots for illegally produced liquor. The newspaper articles one reads about still seizures indicate competition for the distiller, but these seizures I have mentioned constitute a vicious kind of competition for the small retailer who is losing his market because of price competition. The current retail price of moonshine in Philadelphia is now $1 a pint. We know that locally there is always a ready supply. Last year in a single day, a 1,500-gallon still was seized in Philadelphia and a 1,050-gallon still was seized in the outskirts of Pittsburgh. Two weeks ago, a still was seized in the building next to the one in which our local association has its offices.

This situation exists today under the present tax. Any increase in the tax could only result in sending more and more people to the illegal operator, breeding increased disrespect for the law, and bringing about a return of all the social evils of prohibition days.

We ask that the committee, in approaching this excise-tax question, remember that while the 160,000 on-premise retailers are tax collectors, that they are also taxpayers under the Federal income-tax law. This is especially significant when you consider that they also employ thousands of taxpayers. In terms of lower returns from this group, any additional excise tax will cut deeply into Federal revenues.

Along with the other segments of the alcoholic-beverage industry, the on-premise retailers would be hit by increased cost of financing if the excise taxes were raised. We pay the excise taxes in a lump sum through our supplier and reimburse ourselves a penny at a time. The result is that the cost of maintaining inventory will be materially increased if taxes are increased. This is easily seen merely by looking at the situation which will face the small retailer as regards floor-stocks tax.

Senator KERR. Would you explain that statement of reimbursing yourself a penny at a time?

Mr. McGINN. The date the tax becomes effective, the Federal Government requires that all holders of tax-paid alcoholic beverages——

Senator KERR. You mean you pay the tax?

Mr. McGINN. Yes, sir.

Senator KERR. You say you reimburse yourself a penny at a time?

Mr. McGINN. As we sell each drink.

Senator KERR. How much do you get for each drink?

Mr. McGINN. It depends on a number of factors, sir. There are various prices from 25 cents to ——

Senator KERR. What I am curious about is the meaning of the statement that you reimburse yourself a penny at a time.

Mr. McGINN. Well, the increase——

Senator KERR. Does that mean that the tax on a drink is a penny?

Mr. McGINN. The actual cost of the tax as it applies to my tavern in Pennsylvania would be about 47 cents a bottle, sir.

Senator KERR. I am just asking you if the meaning of this is that the tax on one drink is a penny?

Mr. McGINN. No, sir. The word "penny"—by that we mean an insignificant rate of recovery for the large amounts of money that we expend in one lump sum. We have to pay the Government for the total amount of the tax due on the increased—if the increase goes through.

Senator KERR. Then you must get that back from the customer?

Mr. McGINN. As we sell each drink. By "penny" we do not mean that we charge exactly 1 penny per drink.

Senator KERR. How many drinks are there in a quart bottle?

Mr. McGINN. Thirty-two generally, sir.

Senator KERR. Thirty-two. And what is the tax you pay on a quart bottle?

Mr. McGINN. Under this increased tax?

Senator KERR. Now.

Mr. McGINN. Well, it varies by States, sir.

Senator KERR. In your State?

Mr. McGINN. In my State of Pennsylvania? It depends on the proof again. Well, take the average. Take 86——

Senator KERR. The Federal tax is $2.25 per quart.

Mr. McGINN. On a hundred proof.

Senator KERR. What do you average as your selling price?

Mr. McGINN. The majority of what I pour is 86.8.

Senator KERR. Would the tax be less than $2.25 a bottle?

Mr. McGINN. It would be 86.8 of the $2.25.

Senator KERR. Then that would be about $2 a quart, something in that neighborhood?

Mr. McGINN. Yes, sir.

Senator KERR. You get 32 drinks out of a quart?

Mr. McGINN. Yes, sir.

Senator KERR. So that the tax on a drink is about 6 or 7 cents. Seven times 32 would be 224.

Mr. McGINN. Yes, sir; that is right.

Senator KERR. So that it would be between 6 and 7 cents?

Mr. McGINN. Yes, sir.

Senator KERR. What do you average getting for that drink?

Mr. McGINN. Twenty-five and thirty cents.

Senator KERR. Twenty-five or thirty cents?

Mr. McGINN. Yes, sir.

Senator KERR. Now, then, if this were increased $1.50 a gallon, that would be 37.5 cents a quart, or about a penny a drink?

Mr. McGINN. As far as the Federal Government is concerned.

The Pennsylvania State government would then mark it up 48 percent in addition and add on top of that a 10-percent relief tax.

Senator KERR. That would be about a penny and a half, or a penny and three quarters additional cost to you.

Mr. McGINN. Additional cost, sir, that is right.

Senator KERR. All right.

Mr. McGINN. Per drink.

Senator KERR. All right, sir.

Go ahead.

Mr. McGINN. The size of the inventory varies according to the size and type of establishment and according to business patterns followed in various sections of the country.

But a survey among our members indicates that typical tavern and restaurant inventories will be subjected to a floor stocks tax payment varying from $500 to $1,800.

A few can take this payment in their stride, but the great majority will be forced to finance the payment of the tax. The higher the tax, the higher will be the direct cost of doing business.

In closing, it is desired to call to the attention of the committee, section 401 (b) of the House bill.

This is an extremely important provision of the House bill in its application to the small-business men in my industry.

This section would raise the occupational tax from $27.50 to $50—an increase of 82 percent. The Ways and Means Committee stated that the present rate has made it impractical from an administrative standpoint for the Bureau of Internal Revenue to verify the names and addresses of persons paying this tax.

Since the special tax return is now made under the penalties of perjury, the committee's reference to verification in fact means enforcement. The funds raised by this tax are not earmarked for enforcement so it is difficult to find a relation between the amount of the tax and the extent of enforcement activity.

Enforcement is keyed to appropriation and not revenue. We are hopeful that the Bureau will see fit to aggressively enforce this occupational tax because the violators are our unfair competitors—the bootleggers and speakeasys. But there can be no assurance to us in this bill that enforcement appropriations will be made.

It appears to us that the increase of 82 percent would change the character of this tax to a revenue measure which it has never been up to this time.

Senator KERR. That increase from $27.50 to $50, which you mentioned, was that per year?

Mr. McGINN. Yes, sir; an increase of 82 percent.

The amount of the increase cannot be justified by any increase of enforcement cost as shown by the fact that the 82-percent increase would raise $7 million in revenue which is over one-third of the total appropriation of $20½ million which the entire operation of the Alcohol Tax Unit cost last year.

These two subjects are of vital importance to us.

We ask that the committee recommend against an increase in gallonage excise taxes at this time. We believe that the proposed increases would boost illegal sales and bring about a return of the lawlessness of the twenties, force many on-premise retailers out of business, and make our branch of the industry unable to bear its fair share of the over-all-tax burden. We also ask that the occupational tax be left at its present rate.

Senator KERR. All right, Mr. McGinn. Thank you for your appearance.

Senator KERR. Mr. Benjamin Josephs.

All right, Mr. Josephs.

STATEMENT OF BENJAMIN JOSEPHS, PRESIDENT, NATIONAL RETAIL LIQUOR PACKAGE STORES ASSOCIATION

Mr. JOSEPHS. My name is Benjamin Josephs. I live in Worcester, Mass., where I operate a retail liquor package store.

I appear on behalf of the 44,000 retail liquor package store dealers in this country, as president of their trade group, the National Retail Liquor Package Stores Association. The members of my association, like myself, sell liquor by the bottle.

Most of the 44,000 package store licensees in this country whom I represent, are small businesses, many of them family operations. They rely exclusively on sales of bottled liquor for their livelihood. We are just a few, of course, though an important few, of the hundreds of thousands of small businesses which make up the strength of this country.

I, as a typical package store owner, am very much concerned over the future of my business because of the problems which face me today. I know that this same concern and these same problems face other package-store operators.

These problems stem almost entirely from the weight of the current Federal excise tax on liquor. We are caught on a three-pronged fork:

(1) Shrinking sales.
(2) Rising costs.
(3) A very narrow mark-up.

An unrealistic, uneconomic Federal tax burden, you might say, is the handle of this fork.

My sales are shrinking because the Federal tax has put the price of liquor out of the reach of many people. My sales are also shrinking because of increased competition from the moonshiner—the illegal operator—who is underselling me in my own market.

The incentive to stay in business as a licensed retailer is fast disappearing because my profit is shrinking along with my sales. It is shrinking at a much faster rate because my costs have zoomed. At the same time I am getting less of a profit because my mark-up has been declining since 1942. Since that time the Federal tax has increased 50 percent, from $6 to $9.

This tax is just as much a part of my costs of doing business as my phone bills, rent, labor, insurance, and other expenses, including a high license fee. I have to borrow the money to pay this tax when I buy my goods from the wholesaler and I do not collect it back again until I sell the goods to the consumer some time later.

Senator KERR. You refer to the shrinking volume of business. When did that begin to become apparent?

Mr. JOSEPHS. Shortly after the $9 tax levy. When the tax went to $9.

Senator KERR. What date was that?

Mr. JOSEPHS. I do not have that right here.

Senator KERR. You run your business, don't you?

Mr. JOSEPHS. The $9 tax——

Senator KERR. You run your business, don't you?

Mr. JOSEPHS. Yes, sir.

Senator KERR. Tell us when this decrease in business started?

Mr. JOSEPHS. I would say it has been falling down the last 2 years.

Senator KERR. The record presented here by Mr. Heymsfeld, general counsel and vice president of the Distilled Spirits Institute, showed that, for instance, in June 1950, the sales were $121,000,000 as compared to $107,000,000 in June preceding that period.

Senator TAFT. The House report says during World War II and immediate postwar years consumption of distilled spirits climbed almost continuously in spite of higher liquor taxes and prices reached a peak consumption in 1946, and, as I understand it, the consumption has fallen off since 1946.

Mr. JOSEPHS. Since 1946.

Senator KERR. But has it fallen off since 1946?

Senator TAFT. Yes; it has fallen off since 1946, according to the figures.

Senator KERR. Now the House report refers to the 1950 consumption of $100,000,000.

Senator TAFT. At the time of Korea there was a boost. It declined during the postwar years; since the outbreak of hostilities in Korea, it has again increased, and in 1950 consumption was 190,000,000, which was higher than any previous year since 1945 and 1946, when it reached 230,000,000.

Senator KERR. All right.

Mr. JOSEPHS. I have to borrow the money to pay this tax, and I must pay interest on that money. It is a completely unproductive investment because I have paid the tax on my goods before I sell them. I have a sizable loss if any of my goods break or are stolen. The Government does not refund my tax investment if I drop a case of liquor and break a few bottles.

When I first came into the business in 1934 I sold a bottle of blended whisky for $2.25. At that time the Federal excise tax was $2 a gallon. Today I am forced to ask $4.15 for this same bottle of whisky because today the Federal tax is $9 a gallon, 4½ times what it was when I first went into the business 17 years ago.

Consumers are not willing to pay current prices for whisky and other spirits. Those prices are conditioned by taxes, principally the Federal tax, and there is nothing I, as a local retailer, can do about reducing them. Every time I sell a bottle of blended whisky to a customer for $4.15, he is paying to me $2.18—more than one-half of the purchase price—in Federal, State, and local taxes.

Senator KERR. Are you talking about a quart or a fifth?

Mr. JOSEPHS. A fifth.

The retailers in this country are on the firing line; we are the immediate point of contact with the consumer. We know what the consumer is thinking and what he is saying because we are talking to him. The consumer who used to buy a fifth of whisky every 3 weeks now only buys a fifth every month and a half. I ask him why and he tells me: "I'm sorry, Ben, but I just can't afford it." Or maybe he doesn't come in at all and then I know why: Either he's been priced out of the market completely or else he's taken up with a most dangerous competitor, the illegal operator. I hear the same story from the other retailers in my association when I meet them at conventions or hear from them by mail.

Senator TAFT. Perhaps he has gone to Alcoholics Anonymous.

Mr. JOSEPHS. There are not enough to make that much of a dent.

I understand that 20,000 illegal stills were seized last year. This amounts to about one illegal still for each two package stores. That shows you how strong is the competitive advantage enjoyed by the illegal operator.

I have here a stack of telegrams and letters from practically every section of the country from package-store retailers. They say the increased activity of bootleggers which will ensue from higher taxes will definitely be the extra straw that will push them into bankruptcy or serious financial trouble.

At the consumer level, there is a great deal of resentment. Maybe some of it isn't justified, but the feeling is there nevertheless.

What it boils down to is that the Government has kept boosting the tax until only the wealthy can afford this commodity.

Taxes are forcing ever larger numbers of people to go to bootleggers. We have the contradictory situation of having voted to legalize the sales of liquor and establish rules for its orderly handling and then we see that vote literally nullified by a succession of tax increases which remove it from the purchasers' reach.

This confuses the thinking of otherwise decent citizens and results in an increasing disregard for all laws. You know, gentlemen, there is a point where people begin buying the illegal product not just for the saving involved but to express their resentment of excessive Government taxes and restrictions. That point has been passed in the case of liquor.

At the same time, we liquor people feel that we have been unfairly discriminated against by the Government. We feel unfair advantage has been taken of the fact that liquor is generally considered a commodity separate and apart from all other merchandise and trade. During the war a "temporary" tax was imposed with the promise of relief from it 6 months after hostilities ceased. We accepted this temporary tax in the spirit of the war effort, and took no mark-up on it despite rising costs, thereby lowering our return. Now, 6 years after VJ-day, this temporary tax is still in effect. Our mark-up has not increased. Not only has the promise not been kept but now, instead of lowering the tax, it is proposed to boost it still higher.

The Government now wants to raise the tax from $9 to $10.50 a gallon. That would mean that I would have to finance an additional tax of $1.50 every time I bought a gallon of liquor. It would mean an immediate outlay of a sizable amount of cash to pay for present inventory.

I am a small retailer. Laying out the sort of navy required by an additional tax would create an unreasonable hardship. It figures out to a 16.6-percent increase in my financing costs.

But financing a new tax is only one of the retailers' problems. If sales have already fallen off because of the present tax, how much further will they fall off if the tax goes up another $1.50 a gallon?

Before the last tax increase went into effect my mark-up was 33.5 percent. My mark-up today is 27.5 percent and compares with an average mark-up of 34.2 percent for 51 other lines of retail trade. An additional tax of 26 cents per bottle would shrink my mark-up further to 25.5 percent. Under such circumstances, we could not keep our hands above water very long.

Even the Federal Government, as I understand it, agrees that a new tax would result in a falling off in sales, among other things. That means the State Governments will be getting less revenue in the future than they have been getting. How many of them are going to try tapping the liquor again in order to make up lost revenues? How is the retailer going to survive in this two-way squeeze?

In the meantime, the illegal operator has a field day. He doesn't pay any of these taxes. I am told that in my State today it is possible to buy illegally produced liquor for from $2 to $2.50 a fifth as compared with the $4.15 a fifth I must charge for the legally tax-paid product. A new tax will spread the competitive advantage even wider.

Senator KERR. That is about the present situation?

Mr. JOSEPHS. That is what I have been informed, sir.

Senator KERR. That the fifth of illegally produced liquor is being sold to the consumer at from $2 to $2.50 a fifth?

Mr. JOSEPHS. That is in my vicinity, sir.

Senator KERR. So any thought that the consumer was buying the illegal product at the same price for a gallon of it that he pays for a half pint of the legal tax-paid product was an error to that extent according to your best information, is that right?

Mr. JOSEPHS. Well, my understanding would be that that $1 a gallon would be the cost of manufacture.

Senator KERR. I am talking about the cost that the consumer pays when he buys, and that is what you are talking about.

Mr. JOSEPHS. That is right.

Senator KERR. Thank you.

Mr. JOSEPHS. The package retailers in this country do a pretty necessary job, even though they are low men on the totem pole. They sell to the consumer the distilled spirits produced under Federal supervision by the distiller and distributed by the wholesaler. The Federal Government initially collects its tax revenue from the distiller. If the retailer doesn't sell the product because the consumer refuses to buy it, the distiller pays less taxes to the Government.

