In summary, I apologize to my association for not speaking for them, but I believe by the other industry spokesmen the role of the independent producer has been adequately covered.

My grave concern is our overstated, overestimated, overoptimistic estimate of our current actual energy supply situation.

Thank you, sir.

Mr. Engstrand. In the interests of time, since my summary is included in my written statement, I think it would be a little redundant for me to summarize all the points that have been covered by this panel.

In addition to this panel we have another speaker and I am going to ask Dave True to introduce him.

Mr. TRUE. Mr. Chairman, I would like to present as the final member of this group Stark Fox, executive vice president, Independent Oil and Gas Producers of California.

Mr. FOX. Thank you, Dave.

Mr. Chairman, as Mr. True has mentioned, my name is Stark Fox. I am executive vice president of the Independent Oil and Gas Producers of California, which is a consolidation of two independent oil and gas producer associations, both of which date back to the early 1930's.

At the outset we join in the statement of the Independent Petroleum Association of America and with the other statements that have been made here today, and will therefore confine our remarks to a description of conditions among California independents and the impact the proposed tax changes will have upon them.

We are opposed to all changes. Their sum total effect is to lessen the oil industry incentives to find and develop the more than 80 billion barrels of oil needed between now and 1980. The Congress and the administration should be considering ways to add to those incentives rather than reducing them.

In my prepared statement there are statistics which I will not read, but which I assure you support this statement. Conditions in the California oil industry, particularly for the independent, have seriously deteriorated during the past 10 to 12 years. In spite of the obvious deterioration in the independent's position, and in spite of the fact that district 5 does not produce enough oil to fill its own needs, there are those who would further dampen the incentives to explore for and produce oil. They are the ones who would eliminate, reduce or otherwise adjust the depletion provisions in the Internal Revenue Code as well as change other industry tax provisions.

Up to this point they have not succeeded in doing so.

According to press reports, the so-called tax reform bill passed by the House, coupled with the recommendations of the Treasury Department, would burden the oil industry with additional annual Federal taxes of some $600 million. We do not pretend that the ratio of oil production to taxes is direct.

However, using that ratio as a rough guide, the district 5 producing industry's share of that added annual tax load would approximate $84 million per year; based upon its current 14-percent share of national production. We make no effort to determine how much of the added tax burden would fall upon independent and principal minor companies. It would be a significant sum, however, because together they account for 47 percent of all California production and, whatever the amount, it would come directly out of their pockets.

Governor Bartlett stole some of my thunder. I am glad he did. He supports me in saying they cannot pass it on—that is, the independent cannot pass it on—pass on these added costs. They are not integrated companies. They cannot offset a tax increase by charging the ultimate consumer higher prices for their product. They have no ultimate consumer in the classical sense.

It is common knowledge that in the oil-producing industry the buyer and not the seller determines the price that will be paid for crude oil. Hence the producer has no way of shifting the burden of any added expense, be it taxes, higher wages, or any other.

The impact of such added expense is particularly severe for the California producer. California is the only oil-producing region in the Nation where average crude prices today are less than they were in 1959, 10 years ago. They are 4 cents per barrel less than they were then. This is disincentive enough for the California producer, but the tax reform bill passed by the House and Treasury Department recommendations would further curtail his ability to maintain his present none too enviable position.

And why did all this come about? Because of pressures, Treasury Secretary Kennedy is reported as saying. The chairman of the House Committee on Ways and Means was quoted to a similar effect during that committee's deliberations on the bill.

It seems to us that in saying that the recommended changes in Federal oil tax policy, and particularly in the depletion provision, in saying that these changes were brought about by pressures, those who sponsored them or acquiesce in them tacitly admit that no thought has been given to the merits of the case.

The Wall Street Journal supports that opinion. In speaking of the House action on the bill before you, it had this to say, and I quote:

> Everyone is in favor of reform and after more than four decades it is likely that oil taxes could use some of it. Both the Nation and the industry would benefit though from one thoughtful study of the change in its possible impact. But no—

And I am continuing to quote—

> but no, here as elsewhere the tax reformers have simply slashed away and the House has pushed through the whole package without bothering to give it more than a passing glance.

We have tried to give you some idea of the impact of the proposed changes upon the California producer. Our petition to you is simple. We reiterate our opposition to all the proposals and ask only that before you judge because of pressures rather than merits an oil tax policy that has served this Nation for some 43 years you make one thoughtful study of the change and its possible impacts.

Thank you.

The CHAIRMAN. Thank you very much, gentlemen.

Senator HANSEN. Mr. Chairman, may I ask one question?

First, let me acknowledge with my real appreciation the very generous remarks you made, Mr. Murray.

You have testified that the LTP, the limit on tax preferences, will have a very serious impact upon the independents. I would like to ask the panel, and whoever wishes to respond may, will the Treasury proposal, the 60-percent rule, eliminate the independents from the impact that this LTP may have upon the oil industry?

Mr. TRUE. Senator, if I may attempt to answer that, first, no; because, of course, the 60-percent rule does not include depletion.

Secondly, insofar as intangibles are concerned, I know many independents who have associated work, associated income with the production of oil and gas, who would not be covered by the 60-percent rule because 60 percent of their total does not come from as I believe is quoted the sale of oil or gas.

In my own case all of our income except for a few nickels here and there comes from oil-related activities, but because of the experience

I related a little while ago in our exploration program, 60 percent of the total does not come from the sale of oil or gas, and so we will be included, and I know lots of other people such as drilling contractors, pipeline people, oil lease brokers, servicing companies would fall in the same classification.

Senator HANSEN. Mr. Chairman, I have further questions but I do want to congratulate these fine gentlemen on their excellent presentation. I believe that their successful testimony exhibits their keen knowledge in this area.

Mr. MURRAY. May we express to you, Senator, our appreciation for your leadership, knowledge, and ability.

Senator MILLER. Mr. True, I want to thank you for an excellent presentation. For a long time I have been very much opposed to any tampering with the intangible drilling and development costs. I have engaged in a good many debates over the years opposing tampering with the intangible drilling costs. I should like to forget about the rest of the bill and concentrate on percentage depletion. I have also stated publicly that I do not approve the meat-axe approach in cutting back on depletion. But the thrust of your testimony this morning emphasized the need to increase our reserves to meet our requirements in the future. The chart you had before the committee emphasized that we have to meet it, and in effect, I think your testimony was to the effect that if you want us to achieve those national objectives, leave us alone. In addition, Mr. Cleary talked about the apple tree and the necessity of setting aside some seed. If the seed is used for more apple trees and is used to go ahead and develop their drilling and expanding their resources, that is one thing. If not, that is another thing.

I must say that if we have two companies and one company has $100,000 of percentage depletion seed money and uses that seed money and another company has that seed money and doesn't use it, then there should be some difference in treatment.

What the House has done is they have said to both of these companies, each with $100,000 of percentage depletion, treat them both the same—and this troubles me very much.

Mr. MURRAY. Mr. Chairman, I would like to present another philosophy of the depletion allowance which we refer to as an incentive, the jackpot. The slot machine at Las Vegas is there as an incentive. The game is played by gamblers although they know the odds are against them but because the jackpot is there they are willing to play. If you happen to hit the jackpot, you can keep it, but although they usually put it back in. I think they do plow it back and want to plow it back. However, if you told them they had to plow it back, and there was a sign on the machine saying, "anyone who hits the jackpot must put it back in the slot machine then you destroy the incentive when you tell them so. The plowback destroys much of the illusions of the incentive.

Senator MILLER. I think you have a point, but I don't think your example quite fits. Testimony says we are going to plow it back in. A slot machine operator doesn't go and say no matter what happens, I will plow it back in. With respect to your point about the disincentive this gets you down to what might be done in giving some relative—or attaching some relative—importance to plow back. One approach could be to say, "we take the House-passed percentage depletion rates, but if there is plow back, then we will keep the old rates. That would be one example so that there is still some incentive but if you want to keep your old rates of 27½ percent, then you have to have plow backs. You can keep the extra 7½ percent that you still plow back. Have a 2-year plow back, that would mean that one-fifth of your percentage depletion had not been plowed back. One fifth of the 7½ percent extra would not be allowed. This is a much more refined approach. It fits with your testimony. That is what I am trying to come up with. If you have $100,000 depletion and he plows it all back in, I can't see why you should be treated identically, if you want to take the 20-percent depletion. If you want 27½ percent, plow it back; if you don't want it, then plow half of it back. Now I'd like to discuss percentage depletion because I am opposed to monkeying with intangibles.

Forget about the rest of the provisions in the bill. I would guess that a great many members of the committee opposed—put percentage depletion in perspective. I think they are advocating a meat-axe approach. I can't see treating the two examples identically. Try using your analogy of the seed money. I think that there is a strong feeling on the part of many people that there is some abuse in the petroleum industry. Most people who complain about it don't know beans about it. I know some people who are fairly familiar with the subject, and they think there are some abuses and should be some differences in treatment. I am trying to satisfy that feeling so that you can see we are not treating everyone alike in the petroleum industry. Consumers of this country are treated a little better.

Mr. HINTON. A pipeline producer that produces a portion of its own natural gas has been required to pass on its own depletion to consumers who have obtained the benefit of that depletion. The pipeline producers have gone out of business because of the result of the removal of the incentive.

Senator MILLER. I think we received testimony earlier today that if the 27½ percent depletion rate were cut to 20 percent, it would reduce exploration and development by 20 percent. I suggest to you most respectively that if this were reduced from 27½ to 20 percent for those who do use the seed money and kept it at 27½ percent for those who don't drill up their percentage depletion the results you mention are not in the ball park.

Mr. HINTON. If the pipeline producers of natural gas had the option to utilize that money to drill instead of it being passed on, then they would continue to drill.

Senator MILLER. If they had had the plowback alternative, they would still be in business.

Mr. SCHWINN. Of course, some companies would be making studies for possible lease blocks or exploratory work but they would be harshly penalized if they lost their depletion during this period.

Senator MILLER. This is why I have suggested the 2-year period for plowback. I don't know what is wrong with the 2-year plowback. It would meet none of those problems you mention.

Mr. MARTIN. I am sorry to be so presumptuous. I just want to raise a couple of questions. First, in the area of application of the depletion—it varies from 27½ percent down to zero and is computed on a property-by-property basis. Second, since it was pointed out in the testimony that investors from outside of the industry participate in drilling ventures would people in these categories have the same treatment?

Senator MILLER. The doctor who would like to get into a venture—if he gets the check at the end of the year, he is very happy. When he gets a big check at the end of the year, he is happy. Before he goes into it $2,500 of which $2,500 is percentage depletion if you don't want to pay tax on it, that might be a disincentive. On the other hand, it could be an incentive for him to go into another venture. Let him say that 20 percent is percentage depletion. You have the incentive, but you recognize the principle I am striving for. Using the seed money.

Mr. FOX. It is perfectly true under the conditions you have set forth that one company might take his $100,000 worth of depletion allowance and not use that allowance to explore for future oil supplies; but on the other hand, the present 27½ percent depletion allowance not reduced at all does not generate enough capital that the industry, as an industry needs to have. The entire industry retains, through the depletion allowance, something like $1½ billion. And then its entire exploration expenditures are something like $4 billion.

Mr. MURRAY. The point is that other industry people spend more money than they receive from depletion trying to explore and develop new supplies. Your suggestion certainly would not reduce the retention of funds as much as the House meat-axe approach would do, but it would do so to some extent.

Senator MILLER. I would expect a relatively minor effect, but there are some abuses involved. Unsophisticated constituents. But if I get a question, "Are you going to treat one the same as the other?" Then, I can look them in the eye and say there should be some incentive.

Keep the new House rates, but if you want the old House rates——

Mr. MURRAY. We are not in a position to say that we don't think that everything that now exists is not only deserved but needed—90-year old man do the best you can. If we were given 20 percent plus 7½ percent more if it is plowed back in, we say that is much better than 20 percent across the board. We must face reality. However, the full 27½ percent and more is much needed. We realize the need for the producer to provide a justifiable position. We think that what we have and more is necessary.

Senator MILLER. Let me say that I have no clients, there is no oil industry in my State. I had become interested when—and knew something about it because I have been opposed to a meat-ax approach. I have been questioned on my position, and it is too bad but they don't know what they are talking about. At the same time, I must tell you that a great many people have a feeling that there is something here that ought to be changed. Are we going to change it by a meat-ax approach or by a way which will enable us to say we are not treating everyone alike to fit with our national objectives. I think if we could do something like this it would be good for everyone.

Mr. HINTON. What would happen, then, to the funds that would be raised for drilling from the outside investor. Would he then get his depletion for 27½ percent on the first year and then if he didn't plow it back in, he would be cut back to 20 percent.

Senator MILLER. I think we are getting down to mechanics. For example, let's take the doctor. He puts in $2,000 in the venture and the venture is successful. If not, he writes it off. In comes a check for $2,500 of which $500 is percentage depletion and you don't have to pay tax on it. Now, he has 2 years from that year to take that $500 and go into another venture. The following year in comes another check for $500. If he doesn't put it back in, then he will have to pay a tax. He will have one-fifth less than the 7½ percentage difference; $500 percentage depletion. Computed at the rate he pays $2,000 on the regular income. $500 is percentage depletion at 27½ percent. If he doesn't plow it back in, then under the suggested approach, he would have a portion of that reduction (reduced), would only be allowed 20 percent for depletion.

Mr. FOX. Ultimately, this original $2,500 income that he gets from his $2,000 investment, $500 is nontaxable because of depletion. That is a single venture, and it is completed. It is whole. Because he invested his money in exploration and because it was successful, he gets 27½ percent. What happens if he does not reinvest his depletion in future years?

Senator MILLER. He would continue to receive the House rate. He would have 27½ percentage depletion for 2 years, but if at the end of that 2-year period he has not plowed it back in, then he is going to have to pay tax on $100 because 20 percent is the basic rate.

Mr. MCKEITHAN. Under this concept, most of the independents get 20 percent or less than that because of the 50-percent net limitation, so in order to raise these funds, do you think the 50-percent limitation could be increased to make more money available for drilling?

Senator MILLER. I want to concentrate on the 27½-percent depletion rate. It may be that there are some other facets to this. On that point, I don't know what the Treasury estimates will be.

Mr. MCKEITHAN. We always have to deal with our landowners. Under this method they would be getting 20 percent depletion and if those of us who drill had the 50-percent limitation raised, we might approximate the 27½ percent and thus the landowner would start asking more from us in the way of bonuses, and so forth, for the right to lease his land.

Senator MILLER. I would suggest that it might be rather minimal.

Mr. SCHWINN. What about a one-time investor who invests because he had a windfall. He had excess capital at the time he would like to invest.

Senator MILLER. He would have to live with the 20 percent because he is not carrying out the seed rule.

Mr. SCHWINN. Suppose he invests a small amount regularly because of sales in assets or settlements.

Senator MILLER. I don't want final judgments. You people are the experts. All of us have been concerned about our national objectives. We also have a problem with the general taxpayer. That is what this tax reform bill is all about. A response to what some people term as a taxpayers' revolt. To the extent we can satisfy both, I think we will be a lot better off. The implication has been made that perhaps there should be a 30-percent depletion. I suppose you could make an argument for that.

Mr. TRUE. I think this is a matter of degree. Where is the return of capital concept of the original discovery value depletion concept in your overall plowback suggestion or are you just considering the taxpayer revolt?

Senator MILLER. Are you talking about permitting of the cost depletion first?

Mr. TRUE. No, the original depletion concept was based on discovery value, which was an assigned capital value to the discovery. Based entirely on the concept that it was a recovery of capital and that capital should not be taxed. Are you discounting this principle completely, or are you figuring that reduced percentage depletion takes care of it?

Senator MILLER. I think they could have set it up at 30, 25 percent, could have set it up at any figure. But the big hue and cry is that someone—expenditure in $5,000 for an oil property and after maybe 3 years, he has this go on forever. The reason it goes on forever is for the incentive to plant the seed. You can make an argument that it is sort of a reward to agree with you that it is a matter of degree. We have national objectives to satisfy.

Mr. TRUE. I know several people in my area who have made a lifetime business of accumulating royalties to retire on. They have a modest retirement fixed but inflation is claiming 25 percent.

Senator MILLER. If they are down in a lower income bracket, there are other aspects of the tax reform bill which will help. They will be getting a 5-percent reduction—according to the Treasury approach—and they will have relief. I am concerned about people who are retired especically low- and middle-income areas.

Mr. TRUE. These people are living on a declining dollar income.

Senator MILLER. The difference might not be too bad.

Mr. TRUE. Twenty-seven and one-half percent of their additional income is untaxed.

Senator MILLER. As against 20 percent, under the House bill. Percentages can destroy the real picture. But I think we had better wind this up. If any of you have any ideas on how this might be refined, I think the committee would welcome it. I know I would. Thank you.

(The prepared statements of the previous witnesses follow. Oral testimony of the next witness commences at page 4554.)

STATEMENT OF H. A. TRUE, JR., TRUE OIL CO., CASPER, WYO., ON BEHALF OF THE INDEPENDENT PETROLEUM ASSOCIATION OF AMERICA

SUMMARY

1. A healthy, expanding domestic industry has provided the assurance of adequate supplies of both oil and natural gas, and this would be the best assurance for the future.
2. The efficiency of the domestic industry has provided petroleum energy (the producer's average price of both oil and natural gas combined) at a cost of less than $1.90 per barrel as compared with over $2.00 per barrel for imported oil.
3. The domestic industry's activities in searching for and developing U.S. petroleum resources have declined to inadequate levels, imperilling the Nation's economic progress and future security. Assurance of adequate oil and gas supplies to meet future requirements requires much more—not less—domestic exploration and drilling.

4. Proposed changes in petroleum tax provisions would decrease substantially the funds available for exploration and drilling, and sharply reduce the incentive to invest capital in this high-risk business.

5. If proposed tax changes were approved, total expenditures for U.S. exploration and development would decline to only $2.4 billion by 1980, compared with a required expenditure of $8.3 billion—a defficiency of $5.9 billion yearly or more than 70 percent.

6. These tax changes would have a devastating effect on independent producers, many if not most of whom would be forced to liquidate their properties and discontinue exploration and drilling. Competition and the multiplicity of effort that has been a key factor in discovery of new reserves would be seriously lessened.

7. The resulting 1980 deficiency in U.S. crude oil production would result in the U.S. being dependent on foreign sources for over 50 percent of the Nation's requirements—an intolerable situation from the standpoint of national security.

8. The search for new reserves of oil and natural gas is interrelated and inseparable. Natural gas is already in short supply and the proposed changes in tax provisions would aggravate and intensify the existing critical situation as to gas supplies.

9. To offset the effect of proposed tax changes and assure adequate supplies of both oil and gas, the alternative would be increased prices that would cost the consuming public in the order of $10 billion yearly by 1980.

10. Governmental decisions as to federal tax provisions and import policies will determine whether the historical position of U.S. self-sufficiency in indispensible petroleum supplies will be preserved; or whether the U.S. will embark on a course knowingly leading to insufficiency and dangerous dependency on foreign sources.

STATEMENT

My name is H. A. True, Jr., and I am an independent producer, operating the True Oil Company, a partnership in Casper, Wyoming. I am a former President of the Independent Petroleum Association of America, and my testimony is presented on behalf of that Association.

The IPAA is composed of some 5,000 members whose business interests are primarily, and in most cases, exclusively, the domestic petroleum producing industry throughout the 32 producing states of this Nation. I appear before your Committee, therefore, to discuss proposed tax changes and their effect on the domestic industry in general, and the independent producer in particular.

Consideration of this matter should be predicated on the following fundamental premises:

(1) Adequate and steadily increasing supplies of both oil and natural gas, from assured sources, are indispensible in meeting the needs of the consuming public, the country's economic progress and the survival of not only the United States but also the Free World.

(2) A healthy, expanding domestic industry has provided the assurance that adequate supplies are available in both peacetime and times of emergency; and must continue to do so in the future.

Existing tax provisions and other sound governmental policies, such as the Mandatory Oil Import Program, have served the public interest well. The domestic industry has supplied sufficient petroleum at relatively low prices to meet consumer peacetime requirements; to fuel two World Wars; to block aggression in several lesser wars; and to prevent wars that might have exploded during such times as the 1956–57 Suez Crisis and the 1967 Middle East dispute.

For the foreseeable future, there is no practical, dependable or economic alternative to an expanding domestic industry. The life of our country could not tolerate the denial of petroleum energy any more than the lives of our citizens could survive the denial of food.

Trends in recent years, unfortunately, imperil the Nation's strength as to oil and gas supplies. These changing conditions are set forth in the memorandum attached to my testimony. These facts must be taken into account in considering petroleum tax provisions. They show that the industry's activities in searching for and developing the petroleum resources of the Unitied States have declined to inadequate levels.

These trends are reason for concern, but not pessimism. They can and must be reversed in order to assure adequate U.S. petroleum supplies. A healthy economic climate, in which adequate incentives exist for vigorous and expanding petroleum exploration and development, can and must be restored. During the past two years, there has been some upturn in the industry and, under sound governmental policies, domestic producers can and will continue to supply the oil and gas requirements of this Nation.

However, we are now at the cross roads. The Congress is con ring major changes of the industry's tax treatment and the Executive Br n of government is currently making an extensive study of the Mandatory Oil Import Program. Decisions with respect to both of these matters will determine, to a very large degree, whether our nation will continue to be self-sufficient in petroleum. Or whether, for the first time in our history, we will knowingly embark on a course leading to a position of insufficiency and greater dependency on foreign sources.

Proposed Tax Changes

Petroleum tax provisions should be looked upon first as a resource policy and secondarily as a tax issue. We have, therefore, made an evaluation of the long-range impacts of proposed changes in tax policy on the development of domestic petroleum resources, in the hope that such an analysis will be helpful to your deliberations.

Certain tax proposals (such as extension of the surtax, repeal of the investment tax credit, and the change in the treatment of capital gains) would adversely affect all businesses, including the petroleum industry. Additional proposed changes in federal tax provisions directly affecting U.S. oil and gas supplies include:

(1) The changes incorporated in the "Tax Reform Act of 1969," as passed by the House: the reduction in percentage depletion from 27½ to 20 percent which would reduce substantially the funds and incentives for the entire industry; the treatment of production payments as loans which would have the practical effect of eliminating the use of this method of financing for independent producers; and the allocation of deductions which could make percentage depletion and intangible drilling cost deductions less effective for individuals.

(2) The additional changes recommended to your Committee by the Treasury Department: the further reduction in percentage depletion for individual operators by inclusion of depletion as a "tax preference"; the limitation on expensing of intangible, or non-recoverable, expenditures by inclusion as a "tax preference" for individual operators that obtain less than 60 percent of gross income from "the sale of oil and gas"; and the taxation as ordinary income, under a "recapture rule," on the sale of oil or gas properties to the extent of intangible drilling costs previously deducted. Individual, independent producers would bear the primary and damaging burden of these changes.

The above tax changes would substantially decrease the funds actually available for domestic exploration and development. In addition, and perhaps of equal or greater significance, these tax changes unquestionably would have the psychological effect of further substantial reductions in the incentive to invest capital in the high-risk business of oil and gas exploration. I am convinced that the mere consideration of these changes has already had the psychological effect of discouraging investments. In my own case, their adoption would put me out of the business of exploration and development.

Including depletion and/or intangible expenses in any "Limitation on Tax Preferences" (LTP) would have a crippling impact on the operations of independent producers. For example, we made a study of the effects of the Treasury Department's LTP proposals to the House Ways and Means Committee, covering the operations of 56 independent producers. This study revealed that the proposed tax change would have had the effect of reducing the drilling expenditures of these producers by 75 percent. The resulting loss in oil and gas supplies would far outweigh any temporary gains in tax revenues.

The LTP proposal, the allocation of deductions, or any other form of the minimum tax concept, should not treat "Intangible Drilling Costs" (IDC) as a "preference." Intangible drilling costs are ordinary business expenses, paid in cash by the oil producer. The current expensing of IDC, does not permit a taxpayer to conclude the year with untaxed funds on hand. To the contrary, it merely permits the taxpayer to make a deduction for money actually spent—not income. It is entirely inappropriate, therefore, to include this item in any type of minimum tax proposal.

Likewise, with respect to depletion, it is submitted that it is also inappropriate for this item to be included in the LTP proposal or any other minimum tax proposal. Percentage depletion cannot exceed 50 percent of net income from any property. The present law, therefore, already has embedded within it the minimum tax concept.

In addition to the tax changes approved by the House and recommended to your Committee by the Treasury Department, there are other proposals which are of great concern to the domestic petroleum industry. These include a graduated scale for depletion based on the amount of gross income; a limitation on depletion based on the amount "plowed-back" into exploration and development; and a requirement that intangible drilling costs be capitalized and written off over a period of years. Each of these proposals would have serious adverse impacts on U.S. oil and gas supplies, and would compound the unhealthy effects of the other proposed changes.

It should be recognized that the changes in tax provisions affecting U.S. oil and gas production, now being considered by your Committee, are in conflict with the recently-announced national security position of the Department of Defense that "U.S. domestic petroleum capability *must be available* to meet military needs in case normal foreign sources are denied." (underscoring added)

They are in conflict with the statements by the Interior Department and the Federal Power Commission that there are already actual shortages of natural gas and a real danger of inadequate U.S. supplies of oil.

They prejudge the findings of a study now in progress by a special Cabinet Task Force which has not yet determined our security needs as to oil supplies.

They are in conflict with the interests of the consuming public because the inevitable result would be less oil and gas, or higher prices, or both.

They are in conflict with the welfare of thousands of communities in 32 producing states, whose tax revenues and economic structure are dependent on oil and gas production.

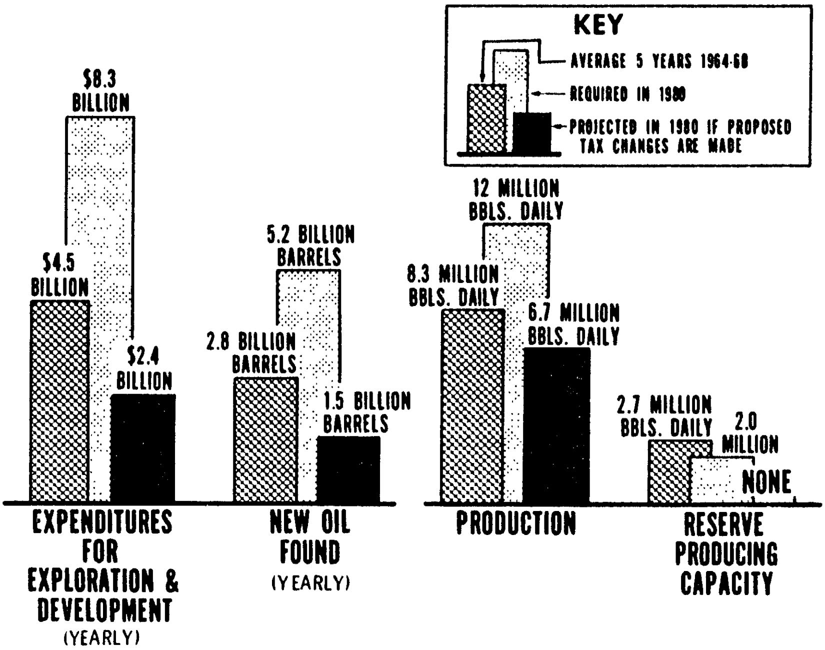
National security, economic progress and the interests of U.S. consumers would be served best by rejecting all proposed adverse changes in oil and gas tax provisions.

Effect of Tax Proposals on Future U.S. Crude Oil Supply

In assessing the effect of the House-approved and Treasury-proposed tax changes on domestic crude oil supplies, we have used the findings of a comprehensive study submitted by the IPAA on July 15, 1969, to the Cabinet Task Force on Oil Import Control. That study showed that total U.S. requirements for petroleum liquids would increase from an average of 12,100,000 barrels daily during the past five years to 18,200,000 barrels per day in 1980, an increase of 50 percent. Imports of foreign oil now supply more than one-fifth of total U.S. oil consumption. To assure adequate domestic supplies, without dangerous increased dependency of foreign sources, the IPAA estimates of oil supplies in 1980 are as follows:

	1980 supply (barrels daily)
U.S. crude oil production	12,000,000
U.S. natural gas liquid production	2,500,000
Imports of crude and products	3,700,000
Total required supply	18,200,000

U. S. CRUDE OIL SUPPLY



This analysis shows that, if these tax provisions were changed, expenditures and supplies would be reduced substantially below current levels, and drastically less than required to provide assurance of adequate supplies to meet the needs of the consuming public, economic growth and national security. A few comments on these figures are in order.

First, total expenditures for U.S. exploration and development would decline by about $2 billion or 47 percent from the level of the past five years. Expenditures in 1980 would total only $2.4 billion, compared with a required expenditure of $8.3 billion; a deficiency of $5.9 billion or more than 70 percent.

Second, and not shown on the table or chart, it is significant to note that, during the latest five year period 1964 through 1968, exploration and development expenditures by independent producers averaged $1.3 billion annually, or about 30 percent of the $4.5 billion expended by the domestic industry. Expenditures by independent producers in 1980 are estimated at less than $500 million, a decrease of 70 percent from the average expenditures during the last five years—a far greater decline than the 47 percent decrease in total industry expenditures. This results from the fact, which should be re-emphasized, that the primary impact of the tax proposals would be on independent producers.

Many, if not most, independent producers would be forced to liquidate their properties and discontinue exploration and development activities. Competition in the domestic producing industry, and the multiplicity of effort that has been a key factor in the discovery of new reserves, would be seriously reduced.

Third, the 1980 deficiency in crude oil production of 5,300,000 barrels daily would have to be imported. Under these conditions, imports would supply about 50 percent of total U.S. oil requirements, with no U.S. reserve producing capacity. This would be an intolerable situation from the standpoint of both national security and the maintenance of peace in the Free World. Russia would be the only major world power in a position of self-sufficiency as to essential petroleum supplies. The United States would have lost its posture of strength in petroleum, and would become subject to the political pressures and demands of producing countries in the Eastern Hemisphere.

In this connection, the September 8, 1969 editorial in The Financial Times of London, England is highly pertinent. That editorial deals with the change in government in Libya and includes the following conclusions:

"The oil has also continued to flow. It is to be hoped that this state of affairs continues. However, the coup has once again demonstrated the fundamental instability and political unreliability of the countries on which Britain and most of the rest of the industrialised world, *apart from the U.S.*, depend for their oil." (italic added)

* * * * * * *

"Security of supply should be given a higher priority than cheapness. In the short run this means that no one country should be allowed to secure a dominant position among Britain's suppliers. In the longer run it may mean that if relatively expensive oil is discovered either in Europe's offshore water or elsewhere—the Canadian Arctic, for instance—is a politically secure country, it should be exploited to our advantage if at all possible, even if it is more expensive than oil from the Middle East and North Africa."

This statement is evidence of the fact that all industrialized foreign countries, including Russia, are directing their policies toward greater assurance of access to essential petroleum supplies. It would be ironic and tragic, indeed, if the United States were to adopt policies that would undermine our capacity to produce crude oil and natural gas.

In discussing petroleum policies, natural gas is too often overlooked. Gas accounts for over 50 percent of the total energy supplied by the domestic petroleum industry. The function of finding oil and natural gas is interrelated and generally inseparable. A reduction in exploration means less oil and less gas.

Unfortunately, unrealistic and short-sighted regulation by the Federal Power Commission has already created a gas shortage. The ratio of proved reserves to production has been declining steadily and substantially. Last year, production outstripped additions to reserves for the first time. Large distributors are already informing customers that supplies are inadequate. Recently, the Federal Power Commission Chairman warned that the nation faces a "critical" supply situation, and the F.P.C.'s "overriding priority" is "to resolve the natural gas supply problem on both a short- and long-term basis."

Adverse tax changes would have only one result: aggravation and intensification of the already critical supply situation as to U.S. supplies of natural gas. In this connection, it should be noted that the domestic producer's price of crude oil and natural gas, converting gas to oil equivalent on a Btu basis, averaged $1.86 per barrel in 1968. This compares with a cost of over $2.00 per barrel for imported oil. The domestic industry, therefore, provides petroleum energy to the American consumer efficiently and at relatively low prices. Aside from the factor of national security—and the term is used in the broadest sense to include economic and political as well as military security—there would be no saving to the U.S. consumer from the importation of foreign petroleum energy.

The consumer would be the ultimate victim of the proposed tax changes. To offset these tax changes and assure adequate domestic supplies of both oil and gas, the alternative would be increased prices. The cost to the consuming public could be in the order of $10 billion yearly by 1980.

Other Effects of Proposed Tax Changes on U.S. Economy

The projected decreases in U.S. expenditures for oil and gas exploration and development and the resulting decreases in U.S. petroleum reserves and production, have far-reaching implications extending throughout the U.S. economy. Some of the more important of these include:

(1) Losses in local and state production taxes

(2) Losses in royalties to Federal and State governments and private landowners

(3) Losses in wages to employees in the domestic producing industry.

(4) Losses in income to manufacturers, suppliers, servicing companies and other allied businesses

(5) Losses in federal income taxes from the above reductions in activity

These losses would aggregate several billion dollars annually. In addition, the increase in imports by 1980 would result in an additional outflow of dollars amounting to over $5 billion annually, thereby seriously aggravating our balance of payments problem.

Conclusions

In conclusion, your Committee is respectfully urged to consider the following:

A. The assurance of adequate U.S. supplies of oil and natural gas requires much more—not less—exploration and drilling by the domestic producing industry.

B. The encouragement and effectiveness of national petroleum policies, particularly federal tax provisions and the Mandatory Oil Import Program, should be improved—not weakened.

C. Under sound national policies, the consumer has enjoyed the benefits of the domestic industry's established record of efficient performance, as evidenced by the fact that the price of U.S. petroleum energy (the average producer's price of crude oil and natural gas combined) is less than the cost of imported oil.

D. Unless prices were increased very substantially, proposed tax changes would result in greatly reduced U.S. oil and gas exploration, development, production, reserves and producing capacity. Resulting dependency on foreign sources would increase to intolerable and dangerous levels, with no reserve domestic capabilities.

E. The independent producer, who has played a vital role in discovering new domestic oil and gas supplies, would become a negligible factor in the U.S. producing industry's operations.

The Nation's posture as to petroleum supplies is at a cross roads. Governmental decisions as to tax provisions and import policies will determine whether the historical position of self-sufficiency will be preserved; or whether we pursue a course leading to insufficiency and dependency on unreliable foreign sources of supply.

MEMORANDUM ON TRENDS IN U.S. PETROLEUM PRODUCING INDUSTRY

(Supplement to statement of H. A. True, Jr., on behalf of the Independent Petroleum Association of America before the Senate Committee on Finance October 1, 1969)

The purpose of this memorandum is to present briefly certain facts, relating to economic conditions in the U.S. petroleum producing industry, that should be considered in reviewing national tax policies as to oil and gas.

Trends in recent years, unfortunately, imperil the Nation's strength as to oil and gas supplies. It is these changing conditions that should be taken into account in considering petroleum tax provisions. The changes in economic conditions are summarized in the form of graphic charts. The charts picture trends in the domestic producing industry since 1956. The industry's activities in searching for and developing the petroleum resources of the United States reached a peak in 1956. The subsequent years have been characterized by:

1. A sharp decline in the search for new U.S. reserves
2. A substantial drop in total drilling activity and employment
3. A steady deterioration in economic conditions affecting domestic producers
4. A weakening of our security posture as to U.S. oil supplies to meet emergencies in the future.

These trends are reason for concern, but not pessimism. They can and must be reversed in order to assure adequate U.S. petroleum supplies. A healthy economic climate, in which adequate incentives will exist for vigorous and expanding petroleum exploration and development, can and must be restored. Under sound governmental policies and favorable economic conditions, domestic producers can and will continue to supply the oil and gas requirements of this Nation.

DECLINING SEARCH FOR U.S. OIL AND GAS RESERVES

The discovery of new reserves, to replace those being consumed, is the foremost and all-important function of the producing industry. Development wells, pipelines, refineries and distribution facilities depend on sufficient new petroleum discoveries to meet increasing requirements.

First Chart

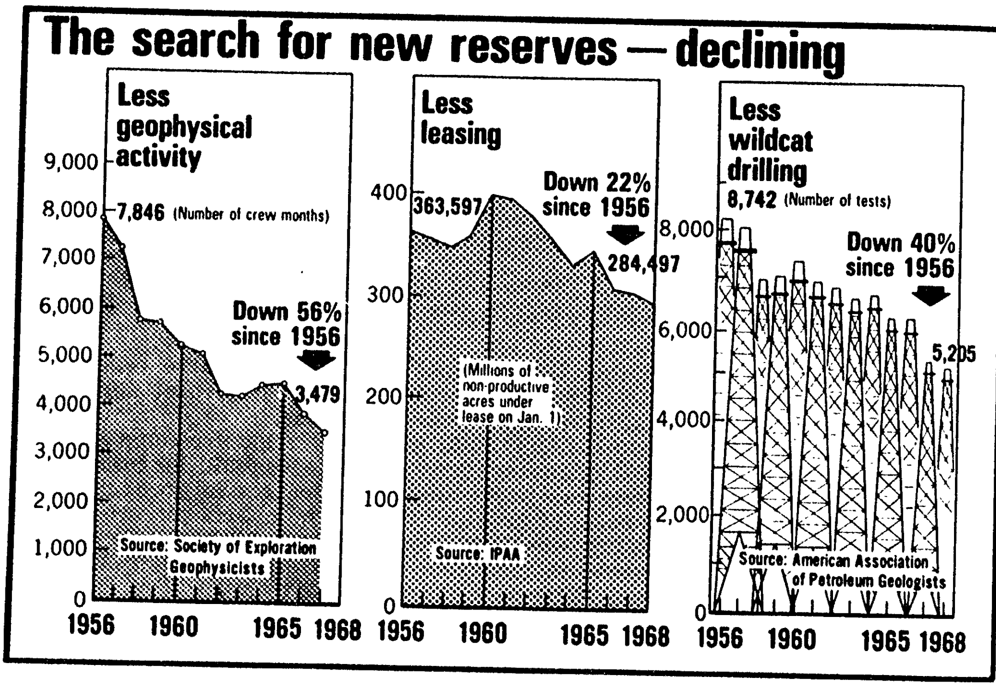
The three sections of the first chart portray essential elements in the search for new reserves: first, the scientific techniques used as guides to possible future producing provinces (as indicated on the chart by the activity of geophysical crews); second, the leasing of acreage not yet productive; and third, the final drilling of wildcat tests, which is the only known method of actually determining whether or not a productive deposit of oil or gas exists.

Obviously, there has been a persistent and sizable decline in all these exploratory activities which has been offset, but only in part, by advances in scientific and technological methods and increased expenditures in such new high-cost provinces as the continental shelf.

Geophysical work, expressed in terms of crew months, has dropped from 7,846 in 1956 to 3,479 in 1967 (the latest year for which data are available). This is a decline of more than 50 percent.

The decrease in advance scientific testing has been followed by a 22 percent decrease in the total non-productive acres under lease in the United States. Almost 80,000,000 fewer acres were under lease in 1968 as compared with 1956.

The effect of declining geophysical activity and reduced leasing are shown in the third section of the chart. The number of wildcat tests drilled in the United States fell from over 8,700 in 1956 to 5,200 in 1968, a drastic reduction of 40 percent.



DECLINING ACTIVITY IN DOMESTIC PRODUCING INDUSTRY

The deteriorating economic conditions responsible for the declining research for new reserves have also been a factor in the shrinkage in the overall activities of the domestic producing industry, as pictured on the next chart.