If the Federal taxes go any further they will cut into the revenue potentials at all levels of Government not only through reduced excise-tax receipts but through reduced collections from all the other taxes which I and other retailers pay—the Federal and State income taxes, property taxes, franchise taxes, license fees, and occupational taxes.

Finally, gentlemen, I do not believe that the Federal Government would get anywhere near the expected revenue. A tax increase would cut legal sales, stimulate consumption of lawless liquor, and do great damage to thousands of small businesses. All this would have a very depressing effect upon revenue receipts. I hope that the committee will not vote any increase in the excise tax on liquor.

I thank you.

Senator KERR. Mr. Josephs, we thank you for your appearance.

Mr. JOSEPHS. Thank you, sir.

Senator KERR. Mr. Eldredge, please.

STATEMENT OF LAURENCE H. ELDREDGE, CHAIRMAN OF THE BOARD OF DIRECTORS OF PENNSYLVANIA ALCOHOLIC BEVERAGE STUDY, INC.

Mr. ELDREDGE. My name is Laurence H. Eldredge. I live in Bryn Mawr, Montgomery County, Pa., and I practice law in Philadelphia.

I am chairman of the board of directors—without salary—of the Pennsylvania Alcoholic Beverage Study, Inc.

I want to emphasize that I do not and have not at any time directly or indirectly represented any brewer or distillery or vintner.

The Pennsylvania Alcoholic Beverage Study, Inc., is a nonprofit corporation. It was organized in 1940 by a group of citizens who had worked for repeal of the eighteenth amendment and who felt a responsibility to do their part in seeing that alcoholic beverages are made and sold under conditions which serve the public interest.

Since its formation, Pennsylvania Alcoholic Beverage Study, Inc., has been engaged in a continuous and extensive study of liquor control. It has consistently advocated laws to prevent abuses in the sale of liquor. It has consistently favored the vigorous enforcement of the liquor laws. The results of its studies in the field of liquor control are reflected in a book, Making Repeal Work, written by Randolph W. Childs, its executive director and counsel, published in 1947. Attached to this statement is an appendix stating the names and addresses and business connections of the officers and directors of the organization, together with excerpts from newspaper editorials concerning its standing and reputation.

The organization has no interest in the liquor business.

I want to emphasize two points. The first is the unfairness of this tax to the consumer and the attitude of mind that unfairness creates in him.

The second, the serious social implications of excessive liquor taxes.

Liquor taxes are too high right now. A person who buys a bottle of blended whisky for $4 is paying 20 times its production cost. Suppose the proposed rates become effective and a disheartened distiller donates—yes, gives away—his bottled stock to the Pennsylvania Liquor Control Board in my State, and says, "You pay the taxes and sell it."

The Federal tax on a one-fifth-gallon bottle of 100-proof liquor would be $2.40. To this the State would add its mark-up of 48 percent, increasing the price to $3.55.

On top of this the State would add its 10 percent sales tax of 36 cents, bringing the price of this bottle of liquor up to $3.91, merely for the taxes and the mark-up on them. I doubt that the distiller will be quite as disheartened as I have supposed, so in fact, his costs and profit, plus retail mark-ups will also be added to that $3.91, making the total cost well over $5, or more than 25 times production cost.

The illustration involves the sale of a bottle of whisky in Pennsylvania State stores. Substantially the same price increase would be involved if the whisky were sold in any State, whether or not it has the so-called monopoly system.

Under the present tax rates, including State taxes, the man who takes a drink is drinking more taxes than he is liquor. Nothing else which is purchased carries such a heavy tax load. Even if you consider liquor to be a luxury it is taxed out of all proportion to other luxuries. A person who buys a diamond ring or a mink coat pays a 20-percent tax on the retail price which is one-sixth of the total cost. But one-half of the cost of a bottle of whisky, or more, under present rates, represents Federal and State taxes.

Senator KERR. Does it represent a percentage of mark-up which the ultimate seller includes in his sale price?

Mr. ELDRIDGE. The one-half, I think, represents the actual taxes themselves before you get the mark-up on it.

Senator KERR. You think it does?

Mr. ELDRIDGE. Yes; I think it does, because when you add the State taxes on to Federal taxes—I say that is pretty exorbitant even on a luxury product and way out of line with all other luxury taxes, but can you really say it is a true luxury?

We know it is used by 65,000,000 persons in the United States. You can hardly call something a luxury which is used with some regularity by a majority of all adult Americans.

Senator KERR. If you had to place it in the category of either being a luxury or a necessity, in which category would you place it?

Mr. [illegible]. It is like moving pictures, expensive suits, a French hat which my wife might buy; a lot of people think it makes life more pleasant, and I think the average drinking citizen looks upon a cocktail, a highball, a glass of beer, or a glass of wine as one of the normal parts of pleasant living.

I think a good many of your colleagues do, and I do, sir.

Senator TAFT. I understand that over 50 it is purely medicinal.

Mr. [illegible]. I think it has purely medicinal qualities. I will be 50 next March, and I have anticipated a bit.

The average person uses them in periods of relaxation and social life.

He thinks that he is entitled to buy them at a fair price. The man who buys a glass of beer does not understand why he should be subject to still higher taxes while the man who buys a soft drink should escape all Federal excise taxation.

The average man resents the fact that these exorbitant taxes raise the price of liquor to a point where only the man of means can afford to buy it. He resents prices which only the wealthy can pay. It is an unsound tax policy which creates a class of favored customers. Such a policy enforces a kind of prohibition on people of moderate means, while allowing unlimited supplies to the rich.

It is significant that even now the excise taxes fall most heavily upon the drinker in the lower income group, who buys gin and the cheaper brands of whisky. Since the tax is computed on a gallonage basis, he pays the same tax as the consumer of high-quality whisky or brandy. Thus the percentage of tax to the price of a bottle of liquor falls as the price increases. Consequently with high liquor taxes, the average citizen cannot buy gin or whisky at a reasonable price.

The result is that many decent citizens feel that their Government is treating them unfairly.

Some public officials cherish the delusion that the man who wants a drink will pay a price which includes any price that the Government cares to impose.

That attitude is reflected in Deputy Commissioner of Internal Revenue Carroll E. Mealey's statement that:

> If tax-paid spirits are available and the customers have the price, they'll line up in front of the liquor stores to get it.

I challenge that statement. Of course, Mr. Mealey is anxious to support the Secretary of the Treasury. However, even his statement is limited to customers who "have the price." The fact is that most people are hard put to find enough money to pay their income taxes and pay ordinary living expenses at today's inflated prices.

The supposition that consumers of liquor will pay prices for legal liquor which they regard as oppressive and unfair is unrealistic.

Experience shows that when liquor is taxed at prohibitive rates, many citizens will patronize a bootlegger. I would recast Mr. Mealey's statement to read:

> If tax-paid spirits are available only at exorbitant prices, many citizens who cannot afford to pay these prices will stay away from liquor entirely or line up a bootlegger to get it.

As long as the law of fermentation continues to operate, the man who wants a drink can get it. If the legal price is too high, illicit sources will supply what the public wants at a price the public is willing to pay. It is quite irrelevant to discuss whether the consumer is morally justified in patronizing a bootlegger. Experience proves that he will do so rather than pay a price which he considers unfair, or rather than give up drinking.

The fact is that the average citizen does not feel there is anything morally wrong in buying liquor as cheaply as he can get it. He looks upon a law which says such conduct is unlawful as a silly law, which is one reason why national prohibition failed and was repealed.

That attitude creates a lawless state of mind in otherwise respectable citizens and makes them a ready prey for bootleggers. Other witnesses have stated the figures which establish the alarming extent of unlawful distilling under the present rate of tax. Bootlegging is increasing in the great eastern seaboard cities. The proponents of another tax increase admit it will further increase illicit distilling. There is something shocking about increasing tax rates on liquor, in order to increase Federal revenues, when the proponents make this admission.

Even the prospect of a large increase of revenue does not justify a tax which will break down law enforcement and undermine public support of the liquor-tax laws. It is a bad bargain, an immoral bargain, which no amount of additional revenue can excuse.

I know something about the operation of the criminal underworld in a large city. When your colleague, Senator Duff, was Governor of Pennsylvania, he appointed me special deputy attorney general of Pennsylvania to investigate and prosecute the chief magistrate of Philadelphia.

My partner in law gave me a leave of absence, and I gave up my private practice for a period to do that public service.

I had that magistrate indicted on more than 600 separate criminal charges relating to his disposition of gambling and liquor cases. I did not convict him, but during that investigation I learned a lot of things Senator Kefauver's committee has recently found out.

The Philadelphia police are constantly making arrests for the sale of bootleg liquor. In 1949 one of Commissioner Mealey's ATU men said publicly that 5,000 gallons of 180-proof illicit alcohol were distilled daily in Philadelphia. I believe bootlegging has increased since then. This traffic requires the corruption of law-enforcement officials.

In yesterday's Inquirer there is a front-page story of four different arrests in four different locations involving the sale of untaxed liquor; in this morning's Philadelphia Inquirer there is a two-column headline "Two stills raided in north Philadelphia yesterday." These are in addition to the Federal figures, you realize. You cannot have this large-scale bootlegging without some corruption of law-enforcement officials.

In recent years the criminal underworld has devoted itself principally to the gambling rackets profits. But it hasn't forgotten the liquor profits during prohibition and it is getting back into that field. It will go wherever the profits are high enough to justify the risk.

The conservative Evening Bulletin, Philadelphia, stated in an editorial on March 8, 1951, entitled "Bootleggers' Paradise":

> It is now proposed to raise the Federal tax on distilling from $9 to $12 a gallon. The Government needs the money. The distiller can pay it. But an increase of the premium on bootlegging is likely to work great harm. There is a disturbing possibility that the tremendous advantage the bootleg producer would have over the licensed distiller at the new figure would lure organized crime into the bootlegging game on a bigger scale than ever and defy efforts to suppress it.

The only way to prevent future large-scale bootlegging is to keep the profit out of it. You cannot prevent it in any other way. During prohibition, countless thousands of Federal and State enforcement agents tried to suppress bootlegging and it flourished like a green bay tree. We must keep the price of legal liquor down to a point where there will not be enough profit in bootlegging to justify the risks.

The social implications of further increases in excise taxes on liquor are serious and of vast importance. I know of no other tax which has such serious social implications. That is the second point I want to emphasize. It is the principal reason why I have come here.

The present tax rates have created bad social results. Does this committee want to make the situation worse, which is what another increase in taxes will do?

As a lawyer and as a student of government I am deeply concerned with the social effects of any resurgence of bootlegging on a large scale. Any law which the people resent, and which makes lawbreakers of respectable citizens, is a bad law and causes social evil. The prohibition era was an era of unparalleled lawlessness in this country. A large part of our population was openly defiant of laws enacted by the Congress. The Volstead Act created in these people and in the community a spirit of contempt not only for this one law, but for law in general. The worst feature of a bad law is that the lawless attitude it engenders toward itself develops into a lawless attitude toward other laws, and a feeling of contempt for law-enforcement officials.

It is revolting to recollect that many gangsters and criminals of the worst type acquired a certain community standing during the prohibition era and were actually regarded with a sort of admiration.

That spirit of lawlessness, coupled with the fabulous profits which were derived by bootleggers from the unlawful sale of liquor, created a situation which was sickening to every thoughtful student of government. There was wholesale bribery and corruption of policemen, district attorneys, and even judges on the bench. It was a condition which was a threat to everything for which law and order stand.

We can revive, in considerable degree, all those evils of the prohibition era by the sole device of making enough money available to the bootleggers to bribe and corrupt law-enforcement agents and public officials. It is that danger which I fear. It is appalling to contemplate the enormous profit which can be realized by criminal gangs if the proposed tax increases should become effective. We want public opinion against the lawbreaker, not for him. We want public opinion in favor of law enforcement, not against it.

The Congress must not create in citizens a resentment toward their Government and public officials, a belief that it has unfair laws, a belief that lawbreaking is to be viewed tolerantly because of such unfairness.

Our form of government is under attack today in a large part of the world. Here at home the Communists continually bore from within. If the Government by unfair-tax laws creates resentment against itself and develops among the people an attitude of disrespect for law and order, the task of preserving our laws and institutions will be all the harder. It is high time that the Congress took cognizance of the fact that excessive taxes on liquor can breed many kinds of social evil which will weaken our strength in the days that lie ahead of us.

They are days, I fear, which will require our maximum strength as a Nation. They will require a united citizenry, proud of its Government, proud of its laws, proud of its officials, and ready to defend its institutions from whatsoever peril the future may hold.

Senator KERR. We thank you very much for your appearance.

The appendices to your statement will be made a part of the record.

(The documents referred to above follow:)

OFFICERS AND DIRECTORS

Laurence H. Eldredge, chairman of the board of directors, is actively practicing law in Philadelphia and is a senior partner in the law firm of Norris, Lex, Hart, & Eldredge. He is adjunct professor of law in Temple University of law, lecturer on medical jurisprudence in the University of Pennsylvania Medical School, former professor of Law in the University of Pennsylvania Law School, and was twice visiting professor of law in Columbia University Law School. He is author of Modern Tort Problems. In 1948 the American Law Institute appointed him revising reporter for the restatement of the law of torts. He is also reporter of the decisions of the Supreme Court and of the Superior Court of Pennsylvania; president of the Philadelphia Art Alliance; president of Episcopal Hospital, Philadelphia; director and a former president of the Better Business Bureau of Philadelphia; and a former special deputy attorney general of Pennsylvania.

W. W. Keen Butcher, president, is a general partner in the Philadelphia firm of Butcher & Sherrerd, members of the New York Stock Exchange. He is an officer and director of General Waterworks Corp., a director of Missisquoi Corp., and vice chairman of the Committee of Seventy.

Other Philadelphia directors are: K. C. Acton, attorney, director of the Pitcairn Co.; Nicholas Biddle, Jr., insurance; William W. Bodine, Jr., assistant cashier, Tradesmens National Bank & Trust Co.; Edward H. Davis, member of patent law firm of Synnestvedt & Lechner; Thomas Hart, attorney, former president of Episcopal Academy, trustee Lankenau Hospital; Leon J. Obermayer, member of the law firm of Edmonds, Obermayer & Rebmann, and member of the Board of Public Education of the City of Philadelphia; Nathan Pitcairn, The Pitcairn Co.; Raymond Pitcairn, attorney, president of The Pitcairn Co. and director of Pittsburgh Plate Glass Co.; Owen Jones Toland, M. D., Episcopal Hospital.

Directors outside Philadelphia are G. d'A. Belin, Scranton, president of E. I. du Pont de Nemours & Co. of Pennsylvania, Thomas P. Dunn, attorney, Howard M. Fish, president of American Sterilizer Co., and Elmer Hess, M. D., physician and surgeon, former president of Pennsylvania Medical Society, all of Erie; Alexander P. Lindsay, member of the law firm of Sherriff, Lindsay, Weiss & McGinnis, and C. McK. Lynch, broker, member of the firm of Moore, Leonard & Lynch, both of Pittsburgh; Donald Markle, Jeddo, president of Markle Corp. and Jeddo Highland Coal Co., Federico F. Mauck, Norristown, attorney, member of the law firm of Wright, Mauck, Hawes & Spencer; Hon. Thomas W. Phillips, Jr., Butler, former Congressman and Republican gubernatorial candidate in the 1930 primary.

The organization's executive director and counsel is Randolph W. Childs, Philadelphia, a former member of the board of governors and former secretary of the Philadelphia Bar Association, member of the law firm of Adams, Childs, McKaig & Lukens, author of Making Repeal Work.

Richard E. Prevall is assistant to the executive director.

PRESS COMMENTS

Pittsburgh Press, February 10, 1948:

"Pennsylvania Alcoholic Beverage Study, Inc., probably has the soundest and most useful ideas and criticisms of the liquor system, year in and year out, of anybody concerned with this problem."

Pittsburgh Press, December 27, 1948:

"Alcoholic Beverage Study, Inc., is a nonprofit, nonpartisan, nonofficial organization of citizens interested in keeping the liquor traffic clean."

The Evening Bulletin, Philadelphia, February 6, 1951:

"The Alcoholic Beverage Study is an association of public-spirited citizens who keep a vigilant eye on enforcement of liquor control."

The Sunday Bulletin, Philadelphia, June 24, 1951:

"The Pennsylvania Alcoholic Beverage Study is a privately supported organization which serves a commendable public purpose in keeping an eye on the operation of liquor control in the Commonwealth.

"It has no discernible partisan objectives. It has been a useful critic of errors in administration and a forthright champion of rigid law enforcement."

Pittsburgh Press, May 10, 1948:

"The Man Who Watches the Liquor Business: Mr. Eldredge, in an accurate sense, is a public-spirited citizen. What he does in the public interest, as he sees it, he does solely for that reason—plus, probably, the satisfaction of trying to do something constructive. He gets no other fees for his trouble. His best known activity, aside from the practice of law, is Pennsylvania Alcoholic Beverage Study, Inc."

Senator KERR. Mr. Harry L. Lourie.

STATEMENT OF HARRY L. LOURIE, EXECUTIVE VICE PRESIDENT, NATIONAL ASSOCIATION OF ALCOHOLIC BEVERAGE IMPORTERS, INC., WASHINGTON, D. C.

Mr. LOURIE. Mr. Chairman and members of the committee, my name is Harry L. Lourie. I am executive vice president of the National Association of Alcoholic Beverage Importers, Inc., 700 National Press Building, Washington, D. C.

The association is a membership, nonprofit organization, organized under the laws of the State of New York. Our members, we estimate, bring to the United States more than 80 percent of all the imported alcoholic beverages taxpaid for sale in our country.

At the hearings held by the Committee on Ways and Means on excise taxes on alcoholic beverages on March 12, 1951, I presented a statement in behalf of importers of alcoholic beverages which summarized the special position of importers of alcoholic beverages in our national economy.

I am attaching a copy of that statement for the benefit and information of members of the Senate Finance Committee.

At this time, I desire not only to reiterate the facts presented at the hearings before the Committee on Ways and Means, but to add some material supplementing that statement.

Imported alcoholic beverages represent a small portion of the total business devoted to the production and distribution of all types and kinds of wines, spirits, and beers. The general economic problems of the entire industry just as much the concern of importers of alcoholic beverages as of the distilling and wine trades. The relationships may be summarized as follows:

(1) All imported alcoholic beverages pay the same internal revenue taxes as are applied to like and similar domestic alcoholic beverages.

Senator KERR. Mr. Lourie, there has been the suggestion that the tax should be on a percentage basis. The average price of imported whiskies is higher than the price on those produced domestically, isn't it?

Mr. LOURIE. It is partly higher because we pay a tariff on all imported products, not only on the beverage, but on the container.

The price we are paying for Scotch whisky today is no higher than the price in 1930 and 1934.

Senator KERR. What about the price with reference to the cost of domestically distilled and sold whiskies?

Mr. LOURIE. At the present time I can only quote the prices in what we call the fair trade market like New York.

Senator KERR. Do you know whether or not you pay an average amount which is higher on the imported whisky than on the average whisky in this country?

Mr. LOURIE. The present price in Scotland runs about $12 per case.

That is the price f. o. b. Scotland. To that we add the cost of freight, ocean insurance, and the Federal taxes, which I thought I would cover later on in the statement.

Senator KERR. Go right ahead.

Mr. LOURIE. (2) All imported alcoholic beverages are distributed through wholesale and retail distributors in the same manner as is used for the distribution of domestic wines and spirits.

(3) Wholesalers and retailers, restaurants and hotels, all distribute both domestic and imported alcoholic beverages.

(4) The general economic conditions of our country have the same general effect on the production, importation, and sale of all alcoholic beverages.

(5) The laws and regulations of the United States Government and the various States apply equally to all alcoholic beverages whether of domestic or foreign origin.

(6) The success or failure of the import branch of the industry depends on the same important factor which determines success or failure for producers and distributors of domestic alcoholic beverages—the ability to provide the ultimate consumer with a first-class product at a reasonable price.

(7) The only tax difference in the case of imported alcoholic beverages is that all imports pay a tariff on the particular alcoholic beverages and its container—if imported in glass bottles—in addition to the excise tax provided for like and similar domestic items.

Senator TAFT. What does that tariff amount to?

Mr. LOURIE. The tariff at the present time is $1.50 per gallon on Scotch.

Senator TAFT. $1.50?

Mr. LOURIE. $1.50.

The tariff varies a little. In the case of brandies, cordials, and liquors, it is $1.25, and in the case of champagnes it is $1.50.

In the case of certain imported wines it is different.

Senator FREAR. That is a domestic gallon or an imperial gallon?

Mr. LOURIE. That is a United States gallon.

This association realizes that despite the important role played by imported alcoholic beverages in aiding the rehabilitation of Western European countries and the British Isles in bring about economic recovery, imported alcoholic beverages cannot be singled out for preferential treatment for excise taxes. Whatever decision is made for the rate of excise tax on spirits, wines, and beers will result in the application of identical taxes to all such products regardless of origin.

For that reason, this association respectfully requests that the Senate Finance Committee in its deliberations give careful consideration to the following points which we believe summarize the difficult position of the entire wine and spirit trade.

(1) Prior to 1944, the internal revenue taxes on distilled spirits had been progressively increased from $1.10 per proof gallon to $6.60.

In April 1944, a war emergency increase was imposed of $3 additional tax making a total of $9 per gallon. This additional tax was earmarked to be removed when the President of the United States proclaimed the cessation of hostilities. The intention of the Congress to have the additional tax of $3 treated as a temporary emergency tax was confirmed not only in the report filed by the Senate Finance Committee at the time, but also by the action taken at a later date by the Congress when it adopted a law setting up the machinery to be put into motion when the President proclaimed the end of the war and the emergency tax was removed. The particular law in question provided for a refund of the equivalent of the $3 tax on all tax-paid spirits in the possession of distillers, wholesalers, and retail distributors.

(2) The alcoholic beverage industry has been a favorite source of revenue for our Federal and State Governments under both peacetime and wartime conditions. The recommendations of the Secretary of the Treasury with respect to increasing excise taxes on distilled spirits were accompanied by an explanation indicating that the Treasury Department felt that there would be a decline of approximately 12 percent in the consumption of legal distilled spirits if the tax should be increased from $9 to $12 per proof gallon. The Treasury Department failed to explain exactly what a decline in consumption of 12 percent would mean to the national economy.

(3) The State and local revenues from alcoholic beverages in the calendar year of 1949 amounted to $686,000,000 for the States and $60,000,000 for local authorities. A decline of consumption of 12 percent would result in financial embarrassment for many of the State and local authorities, since there has been a great deal of reliance on the revenue obtained from alcoholic beverages by States, cities, and counties, for the raising of funds needed for general purposes.

If the States and the local authorities attempt to offset the decline in their revenues by further increases in their local taxes, a tax spiral will be set up which ultimately would defeat in major portion the objective of raising substantial revenues for Federal, State, and local governments.

(4) The Treasury Department has not particularly emphasized the tremendous growth in illicit distilling and distribution which has occurred since the end of the war. That there has been an enormous development in such illicit distilling and distribution is recognized by State and Federal authorities and is definitely confirmed by the reports of seizures of stills issued by the Alcohol Tax Unit, of the United States Bureau of Internal Revenue, as well as by the various States.

Senator TAFT. Do you find any increase in illegal importation?

Mr. LOURIE. We have no record of any seizures of any illegally imported alcoholic beverages since 1935, if my memory serves me correctly.

Senator TAFT. During prohibition days they were certainly very numerous.

Mr. LOURIE. Very numerous.

The Deputy Commissioner of the Alcohol Tax Unit reported that in the fiscal year ended June 30, 1948, his department had seized 5,654 stills, 40,880 wine gallons of non-tax-paid distilled spirits, and 1,700,000 wine gallons of mash. In the fiscal year ended June 30, 1950, the Commissioner reports that the Alcohol Tax Unit had seized 10,030 stills, 140,000 wine gallons of non-tax-paid distilled spirits and 4,892,000 wine gallons of mash.

In addition, it is estimated that the seizures of illicit stills made by the individual States during the same period amounted to approximately 8,000 stills. Thus, in the fiscal year ended June 30, 1950, approximately 18,000 illicit stills were sized.

There appears to be sufficient information to indicate that the illicit operators are not local in the main, but rather that there has been recreated an illicit industry comparable in volume to that which existed during the prohibition era. There has been an increase in the number of stills with large capacity in and near important metropolitan areas. No figures are available to indicate the total volume of illicit distilled spirits produced and distributed by illegal operators and the total revenue which Federal, State, and local authorities lost.

A common-sense yardstick may be applied. If we presume that the lowest capacity of an illicit still is 100 gallons a day, then the 18,000 stills estimated to have been seized in the fiscal year ended June 30, 1950, would represent a day's output of approximately 1,800,000 gallons, which would mean a loss to the Federal Government if these stills operated for only 1 day of $16,000,000.

We know that an illicit still operates for more than 1 day before it is seized. We know from Alcohol Tax Unit report that the average capacity of the still seized is more than 100 gallons. We also know from the statistics issued by the Alcohol Tax Unit that despite the large numbers of stills which have been seized since 1945, increasing numbers are still being located and seized. Evidently there has been a tremendous loss to Federal, State, and local governments because the existing tax is so high as to make it possible for illegal operators to engage in illicit production at a profit despite the large number of stills seized by Federal and State authorities.

(5) The solution to the illicit industry does not rest solely with increased enforcement and increasing the number of enforcement officials. The heart of the solution must depend on removing the tax incentive which already exists under the $9 tax and which certainly would be greatly stimulated if the tax on distilled spirits increases further.

In the statement made before the Committee on Ways and Means, we pointed out that based on the price paid by the importers in Scotland for Scotch whisky, the effective rate of the combined internal revenue taxes and tariffs amounted to 181 percent during the calendar year of 1950, and for Canadian whisky amounted to 188 percent of the price paid in Canada.

We also pointed out the important role imported wines and spirits played in the creation of dollars needed by countries such as England, France, Italy, and to a much smaller extent, Germany, for the purpose of supplies in the United States.

Our international trade in these commodities may be maintained only if prices the consumer pays are reasonable. The impact of the present taxes on Scotch whisky, for example, amounts to $25.20 per standard case of 12 four-fifth quarts. This is the equivalent of $2.70 per bottle and does not include any of the State taxes.

The only change in price to consumers since 1939 for Scotch whisky has come mainly from increased internal revenue taxes, although there has been a slight increase in ocean freight rate charges.

Our position may be summarized as follows:

We feel that if the sole objective of the Federal Government is the obtaining of revenue, then the wine and spirit trade should not be called on again for the collection of increased taxes. In the calendar year of 1950 the Federal Government received from alcohol taxes $2,419,000,000.

The alcoholic beverage industry made the largest contribution of any industry and was exceeded only by corporation and individual income taxes. If the objective of heavy taxes on the alcoholic beverage trade is to reduce consumption, we feel that such an objective will never be attained, since it will only result in increasing illicit operations. It is our belief that where a national emergency exists, the tax base should not be restricted to a few selected industries which have been determined as excellent sources of revenue, but that the problem of financing a national emergency should be solved by widening the application of taxes of all sorts and types, so as to include, as far as possible, all of the people in the United States, rather than those persons who are engaged in special or specific trades.

It is estimated that approximately 2,000,000 people are directly or indirectly working in the alcoholic beverage industry. It is known that all of the companies, whether they are large distillers, or small local retail package stores, pay corporation and income taxes to the Federal Government as well as their State business taxes.

If an increase in the present taxes is adopted by Congress and there results the anticipated decline in the consumption of legal spirits, there also will be the additional result of reduced corporation and individual income taxes from the persons engaged in the industry.

It is our view that the present taxes are much too high and that Congress should consider carrying out the provisions in the Revenue Act of 1943 when it declared definitely that the increased taxes were emergency taxes to be removed when hostilities ceased.

Senator KERR. Mr. Lourie, we thank you. The appendix to your statement will be made a part of the record.

Mr. LOURIE. Thank you.

(The appendix referred to is as follows:)

STATEMENT OF HARRY L. LOURIE, EXECUTIVE VICE PRESIDENT, NATIONAL ASSOCIATION OF ALCOHOLIC BEVERAGE IMPORTERS, INC., BEFORE COMMITTEE ON WAYS AND MEANS

Mr. Chairman and members of the committee, my name is Harry L. Lourie. I am executive vice president of the National Association of Alcoholic Beverage Importers, Inc., 700 National Press Building, Washington, D. C. The association is a membership, nonprofit organization organized under the laws of the State of New York. Our members, we estimate, bring to the United States more than 90 percent of all the imported alcoholic beverages tax-paid for sale in our country.

Imported alcoholic beverages, in addition to paying the tariff rates set forth in the Tariff Act of 1930, pay the same internal revenue taxes as are paid by like and similar domestic articles. It, therefore, follows that since in addition to the taxes which are imposed by the Revenue Act of 1948, we pay rates of tariff, the taxes collected on imported alcoholic beverages by the United States Government are decidedly greater per unit than is true in the case of similar domestic items.

Prior to the adoption of the Revenue Act of 1917, imported distilled spirits paid a tariff of $2.60 per gallon, but paid no internal revenue tax. The Revenue Act of 1917 was a First World War measure and carried a provision for the collection of existing internal revenue taxes on all imported alcoholic beverages.

When prohibition was repealed in December 1933 the rates of duties provided for in the Tariff Act of 1930 were identical with those carried in the Tariff Act of 1922. The rates were extraordinarily high because at the time of the enactment of the Tariff Act of 1922 prohibition was in effect in the United States. There was no import industry for alcoholic beverages and the small amounts which came here, and were permitted entry into the United State for consumption, were to fill prescriptions issued by doctors. As a result, the tariff rates were set at extraordinarily high figures.

Under the various trade agreements, these high tariffs have, for many of the imported wines and spirits, been reduced. At the present time the tariff on imported whiskies is $1.50 per gallon. In addition, the excise tax of $9 is also collected.

It is our view that in considering the rate of tax to be imposed on alcoholic beverages it is not possible to reach a final figure without studying basic facts and without determining not only possible revenue but also the effects on the industry.

The trade agreement program recognized the necessity of developing mutual trade between the United States and other countries since only through mutual trade, moving as freely as possible, with a minimum of impediments, could the United States hope to maintain a reasonable export trade.

The end of the last war brought home forcibly to our country the important stake it had in the building of sound economic systems in Western European countries as well as in the United Kingdom. The Marshall plan was adopted for that purpose. The import trade in alcoholic beverages is of decided value to the British, Canadian, French, and Italian Governments in creating dollar credits to be employed in the purchase of needed materials in the United States. We believe that the proposed tax on distilled spirits should be scrutinized carefully by the committee in order to determine what effect the adoption of the tax might have on the dollar accounts of the countries which have found in the exports of their special distilled spirits a quick and immediate source for establishing dollar credits in the United States.