Second Chart

The total number of active rotary drilling rigs has been more than cut in half—from 2,600 in 1956 to less than 1,200 in 1968. These figures tell only a part of the story. More important than the statistics, equipment has been cannibalized and highly trained employees have left the industry for better opportunities. Today, there is a very critical manpower shortage in the drilling segment of the industry. It is real, and it must be corrected.

The decrease in active rotary rigs has been accompanied by fewer total wells drilled—a drop of more than 25,000 wells, or over 40 percent since 1956.

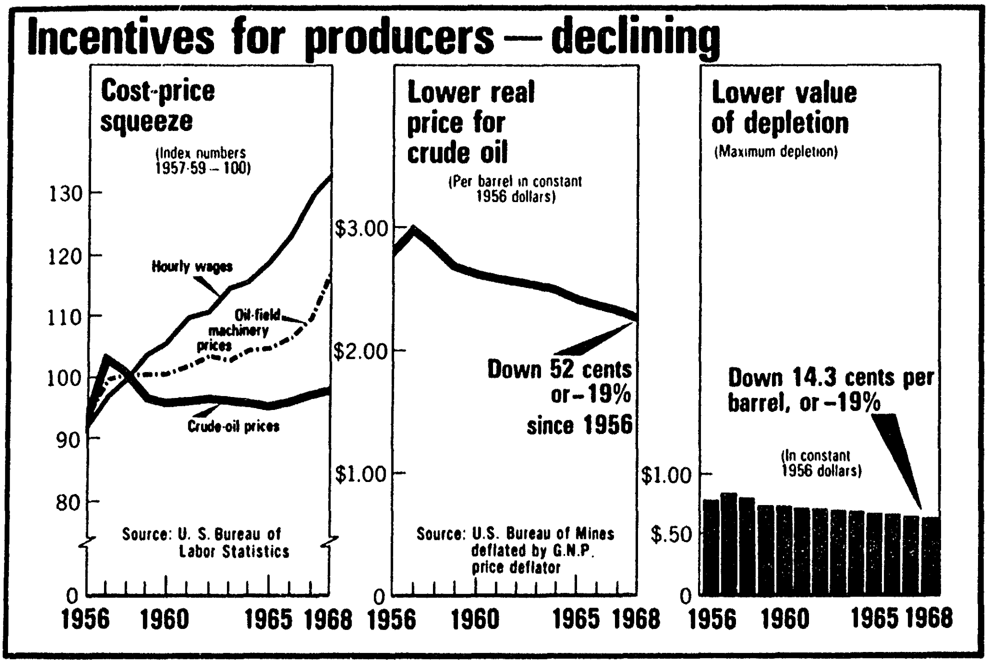
Reference has already been made to the critical manpower shortage in trained employees operating drilling rigs. For the producing industry as a whole, total employment has suffered a decrease of more than 60,000 workers, or almost 20 percent since 1956.

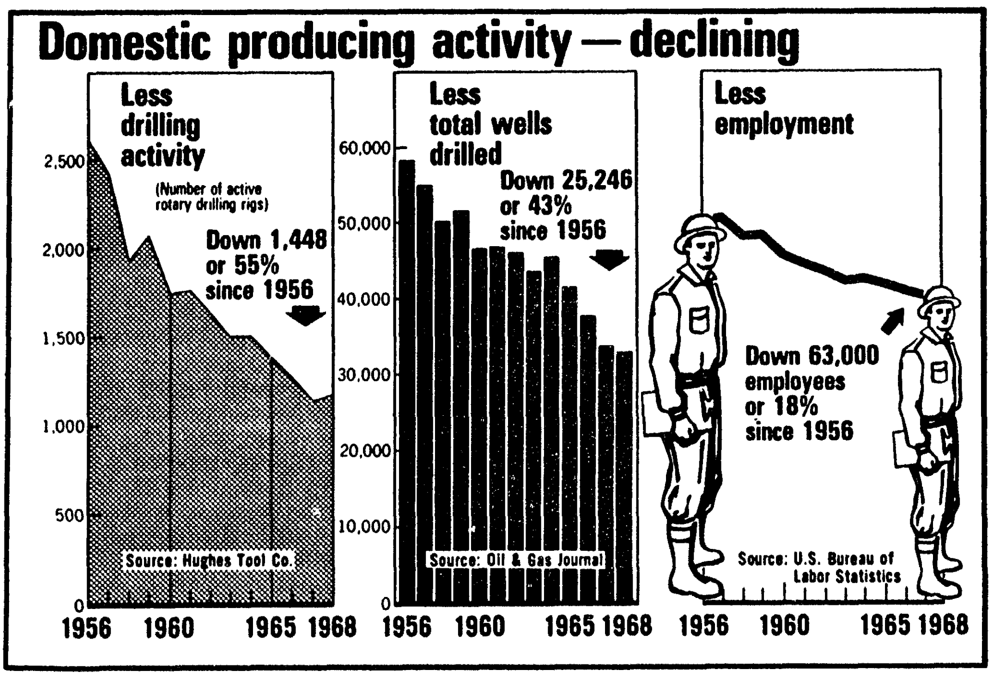
It should be recognized that part of these decreases can be attributed to wider well spacing and increased efficiencies in all phases of drilling and producing operations.

DECLINING INCENTIVES FOR DOMESTIC PRODUCERS

Third Chart

The declining research for U.S. oil and gas reserves and the declining overall activities of the domestic producing industry, set forth in the first two charts, can be attributed to decreasing attractiveness of capital investments in these unusually high-risk ventures. To re-emphasize the degree of risk, only 2 out of every 100 new field wildcats drilled are likely to find large enough to be profitable.





The industry has been caught in a closing vise known as the cost-price squeeze. Since the base period 1957–59, used by the Government in measuring price and cost trends, hourly wages in the industry have increased by more than 30 percent. The cost of oil field machinery has risen by over 15 percent. The average cost of drilling and equipping new wells (not shown on the chart) increased by almost 20 percent in the short period from 1964 to 1967. Inexorably the search for and development of new reserves grows deeper, more difficult and more costly—despite technological advances that have moderated, but not offset these increased costs.

In contrast, the price of crude oil has remained below the 1957–59 level. The average price in 1968 was 2 percent *less* than the 1957–59 price, as compared with the above-mentioned increases in costs and an increase of 8.7 percent in the level of wholesale prices for all commodities.

The result of the cost-price squeeze and the inroads of inflation are demonstrated by the center section of the chart which shows the trend of crude oil prices in constant 1956 dollars. In terms of real purchasing power, the producer has lost 52 cents per barrel since 1956, or almost 20 cents out of every dollar.

The relatively low prices for crude oil have a double-barrel effect. In addition to the cost-price squeeze, the decline in the real price for crude oil results in a lessening in the value and effectiveness of percentage depletion.

Maximum depletion at 27½ percent has declined by 14.3 cents per barrel, or 19 percent, in constant dollars since 1956. Not only, therefore, has the price of crude oil become increasingly inadequate in relation to replacement costs, but also the depletion provision has become correspondingly less adequate as a measure of the capital value of the crude oil being depleted. A miximum percentage depletion rate of 34 percent in 1968 would have been required to prevent the loss in the real value of maximum depletion since 1956. Today, many producers find it more advantageous to sell properties under the capital gains treatment, rather than to continue to operate.

To sum up the situation as to incentives for petroleum exploration and development in the United States, there is an obvious need for more—not less—economic stimuli. A comprehensive study by the National Petroleum Council (the official industry advisory group to the Government, appointed by the Secretary of the Interior) concluded that declining U.S. exploration and development could be attributed to "decreasing profit prospects for new investments."

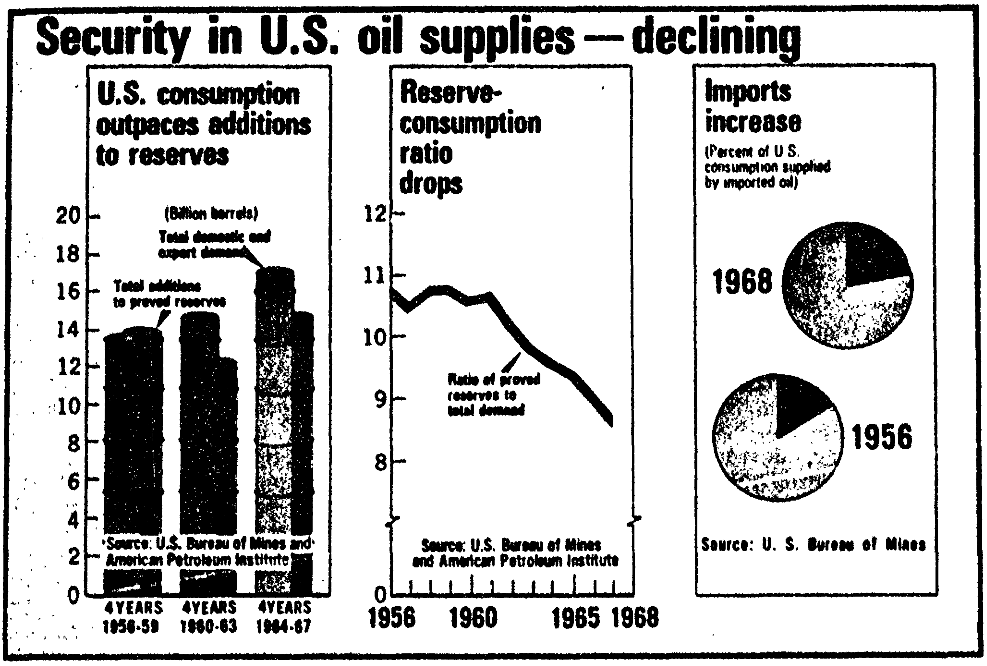
Further declines in economic incentives and further decreases in prospective profitability for new investments would result from any change in petroleum tax provisions. The adverse change that would have the greatest immediate and disruptive effect on drilling, particularly for independent producers, would be any lessening in the effectiveness of the present treatment of intangible drilling expenses.

DECLINING SECURITY IN U.S. OIL SUPPLIES

The foregoing discussion has dealt briefly with deteriorating conditions in the domestic petroleum producing industry. The resulting threat to national security is illustrated by the next and final chart.

Fourth Chart

Total additions to U.S. proved reserves of liquid hydrocarbons have been falling progressively behind our national requirements for petroleum products. In the four-year period 1956–59, additions to reserves were larger than total U.S. consumption. In the latest four year period, total consumption had out-run additions to reserves by almost 2.5 billion barrels. As a result, the ratio of proved reserves to total consumption dropped steadily from 10.8 in 1956 to 8.7. Meanwhile, imports of foreign oil rose from 16 percent of 1956 domestic requirements to 22 percent in 1968.



A statement by the late President John F. Kennedy concluded that, "The depletion allowances which affect over 100 items should be considered primarily as a matter of resources policy and only secondarily as a tax issue." He went on to say that, "Its purpose and its value are first of all to provide a rate of exploration, development and production adequate to our national security and the requirements of our economy . . . The oil depletion allowance has served us well by this test."

More recently, a comprehensive study by the U.S. Department of the Interior entitled "United States Petroleum Through 1980," published in July 1968, concluded:

"Both intangible expensing provisions and percentage depletion have been long standing and durable features of the tax treatment of the petroleum industry, despite repeated efforts to change, reduce or eliminate them. They are an integral part of the petroleum industry's structure of income and expense, and the available evidence suggests that any substantial change in them would have a direct and significant effect upon the future availability and cost of oil and natural gas."

Percentage depletion and related tax provisions have been ingrained for many years in the economic and financial processes of the petroleum industry. Any adverse change in these provisions would have repercussions of vast proportion, including the following:

1. The flight of capital from the industry and disruption of investments, with a chaotic adjustment in industry financial processes.
2. Sellouts and mergers among smaller industry units, already a concern, would be greatly accelerated with a resulting increase in corporate concentration in the production and control of petroleum.
3. Contraction of the industry would result in a reduction in the multiplicity of independent effort that has been so important in the exploration for new reserves.
4. Severe impairment would occur in the economies of the thousands of oil communities throughout 32 producing states.
5. Reduced petroleum activities would be followed by reduced markets for steel, other basic materials, and hundreds of supplying and servicing organizations sustained by petroleum production.
6. Unquestionably there would be less crude oil and gas found and developed in the United States. The alternatives would be either a more concentrated industry at greater cost and much higher prices to consumers, or greater dependence on foreign oil. Neither of these alternatives would be in the interests of the consuming public or, most important, the security of this Nation and the rest of the Free World.

33-865 O—69—pt. 5——39

CONCLUSIONS

Any change in percentage depletion, the treatment of intangible drilling expenses or related federal income tax provisions—designed for the purpose of increasing tax revenues from oil and gas production—would result in less oil and gas and/or higher prices. This fact has been recognized even by academic critics of depletion who have acknowledged that the effect of these tax provisions is to expand investment and output—thus bringing down mineral prices.

Because of the depressing and widespread repercussions of adverse changes in petroleum tax provisions, it is unlikely that such changes would increase federal tax revenues in the long run. The public interest would not be served by weakening the Nation's posture as to petroleum supplies essential to national security, in exchange for the uncertain hope of additional tax dollars.

In conclusion, it should be re-emphasized that the declining trends in the domestic producing industry, as presented in this memorandum, are cause for concern, rather than a lack of confidence in the industry's future abilities. Geologists confirm that there are huge undiscovered deposits of oil and gas in the United States. Advancing research and technology can provide the tools for discovery, development and improved recovery methods. With adequate incentives restored by healthy economic conditions, sufficient domestic petroleum supplies will continue to be available for the consuming public and the security of our country.

TRENDS IN THE U. S. PETROLEUM PRODUCING INDUSTRY
1956-1968

	Geophysical Activity (Crew Months)	Non-Prod. Acreage Under Lease * (Thous.)	New Field Wildcat Wells	Rotary Rigs Active	Total Wells Drilled	Number of Employees
1956	7,846	363,597	8,742	2,618	58,160	340,100

STATEMENT ON U.S. OIL TAX POLICY, SUBMITTED BY CLINTON ENGSTRAND, CHAIRMAN, LIAISON COMMITTEE OF COOPERATING OIL & GAS ASSOCIATIONS

SUMMARY

The Liaison Committee of Cooperating Oil & Gas Associations contends that in order to accomplish the drilling job required by the nation we must at least have—in addition to adequate crude prices and opportunity to produce—the following provisions in our nation's oil tax policy:

1. *Expressing of non-recoverable drilling costs.*—This current tax provision is universally cited by domestic producers as the most important existing tax incentive to encourage exploratory drilling. Even the present low rate of drilling would drop precipitously, should independents be required to capitalize such costs or include such costs in computing income tax liability.

2. *The "loss carry forward" tax provision.*—This current provision is vital in the extremely high risk oil exploration business. Drilling costs approximate an average of $50,000 per well. This cost burden becomes significant in exploratory drilling since only one well in nine finds oil and only one well in each 33 drilled results in a commercial discovery.

3. *Liberalization of the 50 percent net income limitation on percentage depletion application.*—Only by this positive change can the percentage depletion provision more effectively assist in the desired result of increasing domestic oil and gas drilling to levels needed. Without such adjustment domestic independent wildcatters cannot receive the maximum tax incentive authorized under the depletion provision. Even more damaging to the independent would be the Administration's new proposal requiring non-incorporated individuals to include income derived from percentage depletion application in computation of income tax liability.

4. *Retention of capital gains tax treatment for total value of oil and gas property sales.*—Independents must maintain at least the current economic incentive to sell discovered petroleum so that they can be in position to conduct expensive exploration activities. Otherwise, further reduction in already inadequate drilling effort will result causing further reduction in secure domestic reserves.

5. *A positive tax incentive program applied directly to domestic exploration efforts.*—Recognized even by authors of the percentage depletion study submitted by the Treasury Department to this Committee is the increasing need for further attention to the problem of strengthening economic incentive to search for domestic oil reserves. It is in the best interest of the consuming public and the nation's security, as well as the domestic oil producing industry, to seek the most plausible means for achieving this objective. Governmental oil policies can play an important role in this effort.

STATEMENT

Mr. Chairman and Members of the Committee, my name is Clint Engstrand. I am authorized to appear here as Chairman of the Liaison Committee of Cooperating Oil and Gas Associations, an organization consisting of representatives from 21 independent producer, royalty owner and service associations located throughout the nation. Our groups range geographically from Alaska to the Gulf Coast and from California to Pennsylvania.

The producers we represent operate almost exclusively in the inland areas of the United States and concentrate their activity in the exploration, development and production segment of the domestic oil industry. Consequently, we seek national tax policy that encourages rather than discourages development of domestic oil reserves.

To emphasize this position, the Liaison Committee unanimously adopted the following resolution at its meeting in Wichita, Kansas, on September 8th:

"Be it resolved that Liaison endorse any tax legislation (1) which recognizes the dangerous pending energy gap in this nation and the very significant role of the domestic independent in providing for national security and consumer welfare; (2) which recognizes the important, disproportionate role of the independent petroleum producer in exploring for and developing the domestic reserves so vital to national welfare; (3) which supports as necessary to domestic development the continued expensing of non-recoverable costs of drilling; and (4) which returns to the maximum extent necessary incentives for domestic exploration and development."

More than 85 percent of the nation's effort to search for home oil reserves is conducted by independent producers. This high risk, security-vital function constitutes the independents' primary role in the U.S. oil and gas industry. Consequently, if the nation's petroleum discovery effort it in trouble, then so is the independent producer.

The serious decline in U.S. oil and gas exploration activity over the past 12 years submitted in evidence before this Committee by other witnesses here today can only mean, then, a serious decline in independent producer activity. It is equally apparent that if the nation desires restoration of exploration activity to adequate levels, then the incentive for the independent to do so must also be adequate, whether it be in terms of higher prices for oil and gas discovered or revision in national petroleum policy.

Despite this inescapable need, however, the tax reform movement, insofar as it relates to the petroleum industry, has concentrated on ways and means to reduce rather than increase the economic incentive of the independent producer. Attention has been focused on tax changes that would impede independent producer decisions to borrow and/or spend the staggering amounts of funds necessary to drill wells.

Independents operate as individuals, small partnerships or in venture combinations. They rarely incorporate, thereby maintaining the freedom required for well drilling decisions—subject of course to veto by their bankers or investor partners. They are, therefore, highly vulnerable to any adjustment in current tax laws that offer them the incentive needed to drill.

A small business operation in the oil and gas producing industry relies heavily, for example, on the right to expense non-recoverable costs of drilling. Without it, there would be no way to afford the expense of developing discovered oil and gas properties for the simple reason that the independent and his banker must be in position to cope with the non-discovery years in his drilling history that inevitably arise between pertoleum discoveries.

The severe ups and downs experienced by small business in this high risk industrial activity also require the incentive aid that comes from other tax features under attack, including domestic percentage depletion, the ABC payment method, carved-out production payments and capital gains sales of mineral properties. Eliminate or reduce any of these long-standing tax features for either the independent producer or those who help finance his ventures and further reduction in the nation's vital petroleum drilling effort is bound to follow.

Several member Associations of Liaison have representatives here today who have all submitted individual testimony for the record on behalf of their individual Associations. In addition, they are prepared to participate in this oral presentation of the case for the independent producer and royalty owner. With the Committee's permission, I shall introduce each of them and call on them to cover specific aspects of tax reform proposals as passed by the House, as presented by Administration officials before this Committee and as currently being considered by members of the Senate. When they have concluded their remarks, I would like to summarize briefly our position.

In summary it appears obvious to us that regardless of the political necessity to review U.S. oil tax policy, constructive measures must be considered to assure the even more important objective of adequate search for domestic oil reserves. Our consultations involving hundreds of domestic independent producers support our contention that in order to accomplish the drilling job required by the nation we must at least have—in addition to adequate crude prices and opportunity to produce—the following provisions in our nation's oil tax policy:

1. *Expensing of non-recoverable drilling costs.*—This current tax provision is universally cited by domestic producers as the most important existing tax incentive to encourage exploratory drilling. Even the present low rate of drilling would drop precipitously, should independents be required to capitalize such costs or include such costs in computing income tax liability.

2. *The "loss carry forward" tax provision.*—This current provision is vital in the extremely high risk oil exploration business. Drilling costs approximate an average of $50,000 per week. This cost burden becomes significant in exploratory drilling since only one well in nine finds oil and only one well in each 33 drilled results in a commercial discovery.

3. *Liberalization of the 50 percent net income limitation on percentage depletion application.*—Only by this positive change can the percentage depletion provision more effectively assist in the desired result of increasing domestic oil and gas drilling to levels needed. Without such adjustment domestic independent wildcatters cannot receive the maximum tax incentive authorized under the

depletion provision. Even more damaging to the independent would be the Administration's new proposal requiring non-incorporated individuals to include income derived from percentage depletion application in computation of income tax liability.

4. *Retention of capital gains tax treatment for total value of oil and gas property sale.*—Independents must maintain at least the current economic incentive to sell discovered petroleum so that they can be in position to conduct expensive exploration activities. Otherwise, further reduction in already inadequate drilling effort will result causing further reduction in secure domestic reserves.

5. *A positive tax incentive program applied directly to domestic exploration efforts.*—Recognized even by authors of the percentage depletion study submitted by the Treasury Department to this Committee is the increasing need for further attention to the problem of strengthening economic incentive to search for domestic oil reserves. It is in the best interest of the consuming public and the nation's security, as well as the domestic oil producing industry, to seek the most plausible means for achieving this objective. Governmental oil policies can play an important role in this effort.

Statement of Independent Oil & Gas Producers of California, Presented by Stark Fox, Executive Vice President

Mr. Chairman and Members of the Committee, my name is Stark Fox. I am executive vice president of Independent Oil and Gas Producers of California, a consolidation of two independent oil and gas producer associations both of which dated back to the early thirties. We are the only statewide association of producers in California.

At the outset, let me say that we join in the statement of the Independent Petroleum Association of America and will, therefore, confine our remarks to a description of conditions among California independents, and the impact the proposed changes in oil tax policy will have upon them.

Let me further say that we are opposed to all the proposed changes. Their sum total effect is to lessen oil industry incentives to find and develop the more than 80 billion barrels of oil needed between now and 1980, according to the Chase Manhattan Bank and the Department of the Interior. The Congress—and the Administration—should be considering ways to add to those incentives, rather than reduce them.

CONDITIONS IN THE CALIFORNIA OIL INDUSTRY

A 10-year record, 1957–1967, of the California oil industry unveils a gloomy picture, particularly for the smaller independent. The reason we use a 10-year period ended 1967 is that complete statistics for the succeeding period are unavailable. We believe that no significant changes in trends occurred during 1968 or thus far in 1969.

Here are some of the facts:

The total number of companies in the state in 1957 was 1465; in 1967 it was 1044, according to the Annual Review of California Oil and Gas Production compiled by the Conservation Committee of California Oil Producers. The net loss in number of companies was 421, a drop of 29%.

Total employment in oil and gas extraction dropped from 26,000 in December, 1957 to 21,800 in December, 1967, the California Department of Industrial Relations reports in its Labor Statistics Bulletin. The Bulletin also reports that average weekly earnings in the same months of the same years were $111.07 and $146.64, respectively. (Currently, they are $173.43).

The State Franchise Tax Board reports that 1039 companies filed Bank and Corporation Franchise (state income) Tax returns for calendar 1957; only 658 did so for 1967.

Of the 1039 filling companies in 1957, 428 reported taxable income, on which they were assessed $8,263,214.00. Of the 658 filing companies in 1967, 330 reported taxable income, on which they were assessed $16,074,343.00. (Production in 1957 was 928,971 B/D; in 1967 it was 948,722 B/D. Thus the state income tax per barrel of oil produced nearly doubled).

CONDITIONS AMONG INDEPENDENT PRODUCERS

The foregoing data apply to the California industry as a whole, but there is one group, the smaller independent producer, who was hardest hit during the period.

Conservation Committee tabulations show the varying patterns within the industry.

Between 1957 and 1967, the major companies increased their share of total California production from 45% to 53%; the 43 principal minor companies slightly, from 28% to 29%; the independents dropped from 9% to 3.7%. These percentages do not include production from unit operations, in which the small companies have little or no interest.

Figures covering oilfield development show the same trends. In 1957, the majors completed 44.6% of all wells; in 1967, they completed 53.8%. Principal minor companies increased their completions from 24.5% to 37.0%; independents dropped from 30.0% to 8.3%. Again, unit operations are excluded.

In 1957, major companies were credited with 45.5% of all wells; this figure had increased to 53.4% by 1967.

Principal minor companies increased their share of all wells from 25.0% in 1957 to 27.4% in 1967; independents dropped from 22.7% to 10.3%.

DISINCENTIVES

In spite of this obvious deterioration in the independent's position, and in spite of the fact that District V (Alaska, Arizona, California, Hawaii, Nevada, Oregon, and Washington) does not produce enough oil to fill its own needs, there are those who would further dampen the incentive to explore for and produce oil. They are the ones who would eliminate, reduce, or otherwise "adjust" the depletion provision in the Internal Revenue Code, as well as change other industry tax provisions. Up to this point they have succeeded in doing so. According to press reports, the so-called Tax Reform Bill passed by the House, coupled with the recommendations of the Treasury Department, would burden the oil industry with additional annual Federal taxes of $600 million.

We do not pretend that the ratio of oil production to taxes is direct; however, using that ratio as a rough guide, the District V producing industry's share of that added annual tax load would approximate $84 million, based upon its current 14% share of total production.

We make no effort to determine how much of the added tax burden would fall upon independent and principal minor companies. It would be a significant sum, however, because together they account for 47% of total California oil production.

And whatever the amount, it would come directly out of their pockets.

PRODUCERS HAVE NO "ULTIMATE CONSUMER"

They cannot pass it on; they are not integrated companies; they cannot offset a tax increase by charging the ultimate consumer higher prices for their product. They have no "ultimate consumer" in the classical sense. It is common knowledge that, in the oil producing industry, the buyer, not the seller, determines the price that will be paid for crude oil. Hence, the producer has no way of shifting the burden of any added expense, be it taxes, higher wages, or any other.

The impact of such added expenses is particularly severe for the California producer. California is the only oil producing region in the nation where average crude prices are less than they were in 1959—10 years ago. According to the current Statistical Release of the Independent Petroleum Association of America, crude oil prices east of the Rockies average $3.17 per barrel today; in 1959 they averaged $2.95 per barrel.

California crude prices, on the other hand, average $2.51 per barrel today, whereas in 1959, the average was $2.55.

Thus, compared with 10 years ago, producers in the rest of the nation have had per barrel price increases totalling 22 cents; California producers have suffered a loss of four cents per barrel.

This is disincentive enough for the California producer, but the "tax reform" bill passed by the House and the Treasury Department's recommendations would further curtail his ability to maintain his present none-too-enviable position.

And why did all this come about?

"PRESSURES"

Because of "pressures," Treasury Secretary Kennedy is reported as saying.

The Chairman of the House Committee on Ways and Means was quoted to a similar effect, during that Committee's deliberations on the bill.

It seems to us that, in saying that the recommended changes in Federal oil tax policy—and particularly in the depletion provision—were brought about by pressures, those who sponsor them (or acquiesce in them) tacitly admit that no thought has been given to the merits of the case.

The Wall Street Journal—no "friend" of the oil industry, as witness its frequent highly critical editorials about the oil import program—supports that opinion.

In speaking of the House action on the so-called Tax Reform Act, it had this to say:

"Everyone is in favor of reform, and after more than four decades it's likely that oil taxes could use some of it. Both the nation and the industry would benefit, though, from one thoughtful study of the change and its possible impact.

"But no. Here, as elsewhere, the tax reformers have simply slashed away, and the House has pushed through the whole package without bothering to give it more than a passing glance."

We have tried to give you some idea of the impact of the proposed changes upon the California producer. Our petition to you is simple. We reiterate our opposition to all the proposals and ask only that, before you junk—because of "pressures", not the merits of the case—an oil tax policy that has served this nation well for some 43 years, you make "one thoughtful study of the change and its possible impact."

Thank you.

STATEMENT OF INDEPENDENT OIL PRODUCERS AND LAND OWNERS ASSOCIATION TRI-STATE, INC. (INDIANA-ILLINOIS-KENTUCKY), BY D. F. MCKEITHAN, JR., PRESIDENT

Mr. Chairman, my name is D. F. McKeithan, Jr., and my home is in Evansville, Indiana. I am an independent oil producer and the President of the Independent Oil Producers and Land Owners Association, Tri-State, Inc., which association I have the privilege to represent today. The membership of IOPLOA consists solely of small independent oil producers and land owners located in the Tri-State area of Illinois, Indiana and Kentucky.

Before proceeding, I wish to go on record on behalf of IOPLOA as supporting fully the other testimony received today from those independent petroleum associations from other parts of our country, which recognize the role of the independent oil man and the necessity to preserve, as well as to stimulate, his continued contribution to the domestic oil and gas industry. Their remarks are in our judgment sound and well stated. I am, however, here today to tell you about Illinois, Indiana and Kentucky because I know that you, and all the members of this committee, are well versed with the intricacies of the domestic oil business; that you are aware of the serious nature of the proposed tax revisions as they would affect oil. But, you may not know, or be aware of the fact that dependent upon your action an entire industry hangs in jeopardy in my home area. Thus, I will confine my remarks to the three-state area of Illinois, Indiana and Kentucky.

The oil industry to which I refer is almost exclusively composed of small independent producers, suppliers, and drillers. They are the same type of independent who has historically found 80% of our domestic reserves. His usual operation is long on guts and short on capital but, nevertheless, he continues to drill and search for oil Normally, his exploration capital is raised from investors outside of the oil business, from men and women who can afford to risk capital on the 1 in 15 chance that oil will be discovered. Ironically, these same investors who provide the funds necessary to the small independent, are now a primary target of this Congress in its effort to revise the present tax structure.

The proposed tax revisions, if adopted, can only affect adversely those individuals and firms now engaged in the oil and gas industry. This consideration alone is not necessarily a valid reason for avoiding a change. However, all the consequences of any tax change must be measured not only in terms of the immediate revenues expected to be realized but, more importantly, in the long range effects to be expected and the overall impact on the economy and security of our nation. In our Tri-State area, a reduced depletion rate will seriously cripple our segment of the domestic oil industry. This would result in the obvious curtailment of employment with the resulting loss in payrolls and taxes as well as a loss in oil production and, consequently, royalties to the land owners and taxes to the counties.

If it can be recognized that a cut in the present depletion schedule would seriously cripple the Tri-State oil industry, then it is even more apparent that a change in the manner of deduction of intangibles will literally, and without exception, destroy the domestic oil business in our area. Because the principle sources of capital funds relied upon by our operators are derived from outside investors, any required capitalization of such funds will shut off completely this flow of money and force our operators out of business.

Over 1500 small businessmen employing approximately 30,000 men and women in our Tri-State area annually contribute about 400 million dollars to the economy, which includes 30 million dollars annually paid to land owners in royalties and over 6 million dollars in taxes to the counties. As noted, the proposed tax change will not merely work a temporary hardship upon these independents, such changes will virtually eliminate them as a contibuting segment of our economy. Our local economy would be unable to compensate for such a loss. More importantly, we maintain that our country cannot afford to lose this segment of its domestic oil industry. Once it is lost, it is doubtful that either the reserves or the skilled technicians could ever be replaced.

In conclusion therefore, I submit that the action of this committee will very definitely determine the future course of the independent oil man in the states of Illinois, Indiana and Kentucky. Unfortunately, the choice is not one of compromise. Our very livelihood depends upon the decisions you will make.

STATEMENT BY TOM L. SCHWINN, B.S., L.L.D., J.D., EXECUTIVE VICE-PRESIDENT AND COUNSEL, ACCOMPANIED BY V. RICHARD HOOVER, PRESIDENT, CARL W. SEBITS, VICE-PRESIDENT, DAVID TRIPP, C.P.A., WAYNE SUNDLING, C.P.A., ON BEHALF OF THE KANSAS INDEPENDENT OIL & GAS ASSOCIATION

SUMMARY

Drilling, reserves, and productive capacity of both oil and gas, are down in Kansas and in the United States.

1. Intangibles must be preserved at all costs.
2. Depletion and other incentives are also vital.
3. The independent segment deserve special consideration because of its unique and perilous position when pitted competitively against the major international companies.
4. Treasury proposals are an indirect attempt to gut the domestic petroleum industry under the guise of tax reform.
5. The domestic industry is vital to the economic well-being of the producing states and the nation.

STATEMENT

Mr. Chairman, Members of the Committee, the Kansas Independent Oil & Gas Association (Kioga), now in the thirty-fourth (34th) year of its existence, is a petroleum trade association comprised of approximately thirteen hundred (1300) members. It has no major company members. It is producer-oriented.

We are grateful for the opportunity of appearing before this distinguished committee today. We are here to underscore the importance of maintaining and improving current provisions of mineral tax law as they relate to oil & gas. We deem these provisions to be vital to the survival of the domestic independent producer. Collaterally, we shall have something to say about adverse proposals, formal or otherwise, that would do grave damage to the petroleum industry and the energy position of the nation.

Whereas, there are many facets to the Kansas petroleum economy, the independent oil and gas producer continues to be one of its mainstays. Historically, both the major companies and the independents explored and developed the obvious and major petroleum provinces of the state and were the harbingers of the development that occurred throughout the great midcontinent area of the United States. Following discovery and development of these obvious and easily identifiable features, the major companies began to withdraw from Kansas. The hard business of finding elusive oil and gas was left to imaginative independent operators. The state remains one of the principal gas and oil producing states in the nation.

In 1968 more than 96% of all exploratory and development wells were drilled by independent operators in the state of Kansas. Their share of total daily oil production now exceeds 65% and is growing annually. Only in the vast reaches of the Hugoton gas field do the major companies play a significant role in the development and production of the state's petroleum resources. Thus, as will be true in all of the great historic oil provinces of this nation, Kansas' present and future depends increasingly upon the independent oil operator.

The Senate Committee on Finance has the hard task and must assume the responsibility for deciding whether or not this nation shall have an important and viable domestic industry. Tax policies, which are the peculiar function of this committee, have a significant role in determining the level at which this industry will participate economically. It should be no mystery to members of this committee that historically, independent oil men raise the capital necessary for exploration from sources outside of the industry. A modest amount is generated internally. Everyone knows that the search for oil & gas is one of the most highly speculative businesses this side of Monte Carlo. Major companies, because of their sprawling and diversified nature, generate their funds internally, through the sale of products and other items. It is for this reason that the privilege of expensing intangibles during the year in which the item is incurred is so vital to independent operators and not necessarily so important to major companies. Corporate structures, being broad-based, could withstand a period in which intangibles must be capitalized and thereafter be re-captured through amortization; yet there is scarcely an independent in the United States who could sustain a period of more than one (1) year during which his investor would have to capitalize the speculative dollars he spends in the risky business of oil finding.

The world of oil has historically been pictured as a single monolithic industry. This is not true. The world of oil is composed of two segments: independent domestic producers and the major international oil companies. This nation must depend in the foreseeable future upon the independent operator to explore and develop the country's petroleum resources. Because of the relative profitability of foreign oil, the major international companies are spending ever-increasing percentages of their exploration dollar in foreign countries.

Crude oil and natural gas reserves are declining at an alarming rate in Kansas. Already, available supplies of natural gas, so essential for dwelling heat and industrial development, are non-existent. These facts are depicted in the attachment to this statement. The reasons for this decline in reserves (and productive capacity) are two-fold. Numbers of independents are dwindling and fewer wells are being drilled. Both of these trends must be reversed if a genuine energy crisis is to be averted.

Tax policy of the federal government is the hand maiden of a healthy domestic petroleum industry. Incorporated in federal tax policies have been a series of tax incentives which are undeniably vital if the industry is to prosper and meet demands made upon it. The thirst requirements of the nation are growing at an astonishing rate. Tax Incentives in descending order of importance are:

1. *The privilege of expensing non-recoverable business expenses, (intangibles)*.—This privilege is of overriding importance.

2. *Percentage depletion*.—Long considered by some to be a loophole, this provision nevertheless permits a return of capital and pays in part for [illegible] many dry holes that all wildcatters encounter. Contrary to much opinion, producers seldom realize the full 27½%. A recent survey by this association in Kansas disclosed that we are realizing an average net effective depletion rate only 20.4%. Included in this result were scattered good leases on which higher depletion rates are realized.

3. *85% net income limitation on percentage depletion*.—This severely limits depleton and should be liberalized. If this were done, not only more exploration would result, but the ends of conservation would be served, as marginal wells would enjoy a longer life.

4. *Loss Carry Forward Tax Provision.*—This is covered in more detail later in this statement. Suffice it to say that even the prodent operator may experience unexpected losses in any particular tax period. If denied the right to carry these losses forward to the next period, his ability to continue his exploratory efforts will be drastically impaired.

5. *Retention of Capital Gains Treatment.*—This is covered at length later in the statement.

H.R. 13270 has already reduced percentage depletion to 20%. This will reduce the average net effective rate in Kansas to below 15%. Complicating our task has been the efforts of the Department of the Treasury to do by indirection what the Department has not succeeded in doing directly. A special KIOGA Task Force on these limited tax preference proposals has just concluded a study of these matters, which is herewith incorporated as a part of this statement:

The independent segment of the oil and gas industry is in real sympathy with the Treasury's efforts to close and eliminate the so-called tax loopholes which have permitted certain taxpayers to use tax avoidance devices to escape income tax liability altogether or to pay only a minimal amount. However, we submit that the methods proposed in both the House bill and by the Treasury to correct this situation, do not justify the drastic changes and penalties imposed upon the majority of legitimate oil and gas operators who are now paying a fair share of the necessary burden of the cost of government.

In properly analyzing Treasury Department proposals relating to the mineral tax section under Limited Tax Preferences, it was deemed appropriate to note other tax changes, formal or informal, that had been suggested elsewhere or incorporated in a bill. Following passage of the House version of the tax reform law, called by some "the most incredibly complicated tax law in U.S. history," containing categories of proposals which overlap to the extent that the result is grotesque, the Treasury Department now has suggested to the Senate Finance Committee a widened series of proposals that add more complexities:

ANALYSIS OF TREASURY LTP PROPOSALS

1. Capitalization of intangibles (non-recoverable business expenses), even on development wells, which was not proposed formally, but was mentioned, would have the most adverse effect upon the domestic independent petroleum industry.

2. The House-passed cut in depletion from 27½% to 20% was found to be next in severity in its adverse impact upon the domestic independent. Studies disclosed that this change would add approximately 15% to the adjusted gross income of the established investor.

3. (a) LTP provisions would have a nominal effect on the established oil operator or high income investor.

(b) For the young operator with minimal oil and gas income, or for the investor, with small outside income, the reverse is true. Using some reliable assumptions, the adjusted gross income of these two classes of taxpayers was increased by 124%. The reason for this is that the young man started in the oil business, either as an operator or as an investor, is spending a greater proportion of his total income on LTP items than is the older, wealthier individual, operator or major oil company. Please note that the latter category of taxpayer, being incorporated, is not subject to the provisions of LTP.

4. We strongly disagree with the inclusion of the intangible drilling cost deduction in the Allocation of Deductions provision. Moreover, we urge that the 60% limitation for the application of ADR be derived from oil and gas *operations*, including, but not limited to, all phases of exploration, development, drilling and producing, as suggested by Secretary Kennedy, rather than from the *sale* of oil and gas as recommended by Mr. Cohen. There are a number of legitimate related activities for fully qualified oil and gas operators.

5. Intangible drilling costs in any case should be excluded from the Allocation of Deductions Rule. IDC is not truly an LTP item. The theory of ADR is that no cash is expended. IDC involve direct cash outlays in a legitimate search for oil and gas. Inclusion of IDC in the ADR provision is discriminatory against the investor of the independent operator. Therefore, the 60% limitation would be a

disincentive to the independent segment and have no direct affect on the major oil companies. This provision would give a direct competitive advantage to the extremely large operator over the independent segment that historically has discovered more than 75% of our domestic reserves.