Our position may be summarized in the following points:

(1) The proposed tax of $12 per gallon on distilled spirits will mean in the case of imported whiskies such as Scotch and Canadian whiskies a Federal tax of $32.40 per standard case of 12 ⅘-quart bottles, as compared with the existing tax of $25.20. It is our view that the proposed tax is extraordinary in its nature. It amounts to $2.70 per bottle and, of course, does not include State taxes. The extraordinary amount of the proposed tax may be visualized by the committee if it can imagine a situation whereby importers could buy Scotch or Canadian whisky for nothing, bring it to the United States for nothing, and offer it to wholesale distributors at the exact amount of the tax of $32.40 per case. Allowing a wholesaler his usual gross margin and the retailer in turn his usual gross margin, it would mean a retail price of $49.68 per case or $4.14 per bottle without including State taxes. Remember that this figure is based on the proposed Federal tax and does not include anything for the cost of the whisky, the cost of transportation, insurance, the cost of operating an importer's establishment, the cost of moving the goods from the port of entry to consuming centers in the United States, the cost of making sales, etc.

(2) The United States Treasury Department has been the principal beneficiary of the import trade, and the amounts the Treasury has received are far in excess of the dollars paid various foreign producers. For example, in the calendar year of 1950 there was tax-paid in the United States Scotch whisky valued in Scotland at $56,231,000. The United States Government collected in taxes, at the rate now existing, $101,535,000. You will thus note that the rate of tax was 181 percent of the price paid by the importers.

In 1950 the Canadian whisky tax-paid in the United States was valued in Canada at $31,112,000. The United States Government collected on this Canadian whisky a tax of $58,592,000, or at a rate of 188 percent of the price paid in Canada by the import trade.

These figures demonstrate that the benefits our country has sought to make available to the United Kingdom and Canada through trade agreements have also resulted in a large return to our own Government greatly in excess of the dollars paid by importers for the particular whiskies.

(3) Will the imposition of the proposed $12 tax have any serious effects?

We believe that there is bound to be a decline in the consumption of these items in the United States. Thus, although the United States Government may receive revenue equal to or perhaps greater than under present conditions, there is little doubt that the dollars received by the foreign governments will fall decidedly. It is, for example, possible for the consumption of Scotch whisky in the United States to decline 25 percent without any drop in the tax receipts shown at the $9 rate. However, a decline in the consumption of Scotch whisky of 25 percent would mean a very sharp drop in the dollars the British Government would have available for expenditures in the United States.

What will the effect be on the 250,000 retail establishments which sell to consumers alcoholic beverages by the bottle or by the drink?

Here is a group of small-business men, small retailers operating under limited capital and under limited credit facilities. An increase in the tax on Scotch or Canadian whisky from $25.20 to $32.40 per case will result in a serious financial burden for these small companies.

Under the system employed in collecting the tax, the goods handled by these retailers have all been tax paid in advance of sales to consumers. In other words, the industry pays the Federal taxes to the Treasury Department and then proceeds to collect the taxes from the consumers. Every one of these small companies must have sufficient financial resources to enable this advance tax payment. For that reason, the position of these operators should be given most careful consideration. They are not in the same position as other retailers handling jewelry, luggage, furs, or cosmetics. Those retailers advance no taxes to the Government, but at the time of sale collect a 20 percent tax from the buyer. When you consider the enormous portion the Federal tax represents of the price paid by the retailer for the alcoholic beverages he sells to consumers, you will realize that his financial problem is not easy to solve. Here again, we are not including the State taxes which, of course, the retailer also has to advance.

Ever since 1946, the volume of business done by the average retail package store has declined. We are advised that the economic position of the small neighborhood tavernkeeper has been sharply impaired since 1946. There is nothing mysterious about the application of the Federal taxes on alcoholic beverages and who pays the taxes. Although they are paid for in advance of sale, ultimately the taxes are paid by the consumer. It is reasonable to assume that if the sale of distilled spirits declined so sharply under the existing tax system since 1946, increasing the tax from $9 to $12 will certainly not act as an incentive, but will result in a further decline. To the retail business enterprise in our field, the proposed tax represents a definite possibility of not only financial difficulties in handling the tax, but in a sharp decline in actual volume of business coming at a time when all costs of operation have been going up.

We feel that the most careful consideration should be given to the retailers' position and to the danger of bankruptcy to many of these small-business men.

What of the States?

All of the States receive considerable revenue from the alcoholic beverage industry, principally through gallonage taxes and, for some States, through the adoption of State store systems. If the increased tax should result in a drop in consumption, as is anticipated, the revenue receipts of the States will be impaired. The tax history of this industry indicates that whenever States have found a drop in revenue, they also consider an increase in tax. That happened after the sharp decline in consumption which came in 1947.

(4) We feel that the alcoholic beverage industry should not be turned to again for increased taxes. We recognize the needs of our Government. We are willing to pay our share. There must be a limit to the amount of taxes which may be collected from any one industry. Some members of the committee may recall that when the emergency taxes of 1940 were being considered, we recommended that the excise taxes be left unchanged and that a consumers' sales tax be collected at the time of sale. We renewed this recommendation at the hearings

held in 1941. We feel that such a tax on a percentage basis would be flexible in nature, since it could be increased or decreased in accordance with the Government's needs and would avoid imposing on the industry, especially on the 250,000 small retailers, the heavy burden of financing in advance the excise taxes collected on alcoholic beverages. We feel that serious consideration should be given to our views that the tax burden now carried by the alcoholic beverage trade should not be increased.

Senator KERR. Mr. Sweet is our next witness.

STATEMENT OF FRED SWEET, REPRESENTING HOTEL AND RESTAURANT EMPLOYEES AND BARTENDERS INTERNATIONAL UNION, AFL

Mr. SWEET. Mr. Chairman, if you will permit me, I should like to reduce my statement a little bit in order to save your time.

Senator KERR. That is all right. You have the time allotted you, and we shall be glad to stay here for that time and listen to you.

Mr. SWEET. My name is Fred Sweet, of Cincinnati, Ohio. I appear here on behalf of Mr. Miller.

Our union wishes to briefly give our views on certain proposals in H. R. 4473 for increasing the revenues of the Federal Government.

We shall confine our comments to a single, narrow concern—the impact of the proposed new levies on the lives and fortunes of the 2,000,000 men and women employed in the Nation's hotels, restaurants, and taverns.

We have in mind three basic points:

(1) To increase taxes on alcoholic beverages is to put on the street thousands of workers employed in our industry.

You will understand that our jobs are, to an extraordinary degree, dependent upon the legal sale, in licensed premises, of freely available, popular-priced beer, wine, and spirits.

For example, bar receipts in the Nation's hotels currently amount to 17.7 percent of their total sales. The ratio of bar income to the total sales of licensed restaurants is a good deal higher. And you know that most businesses, especially the small, close-margin operations common in our industry, one dollar in eight is more than the difference between solvency and the arrival of the sheriff with a brand-new lock.

Since so important a part of the receipts of the places where we work derives from the bar, and since price rises tend to cut down buying, it follows that any increase in the prices of these beverages will tend to reduce the need for our services.

Already the entertainment side of our industry has found it necessary to lay off kitchen and dining-room workers by the thousands, in many cases shutting up shop, as the public rebelled against the 20-percent tariff on night-club checks. We know that the public will stop coming as often to our places of work if new taxes are added.

Nor are we concerned alone about the direct threat of these tax proposals to our jobs. There is the additional threat to all of us as consumers. The figures show that the United States market for alcoholic beverages runs to some 65,000,000 adult Americans, of whom 80 percent are wage earners.

Senator KERR. How many adult Americans are there?

Mr. SWEET. There are 150,000,000 Americans and I can't take my family as typical because I have four children.

Senator TAFT. You can't find it that way. Roughly speaking, it is about 63 percent, I think.

Mr. SWEET. 63 percent.

Well, 63 percent of these adults—there are a good deal more than 65,000,000 adult Americans.

Senator KERR. I wondered if you had that figure.

Mr. SWEET. I do not have the figure on the tip of my tongue.

What will these millions do when you have taxed out of reach the legal bottle of beer, or the friendly dram, available through supervised, licensed, taxpaying channels?

The overworked men of the Alcohol Tax Unit over at the Treasury know full well what many are doing even now, for the ATU men are out on the firing line, trying to contain the burgeoning bootleg business which has moved from the tall timber and the mountain creeks into the metropolitan markets. These men know that the history of the twenties is already repeating itself as the public seeks out the cheaper, tax-free product of the illegal producer through channels which have no supervision but the tommygun.

Our second point is this: To add excise taxes on any consumer goods including alcoholic beverages, and at the same time to clap another levy on the family earnings of these workers already caught between the millstones of frozen wages and rising prices, is to compound their misery in the way quite out of keeping with the traditional United States tax policy of seeking revenues from those most able to pay.

An excise tax is a sales tax. It is quite like the retail sales tax imposed in my own State, except that excise taxes are generally figured in the merchant's cost when he calculates his mark-up, so that we find ourselves paying not only the higher taxes but an added sum to boot.

To find such increases in a tax bill which includes as well a plan to take another big bite from the take-home pay of the low-wage earner is a shocking blow. It is shocking because, by using the method of multiple taxation, it reveals that the Congress is being taken in by the bland theory that the way out of our troubles is to "drain off excess purchasing power" by pumping dry the purses of the poor.

There is an old adage about taxing that some people think has practical content. "Pluck the goose," says this old saw, "that squawks the least."

But the adage offers no formula for where you turn when the bird is picked so clean that you have killed the goose that lays the golden eggs.

You are killing the goose when you pile still more taxes on the most heavily burdened commodities in our economy, alcoholic beverages.

You are performing the same short-sighted operation when you say to a worker in these low brackets, "We are going to raise your income taxes. Then we are going to hike the tariff on your kitchen clock, your electric iron, your radio, and your beer. We are doing this for your own good, to get rid of your excess purchasing power."

How much "excess purchasing power" has the Louisville waitress on 25 cents an hour, the New York dishwasher on $45 a week, the Sioux City cook on $55 a week?

Tell any of these he is a threat to the national economy because he has more money than he needs to pay the butcher, the landlord, and the doctor—and he will laugh in your face.

In their names we urge you, look elsewhere for your new revenues than in here—in these barren budgets of such as these.

(3) Finally, we wish to protest with all the vigor at our command what we believe to be a pair of "sleepers" in the alcohol tax clauses of this bill. Both are perhaps unsuspected but important collateral effects of this measure. They are, first, the use of the pressure of taxes to squeeze manpower out of an essential industry like so much toothpaste from a tube. The other is the use of the taxing power to gain what cannot be won by the ballot—a sharp reduction in the use of these products as a roundabout road to prohibition.

When this proposal to raise the taxes on alcoholic beverages was first made by Secretary Snyder, the Cincinnati Enquirer, pointing out that these rates were already sky high, added a pointed warning that any more taxes on these products would mean "Prohibition for the masses, but not for the classes."

We remind you of the British example. Back in 1901 the tax on a gallon of spirits in Great Britain was 11 shillings, and consumption in that year stood at 45 million gallons. Today that same gallon of spirits carries a tax of 10 pounds—and consumption in the British Isles has fallen to 8 million gallons.

Senator KERR. You say that the British tax on spirits is 10 pounds to the gallon?

Mr. SWEET. Ten pounds plus to the gallon, sir.

Senator KERR. All right.

Mr. SWEET. Are there those drafting tax laws in Washington who would impose through the taxing power what they cannot establish by the ballot—a return to prohibition? We think this proposal goes a long way toward just such a backward movement for America.

But even more immediate is the other concern of our people employed on licensed premises. Washington is searching for manpower for the defense industries. We believe that one effect of this bill will be to put so powerful a squeeze on workers in our own essential industry as to force scores of thousands of them into the job market.

While many of our people have skills useful in the machine and other defense industries, a very large number do not, having spent their working lives in these service trades. Such people will be the real victims of this squeeze play.

There is much to support this view. The wage freeze is relaxed for industrial workers, but not for workers in the service trades.

Congress and the States adopt laws to protect other employees but leave the service workers out in the cold. Our people because they are not believed to be or held to be in interstate commerce are denied the guarantee of a 75-percent minimum wage under Federal law. And now it is proposed that we be harried out of our jobs by taxing beyond the public's reach the commodities we are employed to serve that public.

Thank you.

Senator KERR. Thank you, sir. Our next witness is Mr. Erwin B. Hock.

STATEMENT OF ERWIN B. HOCK, DIRECTOR, DIVISION OF ALCOHOLIC BEVERAGE CONTROL, STATE OF NEW JERSEY

Mr. HOCK. My name is Erwin B. Hock. I am director of the Division of Alcoholic Beverage Control of the State of New Jersey, and what I have to say before your committee is based on 16 years' experience in liquor control in my State, first as deputy commissioner in this agency, and since 1947, as its head.

Both as a public official and a citizen of the United States, I recognize the necessity for finding additional revenue to meet the added cost of national defense. As I see it, the question under consideration here is whether further across-the-board increases of excise taxes on alcoholic beverages should be adopted and, if so, what effect increases would have with respect to the public interest.

The persistence of the tax-evading manufacture of distilled spirits more than 17 years after repeal—and its mushroom growth today—in my opinion is directly attributable to the heavy tax burden on legal liquor.

Taking into account other levies such as Federal occupation and rectification taxes and State and local taxes over and above the present $9 proof gallon excise taxes on distilled spirits, the tax burden on legal liquor today totals nearly $12 per gallon.

As against this, it is generally accepted that tax-evading distilled spirits can be produced under current conditions for $1 a gallon or less. Obviously the wide differential presents an open invitation to violation and evasion of the law. It constitutes a protective tariff for the bootlegger. Any further increase in taxes on distilled spirits can only aggravate the difficult problem of liquor control.

Governor Driscoll, my predecessor as State commissioner of alcoholic beverage control, told the New Jersey Association of Chosen Freeholders, at its annual dinner on February 5, 1951—

> A sharp increase in alcoholic beverage taxes would certainly result in more bootlegging with a resultant tax loss to the States and an increase in the cost of law enforcement.

A further increase in Federal excise taxes must necessarily increase the price of alcoholic beverages to the consumer, thus inviting many of our citizens either to drink less, spend more for what they drink, or patronize illegal sources. Unfortunately, our experience during the prohibition era indicates that rather than drink less or pay more, many of our citizens would resort to the bootlegger.

During the early years of repeal, Federal, State, and local enforcement agencies expended great efforts, and with marked success, to stamp out the illicit activities which carried over from the prohibition era.

In subsequent years much of the illicit activity was confined to small-scale operations. During the last few years, however, and particularly in recent months, have come indications that the more ambitious, large-scale illicit activity is being resumed.

Senator KERR. The present tax has been on since 1944?

Mr. HOCK. That is right.

Senator KERR. You think that the impact of it has only begun to be felt in recent months?

Mr. HOCK. No. I think the tax went on in 1944, the last increase. That was during the war years. During those early years after that increase we had a war situation where materials were not available to illicit still operators for some time, and that kept down the illicit operations, in my opinion.

After 1945, things began to pick up a little bit, and there was more activity, but still on a small scale. But during the last year and particularly since January 1 some very large stills have been seized in the northeastern part of the country and arrests have been made.

Senator TAFT. Since the Kefauver committee started to operate.

Mr. HOCK. No; I do not think the Kefauver committee had anything to do with these still raids.

Senator TAFT. I do not think so, either.

Mr. HOCK. I would say about the Kefauver committee that many of the people who were mentioned during the course of that investigation had old prohibition records; and one of the concerns——

Senator TAFT. You think they may be connected with the more ambitious large-scale activities that are now being resumed?

Mr. HOCK. I think if they are driven out of their present sources of revenue, they might well go back to their old sources of revenue.

Senator KERR. Is it possible that decrease in consumption in the last 12 months, if that is a reality, as has been indicated, is traceable to other causes than a continuation of the same rate of taxation during the past 12 months that had been on it the 6 years prior to that?

Mr. HOCK. I question that there has been a serious decrease in consumption.

Senator KERR. Of legal liquor.

Mr. HOCK. I think there has been maybe of legal liquors. But I do not think that people have stopped drinking who had been drinking.

Senator KERR. I am talking about the decrease in the consumption of legal liquor in the last 12 months referred to. I ask you if it is not entirely possible that that could have been caused by other things than the continuation during that period of the same tax Federalwise that had been on it for 6 years prior to that time.