6. The suggested recapture rule for intangible drilling costs, upon the sale of the property, would have its most adverse effect upon the small operator who periodically may be forced to sell a discovered lease to retire bank loans and other obligations incurred in drilling and developing the lease. Even Treasury has labeled IDC as "an annual expense" and has always required that IDC be used to reduce depletion allowance in prior years under the net income provision.

7. We object to the retroactive provisions in this regard too, because it is suggested that IDC be recaptured for each year it was claimed as an annual expense since the discovery of the property. This could apply in retrospect for as long as 43 years (Percentage depletion enacted, then). Record retention, sensibility, and any fair Statute of Limitations makes this requirement ridiculous. Having changed the maximum 25% capital gains treatment accorded a transaction involved in the sale of a property, we deem it improper to impose additional tax by use of the recapture feature.

8. The proposed 50% top marginal rate on earned income coupled with other proposed tax changes which affect the investor will work to eliminate him as an oil and gas speculator. The point here is that traditionally, the independent oil and gas operator generates his capital from outside the industry. Major companies generate their capital internally from the sale of products, etc. Looked at in this light, the reduction in the tax rate is a disincentive to investment in oil and gas exploration. Lack of investors will hasten the disappearance of the independent oil man from the scene.

9. Treasury proposals take little note of the fact that commitments beyond the control of the prudent independent may cause an unplanned, heavy, financial investment in any year, thereby turning a profit into a loss for a particular year. Examples are: Offset obligations, farm-out commitments, production problems and expensive completion problems in deep holes.

10. The latter pages of Treasury testimony are an undisguised and lengthy attempt to justify continuation of foreign tax credits, which are actually nothing more than royalty payments in most cases.

11. In addition to the increased tax burden which would be imposed by many of the proposals, the complexities of trying to interpret regulations and filing a tax return would be worse confounded. Some of the proposals would require computation, re-computations and comparisons of computations that would be vexatiously time-consuming and expensive and would leave the taxpayer with no certainty whatever that he had properly interpreted the regulations and properly filed his return.

Rather than simplification, which should be one principal goal of tax reform, Treasury proposals, in our judgment, will create mass confusion in the business community. It will be years before the true impact is fully known. In the meantime, all of us will face enormously increased costs of accounting, appeals and litigation.

All current incentives available to the domestic petroleum industry need to be maintained and improved. Of all of these, the privilege of expensing intangibles is of overriding importance to the domestic segment. But depletion and all the rest are each important—and in different ways and at different times.

We respectfully submit that adverse changes in mineral tax policy will literally devastate the basic economy of our state.*

Although it might be considered slightly academic there is merit in assessing the effect of the decline and even the possible virtual disappearance of the Kansas petroleum industry. What are the plausible impacts of such a situation?

Such a state of affairs can probably be most realistically visualized in terms of the estimated current dollar values generated by the Kansas petroleum industry. Suppose for sake of emphasis, the entire oil industry were to cease; what would this mean in direct and side effects, measured in dollars?

---

*Ronald G. Hardy, Chief Mineral Resources Section, State Geological Survey of Kansas. Acknowledgment: Input-output data for this report has been furnished by Dr. Jarvin Emmerson, State Economic Analyst, Manhattan, Kansas.

MEASUREMENT METHOD OF POTENTIAL LOSSES

In order to do this we turn to the system of social accounting known as input-output (1-0) analysis. Because the petroleum industry is a major one in the economy of many regions in Kansas, the impact of changes is significant. Instability in this industry will effect numerous parameters in the private as well as public sectors of the regions economy; in particular it will affect personal incomes and sales and employment in other industries. The demand for land and for local government services and the magnitude of tax receipts will be affected.

The (1-0) analysis simulates these relationships and is therefore a valuable tool with which to measure the impact that changes in any economic activity will have on all other activities, not only after the fact but also for assessing proposed changes.

The data of 1-0 analysis are the flows of goods and services inside the economy that underlie summary statistics by which economic activity is conventionally measured. This technique is essentially a system of double-entry bookkeeping which shows for each sector of the economy purchases from and sales to each of the other sectors during a given period.

POTENTIAL LOSS ESTIMATE

In the light of the foregoing, the Kansas 1965 1-0 analysis shows the following interindustry effects, assuming the Kansas petroleum industry was removed from the economy.

(1) The effect on all other Kansas industry outlays:

(*a*) The crude oil and natural gas production industry has an output of $441 million. If this were to cease it would result in a loss of $660 million in the output of the remainder of the state's industry.

(*b*) Oil field services now has an output of $46 million; removal of this industry would be reflected in a $68 million loss in the remaining state's industries output.

(*c*) The present Kansas petroleum refining industry has an output valued at 580 million. If this were to cease it would create a $1 billion loss in the remaining state's industry sectors output.

(2) The effect on wages and salaries:

(*a*) The crude oil and natural gas production industry now pays wages and salaries of $37 million. If this industry were to disappear it would create a loss of wages and salaries in all of the remaling industries of $169 million.

(*b*) Salaries and wages in the oil field services industry now total $25 million. Loss of this industry would cause a loss of $45 million in all of the remaining state's industries.

(*c*) The refining industry now has a wage and salary payroll of $38 million. Should this be eliminated, there would be a loss of $191 million created in the remainder of the state's industries.

(3) State and local taxes:

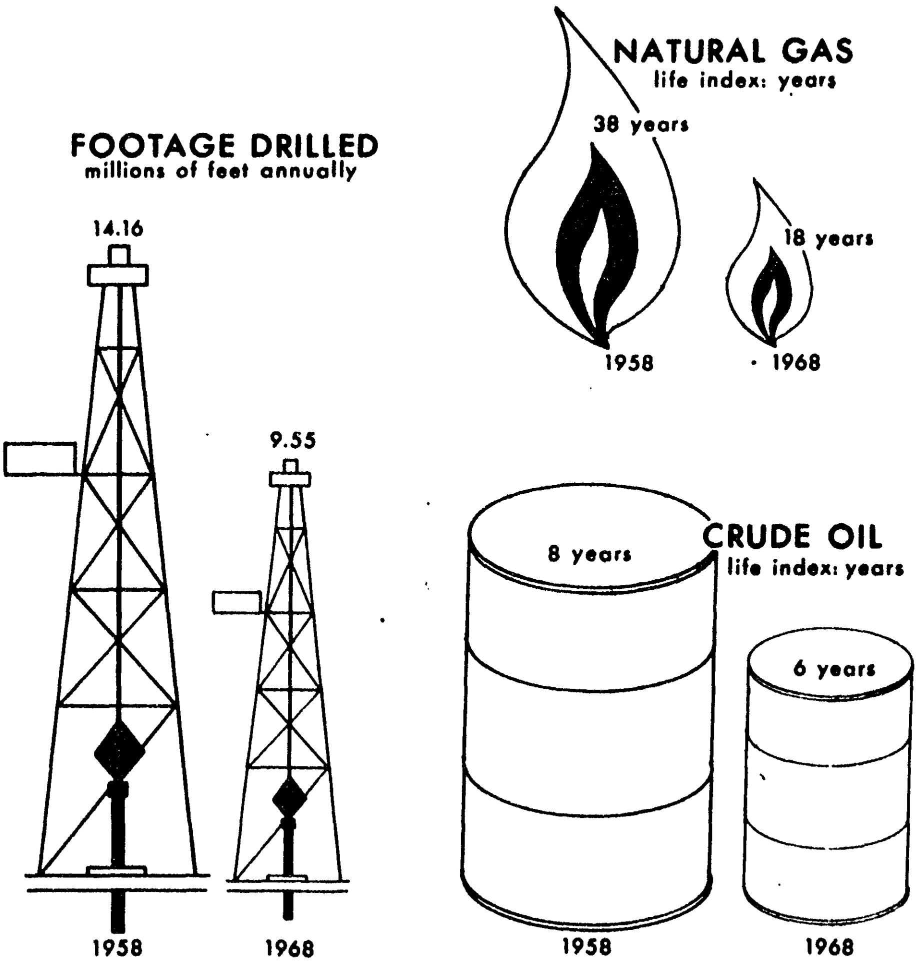
(*a*) The impact of the removal of the Kansas petroleum industry would be a loss amounting to $43 million. About half of this, or $20 million, represents income taxes and since total state income taxes is currently about $10 million this is a loss of 20%.

Summing all of the losses that could occur with the cessation of a Kansas petroleum industry amounts to approximately $3⅓ billion. Total Kansas output for 1965 was close to 25⅓ billion dollars, thus the loss is very close to 13% of this total. The impact of this would result in very serious dislocations in many Kansas regions for a long period of time. The foregoing social cost loss would seem to be a heavy one that in the long run would be less costly to prevent.

Respectfully submitted,

THE KANSAS INDEPENDENT OIL AND GAS ASSOCIATION.

KANSAS Oil and Gas Reserves Shrink as Drilling Declines



A sharp decline in drilling along with a rapid increase in energy consumption has cut deeply into the proven reserves of oil and natural gas in the State of Kansas. Life index is a theoretical figure determined by dividing proven reserves by current rate of production for each year.

KANSAS INDEPENDENT
OIL & GAS ASSOCIATION

September, 1969

STATEMENT OF WILLIAM B. CLEARY, PRESIDENT, OKLAHOMA INDEPENDENT PETROLEUM ASSOCIATION, AND PRESIDENT, CLEARY PETROLEUM CORPORATION, OKLAHOMA CITY

SUMMARY

Oklahoma now produces about 600,000 barrels of oil per day which is about 6 percent of total U.S. production. We produce 7 percent of the Nation's gas production and our operating area has about 12 percent of the probable undiscovered U.S. gas reserves in the lower 48. Independents now drill more than 85 percent of the exploratory tests in our state and well over half of the exploratory tests in this country. We expect the major companies to do even less drilling in our area as budgets are shifted more and more to offshore areas and Alaska. *So the burden of finding new domestic reserves of oil and particularly of natural gas falls squarely on us.* In Oklahoma we have not been able to produce enough oil to meet demand for nearly two years and the gap gets larger. The Nation's natural gas supply is dropping at an alarming rate, a fact that is well documented.

Oil and gas exploration is a speculative business. In order to attract capital, return must justify risk. Present prices and tax provisions do not provide enough incentive to have supply meet consumer demand. *Available risk capital has dried up appreciably in the past two months because of present uncertainty over the tax laws.* The effect of the present tax handling of non recoverable so-called intangible costs will be covered by other witnesses. *Percentage depletion,* the principal subject of this testimony, *serves a vital function on the return side of the risk return formula.*

The percentage depletion concept is sound. We deplete our capital assets when we produce our oil and gas. An oilman can be likened to an apple farmer who cuts off a limb with each apple so that when his crop is harvested he has no more tree, no crop next year. Depletion acknowledges this depleting asset concept and says that a portion of the apple crop should be set aside before tax liability so that new land can be bought and new trees planted. The risk of crop failure for oilmen is extremely high. The tax climate for oil and gas has a very considerable effect on whether our crops will flourish or wither and die.

Current tax laws provide an artificial limitation on that depletion which renders it largely ineffective when it is most needed. This 50 percent net income limitation accounts for the fact that Oklahoma producers we have surveyed get about 21 percent actual percentage depletion rather than 27½ percent. We therefore urge that this 50 percent net income limitation on any percentage depletion be eliminated.

The consumers domestic energy needs are outrunning our supply capability, particularly in natural gas. If present trends continue, the consumer won't have anything to consume. Any politically feasible change in the present tax laws which will help rather than hurt incentive to find new reserves should be carefully considered. *We strongly recommend removal of the 50 percent net income limitation on depletion.*

STATEMENT

I am William B. Cleary, President of Oklahoma Independent Petroleum Association representing more than 800 independent oilmen in Oklahoma. I'm also President of Cleary Petroleum Corporation, Oklahoma City. Our company drills about fifty wells a year. Our state has significant oil and gas reserves both producing and undeveloped. We currently produce about 600,000 barrels of oil per day which represents about 6 percent of total U.S. production. We produced about 1.5 trillion cubic feet of gas last year which represented about 7 percent of the Nation's gas production. The area we operate in has about 12 percent of the probable undiscovered U.S. gas reserves according to a study by the Colorado School of Mines Mineral Resources Institute, Potential Gas Agency Branch. (See attached map, Exhibit A).

Oklahoma independents do about 85 percent of the drilling in the state and are directly responsible for about 40,000 jobs in the state. Under present prices and existing tax provisions we have not been able to keep up with growing demand for new oil and gas reserves in our area and this situation is now approaching a critical stage. For more than 20 months demand for Oklahoma crude has exceeded supply, and the gap gets larger (Exhibit B). The supply situation in natural gas is even more critical. Mr. John O'Leary, head of the Bueran of Mines, has warned of the approaching critical shortage of natural gas. Mr. John Nassikas, head of the Federal Power Commission has also expressed his concern about our dwindling supplies as have other members of the FPC (see Exhibit C). Every gas well my company has which sells to interstate pipelines is selling at more than contract rates where the well is capable of producing additional gas. Three years ago the FPC staff spoke of fifteen to seventeen years of natural gas supply. The head of the FPC stated earlier this month that a new study indicates we may now have a ten years supply. My own experience tells me the figure is likely to be considerably lower than that.

Independents have been drilling more than 85 percent of the new oil and more important new gas wells drilled in our state. With major oil company budgets being committed to the North Slope and Offshore, I expect that percentage to increase, if we independents are still in business when the new tax law becomes effective. I can honestly say that if we don't do the exploring I don't know who will.

Ours is a speculative business and in order to attract risk capital (and more than 70 percent of our risk capital comes from outside the oil business) cost, risk and ultimate return must be balanced. If incentives are too great supply exceeds demand. If incentives are not great enough demand exceeds supply and that is the condition now.

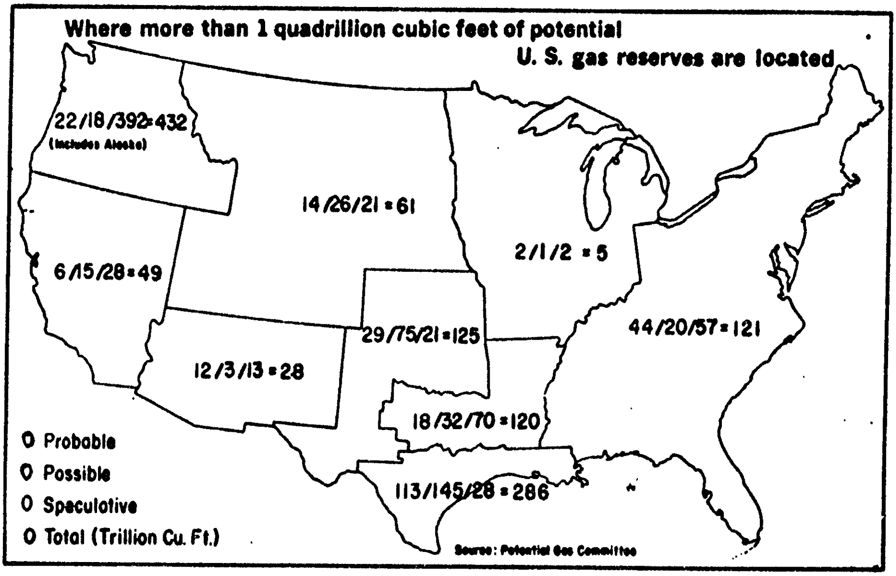
Others here will testify as to the effect of the present tax handling of non recoverable costs on the cost side of this teeter-totter.

I would like to tell you of the importance of depletion on the ultimate return side and make a suggestion regarding depletion. Risk capital for oil and gas exploration is a fragile flower and it withers easily. We have already seen a marked decline in availability of risk capital as a result of the present tax deliberations. If producers after tax costs are increased our ultimate return is reduced and supply must suffer. The consumers cannot force producers to take unjustified risks.

The percentage depletion concept is a sound one. Oil and gas in the ground is a capital asset and when it is produced it should be taxed as a depleting capital asset rather than as an asset which can produce continuing income. An apple farmer pays an income tax on the sale of his apples because he can produce them year after year. An oilman depletes his total asset with each barrel he removed from the ground. If he were an apple farmer you could think of him as cutting off a bit of the tree with each apple he harvests so that when his harvest is complete he not only has no more apples but he has no more tree. Rather than tax the whole crop as income, a portion of this crop has wisely been set aside to be free of tax so that he can plant another tree and try again. I can assure you the risk of crop failure is extremely high, and changes that have been proposed in the tax climate will make the attrition even higher.

Where does depletion come into the picture? It of course affects the amount of money an investor in oil eventually has in his pocket, after paying all the bills. It controls his ability to try again. We have all head a great deal about the perhaps unfortunate symbol of 27½ percent depletion. The symbol is an unfortunate one particularly for Oklahoma producers, because an Oklahoma University Bureau of Research survey conducted earlier this year showed that independents in our state average around 21 percent depletion rather than 27½ percent. The difference comes about because of the *limiting factor* in the present law which is *virtually unknown to most tax payers outside the oil business.* It says that percentage depletion shall be limited to 50 percent of the net income from a given property. Let's see how this works. In Oklahoma our average per well production last year was a little over 7 barrels of oil per day. The national average, because of flush new production in Montana, Texas and Louisiana, averages about 12 barrels per day. This is marginal production but it is production the Nation can ill afford to lose. It costs as much to produce a 7 barrel well as it does a 100 barrel well, and frequently costs more. For the producers who has $100,000 a year in oil and gas sales with production like this, costs of production might easily be $80,000 leaving him a net income of $20,000. Percentage depletion on his $100,000 sale would say that he should have $27,500 available for replacement of reserves before incurring tax liability. The 50 percent net income limitation however says that his depletion cannot exceed half of his net income. His net income was $20,000, so his percentage depletion would be $10,000 and he'd pay tax on the other $10,000. This restriction puts a particular penalty on the independent producer and the penalty is most burdensome in the marginal years of production when the producer has the greatest need for reinvesting his money in the search for more oil and gas.

Our Nation's domestic energy needs are outrunning our supply capability at increasing rates. When you consider the incentives the producing segment of the industry needs in order to fulfill the consumers demands at the stove and the gasoline pump, I urge you to consider removal of the net income restriction on percentage depletion. It would help offset the adverse effects on incentive of any reduction in percentage depletion. It is politically feasible. It would be particularly beneficial to the independent segment of the industry.



Undiscovered U.S. gas reserves total 1,227 trillion cubic feet

THE POTENTIAL GAS COMMITTEE estimates undiscovered natural gas reserves in the United States total 1,227 trillion cubic feet—nearly double the Committee's estimate of 690 trillion cubic feet two years ago.

Reasons for the increase: Alaska's reserves are included for the first time (400 trillion cubic feet); water depths for offshore reserves were increased from 600 feet to 1,500 feet; well depths were increased from 25,000 feet to 30,000 feet.

The new PGC report explains that nearly one-third of the total undiscovered natural gas supply is in Alaska, and will not be available to markets in the "lower 48 states" until pipe lines are built, or until gas can be liquefied and moved south in tankers. The increases in water and well depths add several hundred trillion more cubic feet to the total.

The Committee estimate is divided into the following categories: probable supply—260 trillion cubic feet; possible supply—335 trillion; and speculative supply—632 trillion. These totals are in addition to 287 trillion cubic feet of proved recoverable reserves, as of December 31, 1968.

For the first time, the PGC reports U.S. potential natural gas supply by nine supply areas (See map). Boundaries of each region coincide with the boundaries used by the American Gas Association Proved Reserves Committee. Two years ago the report was divided into estimates for three areas: East, Central and West U.S. Offshore Gulf Coast undiscovered supply for Louisiana and Texas is separated from the onshore supply for the first time.

The 150-member Potential Gas Committee is sponsored by the Colorado School of Mines' Mineral Resources Institute, Potential Gas Agency branch. The Agency's activities are financed by the American Gas Association, Inc.; the American Petroleum Institute; and the Independent Natural Gas Association of America.

The report emphasizes that huge gas reserves remain to be found, but "economic incentives must be provided to encourage people to go get it."

In recent years, fewer and fewer wells have been drilled in search of new reserves. As a result, the American Gas Association reports that in 1968, for the first time since World War II, the U.S. used more gas than it discovered—by 5.5 trillion cubic feet. Reserves were increased by 13.5 trillion cubic feet, but consumers used 19 trillion cubic feet. ■

[From the Daily Oklahoman, Sept. 24, 1969]

OKLAHOMA CRUDE DEMAND STILL OUTPACES PRODUCTION

(By Deacon New)

Demand for Oklahoma crude oil continues firm, outstripping the state's productive capacity.

Crude purchasers told the state Corporation Commission Tuesday they need 631,090 barrels daily next month, an 11,267-barrel jump over September requests.

The nominations totaling 631,090 barrels a day compares with pipeline runs during August averaging 607,468 barrels a day. Output the first 13 days of September is runiing about the same rate, 606,954 barrels daily.

Most purchasers testifying at the commission's market-demand hearing recommended continuation of the current 100 per cent factor applied to the basic depth-acreage allowable table.

Dan R. Dunnett, director of the commission's oil and gas conservation department, also favored holding the allowable at the same rate.

Dunnett said the Bureau of Mines forecast of demand for Oklahoma crude during October at 620,000 barrels a day, the same as the September estimate.

Wilburn Cartwright, commission vice chairman, presided at the hearing in the absence of the chairman, Charles Nesbitt. Nesbitt is in Alaska attending an Interstate Oil Compact Commission executive committee meeting.

Cartwright and Ray C. Jones, who heard the purchasers' testimony, said the October allowable will be set later this week.

The increase in the total nominations was more than accounted for by a boost in the request of Mobil Oil Corp. Mobil increased its nomination 12,500 barrels to 48,200 barrels a day. The company's purchases totaled 55,899 barrels a day during August.

George Stricker, representing Mobil, told the commission the increased nomination represented a firm demand for Oklahoma crude.

The purchasers, reporting on company-wide stocks, said total inventories as of September 1 were 9,570,844 barrels above desired level. That compares with a surplus the month before of 17,023,597 barrels.

A breakdown showed crude stocks at 7,493,426 barrels on the plus side, while products in storage were 2,077,418 above desired level.

	Actual production BOPD	Crude buyers nominations BOPD
1968—		
January	604,000	644,000
February	618,000	650,000
March	620,000	643,000
April	628,000	636,000
May	613,000	634,000
June	610,000	630,000
July	614,000	628,000
August	614,000	628,000
September	610,000	628,000
October	606,000	626,000
November	610,000	619,000
December	612,000	616,000
1969—		
January	615,000	615,000
February	619,000	634,000
March	609,000	635,000
April	626,000	628,000
May	610,000	642,000
June	617,000	637,000
July	608,000	619,000
August	607,000	619,000

Note: State allowable was at 65 percent of table A maximum January 1968 through May 1968. From then through the end of 1968 it was 75 percent and early in 1969 went to 90 percent. It has been at 100 percent since March and production is declining.

EXHIBIT C

NASSIKAS MEANS BUSINESS ON GAS SUPPLY

New FPC chairman sees no lack of evidence that gas is in short supply and fast getting shorter, says he doesn't need national survey to precede action. If higher price is solution, he'll likely buy that.

(Gene T. Kinney, Washington Editor)

The new chairman of the Federal Power Commission doesn't intend to wait for a national gas survey before doing something about a growing supply problem.

This presumably means raising wellhead prices, if it appears this is the likely solution.

John N. Nassikas, who took office Aug. 1, expresses confidence FPC has the flexibility to help turn supply trends around.

Named by President Nixon to suceed Lee C. White, Nassikas revealed his attitude in an interview last week. It contrast sharply with that of his Democratic predecessor.

White never really conceded there was a supply problem, in spite of a 5½-trillion-cu-ft decline in reserves last year. He led the commission in a deep slash of rates in South Louisiana, the most important producing area in the nation—a move hardly calculated to boost reserves. Moreover, he contended a study of some kind, such as the survey he pushed unsuccessfully, was necessary to establish the facts.

Nassikas, the 52-year-old Republican lawyer from Manchester, N.H., has found plenty of evidence of declining supply. He cites studies by industry groups and FPC's own staff.

In his view, past FPC decisions—notably in the Permian basin and South Louisiana—and rulings of the Supreme Court have not frozen present producer rates. Quite the opposite, he says. In Permian, he stresses, the high court affirmed FPC's wide discretion in using varying price levels to bring forth adequate supply.

FPC study. Nassikas, after 6 weeks on the job, considers the evidence of supply trouble to be "rather convincing."

He cites the annual report of proved reserves by the American Gas Association and other studies, including one by the FPC staff.

"All confirm an increasing problem with gas supply," he says.

The FPC study, to be published soon, shows a deliverability life from present reserves of only 10 years, the chairman discloses.

In view of increasing demand and recent declines in reserves. Nassikas believes the supply-demand curves will intersect much sooner than 10 years from now, unless the supply trend is reversed.

"When you have that close a margin," he declares, "a critical supply situation exists."

Top priority given. In view of this situation, the FPC chairman says the "overriding priority of FPC is to make sure to resolve on a practical, expeditious basis the gas-supply problem in the United States."

Unless this is done on a short-term and long-term basis, FPC is not doing justice to a $30-billion industry, its investors, and consumers who rely on it.

Nassikas says he became somewhat familiar with FPC issues during the past year as counsel to the minority on the Senate Commerce Committee, which has legislative oversight of the agency. Also, he took a cram course beginning last April, when he became aware of the President's intention to install him as chairman of FPC.

Since that time, he says he has become convinced that the supply issue deserves priority attention. He rejects any thought of "rationing scarcity," as a solution, preferring instead a "share abundance."

A national gas survey may be desirable, he says. "But absence of a survey is no excuse for delay in meeting a problem that is manifest."

Problem cause. Nassikas refuses to attribute the reserves decline directly or solely to FPC's policies of keeping the lid of producer prices.

But he does quote with approval an economic axiom stated by Milton Friedman. The surest way to achieve a shortage in a commodity, according to the economist, is for the Government to impose a price ceiling that is too low.

The new chairman plans first to determine what has caused the decline in drilling, the slide in the reserves-production ratio and deliverability life, and, last year, the absolute drop in proved reserves.

If FPC finds that its price policies have been responsible, he says, then these policies should be reversed.

He says FPC must ascertain whether price alone offers adequate incentive or disincentive to control the supply of gas. And he suggests that assurance of a firm price once approved may be almost as important as the price level itself.

The industry has drafted proposed contract-sanctity legislation that would prevent future FPC rollbacks of prices once approved. But no drive has been mounted to push the legislation.

The cure. Once the cause of present supply trends is established, Nassikas says, the policy actions should be fairly clear.

He expresses confidence FPC machinery is not so cumbersome it cannot deal with the situation. He says the commission has several possibilities, without commenting on any of them.

He acknowledges that the commission has set "permanent" rates in the Permian basin and South Louisiana. The first case was upheld 100% by the Supreme Court, and the second is before the Fifth Circuit Court of Appeals with oral argument set for Oct. 6.

FPC and the courts are bound to decide these cases on the facts and circumstances in the record.

But, Nassikas points out, the FPC and the courts can set new rates, or adopt new formulas, in subsequent cases, if the facts or circumstances change.

This is the principal argument of producers, pipelines, and a large group of distributors—that circumstances have changed, requiring higher rates to avoid a threatened shortage.

Nassikas says FPC is already making "policy decisions" aimed at dealing with the question.

Last week the commission set oral argument on two pending rate cases for Oct. 31. These deal with producer prices in the big Texas Gulf Coast and Hugoton-Anadarko regions, pending before FPC on examiner's decisions since Sept. 16, 1969.

The commission also has before it a reopened proceeding embracing the federal offshore portion of South Louisiana, and a settlement proposal for Hugoton-Anadarko. There are also motions to expand the offshore proceeding to include onshore Louisiana as well, and even motions to consider a national proceeding.

Nassikas believes FPC has wide discretion in dealing with supply, and even the contract sanctity question.

Favors regulation. FPC is duty-bound to act so that the industry will be able to meet future gas demand, Nassikas believes.

If it finds itself impotent to solve the problem, then he feels the commission should recommend appropriate legislation.

But decontrol—or regulation within narrowly defined limits under legislation—is not the best approach, as far as he is concerned.

Under present statutes and court rulings, FPC ought to be able to respond to particular problems, he says. He declines to lay the blame for any current troubles on restrictive court decisions. The courts, he emphasizes, have not put FPC in a strait jacket.

"We should improve the concept of producer regulation, not discard it because we happen to have a problem."

He also opposes the Burleson bill, which would require regulatory agencies to gear rate of return to inflationary trends. Pipelines have sought this legislation as a solution to their rate-of-return problem.

But this approach, the chairman warns, would only lead in the long run to broader problems than the narrow one the legislation is designed to solve.

"The regulatory process itself," he declares, "is the appropriate forum to resolve inflation problems or any other pressures to erode rate of return, rather than use the legislative approach when FPC may in the past have failed to resolve the problem."

New staff appointments. Nassikas promises to begin announcing, perhaps in less than a month, new appointments to the Office of Executive Director, chief of the Bureau of Natural Gas, and deputy chief of the bureau.

He declines to say whether he will replace the present general counsel, Richard Solomon.

Nassikas says he is seeking qualified men of integrity, familiar with the regulatory process and the problems of industry, consumers, and investors. Top staff members also should be aware of the impact of FPC decisions on regulated industries, he adds.

Action, not talk. Nassikas gives the impression of a man who is not at all intimidated by the immensity of the problems facing FPC.

He shows sign of becoming an activist chairman willing to take initiative where departures from present policies seem called for. And the initiative won't be long in coming, if his present plans are realized.

"I am talking about a series of regulatory decisions which we will be in the process of making this year," he says. "We will start soon. I am not talking about a thinking process of a couple of years. We have gone through that process and are formulating policies designed to deal with the gas supply and deliverability problems."

TWO JURISTS PICKED IN ALGERIA FUSS

Atlantic Richfield Co. last week said that two of the three judges on an arbitration court to rule on its dispute with Algeria have been appointed.

Under the rules, one judge is to be named by the International Court of Justice at the Hague, and one by each of the dissenting parties.

The International Court of Justice named Prof. Giorgio Balladore Pallieri of Milan, Italy, a judge at the European Court of the Rights of Man, as president of the aribtration court.

ARCO then announced its appointment of Prof. Francois Luchaire of the University of Paris, a member of the French Constitutional Council, as the second member.

So far, the Algerian Government has not announced its appointment of the third judge, and there's no guarantee it will deign to do so.

A spokesman for Sinclair Mediterranean Petroleum Co., the ARCO subsidiary whose Algerian properties are at stake, said that Dr. Jose Luis Bustamente y Rivero, president of the International Court, had advised the company of Pallieri's appointment and said the Italian barrister had accepted.

Sinclair Mediterranean announced last May 13 that it was initiating the arbitration proceedings to protest the forfeiture of its properties to the Algerian Government. Principal of these is a 28% interest in Rhourde el Baguel oil field, where Sinclair's share of production was 22,981 b/d in 1968. There was no return to the company, however, since it has been under Algerian Government control since June 1967.

STATEMENT OF THE PANHANDLE PRODUCERS AND ROYALTY OWNERS ASSOCIATION, AMARILLO, TEX., PRESENTED BY C. H. HINTON, PETROLEUM CONSULTANT

SUMMARY

The scope of my statement covers statistics on the recoverable natural gas reserves for the period ending each year from 1955 through 1968. It also shows the annual production for the same period and the number of well completions in the United States extending over the same period. This is shown in graphic and schedule form.

My statement also covers the estimated gas requirements for the future up to 1990.

I have made an effort to point out why there has been a decline in the number of wells drilled in the United States; why it is essential for the number of wells to be increased to a level of twice the 1968 number; and why the removal of any existing tax deductions would have an adverse effect on drying up drilling funds that would cause a further reduction in the number of well completions.

I have discussed the reserve life index or the ratio of production to reserves and explained that the use of such reserve life index as a yardstick for the life of natural gas reserves furnishes the most optimistic picture of the availability of natural gas for the future.

The producers have been classified as the pipeline producers, large independent producers, and the small independent producers, with the contribution that each makes to the natural gas supply.

My entire statement has been reduced to four Conclusions which are of importance in the action which this committee might take with respect to reducing statutory depletion, or removing intangible drilling costs as income tax benefits.

CONCLUSIONS

1. It is an indisputable fact which must be faced—that there is a very serious shortage of natural gas being developed in the United States.
2. If future requirements are to be supplied, the number of well completions must be doubled over the 1968 level in the shortest possible time.
3. There are thousands of yards of sediments which are estimated to be productive of natural gas that have not been tested by the drilling of wells.
4. Any downward reduction in statutory depletion, or any reduction in intangible drilling costs as a tax reduction will cause a further decline in the number of well completions.

TABLE OF CONTENTS

STATEMENT

My name is C. H. Hinton. I reside in Amarillo, Texas. My office address is 1012 West Tenth Street. I am a petroleum consultant and President of Consulting Services, Inc.

For the past 33 years I have spent a major part of my time on problems related to natural gas supply and the requirements for natural gas.

I am a member of the National Society of Professional Engineers; the Society of Petroleum Engineers of the American Institute of Mining and Metallurgical Engineers; the Texas Professional Engineers; and I am a registered professional engineer.

I am appearing here today as a member of, and in behalf of, the Panhandle Producers and Royalty Owners Association.

The Gas Supply Situation from 1955 through 1968

In order to present a clear picture of gas supply trends and the increase in the annual requirements to supply markets, I prepared three graphs which are attached to the back of this statement.

Graph No. 1 shows the recoverable natural gas reserves for the 14 year period 1955–1968. At the top of each bar the reserve is shown as of the end of the year in trillions of cubic feet. Immediately to the right of the recoverable reserve is a bar which shows the gross additions to reserves for each of the years. Your attention is called to the fact that back in the mid-50's the gross additions to reserves were more than twice the annual volume of gas produced. In 1968, for the first time in the history of the natural gas industry, production was greater than the additions to reserves. To the extreme right is a bar which shows the annual production. It can be noted that annual production has almost doubled from 10.1 trillion cubic feet in 1955 to 19.4 trillion in 1968.

The reserve life index is shown by years for the period and has declined from 22.1 years in 1955 to 14.8 years in 1968. The reserve life index is obtained by dividing the annual production into the year-end recoverable reserves.

The American Gas Association has caused to be formed a Gas Industry Committee to study the future gas requirements of the United States. It is estimated that the requirements will increase to 25.5 trillion for the year 1975 and 36 trillion by the year 1990. In order to present the upward trend in natural gas requirements, Graph No. 3 was prepared and is attached hereto, which shows the annual increase in natural gas requirements.

The interstate pipeline companies have been unable to contract the full volume required to meet present and estimated future requirements for the past few years. The reasons that there are inadequate volumes for interstate transportation to supply the United States requirements are:

(1) the reduction in the number of well completions, and

(2) the gas requirements in the producing states, particularly Texas and Louisiana, have increased at a very substantial rate.

A schedule which shows gas volumes and reserve life index in more detail is attached to this report and is shown as Schedule 1(a).

History of the number of wells drilled in the United States

The downward decline in the number of well completions in the United States is shown on Graph No. 2 with the detailed numbers on the schedule numbered 2(a) which both appear at the back of this report.

The largest number of wells ever completed in the United States in any one year occurred during the year 1956. That year 57,111 wells were drilled in the United States, of which 35,273 were productive of oil or gas and 21,838 were dry. There has been a decline in the number of wells drilled since 1956 down to a low since World War II of 30,599, of which 17,612 were productive of either oil or gas and 12,987 were completed as dry holes or non-producers.

The question arises as to why there has been such a drastic reduction in the number of wells drilled in the United States over the past 13 years. I will set out the principal reasons which have caused this reduction:

1. The method of Federal Power Commission regulation as applied to wells which were drilled by the pipeline producer. A pipeline producer is a company engaged in the finding and development of gas reserves and is also engaged in the interstate transportation of natural gas. Since 1941, as a result of a Federal Power Commission decision in the Hope Natural Gas rate case, all pipeline producers were placed under the regulation of the Federal Power Commission and the price which was permitted to be charged for natural gas was based on a utility cost of service concept. The impact of this type of regulation on producing properties caused the pipeline to reduce its production activities as this type of risk capital investment cannot be expended where the regulation is determined on a cost of service basis. The incentive for the pipeline producer to continue to look for and develop gas reserves was further retarded when the Federal Power Commission took the position that all statutory depletion should pass directly to the consumer as a reduction in the amount of income tax that is to be paid and included as a part of the cost of service.

2. The Supreme Coure decision in the Phillips case, handed down in June 1954, placed the non-pipeline producer under the jurisdiction of the Federal Power Commission as to the price which might be paid for natural gas that was contracted to be sold in interstate commerce.

After years of lengthy hearings the Federal Power Commission proceeded to regulate the price of natural gas by putting into effect area guideline prices and would not accept contracts for filing which provided for prices higher than the area guideline prices. Even after all of the hearings, which cost the producer and the government millions of dollars, the area guideline prices correspond very closely to prices which were being paid for gas on contracts made prior to 1960 and contracts which were entered into after 1960. Thus, the industry has lived for nine years under prices which were determined at the 1960 level.

During the period 1960 through 1968 you will note that there has been a very alarming decline in the number of wells drilled in the United States.

3. Each year during this period there has been an increase in the barrels of oil which have been imported into the United States. Imported oil does not add to the natural gas reserves. For many years the natural gas which was produced in conjunction with the production of oil supplied approximately ⅓rd of the total

natural gas consumed in the United States. The reduction in the number of well completion in the United States in the face of the increased gas requirements has lowered this percentage and for 1968 only approximately 20% of the total gas was supplied from oil-well gas.

4. The oil industry is concentrating on obtaining an increasing percentage of the domestic production through secondary recovery operations. This secondary recovery oil is obtained by methods of driving oil to the well bore by water flooding, gas injection, and utilization of other liquids by injecting materials into a reservoir which will no longer produce economic amounts of oil.

Secondary recovery operations make very little contribution to the gas supply as the primary production of oil generally utilizes both gas-cap gas and solution gas.

Reserve life index

I have explained that the reserve life index is an arithmetic computation which shows the number of years of life that the recoverable reserve would last if produced at an annual rate which is equivalent to the annual volume produced during any year. Reserve life index, however, does not give consideration to any increase in future requirements or any additions to recoverable reserves.

A natural gas well loses a portion of its physical ability to produce gas with each one thousand cubic feet produced, and, in general, natural gas wells will be depleted to the extent that the wells will have very little peak producing ability after about the first 12 years of production where the gas is produced in accordance with the contract provisions determining the quantity which may be produced. There is normally a lag of two to three years from the completion of wells in a new reservoir to the date of first production and sale. Thus, the portion of the recoverable reserve available for the consumer supply is narrowed down to 11 to 12 years.

Cycling operations which are carried on in the United States tie up approximately the equivalent of 20 trillion cubic feet, which further reduces the volume available to the consumer.

Therefore, when the reserve life index is determined on the gas connected to the pipelines it is from three to four years less than is shown by the simple computation of dividing the annual current production into the recoverable reserves.

Analysis of future gas requirements

The estimated demand for natural gas required in the future should receive the complete attention of Congress, the consuming public, and the transporter and producer of natural gas. The drastic reduction in the number of well completions and the historical annual increases in the gas requirements, coupled with the estimated future requirements, create a problem which cannot be ignored.