Mr. HOCK. Very probably certain economic conditions carry some factor in reduction.

Senator KERR. In giving consideration to this, every factor is entitled to be taken into account, but an intelligent consideration of it would not give a greater amount of consideration to an element than it is entitled to receive or than it should receive in relationship to the other elements that are involved. You would agree with that?

Mr. HOCK. Yes, sir; I would.

Senator KERR. All right. I am very interested in everything you have to say here.

Mr. HOCK. Since January 21, this year, my division has seized 11 stills in New Jersey, 7 of which were large commercial operations—one having a daily capacity of 1,000 gallons of high-proof alcohol.

There is also evidence that these large commercial tax-evading operations are being conducted on an organized syndicate basis. On May 18, 1951, a large commercial still was raided by Federal agents near the city of Baltimore and among those arrested at the site of the still were three New Jersey residents, one of whom was a familiar figure in illicit liquor operations during prohibition.

As recently as July 17, a 1,000-gallon still was raided in the State of New Hampshire. Two of the four men arrested in connection with this illegal operation were also from New Jersey and one has a prior record of illicit liquor operations in my State.

Senator KERR. You do not say that your boys in New Jersey have enforced your laws so well that you have kind of scattered them?

Mr. HOCK. We would like to think that. I would say during the prohibition era New Jersey was rather famous for its still operations.

Senator TAFT. It still may be the center of the operations.

Mr. HOCK. I think we have a lot of trained operators who have carried over from prohibition and have gone out to other areas for operations, though we have some in our State that operate there.

Those who participate in illicit liquor business do not balk at interstate transportation. State enforcement officials are deeply concerned over the accumulating evidence of increased illicit liquor activities and the indications of organized group activities. Because of this State liquor enforcement officials from Maryland, Delaware, the city of Baltimore, Pennsylvania, New Jersey, New York, Connecticut, and Rhode Island, conferred in New York City on June 6 and June 20, 1951, to discuss ways and means of coping with the problem. It was unanimously agreed that State boundaries are no barrier to illicit liquor operations; that increased illicit liquor activities necessarily result in disrespect for law generally and a weakening of our control systems; and that increased tax-evading activities necessarily result in loss of revenues to the State.

As a result of this conference a program has been set up for the interchange of all available information on illicit operations along the eastern seaboard, from Maryland to Rhode Island. It is our hope that through cooperative effort we may alleviate this problem which has grown up around the present tax burden.

With respect to wine: It is generally accepted that our greatest consumption of wine is among persons of foreign origin or foreign extraction. Undoubtedly an increase in taxes on wine, which would increase the cost to the consumer, might very well drive thousands of people to home manufacture of the product with a resultant decrease in tax revenue and an increase in enforcement problems. Even under current conditions, my division frequently finds instances of wine being illegally manufactured in homes and then being illegally sold.

With respect to beer: Although I do not believe that an increase in excise taxes on beer would bring back the days of home brew, I look upon beer as the modest drink of the workingman and believe that a further increase of malt alcoholic beverage taxes would do him an injustice.

In addition, a further increase in the cost of this product to the consumer as a result of increased taxes might very well cause many consumers to become ready customers of the illicit whisky operators. There was much evidence of this during the prohibition era, when numerous preprohibition beer drinkers were converted to hard-liquor consumers.

In reviewing the entire problem of an across-the-board increase in alcoholic beverage taxes, serious consideration should be given to the additional financial burden placed upon the alcoholic-beverage industry, particularly the many thousands of small retailers throughout the country. If the proposed increases on the various alcoholic beverages were adopted, it would mean that every licensee would need substantially more money to finance his business. Obviously this would place an onerous load upon the small licensees throughout the Nation and would probably force many of them either to go out of business or resort to practices inimical to the public interest.

The law in most States where the sale of alcoholic beverages is legalized provides that one of the primary responsibilities of liquor administration is the promotion of temperance. I am convinced that liquor administration can best carry out this responsibility where there is an orderly distribution of alcoholic beverages to members of the public and where the legal beverages are made available at a reasonable price. Our years under prohibition were the most intemperate in our history. Inordinately high taxes may not have the sound of prohibition, but I am convinced that a further increase in Federal taxes would result in great intemperance because of increased quantities of illicit alcoholic beverages distributed at bargain prices without control.

The public generally realizes that both Federal and State Governments require increased revenue. It does not follow, however, that a substantial share of this increase should be placed upon an industry which already carries so heavy a tax burden. It is the time-tested truth that a lower tax widely distributed produces more revenue than a high tax, the incidence of which falls solely upon a special class. It is my firm opinion that even greater revenue than is anticipated by the presently proposed increase in excise taxes on alcoholic beverages may be obtained by strengthening enforcement under the present rates and by imposing more severe penalties against violators. The solution will not be found in merely increasing a tax on a commodity so long as the potential producing capacity of tax-evading still exceeds the production of legal distilleries.

Senator KERR. All right, Mr. Hock. We thank you for your appearance.

Mr. HOCK. Thank you, sir.

Senator KERR. Is Mr. Frank Sims here?

Mr. SIMS. Yes, sir.

Senator KERR. Mr. Sims, how much of a statement do you have?

Mr. SIMS. Ten minutes, sir.

Senator KERR. All right, sir. Come forward.

Identify yourself for the record, and proceed.

STATEMENT OF FRANK K. SIMS, JR., EXECUTIVE VICE PRESIDENT, NORTH CAROLINA ALCOHOLIC BEVERAGE CONTROL ASSOCIATION

Mr. SIMS. My name is Frank K. Sims, Jr., Charlotte, N. C.

I would like to say that I became interested in the question of the control of alcoholic beverages while serving as judge of the municipal criminal court in Charlotte, N. C., and then as a member of the General Assembly in North Carolina, sponsored and fought for legislation that might strenghten the control system in our State.

I am now chairman of the Mecklenburg County Alcoholic Beverage Control Board in North Carolina and also the executive vice president of the North Carolina Alcoholic Beverage Control Association. North Carolina is one of the 17 monopoly States, where liquor is sold only through government stores. But in our State the monopoly system operates on a county rather than a State-wide basis, and the revenue obtained goes primarily to the counties, not to the State.

Senator KERR. Do you have local option?

Mr. SIMS. Yes, sir.

Senator KERR. In what part of the State——

Mr. SIMS. Thirty-three counties are now under the alcoholic beverage control system.

Senator KERR. How many counties do you have?

Mr. SIMS. One hundred.

Senator KERR. That means 67 counties—in those counties it is illegal to sell?

Mr. SIMS. That is correct.

Senator KERR. All right.

Mr. SIMS. I very much appreciate the opportunity of appearing before the members of this Committee on Finance, and although I am not empowered to speak on behalf of the other monopoly States in this country, I assure you gentlemen that the interest which I express in the Federal tax proposals on distilled spirits is undoubtedly equally shared by other monopoly States.

There are several points related to monopoly revenue problems and the dependence that essential government activities have on liquor revenue that I would like to discuss with this committee. It is widely recognized that today our State and local governments are facing a serious problem in finding additional sources of revenue to pay for the essential services provided for their citizens. The fact that the Federal Government has access to sources of revenue that are not available to State and local governments must be taken into consideration. Furthermore, even where commodities are subject to tax by the State and local governments, this usually means that State levies must be made over and above Federal taxes, so that prices are increased to a point that often leads to diminishing returns at both levels. In behalf of North Carolina, now faced with the problem of finding a way to increase revenues from new and old sources, I urge you gentlemen to consider the liquor tax proposal in terms of the effect it would have on State budgets.

It seems worth while citing to you the share that is contributed by liquor revenues to the total tax collections of several of the monopoly States. North Carolina, for example, with no private licenses derives 7 percent of its total revenues from sales and taxation of alcoholic beverages.

Senator KERR. You are talking about the local governments in North Carolina, or the State?

Mr. SIMS. I am talking about the State in that instance. That is what they get.

Ohio derives 11.8 percent of its total revenues from alcoholic beverage income, Pennsylvania, 18.6 percent; and Virginia, 15.5 percent.

These funds are allocated to a variety of State programs, such as education, old-age pensions and assistance, and school-lunch programs, and so forth.

For the calendar year 1950, Alabama, for example, applied its alcoholic beverage revenue as follows:

Cash payments

To State general fund	$6,191,841.80
To State public welfare	200,000.00
To counties general fund	1,084,804.41
To counties public welfare	200,000.00
To municipalities in which stores are located	820,770.20
To all incorporated municipalities	9,020,704.80

Senator KERR. Does that figure include the preceding one?

Mr. SIMS. No, sir; that is separate.

Senator KERR. All right.

Mr. SIMS. In another case the State of Washington appropriates the money received from liquor sales, taxes and license fees to its cities and counties and, notably, to the University of Washington and Washington State College.

Thus, it is apparent that liquor revenues contribute substantially to the operation of State programs and to the well-being of the people of these States.

Another aspect of the problem for the monopoly States is the impact of a Federal tax increase on revenues of States and counties whose budgets are already heavily burdened by increasing costs of operation. A Federal tax increase will undoubtedly result in decreased legal consumption. Under the present tax, sales to consumers have already dropped markedly since 1946.

Senator KERR. Is the all-time high in 1946?

Mr. SIMS. I think that is the leveling-off point, sir. I do not think that is the all-time high.

Senator KERR. Has it been higher than that since?

Mr. SIMS. I do not think for a full year. I think there have been periods during a year.

Senator KERR. The $9 tax was put on in 1944.

Mr. SIMS. The last tax was put on in 1944.

Senator KERR. The present tax?

Mr. SIMS. Yes, sir. The $9 tax.

Senator KERR. So that the consumption continued to increase through 1945 and 1946.

Mr. SIMS. Until the year 1946.

Senator KERR. Then the leveling-off started, and it went down, and then in 1950 it was almost back up to 1946.

Mr. SIMS. Yes, sir.

Senator KERR. All right.

Mr. SIMS. If taxes push the retail price of liquor any higher, the legal product will go out of the reach of any purchasers who today are hard-pressed by higher costs of food, rent, clothing, and so forth.

When the Federal Government on April 1, 1944, imposed an increase of $3 per proof gallon—termed a war tax to be removed at the end of World War II—the counties of North Carolina absorbed some of this increase, just as they had absorbed a portion of the 1942 increase of $2. We felt that to pass these increases on to the public would seriously reduce our sales and greatly encourage and increase the manufacture and sale of illicit nontax paid whisky. As a result, profits have been reduced to an absolute minimum. Any further in-road would eliminate the incentive of the county control system as far as revenue is concerned.

Any further increase in the tax on distilled spirits will certainly mean continued losses to the States and counties—losses which must be counterbalanced from some source in order to maintain adequate State programs for health, welfare, and education.

I would like to interpose to say that Georgia is an outstanding example of how high taxes result in bootlegging and lost revenues.

In 1946 the State raised the liquor tax from $1.20 to $4 a gallon. Georgia revenues dropped from $18,000,000 to $10,800,000.

The next year they dropped to $9,400,000. Then in 1949 in order to offset falling revenues the tax was raised again from $4 to $5 a gallon. But by the end of 1950 revenues had fallen 55 percent, while seizures of illicit stills in Georgia by Federal agents alone increased 45 percent from 1,305 to 1,904.

Finally, on April 2, last, under the recommendation of the revenue commissioner, there was a drastic tax reduction from $5 to $2 a gallon.

The results of that tax reduction are striking.

The department of commerce figures show that in April 1951, Georgia had an increase of 92 percent in sales over the previous month, and in May there was an increase of 49 percent over April.

Stamp sales in Georgia in May 1951 were 119,172 as against 83,263 in May of 1950 and were 208,000 in June 1951 against 128,000 in June 1950.

Senator KERR. What other revenues do they get besides stamp sales?

Mr. SIMS. The State has a gallonage tax.

Senator KERR. Besides the stamps?

Mr. SIMS. Besides the stamps.

Senator KERR. All right.

Mr. SIMS. It is of interest to know that our county of Mecklenburg alone paid the Federal Government $10,056,017.35 in excise taxes on the sale of whisky during the first 42 months of operation. The present $9 tax has amounted to 60.47 percent of the total cost of the whisky sold.

Senator TAFT. You mean you manufacture it?

Mr. SIMS. No, sir; that is the percentage of what we pay the distillers for the whisky.

Senator TAFT. That is not paid in Mecklenburg County?

Mr. SIMS. No, we pay that to the Federal Government.

But that represents 60 percent of our cost merchandise.

Senator KERR. How much do you mark it up?

Mr. SIMS. We started off with a 50-percent mark-up. It is now actually a 26 percent mark-up, because we have absorbed some of these taxes. The original tax prior to the tax in 1942 is figured in by the distiller. Then since the $9 increase, that is paid separately. We pay that separately.

Senator TAFT. When you say you pay, you mean you pay the distillers that much, and they then pay the Federal Government?

Mr. SIMS. Yes, but we have to pay that tax when we get the whisky.

Senator TAFT. I understand that.

Mr. SIMS. The biggest problem facing the ABC Association today is the illicit manufacturing of non-tax-paid "moonshine" whisky in North Carolina. Within the past 3 weeks agents of the Alcoholic Tax

Unit have captured and destroyed the two largest illicit stills ever caught in North Carolina. One of these had a capacity of 714 gallons—a loss to the Federal Government of $6,426 every day it operated at capacity. The other, in a small county in eastern North Carolina had a capacity several times the total amount of legal liquor sold in that county in a day. The price of such whisky in North Carolina is approximately $3 per gallon at the still.

I am being very generous allowing for their profits. It varies from $1.50 on low-grade whisky to $2 on average grade whisky and $3 for their best quality moonshine.

Senator KERR. How does that quality compare with what you sell?

Mr. SIMS. We do not think that it compares at all. At $3 a gallon, they double and twist it and run it through at about 120°, and that brings a premium. You can get it with a little creek water in it and it will sell for $15 a case, $12 to $16 a case. That is 6 gallons the way they handle it. It will average around $2 to $3.

Senator TAFT. Is it bottled and gotten up in an attractive style?

Mr. SIMS. No, sir. It is all in fruit jars. In some States it is much less. The Federal tax alone on legal whisky is $9 per gallon. Thus it is obvious that any increase in Federal tax would encourage the moonshiner and the bootlegger.

Any increase in the illicit whisky traffic will make definite inroads not only in profits now accruing to the North Carolina counties, but also in the taxes paid the Federal and State Governments.

We are spending a large part of our profits for law enforcement and will continue to do so, but any increase in taxes on legal liquor will make our law-enforcement efforts far more costly.

Senator KERR. You state you spend a large amount of your profits for law enforcement. Do you think you make enough profit from the sale of liquor to pay for the increased law enforcement that it requires?

Mr. SIMS. We, in our county, Senator—I will answer by saying that is my interest. My interest is in law enforcement. I am not connected with any distiller, have no interest in the industry.

In our county we will spend any amount necessary, and when I took the job as chairman, I said I would spend a hundred percent of the profits if necessary to enforce the law. We, in Mecklenburg County, consider that to be the excuse for our existence. We are spending between 5 and 10 percent of our net profits—that is, after paying our Federal taxes and after paying our State taxes, which is 8½ percent on top of the Federal taxes, and everything else.

We, in our county, which I think is outstanding—and I will brag to the extent that I think I have the best law-enforcement agency in the country. The ATU has been kind enough to say the same thing. We can police our county. We will spend whatever money is necessary, but we have this mountainous country up there where the bootlegger is fast coming back into his own, and that one still I mentioned, there is no way of estimating how long it had been operating. That is our only problem in North Carolina.

I am wiling to spend every dime of my profits for law enforcement. We have adopted a slogan which is, "Control of the sale of alcoholic beverages by law rather than leave it in the hands of outlaws."