If present and future customers are to be served a continuing supply of natural gas, there must be a broad change in regulatory bodies having jurisdiction over price. Please bear in mind that of the total amount of money which has been invested by interstate pipeline companies and distributors who receive the major portion of the gas from interstate companies, approximately 71% of such investment remains to be depreciated. Unless there is an increase in the gross additions to reserves much greater than has been experienced over the past few years, new depreciation rates will have to be placed in effect in order for the investor to recoup his money. This means a higher cost to the consumer for the same limited supply of natural gas.

Producer Classification

The producers of natural gas fall into three general classifications:

1. The pipeline producer who can no longer be classed as a major contributor to the production of natural gas. The pipeline producer volumes have declined from more than 50% of the total requirements during the early life of the long distance interstate pipeline companies to approximately 8% of the total gas produced.
2. The major producer of natural gas is usually an integrated company that carries on manufacturing activities requiring hydrocarbons and this group has, over the past few years, drilled from 30 to 35% of the total wells drilled.
3. The most important contributor to oil and gas discoveries and development is the smaller independent producer whose principal business is the drilling of oil and gas wells and the production therefrom.

The small independent drills from 65 to 70% of the total number of wells drilled in the United States. While the big acreage sales are bid in by the major oil companies, in most cases such companies have adequate collateral and income from sources other than production to make the financing of the major acquisitions possible, but the small independent producer group makes the greatest contribution to domestic gas reserves.

In the majority of projects the small independent producer receives the money utilized in the drilling wells from independent investors who invest risk capital solely from the standpoint of the reduction in federal income taxes which would otherwise be paid. The removal of intangible drilling costs as a tax deductible item would promptly dry up drilling funds received from such investors. The lowering of statutory depletion from 27½% to 20% would likewise contribute to a lack of drilling funds from investor sources.

Natural gas has established itself as a highly desirable heat energy source which has been supplied in the desired volumes at a price which has been lower than other competitive sources of energy. The finding and development costs have gradually increased to a level where greater incentives must be provided for continuing development.

Impact of a lessened incentive for the producer to drill

If tax incentives for the drilling of oil and gas wells should be adjusted downward, it removes a source of funds that have been available for such drilling.

The question has often been asked—why the number of well completions have declined with the present tax deductions. The answer is relatively simple.

Under the present price structures which cover the cost of finding and development and the income which is generated at current oil and gas prices, the margin of profit is inadequate to induce the expenditure of risk capital and the drilling of wells in the search of oil and gas is certainly of a high risk nature. It is evident that a higher price must be paid for oil and for gas in order to have the number of wells drilled which will supply current and future requirements. Any downward adjustment in the existing statutory depletion, or the allowance of intangible drilling costs, can only cause a higher price to be paid for the oil and gas which will be produced.

Example of how statutory depletion and intangible drilling costs really work

The existing tax regulations are applied to an investor who advances $1,000,000 for the search and development of natural gas. Based on statistics, approximately 50% of the $1,000,000 will be spent on non-productive drilling. This amount will be totally deductible for income tax purposes. The other 50% of the drilling fund would be required to drill 4 wells to a depth of approximately 8,000 feet. The average reserve per well drilled to that depth has averaged out approximately 5 billion cubic feet per well. The gross income from such a well under existing contract terms used in the industry would amount to $37,168.00 per year. Gross production taxes range from 5.4% to 7.5%. Ad valorem taxes amount to approximately 20% of the investment and operating costs range from 5% to 10% of the gross income. The taxable income after the application of the statutory depletion amounts to approximately $10,000 and the income tax for the private investor would amount to about $7,000 per well.

If the investor did not advance these funds on the basis of obtaining the tax deductions, the wells would not have been drilled and the local community would not have the benefit of the industry employing personnel to drill and operate the wells; the state would not have the benefit of the gross production and ad valorem taxes; and the federal government would not have the benefit of the income tax.

The same million dollars could be invested in tax-exempt bonds and make approximately 50% of the same amount of money without taking a risk of losing the entire amount.

Conclusions

1. It is an indisputable fact which must be faced—that there is a very serious shortage of natural gas being developed in the United States.

2. If future requirements are to be supplied, the number of well completions must be doubled over the 1968 level in the shortest possible time.

3. There are thousands of yards of sediments which are estimated to be productive of natural gas that have not been tested by the drilling of wells.

4. Any downward reduction in statutory depletion, or any reduction in intangible drilling costs as a tax reduction will cause a further decline in the number of well completions.

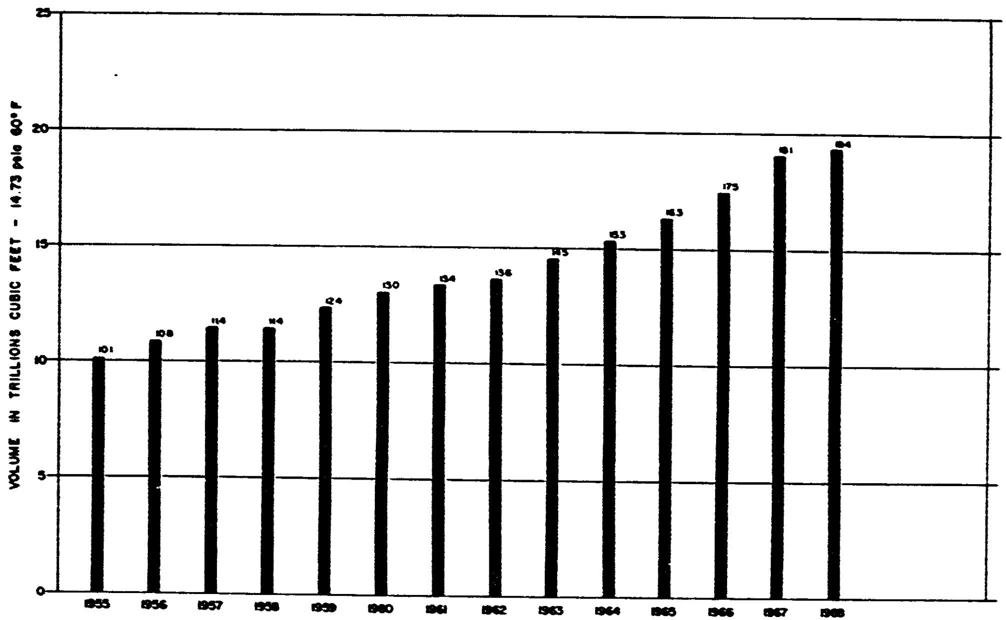
Annual Natural Gas Production



STATEMENT OF WILLIAM J. MURRAY, JR., TEXAS INDEPENDENT PRODUCERS & ROYALTY OWNERS ASSOCIATION

I. The nation is running out of oil and natural gas—not for lack of adequate domestic resources but rather for lack of adequate incentive for domestic exploration and drilling.

—Reserve productive capacity has been grossly overestimated, and some degree of Consumer rationing might prove necessary in any future foreign-supply curtailment.

—There is growing recognition within both industry and government that an energy gap looms just ahead, unless domestic drilling rates are restored at least to former levels.

—"End use controls," a form of consumer rationing, may soon be required for natural gas because of diminishing supply; a new FPC study, revealed by Chairman Nassikas, indicates that the supply of deliverable gas is already down to 10 years, and continuing a sharp decline.

—To attempt to fill the emerging energy gap by increasing imports would not only endanger national security but would thwart all efforts to close the nation's payments gap.

—Paradoxically, the proposals before the Committee, labeled tax reform, would further depress domestic exploration and drilling at the very time when an increase is required to avert a supply crisis.

II. The expensing of non-recoverable costs is absolutely vital to the domestic wildcatter, and to require that these costs be capitalized would render it impossible for most small operators to look for oil and gas.

—The independent producer is not trying to escape his fair share of the nation's tax burden; he is quite willing to pay taxes on oil and gas produced and sold, but cannot be expected to drill for oil if denied the privilege of expensing intangibles.

—The intangible charge-off privilege does not allow the producer to retain or pocket one cent of his income, but rather serves to encourage him to go into debt or seek outside risk capital in order to remain in the business of searching for reserves to produce.

—Denying the intangible expensing privilege would be particularly injurious to independents trying to get started, while having relatively far less effect upon the large integrated companies and larger independent producers.

III. The 27.5 percent factor is supportable on numerous bases. Fundamentally, if the rate were too high, there would be disproportionate concentration of resources into this enterprise, when the contrary is true.

IV. The 50 percent of net limitation works a particular hardship upon the smaller operator and upon the caretakers of the nation's marginal or stripper wells so essential to America's relative self-sufficiency in energy resources.

—Because of the 50 percent of net limitation, few domestic independent producers enjoy anything approaching the full 27.5 percent depletion.

—An increase in the net limitation would enable all operators to realize a more nearly uniform depletion percentage factor and serve to encourage domestic independents to become more active in the search for oil.

V. Particularly injurious to independents would be the proposal to require individual producers and outside investors who derive less than 60 percent of their income from oil and gas operations to include intangible expensing and depletion income in computing their tax liability.

—The LTP plan, while excluding large corporations, seems aimed directly at the independent producers, upon whom the nation historically has relied for 75 percent of domestic discoveries.

—It is the independent who is aggressively searching for oil and spending every cent he takes in and can borrow who would be the principal victim of the LTP provision.

VI. The mineral interest holder, or land and royalty owners, more than a half million in number, would be particularly effected by the LTP and percentage reduction proposals.

—Proposals denying land and royalty owners full participation in depletion would undermine the foundation upon which America has built her great energy industry, and would further depress domestic exploration and drilling by denying a primary investment stimulus to this nation's drilling efforts.

VII. Elimination of the ABC method of financing development, elimination of carved-out production payments, and the proposed recapture rule that would require treating as ordinary income any gain or sale of mineral properties to the extent of intangible drilling costs previously deducted, all would hit hardest at the domestic wildcatter.

VIII. The time is at hand to increase, not decrease, incentives to domestic independent oil and gas producers, if we are to avoid a dangerous energy gap.

—Any increase in the tax burden upon the domestic producing segment of the petroleum industry will result either in curtailed drilling or an increase in consumer prices.

STATEMENT

Mr. Chairman and Members of the Committee; my name is William J. Murray, Jr., and I am President of the Texas Independent Producers and Royalty Owners Association. Our membership approximate 3,500 independents who have oil or gas operations in the State of Texas.

TIPRO welcomes this review of oil tax policy, recognizing that the extremely serious problem of inadequate domestic oil and gas supply to meet projected needs must be the central consideration in governmental deliberation of the oil tax program. Independent producers and royalty owners across the nation share a deep concern over the failure of national oil policy to ensure adequate search for domestic reserves.

In considering tax reform proposals as they affect the domestic oil and gas producer, there is first the need for a realistic appraisal of the actual condition of the domestic petroleum industry today.

Bluntly speaking, the nation is running out of oil and natural gas—not for lack of adequate domestic resources but rather for lack of adequate incentive for domestic exploration and drilling.

There are some who realize that this is true but fear that such a statement will harm the industry and worsen the already-alarming situation. Others fail to speak out because of vast undeveloped reserves of petroleum both on land and offshore, tremendous quantities of secondary recovery oil which may become available, and potential liquid hydrocarbons which can be produced from oil shale. However great our potential, the hard-boiled statistical fact is that these potentials are not being realized.

The U.S. has grossly inadequate proved recoverable reserves of oil and natural gas to meet the increased demands of the future. Annual additions to reserves are less than consumption; and the method of reporting reserves probably obscures an even darker picture.

This Committee is surely aware of the importance of surplus domestic producing capacity to national security and to a dependable consumer supply. In view of this, it is important to realize capacity has been unintentionally but almost always overstated in the past, and in my opinion is being overstated today—to the extent that surplus capacity is almost non-existent.

All of the states in this nation, other than Texas and Louisiana, are admittedly producing at capacity. Texas and Louisiana do have some fields that could produce more than they are currently producing but they also have hundreds of fields that cannot long efficiently sustain their current rates. It is probable that the natural decline both in efficiency and in actual productive capacity of these older fields will about offset the remaining efficient surplus capacity of a few other fields. (Even the most conservative estimates indicate that by 1972 Texas, for example, will have run out of surplus producing capacity.)

According to Texas Railroad Commission reports during the first half of 1969, Texas underproduced its oil allowable by nearly 520,000 barrels authorized during the past five years. In 1969, the State produced one-third less than it did in 1965 per producing day authorized. For Texas—the state which produced more than two-thirds of all the oil used by the nation's military during World War II and which largely met the sudden needs occasioned by the Korean conflict and the various Mideast crises—to now be so underproducing its allowable in a relatively normal period is a very sobering fact.

The situation regarding natural gas is fully as bad—probably worse when it is realized that it is technically difficult and economically unsound to import natural gas from overseas. The reported situation on proved reserves and discovery rates in themselves reveal inadequate supplies to meet future increased demand. But these reserve estimates, like estimates of oil producing capacity, are based on out-of-date studies and are understandably but dangerously optimistic.

Only in recent days the new chairman of the Federal Power Commission, John Nassikas, revealed that a staff study now nearing completion indicates a 10 year supply of deliverable gas. This finding, coupled with available government and industry information, clearly constitutes a warning that unless present trends are reversed soon this nation will face a critical gas supply problem.

We say to you without fear of contradiction that all responsible studies in recent months have concluded that we face a critical oil and gas supply problem—a domestic energy gap, so to speak. Further, we charge that this energy gap is wholly unnecessary, the result entirely of the denial of adequate incentives for domestic exploration and development. For a great many reasons, our nation cannot and must not tolerate this situation.

At stake not only is consumer discomfort. If rationing of our prime energy resources were the only danger, maybe that would be tolerable. The day we become helplessly dependent upon foreign energy sources, not only will the American consumer be gouged mercilessly in the price he pays but may quite easily find himself denied adequate energy at any price. Quite obviously, this situation would threaten our survival in a hostile world. Our national security and our economic stability are very much imperiled by the present trend.

This, then, is hardly the time to be talking about proposals which would further curtail home exploration and drilling. Yet that is precisely what is before us in the guise of tax reform.

Role of the independent explorer

Unquestionably, the most important factor behind the nation's petroleum supply crisis is the decline in independent producer activity. Historically, the independent has been responsible for more than 75 percent of the nation's exploration for domestic oil reserves. It is he who in the past has been willing to assume the substantial risk of drilling wildcat wells.

Since the mid-1950's, however, declining economic incentive has cut the independent's well drilling activity by more than half. This is reflected in the attached chart which shows the sharp decline in the number of wells drilled annually in the nation's largest producing state, Texas. A total of 18,526 wells were drilled in 1950, while a total of only 8,750 is anticipated for 1969, a drop of 52.8 percent.

While the growing demand-supply squeeze has alleviated one of the independent's former economic problems—severely restricted opportunity to produce—several others remain to assure inadequate exploration and development activity on his part. Among them are: an inadequate price for domestic crude oil that still remains below decade-ago levels; sharply increasing costs, which continue to rise in the extended inflationary era now being experienced; ineffective oil import regulation which not only failed to restrict import growth in reasonable proportion to domestic production but also apportioned import quota privileges in a manner which served special interests without due regard for the objective of ensuring adequate domestic exploration and drilling; a steady increase in state and local tax burdens; seriously inadequate natural gas prices depressed by an unrealistic area pricing policy administered by the Federal Power Commission; and federal economic policies which have discouraged outside investment in drilling activity. These drilling-incentve depressants virtually guarantee inadequate home drilling in the critical decade ahead, even without the tax proposals currently being aimed at the independent.

There is growing awareness in the Federal Government that a supply crisis exists and that something must be done to assure an adequate domestic drilling program. Yet, paradoxically, serious consideration is now being given by both the Administration and Congress to tax proposals which would further reduce drilling incentives for domestic independent producers in particular.

Current and proposed tax provisions

To emphasize the seriousness of this paradox there is need to discuss current tax provisions and the way in which a typically small but aggressive independent producer operates.

Expensing of Non-Recoverable Costs.—First and most important to the independent is the right to expense the non-recoverable costs. These, usually referred to as "intangibles," include the cost of drilling the hole, the cost of mud, cement and chemicals used in drilling and the cost of various services such as electric logging, gun perforating, acidizing or fracing. Tangibles includes casing, tubing, rods, underground pump equipment, surface pump jacks and motors, stock tanks, separator heater treaters and all other surface equipment. Under the present tax law all operators must capitalize their tangible costs but have the option of either capitalizing or expensing the intangibles. It is my understanding that most oil producers currently elect to expense intangibles. However, it has been suggested that the large corporations who are reasonably certain of continuous income for the next ten or more years would not be seriously penalized by the requirement that intangible costs be capitalized and depreciated over a ten-year or longer period.

On the other hand, capitalization of intangibles would so adversely affect the independent explorer and producer as to cause almost complete cessation on his part of further exploration and development expenditures. This we contend would be extremely harmful to the national welfare.

Furthermore, the privilege of expensing intangibles cannot be considered a tax loophole because it does not permit retaining tax-free income. Actually, the typical aggressive independent who has been criticized for escaping income tax does so only because he spends his total income on intangibles and dips into capital or more usually borrows an approximately equal amount to pay for the tangible costs.

The ratio of tangible to intangible costs varies, but on the average well are approximately equal. It should be emphasized that statements early attributed to Treasury officials must have resulted from misquotation or misunderstanding because no producer is allowed to charge off the entire cost of a producing well. He is currently permitted to expense only the intangible costs but must capitalize the approximately equal tangible costs.

The privilege of expensing intangibles does allow the aggressive independent to escape taxation for a period of time if he uses all of his income on intangible development costs and goes into debt for an approximately equal amount of tangible costs. But during this period when he "escapes" taxes there are no loopholes involved, because he is actually keeping no money—but rather he is continuously going deeper into debt. The incentive for doing this is the anticipation that some day he will be able to enjoy the fruits of his occasionally-successful ventures, either by statutory depletion or by capital gains sales. These incentives must be retained. The immediate point is that intangible expensing can not correctly be described as a loophole but rather a very important tax option if domestic exploration and development are not to be severely retarded.

This is particularly important to young men or young companies who are trying to get started in the oil business. Intangible expensing is vital to them and the proposed "60 percent of income from oil" requirement would never allow them to get started. In effect, it would give a monopoly to existing oil companies and no opportunity for newcomers.

27.5 Percent Depletion Allowance.—We firmly agree with the other industry witnesses who have presented to this Committee sound arguments supporting the economic justification of at least the current percentage depletion allowance. There remains the basic fact that percentage depletion is an incentive to drill in a high-risk industry. Unfortunately the odds are against those who will explore for petroleum in the United States. But the fact that some do hit and because of depletion can keep a significant portion of their income encourages a great many others to continue year after year to invest more in exploration than they ever receive.

The logic of the 27.5 percent factor is supportable on numerous bases. For one think, if it were too high, as some charge, there would be disproportionate concentration of resources into this enterprise. The opposite is true, quite obviously, today. But in terms of the objective of avoiding taxes upon that portion of gross income which represents a return of capital, it can likewise be more than justified. A test of the formula to see whether 27.5 is indeed too high can be conducted simply by asking whether the depletion rate times the gross selling price of a unit of production equals the price at which a similar unit of production can be purchased in the ground. Stated another way, a producer should be entitled to end up the year with the same reserves he started with before he has taxable income.

In the case of oil, assuming the average price at lease tanks of $3.00 per barrel, when 27.5 percent is taken, a producer deducts 82.5 cents from his net income.

But he currently must pay $1 to $1.25 per barrel for reserves to replace the barrel produced. The point is that a producer should have a depletion rate which will give him enough money tax free to replace that year's production by buying reserves. He may of course decide instead to gamble that he can replace them more cheaply by finding them himself and this is his decision and his risk. If a producer can take only 82.5 cents tax free out of a barrel of oil, he is much more inclined to sell his reserves for $1.25 per barrel than if his depletion is $1.25 per barrel. The fact that the 27.5 percent factor is not returning his capital holding accounts for the persistent stream of sellouts with its monopoly implications.

With this in mind, we believe the primary concern of this Committee should be whether or not percentage depletion is performing its intended function both as an incentive to drill and a means of returning capital investment. Since the facts at hand support the contention that the economic and military survival of this country require a greater exploratory effort than is taking place, Congress should be looking for ways to increase rather than retard the incentive for the risk-takers.

The 50 Percent of Net Limitation.—One of the main reasons the current depletion provision has failed to provide adequate incentive is the companion restriction of its application to 50 percent net income. This hits hardest the independent operators are able to enjoy the full 27.5 percent depletion, whereas such may not be the case with international companies. To illustrate how effective the 50 percent net limitation decreases percentage depletion taken by small operators, this Association sampled its membership. Of 70 operators sampled the average depletion taken was only 19.00 percent. One of these, a reasonably typical independent in Texas with a great many years of exploration experience, and a demonstrated capacity as a competent oil finder and producer, has failed to achieve the full 27.5 percent depletion on all but three leases since 1952. Even on these three leases, the full application was short lived in each case.

Internal Revenue studies, we believe, do not properly reflect the true picture for typical independent producers. The examples most often cited are anything but typical, and have almost no relation to the operations of domestic non-integrated independent producers—the nation's wildcatters.

There are several reasons independents are unable to enjoy full depletion. As a rule, they have little or no low-production-cost holdings, more typical of foreign reservoirs, on which attainment of the full rate is normal. Independents are badly hurt by the inflation squeeze on operations, since crude prices have failed to keep pace with higher wages, material and administrative costs of operation, thereby triggering the 50 percent net income limitation. Most independents are "caretakers" of the nation's defense—vital marginal or "stripper" production operations, protecting some 6.8 billion barrels of oil reserves, which reduce net income levels. Finally, few independents are fortunate enough to discover production sufficiently flush to command full depletion after the waiting period during development when percentage depletion does not apply.

It is our position, in short, that present depletion provisions are anything but excessive to the purposes for which percentage depletion was provided, insofar as domestic operations are concerned. To repeat, the 50 percent of net profit limitation serves unnecessarily to prevent its functioning effectively as an incentive to adequate drilling at home.

Other Tax Provisions.—We most strenuously object to the proposal to require individual producers and outside investors who earn less than 60 percent of their income from oil and gas operations to include income derived from application of intangible expensing and percentage depletion in computation of their income tax liability. This would have precisely the same adverse effect on incentive to drill, in principle if not in degree, as the elimination of intangible expensing or reduction in percentage depletion would have. This proposal, commonly referred to as a plank of the Limitation on Tax Preferences plan, would, moreover, be aimed directly at the independent producer as opposed to the major oil corporation.

The independent who is truly aggressive in development is not only spending all of his income but borrowing a substantially equal additional amount. He is building for the future in the hope then that he can develop production on which to pay full taxes. It is this very sort of independent upon whom the nation must depend to do the exploration and development which the country now so desperately needs. It is the independent who is spending every cent he takes in and every cent he can borrow who would be the victim of the LTP provision

The mineral interest owner, the land and royalty owners of this nation, more than a half million in number, would be particularly affected by this and other proposed changes. At stake quite literally may be the foundation upon which America has built its great energy industry. If the land and royalty owners are denied any part of the present depletion provision, the result can only be a further depressant upon domestic exploration and drilling. For it is this source which provides a primary stimulus—in the form of risk capital and encouragement—to the exploration and drilling efforts which have so often proved vital to our national survival.

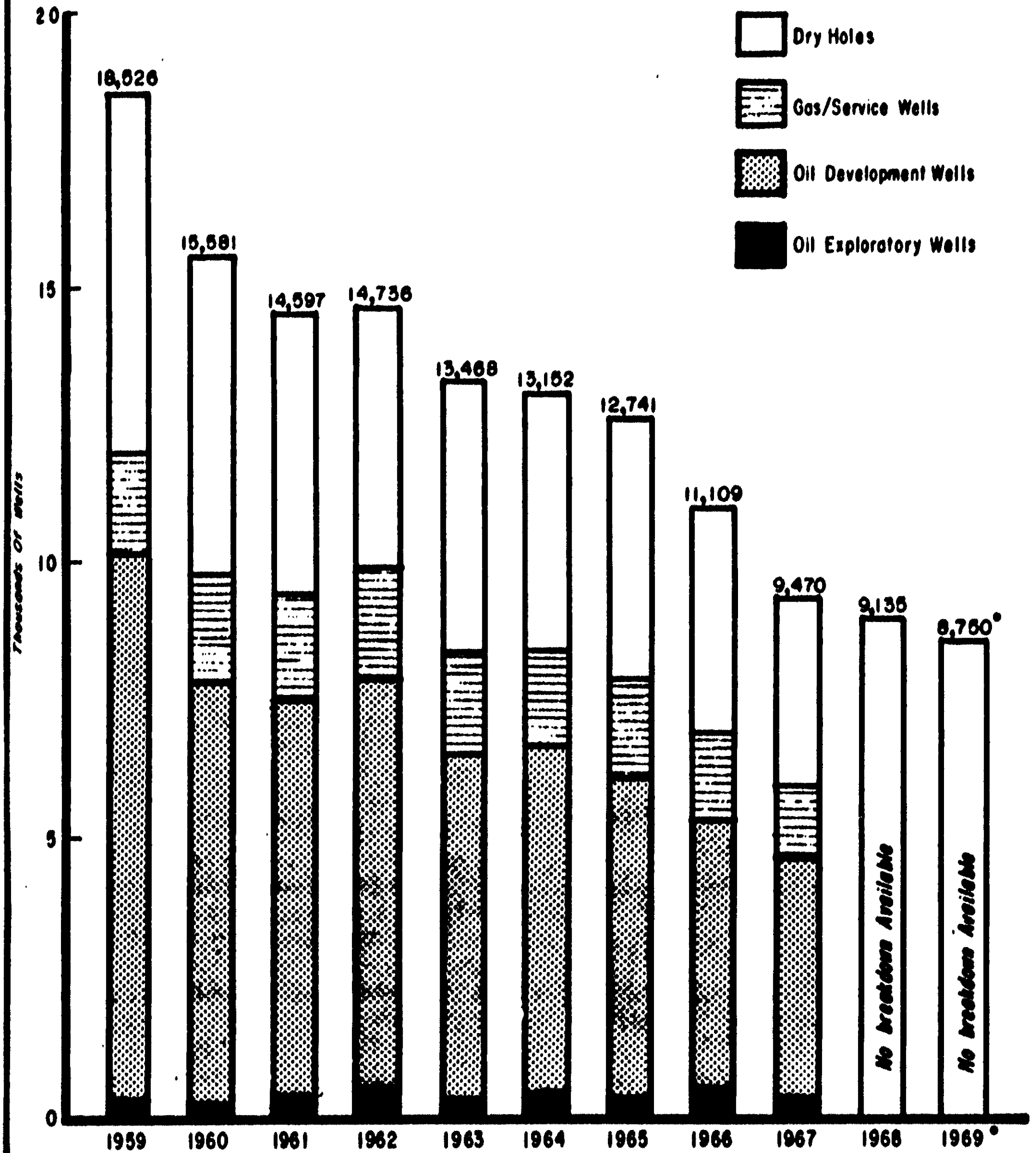
Other proposals either passed already by the House of Representatives or proposed by the Administration which hit hardest at the small independent include elimination of the ABC method of financing development of discoveries, elimination of carved-out production payments, and the proposed recapture rule that would require treating as ordinary income any gain on sale of mineral properties to the extent of intangible drilling costs previously deducted. While independents favor elimination of abuses or inequities under the Internal Revenue Code, they view these current provisions as vital incentives for further exploration. Their elimination or revision would be a devastating economic blow for most independents, necessitating a further sharp curtailment in their drilling programs.

Conclusion

If this Committee concurs in the conclusions that the nation is already facing an energy gap which could soon threaten its very survival, then surely it concurs also that the time is at hand to devise means of revitalizing the domestic producing industry. The future of the industry will literally be determined by what government oil policy emerges in the next few months. Time is about to run out for a relatively self-sufficient energy industry in this nation under present policy. If it is agreed this is vital, then incentives must be improved, not lesssened, for the domestic oil and gas producing segment of the industry. If the proper changes are not made, then investments will increasingly be channeled abroad, with consequent impairment of the domestic industry—and with dire consequences to the nation's security and payments balance.

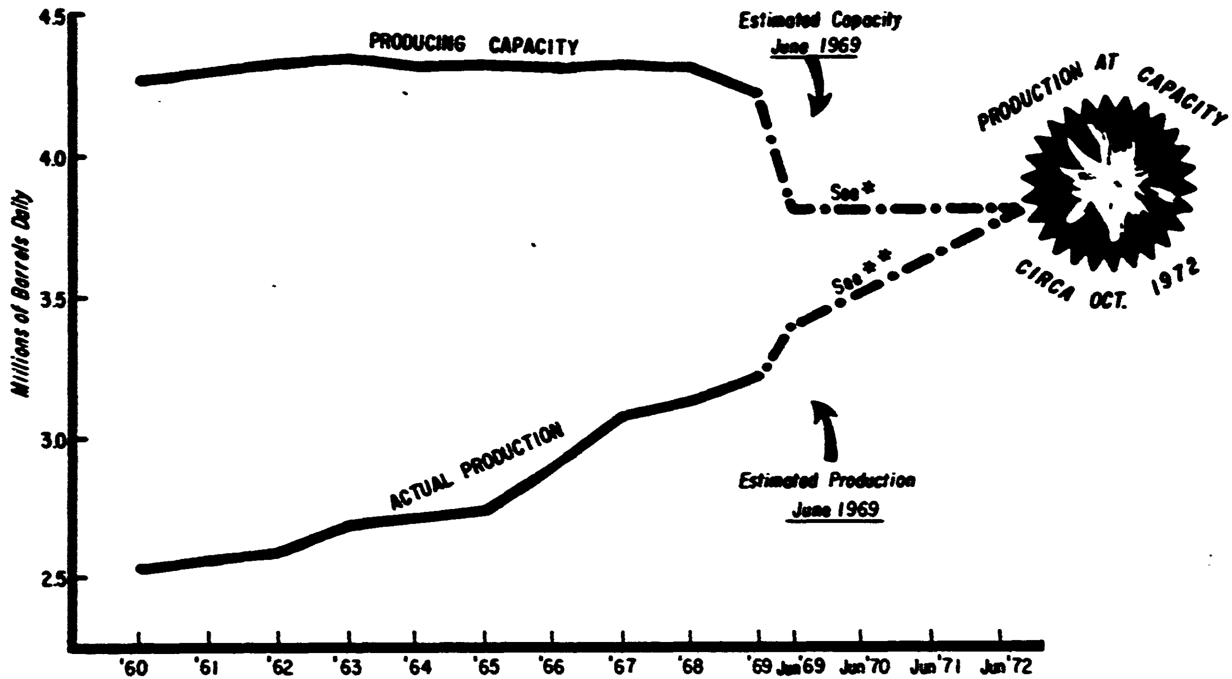
It seems not improper or presumptuous under these circumstances, to say frankly that responsibility for what happens should be clearly assumed by those in a policy-making position of government. If this Committee does not want this nation helplessly dependent upon foreign sources for its energy resources, then any changes in federal taxation of the domestic oil and gas producing industry should be in the direction of increasing incentives for the domestic independent producing segment of the industry.

TRENDS IN TEXAS WELL DRILLING DURING 1959-69 DECADE



* Projected.

ACTUAL AND PROJECTED COMPARISON BETWEEN TEXAS OIL PRODUCTION AND PRODUCTIVE CAPACITY: 1960 - 1972



* Experts close to the situation estimate maximum capacity of 3.8 million barrels daily now and for the foreseeable future, assuming little improvement in drilling rates, upward revision of field MERS and allowable limits where feasible, and continued secondary recovery activity at current levels.

** Assuming an annual growth rate in demand for Texas crude of 3.5%. May be higher due to lack of surplus capacity in other states between now and 1972.

4552

Statement of A. V. Jones, Jr., President, West Central Texas Oil & Gas Association, Abilene, Tex.

SUMMARY

Recommending:

1. The petroleum industry serves the consuming public and serves it well.
2. Petroleum exploration must be increased and since it is risky all costs should be deductible when incurred.
3. Rules on statutory depletion and production payments should be retained.
4. The limit on tax preference (LTP) is directed exclusively towards the small businessman and it will destroy him. If this provision becomes law, it will foster a major company monopoly in the petroleum industry.
5. Recommendation that the present oil and gas tax structure be left unchanged.

Mr. Chairman and members of the committee, my name is A. V. Jones, Jr. I am an independent oil and gas producer and live in Albany, Texas. I appear here today as president of the West Central Texas Oil and Gas Association and am representing the members who belong to this association and also as an individual small businessman widely experienced in oil exploration and development.

I appreciate the priviledge of being allowed to appear here today before the Senate's Committee on Finance because the tax proposals you are considering are of grave concern to me individually, the members of my association, and all who participate with us financially, also vitally concerned are the hundreds of thousands of people in all of 32 oil and gas producing States who are directly involved in the domestic petroleum industry

The consuming public, all the people of this Nation, has been well served by the petroleum industry. Few industries have supplied the consuming public with continually improving products at essentially the same real price. Any adverse legislation will directly affect all consumers.

To supply the energy needs of this Nation, most governmental and industry reports emphasize the fact that petroleum exploration must be increased substantially over the next few years. Historically the independent segment of the petroleum industry explored for and found most of the domestic production. In order to continue the necessary domestic exploratory effort, the cost of exploration and drilling—known as intangibles—must continue to be recognized as essential business expense for all participants in the oil and gas industry. There must be no 50% or any other limitation—all costs should be deductible when they are incurred.

Petroleum exploration is a very risky enterprise and correspondingly there must be *substantial profits* to balance the *extensive* losses. The public hears about the few winners—but never hears about the large number of losers. These losers are a necessary part of the industry. Some make it big and some lose—*this business is unavoidably* different from farming or manufacturing or merchandising—it is a high risk operation. Legislative proposals have often questioned the need for deducting intangibles from taxable income. Intangibles are the cost of finding petroleum and drilling wells necessary to produce the oil or gas. They are routine, normal, legitimate costs of doing business. There should be no limitation whatsoever on what can be invested or reinvested in the business of oil and gas exploration to provide for our Nation's needs.

Statutory percentage depletion has been widely misunderstood. When oil and gas are sold the receipts are partly capital and partly income. Our national tax policy has always recognized that the sale of a capitol asset should be given special treatment. This accounts for the fact that more than 100 mineral products are subject to a depletion allowance and rightly so. Currently percentage depletion is limited to 50% of net income. Due to the extreme risks of the petroleum industry, however, this limitation should be raised to 75% or more.

Production payments and their uses have been the source of considerable confusion. It is our belief that present tax treatment of both ABC and carveout type oil and gas payments should be continued.

Most of the currently proposed oil industry tax reforms are directed against the small businessman engaged in oil exploration and development. To be specific, the so-called limit on tax preferences (LTP) is applicable only to *individuals, partnerships, trusts and small corporations.* This is a punitive proposal, which if it becomes tax law will practically wipe out the independent segment of the industry when the need for our efforts has never been greater. Not only will this so-called limit on tax preferences (LTP) provision wipe out the independents in oil and gas exploration, but *ultimately it will create a major company monopoly by destroying small businessmen.* It does not seem likely that it is the *intent* of tax reform to foster any monopoly, but it will be the *inevitable result* of this limit on tax preferences (LTP) to create just such a major company monopoly in the petroleum industry.

The basic economic facts of fundamental, importance to our industry and national security have become obscured and confused. It appears that the emotional and political aspects of tax reform proposals have shaped them into a discriminatory program—not into a soundly considered piece of tax legislation.

Instead of creating the necessary economic climate for the expansion required, the proposals before you would destroy most of the incentive for petroleum exploration.

Gentlemen, it is my recommendation that the tax structure of the domestic petroleum industry be left unchanged.

The CHAIRMAN. Now we will hear another witness who has to leave town shortly.

Mr. Eberhard P. Deutsch, speaking for the Permian Basin Independent Petroleum Producers Association.

I am very happy to call Mr. Deutsch, a very dear and old friend of mine for a number of years and one of the great lawyers of our country. Mr. Deutsch is responsible for Austria being a free country today. I say that in all seriousness.

STATEMENT OF EBERHARD P. DEUTSCH, REPRESENTING THE PERMIAN BASIN INDEPENDENT PETROLEUM PRODUCERS ASSOCIATION; ACCOMPANIED BY FORD CHAPMAN, PRESIDENT, PERMIAN BASIN PETROLEUM ASSOCIATION

Mr. DEUTSCH. Thank you very much, Mr. Chairman. I can imagine no greater compliment than one coming from you; along with 100 percent of the other electorate of Louisiana, we regard you in that light.

Mr. Chairman, I am speaking here in behalf of the Permian Basin Petroleum Association composed actually of some 3,000 members. In my original written statement I said there were 650 members. That was an error.

Sitting at my right is Mr. Ford Chapman, the president of that association.

I am going to address myself very briefly to one phase of this matter which I have not heard discussed and have not seen treated in the hearings which you have had up to this point.

Of course, the Permian association actually feels the same way as the other independent producers who have expressed themselves here today; that is, they have the same reaction toward the depletion allowance and so on. I am speaking to this subject now because exploration has become so much more expensive through deeper drilling and other factors, and so much of it being done by wildcat independent producers, that they have had to finance themselves through what is known as carve-out production payments.

This subject, so far as I know, has not yet been touched on in this hearing, and I think I can handle it very briefly. A carve-out production payment is merely a sale of perhaps a reservation of, in some cases, a part of a future production of a mineral property. Those payments have had the large tax advantages primarily through the depletion allowance, and they have been recognized just about as long as the depletion allowance has, close to 40 years.

Now, the point that I want to get across is that the independent producers are going to have a frightful time living as such at all if they cannot continue to have the privilege of financing themselves through their producing properties with this carve-out payment system.

The first point I make therefore is that this system should not be abrogated as is proposed in the House bill. If, in the last analysis, the fate of the Nation or the imperative transcendant needs of the Nation demand that that change be made, and I would disagree with that, but, if you gentlemen in your wisdom find that to be the case, at least the retroactive provision of the proposed bill, discontinuing such payments retroactively should not be permitted to stand as is presently written.

Of course, if ultimately the carve-out production payments system is eliminated, with the tax advantage which has accompanied it up to this time, they are not all going to fold up their tents and crawl away. An effort will be made somehow to continue their business. They are American. They are all good Americans, and they still make every effort with the private enterprise system, the capitalistic system, to continue to work out somehow, even with those difficulties, to finance their exploration and development programs.

I think it must be borne in mind, and it is really a simple proposition, that these carve-outs, with which I assume you are familiar, have to be worked out in advance. It takes 2 to 3 years to make appropriate commitments of land leases. A buyer must be found. Geophysical work has to be done to determine how much income will be available to repay a production payment. A drilling contractor has to be found in advance, and so on, in order that equipment may be available when the time comes.

A production payment made in the fall generally has been arranged at least in the spring. It takes months and months, sometimes even a year or so to work that out. Unless that system is continued in effect, and certainly unless it is not permitted to have retroactive effect as now written many of these people will not even be able to repay their present loans that they have contracted on the faith of those provisions of the present loan. They may not be able to honor their contracts. They may not even be able to pay their current drilling bills, and certainly those that are well enough off to take care of their current needs will be unable to take care of any future years, that is starting with 1970, under any circumstances.

Some day perhaps prices will increase, but we cannot help but feel that the independent producers should not raise his capital through price increases which ultimately find their way to the consumer in an inflationary cycle.

Now, we simply submit that the rules of the game should not be changed after play has started, and especially after the second half has been entered as it has at this time. We submit that the tax treatment of carve-out payments under the present depletion allowance should be permitted to stand, but if that simply cannot be done under the paramount needs of the United States of America, then at least it should not be done retroactively and clearly unfairly to these independent producers.

The CHAIRMAN. The so-called carve-out is a way of financing the sale of oil and gas, is it not?

Mr. DEUTSCH. It is the actual sale of oil and gas. If I own a piece of producing property, I sell a part of it to somebody and then it is paid back out of that production, and when the payment has been made in full it reverts to me. It is simply a method of financing exploration used primarily by the independent groups.

The CHAIRMAN. And if this carve-out method of doing business is to be taxed, I suppose it would not be practical to use that method of financing?

Mr. DEUTSCH. It would be impossible.

The CHAIRMAN. Am I right in assuming that this would not present any particular problem to a major company, but that it would present some very serious problems to quite a few independents?

Mr. DEUTSCH. I think that is an eminently fair way to put it. Some of the major companies use carve-outs, but I think they can probably get along without them. They have better credit facilities. They have adequate backing for their financing needs through the banks. The chap from the First National City Bank, for instance, is going to look after the majors all right. But the independents simply do not have that type of situation, and this would be a frightful blow to them.

The CHAIRMAN. Chase-Manhattan can find some money for Standard and First City can find some money for some of the others, Melon Bank can find some money for Gulf. But these independents need something like this, as I understand it, in order to finance further exploration, to sell some of what they have so they can go out and try to find something else?

Mr. DEUTSCH. I would say that many of them will be put out of business if this is not permitted, if they are not permitted to finance in that way.

Senator HANSEN. Mr. Chairman, just let me take this opportunity to compliment your distinguished friend the attorney from New Orleans on his testimony. He has certainly spoken very well the case for independents in Wyoming. They too find just as you have found, the extreme importance of this type of financing in order to carry on an exploratory program, and I hope that everybody in this country, before these sessions are concluded, may better understand that fact.

Mr. DEUTSCH. Thank you very much, Senator. I was not really testifying solely for the Texas, the west Texas producers, but for all of them, of course, including those in Wyoming and in other States.

The CHAIRMAN. Thank you very much.

Mr. DEUTSCH. Thank you very much. I would like, Mr. Chairman, if I may, if it is appropriate, to put into the record an interesting cartoon which appeared on this subject in the New Orleans States-Item, the day before yesterday, and I think it is highly illustrative in graphic form of the point I have been trying to make.

(The cartoon and Mr. Deutsch's prepared statement follow:)

'Yes Sir, I Think I'm Gonna Like You!'

STATEMENT BY EBERHARD P. DEUTSCH, NEW ORLEANS, LA.

SUMMARY

1. The independent petroleum producers of the United States oppose any reduction in the present oil-depletion allowance under the income-tax laws, on the ground that this allowance is a vital incentive to stimulate the search for new sources of oil and gas.

2. Exploration and development of oil and gas reserves have grown increasingly expensive in recent years. The independent producer has had to meet these ever-increasing costs, in large measure, from carved-out production payments.

3. The present advantageous tax treatment of such payments was accorded to the petroleum industry to encourage the search for oil and gas, and to stimulate its production.

4. It is accordingly tremendously important, especially to the independent petroleum producer who has limited means at his disposal, that the present tax treatment accorded to carved-out production payments be retained.

5. Drilling budgets for one year are always prepared during the preceding year, and land-lease acquisitions are ordinarily worked out and committeed two or three years in advance; and it is contemplated that carved-out production payments are to bear most of the exploration and development expense in the year in which that work is done.

6. If it is deemed necessary, for reasons beyond the crying needs of the independent oil producer, to discontinue the present tax treatment of carved-out production payments, that should under no circumstances be done retroactively.

7. Such retroactive repeal would deprive the independent producer of venture and short-term operating capital, after he is committed and already in debt, at a time when it is virtually impossible to borrow money, and may well drive him out of business.

8. The rules of the game should not be changed after play has already entered the second half. Carved-out production payments have had special tax treatment for more than thirty years.

9. The present treatment of carved-out production payments should be left undisturbed; but if it must now be changed for supervening reasons, it should at least be permitted to remain in effect for the taxable year in which new legislation is enacted.

STATEMENT

My name is Eberhard P. Deutsch. I am a New Orleans lawyer, and appear here in behalf of the Permian Basin Petroleum Association of Midland, Texas—an association of some 3,000 independent producers of petroleum, and individuals and firms affiliated with them, primarily in West Texas.

The Association opposes strongly any reduction at all in the present oil-depletion percentage allowance under the income tax laws of the United States, which its members submit is necessary to provide adequate incentive to stimulate the search for new sources of oil and gas.

The share of petroleum in the United States energy market has shown a steady growth for many years. The increased demand has been equivalent to an annual average advance of 5.5 per cent since 1920. Demand has increased to such an extent that, today, the Department of the Interior estimates that seventy per cent of the energy consumption in this country is provided by crude oil and natural gas. The oil industry must meet this petroleum demand in the United States. There can be no doubt that greater oil production is imperative to our national security.

From the time that oil was first discovered in commercial quantities in 1859 at Titusville, Pennsylvania, the United States became an explorer of both crude oil and its derivatives. But in 1948 the United States became a net importer. Since then, foreign oils have gradually increased until now some 21.1% of the United States crude oil supply is imported.

The international petroleum industry is today experiencing a supply-demand race for world markets. In 1964, for the first time, production in Middle East fields equalled that of the United States. Because the expense of discovering and developing foreign production has been lower than that for domestic exploration and development, American oil companies are participating increasingly in foreign operations to the detriment of domestic production. To obtain an advantage of $1 per barrel in discovery-production cost below that in the United States, American producers are willing to absorb the high initial costs of establishing foreign production and markets.

Oil and gas is the only depletive-resource industry which spends a major share of its earnings on the finding and development of new reserves. Nearly one-quarter of the industry's gross revenues is spent on exploration alone, most of which fails to locate any oil. Eighty per cent of new wells are development wells, drilled to sustain existing production in order to compensate for the continuous depletion of older wells whose productivity is tapering off.

The domestic petroleum industry has encountered increasing difficulty in locating new crude oil reserves to meet the ever-increasing demand, in spite of a major increase in its effort to find oil. Drillers must bore deeper into the earth than ever before to find new reserves; and this increases their cost, as does also the constantly rising cost of leasing land.

The capital required to finance these increased costs and efforts inevitably strains the industry's capacity to generate such funds; and the small independent producer must obtain this money from carved-out production payments to meet the cost of its drilling program.

A "carved-out production payment" is created by the sale, by the owner of a mineral property, of a portion, but not all, of the future production attributable to his property. A "reserved production payment" comes into being, by the mineral-property owner's reservation to himself, of a portion of the future production attributable to his property, and his sale of the remainder to another person.

The money received by the seller of the carved-out production payment is generally classified as ordinary income subject to depletion during the year in which it is received. The money received by the owner of the retained production payment is subject to percentage depletion during the payout period.

That portion of the production income, in either a retained or carved-out production payment situation, used to pay off the amount of the production payment, is excluded from the income of the mineral-property owner during the payout period. Any money received by the mineral-property owner, not applied to the production payment, constitutes ordinary income to such owner, subject to cost or percentage depletion depending on his cost basis for the mineral property.

In a carved-out-production-payment situation, expenses attributable to producing the minerals subject to the production payment are deductible during the year in which they are incurred.

The present advantageous tax treatment of carved-out production payments was accorded to the oil industry more than thirty years ago to encourage the search for oil and gas, and to stimulate the increased production thereof.

Oil companies, both large and small, prepare their drilling budgets about six months in advance of the beginning of their fiscal years. The drilling program is planned: so many wildcat wells, so many development wells, so much geophysical work and so many leases to buy. Contracts are made in advance with drilling contractors, so that when the time comes for a well to be drilled, a rig is available. The current year's budget was accordingly prepared during the preceding year, and in the case of the small independents, cost is almost always tied to monies received from, and the tax treatment afforded, production payments.

As stated, independent oil producers normally make extensive use of short-term debt capital, from loans which are usually secured by all, or substantially all, of their producing properties. They have access to only very limited amounts of additional borrowing. To implement the financing of their operations, the independent producers have had to rely heavily on various types of sharing arrangements.

Short-term operating credit can literally disappear overnight as a result of some change in the industry's economic environment. The over-all effect of even a minor change in a long-standing oil-tax provision will seriously limit, if not take away entirely, a small producer's short-term fund raising ability. Because of the risks inherent in this activity, exploration cannot ordinarily be financed directly with normal loan proceeds, unless the loans are secured by other assets.

As any wise investor will attest, it is the height of business folly to finance exploration for mineral resources with funds borrowed in the ordinary course. An operator who borrows money for use in exploration runs the double risk of losing the funds in unrewarding ventures, and the possible loss of his producing properties, through foreclosure or by forced liquidation to retire debt.

In addition, the petroleum industry must remain competitive in the capital market, particularly in times of rapid economic growth, and, as now, during periods of tight money.

For the reasons stated, the Congress is urged to retain the present tax treatment of carved-out oil and gas production payments. If, however, it is found to be imperative, for reasons beyond the crying needs of the independent oil producer, to discontinue that tax treatment of such payments, the members of the Association for whom I speak will make every effort to work out, for the future, some new practicable means, through possible long-term financing, of carrying on their exploratory operations.

But, in that unhappy event, they request that their present methods be not cut off retroactively as proposed in H.R. 13270, already passed by the House of Representatives.

Any adverse change, without time to prepare for such change, would immediately affect the collateral securing existing loans, and would drastically restrict the ability of the independent producers to finance their operations with the proceeds of new loans until some new means of fund-raising can be worked out.

It should be emphasized that a sale of a carved-out production payment is not consummated overnight. In the first place, land-lease commitments must normally be made at least two to three years in advance. Months of preparation are spent thereafter finding a buyer for a carved-out production payment on producing property, arranging the financing, gathering the necessary geological and engineering data as a basis on which to evaluate the oil and/or gas in place, and to predict the income. One can be sure that almost every sale of a production payment made in the Fall was initiated in the Spring.

A large percentage of wildcat drilling is done by the smaller independent producers. No banker will finance wildcat drilling ventures without substantial collateral. The money to stay in business must come from discoveries already made. Retroactive repeal of the present tax treatment of production payments, added to the financial problems which the independent producer already faces, will deprive him of the availability of venture and short-term operating capital, and may well drive him out of business.

Unless the effective date of the proposed legislation is postponed until the end of the taxable year in which the legislation is enacted, many small oil companies will be unable to meet their short-term bank loans, to honor their contracts, or even to pay for their current year's drilling programs; or, at best, they will be unable to drill any wells at all during the following year; all because funds allocated for such costs will not be forthcoming.

Another reason for giving the industry time to adjust to a sudden change in its tax treatment, is to preserve its right to sell an oil payment for income to offset a loss carry-forward. Suppose that a company, which may have had a loss five years ago, has attempted unsuccessfully to earn profits in the course of its normal business transactions over the past four years. The company now perforce plans to sell a production payment to make up its loss. Making the effective date of the proposed change in the production-payment tax allowance retroactive, would penalize the company which had endeavored to avoid selling a production payment in prior years in the futile hope of other profits which had failed to materialize. There should be no difference between this situation, and that of a company in any other industry which sells assets at a profit to offset a loss carry-forward.

If the carved-out-production-payment tax treatment is taken away retroactively on the effective date proposed by the House of Representatives, it will leave an important segment of the oil industry without capital at a time when it is virtually impossible to borrow money, whereas, if the effective date is deferred until the end of the taxable year of enactment, the independent can at least try to devise some other means—however difficult he may find that to be—to meet his expected financial needs.

No company—and especially no independent oil producer—can operate without capital. If one source of exploratory and development capital is abrogated retroactively, and without adequate time to endeavor to arrange other sources, the industry may be driven to the wall. If it can find no other source of funds, it may well have to look to the consumer for finances in the form of higher prices. Concededly, it is not sound economics to raise capital by raising prices in an inflationary cycle; but if there is no other plan, that becomes the only way.

It is respectfully submitted that the rules of the game should not be changed after play has started, and has, in fact, entered its secon half. As stated at the outset, the members of the Permian Basin Petroleum Association, whom it is my privilege to represent before you, will make every effort if they must, to find new ways and means to finance their future exploratory programs in place of the production-payment method which has heretofore worked so well for all concerned.

They urge, however, that the present method be permitted to stand; but if, for reasons beyond their own imperative needs, this system, which has been in effect for more than thirty years, must now be abandoned, they earnestly request that the present tax treatment of carved-out production payments be permitted at least to remain effective for the whole of the taxable year in which the new legislation is enacted.

The CHAIRMAN. We will be back here at 2 o'clock to take the testimony of the remaining witnesses. I regret we have not been able to hear all the witnesses in this morning's session.

(Whereupon, at 1:05 p.m., the committee recessed, to reconvene at 2 p.m., on the same day.)

AFTERNOON SESSION

The CHAIRMAN. Ladies and gentlemen, other Senators will be along as the afternoon goes on.

Next, I call Mr. Joseph R. Rensch, president of Pacific Lighting Service Co.

We have your statement, Mr. Rensch. You can proceed to summarize it.

STATEMENT OF JOSEPH R. RENSCH, PRESIDENT, PACIFIC LIGHTING SERVICE CO.

Mr. RENSCH. Thank you, Mr. Chairman. I am here speaking on behalf of the American Gas Association as well as my company, the Pacific Lighting group of companies. We serve, in southern California, the largest gas distribution system in the country, and we are responsible for gas service to 12 million people in an area that is very heavily dependent on natural gas.

The American Gas Association represents almost all of the public utilities who distribute gas in this country, as well as the pipelines who buy the gas from the producer and sell it to us.

My remarks today are going to be confined to the natural gas situation and the very critical supply outlook that we face at this point, I speak as a distributor in saying that; then, I will talk about the impact of the proposed changes in tax incentives for exploration as they are going to affect our industry and our consumers, and I am talking about 200 million people.

We have a dilemma, Mr. Chairman, in this respect: Our potential supplies are up. As technology advances, as we learn more about the geological structures in our country, our estimates of the gas available to be discovered are increasing, and very much so.

For example, a very important estimate of potential supplies has been doubled just in the last 2 years. But at the same time, the development of proved gas reserves is lagging badly, and, as has been mentioned this morning, we are actually faced with the situation that our proved reserves of natural gas in this country declined last year.

Drilling for gas is lagging for two very basic reasons:

(1) There is a lack of incentive to drill for gas in this country, and (2) there is a lack of capital available to drill; and the two, as you know, are very closely related.

The gas industry is working hard to correct those factors that we can do something about, and that is why we are here today. We can't do anything about the tremendous demand for capital of the oil companies, the tremendous demand for the uses of this very limited capital, such as refinery expenditures, and that sort of thing. We cannot do anything about the tight money situation, which is hitting the oil companies very hard these days with the result that they are turning more and more to the money market, particularly the debt market.

I think most particularly we gas distributors cannot do anything about the fact that the producers are not public utilities, and, therefore, have no obligation to go out and drill for one cubic foot of gas.

We can seek to do everything we can to preserve the incentives to drill, the incentives to explore for gas, the incentives to develop gas.

The percentage depletion provisions in our present tax laws and other tax incentives now available do provide the incentive to explore for gas, and they do provide internally generated funds.

This comes to one of the very important problems we, in the gas industry, have now. This country is becoming more and more dependent on natural gas, because of its effect on the environment—this clean-burning fuel that we have available to help us meet a very critical national problem, and we are now supplying one-third of this Nation's total requirements. Despite the tremendous demand for our product, the gas industry is at the end of the line as far as attracting the producers' drilling dollar. We are at the end of the line.

I can state this another way: Any limitation on exploration dollars available to the major oil companies and the independent producers, hits gas first.

The CHAIRMAN. You might explain that. Why is it that a reduction in depletion allowances will force the housewife to pay more for natural gas and for electricity?

That is what you are saying, as I understand it.

Mr. RENSCH. We are going to still be able to beat electricity, but she is going to have to pay a lot more money if we do cut down the depletion allowance and do reduce the exploration for gas.

The CHAIRMAN. Explain how that would come about.

Mr. RENSCH. All right. This is the way it works, Mr. Chairman. Natural gas in this country is priced on a cost basis. All the gas we buy—and we buy over a trillion cubic feet of gas every year to deliver to our consumers in southern California—is based on cost.

If you take away the depletion allowance and if you take away the other tax incentives available to these producers, that cost then automatically will get in the pipeline company's cost and will automatically come into ours, and we, in turn, will pass it on to our 12 million customers to whom we serve gas. But that is only the start.

At that point, you can say: "All right. All you have done is taken a dollar out of one pocket and put it into the other." But here is the other area of costs imposed on this consumer who has the mistaken impression that he is going to gain something by reducing this depletion allowance. Here are some unnecessary costs that he is going to have to pay, if depletion is reduced and exploration therefore is also reduced.

If we can't get an adequate gas supply developed in this country and we have to back away on our industrial sales of gas which keep our facilities fully utilized—and, remember, we have got $35 billion of facilities around this country, high capital-cost facilities—if we have to reduce the use of those facilities because of the shortage of natural gas, then those continuing high fixed costs of gas have to be imposed on that little household consumer. And I could get very specific on the type of dollar impact, but I will not take your time unless you wish me to dwell on it.

But I can tell you, sir, that we have spent a lot of time on computer studies, showing what happens when we cut down on supply but maintain our facilities at fixed costs, and the person who is going to pick up that bill is this little consumer who thinks he is going to gain something by a reduction in the depletion allowance.

The CHAIRMAN. What you are saying is that when you reduce the depletion allowance, you are raising the tax on the people who are producing natural gas.

Mr. RENSCH. Yes.

The CHAIRMAN. And when you raise the tax on them, they are going to pass it on to you. As a man who is an executive of a utility company, you, in turn, have to pass that on to the housewife.

Mr. RENSCH. That is exactly right, and, then, in addition, Mr. Chairman, we have got to pass more costs on to her. In other words, it is not just a matter of putting dollars out of the gas consumer's pocket into the Treasury; it is going to cost that consumer more money, because we are going to have idling of facilities, which is an unnecessary cost that is also going to come out of the consumer's pocketbook. Another thing that is going to happen to us, Mr. Chairman——

The CHAIRMAN. Let me get that part of it straight. What you are saying, as I understand it, is that when the incentive to drill for oil and gas is less than it is now, you already have a developing shortage of gas at the moment; don't you?

Mr. RENSCH. Yes, we do.

The CHAIRMAN. And so the shortage will get worse because of less incentive to drill for oil and gas, and, as the shortage becomes more pressing, then, you will not be able to fully utilize the plants that you have to use this fuel. And since you can't fully utilize it, the per-unit cost of the electricity and the gas that you are passing on through to the consumer will have to rise because you cannot fully utilize your facilities.

Mr. RENSCH. Exactly. That is exactly what will happen. And in addition to that cost, Senator Long, we are going to have another cost imposed on our consumers, and it is caused by this factor.

We in the gas business are not just about to go out of business just because we are not developing adequate domestic supplies. We are going to get the gas into our system. The two places we are going to turn are imported supplies—and by that I also include Alaska. My company is looking at Alaska right now. We are going to turn to those supplies, and we are also developing, just as fast as we can researchwise, synthetic natural gas.

This is a long-range solution, because synthetic natural gas can be made from our abundant supplies of coal, and we are going to have that gas available.

But that costs more money, and it just does not make a bit of sense to go out and pay 50 percent more for those supplies when we can develop our own domestic natural gas supplies and hold that off.

I mean the consumer is the fellow that is going to have to pay that bill and this consumer is the fellow who thinks he is gaining by the elimination of this depletion allowance.

The CHAIRMAN. Can you tell me how much gas—on a B.t.u. basis—sells below the cost of oil? In other words, if oil is $3 a barrel, let us say in terms of B.t.u's, how does the price of gas compare?

Mr. RENSCH. It varies around the country. If you go up to the New England area, for example, gas can't compete with oil at that price. Now, down in my area we can, and we can beat $3 for oil rather substantially. I think our equivalent price is about $2.10 a barrel.

But more than that, in southern California, Mr. Chairman, the gas is burned whenever it is available because of the air pollution problem we have out there. Any gas we can bring in there, they burn, and that is why Los Angeles has the most efficient air pollution program in terms of control of stationary sources in the country.

It is because we burn tremendous quantities of natural gas and oil is only burned when gas is not available, and coal is not burned at all out there. So, pricewise, we happen to be below oil. Electricity is two and a half times our cost, and we are below the price of oil, and fortunately gas is what they want to burn out there from the standpoint of air pollution; that pressure is intense in the southern California area.

The summary of our position before this committee is that we do have in our industry a temporary gas supply problem that is most critical now. I emphasize the word "now", because, if we do get this thing turned around, by preserving the present tax incentives and a more realistic policy as far as natural gas is concerned, it is still going to take time for us to get natural gas supplies back at the level they should be. We need time before we can get these synthetic supplies and imported supplies in.

I just can't say strongly enough that any reduction in the tax incentive as it affects the drilling for gas could not come at a worse time. Every effort right now should be made toward increasing, not decreasing, the incentive to go out and drill for gas.

Thank you.

The CHAIRMAN. Thank you very much, sir.

STATEMENT OF JOSEPH R. RENSCH ON BEHALF OF THE AMERICAN GAS ASSOCIATION, INC., AND THE PACIFIC LIGHTING SYSTEM

SUMMARY

1. A disturbing paradox exists currently: Estimates of *potential* gas supplies have increased substantially; estimates of *proved* recoverable reserves declined last year.
2. Since 1946, the Nation's gas Reserve/Production ratio has declined from over 32 to less than 15.
3. Additions of new proved reserves are lagging because drilling activity has declined sharply since 1956.
4. At the very time Congress is considering a reduction in the incentives to drill, the temporary supply problem is most critical.

5. The long-term outlook for adequate gas supplies is bright because domestic supplies will be supplemented by imports and synthetic pipeline gas, but maximum domestic supplies must be developed now because there will be a time lag before there supplemental supplies become available in significant volumes.

6. Reduction of the depletion allowance and other tax incentives would impose added and unnecessary costs on the consumer.

   a. An increase in the producers' tax expense would flow through to the consumer.

   b. Shortage of domestic natural gas supplies would hasten the dependence on higher cost imported supplies and synthetic pipeline gas.

   c. If gas supplies should become inadequate to continue service to the load balancing industrial market, the cost of serving the small household consumer will be increased.

7. The current lag in exploration and development of new domestic gas supplies can be attributed basically to lack of available capital and incentive to drill for gas.

8. Reducing tax incentives at this time would further reduce cash available for drilling and would be a severe blow to the gas industry's efforts to develop gas supplies that are available and badly needed now. Such a reduction could not come at a worse time.

Statement

I am President of Pacific Lighting Service Company, headquartered in Los Angeles, California, and I am appearing on behalf of the American Gas Association and the Pacific Lighting System.

THE AMERICAN GAS ASSOCIATION

The American Gas Association is comprised of 271 gas distribution companies, 67 gas and electric distribution companies, 31 gas pipeline companies and several thousand individual members. Over 40 million homes, businesses and industries in this country are served with natural gas; the distribution companies in this Association serve over 90% of these customers.

This Nation has become highly dependent on this clean, efficient and economic source of energy. Over one-third of the country's total energy requirements are now provided by natural gas. This dependency is reflected by the gas industry's $35 billion investment in facilities and many more billions of dollars of consumer investment in appliances and other equipment.

THE PACIFIC LIGHTING SYSTEM

The Pacific Lighting companies serve the country's largest and fastest growing gas distribution system. Our two large distribution companies, Southern California Gas Company and Southern Counties Gas Company, serve approximately 3,100,000 retail customers and wholesale natural gas to supply another 470,000 customers in Southern California. Over 12 million people depend on our companies for a reliable supply of natural gas at a regulated reasonable price. Our gas operations trace back over 100 years and, for over 40 years, Southern Californians have been heavily dependent on natural gas as an energy source.

THE CURRENT NATIONAL GAS SUPPLY OUTLOOK

A disturbing paradox exists currently in the natural gas industry. Estimates of *potential* natural gas supplies—waiting to be searched for, discovered and developed—have been increased substantially due to recognition of new provinces and improved technology. Consumer demand for this clean, economic energy source is climbing sharply. Yet, the finding and development of proved gas reserves are sagging simply because the producers are not devoting the necessary drilling capital in the continental United States.

I have reviewed 36 estimates of *potential* supplies prepared since 1950. During this period, as new provinces were discovered and technological improvements emerged, these estimates of potential supplies have increased substantially. The Potential Gas Committee, which acts under the objective guidance of the Colorado School of Mines and relies on the input of a large number of the most technically qualified people in the industry, increased its estimates of future potential gas reserves from 690 trillion cubic feet in 1967 to 1230 trillion cubic feet in 1969, due primarily to the new provinces in Alaska and the technological developments that permit deeper drilling both onshore and offshore. But all of these potential supplies are of no value to the consumer until they are drilled for and put on production.

Paradoxically, this year the American Gas Association Reserves Committee reported a decline in the Nation's *proved* recoverable gas reserves for the first time since this nationally accepted Committee commenced publishing annual reserve statistics 23 years ago. During the year 1968, 19.4 trillion cubic feet were produced while only 13.8 trillion cubic feet of new gas reserves were added, so that the Nation's proved reserve inventory declined from 292.9 trillion cubic feet to 287.3 trillion.

The chart in Appendix A compares the yearly reserve additions with the net annual production totals since the end of World War II and graphically illustrates the recent disparity between increases in supply and demand for gas. During this period, the Nation's ratio of proved reserves of natural gas to annual production has declined from over 32 to less than 15 by 1968. (See Appendix B) The sharp downward trend in the Nation's Reserve/Production ratio must be arrested by the development of new domestic reserves so that the inventory does not get too low before large scale production of synthetic pipeline gas becomes available.

The tabulations of certain key statistics included in Appendix C demonstrate why the addition of new proved gas reserves is lagging. Total new well drilling reached a peak in 1956 and has been declining ever since. Since that year, the following decreases have been recorded:

Total exploratory wells	down 45%
Gas discoveries	down 48%
All new wells	down 47%
Gas producers	down 26%
Active drilling rigs	down 57%

This tabulation also shows that the total number of producing gas wells has declined in each of the past two years.

Now, at the very time Congress is considering a reduction in the incentives to drill, the industry's temporary supply problem has reached its most critical stage. Many of the gas pipeline companies have been unable to acquire the gas supplies to meet the normal growth requirements of the gas distributors this year. Every effort must be made to turn this situation around and accelerate drilling for gas to higher rates of activity than ever before. Time is of the essence because there is a time lag between the resumption of accelerated drilling activity and the proving up of the gas reserves to deliver to the pipelines.

FUTURE SUPPLIES

The long-term outlook for adequate gas supplies is bright not only because our growing recognition of the large volume of potential supplies and our ability to supplement future supplies with imported volumes (delivered by pipeline or by tanker in the form of liquefied natural gas) but, most important in terms of the next century, because of the outlook for production of synthetic gas from the Nation's abundant supply of coal.

This raises another reason for developing the maximum volumes of gas supply in the continental United States at this time. These important future supplemental supplies will be higher priced. The maximum early development of the lower-cost, domestic natural gas supplies will postpone the blending in of these supplemental sources to the benefit of the consumer's pocketbook. Furthermore, although the gas industry's goal is to attain an annual supplemental gas production rate of 20 trillion cubic feet of synethetic gas by the year 2000, further time is needed for pilot plant and development work and the first large scale production facility cannot be expected to be in service much before the mid-1970's.

To fill this time gap, the current rapid decline in the Nation's gas Reserve/Production ratio must be arrested by giving the producers the maximum immediate incentive and access to funds to accelerate the level of drilling activity. Any elimination of the present tax incentives—which, in turn, are a key source of exploration capital—will severely impair the gas industry's effort to solve the immediate supply problem.

THE COST IMPACT ON THE CONSUMER

The American consumer—feeling the need for tax reform—is under the natural impression that he would be benefited by a reduction of the symbolic depletion allowance and other tax incentives now available to the oil and gas producers. Actually, the consumer will not only bear the cost burden of the additional tax revenue but, in addition, will fall heir to other unnecessary costs if the incentive to explore for gas is further reduced by limitations on the tax incentives.

The price of gas flowing in interstate commerce is regulated on the basis of cost, and it can be assumed that any increase in the producer's tax expense will flow through to the consumer. Unfortunately, the cost impact on the consumer would not stop here. First, as indicated above, the certain adverse impact on exploration for domestic gas supplies would hasten the dependence on higher-cost, imported supplies and synthetic gas. Of even greater importance, if gas supplies are inadequate to continue service to the important load-balancing industrial market, gas pipeline and distribution companies will operate their high capital cost facilities at reduced load factors, and this automatically increases the cost of serving their customers. This unnecessary economic penalty on the small household consumer will result if the producers do not proceed to develop adequate domestic supplies now.

THE RELATIONSHIP OF TAX INCENTIVES TO DRILLING

The current lag in exploration and development of new domestic gas supplies can be attributed basically to lack of available capital and incentive to drill for gas. Both of these factors would be worsened by a reduction in percentage depletion and elimination of other tax incentives.

There are other factors currently dampening exploration activity and the gas industry is working hard on those that are subject to alleviation. Unit drilling costs and average well depths are increasing while exploratory success ratios are declining. Shallow, easy-to-find fields have already been found. Many in the industry feel that past Federal regulatory policies have stifled the incentive to explore for gas.

The tight money situation is certainly having its impact. Historically, the producing industry has relied heavily on internally generated funds, but increasing capital requirements have forced much more extensive use of debt capital. And the capital demands on the producers are intensifying further. Recent high bonuses paid for offshore and Alaska North Slope leases have drained exploration budgets. All of these factors combine to make it difficult to attract exploration capital into badly needed domestic gas drilling.

Adding the reduction of tax incentives at this time will decrease the cash which would otherwise be available for exploration and development work and will be a severe blow to our efforts to bring forth the valuable domestic gas supplies that are available to be developed and so badly needed now.

CONCLUSION

The gas industry is seriously concerned that the urgent need of the natural gas consumers has been obscured. It cannot be emphasized strongly enough that any reduction in the tax incentive to drill for gas could not come at a worst time. An all-out effort must be made to increase—not decrease—the incentive to explore for and develop critically needed gas supplies.

The CHAIRMAN. The next witness will be Mr. Walter E. Rogers, president of the Independent Natural Gas Association of America.

Mr. Rogers, we are pleased to have you here as a witness.

We recall the years when you served with great distinction over in the other body, in the House.

STATEMENT OF WALTER E. ROGERS, PRESIDENT, INDEPENDENT NATURAL GAS ASSOCIATION OF AMERICA; ACCOMPANIED BY JEROME J. McGRATH, VICE PRESIDENT AND GENERAL COUNSEL, INDEPENDENT NATURAL GAS ASSOCIATION OF AMERICA, AND CHRISTOPHER T. BOLAND, MEMBER, LEGAL COMMITTEE, INDEPENDENT NATURAL GAS ASSOCIATION OF AMERICA

Mr. ROGERS. Thank you, Mr. Chairman.

The CHAIRMAN. I recall the courteous treatment you gave me before your committee, and I am happy to welcome you before ours.

Mr. ROGERS. Thank you, sir.

I have here with me our vice president and general counsel, and also a legal committee member in our group, who I would like to have at the witness table.

The CHAIRMAN. By all means.

Mr. ROGERS. Mr. Chairman and members of the committee, it is a pleasure to be before this committee to present our views on the tax reform bill. My statement has been filed, as instructed by the chairman, and I will proceed to summarize it.

For the record, I would like to say my name is Walter E. Rogers. I am president of the Independent Natural Gas Association of America which is frequently referred to as INGAA. INGAA is a nonprofit national trade association representing virtually all of the major interstate natural gas transmission companies, subject to the jurisdiction of the Federal Power Commission under the Natural Gas Act of 1938. Our member companies account for over 90 percent of the natural gas transported and sold for resale in interstate commerce. These companies have a total gross transmission, storage and production plant investment of over $15 billion.

Natural gas transmitted through these facilities reaches every State of the Union with the exception of Alaska and Hawaii. The association also includes a substantial group of producers and distributors of natural gas in its membership.

Now, my testimony today, Mr. Chairman, will be directed at two particular features of the tax reform bill. One of these, the first one with which I will treat, will be with reference to accelerated depreciation allowed regulated industries as it applies to the natural gas pipeline industry, and the other will be the matters concerning the depletion allowance.

At the time I requested time to appear before the committee, I asked to be heard on those two subjects, and also on the investment tax credit, but I understand that the committee has already taken care of the latter and that the chairman does not want to hear further on it at this time. So, we will confine our remarks to the two items first mentioned, and I will make this just as brief as possible, and I think we can point it up very quickly.

In 1954, the Congress amended the Internal Revenue Act, section 167, to permit the use by business generally of several types of depreciation. Of course, the straight-line type of depreciation, and then they permitted accelerated depreciation which encompassed several different types of accounting.

Now, subsequent to that time, the regulatory agencies having jurisdiction of regulated industries and the Federal Power Commission in particular, insofar as our industry is concerned, decided that those companies who had the availability of accelerated depreciation must take it and flow it through to their customers.

Now, this is a situation with which these industries are presently faced: If this is done, any tax benefits flowing to the regulated industry must be flowed through to earnings, and this goes on to the customer.

Now, this creates two situations: In the first instance, it deprives the Treasury of much needed revenues.

In the second, it denies to the regulated industry the use of funds that should be available to that industry for investment purposes, as was originally inended when accelerated depreciation was provided.

Now, this has caused several other situations in the regulated industry. For instance, some of the regulatory agencies were not as quick to decide that you must flow through these tax benefits to your customers, so the regulated industries under those agencies simply continued on straight line, and some of the people in our industry continued on straight line.

Others went on to accelerated depreciation, and the ones who did this had to flow through. They were not required by law to flow through, but they were told by these commissions in effect that if they did not flow through, flow through would be imputed to them.

As I pointed out in my written statement, if you tell a man he is going to be snake-bit if he does not move, the chances are he will move, and this is exactly what these companies did.

Now, when the tax reform bill was passed by the House, it froze into these various areas of depreciation each company on the basis they had been conducting their business and using their method of accounting as of July 22, 1969. This simply means that if you were on straight-line, assuming that the House bill is accepted at face value—that if you were on straight-line prior to July 22, 1969, you are frozen on straight-line. If you were on accelerated and you were normalizing, you are allowed to continue that normalization. If you were on flow-through which most of the companies were, you are frozen on flow-through from now on, and there is nothing you can do about it, without the consent of the regulatory agency.

On new property (property acquired after Dec. 31, 1969) a proviso is made for a company on straight-line to go to normalization, that is, to go to accelerated and normalize, but you cannot go on to flow-through. If you are on flow-through on old property, you must stay on flow-through as to new property. So, for all purposes, you are frozen into the flow-through method.

Of course, this is a continuation of the denial of revenues to the Federal treasury, and a continuation of the denial of the tax benefits intended by the Congress to flow to business for investment purposes simply because that is a regulated business.

Now, we have attached to this statement a proposed amendment. We are not wedded to any particular language, but we feel, Mr. Chairman, that a regulated industry ought to have the same treatment as a non-regulated industry.

We feel that, if there are several methods of depreciation provided by the Congress of the United States, the regulated industry should be allowed to use whichever one of those in its best-business judgment will fit its needs; and not be subjected to having these benefits denied because of the ruling of a regulatory agency.

What we have done is this: We would prefer that the industry have complete flexibility in both directions, either to go to flow-through or to go off of flow-through, but realizing the position of the Treasury at this time with regard to the needs for money, we have taken the position in the amendment that we are suggesting so that the industry can go to a slower type of depreciation but not to a faster.

Now, if this is adopted, it simply means this: that the companies will have the opportunity to use these tax benefits, and it will also mean that the Treasury will get more money, more on a short-term basis, and certainly a great deal more on a long-term basis.

If this is not done, it is going to put these companies, which are high-debt-structure companies, very high-debt-structure companies, probably as high as any other industry in the United States with the exception of the housing industry—if this tax benefit is denied to these industries, it simply means this, that they are going to have to go into the money markets and competitively bid for money to meet their needs in the future. If this is done, of course, it is going to contribute constantly to the increase in interest rates.

In my written statement, I said that these interest rates have already gotten above eight and a half percent. It is my understanding that since that time that those interest rates have increased to approximately 9 percent, insofar as the requirements on the company are concerned, because the bonds that they have sold had to be sold at a discount; so, it simply means that their payout is going to require them to produce a little over 9 percent.

Now, whether or not this will be reduced, I do not know. The chances are it is going on up, but we would hope, as an industry, that this committee would see fit to amend this act so that the flexibility that was intended by the Congress when they passed the amendment in 1954 to allow accelerated depreciation so that the members of our industry could avail themselves of the tax benefits—we think that it would serve the country much better; we think that the needed expansion of the interstate pipelines would be served, and we think it would help the general economy all over.

With regard to the depletion allowance, I have listened intently to the presentation of the witnesses this morning, and would simply say that we could endorse practically everything that was said. Our association is unqualifiedly opposed to a reduction in the depletion allowance.

When you look back over the picture, you see that in 1926, if I recall correctly—and, Senator Anderson, I am sure you remember it quite well—the Treasury Department, at that time, suggested above 30 percent as the proper percentage depletion, but, as many things are handled in the Congress, the 27½ percent came out as a compromise, and I think, when we look across the pages of history and see what the oil and gas industry has done for this Nation in comparison with what has been done in other nations, that we ought to try to apply some of the rules that are applied to them to maybe other industries rather than to try to destroy an industry that has contributed as it has, as the oil and gas industry has, to the great achievements of this country.

You may ask and others may ask: "Well, what difference does it make to a pipeline? What difference does it make to an interstate transporter? You are the middleman; you get the gas from the producer, you take it across the country, and you turn it over to the distributor."

Well, you have heard testimony from Mr. Rensch. You have heard testimony from the producers this morning, both the majors and the independents, pointing up the problem.

Our gas supplies are dwindling, and much faster I think than we are anticipating. I was looking at some statistics the other day that our reserves in 1946 measured by years were 32 years. Today, they are about 15. Now, this has been caused by an increasing demand by an expanding population, by new technologies for the use of gas, and, on the other side, you have a dwindling supply. Gas is the lifeblood of the interstate pipeline industry.

Although these projections of the future as to the shortage appear rather bad, I think that there is a possibility that they will be much worse.

I remember, when I first came to Washington, we had some experts that predicted that by 1975 this country would have 200 million people in it. Well, you know we passed that 200 million people in October of

1958. Now, imagine how much they missed their predictions; maybe they wanted to be overly conservative, but 17 years is a bad miss.

I think the same thing could be applied with regard to the energy needs of this country, and I think that one of the best investments that was ever made by the Congress of this country was to provide a 27½-percent depletion allowance and the expensing of intangible drilling costs. Certainly you have the proof of that statement in the great contribution made by the oil and gas industry.

Now, maybe 27½ percent, maybe expensing of intangible drilling costs did not cause it, but I can tell you that it caused a big part of it, because I have spent a lot of my time in the oilfield areas of this country, and I have seen the development and the contribution to the wealth of this country and the contribution to the tax structure, and we would hope that this honorable committee would follow what I think is the splendid record of the past and continuing the 27½-percent depletion allowance, and also the expensing of intangible drilling costs.

Thank you very much.

Senator ANDERSON. Thank you, Mr. Rogers.

(Mr. Rogers' prepared statement follows:)

STATEMENT OF WALTER E. ROGERS, PRESIDENT, INDEPENDENT NATURAL GAS ASSOCIATION OF AMERICA

My name is Walter E. Rogers. I am President of the Independent Natural Gas Association of America, which is frequently referred to as INGAA. INGAA is a non-profit national trade association representing virtually all of the major interstate natural gas transmission companies subject to the jurisdiction of the Federal Power Commission under the Natural Gas Act of 1938. Our member companies account for over ninety percent of the natural gas transported and sold for resale in interstate commerce. These companies have a total gross transmission storage and production plant investment of over $15 billion. Natural gas transmitted through these facilities reaches every state of the Union with the exception of Alaska and Hawaii. The Association also includes a substantial group of producers and distributors of natural gas in its membership.