Outlaws are about to run over us when they can compete with us. In my section economically we can't pay the Federal Government

$10 a gallon for tax and expect our industrial workers—and we have some low-paid industrial workers—we can't expect to compete with $2 and $3 a gallon bootleg liquor brought in there from the mountains.

Senator KERR. We recognize that.

Mr. SIMS. That is the situation.

Illegal distilling operations serve as an impetus to crime, especially since the "moonshiners" have developed the technique of delivering their product by using the dangerous "hot rod" cars. These are a menace on the highway, as any driver will testify, and the curbing of their use means still more work for local officials and more danger for law-enforcement officers.

We contend, gentlemen, that any increase in taxes on liquor will serve in effect to subsidize the illegal operator and create a situation which will be extremely difficult to control with the present staff available in most localities. Therefore, in our opinion, any action which would discourage legal sales of liquor, already on the decline because of the present tax rate, would be most harmful to the interests of the monopoly States.

The primary responsibility for control and enforcement is vested in the individual State governments by the terms of the twenty-first amendment to the Constitution. The control and enforcement activities, however, require the availability of appropriate moneys. Thus it seems a reasonable inference that State governments should also enjoy the availability of liquor revenues through taxation, monopoly profits, and other appropriate sources, in order to help them discharge their responsibilities to the people.

For all these reasons, I believe that any increase in Federal excise tax on liquor would work contrary to the best interests of the monopoly States. I hope that no increase will be adopted.

Thank you, gentlemen.

Senator KERR. Thank you very much for your appearance.

The Chair inserts a letter from the Department of Finance and Taxation of the State of Tennessee and a statement of Guy C. Shearer, chairman, the Kentucky Alcoholic Beverage Control Board, in lieu of personal appearance, in the record at this point.

STATE OF TENNESSEE,
DEPARTMENT OF FINANCE AND TAXATION,
Nashville, July 27, 1951.

Hon. WALTER GEORGE,
Chairman, Finance Committee,
United States Senate, Washington, D. C.

DEAR SENATOR GEORGE: I understand that on next Monday your committee will consider the matter of the proposed increase in alcoholic-beverage taxes.

In my official position, I am charged with collecting the State's revenue on alcoholic beverages, the regulation and control of licensees, and the destruction, insofar as possible, of the "moonshine" industry.

We have a constant battle in the Southeastern States, with our half-wet, half-dry situation, to keep down the traffic in "moonshine" liquor. It can be curtailed, and with the assistance of the Federal Alcohol Tax Unit, we have to some extent curtailed it in this State; it cannot be eliminated without prohibitive enforcement costs.

I believe that increased taxation of alcoholic beverages will inevitably increase the economic incentive for "moonshine" production and will increase "moonshine" consumption, and along with it, to some degree, decrease the consumption of lawful beverages. I believe that this factor should be carefully considered by your committee in arriving at its conclusion.

I fully realize that the need for revenue, and the sources thereof, are very broad issues, and on them I make no comment.

I will appreciate your filing this letter as a part of the record of your committee hearing.

Respectfully,

JAMES CLARENCE EVANS, *Commissioner.*

WRITTEN STATEMENT OF GUY O. SHEARER, COMMISSIONER-CHAIRMAN OF THE KENTUCKY ALCOHOLIC BEVERAGE CONTROL BOARD

I am Guy O. Shearer, commissioner-chairman of the Kentucky Alcoholic Beverage Control Board. My statement is one of protest against the recommended $1.50 per gallon raise of the excise tax on whisky to $10.50 per gallon.

I will not discuss the economic or State tax features or figures with this committee as others will cover those features. Nor will I discuss or interpret in detail the fact that 10,000 illicit whisky stills were seized in 1949, capable of producing 520,000 gallons of whisky per day. The capacity production amounted to almost 120,000 gallons more per day than was actually produced in 1949 by the legal taxpaying distilled spirits industry.

As Government and industry statistics on whisky are endless, I am going to leave those to others more qualified than I. However, it is my duty as commissioner of the Kentucky board to direct field operations in the endless fight on illicit whisky production.

Our State of Kentucky, with its rough terrain, mountains, thousands of small streams, 2,500 miles of navigable rivers, and 10,000 miles of caves, many of which have streams and rivers in them, is ideally situated for the illicit manufacture of whisky. Our geographic advantages have not been neglected by the illicit whisky producers, as Kentucky generally ranks among the top eight States in illegal whisky production. Kentucky is also the Nation's leading producer of legal whisky.

In the past 3 years your Federal Government, through its excellent Alcohol Tax Unit of the Treasury Department has made a wonderful law-enforcement record in Kentucky. Our State alcoholic department has cooperated with and tried to assist them in this work.

As an enforcement official and citizen, I am greatly concerned over the fact that by the proposed $10.50 per gallon excise tax on whisky, the Federal Government may be buying revenue at too great a price.

This proposed legislation was undoubtedly designed for the purpose of obtaining additional revenue for the Federal Government rather than for the purpose of bringing about a prohibition of legal whisky for the average consumer.

The anticipated and estimated revenue is probably the sincere opinion and the work of the tax, revenue, or Treasury expert. It is the competent, sincere expert that estimates and the Congress that levies the whisky excise tax but it is the consumer that in the final analysis determines the actual revenue return from such taxation. Mr. Consumer is the paymaster.

A sufficiently high but fair excise tax on whisky is good for the Federal Treasury, acceptable to the average consumer, but is destructive for the unlawful manufacturer (moonshiner), transporter, and bootlegger.

The maker, transporter, and seller of illegal whisky cannot prosper unless, and until they have an opportunity to do so. They cannot and will not have the opportunity to prosper without a market for their product. There can be no adequate market for these illegal operators unless one is created for them.

The two things that can, do now, and will continue to create such a market is (1) a shortage of legal whisky, or (2) an excessively high price on legal whisky to the consumer. More than half of the present high price of whisky to the consumer is the result of the now existing high Federal excise tax. When legal whisky has an excessive retail price, be it the result of an overburden of taxation on the product or any other cause, the average consumer begins to feel justified in buying an alcoholic product illegally produced. His preference for legal whisky and his sales resistance to illegal whisky is eradicated by the great differential in price. In the prohibition era, it wasn't the fact that one couldn't get legal whisky that brought about the big-time moonshiner, rum-runner, and underworld boss. It was the price that the consumer had to pay for legal whisky. The purchaser of legal whisky had to first pay for the prescription that would permit him to make the legal purchase and then proceed to buy the legal product. Those of us on State liquor boards that have been called in and consulted by authorities relative to what disposition should be made of cases or half-cases of prescription whisky left as part of the estate of some wealthy decedent, realized that legal whisky was available for those who could pay the price in the prohibition era. From these observations of the prohibition era, we get some idea what to expect as a result of excessive excise-whisky-tax legislation. While the proposed excise-tax legislation might produce some additional revenue, it will also go a long way toward bringing about prohibition of legal whisky for the Mr. Average Man of the consuming group.

Since the richest prospect for the manufacture and seller of illicit whisky is at present, and will continue to be (unless present taxes are lowered) the middle class, the average every-day fellow, it is appropriate that we consider the now-existing taxes on the product.

Exclusive of barreling, storing, aging, bottling, labeling, and marketing present whisky production, costs range from $1 per gallon to $1.25 per gallon. The liquor taxes are 10 times the actual cost of production. Federal, State, and local taxes total from $10.84 to $15.00 per gallon. Such is the cost of legal whisky that now goes to market in competition with illegal whisky, the production cost of which is from 60 cents to 90 cents per gallon, and is free from any tax, Federal or State.

In the light of these facts, is it surprising that bootlegging is now more prevalent than when the excise tax was only $6 rather than the present $9 per gallon? In the light of these facts, wouldn't the Congress be justified in keeping the commitment made and included in the original $9 excise tax on whisky to the effect that the $9 tax would be again lowered to $6 per gallon when the World War II emergency had terminated? It's a most unusual product that can never be taxed enough. The Federal excise tax on a gallon of whisky has increased 800 percent since 1942. It is $9 now as compared with $3 in that year. The tax on whisky is greater than the tax on any other luxury item.

The fact that bootlegging is more prevalent than when the excise tax was $6 indicates an overburden of taxes. It has not been and will not be the tax burden, but the tax overburden that kills the legal whisky sale.

In the prohibition era, we learned, and the history of mankind discloses, that, be they rich or poor, "the thirsty find drink" in some form. The alcoholic beverage consumers' desire for spirituous drink will be attained, be the drink a legal or illegal product, or be it fit or unfit for human consumption.

In my opinion, if the $10.50-per-gallon excise-tax legislation passes, it will not only bring out the hillside moonshiner, the home-distillery assembly units, formerly used in prohibition days to make a little whisky for the family and a few neighbors, but moonshining will again move into the big-time business classification.

From the raise of the present excise tax from the $6 to $9 level, we see signs that the present excise tax is now excessive. In 1949, illegal still seizures totaled 370 in Kentucky, and the State ranked eighth in still seizures. In 1950 there was an increase to 500 stills, with a capacity of 34,545 gallons per day, that were destroyed. Three thousand nine hundred and eleven gallons of moonshine were seized and 45 automobiles and seven trucks became the property of the Alcohol Tax Unit as contraband and 500 arrests were made.

Within the past 4 months, a still having 1,500 gallons per day capacity was seized within 22 miles of Louisville. This was the largest still that the Alcohol Tax Unit had seized in Kentucky in the past 15 years.

It is my opinion, which is based on 15 years in Government; on the experience of having grown up in the prohibition era, on the experience of approximately 15 years as a practicing attorney, and 3 years as chairman-commissioner of the Kentucky Alcoholic Beverage Control Board, that—

1. The estimated revenue from the pending excise legislation will not be nearly as great as anticipated;

2. As the price of legal whisky is increased, and the differential between legal and illegal whisky grows greater, the whisky consumers' sales resistance to illegal whisky is reduced proportionately;

3. That so long as whisky is legally sold, it should be kept within the price range of the of the average consumer;

4. The pending $10.50-per-gallon excise tax should be defeated;

5. That if the $10.50-per-gallon excise whisky tax act passes, the big-time moonshiner, rum-runner, and bootlegger will again become a tremendous problem;

6. That numerous newly created enforcement problems at the Federal, State, and local levels, will necessitate large expenditures of money and the employment of many men thereby depleting our national manpower that will be sorely needed elsewhere during the present emergency;

7. That the Federal excise tax should be lowered to $6 per gallon.

It is to be remembered that excise tax, whether it be State or Federal, is derived only from the sale of legal whisky.

BONI, WATKINS, MOUNTEER & CO.,
New York, N. Y., August 1, 1951.

The Honorable WALTER F. GEORGE,
Chairman of Finance Committee,
United States Senate, Washington 25, D. C.

DEAR SIR: As an economist with a keen appreciation of the fateful import of the deliberations of your committee on current fiscal policy, I venture to proffer a brief economic analysis of what appear to be the main issues at stake. In the course of the discussion some suggestions are advanced which I hope you may find promising, and may even be inclined to put to a practical use.

Between April 15, 1950, and April 15, 1951 (date of latest available figure for comparisons here in view), the all-commodities wholesale price index rose exactly 20 percent. In the same period, business loans of commercial banks rose 40.5 percent and the amount of consumer credit outstanding (installment loans) 14 percent, while currency in circulation remained virtually unchanged. The result was a net addition, during the year, of $7.1 billion to means of payment for goods and services. But gross national product (seasonally adjusted at annual rates), expressed in constant (1939) dollars, was actually lower by 0.68 percent in the quarter ending March 31, 1951, than a year earlier ($182.2 billion as against $183.1 billion). These facts plainly spell inflation and clearly point to its major source.

An increased quantity of means of payment running after a decreased volume of goods and services leads to higher prices, unless the means of payment "run slower" (money circulates less rapidly) than before. However, as the volume of money chasing goods increases, the likelihood is that its rate of circulation will also increase. While no official data are available on recent changes in the rate of currency circulation, FRB data on deposit turn-over (for weekly reporting member banks) disclose a rise, during the year ending March 31, 1951, of 20 percent in the New York City banks' rate and of 16 percent in that of banks in "other leading cities." Thus, the inflationary effect of the increase in the quantity of money (through credit expansion) without any increase in the volume of goods and services to be exchanged (bought and sold) was compounded by a sharp rise in the "efficiency" of money. In such circumstances, attempts to "freeze" prices are, at best, futile.

Control of the supply of money is one of the sovereign functions of government. The Federal Government's primary responsibility for the inflation that has occurred in the past year should be clear. It was in position, as was no other body or group, to halt the expansion of credit—which constitutes the largest part of money supply. Tardily it has taken steps in this direction: By raising bank reserve ratios, by restricting consumer credit (including real-estate credit) and, most important of all, by discouraging the "cashing" of Government bonds (especially by bank holders) through "unpegging" their prices and permitting interest rates to rise. It has also, within recent weeks, encouraged an organized movement for voluntary restriction of bank credit, which is already showing salutary results. Whether these several measures are sufficiently rigorous to check the inflationary forces that were earlier allowed virtually to run rampant is an open question. But that they came too late to prevent a sharp decline in the purchasing power of the dollar is obvious.

The damage inflation has already done, however, cannot be undone. The question now is whether the general public is to be exposed to the same "pickpocket" operation on an even bigger scale henceworth, or, to be more definite, say in the next 12 months. Taking due account of the genuine (though none too rigorous) anti-inflationary measures now in force, the danger that it will be is great. The grounds for this conclusion can be better appreciated in the light of a brief review of the circumstances that prompted the credit-implemented buyers' stampede of the past year. Beyond question, the specific "circumstances" were the Korean outbreak and the ensuing rearmament program. True, these developments led to no immediate large-scale increase in Government expenditures involving an expansion of the money supply. But "coming events cast their shadows before them." In this instance the coming events were anticipated acute goods shortages and sharply higher prices. Few people apparently, recalling 1940–41 experience, could believe that the Government would be foresighted enough to enforce the necessary retrenchment on the demand for men, machines, and materials in the production of civilian goods and services to enable military procurement officials to "draft" sufficient productive resources to fulfill the rearmament program (at home and abroad) without forcing up prices. Hence came about the wave of "scare buying" by consumers and inventory accumulation by business, much of it credit-financed.

Thus the inflation of the past year was occasioned by the mere "shadows" of prospective rearmament expenditures. It owed nothing to a budget deficit, for there was none. In fiscal 1951, the Treasury's cash intake was $7.3 billion greater than its cash outgo, and even on a budgetary basis its excess of receipts over expenditures amounted to $3.5 billion. Though Federal fiscal policy manifestly was not a cause of the inflation during this period, it might have been used more effectively than it was used to combat an inflation having its roots elsewhere.

Parenthetically, the ardent advocates of a pay-as-we-go fiscal policy might well reflect on these facts. Just as the Government's financial rectitude in "living within its income" in the past year did not forestall inflation, so a temporary lapse of balanced budgeting in the coming year would not necessarily promote inflation. A tax program designed to stimulate private savings could divert purchasing power from civilian goods and services markets quite as effectually as a tax program designed to reduce purchasing power so disposable. With equal efficacy from the standpoint of preventing inflation, the Government can obtain part of the funds required for defense expenditures out of real savings transferred to the Treasury through bond purchases or it can obtain all of them through higher taxes. The only fundamental difference between these two methods of relieving inflationary pressures on civilian goods and services markets is that in the one case the public secures something in return for the purchasing power currently foregone, specifically, a promise of future repayment, whereas in the other case it gets back nothing—except perhaps a feeling of virtue from sacrifices endured.

Inasmuch as to fulfill the promise of future repayment of the bonds, with interest, the Government will be obliged to levy heavier taxes hereafter than it otherwise would, it might appear that it is a matter of indifference, from the viewpoint of the public as a whole, which of these alternative methods of financing rearmament is adopted. This is by no means so. In the first place, cultivation of habits of thrift yields lasting benefits to any economy, and especially to a private enterprise economy. Poor Richard's advice was not meant for the eighteenth century alone; it is still good counsel for the twentieth. Secondly, by contributing to the solidarity of a democratic society, there are advantages in making patriotic sacrifices formally compensable. The Congress has wisely recognized this principle in the GI bill of rights. It would earn credit for itself, and strengthen popular faith in democratic government, were it to apply the same principle in respect to some part of the economic sacrifices entailed by rearmament.