My testimony today will be directed principally to two features of the tax reform bill, both of which are of great concern to our industry. It is the studied opinion of INGAA that if these two features are adopted as presently written in the bill, they could result in serious adverse effect on the industry, the general economy, and the welfare of the nation.

The two features referred to are:

1. Accelerated depreciation allowed regulated industries, and
2. Reduction in the depletion allowance for oil and gas.

These two items will be discussed in the order named.

ACCELERATED DEPRECIATION ALLOWED FOR REGULATED INDUSTRIES

In 1954 the Congress amended Section 167 of the Internal Revenue Code with respect to the depreciation methods and rates available to taxpayers in computing depreciation on tangible property used in trade or business. The taxpayer was given the right by that amendment to elect, from the methods available, to use either straight line depreciation or accelerated depreciation in computing his income tax, and to discontinue its use at any time, both as to new and old property.

The legislative history of the amendment to Section 167 clearly indicates that it was the intent of Congress in providing the depreciation methods described in Section 167(b)(2), (3) and (4) of the Code to allow all taxpayers the free exercise of business judgment in the selection, from among those methods authorized, of the appropriate method of allocating the depreciable cost of property over the years of service, *without restriction by regulatory agencies in the case of taxpayers subject to regulation*. The Code further permits the use of accelerated depreciation for tax purposes and straight line depreciation for book purposes. Normalization is defined generally as the computation of tax expense, for cost of service purposes, by using a method of depreciation which is different from the method actually used for computing Federal income taxes and adjusting a reserve for deferred taxes to reflect the deferral of taxes resulting therefrom.

Despite the clear intent of Congress that regulated industries be permitted the same elections and the same benefits regarding depreciation of their business property as non-regulated taxpayers, several of the regulatory agencies took the position that those regulated companies within their jurisdiction, using accelerated depreciation for tax purposes, would be required to "flow through" currently to the companies' customers any and all tax benefits or reductions in income taxes. Such policy is presently being pursued by the regulatory agencies referred to, and unless corrections are made in this legislation, they may continue to do so.

The consequence of such action is rank discrimination against the regulated industry, in that the very purpose and reason for accelerated depreciation is defeated, and the Treasury of the United States is deprived of substantial tax revenue. The latter point being expressly pointed out by Assistant Secretary of the Treasury Edwin S. Cohen in his testimony to the Congress.

It should also be pointed out that the former Chairman of the Federal Power Commission, the Honorable Lee C. White, told the Ways and Means Committee of the House of Representatives on March 25, 1969, that the taxes payable by natural gas pipeline companies in 1967 were *reduced* by about $72 million due to the use of the "flow through" policy referred to. Such policy also operates to deny to the regulated industry the much needed funds intended by the Congress to be available to industry for investment in new plant and equipment. Hence, the natural gas pipeline industry, as one of the regulated industries, is forced to go into the highly competitive money markets of the nation in order to acquire the funds necessary to carry out its responsibilities in providing and furnishing gas to meet the rapidly expanding demands throughout the nation, especially in the metropolitan areas. In order to get these funds, the natural gas pipeline industry, a highly debt-structured industry (perhaps the highest with the exception of the housing industry), must compete with all others seeking additional funds. The result has been constantly increasing interest rates, which are now in excess of 8½% and may be expected to continue to climb in the absence of a realistic approach to such problems as those outlined in this presentation. Thus, the present policy of the F.P.C. obviously contributes measurably to the inflation spiral and also to the increased cost to the consumer. It is the opinion and view of INGAA that the "flow through" policy of the regulatory agencies is in violation of the clear intent of Congress, results in discrimination against the regulated industry, is a disservice to the consumers of products and services subject to regulation, deprives the United States Treasury of much needed revenue, and is not in the best interest of the general economy of the country.

It is the further opinion of INGAA that Section 451 of H.R. 13270, which would amend Section 167 of the Internal Revenue Code, does not cure the problems outlined nor afford the remedy so badly needed.

We believe that the taxpayer, whether regulated or non-regulated, should, in the exercise of his best busines judgment, have the freedom of electing that method of depreciation authorized in Section 167 which is best suited to his needs; and that such election should be completely free of any interference from regulatory agencies. We firmly believe that no regulatory agency with authority to establish or approve the rates of any taxpayer should, without the consent of the taxpayer, specify or prevent a change of the method or rate of depreciation allowable under the Code used or proposed to be used by such taxpayer in computing the amount of its Federal income tax. We further believe that no regulatory agency, in determining the taxpayer's expense for Federal income tax, should be allowed to utilize any other method of depreciation other than that used or proposed to be used by the taxpayer in computing its Federal income tax nor be permitted to exclude from such tax expense, either directly or indirectly, the amount of any reduction in Federal income tax payable for any period utilized by the regulatory agency in establishing the taxpayer's cost of service.

In short, it is the strong opinion of INGAA that the choice of the method of depreciation to be used by the taxpayer from among those methods authorized by law should be solely the choice of the taxpayer, and that such choice be inviolate for all purposes.

We fully appreciate the dilemma faced by this Administration with relation to Treasury revenues because of the trend toward the "flow through" of accelerated depreciation tax benefits. However, we would hasten to point out that the change over by many of the regulated industries has been the result of implied threats by the regulatory agency having jurisdiction to impute to such industries the "flow through" theory in fixing "cost of service" for rate making purposes. In short, the change over has been involuntary. It is like telling a man that unless he moves he will be "snake bit." The chances are he would move. Such has been the case in many instances of natural gas pipeline companies in moving over to the flow through method of accounting. Some of them would like to return immediately to either straightline depreciation or to accelerated depreciation with normalization. Some of them find that they canot immediately make such change because their programs have been worked out over a period of several years using the flow through method which was virtually forced upon them.

Under the circumstances the proper solution to the problem faced by the Treasury and also by the companies, would seem to be an authorization for those companies to return to a slower method of depreciation but not allowed to go to a faster depreciation. In other words, if Section 167 of the Internal Revenue Code could be amended to provide the election to the taxpayer to remain on the method of depreciation being used as of July 22, 1969, or to return to a slower depreciation, any moves from flow through to normalization or straight line would result in additional revenues to the Treasury on an early basis and substantial increases on a long range basis. It would also enable the regulated companies to have flexibility in meeting their capital needs for expansion requirements, and would be a contribution toward the solution of the inflationary problem.

This could be done as to both old and new property, as defined in H.R. 13270, and the result would be additional revenues to the Treasury. A suggested amendment is attached hereto and made a part of this statement for all purposes, which in the opinion of INGAA, will accomplish the results sought. Unless such an amendment or one of a similar nature accomplishing the purposes outlined, is adopted, there will result rank discrimination and unfairness as between regulated and non-regulated industries and also as between regulated industries. It should be noted that as the "flow through" policy was developing in the minds of the regulatory agencies, some of those agencies moved faster than others in indicating to those companies under their jurisdiction, the intention to adopt flow through policies for rate making purposes. Hence, many of the companies that moved to "flow through" before July 22, 1969, because of such indications or implied threats as the case may be, find themselves frozen into "flow through" on both old and new property, under the provisions of the language adopted by the House of Representatives (Section 451 of H.R. 13270) unless permitted by the regulatory agency to change. Other companies which had not moved into the flow through method but had continued to use straight line depreciation may remain on straight line depreciation both as to old and new property. The taxpayer using accelerated depreciation on or before July 22, 1969, and normalizing, would be allowed to continue to use accelerated depreciation and to normalize with respect to old property. If the taxpayer was using accelerated depreciation and flowing through, he would be required to continue to use such practice in the absence of permision by the regulatory agency to go to a slower depreciation. In other words, he would be frozen into the "flow through" method, even though he had adopted such method against his best business judgment and only because of the insistence of the jurisdictional regulatory agency.

With relation to new property (property completed or acquired after December 31, 1969), a taxpayer on straight line or on accelerated depreciation with normalization would be permitted to take accelerated depreciation and normalize. If the taxpayer was on flow through as of July 22, 1969, he would have no choice but to stay on flow through unless he could get the permission of the regulatory agency having jurisdiction, to return to a slower method of depreciation, a permission that could not be obtained under any circumstances insofar as the Federal Power Commission is concerned unless the said Federal Power Commission changes the policy it has pursued to the date.

The unfairness with relation to regulated industries forced into the flow through method of accounting is quite obvious, and in the opinion of INGAA should be changed.

INGAA respectfully submits to this Honorable Committee and the Congress that fairness in the application of tax requirements or benefits demands uniformity in the law as applicable to both regulated and nonregulated industries, and especially is this true with regard to the several industries falling within the category of the "regulated" field. It is the position of INGAA that all regulated industries now using the "flow through" method of accounting for depreciation purposes should be given the right and option as to both old and new property to change such accounting method to a slower method of depreciation, to wit, "straight line" or "accelerated depreciation with normalization," but not be required to. All companies presently using accelerated depreciation and normalizing should be allowed to continue such accounting practice as to both old and new property, or to go to a slower depreciation on either type of property or both types, but not be required to. Those companies presently using the straight line method of accounting for depreciation purposes should be permitted to use accelerated depreciation with normalization on new property.

If the Congress will adopt such policy, it is the opinion of INGAA that the best interests of the country will be served.

Reduction in the Depletion Allowance for Oil and Gas

INGAA respectfully submits that it is unqualifiedly opposed to any reduction in the 27½% depletion allowance on oil and gas which has been in effect for more than forty years.

A review of history will reveal that at the time of the adoption of the percentage depletion formula in 1926, the Treasury of the United States, having made a thorough and complete study of the issue, recommended more than 30% as an appropriate and fair figure. The 27½% was the result of a compromise. It has been attacked annually for many years and has always withstood the onslaughts directed against it, because it is reasonable, just, fair, and has served to produce the incentive for the tremendous progress enjoyed by this country in the development of oil and gas. That incentive made it possible for this country to move to the forefront in the exploration, discovery and development of great petroleum resources in our nation. Resources without which this country could well have been the loser in armed conflict that has challenged free man constantly during this century. Resources that not only provided the major difference in our defense posture, but served as the basis for the greatest advancement of mankind in contributions to the needs and requirements of the individual during peace time. There is no area of human need or endeavor in which petroleum does not play some substantial role. I have often wondered in my own mind what the picture would be today had there not been an incentive to promote and foster the search for oil and gas, such as the 27½% depletion allowance. Would there have been a North Slope of Alaska? Would there have been a Texas Panhandle field? Would there have been an East Texas field? Would there have been many of the discoveries on foreign soil? Would America have won World War II? What would be the situation in the field of medicine, to which petroleum products have so measurably contributed? What would have happened to our automobile industry or to the labor groups? This same question could be asked about every phase of American life since the original discovery of oil in Pennsylvania.

Some may say that there is no relationship between the 27½% depletion allowance and the great strides that we as a nation have made, both collectively and individually. However, the facts of history simply do not bear out such an allegation. It has been the hope of reward that has spurred on the single wildcatter, the small partnership, the corporations and combinations of these entities to risk their time, their energies and their worldly goods in the quest for petroleum products. It has been the product of that quest that has made this country the world's leading producer of petroleum products over the years and the world's greatest consumer of those products. In 1967 the records reflect that there were 5,260 new-field wildcat wells drilled, 4,700 of which were dry holes. This reflected a productive percentage of only 10.6%. Had it not been for depletion allowance and the expensing of intangible drilling costs, no one would be naive enough to suggest that such a drilling program could have been mounted. If either or both of these incentives are measurably reduced or destroyed, it is almost certain to follow that there will be a substantial reduction in wildcat wells drilled and in new-field wildcat wells drilled. Even under present circumstances, records reflect that there has been a constant reduction in wildcat wells drilled from 12,000 plus in 1956 to 6,026 in 1967. In new-field wildcat wells drilled, the reduction has been constant since 1956 from 8,709 to only 5,260 in 1967.

INGAA realizes that this Honorable Committee has received a great and varied amount of statistics on this subject. It is not our purpose to indulge in repetition, but we do hope that the gravity of the situation has been made clear and that this Committee will conclude that the true value of the depletion allowance has been proven many, many times.

One might ask why the gas pipeline industry would have an interest in a matter that should be of greatest concern to the oil industry. The answer is quite obvious. Gas for many years was looked upon as a by-product of the oil business, without any great value. Wells were drilled for oil, not gas. Gas was discovered while the search was being made for the oil. It was during World War II that the great need for energy opened the door for the large interstate pipelines to be constructed and provided the opportunity for gas to assume its proper role in the energy requirements of this nation. Today gas provides one-third of the energy requirements of our country, and the demand for additional service and supplies is constantly rising. Hence, natural gas is the lifeblood of the pipeline industry. Unless it is available in appropriate quantities, the industry itself will suffer measurably, the serious effects on the industries utilizing it cannot be over emphasized, and cold homes and apartments would not be an idle thought. As before mentioned, the demands for natural gas are on the constant increase. It is estimated at the present time that such requirements will increase at the rate of about 4% per annum. New gas discoveries are not keeping pace with demand. For the first time since 1946 the records reflect that natural gas production in 1968 exceeded new discoveries. Total reserves showed a decline over the previous year of 1967. Additions to reserves were approximately 6 trillion cubic feet *less* than the amount produced in 1968. The Federal Power Commission in July of this year reported that domestic natural gas reserves of 64 major pipeline companies dropped during 1968. In recent months pipelines and distributors have experienced difficulties in contracting for anticipated requirements, and in a number of instances have not been able to obtain the needed gas. These declines, if allowed to contine, coupled with the population explosion in this country, could signal the beginning of a most critical stage in the ability of this country to meet its energy requirements.

It would appear that the logical, the sensible, and the realistic approach at this time would be for the Administration and the Congress to be searching for new ways to promote the exploration and discovery of petroleum products. Certainly it is not the time to reduce the incentives presently available and thereby create a risk that this country cannot afford to take. If there was ever a time in the history of this country when we need to search out every possible source of energy in the continental United States, it is now. We are well aware that much has been said about the potential reserves of oil and gas in this country. The Potential Gas Committee, which has done an admirable job in association with the Colorado School of Mines, has estimated future potential gas reserves of 1,230 trillion cubic feet, both on shore and off shore in the continental United States. This all sounds wonderful, but the word "potential" cannot be associated with "known reserves." If these potential estimates are to be realized, there must be a measurably stepped-up exploratory effort resulting in new discoveries. Results that will not come about unless proper incentive is present.

It is the opinion of INGAA that the most sensible investment this country could make at this time would be to retain the incentives presently available in the oil and gas industry, and if necessary, to add thereto rather than subtract therefrom. If such a course is followed, the average American citizen will be the beneficiary, both from a personal and a national standpoint.

Amendments Proposed by the Independent Natural Gas Association of America to H.R. 13270

On page 266, strike out lines 14 and 15 and insert in lieu thereof the following:

"(B) the requirements of paragraph (2), to the extent applicable, are met with respect to such property."

On page 266, line 16, strike out the phrase "Continuation of Normalization" and insert in lieu thereof "Elections."

On page 266, after line 25, add the following new paragraph:

"In the case of public utility property described in paragraph (1) with respect to which (or with respect to property of the same kind) the taxpayer as of July 22, 1969, used a method of accounting other than normalization, the taxpayer may continue to use a method other than the straight line method with respect to such property for the purposes of computing taxable income, or such taxpayer may elect to utilize a straight line method of depreciation for computing taxable income with respect to such property.

"In the case of public utility property described in paragraph (1) with respect to which (or with respect to property of the same kind) the taxpayer as of July 22, 1969, used a method of accounting other than normalization, the taxpayer may adopt the normalization method of accounting with respect to such property.

"No agency or instrumentality, commission, or other similar body with authority to establish or approve the rates of any taxpayer shall, either directly or indirectly, limit the elections of such taxpayer as herein described."

On page 267, line 18, after the period, insert the word "or," and add a new paragraph to be designated (C) to read as follows:

"(C) the taxpayer referred to in (B) above elects to use the normalization method of accounting with respect to such property. No agency or instrumentality, commission, or other similar body with authority to establish or approve the rates of any taxpayer shall, either directly or indirectly, limit the election of such taxpayer as herein described."

Senator ANDERSON. The next witness is Mr. William Jackman.

STATEMENT OF WILLIAM JACKMAN, PRESIDENT, INVESTORS LEAGUE, INC.

Mr. JACKMAN. Mr. Chairman, I have received a telegram from the committee which permitted me to include my capital gains statement and the depletion statement all in one, to prevent my having to make two different appearances, and that is the reason I am doing it today.

I am William Jackman. I am president of the Investors League in New York City. I reside in East Orange, N.J., and we have thousands and thousands of members residing in every State in the Union. So, it must be obvious why I am before this committee.

If Winston Churchill were around today, I am afraid he might say that yours is a monumental task, and may God be with you during your deliberations.

Senator BENNETT. Excuse me, just a minute. We have had a call from the Senate.

(Discussion off the record.)

Senator BENNETT. Mr. Jackman, I notice that you have a text for what I assume is a summary.

Mr. JACKMAN. Yes.

Senator BENNETT. Which will consume all of your time.

I notice you are getting off of your text. I thought that I had better warn you.

Mr. JACKMAN. Well, I will not do that.

Mr. BENNETT. I did not see Winston Churchill in the text.

Mr. JACKMAN. No, I just thought I would inject that, because I think it is rather appropriate.

Nevertheless, the tax reform bill, H.R. 13270, which had passed the House by a majority of 394 to 30, is, in my personal opinion, a bill that was conceived and enacted in astonishing haste without giving the legislators time to digest it. Even Mr. Mills of the Ways and Means Committee had to confess himself confused. He had to reassemble his committee to amend the rate schedules for low-income taxpayers because of what he called misunderstanding.

A further indication of the haste in which this legislation was considered by the Ways and Means Committee was the extraordinary session called by the committee on the day before the bill was scheduled for action on the floor because it had somehow overlooked millions of potential beneficiaries.

Even more astounding was the fact that these persons were in the $7,000 to $12,000 annual income group, the so-called middle income.

This oversight was quickly corrected by the committee, although the action cost the Government $2.4 billion in anticipated lost revenue.

It adds untold pages to the "infernal" Revenue Code, magnifying the complexity of existing conditions. It is time for the Congress to realize that true tax reform can only be achieved through simplification.

In the tax reform bill of 1969, there are provisions to increase the maximum rate on long-term capital gains from 25 to 30 percent—and this is the crux of my argument—indicating the Treasury would gain $300 million of new revenue from this source if this were accomplished.

The facts are contradictory. The Treasury would lose money if its provisions remain in the bill. Investors would not sell. They would be frozen.

A recent survey that was conducted by the New York Stock Exchange, by Louis Harris and Associates, shows that if the long-term capital gains were reduced from 25 to 12½ percent, the Treasury would receive an estimated $2.5 billion in revenue. That is over $2 billion more than they are presently receiving.

A similar survey was conducted by the Investors League of its own members and substantiated these figures.

When the Government needs revenue and can get it from a tax decrease, why shouldn't it do so?

The capital gains tax is not a tax on income at all. A man is no richer nor poorer when he sells an asset and reinvests it in another. Secretary of the Treasury Kennedy expressed concern about the bias in the bill against the investment in favor of consumption, saying that the overweighting embodied in the proposed treatment of capital gains as well as corporate tax increases could impede economic growth in the years ahead by curtailing the incentives to make productive investments.

We are opposed to the imposition of the capital gains tax at the time of death for the same reasons. If the capital gains tax is retained in 13270, the Tax Reform Act of 1969, in the bill's final form, we are headed for an investors tax strike.

The action of the stock market indicates to me that America's 27 million investors are in a mood for such a movement. It will not materially relieve the long-suffering public, nor will any kind of tinkering tax reform in itself. Only good sense in Congress and sound Federal housekeeping can do it.

Honest tax relief from high taxes and reversal of inflation as well can only be brought about by curtailment of runaway Federal spending. We must not forget, gentlemen, that it costs approximately $30,000 to put a man to work, and if the investor does not furnish this money, who will? We will go to socialism.

Now, in reference to depletion, it is very simple. I remember not very long ago when I was talking on the question of natural gas—at that time I knew nothing about natural gas—I went to the fields and saw what they had to do. And prior to that time, all I knew about gas was that if you burped, you got rid of it; but, after that, I saw what had to be done. It is not any wonder that you have to put up $100,000 to dig a hole.

Therefore, I would sum up my depletion statement by saying the percentage depletion is not a tax loophole.

No. 2, the phrase "oil depletion allowance" is a misnomer.

3. Ours is an energy-based economy with oil and gas supplying nearly three-fourths of the energy.

4. The petroleum industry pays its fair share of domestic taxes. We have heard that this morning.

5. Percentage depletion does not produce excessive profits for oil companies.

6. The real beneficiary of depletion, percentage depletion, is the American consumer.

7. Percentage depletion has worked. We will not have a pilepine across the Atlantic Ocean in the next war, if we have one.

We cannot afford to let ourselves become dependent on foreign oil, and our testimony includes in exhibit "A" and lists all of the minerals to which the depletion allowance applies.

So, I say, gentlemen, it is a question here of compromise, and, again, I will go back to Mr. Churchill and say, in conclusion, that Government is the art of compromise, but there comes a moment in the lives of men when to stoop before the altar of expediency is to sacrifice your birthright. God forbid you should do that.

Thank you very much.

Senator CURTIS. I think Mr. Jackman has made his points very well. I do not know when we will be called to the floor. There are other witnesses to be heard, and I will forego the temptation to express my agreement with him.

Mr. JACKMAN. Thank you so much, sir.

Senator BENNETT. He means he agrees with you but he foregoes the temptation to tell you so.

Senator CURTIS. To illustrate.

Senator BENNETT. Thank you, Mr. Jackman.

(Mr. Jackman's prepared statement follows:)

STATEMENT OF INVESTORS LEAGUE, INC., BY WILLIAM JACKMAN, PRESIDENT

SUMMARY

My name is William Jackman. I am president of Investors League, Inc., 84 Fifth Avenue, New York, N.Y. and a voting resident of East Orange, N.J. The Investors League is a non-profit, non-partisan voluntary membership organization of thousands of businessmen and investors, large and small, residing in all of the fifty states of the nation.

CAPITAL GAINS

Mr. Chairman and members of the Committee, the Tax Reform Bill of 1969 (H.R. 13-270) passed in the House by a majority of 394 to 30. It is my personal opinion that this bill was conceived and enacted in astonishing haste without giving the legislators time to digest it.

Even Chairman Mills of the House Ways and Means Committee, had to confess himself confused. He had to reassemble his Committee to amend the rate schedules for low income taxpayers because of what he called a "misunderstanding."

A further indication of the haste with which the legislation was considered by the Ways and Means Committee, was the extraordinary noon session called by the committee on the day before the bill was scheduled for action on the floor because it had somehow "overlooked" millions of potential beneficiaries. Even more astounding was the fact that these persons were in the $7,000 to $12,000 annual income group, the so-called "middle-income" taxpayer. *This oversight was quickly "corrected" by the committee*, although the action cost the government $2.4 billion in anticipated lost revenue.

It adds untold pages to the Internal Revenue Code greatly magnifying the complexity of existing conditions. It is time for the Congress to realize that true tax reform can be achieved only through simplification.

In the Tax Reform Bill of 1969 there are provisions to increase the maximum rate of the long term capital gains from 25% to 30%, indicating that the Treasury would *gain* $300 million in new revenue from this source if this were accomplished. The facts are contradictory. The Treasury would *lose* money if this provision remains in the bill. Investors wouldn't sell.

A recent survey conducted for the New York Stock Exchange by Louis Harris and Associates, Inc. showed that if the long term capital gains tax were reduced from 25% to 12½%, Treasury would receive an estimated $2.5 billion in revenue—over $2 billion *more* than the $500,000 million they now receive under present rates.

A similar survey recently conducted by the Investors League of its own members, substantiated these figures.

When the government needs revenue and can get it from a tax decrease, why shouldn't it do so?

The capital gains tax is not a tax on income at all. A man is no richer nor poorer when he sells an asset and reinvests it in another.

Secretary of the Treasury Kennedy, expressing concern "about the bias in the bill against investment in favor of consumption," said this overweighting embodied in the proposed treatment of capital gains, as well as corporate tax increases, could impede economic growth in the years ahead by curtailing the incentive to make productive investments.

We are opposed to imposition of a capital gains tax at time of death or gift for the same reasons.

If the capital gains tax increase is retained in H.R. 13270, the Tax Reform Act of 1969 in the bill's final form, we are heading for an investors tax strike. The action of the present stock market indicates to me that America's 27 million investors are in the mood for such a movement.

Loophole closing will not materially relieve the long-suffering public, nor will any kind of tinkering tax "reform" in itself. Only good sense in Congress and sound Federal houskeeping can do it. Honest tax relief from high taxes—and reversal of inflation as well—can only be brought about by curtailment of runaway Federal spending.

We must not forget that it cost approximately $30,000 to put a man to work and if the investor does not furnish this money, who will?

OIL AND NATURAL GAS DEPLETION

1. Percentage depletion is not a tax loophole.
2. The phrase "oil depletion allowance" is a misnomer.
3. Ours is an energy-based economy—with oil and gas supplying nearly three-fourths of that energy.
4. The petroleum industry pays its fair share of domestic taxes.
5. Percentage depletion has not produced excessive profits for oil companies.
6. The real beneficiary of percentage depletion is the American consumer.
7. Percentage depletion has worked.
8. We cannot afford to let ourselves become dependent on foreign oil.
9. Our testimony includes "Exhibit A" which lists all of the minerals to which the depletion allowance applies.

STATEMENT

Mr. Chairman and members of the Committee, I wish to thank you for the privilege of presenting this statement before your committee on behalf of America's many millions of tax-paying voting investors (who are also consumers) on H.R. 13270 the Tax Reform Bill of 1969 now before you.

This Bill passed the House by a majority of 394 to 30 which was utterly ridiculous. It was conceived and enacted in astonishing haste without giving the legislators sufficient time to study and digest it and there was no opportunity for amendments from the floor of the House. It was found irresistable also because it promised low-income and middle-income taxpayers about $9.2 billion in tax-relief. As Assistant Secretary of the Treasury, Edwin S. Cohen, ruefully put it, the House Tax "reform" bill might better be known as "the lawyers and accountants relief act of 1969."

Another stinging rebuke to those who favorably reported the Tax Reform Act out of the Ways and Means Committee was offered by Congressman James B. Utt, an important member of this Committee. Said Mr. Utt: "This tax reform bill follows past practices in enacting patchwork provisions to the code—History shows that this approach adds untold additional pages to the Internal Revenue Code, greatly magnifying the complexity of existing provisions. The more complex the law becomes the greater the number of inequities we face."

"It is time for the Congress to realize that true tax reform can be achieved only through simplification. Tax simplification can be achieved by a broadening of the base and a reduction of the rates. By achieving this goal, the incentive for avoiding taxes through a variety of sophisticated devices diminishes".

Since many of the bills provisions of the Act were announced piecemeal, at least in principle, there was a general understanding that the bill would help the low income taxpayer and soak the wealthy taxpayer; but since many of the provisions had not been put into precise language, and no committee report was available, there was considerable confusion as to what had actually been done. In a tax bill, the exact words are more important than the generalities.

Even Chairman Mills of the House Ways and Means Committee, had to confess himself confused. He had to reassemble his Committee to amend the rate schedules for low income taxpayers because of what he called a "misunderstanding". As it turned out, a $2.4 billion misunderstanding. A summary of the bill was finally made available, but it takes time to digest 226 pages of tax-prose and another 143 pages of "technical explanation" even if you're a Philadelphia lawyer.

As a clear indication of the haste with which the legislation was considered even by the Ways and Means Committee, Rep. Peter H. B. Frelinghuysen (N.J.) and others have pointed to the extraordinary noon session called by the committee on the day before the bill was scheduled for action on the floor because it had somehow "overlooked" seven million potential beneficiaries.

Even more astounding was the fact that these seven million persons were in the $7,000 to $12,000 annual income group, the so-called "middle-income" taxpayer. This oversight was quickly "corrected" by the committee, although the action cost the government $2.4 billion in anticipated lost revenue.

In a separate statement of his views in the Ways and Means Committee report, Rep. James B. Utt (R.-Calif.) one of the committee members, made some telling criticisms. The committee, he said, simply did another patchwork job. By trying to "delineate tax equity with needle-like precision", it made the law immensely more complex and onerous for the individual taxpayer than it already was. Tax simplification, he insisted, which should have been given No. 1 priority, was forgotten.

"It is certainly anomalous", added Mr. Utt, "to recommend passage of the surtax for a full year on the theory that we need additional revenues to reduce present severe inflationary problems while at the same time providing a tax decrease of nearly $2 billion. But this is precisely what the committee has done. . . The revenue reductions in this bill will grow from nearly $2 billion in fiscal 1970 to nearly $7 billion in fiscal 1975, and this is bound to aggravate our problems with inflation. . . Since any surplus we will realize is due to an excess of trust funds receipts over disbursements, the federal budget on a federal funds basis will continue to be in deficit".

The statement did not mention that even since the tax cuts were passed by the House, the President had not yet put forward his guaranteed income proposal which would add from $4 billion to perhaps $10 billion a year of government outlays and increase the inflation probability all the more.

In the Tax Reform Bill of 1969 before your Committee to *increase* the maximum tax on long term capital gains from 25% to 30% indicating that the Treasury would *gain* $300 million of new revenue from this source if this were accomplished. Who on earth has arrived at this assumption. I would like one of you gentlemen to explain it to me. The facts are contradictory. The Treasury would lose money if the Senate Finance Committee allowed this provision to remain in this Bill.

Congressman Mr. Utt, on August 6, 1969 made the following observation: *"The last item and, to me, the most deadly to the American free enterprise sys-*

tem, is the tax treatment given to capital gains. Some one has convinced the majority of our committee that there is no difference between capital and earned income. That is a deadly assumption. Capital is the thing that makes possible creative risk investments, and is entitled to separate and preferred treatment. The history of the great economic progress in America has been based on the willingness of millions of individuals to risk their hard-earned cash for research, development, expansion and production of goods in America. We stand today on the threshold of the greatest opportunity in our history to perfect and produce gadgets of every sort and description at cheaper and cheaper prices in order to give America a still higher standard of living than we have now. We must not destroy that incentive; that creative imagination which can give us the greatest progress in our history. Here, again, we are stymied by the Marxian doctrine of social reform through taxation. When capital gains taxes were under discussion a few years ago, and Mr. George Meany was on the stand, I (Congressman James B. Utt) asked him if he believed in taxation for revenue or punitive purposes. He quickly replied "for revenue." Then, I said, "Mr. Meany, studies have been made by The Brookings Institute which showed that if you reduced the capital gains alternative tax and reduced the holding period, there would be more than a trillion dollars worth of real estate and stocks which would become unfrozen and would double the amount of revenue from the capital gains sector." He replied, "Yes, Mr. Utt, but that would be socially unjust." In that statement alone is the fallacy of his whole reform legislation."

A recent survey conducted for the New York Stock Exchange by Louis Harris and Associates, Inc. (See Exhibit "A" attached) showed that if the long term capital gains tax were reduced from 25% to 12½%, the Treasury would receive an estimated $2.5 billion in revenue—over *$2 billion more* than the $500,000 million they now receive under the present rates.

A similar survey recently conducted by the Investors League of its own members substantiated these figures.

When the government needs revenue and can get it from a tax decrease why shouldn't they do so?

The one-sidedness of the new bill is particularly glaring in its harsh treatment of capital gains.

The bill increases from six months to 12 months the period during which an asset must be held if the receipts from its sale are to be treated only as long-term gains subject to lower tax rates. But the highest tax even on long-term capital gains is no longer to be 25 percent; it will be one-half the tax rate on regular income, and so can rise to 35 per cent to taxpayers in the highest brackets.

The attitude of successive Administrations and Congresses toward capital gains has been hypocritical, a cynical heads-I-win tails-you-lose treatment of the taxpayer. If Congress really believed, as it professes to, that net short-term capital gains are justly treated as a full addition to ordinary income, then it should agree that net short-term capital losses should be deductible in full against the same year's ordinary income.

Or if it is right that half of all net long-term capital gains in a given year should be added to that year's ordinary income and taxed as such, as they are, then half of all net long-term capital losses in a given year should be deductible against that year's ordinary income. But no member of Congress even mentions any such even-handed treatment.

As a result of the inflation of the last 36 years, people have been paying taxes on "capital gains" that are in fact non-existent.

For instance, suppose you bought stock or real estate for $10,000 in 1939 and sold it for $26,400 today. You would be taxed for a capital gain of $16,400. Actually, as the cost of living has also risen 164 percent in this period, you would have achieved no real capital gain at all. Your $26,400 would buy no more than $10,000 bought in 1939.

There are at least a dozen different possible reforms of the capital gains tax, any one of which would make it less one-sided. I suggest we begin with this one: When a taxpayer sells shares or a piece of property held over a long period, he should be permitted to calculate his real gain (or loss) by reducing his nominal money gain against the increase in the official price index since the year in which he originally acquired the property.

To expect this is probably utopian. But is it even utopian to hope that at least a few of the abuses in the House tax bill can be corrected in the Senate by this Committee?

EXHIBIT "A"

TABLE I

STOCKHOLDINGS OF 1494 INDIVIDUALS

Value of Stock Held (At Price Levels of Dec. 31, 1964)	$66,268,000
Market Value of Stock When Purchased	29,813,000
Unrealized Capital Appreciation	36,455,000

AT CURRENT CAPITAL GAINS TAX RATE (25% Maximum)		
Would Sell in 1965	$ 1,515,000	
Capital Appreciation Realized		$ 490,000
WITH 50% CUT IN CAPITAL GAINS TAX (12½% Maximum)		
Would Sell in 1965	11,526,000	
Capital Appreciation Realized		5,714,000

IF THE PRESENT CAPITAL GAINS TAX RATE REMAINS UNCHANGED —MAXIMUM TAX OF 25%:

The indicated annual market value of sales of stock by all individual investors would total about $10.3 billion—of which some $3 billion would represent capital appreciation subject to the capital gains tax.

In terms of revenue, the Treasury would receive an estimated $440 million.

*All tax implications described in the survey assume an expanding economy which will follow the same basic growth patterns evident in recent years. Were the price level of the market to drop appreciably, the net gain could be substantially less than is indicated in this report.

TABLE II

TOTAL INDIVIDUAL SHAREHOLDINGS IN PUBLICLY OWNED CORPORATIONS ESTIMATES OF AMOUNT OF UNLOCKED CAPITAL AND IMPACT ON FEDERAL REVENUES UNDER THREE ASSUMED CAPITAL GAINS TAX SITUATIONS

Estimated Value of Stock Held (Dec. 31, 1964)	$386,980,000,000
Estimated Unrealized Capital Appreciation	208,300,000,000

AT CURRENT CAPITAL GAINS TAX RATE (25% Maximum)			
Would Sell in 1965	$10,340,000,000		
Capital Appreciation Realized		$ 2,970,000,000	
Tax To Treasury			$ 440,000,000
WITH 50% CUT IN CAPITAL GAINS TAX (12½% Maximum)			
Would Sell in 1965	67,320,000,000		
Capital Appreciation Realized		29,220,000,000	
Tax To Treasury			
Initial Sales			2,490,000,000
Annually After Leveling Off			760,000,000

IF THE CAPITAL GAINS TAX RATE WERE REDUCED TO A MAXIMUM OF 12½%:

The market value of sales by all individual investors would soar from $10.3 billion to $67.3 billion. Total capital appreciation of $29.2 billion would become subject to the lower capital gains tax rate. Thus:

Nearly seven times as much stock would be sold.

Nearly ten times as much capital appreciation would be unlocked and thus become subject to the lower capital gains tax rate

IN TERMS OF DOLLARS..

$57 billion more of capital would be freed for reinvestment than under the present rates.

AND

The Treasury would receive an estimated $2.5 billion in revenue—over $2 billion more than under the present rates.

CAPITAL GAINS TAX AT DEATH

We are opposed to the imposition of a tax at capital gains rates on all net gains accrued on capital assets at the time of transfer at death or gift. We are equally opposed to carrying over the decedent's basis for property included in his estate.

A tax on appreciation at death would lead to substantial shift of equity investment to sheltered investments. If done on a large scale, this could have a serious effect on the investment markets and attitudes of investors. The use of substituted bases is completely unworkable from a record keeping standpoint. *The problem of trying to establish fair market values for all properties as of the date a new tax reform bill becomes law would be fantastic. It would parallel the problem we had for decades in determining the value of property as of March 1, 1913.*

A tax on appreciated property not sold or exchanged would constitute a new capital levy on death. In effect, it would be an additional estate tax imposed specifically on those persons who have been successful in taking the investment risks which are a most important part of our economic system.

DEPLETION ALLOWANCES

I now will discuss sections of the bill which pertain to lowering the depletion rate on oil and natural gas from 27½% to 20%. We oppose lowering such rates for the following reasons:

First. Percentage depletion is not a tax loophole. It was deliberately devised by Congress more than 40 years ago and is consistent with the policy of not taxing capital value as income.

Second. The phrase "oil depletion allowance" is a misnomer. This provision applies to more than 100 different minerals important to our national welfare and to the economies of every State.

Third. Ours is an energy-based economy—with oil and gas supplying nearly three-fourths of that energy. Percentage depletion is essential if the industry is to meet the anticipated tremendous future demand for petroleum.

Fourth. The petroleum industry pays its fair share of domestic taxes—exactly the same percentage of its revenue as other industries, according to authoritative studies.

Fifth. Percentage depletion has not produced excessive profits for oil companies; in fact, their profits have averaged slightly less than those of manufacturing industries as a whole.

Sixth. The real beneficiary of percentage depletion is the American consumer. If the mineral depletion provision were deleted from our tax laws, the consumer would have to pay more for his every purchase since the cost of both the raw material in the product and the energy required to produce it would be more expensive.

Seventh. Percentage depletion has worked. It has enabled the petroleum industry and other mineral producing enterprises to meet the rapidly rising demands of an industrial civilization in peacetime, wartime, and the cold war era. It has helped keep our standard of living the highest in the history of the world. And, if we want an especially timely reminder of the value of percentage depletion, all we have to do is read any morning's headlines about what is going on in the Middle East.

Eighth. We have just seen the nationalization of oil properties of several American companies in the Middle East. How much more of a warning do we need that we cannot afford to let ourselves become dependent on foreign oil any time or anywhere in the world? We need percentage depletion because we need to maintain our national independence and our vital fuel supply. It is as plain and simple as that. And if we can learn anything at all from the news of the day, it is that percentage depletion—far from being a loophole is a lifeline for America.

Gentlemen, I thank you.

(See Exhibit "A" attached) Percentage Depletion Rates for Mineral Production.

Exhibit "A"

Percentage Depletion Rates for Mineral Production

Since 1926, the Internal Revenue Code has authorized percentage depletion at a 27½% rate for oil and gas wells. This rate is applied to the gross income from the wells, subject to a 50% of net income limitation.