Though the cost of building up a Defense Establishment adequate for national security must, in one way or another, be borne by the present generation, the deprivations it entails can be enormously lightened by holding out to those (all of us) whose real income is thereby lessened a compensatory claim on future income. It could be argued, of course, that from the viewpoint of the public as a whole the "future income" from which reimbursement is to come is our own, so that the "compensation" (in the form of Government bonds) for current income foregone is illusory. In a sense, this is true. But "the viewpoint of the public as a whole" is likewise in a sense illusory. In a democratic society the public is not a homogeneous mass of undifferentiated persons. It consists of individuals, each with distinctive traits, capacities, and ambitions. Earning power and the kind and amount of accumulations vary incontinently. Such being the case, the size and composition of the saving group and of the taxpaying group are far from identical.

So it does not follow that a fiscal program for the emergency aimed at a just balance between higher tax levies and Government borrowing of increased real savings, in preference to an uncompromising application of the pay-as-we-go shibboleth, is illusory. On the contrary, it offers genuine, long-run economic advantages of a kind that are preeminently worthy of congressional solicitude in unsettled times like the present.

To return now to the main theme, the defense program will shift into high gear in fiscal 1952 (year ending June 30, 1952). Estimated defense expenditures will nearly double those of fiscal 1951, rising from an average monthly rate of $2.9 billion to one of $4.8 billion. The diversion during the year ahead of an extra $23 billion worth of goods and services from the civilian market to the military can only be accomplished without further inflation by reducing civilian demand. (In view of the actual decline during the past year in the total real output of goods and services and of the prospective absorption by the military services of about 3 million men, we assume here that, at a maximum, increased productivity cannot offset a rise of real output in the coming year by more than 4 percent. This would be equivalent to a rise of say $8 billion in 1939 dollars or $19 billion in current dollars.) The two levers at the Government's command for accomplishing such a reduction are fiscal and monetary. (In an emergency, the materials allocation device is indispensable for assuring adequate military supplies. But as it does not directly reduce civilian demand, we omit it here.) If the foregoing analysis is correct, to avoid further inflation the Government will need to use both levers more vigorously than heretofore.

The simplest and most effective way to reduce civilian demand is to reduce business expenditures on nonmilitary production (including investment) programs. Consumer expenditures will take care of themselves if business expenditures are properly regulated, for the wherewithal of the former has its principal source in the latter. And by and large restriction of business expenditures on civilian production programs can be most expeditiously and economically enforced by restriction of bank credit. In existing circumstances, it would be imprudent, for this purpose, to trust exclusively to Federal Reserve open market operations and voluntary compliance with the recently organized movement to curb bank loans to business. Statutory authorization is clearly expedient for imposing higher reserve ratios if need be, for extending FRB control of reserve ratios to nonmember banks, and for implementing the FRB proposal to institute secondary reserves freezing part of the bank holdings of Government securities. These measures judiciously administered would go far to abate the dangers of further inflation.

The fiscal lever can and should be used in three ways: By cutting Federal nonmilitary expenditures, by increasing anti-inflationary taxes, and by stimulating both private savings and their investment in Government bonds.

(1) The Government can economize in its own demands on the limited available supplies of men, materials, and machines by diverting to rearmament a substantial part of the funds now being spent on scores of civilian activities that are not essential to defense. Indeed, retrenchment in the Government's civil expenditures, in some directions, would eliminate flagrant wastes known to all men. Outstanding examples are afforded by the rivers and harbors pork barrel, agricultural subsidies, and mail subsidies to periodicals.

(2) The Government can obtain an even larger contribution to defense costs by turning the tax screws a bit tighter. It is important to remember, however, that not all taxes are equally anti-inflationary. In the present context, i. e., as a means of counteracting inflationary forces implicit in a sudden, radical increase in military expenditures, the most efficacious taxes are those that have a minimum adverse effect on current production and a maximum tendency to promote saving. It is a common mistake to overlook, in this connection, the role of investment. The frequent declaration that a sound taxation policy, in the present emergency, will repress consumption is no more than a half-truth. Investment is no less inflationary than spending. Indeed, dollar for dollar, it is far more inflationary, as Keynes was at pains to emphasize. So diversion of savings, both individual and corporate, from civilian goods and services markets (including construction goods and services) to Government bond purchases is a necessary part of any program for strengthening our military defenses without weakening our economic defenses.

Probably the individual income tax provides the most efficacious and equitable fiscal means of diverting available purchasing power from civilian markets. But it should not be overlooked that whatever part of personal income-tax revenues would have been saved had the tax collector not got them represents a depletion by so much of the supply of funds the Treasury can tap by its bond issues. Accordingly, to provide a salutary stimulus to individual saving, it would appear advisable, while reducing personal exemptions and increasing moderately the applicable rates all along the income scale but especially in the middle brackets, to deduct from taxable income life insurance premiums and all or some part of the funds used to buy United States savings bonds. Limits are already in effect on the latter channel of investment, and to prevent misuse of the former maximum deductions therefor might well be stipulated. Such a tax measure would make a higher income tax rate much less unpalatable and presumably have less adverse effects on production incentives than the increased rates otherwise might. At the same time it would provide a direct and powerful inducement to spend less and privately invest less and to save more and buy more Government new issues. (And given a continuation of the Treasury's acquiescence in an upward movement of interest rates, undoubtedly a large proportion of insurance companies' liquid investment funds would flow into "Governments," new or old, in either case helping to turn back the inflationary tide.)

Though the corporation income tax is less anti-inflationary than the individual income tax, its more rigorous use in the present emergency would help appreciably to close the inflationary gap. This is particularly true if the device were used in conjunction with effective credit control measures, as suggested above. For then resort to bank borrowing as an alternative source of funds would be impeded, if not blocked. But the frequent allegation that the entire burden of corporation income taxes is simply shifted to consumers in the form of higher prices cannot be sustained. In their very nature such taxes bear unequally on different enterprises competing in the same market, and in few industries is the market position of every competitor strong enough to permit each to recoup the full amount of the levy.

Parenthetically, we do not minimize the long-run disadvantages of a levy that cuts down corporate savings and the volume of earnings "plowed back," or reinvested. Under ordinary conditions any advance in the high corporation income tax rates now in effect would clearly be uneconomical. But when the paramount consideration is to shift men, materials, and machines to defense production, a check to plant expansion in civilian goods lines is a sine qua non of preventing inflation. For the goods shortage that such plant expansion programs might relieve is a future shortage. To construct additional facilities for civilian production now is to give the 1951 economy a double-barreled inflationary charge: increasing consumers' disposable income and decreasing the means of production available for the defense program (not to mention preventing, by so much, an increase in the current supply of consumers' goods).

Probably the least anti-inflationary taxes of all are excise duties and so-called excess-profits levies. Both are highly discriminatory and inequitable. On economic no less than social grounds, with two exceptions their repeal forthwith would be an all-round gain. The exceptions are the excises on liquor and tobacco. Because these products have no close substitutes and because to the extent that their consumption is repressed few question the benefits to production efficiency, their revenue-yielding advantages outweigh their regressive incidence.

(B) If, used in conjunction with more rigorous monetary measures to keep down prices, the combination of Government retrenchment on civil expenditures and selective anti-inflationary taxation fails to yield enough to offset the mounting outlays for exigent military requirements, the balance must be found from borrowing.

The Government can in two principal ways foster real savings—and obtain thence, if necessary, the means of paying for part of the rearmament cost. The first is by offering the inducement of an attractive rate of interest. In an emergency like the present, voluntary savings thus induced would be "cheap at double the price" now offered. The second method is by vigorous campaign to encourage systematic saving habits and regular investment in Government bonds. To this end, the device previously suggested, of providing for deduction in certain circumstances of United States savings bonds purchases from taxable income, should contribute powerfully. Another device working toward the same end might well be tried, namely one assuring purchasers of a special series of savings bonds that their frugality would not be in vain. Guaranteed that, "come what may," the investor in a savings bond, series —, would be entitled at maturity to a fund of purchasing power equivalent to that foregone in purchasing the bond, there is little doubt that the volume of voluntary savings in this country would mount to a level more than adequate to meet the Government's financial needs in the present, or any foreseeable, emergency. Preventing inflation would then be no problem at all.

The objection has been raised that offering a "purchasing power" bond would lead to a flood of conversions of present issues, and of transfers of funds from existing nongovernmental obligations, into such a series. But restriction of such an issue to individual purchasers and limitation of holdings, similar to, but if need be lower than, the limitation now in force with respect to United States savings bonds, should suffice to forestall the apprehended "stampede" of funds thereto.

In conclusion, without attempting to summarize the analysis, four features deserve emphasis. First, the danger of further inflation is real—an ominous menace to the abiding interest of every class in the community. Second, the source of inflation is an excessive supply of money relative to the available supply of goods and services, and not, as frequently contended, excessive income payments. Rising wages and profits are signals, not causes, of inflation. Third, efficacious means of preventing further inflation are available, but responsibility for invoking them lies on the Government. Spontaneous, sporadic, self-selected measures for meeting the inflationary peril are likely to cancel out, if indeed they do not aggravate the crisis through degenerating into a sauve qui peut scramble. Fourth, the paramount need is to release from civilian production the men, machines, and materials required for executing the defense program. The fairest, surest, and most economical way to accomplish this is through a blend of governmental economizing, heavier taxation, and vigorous stimulation of savings. Pursued resolutely and firmly, yet without forgetting the virtue of moderation in all things and above all in fiscal affairs, these polices would enable us to avoid the economic quicksands of inflation.

Sincerely yours,

MYRON W. WATKINS.

URBANA WINE CO., INC.,
Urbana, Hammondsport, N. Y., August 6, 1951.

Hon. W. F. GEORGE,
Chairman, Senate Finance Committee,
United States Senate, Washington, D. C.

DEAR MR. GEORGE: We follow with great interest the tax hearings; the way they are conducted is a credit to you and your committee and the best protection our people have against unwise and unfair tax proposals.

The American wine industry has always been ready to accept its share of the tax burden, and in return it expects fairness in its distribution.

It is for that reason that we respectfully remind you that the greatest part of the present excise taxes on wines are special war taxes; they were considered as very heavy and exceptional, they were voted as temporary measures, to be repealed at the end of the war. Now, not only have they not been repealed for the last 4 years, but it is proposed to increase them again.

There is another side to the question, an important moral side. Every informed citizen knows all the evils generated by prohibition. Outrageous taxes on alcohol bring the same result. One of the best ways to fight alchoholism in this country is to favor temperate drinking of table wines with meals against heavy liquor drinking before meals. Any additional taxation on wines now would be a terrific blow to temperance and a great victory for the bootleggers and producers of moonshine alcohol.

I also wish to bring to your attention the terrible injustice of the champagne tax. If the American Government had desired to destroy the champagne industry, it would have not acted in any different way.

The American champagne production has always had to compete with French champagnes made at a lower cost and with cheaper labor, while it has slowly been recovering from the blows dealt by prohibition. The Government has given tremendous help and protection to all other agricultural industries in similar circumstances; what has it done for the Amercina champagne industry?

Since repeal of prohibition it has raised the tax per case first from $1.20 to $1.44 and then to $7.20 during the war. During the same period of time, it has reduced the import duty per case of French champagne first from $14.40 to $7.20 and then lately down to $3.60.

Can any industry in the United States claim such unfair treatment? If so, I would like to know it.

Champagne is the only wine not taxed on the alcohol content. It is supposed to be a luxury beverage because it sparkles. Then why not heavily tax sparkling water because of the luxury of its bubbles? And why should a bottle of champagne at $3.90 a fifth be taxed as a luxury when a bottle of old French still Burgundy at $5 a fifth is not?

Champagne is a dry wine and a temperate drink and it should be taxed at the rate of the dry wine tax.

The dollar receipts from the champagne tax is extremely small compared with the balance of the wine industry tax receipts. An extremely small increase in the wine tax would easily compensate the loss of revenue from the repeal of the frightful and unjust champagne tax.

As this tax is added to the price of a champagne case when it leaves the winery, it is included in the price charged to the wholesaler. After the 25 percent mark-up price of the wholesaler and the 50 percent mark-up of the retailer, the increase in the price of champagne to the consumer due to the tax is $14.40 per case or one third of the retail price.

I am sure that your committee will study these facts carefully and take appropriate action.

Yours very truly,

URBANA WINE CO., INC.
CHARLES M. FOURNIER,
President.

Senator KERR. We will now recess until 10 o'clock tomorrow morning.

(Whereupon, at 1:15 p. m. the committee recessed to reconvene at 10 o'clock a. m., Tuesday, July 31, 1951.)

REVENUE ACT OF 1951

TUESDAY, JULY 31, 1951

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
Washington, D. C.

The committee met, pursuant to recess, at 10 a. m., in room 312, Senate Office Building, Senator Harry F. Byrd presiding.

Present: Senators Byrd, Hoey, Kerr, Taft, Martin, and Williams.

Also present: Elizabeth B. Springer, chief clerk; Colin F. Stam, chief of staff, Joint Committee on Internal Revenue Taxation.

Senator BYRD. The committee will come to order.

Mr. John Canelli.

STATEMENT OF JOHN CANELLI, PRESIDENT, NATIONAL BOWLING COUNCIL

Mr. CANELLI. Good morning, Senator Byrd. Mr. Chairman, we are aware of the work that you have to do. Can we have permission to file our formal brief with the reporter? We will be glad to do so and waive our time for oral presentation.

Senator BYRD. Thank you.

Mr. CANELLI. It has already been filed for your benefit. May I give you and the other members a synopsis of our brief which will help you in understanding it?

Senator BYRD. Yes.

Mr. CANELLI. Thank you.

(The prepared statement referred to follows:)

STATEMENT OF JOHN CANELLI, PRESIDENT, NATIONAL BOWLING COUNCIL, WASHINGTON, D. C.

My name is John Canelli. I am from Toledo, Ohio. I am president of the National Bowling Council, and also president of the American Bowling Congress.

The National Bowling Council is composed of representatives of all of the various bowling groups of the country: The American Bowling Congress, the Woman's International Bowling Congress, the National Duck Pin Bowling Congress, the Allied Candle Pin and Rubberband Pin Associations, etc., representing some 16 million bowlers.

We object to and oppose the proposal of the Secretary of the Treasury, Mr. John W. Snyder, for a 20-percent tax per game on the use of bowling alleys and billiard and pool tables in connection with the enactment of H. R. 4473 known as the Revenue Act of 1951.

Our objections, and the reasoning therefor which follows, were presented to the Committee on Ways and Means of the House, which, after due and thorough consideration, believed our reasoning to be sound and valid, and substituted for the proposed 20-percent tax per game an annual tax increase of $5 per unit to be added to the present annual tax of $20 per alley bed and billiard and pool table.

We object to and oppose the proposed 20 percent tax per game on the use of bowling alleys, billiard and pool tables, the imposition of which would be an outright tax on these 16,000,000 bowlers on what has long been recognized as their necessary physical recreation activities. The proposed tax is the difference between taxing the participant in a recreation or sport instead of taxing the spectator who is being entertained or amused. The proposed tax would also bring about a drastic curtailment in the operation of the facilities needed to be maintained in order that these millions of our citizens can continue to participate in their favorite and beneficial recreation.

Bowling is not a luxury, nor can this proposed tax be in any manner construed as a tax on a luxury article. Bowling is not an amusement. It is a participant recreation, providing valuable and necessary physical recreation for these millions of Americans, and is a valuable part of the employee recreation program of some 20,000 industrial plants, large and small, throughout the Nation. I also wish to add, that 15 percent of the membership of the American Bowling Congress is made up of church and Sunday school leagues, and here in Washington more than 4,000 bowlers from the duckpin group are from the various churches.