During the decades that percentage depletion has been a part of the revenue laws, it has been extended to almost all other U.S. minerals at rates ranging from 5 to 23% of gross income from the mineral producing property, as follows:

TWENTY-THREE PERCENT DEPLETION APPLIES TO THESE MINERALS

Antimony.
Anorthosite (to extent alumina and aluminum compounds extracted therefrom).
Asbestos.
Bauxite.
Beryl.
Bismuth.
Cadmium.
Celestite.
Chromite.
Clay (to extent alumina and aluminum compounds extracted therefrom).*
Cobalt.
Columbium.
Corundum.
Fluorspar.
Graphite.*
Ilmenite.
Kyanite.
Laterite (to extent alumina and aluminum compounds extracted therefrom).
Lead.
Lithium.
Manganese.
Mercury.
Mica.
Nephelite Syenite (to extent alumina and aluminum compounds extracted therefrom).
Nickel.
Olivine.
Platinum.
Platinum Group Metals.
Quartz Crystals (Radio Grade).
Rutile.
Block Steatite Talc.
Sulphur.
Tantalum.
Thorium.
Tin.
Titanium.
Tungsten.
Uranium.
Vanadium.
Zinc.
Zircon.

FIFTEEN PERCENT DEPLETION APPLIES TO THESE MINERALS

Aplite.
Barite.
Bentonite.
Borax.
Calcium Carbonates.
Clay, Ball.*
Clay, China.*
Clay, Refractory & Fire.*
Clay, Sagger.*
Copper.
Diatomaceous Earth.
Dolomite.
Feldspar.
Fullers Earth.
Garnet.
Gilsonite.
Gold.
Granite.
Graphite (Flake).*
Gypsum.
Iron Ore.
Limestone.
Magnesite.
Magnesium Carbonates.
Marble.
Metal Mines (not otherwise named).
Mollusk Shells (when used for chemical content).*
Molybdenum.
Phosphate Rock.
Potash.
Quartzite.
Rock Asphalt.
Silver.
Slate.*
Soapstone.
Stone (dimension or ornamental).*
Talc.
Thenardite.
Tripoli.
Trona.
Vermiculite.
Other minerals not covered elsewhere.

*Note differing rates, depending on use.

TEN PERCENT TO THESE MINERALS

Brucite.	Perlite.
Coal.	Sodium Chloride.
Lignite.	Wollastonite.

FIVE PERCENT TO THESE MINERALS

Clay (used for drainage and roofing tile, flower pots, etc).*

Gravel.	Sand.
Mollusk Shells.*	Scoria.
Peat.	Shale.*
Pumice.	Stone.*

If from Brine Wells—Bromine, Calcium Chloride, Magnesium Chloride.

SEVEN AND ONE-HALF PERCENT TO THESE MINERALS

Clay and Shale (used for sewer pipe or brick).*
Clay, Shale, and Slate, (used as lightweight aggregate).*

Senator BENNETT. The next witness is Mr. Morton M. Winston, executive vice president, the Oil Shale Corp.

STATEMENT OF MORTON M. WINSTON, EXECUTIVE VICE PRESIDENT, THE OIL SHALE CORP.; ACCOMPANIED BY ROBERT C. BARNARD, ATTORNEY, OF CLEARY, GOTTLIEB, STEEN & HAMILTON, WASHINGTON, D.C.

Mr. WINSTON. Thank you, Mr. Chairman.

Senator BENNETT. Before you start, did you notice one witness this morning called shale oil synthetic oil?

Mr. WINSTON. I did.

Senator BENNETT. Do you agree with him?

Mr. WINSTON. I see no reason to disagree with him. It is oil.

Senator BENNETT. It is oil, but it is not synthetic in my definition. It was not created out of unrelated chemicals. It does happen to occur in a different form in nature.

Mr. WINSTON. If I may pass the buck, Senator Bennett, I think the name was first fixed on the product by the Congress of the United States when it passed something called the Synthetic Liquid Fuel Act and we have never been able to get rid of it.

Senator CURTIS. What should it be called?

Mr. WINSTON. Crude oil.

Senator BENNETT. Or oil shale.

Senator CURTIS. I did not think it was oil from the standpoint of applying depletion.

Mr. WINSTON. That, Senator, is precisely what we are here to discuss with you.

Senator BENNETT. That is the reason he is going to testify.

It seems to me the fundamental difference is what we call crude oil or oil as it comes from a well is that it is in a rock formation in which the rock gives it up very easily and oil in shale is in a rock formation in which it requires heat and pressure for the rock to give it up.

---

*Note differing rates, depending on use.

Mr. WINSTON. I think that is quite accurate, except we tend to forget that so-called conventional oil, which is found often in pools, is often not so easy to get out, and we apply heat and we apply pressure and we apply all sorts of extraordinary and costly means to acquire it.

Senator BENNETT. I will give up trying to tell you how to run your business and invite you to give us your testimony.

Mr. WINSTON. Thank you, Senator Bennett.

Members of the committee, I am accompanied, with your permission by Mr. Robert C. Barnard, who is a valued adviser to our company.

I would like, rather than read my written remarks, to request that they be accepted for the record and that I be allowed to summarize more briefly.

Senator BENNETT. They will be.

Mr. WINSTON. I would like to thank you for making time in a crowded schedule available to the Oil Shale Corp., which I represent, to present its views on the percentage depletion of shale oil.

The present law imposes what we regard as an injust discrimination against shale oil, that is, oil produced from oil shale as against oil produced from wells.

The House of Representatives has acted to remove much of the existing inequity and our purpose in being here is to ask this committee that it carry forward in this respect what the House of Representatives has done.

The commercial shale oil industry in the United States has not yet begun but it is near at hand. We and our point-venture partners, Atlantic Richfield Co., Sohio Petroleum Co., and the Cleveland Cliffs Iron Co. have, since 1954, expended more than $50 million to establish reserves and technology for commercial production. We are presently engaged in a commercial development program in the field which will cost approximately $12 million. We are doing so, because shale oil, as you have heard at length today, is needed and needed now.

Virtually unanimous projections of domestic petroleum demand and reserves foresee a sharply narrowing U.S. petroleum base between now and 1980, and, as an earlier witness said, the pattern remains the same, if it is projected to 1985.

The several hundred billion barrels of shale oil that have been estimated to be contained in the tristate area of Colorado, Utah, and Wyoming can make an important contribution. But to do so, and do so soon, arbitrary road blocks must be removed.

Under present depletion law and interpretations of that law, shale oil, which is oil and which must compete in the marketplace with oil from wells or from any other source utilized for the same purposes, is subject to two important competitive discriminations.

First, the value of shale oil is not depletable. I think that is what Senator Curtis was referring to. Only the supposed value of crushed rock is depletable, but oil from wells is depletable at the full wellhead value of the crude oil.

Second, under present law, the depletion rate for oil shale is 15 percent, a rate below that accorded oil recovered from wells.

In H.R. 13270, the House took three steps. First, it has created new provisions to provide expressly for shale oil depletion, removing it from general provisions which were never designed to deal with shale oil.

Second, it has specifically fixed the depletion rate at 15 percent.

Finally, and most important, it has established shale oil as the depletable value by fixing the point of application of the depletion rate at the first oil produced by the retorting process before any other processing.

This simple change is very important. It will give shale oil a more just competitive opportunity to find its place in oil markets. It will not diminish tax revenues. There are none now from this resource. Instead, it will produce revenues faster and in larger amounts as the unfettered industry has the opportunity to grow and make its needed contribution to oil supplies.

We are aware of only one objection that has been raised to the action taken by the House. The administration has said that shale oil should not be depletable, because it thinks the retorting process for oil shale is a manufacturing process and as such is inconsistent with the concept of depletion.

I would like to make one thing crystal clear: The retorting of oil shale is a separation process, not a manufacturing process. Only by retorting—which means in this case simply the application of heat—can the small percentage of the rock which is oil that has value, be separated from the enormous quantity of waste rock in which it is found.

It is for recovery of shale oil that production operations are conducted; and it is to shale oil first acquired by the separation process that the House finds depletion should be applicable.

Thank you.

Senator BENNETT. Thank you very much.

Any questions?

Senator CURTIS. No questions.

Senator BENNETT. I appreciate your appearance, because my State of Utah is one of those States a part of which is underlain with oil shale or oil-bearing shale.

I would just like to make one comment.

You have mentioned the fact that under some circumstances it takes the application of heat to get so-called liquid oil out of the ground. I suppose the Treasury would not say that that was a manufacturing process, and, therefore, oil thus produced could not qualify for depletion

Mr. WINSTON. It has not, to my knowledge, said so.

Senator BENNETT. I am glad this comment is in the record, because it might help us when we meet to work on the problem.

Thank you very much.

Mr. WINSTON. Thank you, sir.

(Mr. Winston's prepared statement follows:)

STATEMENT OF MORTON M. WINSTON

I am here today representing The Oil Shale Corporation, a publicly-held company, which—together with Atlantic Richfield Company, Sohio Petroleum Company, and The Cleveland-Cliffs Iron Company, as joint venturers—is now completing the development stages of the first commercial petroleum production complex from oil shale in North America.

As you know, "oil shale" is a marlstone containing a hydrocarbonaceous substance, finely distributed through the rock matrix, called "kerogen". The large oil shale deposits of Colorado, Utah and Wyoming have been estimated to contain some 800 billion barrels of petroleum reserves of good quality.

We and our joint venture partners have spent more than $50 million to establish reserves for, and the technical and economic feasibility of, commercial-production facilities for oil-shale mining, crushing, and retorting—that is, for the extraction of oil from the shale by heating. Oil-shale retorting is not a refining process; it is a separation process for the separation of the kerogen, as shale oil, from the rock by heat.

We have made this investment because we are convinced that without shale oil even the best efforts of the skillful American petroleum industry cannot keep pace with the tremendous growth of demand for liquid and gaseous petroleum and maintain safe reserve levels in the United States.

Petroleum demand is now approximately 13 million barrels per day. By 1980, it will be—conservatively—17 million barrels per day. As Director David Freeman of the President's Energy Policy Staff told the Senate Interior Committee this summer, "In view of the tremendous future demand for energy facing this nation, it would seem prudent that we develop a policy that would at least determine whether the shale resource can compete with other forms of energy. Otherwise this vast source of potential energy cannot be called upon to play its rightful role in meeting the nation's energy needs."

We and our joint venture partners are now demonstrating in field operations our conclusion that shale oil is an economic supplement to domestic petroleum supplies. But the present Internal Revenue Code is frustrating shale oil development.

Oil and gas produced from oil shale are subject to two competitive injuries in the depletion calculation under current interpretations by the Internal Revenue Service:

1. The I.R.S. ruled in 1957 that oil shale "mined solely for its kerogen content" was in the category of "all other minerals" (now section 613(b)(7) of the Code), and therefore entitled to a depletion allowance of 15%.
2. The point of application for the depletion allowance must be, according to the I.R.S., the value of the crushed oil shale rock before retorting.

Stated another way, there is no specific depletion allowance on shale *oil* under existing interpretation of the present tax code. There is only a 15% depletion on the supposed value of the unmarketable shale rock from which the oil is separated. Yet, shale oil must compete with crude oil from wells. That oil is allowed depletion at its full value at the wellhead, and the present rate is 27½%.

This depletion discrimination against shale oil production is as plain as it is indefensible. It mitigates against the flow of capital into shale oil development, and it places shale oil at a competitive disadvantage in the market place.

To remove this inequity and to encourage the development of the nation's oil shale reserves, the House Ways and Means Committee and the full House of Representatives voted to change the existing tax code as to the depletion allowance on shale oil. H.R. 13270, now pending before this Committee, sets up separate provisions for shale oil, expressly fixes the depletion rate at 15%, and fixes the point of application as the value of the oil after retorting, that is, after the separation process but before any refining.

As the Secretary of the Interior wrote in a letter to Chairman Aspinall of the House Interior Committee in 1965 commenting on a bill to apply the depletion allowance at the end of the retort:

> "Application of the depletion allowance on the gross value of crude shale oil as it comes from the retort provides a fair comparison with natural petroleum at the well-head. Crude shale oil is a product which is easily measurable and it is physically similar enough to natural petroleum to be handled in oil pipelines and sold to refineries equipped to process it further."

Oil shale retorting is not a manufacturing or refining process. It is a separation process, the only known method to separate kerogen from the shale. Shale itself has no value *per se*. It is the kerogen, which is a small part of oil shale, which has a value; and the logical point for applying depletion is after kerogen is first recovered by the separation process, and before any further processing.

This simple change in the tax code, applying shale oil depletion to the value of the oil instead of the rock, will not affect present tax receipts one iota. There is no taxable income from the shale oil industry today. To launch this industry requires large amounts of capital and entrepreneurs willing to assume the substantial risks involved, both technical and financial. If you approve the change made by H.R. 13270, it will be a significant step toward making it possible for the new industry to come alive and to grow. When that occurs, there will be taxable revenue and our vast shale oil resources will be contributing to meeting America's enormous demands for liquid fuel. This is why we urgently ask that this Committee help remove the tax discrimination against shale oil and to approve the change made by the House.

Senator BENNETT. The next witness is Mr. B. P. Huddleston, Citronelle-Mobile Gathering System Co., Inc.

STATEMENT OF B. P. HUDDLESTON, CITRONELLE-MOBILE GATHERING SYSTEM; ACCOMPANIED BY ROBERT W. WELLS, OF ARTHUR ANDERSEN & CO., NEW ORLEANS, LA.

Mr. HUDDLESTON. Mr. Chairman, members of the committee. My name is B. P. Huddleston, an independent petroleum engineer from Houston, Tex., representing the Citronelle-Mobile Gathering System, located in Mobile, Ala.

I am accompanied by Mr. Robert W. Wells of Arthur Andersen & Co., of New Orleans, La.

As a petroleum consultant these past few years, I have provided oil and gas estimates for a number of individuals, independent and major oil companies, and financial institutions.

Rather than reiterate the overall implications to the domestic industry resulting from the proposed changes in the tax law, I will limit my oral statement primarily to describing the economic effect on a producing field.

I submit to you that this case is more representative for the vast majority of individuals owning oil interests than the special case cited by the opponents of the present 27½ percent depletion allowance.

Furthermore, upon the request of your staff, I will be pleased to provide you with basic information prepared for other purposes from my files for similar analysis of the effect of changes in the depletion schedule for reserves located in New Mexico, Texas, Oklahoma, Louisiana, Arkansas, Mississppi, and other States.

Citronelle field, Alabama, has been selected as an example, not because of my association with Citronelle operators but because this field is uniquely representative of an oil reserve with diverse operating ownership. Over 500 individuals and corporations own interests in Citronelle. Major oil companies own less than 20 percent of the total operating ownership.

In addition, over 1,000 individuals receive royalty income from Citronelle production.

Citronelle field was discovered in 1955 by independent operators, and at this time is one of the most prolific fields in the southeastern United States. Through August of 1969, Cintronelle field had produced over 80 million barrels of oil. Had high-risk water flood operations been unsuccessful, this field would be uneconomical today. Rather the field is producing in excess of a half million barrels of oil per month.

Ultimate recoverable oil from this field is estimated to be in excess of 150 million barrels of oil with existing tax laws. And I might add. in my opinion, something less with the proposed changes.

Incidentally, to my knowledge, Cintronelle field is the deepest successful waterflood in the world.

The effects of the proposed changes in the tax laws on operating-interest owners in the Citronelle field were calculated for eight different cases as shown in our written statement. In the appendix, there are two complete sets of calculations, provided primarily for your staff.

The forecast of production and expenses shown therein were prepared to guide future operations in the field and do not represent special forecasts for purposes of this study. The following two cases that I will cite to you will illustrate the increase in Federal income taxes for Citronelle operators resulting from the proposed reduction of the depletion rate from 27½ percent to 20 percent. These calculations are for the 100 percent ownerships in the field, so the examples do not represent any particular individual or corporation. In fact, I believe, after the five or six largest owners, there is no one owner that owns more than 1 percent of the field. These interests are pooled so that the operators share expenses and production in proportion to their interests.

The cases in our text for the 27½ percent depletion as opposed to to 20 percent depletion show that the Federal income tax rate is increased by 19.5 percent. These were calculated for both a 25 percent and a 50 percent tax bracket, and interestingly enough, it is the same percentage increase for different tax brackets.

The actual effective depletion rate here is higher than most of the fields that I studied. For the existing 27½ percent depletion rate, the actual effective rate is 25.6 percent. If it is reduced to 20 percent, the effective rate is 19.3 percent. The vast majority of the Cintronelle owners will not have the opportunity to recover the added tax costs as do the major companies as has been described this morning.

Further, we have calculated the effect on market values of reducing the depletion allowance to 20 percent, and by elimination of the ABC transaction.

Senator CURTIS. What is an ABC transaction?

Mr. HUDDLESTON. In simple terms, "A" is the seller and he sells his property to two entities, "B" being the entity that takes the high risk on the property, and "C" being what we commonly know as the purchaser of the production payment, taking a lesser risk.

Senator CURTIS. What is the property?

Mr. HUDDLESTON. The oil property is the property sold.

Senator CURTIS. The mineral rights?

Mr. HUDDLESTON. Yes, sir, the mineral rights in the oil property. "B" would be what we think of as the conventional buyer of the property; "C" being perhaps somewhat analogous to the mortgage-holder.

In our case here, we show that the combined Federal income tax paid with the existing tax laws by the seller, the purchaser, and the purchaser of the production payment actually exceeds the Federal income tax that would be paid by the owner if the property is held throughout the economic life and subject to existing tax laws. We find in this case, with existing laws, that the market value for 100-percent ownership would be $42.5 million. However, if we lower the depletion rate from 27½ percent to 20 percent and eliminate the ABC transaction, the market value is reduced to $28 million.

These computations show that the proposed changes in the tax law would reduce Cintronelle market values by 34 percent. In all cases, our calculations show that the effective depletion allowance is always less than the maximum allowed depletion allowance, whether it be 27½ percent or 20 percent whichever appies, with or without a production payment.

Most retroactive tax legislation is discriminatory, even that legislation which can truly be called tax reform. The present bill provides for an exception to the effective date provisions relating to the creation of the production payments, if the parties have entered into a binding contract before April 22, 1969.

If two taxpayers were negotiating for an ABC sale of properties to the same purchaser, one closing his transaction on April 21 and the other closing his on April 23, the former would meet this exception while the latter would not even though the proposed tax law change governing the transaction was not presented to the House of Representatives until more than 3 months later and was not enacted until the following year.

It is strongly urged that the provisions of the bill not be effective before taxable year beginning after the date of enactment or, at the very earliest, for events coming after the date of the enactment.

Thank you.

Senator MILLER. I just want to ask a couple of questions, Mr. Chairman.

Mr. Huddleston, do you have any estimate of the amount of the percentage depletion allowance covering this Citronelle-Mobile gathering system in 1 year?

Mr. HUDDLESTON. Well, actually, I am not aware of the tax structure of the Citronelle-Mobile gathering system at all. I am here merely to represent the effects of the tax bill on the ownership in a field. I am really unaware of their specific situation.

Senator MILLER. Well, for the ownerships in the field, have you any estimate on the amount of percentage of the depletion allowance the entire ownership would comprise?

Mr. HUDDLESTON. It would be, I would estimate now, about 26 percent which I said earlier would be relatively high.

Senator MILLER. I mean in dollars.

Mr. HUDDLESTON. Yes, sir, I can find it here if you will allow me to look at the text.

Senator MILLER. Just a rough estimate; say, for 1968.

Mr. HUDDLESTON. All I have is our forecast here. It would be $2.6 million, and it would be approximately the same, by the way, for 1968.

Senator MILLER. All right. Now, do you have any estimate of how much the ownership spent during a year for exploration, for drilling costs?

Mr. HUDDLESTON. No, sir, I do not. The ownership in Citronelle is so diversified, it represents just about every type of individual from housewives to people that are actively in the exploration business, to independent companies, to people that live in the field, and I would have no idea how active they are in the exploration business.

Senator MILLER. Some of them would probably be active, and some probably would not be.

Mr. HUDDLESTON. Some of them are quite active; and for some of them, this would be the only property that they have ever participated in.

Senator MILLER. Thank you very much.

Senator CURTIS. Senator Hansen?

Senator HANSEN. I have no questions, Mr. Chairman.

Senator CURTIS. Thank you very much for your appearance.

(Mr. Huddleston's prepared statement follows:)

CASE HISTORY—THE EFFECTS OF REDUCING THE OIL DEPLETION ALLOWANCE AND THE ELIMINATION OF THE ABC TRANSACTION AS PROPOSED IN HR 13270, SECTIONS 501(a) AND (b)

(By B. P. Huddleston, P. E., Petroleum Reservoir Engineer, Houston, Tex.)

SUMMARY

This study illustrates the effect of the proposed changes in the Federal Income Tax Law relating to the percentage depletion allowance and the ABC transaction on the independent oil operator. The illustration is based on a series of cases developed from Citronelle Field, Alabama. Citronelle Field is uniquely representative of a significant oil reserve with diverse operating ownership of over 500 individuals and corporations. Major oil companies own less than 20% of the total operating interest ownership. In addition, over 1000 individuals receive royalty income from Citronelle production.

The examples herein show that the Federal income tax burden of the Citronelle operators would be increased by 19.5% if the percentage depletion rate is reduced from 27.5% to 20%. The combination of the reduction in the depletion rate and the elimination of the ABC transaction reduces the market value of the Citronelle owners' operating interests (the price that would be paid by a willing purchaser) by 34%. Independents are differentiated from major integrated oil companies since the major company can be expected to pass on these drastic effects to the ultimate consumer.

INTRODUCTION

A careful study of the proposed changes in oil and gas taxation, as described in HR 13270, Sections 501(a) and 501(b), shows that the ultimate payor will be the independent oil operators and finally the consumer. The far reaching effects of the proposed changes on the future of exploratory drilling for oil and gas reserves have been adequately described by articulate spokesmen for the petroleum industry and therefore are not treated here. Nor do we offer the oft repeated arguments for depletion or for justification for the ABC transaction. The case history described herein illustrates that the tax changes would drastically increase the tax burden of the independent oil operator and reduce the value of his properties.

CASE HISTORY

Citronelle Field, Alabama, one of the most prolific producers in the Southeastern United States, was discovered by independent oil operators in 1955 and subsequently developed primarily by independents with the drilling of over 400 wells. Only one major company made a significant contribution to the field and relatively early in the producing life this company chose to sell out rather than risk the complexity of initiating secondary recovery operations.

Through August, 1969, Citronelle Field has produced over 80 million barrels of oil. Had high-risk water flood operations been unsuccessful, the field would be uneconomical today. Rather, the field is producing approximately 500,000 barrels of oil per month. Ultimate recoverable oil from the field is estimated to be in excess of 150 million barrels with existing tax laws.

The effects of proposed changes in the tax laws on operating interest owners in Citronelle Field are shown in summary for eight different cases on Exhibit 1. Appendix A shows the complete calculations for two cases. Future project life is estimated to be 25 years. The average royalty burden is assumed to be 25% although some operators' royalty burden is considerably greater due to overriding royalties being paid to major companies.

The following two cases illustrate the increase in Federal income taxes for

Citronelle operators resulting from the proposed reduction in the depletion rate from 27.5% to 20%. These calculations are for the 100% operating ownership so that the examples may not represent any particular corporation or individual.

[Dollar amounts in thousands]

	Net revenue after FIT	Federal income tax	Actual effective depletion, percent
Case 3 [1]—27.5-percent depletion: Property is held throughout economic life subject to existing tax laws	$70,072	$27,017	25.6
Case 4 [1]—20-percent depletion: Property is held throughout economic life with statutory depletion rate reduced to 20 percent of gross income, but otherwise subject to existing tax laws	64,807	32,252	19.3

The increase in Federal income taxes is a significant 19.5 percent. The percentage increases in taxes is the same for all owners, regardless of their tax bracket. Furthermore, the vast majority of the Citronelle owners do not have the opportunity to recover the added tax cost as do the major oil companies. The 2 cases shown below illustrate the effect on the value of Citronelle oil properties considering that the depletion rate is reduced and the ABC transaction is eliminated.

	Net revenue after FIT	Federal income tax	Market value
Case 7 [1]—Property is sold to purchaser corporation in ABC transaction using $30,000,000 production payment subject to existing tax laws:			
Seller	$31,875	$10,625	
Purchaser	30,681	15,604	
Holder of production payment	4,152	4,152	
Total	66,708	30,381	$42,500
Case 4 [1]—Property is sold to purchaser corporation without ABC method and with statutory depletion rate reduced to 20 percent, otherwise subject to existing tax laws:			
Seller	21,000	7,000	
Purchaser	36,807	32,282	
Total	57,807	39,292	28,000

[1] Case numbers refer to cases listed in exhibit 1.

The ABC transaction example is based on the assumption that sixty percent of the gross revenue is dedicated to retirement of the production payment. Market value is calculated to be that sum that will provide the purchaser a rate of return of 15% on his invested capital. These computations show that proposed changes in the tax laws would reduce Citronelle market values by 34%.

In all cases, the calculations show that the effective depletion allowance is less than either 27.5% or 20% of gross revenue, whichever applies, since the deduction for allowable depletion is limited to 50% of net income computed on a property-by-property basis.

THE MAJOR COMPANY ADVANTAGE

Most major companies generally are engaged in exploration, production, transportation, refining and finally marketing of petroleum products on both a domestic and international level. In the total development and sale of products, the composite of these companies, while subject to fierce individual competition, dominate the market and can thereby expect a fair return on investment. Exhibit 2 shows that the oil companies' return on invested capital is about 12.5%, or about the mid point of the spectrum for all industries in the United States. It is reasonable to anticipate that the stockholders of the major companies will not be willing to accept an increased tax burden at the expense of lower profits.

Exhibit 3 shows the concentration of sales by oil companies. The top thirty companies represented 68% of petroleum sales in 1963 compared to 48% in 1939. Obviously, the percentage of sales contributed by smaller companies has continued to decline and the independent oil producer is being phased out of business.[1] Most of the thirty largest companies are fully integrated and therefore in a position to stabilize profits by controlling all phases of their budgets from exploration to marketing.

The point is simply that the major companies can pass any increase in taxes on to the consumer. If the price of gasoline is increased the traditional one cent per gallon, the consumer costs will be increased $800 million per year. Treasury Department estimates show that proposed change in the depletion allowance will generate $425 in tax revenues.

REMAINING OIL RESERVES IN THE UNITED STATES

In a comprehensive three phase treatment, M. King Hubbert[2] concluded that ultimate United States oil production would be approximately 160 billion barrels of which over 85 billion barrels have already been produced. Based on API estimates, cumulative discoveries to date would ultimately yield 136 billion barrels of oil leaving 24 billion barrels to be discovered. An approximate median of several other estimates place ultimate reserves at approximately 250 billion barrels. In any event, we have further produced or discovered over one half of the estimated ultimate production. Tax reform which increases materially the tax burden of an industry earning only average profits on depleting assets must be illogical by any yardstick.

The economics related to any depleting industry obviously deteriorate with continued production. The petroleum industry continues to cite irrefutable statistics to show the average well is now drilled deeper than ever before, the discovery ratio is lower, the volume of reserves for each new discovery is smaller, and finally, that only an average of 38 barrels of oil is discovered per foot of hole drilled compared to 160 barrels of oil per foot of hole drilled from 1929–35. While these data are presented, no comprehensive study by objective knowledgeable persons familiar with the petroleum industry is offered to show that the proposed tax changes will benefit the American people. At best, the argument is that the proposed changes in the tax laws may not be detrimental to our prime energy source.

If the remaining domestic reserves of 100 billion barrels are reduced by only 10 percent or 10 billion barrels by poor tax planning now, the claimed but improbable increased tax revenue will be wiped out over threefold by the value of energy lost to the United States.

EFFECTIVE DATES OF PROPOSED LEGISLATION

Most retroactive tax legislation is discriminatory, even that legislation which can be truly called "tax reform." The present tax bill was assembled and presented with such haste and is of such magnitude that the thought that it could be enacted in its present form with its many different effective dates makes one shudder. Business plans are not made overnight. Most important transactions in all industries require lengthy periods of time for negotiation and agreement, the oil and gas industry being no exception.

The present bill provides for an exception to the effective date provisions relating to the creation of production payments if the parties had entered into a binding contract before April 22, 1969. If two taxpayers were negotiating for an ABC sale of properties to the same purchaser, one closing his transaction on April 21 and the other closing his on April 23, the former would meet this exception while the latter would not, even though the proposed law change governing the transaction was not even presented to the House of Representatives until more than three months later and was not enacted until the following year.

It is strongly urged that, if enacted in its present form, the provisions of the bill not be effective before taxable years beginning after date of enactment or at the very earliest for events occurring after date of enactment.

CONCLUSIONS

1. The reduction in the depletion allowance from 27½% to 20% will increase the tax load of the operators by 19.5% in the examples calculated herein.
2. Elimination of the ABC transaction combined with the reduction in the depletion rate will result in a loss in market value of 34% for the oil property in the attached examples. This loss will effect over 500 property owners.
3. The integrated major oil companies will probably pass any increase in taxes on to the consumer in order to maintain their present rate of return on invested capital. The independent oil operator will not have the means available to maintain such return on investment. Thus, the proposed changes in oil and gas taxation would uniquely penalize the independent oil operator.
4. The effective date of enactment of changes in the tax law should not be effected before the beginning of the first taxable year following the changes.

EFFECTS OF PROPOSED CHANGES IN FEDERAL INCOME TAX, SUMMARY OF 8 CASES, CITRONELLE FIELD, ALABAMA

[Dollar amounts in thousands]

Case No.	Federal income tax rate, percent	Maximum allowed depletion, percent	Actual effective depletion, percent	Adjusted gross income	Operating costs	Depletion allowance	Federal income tax	Future net revenue, after	Net revenue discounted at 9 percent	Production payment	Estimated market value
1	25	27.5	25.6	167,742	70,653	43,054	13,509	83,580	51,143	0	38,000
2	25	20.0	19.3	167,742	70,653	32,525	16,141	80,948	49,453	0	36,000
3	50	27.5	25.6	167,742	70,653	43,054	27,017	70,072	42,712	0	31,000
4	50	20.0	19.3	167,742	70,653	32,525	32,282	64,807	39,332	0	28,000
5	25	27.5	21.7	126,993	68,208	27,576	7,802	50,983	24,590	30,000	45,000
6	25	20.0	17.6	126,993	68,208	22,293	9,123	49,662	23,963	30,000	44,500
7	50	27.5	21.7	126,993	68,208	27,576	15,604	43,181	20,803	30,000	42,500
8	50	20.0	17.6	126,993	68,208	22,293	18,246	40,539	19,549	30,000	41,500

Notes:
1. Comparison of case 1 through 4 shows effects of reducing the depletion allowance.
2. Comparison of case 5 through 8 shows effects of reducing the depletion allowance if properties are subject to production payment.
3. Comparison of case 2 to 5 and case 4 to 7 shows combined effect of reducing the depletion allowance and eliminating the production payment.
4. Market value is equal to sum of the production payment and the amount that will yield equity 15 percent annual rate of return on invested capital.

Appendix A: Example Calculations for Cases 4 and 7

EFFECT OF PROPOSED TAX CHANGES—CEITRONELLE FIELD, ALA., CASE 4

Starting date	Jan. 1, 1970
Well type	oil
Discount rate for remainder	0.2021
Number of months in last year	48
Present worth factor	0.090
Times/year PW factor and CF reinv. are compounded	2
Life of project in years	26
Lifting cost, dollars per well/month	500
Expense, fraction of gross revenue	0.0600
Operating cost (dollars/barrel)	0.500
Income tax rate	0.500

Depreciation period, in years	0
Percent 1st year tangible investment included in discount total investment	0.000
Salvage value, fraction of tangible investment	0.000
Discount rate for investment	0.000
Percent of tangible investment subject to tax credit	0.000

Areas 1 and 2 will be cleared and the results added to 1.
Undepreciated tangible investment is not added to C.F. of last year.
Depreciation is bypassed.
Cash flow is calculated without reinvestment.
Tax credit is bypassed.
Negative taxes are set to 0 and credited to next year.
Calculation will include 20 percent depletion.

Year	Production		Investments			Extra expenses	Price		Number of wells	Interest

Appendix A - Exhibit 1 - Page 6 of 6

EFFECT OF PROPOSED TAX CHANGES—CITRONELLE FIELD, ALA, CASE 7

Starting date	Jan. 1, 1970
Well type	oil
Discount rate for remainder	0.2021
Number of months in last year	48
Present worth factor	0.090
Times/year PW factor and CF reinv. are compounded	2
Life of project in years	26
Lifting cost, dollars per well/month	500
Expense, fraction of gross revenue	0.0600
Operating cost (dollars per barrel)	0.500
Income tax rate	0.500
Depreciation period, in years	0
Percent 1st year tangible inventory included in discount total inventory	0.000
Discount rate for investment	0.000
Salvage value, fraction of tangible investment	0.000
Production payment	30,000,000.
Interest rate on production payment	0.090
Percentage of production applied to payment	0.600
Percent of tangible inventory subject to tax credit	0.000

Areas 1 and 2 will be cleared and the results added to 1.
Unpdepreciated tangible inventory is not added to C.F. of last year.
Depreciation is bypassed.
Cash flow is calculated without reinvestment.
Tax credit is bypassed.
Negative taxes are set to 0 and credited to next year.
Calculation will include 27.5 percent depletion.

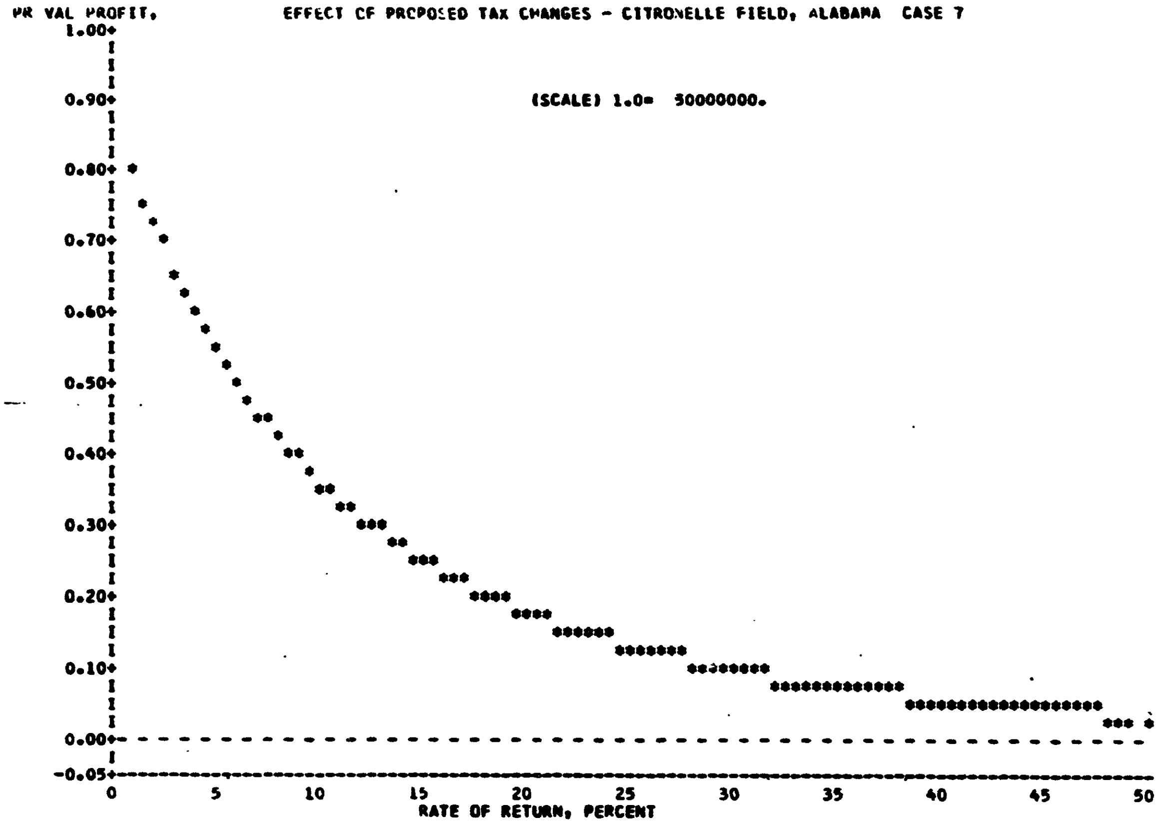
Appendix A - Exhibit 2 - Page 6 of 6



Senator CURTIS. Mr. Harold Rogers, North Texas Oil & Gas Association.

STATEMENT OF HAROLD D. ROGERS, ATTORNEY, OF SHERRILL, PACE & ROGERS, WICHITA FALLS, TEX., REPRESENTING NORTH TEXAS OIL & GAS ASSOCIATION, WICHITA FALLS, TEX.

Mr. ROGERS. Mr. Chairman and members of the Senate Finance Committee, my name is Harold D. Rogers and I am an attorney practicing law in the law firm of Sherrill, Pace & Rogers, Wichita Falls, Tex. I am here representing the North Texas Oil & Gas Association, Wichita Falls, Tex.

I appreciate the opportunity to appear before you to present to you the position that section 501(b) of the proposed Tax Reform Act of 1969 is unconstitutional. The position stated herein has the approval and concurrence of Mr. Leland Fiske, chairman of the natural resources committee, taxation section, American Bar Association.

In addition—this is not in my transcript—Mr. Isidore Specks, who is an attorney and an accountant in Dallas, Tex., assisted in the preparation of this testimony, and Mr. Specks, prior to 1963, when he left the Government service, had spent 44 years as an attorney in the appellate division in the Dallas region, and, as such, he was known pretty much as "Mr. Internal Revenue" in the Dallas region of Internal Revenue. He, of course, concurs in the position taken here.

Senator CURTIS. What provision is it that you attack the constitutionality of?

Mr. ROGERS. It is the provisions relating to carved-out production payments and retained production payments. I am going to state right now, the provisions.

Section 501(b) in title V of the Tax Reform Act of 1969—H.R. 13270—provides that income from mineral production payments—whether carved-out or retained—be taxed to the owner of the mineral property, not to the owner of the production payment.

Proposed section 636(a) reads as follows with respect to carved-out production payments:

> A production payment carved out of mineral property shall be treated as if it were a mortgage loan on the property and shall not qualify as an economic interest in the mineral property.

Proposed section 636(b) reads as follows with respect to retained production payments:

> A production payment retained on the sale of a mineral property shall be treated as if it were a purchase money mortgage loan and shall not qualify as an economic interest in the mineral property.

Senator CURTIS. Tell us what your language "carved out" is.

Mr. ROGERS. Let me give you an example in connection with a reserved or retained production payment.

A sells producing mineral property to B for $10,000, reserving unto himself a $15,000 production payment, payable out of 50 percent of the gross sales price of all of the oil produced from the mineral property, so that B has purchased the mineral property but A has reserved a production payment out of that mineral property, so A then owns the production payment and B owns the mineral property.

Senator CURTIS. Production payment is the sale of the oil when you start to produce; is that right?

Mr. ROGERS. That is right.

Senator CURTIS. So, he gets $10,000 cash and he is to get $15,000 as he starts to pump oil; is that what you mean?

Mr. ROGERS. That is correct.

He gets that out of 50 percent of the oil sales out of the ground; 50 percent of the oil sales would go to B.

Senator CURTIS. Out of the $15,000.

Mr. ROGERS. Right.

Senator CURTIS. Now, what is it you call that?

Mr. ROGERS. That is a reserved production payment.

Senator CURTIS. What is this "carved out" expression?

Mr. ROGERS. A carved-out production payment would be where A sells a production payment to B in the amount of $25,000, for example, and B then owns an undivided 50 percent of the oil in the ground until he has recovered $25,000 out of oil sales, and A owns the mineral interest. So, in that example A owns the mineral interest, B owns the production payment and is entitled to receive 50 percent of the oil sales until he has recovered $25,000.

Senator CURTIS. In that case, A does not sell the property.