Bowling is the poor man's recreation. The income chart submitted by the Secretary of the Treasury, Mr. Snyder, shows that 83 percent of the taxpayers of the country earn less than $5,000 per year. A few years ago the United States Department of Commerce issued a report showing that 77 percent of the wage earners of the country were in the less than $3,000 per year salary bracket. In relative values of today's salary levels and cost of living we are certain that the same percentage still holds. A very careful survey by the national bowling organizations shows that 75 percent of the bowling participants come from these low-income brackets and, as such, are least able to pay the proposed tax.

The proposed tax is discriminatory and grossly unfair, in that it is an unprecedented tax on the participants in a particular recreation and sport. Bowling is one of the greatest, if not the greatest, of participant recreations, and the participants come mostly, as already stated, from the lower income groups with strictly limited amounts of money to spend for recreation. In fact, it is the only sport available to millions who, because of some physical disability, advanced age, or other causes, are unable to take in any other participating recreational sport. It is obvious what will happen if the cost of bowling is increased 20 percent by the addition of the proposed tax. A large number of the bowlers of the Nation, already faced with the burden of increased costs of living and the problem of making both ends meet, will undoubtedly be forced to give up participation entirely. And the majority of the rest will be compelled to curtail their only regular form of exercise and recreation.

As a logical result of this a further, and probably more serious effect of such a tax would be its effect on the average bowling establishment owner. We conscientiously tell you that the imposition of this tax would force thousands of bowling establishments to close. Bowling participation has already sharply declined during the past several years, approximately 20 percent in the past year, due to only one reason—insufficient funds on the part of the participant, occasioned by the continued rise in the cost of living further reducing the amount of money left over from the pay check for recreation and other purposes. This statement of fact of the decline in bowling participation, only too well known to us and the ten thousand-odd bowling proprietors of the Nation, represents a fact that is substantiated by the Secretary of the Treasury's own figure.

By that I mean this: In 1948, when a similar tax of 20 percent was proposed on the cost of bowling, the estimated revenue to be raised by such a tax was listed in the bill then before your committee as $27,000,000. The Secretary of the Treasury now estimates that the selfsame 20-percent tax would bring in a revenue of only $20,000,000, admitting a decline of more than 25 percent in bowling participation. It is also only too well known to us that during the past year bowling establishment after establishment has been striving to keep its doors open hoping for better days. A further reduction in the purchasing power of the participant by the imposition of a 20-percent tax would so reduce participation in bowling that it is certain several thousand establishments would be forced to close, thereby causing both the entire loss of the capital investment of the owner as well as the present means of livelihood. As about 70 percent of the bowling establishments are located in the smaller towns and rural communities, this would deprive a large number of these communities of necessary recreation facilities.

When the proposed 20-percent tax on bowling was before the Congress in 1943, President Truman, then a Member of the Senate, wrote the following, under date of December 1, 1943, to the president of the Bowling Proprietors Association of America, saying: "I agree with you that such a tax would be highly discriminatory against one of our most popular and beneficial recreations and would probably result in many bowling establishments going out of business. It would be an injustice to both proprietors and participants of the game." As far as the statement of Mr. Truman is concerned, definitely the conditions which prompted him to say this in 1943 are not anything but worse, as is proved by the figures of the Secretary of the Treasury in 1943 and those of the present Secretary, which bluntly admit a 25-percent decrease in the volume of business.

In 1943 the Treasury, in connection with a similar 20 percent tax proposal estimated the tax revenue at $27,000,000 for bowling and billiards. Billiards, however, was to be subject to a $20 per table tax, which would result in a revenue of about $2,000,000. It follows that the estimated tax revenue in 1943 for bowling alone was expected to be $2,000,000, thereby indicating a gross volume of business of $125,000,000. In 1951 the Secretary of the Treasury's estimate is $20,000,000 tax income for bowling and billiards combined. Since billiards accounts for about one-third of the total, the Treasury expects about $13,000,000 from bowling, thereby indicating a $65,000,000 gross volume of business for bowling. Despite more bowling alleys in existence than in 1943, the Treasury expects the volume of business to be about one-half of what it was in 1943 (which apparently was arrived at after taking into account the anticipated drop the imposition of this tax would cause).

One would be hard put to it to think of a business that could continue with a 50-percent reduction in its volume. Especially is this so with a business all of whose expenses and charges are fixed and not variable with a decrease in volume of business. That is exactly the kind of business bowling is, with the net result that most establishments, already operating perilously close to the area of red-ink figures, will have to close. In addition to our concern over the serious impact the proposed 20-percent tax will have on the millions of bowlers in drastically curtailing their recreational activities, a further concern here is to see that the bowlers are not deprived of places to bowl by these bowling establishments being forced to close.

May I also point out to the committee that, at present, the Government is collecting $20 tax per bowling lane and billiard and pool table per year, and that there will be no collectible tax at all from the establishments that are forced to close.

May I review the history of this same proposed 20-percent tax on bowling and billiards. Our groups were very negligent back in 1943 when a similar proposal was up for hearing. In our negligence we failed to supply the Committee on Ways and Means of the House with adequate information and the House voted in favor of the tax.

When, later, we did give a more adequate story to the Senate Committee on Finance the 20-percent tax aspect was removed from the bill. The Senate committee voted unanimously against it. Chairman Walter F. George, reporting out the bill, making the following comment: "The House bill shifted the tax on bowling alleys from a flat $10 per alley to 20 percent of the charge. * * * This shift appeared to be unduly burdensome for a participant sport, such as bowling. Further, the tax on a per-game basis would require a great deal of bookkeeping and auditing that would not be required on a flat tax per alley. Hence, your committtee set the bowling alley tax at $20 per alley." and when the matter was referred to the conferees of the House and Senate the House Members accepted the Senate version, with the result that the 20 percent tax on bowling was eliminated entirely, and the $10 per alley bed tax was increased to the now existing $20 per bed levy.

Any tax law must be fair and serve some useful purpose not outweighed by the damage it will do. This tax proposal is unsound and will not serve a useful purpose commensurate with the damage it will do. First, the proposed 20-percent tax on bowling will not stop any inflationary impetus in that the money proposed to be taxed has not caused any inflation in the past, and will not reach any future spending tending to an inflationary impetus, since bowling spent money is not luxury-spent money, but money spent on a necessary and essential participant recreation and sport. Second, and to the contrary, this tax will impede and restrict a necessary recreation pursuit of millions of our citizens, with an anticipated but purely conjectural revenue of $20,000,000 only and if the same volume of bowling continues as anticipated by the Treasury Department, and if all presently operating bowling establishments, billiard rooms, and so forth, are able to remain in business. Isn't it reasonable and sound to expect that, with 20 cents being taken out of the bowling participant's dollar for tax, that he must, of necessity, have 20 cents less from each dollar to spend for bowling which, translated into cold facts, means a further reduction of 20 percent in bowling participation for the proprietor. In the time that has elapsed since the proposal of this tax we have heard from approximately 1,000 proprietors, from every State in the Union, 75 percent of whom have said they would be forced to close if the tax is put into effect.

We submit to the committee that the harm and damage to be done by the imposition of this tax would in no way be compensated for by the amount of good that could be done with such a comparative small amount of money, even if you got it. We respectfully and earnestly urge that the proposed 20 percent tax on bowling, billiards, and pool, as recommended by the Secretary of the Treasury, Mr. Snyder, be rejected and we feel that in the best interests of the important and needed recreation programs for the citizens of our country, in which bowling plays an important and major part, the tax on bowling, billiards, and pool should remain at $20 annually per bowling alley, billiard, and pool table.

Senator BYRD. Mr. Earl E. Raymond?

STATEMENT OF EARL E. RAYMOND, CHAIRMAN, WASHINGTON ACTIVITIES COMMITTEE, TRAILER COACH MANUFACTURING ASSOCIATION AND TRAILER COACH ASSOCIATION (WEST COAST)

Mr. RAYMOND. Mr. Chairman, I have a prepared statement and I will take less than 10 minutes.

May I read it?

Senator BYRD. Yes, go ahead, Mr. Raymond.

Mr. RAYMOND. Mr. Chairman and gentlemen of the committee, my name is Earl Raymond. I am a trailer-coach manufacturer from Saginaw, Mich., and am chairman of the Washington Activities Committee representing the Trailer Coach Manufacturers Association, 20 North Wacker Drive, Chicago, Ill., and the Trailer Coach Association of the West Coast, located in Los Angeles, Calif. These two associations represent approximately 85 percent of the production of the industry.

Our industry is appearing before you today to ask that trailer coaches, which are in reality mobile homes, be exempted from the Federal excise tax.

Since 1941 our product has faced an excise tax of 7 percent. The revenue act of that year uses the word "trailer" in section 3403 (subsec. B) of the Internal Revenue Code. That section pertains to the excise tax imposed upon automobiles and related vehicles.

At the time the act was passed in 1941 there was no question but that a considerable percentage of our production was used for travel and vacation activities.

However, since 1941, the character of the trailer-coach business has changed radically. More and more—and the trend has been accelerated in recent years—trailer coaches have come to be used as mobile homes, used the year round and moved from place to place as circumstances dictate.

A recently completed survey made by Trailer Finance Associates of Grand Rapids, Mich., a leading national trailer coach banking group, showed that about 93 percent of the trailer coaches sold today are used as mobile housing. About 68 percent of the trailers are used by defense workers and approximately 25 percent by military personnel and their families. Of the remaining 7 percent only about 1 percent is used for vacationists, or tourists.

The Trailer Coach Association of the West Coast has made a similar survey and reports almost identical percentages of use.

Added proof that trailer coaches today are being used as mobile homes is found in the type of unit we are constructing. We are following the demands of the customers. So far in 1951, 69 percent of the coaches constructed have been 30 feet, or longer, as compared to only 17 percent in that bracket in 1948. In 1948, 29 percent of those constructed were coaches of 23 feet, or shorter, while that size group has dwindled to 2 percent today.

All coaches constructed today are complete mobile living units equipped with modern kitchens, complete bathroom facilities, and furniture.

The type of coach manufactured when the excise tax was first imposed did not have all this modern equipment.

For illustrations of the modern mobile home trailer coach, I refer you to the attached booklet entitled "Mobile Housing for National Defense."

Since World War II many Government agencies, as well as congressional committees, have recognized and classified trailer coaches as mobile homes. The National Security Resources Board, vitally interested in the defense of our country, made a complete survey of defense housing needs of the Nation. This was done under the supervision of Mr. Ralph Kaul, who, at that time, was Acting Director of the Housing and Community Facilities Division of NSRB. Mr. Kaul is now chairman of the Critical Areas Committee of the Defense Production Administration.

In Mr. Kaul's final report to the NSRB, trailer coaches were definitely classified by him as mobile homes and as a vital and indispensable segment of any emergency housing program.

The Bureau of Standards in the Department of Commerce is currently developing plumbing standards for trailer coaches similar to those applied to permanent type houses.

The United States Public Health Service is developing suggested regulations for the establishment of trailer parking facilities as part of the development of mobile housing.

The Atomic Energy Commission is finding mobile housing a solution to some of its current problems. At its request, since January, our group has had a field staff working closely with the Atomic Energy Commission, the contractor, and State and municipal authorities in planning and developing proper trailer parking facilities for construction workers on the projects in South Carolina and Kentucky.

Recognition for this work has come from Dean Snyder, Deputy Commissioner for Special Services of the Federal Security Agency. Mr. Snyder states in a letter dated May 4, 1951:

> Your organization deserves great credit for the constructive work that you are doing in the Savannah River and Paducah areas.

Just as important, I believe, is recognition by Members of Congress. The Senate Preparedness Subcommittee, of which Senator Lyndon B. Johnson is chairman, in a report on July 19, 1951, recommended that the Department of Defense should—

> immediately initiate, to the fullest extent of its powers and resources, measures to alleviate housing conditions described in this report including:
>
> * * * * * * *

C. The utilization of any vacant or unused property for trailer camps.

That report dwelt on the deplorable housing conditions to which many servicemen and their families are subjected.

The report clearly indicates that trailer coaches, where good trailer parks are available, are a satisfactory answer to the conditions described in the report. In this connection, I have already quoted the recommendation with regard to the utilization of unused space on military reservations for trailer parks.

The report also mentions some substandard trailer parks on private property and justly criticizes them. But the same report clearly indicates that trailer coaches, where good trailer parks are available, are a satisfactory answer to the conditions described therein.

Secretary of the Army Frank Pace, Jr., immediately took cognizance of the report and wrote a letter to Senator Johnson in which he said:

I have directed the commanders of our installations to immediately study the feasibility of using any vacant or unused property for trailer camps.

The very tax bill you are considering recognizes the differences between mobile housing and the automobile industry. The House of Representatives voted to increase the automotive excise tax from 7 to 10 percent but voted to hold the tax on trailer coaches at 7 percent. If the House had not recognized the difference, the tax on trailers also would have been increased.

We feel that the House should have gone further and should have removed the tax on trailer coaches completely. There is no other way than removal of the tax to be fair to the servicemen and defense workers who are using trailers as homes—and almost all trailers sold today are being used as homes. We would like to point out that no excise tax is placed on ordinary type homes, whether luxury type or even vacation cottages. Yet, a burdensome and inequitable tax is placed on those who seek to meet the housing emergency through the use of trailer coaches.

A mistake with regard to trailers during World War II has been corrected. During the war WPB classified our product, so far as material allocation was concerned, in the automotive divisio...

There is no question that such a classification was an error since the automotive division had little to do with housing and the Government during World War II prohibited the manufacture of trailer coaches, except for housing for Government use. A lot of confusion resulted.

Today, trailer coaches are properly classified in the Building Material Division of NPA, and we have been granted specific allocations of critical materials under CMP for mobile housing purposes.

We are not at this time questioning the original action which classified us as an automotive industry but we do feel that an error has been committed in keeping the excise tax on trailer coaches, and we appeal to you to correct that mistake.

The Senate recognized the trailer coach as housing when it passed its defense housing bill, by stating that wherever the words "prefabricated house" are used they shall also apply to "mobile housing." Why then should the prefabricated house be free from a Federal excise tax and the mobile house be taxed when both are "housing"?

Many persons are under the impression that the trailer coach is not taxed other than the Federal excise tax. This presupposes that the trailer coach vanishes after it is purchased.

We would like to point out that virtually all trailer coaches pay a highway vehicle tax; many must pay a personal property tax; some States and municipalities impose a special trailer tax; and almost all trailers are taxed through taxes imposed on trailer parks, either as improved property, or as levies on each trailer site reflected in rentals.

As an association, we want trailers to pay their fair share of State and community taxes, and feel that, in most instances, they are paying taxes commensurate with other housing now. However, this is a State and local problem and has nothing to do with a Federal excise tax which is placed on one type of housing and not on other types.

Not only does discriminatory taxation on trailer coaches affect the individual purchaser but it affects the ability of industry to help solve the defense housing problem.

In the Savannah River area the du Pont Corp., charged with constructing the atomic energy plant there, has requested bids on a vast housing project specifying trailer coaches, or small portable or prefabricated houses. We feel that trailer coaches are the answer to the fundamental housing problem at Aiken. But this discriminatory tax puts the trailer coach manufacturer at a tremendous competitive disadvantage.

There is currently discussion about emergency housing problems in Kansas City, Kans., an area devasted by floods? Some prefabricated house manufacturers have made claims that they can offer housing at a lower cost than trailer coaches. Whether their claims are correct or not is not to be discussed here but my point is that again the trailer coach industry must consider the tax burden before it can even enter bids, if bids are asked for. If the unfortunate flood-stricken families desire to purchase individual mobile housing direct—they again must pay a tax for that privilege.