Mr. ROGERS. He sells an undivided 50 percent of the oil.

Senator CURTIS. As it is produced?

Mr. ROGERS. Until $25,000 is recovered; so, he actually gets $25,000 in cash from B, you see, and then B owns an undivided 50 percent of the oil in the ground, until he recovers his $25,000.

Senator CURTIS. And A owns it afterward?

Mr. ROGERS. That is right. A owns it all the way through. However, during the payout period of the production payment he only owns 50 percent of the oil.

Senator CURTIS. What did the House do?

Mr. ROGERS. I was going to explain that next.

Senator MILLER. Excuse me. May I ask a question at that point?

What is the difference between that and somebody who owns a rental property and he retains the basic ownership of the rental property but he sells to B the right to the rental income for a 10-year period?

Mr. ROGERS. No difference. In fact, later on in my testimony, I am going to compare those as being exactly the same, Senator.

Senator FANNIN. What incentive is there for him to put up this money?

He gets back more than $15,000. You just stated he gets back $15,000. He gets a return on that $15,000, does he not?

Mr. ROGERS. Yes.

Senator CURTIS. He may pay less than the $25,000.

Mr. ROGERS. The production payment owner will get $25,000 plus an amount equal to, let us say, 8 percent interest per annum.

Senator FANNIN. That is what I am talking about.

Mr. ROGERS. That is right.

Senator FANNIN. In other words, he is not just getting his money back because he would have no incentive whatsoever.

Mr. ROGERS. That is right. He will have a profit.

Senator FANNIN. An undetermined profit.

Mr. ROGERS. Yes, depending on the life of the property, that is right.

QUESTION PRESENTED

Whether Congress would be violating the U.S. Constitution by enacting legislation which would require taxpayer B in the following two examples to include in his taxable income the amounts received by taxpayer A from a production payment owned by A—this example is the same example that I gave Senator Curtis.

"A", the owner of a producing oil lease (sometimes called mineral property or working interest) sells the lease to "B" for $10,000 reserving unto himself a $15,000 production payment (plus a sum equal to interest at the rate of 8 percent per annum) payable out of 50 percent of the gross sales price of all of the oil produced from the mineral property.

Now, the House bill which relates to retained production payments proposes to tax to "B" the $15,000 received by "A" even though "A" owns the production payment and will receive the entire $15,000 as paid from oil sales made from the lease.

Example 2. "B"—and I have characterized it in both examples as "B" owning the mineral property. "B", the owner of a producing oil lease, sell a $25,000 production payment to "A". The production payment is payable out of 50 percent of the gross sales price of all the oil sold from the lease plus a sum equal to interest on said $25,000 at 8 percent per annum.

In that example, the House bill relating to carved-out production payments proposes to tax to "B" the $25,000 as received by "A" even though "A" owns the production payment and will receive the entire $25,000 as paid from oil sales made from the lease.

Law and Discussion: The proposed law as set forth in section 501 (b) to tax the income of "A" to "B" as outlined in examples "1" and "2" above is clearly unconstitutional. The Supreme Court held in *Hoeper* v. *Tax Commission of Wisconsin* (1931), 284 U.S., 206 that due process is denied where one person is taxed upon the income from the property owned by another. In that case the State of Wisconsin had attempted by statute to tax a husband on income earned by his wife from her separate property. The U.S. Supreme Court held that an attempt by the State of Wisconsin to measure tax on a person's property or income by reference to another's property or income is contrary to the due process clause of the 14th amendment. The Court stated at page 215:

"That which is not in fact the taxpayer's income cannot be made such by calling it income."

Proposed section 501(b) as quoted above constitutes a denial of due process under the fifth amendment to the Constitution. These proposals attempts to tax the income of one person to another person. In example "1" above and on the chart "A" is the owner of the production payment since he retained the production payment from his conveyance to "B" and he is the only person entitled to receive the income from the production payment. "B" has no legal rights in the production payment nor does he have any command over the income from the property.

It has been settled law for many years that property rights depend upon the law of the State where the property is located. The Supreme Court has held that State law controls in determining the nature of the legal interest that a taxpayer has in property. *Tyler* v. *United States*, (1930), 281 U.S. 497; *Blair* v. *Commissioner*, (1937), 300 U.S. 5. The various States have unanimously held that the owner of a production payment is the owner of a vested property right. Furthermore, the Supreme Court has held that the owner of a production payment, not the owner of the mineral property, is taxable on the amounts received from the production payment. *Thomas* v. *Perkins*, (1937), 301 U.S. 655.

The proposed statute, as passed by the House, is unconstitutional because it taxes to one person the income from property owned by another person. Moreover, the proposed statute attempts to create a mortgage when no mortgage exists. In example "1" above, the proposed statute provides that "B" purchased the lease for $25,000—$10,000 cash and $15,000 purchase money mortgage. But "B", did not sign a promissory note in the amount of $15,000 in favor of "A" nor did he execute a mortgage granting to "A" a lien of $15,000 against the property. If the oil produced is insufficient to pay $15,000 to "A", then "A's" interest is terminated. "A" has no rights against "B" for the failure of the production payment to pay the full $15,000.

The factual situation in example "1" above is no different than the sale of real property by "A" to "B" with "A" reserving a life estate in the property.

Senator CURTIS. Mr. Chairman, could I ask a question?

Do you know anything about the origin of this in the House?

Is there something similar to this that does constitute an unwarranted tax shelter that they were trying to reach in this?

Mr. ROGERS. I do not know, Senator. All I know is——

Senator CURTIS. Let me put the question this way:

Is this sort of an arrangement that you described carried on for economic and business reasons or for purposes of a tax shelter?

Mr. ROGERS. In North Texas, primarily for economic reasons, because a man can pay more for his property where "A" sells to "B" and "B" says "I do not think your property is worth $25,000. I am not going to pay you $25,000, but I will pay you $10,000 and let you reserve out of the oil an oil payment in the amount of $15,000, if you think there is that much oil in the ground, but I am not willing to pay $25,000."

So that "A" then can actually realize $25,000 from the property; whereas, if he had to make a straight sale he could not realize that much out of the property.

Senator CURTIS. Suppose the provisions of the House bill were enacted, will it produce any additional revenue?

Mr. ROGERS. I think the Treasury had some testimony in the House. I would be unable to answer that question.

Senator CURTIS. Is this a Treasury proposal?

Mr. ROGERS. Yes, it was a Treasury proposal, but I might state, for background, that at no time in the House was there any testimony presented that this would be unconstitutional as taxing income from one person's property to some one else. That was never presented.

The CHAIRMAN. That is an interesting point. We have had lawsuits on about everything, but do you mean to tell me that we have never had a lawsuit go before the Court on the right of the Government to tax one man for the income of another man?

Mr. ROGERS. Senator, before you came in I cited the Supreme Court case. There is a case, a Supreme Court case, on that point which is in my testimony, and the Supreme Court held that it is unconstitutional and a denial of due process to tax one man on income from someone else's property. And the Treasury admits that that is the law, in a memo which they submitted to Congressman Bush. So, there is no question but what that is the law of the land.

Senator MILLER. Will the Senator yield?

As I understood, that was a case, however, involving an action by a State under the 14th amendment.

Mr. ROGERS. Yes.

Senator MILLER. And this is not an action by a State; this is an action by the Federal Government, so I am not too sure that the 14th amendment case would be applicable.

Mr. ROGERS. Senator, the Treasury Department, in the memo which I cite in my testimony here which they submitted to Congressman Bush, admits that this action would be a violation of the fifth amendment if it is a taxing of income from one man's property to someone else. In other words, the fifth amendment would apply, and I think the Supreme Court case in the *Hoeper* case clearly held that although the 14th amendment applies to the States, the fifth amendment would apply to the Federal Government.

(The memorandum referred to follows. Oral testimony continues on p. ——.)

MEMORANDUM RE CONSTITUTIONALITY OF THE TREASURY PROPOSAL REGARDING THE TREATMENT OF PRODUCTION PAYMENTS

PRESENT USAGE OF PRODUCTION PAYMENTS

Production Payment

The term "production payment" may be described as the right to a specified sum of money, bearing interest, payable out of a specified percentage of production from a mineral property or the proceeds received from the sale of such minerals, if, as and when produced. Depending on how a production payment is created, it may be classified as a carved-out production payment or a retained production payment. A production payment is secured only by an interest in the minerals, and therefore the known mineral reserves available are substantially in excess of that required to pay off the production payment. Thus a production payment is paid off over a period of time considerably shorter than the expected productive life of the property.

Carved-Out Production Payment

A carved-out production payment is created when an owner of a mineral property sells a production payment to an outside party, usually a bank or other financial institution. Under present law, the purchaser of the production payment treats the payments received as income and is entitled to cost depletion for the purchase price paid. The seller of a production payment immediately realizes ordinary income and is entitled to the allowance for percentage depletion. Thus if the owner of a mineral property "carves out" a production payment of $5 million (plus a sum equal to interest at the rate of 5½ percent per annum) payable from 75 percent of the minerals produced and sells it to a bank for $5 million, the owner immediately realizes $5 million of ordinary income, subject to depletion.

The use of carved-out production payments to convert future income into present income at whatever time and in whatever amount desired has led to significant tax reduction. When the minerals to satisfy the production payment are sold in subsequent years, the sale proceeds, to the extent of the production payment, are excluded from the gross income of the owner of the mineral property. But the production expenses are deducted by him in those years. This bunching of income in one year followed by tax deductions in subsequent years has permitted taxpayers to minimize the effects of those annual limitations on deductions and credits which are stated as a percentage of taxable income.

For example, assume that the owner of a domestic lead mine has fully recovered his capital investment and that the gross income from the mine in a particular year is $10,000,000. The percentage depletion rate for domestic lead is 23 percent, and his depletion deduction would therefore be $2,300,000. However, since the depletion deduction is limited to fifty percent of taxable income, if the production expenses of the lead producer were $9,000,000, his taxable income would be $1,000,000, and his depletion deduction $500,000. He would be required to pay tax on the remaining $500,000. By increasing taxable income through the sale of a production payment, the lead producers can increase his depletion deduction, because fifty percent of his taxable income will now be a larger figure.

In the following year a tax loss occurs because a substantial portion of the taxable income which the lead producer would have received in the second year has already been realized as a result of the sale of the production payment in the previous year. This tax loss can then be carried back to the first year, resulting in a refund of the tax paid in that year. Thus, the use of the carved-out production payment may have the result that no tax is paid over the two-year period although, but for its use, there would have been substantial taxable income for the two years.

ABC Transactions

A retained production payment is used in the so-called ABC transaction. A, the owner, sells a mineral property to B, who will own and operate it, taking a small down payment. A retains a production payment, which bears interest, for the major portion of the purchase price. A immediately sells the production payment to C (usually a bank or other financial institution) for cash.

A realizes capital gain (or loss), since his entire itnerest in the mineral property has been sold to B and C. C receives taxable income to the extent of the interest income from the production payment, since the principal amount of the production payment is recovered tax free through cost depletion. B excludes from gross income the mineral sales receipts used to pay off C's production payment. As a result of this exclusion, B recovers his capital investment in the mineral property much more rapidly in an ABC transaction than would be the case if he purchased the property outright, either with or without a mortgage. It is also generally possible for B to claim percentage depletion in the years after C's retained production payment has been paid off. Consequently, the total depletion deductions which can be claimed in an ABC transaction are greater than in cases in which a mineral property is purchased outright. For an explanation, see Wilknson, "ABC Transactions and Related Income Tax Plans," 40 Texas L. Rev. 18 (1961).

THE TREASURY PROPOSAL

In General

The Treasury proposal would treat a production payment as a loan by the owner of the production payment to the owner of the working mineral interest to which the payment relates. The owner of the working interest will include all receipts from the minerals produced in his gross income, subject to depletion. The owner of the production payment will not be treated as receiving income from mineral property, subject to cost depletion, but as a lender who receives a return of principal and interest. The result of these statutory changes will be to include in the same year the income and expenses of the owner of the working mineral interest. The purpose is to "stop artificial creation of net operating losses" in the mineral industry. Message of President Nixon to the Congress, dated April 21, 1969, Weelky Compilation of Presidential Documents, Vol. 5, p. 588.

Operation With Respect to Curved-Out Production Payments

Treating a carved-out production payment as a loan means that the cash received by the owner of the working interest at the time of sale of the production payment will be treated as a nontaxable receipt, just as borrowed money is treated. Therefore, except for interest and other expenses attributable to the sale of the production payment, the owner of the working interest will compute his income tax liability for the year the production payment is sold, and for the years it is being paid off, as the owner of the mineral property encumbered by a loan in the form of production payment.

The bank or other financial institution which owns a production payment would not be treated as an owner of the minerals in place who receives production payment income subject to cost depletion. Instead, it would receive the same treatment as any other lender whose loan is repaid with interest. Thus only the *interest* on the production payment would be included in the gross income of the owner of the production payment; the remainder of the payments received would be treated as a tax free return of the principal loaned.

Operation with respect to ABC transactions

Treating a retained production payment as a loan means that the owner of the working interest (B) will be required to include in his gross income the full amount of the proceeds from his sales of minerals to satisfy the retained production payment. He will be entitled to percentage depletion on all minerals produced and to deductions for the costs of producing minerals to satisfy the production payment, and for interest and other expenses incurred in connection with the satisfaction of the retained production payment. The net result of these changes will be to place the owner of the working interest in essentially the same position as other businessmen who purchase business assets subect to an outstanding mortgage.

The bank or other financial institution involved (C) will be treated in substantially the same way as a lending agency which owns a carved-out production payment. The seller of the mineral property (A) will continue to receive capital gain treatment.

CONSTITUTIONALITY OF THE TREASURY PROPOSAL

The Challenge

In a legal memorandum submitted to this Department for our consideration, the proposed treatment of production payments as loan transactions is assailed as a denial of the due process under the Fifth Amendment. The question presented is set forth in that memorandum as follows:

"Whether Congress would be violating the United States Constitution by enacting legislation which would require B in the following two examples to include in his income the income received by C from the production payment owned by C:

(1) B, a coal company, sells a $300,000 production payment to C. The production payment is payable out of 90 per cent of the net profits to be derived from the operation of the coal properties plus a sum equal to interest on said $300,000 at 5½ per cent per annum. The $300,000 will be liquidated in three years.

"The Treasury proposes to tax B on the $300,000 as received by C even though C receives the income from the production payment owned by C.

(2) A, the owner of a producing oil and gas lease, sells the lease to B for $1 million and retains a production payment of $3 million (plus a sum equal to interest at the rate of 5½% per annum) payable from 75 per cent of the production from the lease. Simultaneously, A sells the retained production payment to C for $3 million cash.

"The Treasury proposes to tax B on the $3 million as received by C even though C receives the income from the production payment owned by C."

The income of C under the Treasury proposal is stated to be $300,000 and $3 million in the two examples,[1] and it is said that Treasury proposes to tax this income of C to B. To avoid confusion as to the treatment of C, it should be pointed out that under the Treasury proposal the $300,000 and $3 million are not treated as C's income, but rather as a return of principal loaned. C's only income is the 5½ percent *interest* on the $300,000 and $3 million production payments. Without affecting the constitutional argument advanced in opposition to the Treasury proposal, the question presented can be framed in the setting of the proposed tax treatment of both B and C as follows:

Whether the guarantee of due process under the Fifth Amendment would be violated by legislation taxing B in the examples above on the proceeds of mineral sales used by B to pay off the production payments.

Three cases are cited in the text of the legal memorandum as support for the proposition that the Treasury proposal to tax B in the examples above on all

---

[1] The first of the examples illustrates the use of a carved-out production payment; the second example illustrates the classic ABC transaction.

income from the production of minerals, including that used to pay off the $300,000 and $3 million production payments, is clearly unconstitutional.

The first of these cases, *Hooper v. Tax Commission*, 284 U.S. 206 (1931), held that an attempt by the State of Wisconsin to measure the tax on a husband by reference to the income of his wife denied him due process.[2] Assuming, for the sake of argument, the continued viability of this holding,[3] its relevance here is obscure. The Treasury does not propose to measure the tax on B's income by reference to the income of C; *it proposes to tax B's income to B*. This treatment could only be questioned if what Congress taxes as income to B is, in terms of the actual command and control over this income, in fact the income of C. This is a different constitutional issue from that present in *Hooper*, where the wife's salary, interest and dividends, etc., were admitted as a *fact* of that case to be her income, not her husband's.

The remaining two cases relied upon; *Poe* v. *Seaborn*, 282 U.S. 101 (1930) and its companion case, *Hopkins* v. *Bacon*, 282 U.S. 122 (1930), also fail to afford support for the constitutional attack on the Treasury proposal. It is said that in *Poe* v. *Seaborn* the Supreme Court held "that all of the income of the community could not be taxed to the husband because the husband did not own all of the community property." But this holding was based on a construction of the statutory phrase "net income of every individual" in the Revenue Act of 1926, not on constitutional doctrine. Indeed, the Court intimated that community income could constitutionally be taxed to one spouse when it referred to Congress' refusal to change the wording of the federal income tax to make community income "returnable as the husband's income." 282 U.S. at 116 and 114 fn. 6.

The response

The legal memorandum submitted to this Department offers no argument that the economic realities of transactions involving the use of production payments do not warrant treating such transactions as being in the nature of loans. Rather, the argument reduces to the contention that the owner of the working interest in mineral property may not be taxed on all income generated by the production of minerals when part of such income is used to pay off a production payment *owned* by a third party.

It may be conceded, as stated in the legal memorandum (p. 4, fn. 2), that "state law controls in determining the nature of the legal interest that a taxpayer has in property" and that the owner of a production payment under state law is the "owner of a vested property right."[4] The legal incidents of production payments under state law do not, however, preclude Congress from treating transactions involving their use as loans for federal tax purposes. It is well established that while state law determines the legal interests a taxpayer has in property, federal law determines how those legal interests are to be taxed by the United States. Therefore, the Treasury proposal cannot be regarded as unconstitutional solely because a production payment is an "interest in land" or a "vested right" under state law. The only possible constitutional issue is whether the proposed plan of taxing the working interest owner on all income from the production of minerals is so unreasonable that it violates the due process guarantee of the Fifth Amendment.

Argument

All mineral sales proceeds used to pay off a production payment are produced by the efforts of the owner of the working mineral interest, who extracts the minerals and bears all the expenses of production. Under present law, if he sells a production payment, he realizes ordinary income. In the absence of a production payment, the entire income derived from the sale of the minerals would be taxed to the owner of the working interest. In this situation, can it be doubted

[2] While *Hooper* involved due process under the Fourteenth Amendment as a limitation on state taxing power, no distinction between Fifth Amendment and Fourteenth Amendment due process is claimed here.

[3] Justce Holmes, with whom Justices Brandeis and Stone concurred, dissented on the grounds that husband and wife could constitutionally be consdered as an economic unit for tax purposes. Justice Holmes' view has since been vindicated. See *Fernandez* v. *Wiener*, 326 U.S. 340 (1945), in which the Court sustained a federal estate tax which treated husband and wife in community property states as an economic unit, thus—in principle—completely devitalizing *Hoeper*. Justice Douglas, in his concurring opinion in *Fernandez* v. *Wiener* (joined by Justice Black), endorsed Justice Holmes' criticism of the majority's view in *Hoeper*, 326 U.S. at 365–66.

[4] A mortgagee's rights might be similarly characterized, particularly in title theory states.

that Congress has the power to determine which event, i.e., the sale of the production payment or the sale of the underlying minerals, results in the realization of taxable income? Moreover, even if the sale of the production payment were considered the taxable event resulting in the realization of income, Congress could postpone the *recognition* of that income to the years of the pay out in a manner that would recognize the realities of the situation for tax purposes.

It is evident that the owner of the working interest has actual command and control over income from the production of minerals[5] and, apart from tax considerations, has equally enjoyed the fruits of his investment and labor whether he owns the property free and clear, or burdened by a production payment. Thus, regardless of the property interest the owner of a production payment is deemed to have under state law, it seems reasonable for Congress to require the owner of the working interest to include all mineral sales proceeds in his gross income, even if he must use a portion of those proceeds to pay off a production payment.

Indeed, it is because the present tax treatment of production payments is unreasonable, and results in the "artificial creation of net operating losses"[6] that remedial legislation has been proposed by the President. It may be worthy of note that while the proposed treatment of production payments was vigorously opposed by some witnesses at the Tax Reform Hearings,[7] its constitutionality was apparently not questioned.

The courts have considered the nature of production payments. In *Commissioner* v. *P. G. Lake, Inc.*, 356 U.S. 260 (1958), the Court examined the question whether the consideration received for an assignment by the taxpayer, the owner of the working mineral interest, of a carved-out oil production payment was taxable as ordinary income, subject to depletion, or as capital gain. While conceding the premise that oil payments were "interests in land" under Texas law, the Court held that the consideration received for such payments was taxable as ordinary income, subject to depletion. *Id.* at 264. Speaking for a unanimous Court, Justice Douglas stated (356 U.S. at 266–67): "These [production payment] arrangements seem to us transparent devices. Their forms do not control. Their essence is determined not by subtleties of draftsmanship but by their total effect." After discussing precedents involving the assignment of income doctrine, the Court concluded that it was clear that the taxpayer was simply "converting future income into present income." The Treasury proposal would simply prevent this from being done for tax purposes through the use of production payments.

In *Anderson* v. *Helvering*, 310 U.S. 404 (1940), the Court held that the owner of the working interest in mineral property was taxable on the proceeds of mineral production used to pay off a "production payment."[8] This "production payment" was secured by an interest in the oil and gas production *and* by an interest in the fee title to the lands conveyed. This additional security, in the opinion of the Court, served to distinguish a contrary result reached in *Thomas* v. *Perkins*, 301 U.S. 655 (1937), where a production payment was only payable out of oil if, as and when produced.

This difference in the security interest involved in the *Thomas* v. *Perkins* and *Anderson* v. *Helvering* cases is, of course, not a difference of constitutional dimensions.[9] The essence of a lending transaction is not affected by the nature of the security interest involved.[10] It follows that there can be no constitutional objection to the Treasury proposal which would merely extend the rule of

[5] In fact, for tax purposes, he can use a carved-out production payment to increase his taxable income for a particular year to an amount he desires.

[6] The present tax treatment of production payments also results in special tax preferences unavailable to taxpayers financing nonmineral property. Efforts to obtain the tax advantages of production payments in the purchase of nonmineral property have not been successful. See *Bryant* v. *Commissioner*, 399 F.2d 800 (5th Cir. 1968) (purchase of farm); *Larry D. Hibler*, 46 T.C. 663 (1966), aff'd per curiam, 383 F.2d 989 (5th Cir. 1967), cert. denied, 390 U.S. 949 (1968) (purchase of insurance agency).

[7] See, for example, Hearings before the House Committee on Ways and Means on Tax Reform, 1969, 91st Cong., Part 9, 3162–64 (1969). The Treasury proposal was also supported. *Id.* at 3427–29. And the neutral suggestion was made that the same results could be reached by employing such techniques as income deferral or reserves for estimated expenses. *Id.* at 3357–58.

[8] Of course it is not tenable to argue that the Supreme Court reached a result contrary to the Constitution.

[9] As the Court stated in the *Anderson* case, "The holder of an oil payment right, as an original proposition, might be regarded as having no capital investment in the oil and gas in place." 310 U.S. at 410.

[10] We understand that it is accepted banking practice to treat production payments held by banks as loans.

Anderson v. *Helvering* to all production payment transactions, regardless of the nature of the underlying security.[11]

In an analogous situation the Congress exercised its power to base tax consequences on economic realities without regard to state law characterization of property interests. In 1956 a court held that a person retaining a Maryland ground rent was the actual owner of the property under Maryland law, and therefore a builder who sold houses subject to such rents did not have to include the capitalized value of these rents in determining his gain from the sale of houses. *Commissioner* v. *Simmers' Estate*, 231 F.2d 909 (4th Cir. 1956) ; followed in *Welsh Homes, Inc.* v. *Commissioner*, 279 F.2d 391 (4th Cir. 1960). To avoid getting whipsawed, the Treasury ruled that payments of ground rent were no longer deductible as interest.

Said the House Committee on Ways and Means in its Report on a bill to reverse these decisions by legislation:[12]

Your committee believes, without regard to the formal legal theory involved, that the result obtained under the court decision in practice is the wrong result. It sees no reason why the home buyers in Maryland should receive smaller deductions for tax purposes with respect to payments made on their homes than is true of taxpayers elsewhere with respect to similar payments made on their homes.

On the other hand, there also appears to be no justification in permitting the seller of the property in these cases to reduce the gain at the time of his sale below that which would be realized in other States merely by making use of the redeemable ground rent device available in Maryland, rather than a purchase money mortgage which generally would be used in most other States to achieve substantially the same results.

Legislation enacted provided that "any annual or periodic rental under a redeemable ground rent * * * shall be treated as interest on an indebtedness secured by a mortgage." Section 163(c) of the Internal Revenue Code. Section 1055 was added to the Code, subsection (a)(1) providing that "a redeemable ground rent shall be treated as being in the nature of a mortgage." Similarly, the Congress has constitutional power to provide that production payments shall be treated as loans. In fact, one court reached this result on the rationale that an assignment of a production payment was "similar in effect to a mortgage upon real estate." *Commissioner* v. *Slagter*, 238 F. 2d 901, 904 (7th Cir. 1956).

Conclusion

The legal argument submitted to the effect that the Treasury proposal would be unconstitutional misconceives, we believe, the concepts underlying the Treasury proposal. It is not proposed to tax the income of C to B. Rather, it is contemplated that the economic realities of production payment transactions will be recognized for tax purposes. Thus B will be taxed not on C's income, but on income which B derives from the sale of minerals he has extracted, even though B has entered into a contract obligating him to pay a portion of the mineral sales proceeds to C. It is inconceivable that the proposed treatment of production payments denies B due process of law as guaranteed by the Fifth Amendment.

Since a bill to carry out the Administration proposal has not yet been introduced in the Congress, necessarily the above discussion has been based entirely upon the basic concepts contemplated by the proposal. The Congress will certainly be careful to insure that these concepts are implemented in a constitutional manner. In light of the above discussion, there is no question that this can be done.

The CHAIRMAN. It was a constitutional amendment that gave a right to tax a person's income. But that is his income it gives the right to tax.

Mr. ROGERS. That is right.

The CHAIRMAN. Not the right to tax him for somebody else's income. That is what you are saying.

[11] Such legislation, by treating the consideration for assignment of a production payment as a loan to the owner of the working interest, would moot *P. G. Lake*.

[12] H. Rept. 24, 88th Cong., 3 (1963). To the same effect, see S. Rept. 72, 88th Cong. 2–3 (1963).

Mr. ROGERS. That is correct.

The CHAIRMAN. Of course, that is obvious, on the face of it, I would think.

Mr. ROGERS. Yes; it is.

The CHAIRMAN. But I can't predict what they will do over there. I hope they will become more predictable as time goes by.

Mr. ROGERS. I am just about finished here.

The factual situation is no different than the sale of real property from "A" to "B" with "A" retaining a life in the property. This happens every day in America. During "A's" lifetime the income from the property is taxable to "A", not to "B". This is true because "A" owns the life estate (a vested property right) and has the legal right to receive the income from the property. Any attempt by Congress to tax such income to "B" would be unconstitutional. (*Hoeper* v. *Tax Commission of Wisconsin, supra.*)

You could not tax, the Congress could not pass a law to tax, "B," the remainder man on "A's" income, because "A" is the life tenant and he receives all the income as long as he lives. Also, the factual situation in example "2" above is no different than the sale of any property interest for a term certain. For example, if "B" owned an apartment house and sold it to "A" for a 3-year term certain, the income from the apartment is taxable to "A" during such 3-year period, not to "B," does not have the right to the income.

The Treasury Department in its memo delivered to Congressman Bush has attempted to defend the proposed statute on the ground that taxpayer "B," the owner of the mineral property, should be taxed on the proceeds from the sale of all of the oil, "since 'B' has extracted the oil from the ground even though 'B' has entered into a contract obligating himself to pay a portion of the oil sales proceeds to 'A'." The fatal error made by the Treasury in making that quoted statement is their total lack of knowledge of who owns and sells the oil in the ground. In our first example; "A" owns 50 percent of the oil in the ground until he has received $15,000. "A" sells his oil in the ground to the purchasing oil company and receives payment direct from that purchaser. "B" does not receive any part of the proceeds from oil sold by "A" or by the royalty owner. "B" has no contract to pay over any part of the oil sales to anyone. Moreover, if the reasoning of the Treasury is sound, then "B," the mineral property owner, would be required to include in his taxable income all of the proceeds from oil sales including the amounts paid direct by the purchasing oil company to the other owners of property interests; that is, royalty owner, overriding royalty owner or the net profits owner. Such a position is absolutely absurd.

It follows then that a congressional attempt to tax income from a mineral production payment to a person who does not own the production payment represents a denial of due process of law. The mere fact that Congress designates certain transactions as a loan will not result in creating taxable income when, in fact, the income from the property is not the taxpayer's income.

These proposed statutes remind me of a story attributed to Mr. Lincoln. It is told that in the course of cross-examination he asked: "How many legs does a dog have?" The adverse witness replied: "Four." Mr. Lincoln then said: "If you call the tail a leg, how many legs does the dog have?" To which the witness replield: "Five." Mr. Lincoln then said: "No, sir, you are wrong, calling the tail a leg don't make it a leg."

Senator CURTIS. I want to make sure I understand your example. "A" sells a producing mineral property to "B" for $10,000, reserving unto himself a $15,000 production payment. Now, how much does "B" agree to pay "A"?

Mr. ROGERS. $10,000. He pays him $10,000 cash for the property.

Senator CURTIS. And does "B" give him any kind of a mortgage?

Mr. ROGERS. No notes, no mortgage; nothing. In the actual conveyance, the statement is than made that "A" reserves the right to a $15,000 production payment out of oil sales if and when made, and if there are no oil sales made, then "A" is not going to get anything more besides his $10,000. If, let us say, $5,000 is recovered by "A", then that is all "A" gets, and he has no right to sue "B" for the $10,000 or the $15,000, or the balance.

Senator CURTIS. Thank you.

Senator BENNETT. I was not here in the early part of your testimony. Is "A" required only to deliver to "B" half of the income he receives from the oil in the ground?

Mr. ROGERS. Let me state it this way: After the sale is made then oil is produced. Fifty percent of the oil—well, first, all of the oil is sold to, let us say, Mobil Oil Co. Now, let's say in 1 month there was $5,000 in oil sold off that one well. Mobil would pay $2,500 to "A" and $2,500 to "B" direct.

Senator BENNETT. That is the point I wanted to get clear.

Mr. ROGERS. Until "A" recovered out of his 50 percent, $15,000.

Senator BENNETT. Then, Mobil is given notice of the ownership of the oil?

Mr. ROGERS. Yes.

Senator BENNETT. And it is required to make its payments in accordance with that agreement.

Mr. ROGERS. That is correct, Senator.

Senator McCARTHY. Thank you very much.

Senator HANSEN. Mr. Chairman, if I could, in order that I understand this more clearly than I do now—would I infer from your example that "B" in purchasing this mineral property for $10,000 is not necessarily assured that there will be a recovery of $15,000 worth of oil?

Let me state it differently. If "A" receives $15,000 additional in production payments, it would not necessarily follow—I mean if "A" receives $15,000 additional money in production payments, it would not necessarily follow that "B" would get the same amount because he has got to pay the cost of producing this oil; is that correct?

Mr. ROGERS. That is correct. "A" is paid out of the gross, and "B" of course is going to have to pay for the lifting costs, because he is going to operate the property. That is right.

Senator HANSEN. Thank you, Mr. Chairman.

Mr. ROGERS. Thank you very much.

(The following letter was subsequently received for the record with respect to the testimony of the preceding witness:)

AMERICAN BAR ASSOCIATION,
Washington, D.C., October 7, 1969.

Hon. RUSSELL B. LONG,
U.S. Senate,
Washington, D.C.

DEAR SENATOR LONG: On Wednesday, October 1, 1969, the Senate Finance Committee received a statement from Harold D. Rogers of Wichita Falls, Texas, dealing with the taxation of production payments as proposed by section 501(b) of the bill. In his statement Mr. Rogers says that the position being urged has been approved by Mr. Leland Fiske, Chairman of the Natural Resources Committee, Taxation Section, American Bar Association (Testimony of October 1, 1969, p. 345).

The purpose of this letter is to advise the Committee that the approval of Mr. Fiske is his individual view. The Section of Taxation has not taken a position with respect to section 501(b). As pointed out in my statement to the Committee on October 3, 1969, the Section of Taxation has not been authorized to support or oppose proposals of a controversial nature affecting the distribution of a substantial part of the tax burden to a particular class or classes of taxpayers. In my judgment, comments by the Section of Taxation on Section 501(b) would be barred by this limitation.

Respectfully yours,

SCOTT P. CRAMPTON.

Senator MCCARTHY. Prof. Arthur W. Wright.

STATEMENT OF ARTHUR W. WRIGHT, PROFESSOR, DEPARTMENT OF ECONOMICS, UNIVERSITY OF MASSACHUSETTS

Mr. WRIGHT. Mr. Chairman, members of the committee, my name is Arthur Wright. I am assistant professor of economics at the University of Massachusetts, in Amherst, Mass. Thank you for permitting me to appear before you here today, to testify on the important matter of the tax treatment of natural resource industries. I shall confine my remarks today to a brief summary of the written statement submitted to the committee.

I have also submitted a background paper and a document containing some comments on the Mid-Continent Oil & Gas Association's critique of the Treasury CONSAD report, which report I shall touch upon briefly today.

With the chairman's permission, I would like to have these materials placed in the written record of these hearings following my written statement.

After considerable study, I have concluded that there are three undesirable aspects of our present tax treatment of the natural resources industries. First, this tax treatment is an important source of unfairness in the Federal tax system. The present tax rule for natural resources makes it possible for many extremely wealthy individuals to pay less Federal taxes than persons living in what the Federal Government defines as poverty. The present tax rules also enable corporations engaged in mineral production to pay far less Federal taxes than do other corporations.

Second, the present tax treatment of natural resources is a wasteful and inefficient form of subsidy, the need for which has not been demonstrated. I would suggest that the proponents of continued mineral tax subsidies should have more faith in the ability of the American free-market economy to produce minerals and fuels without Federal aid.

Third, the present system of mineral tax subsidies creates severe administrative burdens for Government and business alike. The areas of greatest administrtaive difficulty concern so-called economic interest questions, depletion rate determinations, cutoff point questions, unit price computations, and the 50-percent net income limitations on percentage depletion deductions.

Regarding the second aspect which I mentioned, there is a distinct lack of hard evidence that we need tax subsidies for natural resources, or that the present system of subsidies is even very efficient. The Treasury's CONSAD report, published in March 1969 jointly by the House Ways and Means Committee and this committee, and the only thorough study to date of the effects of the present system, found these tax subsidies to be inefficient. The CONSAD report has withstood the many criticisms leveled at it by the petroleum industry, most notably by the Mid-Continent Oil & Gas Association.

I urge the industry to commission studies of equivalent stature and thoroughness to the CONSAD report rather than merely criticizing this report.

A number of claims in support of continuing the present system of tax treatment for natural resources industries have been put forward. I find most of these claims to be without substance.

For example, claims that natural resource producers now pay their fair share of taxes typically use misleading bases for comparison, such as gross income instead of taxable income, or else they inconsistently lump together foreign taxes, Federal taxes, local taxes, and user charges when computing the so-called industry tax burden.

It is also claimed that the present tax treatment of natural resources is needed to let natural resource producers recover their capital investment in mineral properties. In fact, true recovery of capital can be accomplished through cost depletion. Present tax treatment, which allows percentage depletion, is defective because it permits tax-free recovery of amounts far greater than the mineral producer's original capital investment. Such tax treatment discriminates against other industries that must also attract substantial amounts of capital investment.

It is also claimed that percentage depletion helps keep gasoline prices down. The Treasury has recently estimated there would be an increase in the price of gasoline at retail of less than one-half cent per gallon if the percentage depletion rate were reduced to 20 percent. If we really want low retail gasoline prices, we can reduce them not by less than one-half cent per gallon but by several cents per gallon by removing the import restrictions and the Federal support for market prorationing.

Finally, the mineral industry spokesmen claim that their tax benefits should be continued because industry rates of return on capital are low. First of all, there are strong doubts that they are, in fact, lower than those of nonmineral industries. Rather, the data suggests a rough equality. This is what we would expect in the American market economy, rates of return tending to equalize in all industries after taking into account the tax benefits granted each industry.

In summary, I find the present program of tax assistance to the natural resource industries an inequitable, wasteful, problem-ridden Government aid program. I urge the committee to introduce legislation to scrap the existing aid program and substitute depletion computed on the basis of actual cost, together with capitalization of intangible drilling costs and their recovery over the useful life of the property, as is done for business investment in other industries.

The natural resource provisions in the House bill, H.R. 13270, which is here under review, in my opinion constitute a step in the right direction. However, I find it regrettable that both the House bill and the administration's proposals in response to that bill failed to eliminate percentage depletion entirely and most particularly failed to require full capitalization of intangible drilling and development costs.

Thank you.

Senator McCarthy. Does that complete your statement?

Mr. Wright. Yes.

Senator McCarthy. Do you have any questions?

Senator Hansen. Thank you, Mr. Chairman.

I would like to ask unanimous consent to insert in the record the analysis and comment relating to the CONSAD report on the influence of U.S. petroleum taxation on the level of reserves as compiled by the Mid-Continent Oil and Gas Association.

Our distinguished witness has referred to that report, and I think it might be helpful to the committee if they had the opportunity to review it in the context of his remarks, the observations and the analysis made by Mid-Continent.

(The report referred to follows. Testimony continues on p. 4647.)

Analysis and Comment Relating to the CONSAD Report on the Influence of U.S. Petroleum Taxation on the Level of Reserves

Summary

The conclusions of the CONSAD report can be given no credence because:

I. The mathematical formula (an "economic model") from which the conclusions are drawn is conceptually inappropriate for the purpose.

II. CONSAD, itself, issues repeated warnings about the pitfalls of its model-building. The combined impact of these cautions is a clear signal that CONSAD should have rejected this model, as it did two other models—and as it did *this* one for natural gas.

III. The quality of the data used in the formula is questionable, as is the method of manipulation.

IV. There are factual errors in the report.

V. The study proceeds from a number of doubtful premises about the economics of the petroleum industry.

I. Inappropriateness of the CONSAD Formula

The CONSAD study employed mathematical methods to predict the change in petroleum reserves that would result from elimination of percentage depletion. A fundamental error was made by using a formula that cannot answer this question. It was assumed that *production would not change* in the event of an increase in petroleum taxation, and the formula was designed to determine the level of reserves that would be required to accommodate the assumed fixed level of production.

Once it made the assumption that outut is fixed regardless of profitability, it was inevitable that CONSAD would find that there would be little change in the desired level of reserves, since the required level of reserves is technologically determined by the level of production. It is indisputable, owing to the nature of petroleum deposits, that any given level of production requires a supporting amount of reserves which is a multiple of production—as CONSAD acknowledges on page 7.3 of the report. (To produce one barrel of oil annually, there must be about ten barrels of supporting reserves in the ground.)

CONSAD actually ignored the *real* problem, which is how the long-run level of output would change in reaction to a decrease in profitability resulting from increased taxation. Instead, CONSAD indefensibly assumed that the desired level of production is independent of the level of profitability of the industry.

Indeed, the CONSAD model makes no provision for unprofitability (except at a zero price of crude oil). The mathematical model is so formulated that it tells us that the industry would find and develop reserves even if price were less than cost. Any model which states that businessmen desire to invest when price is less than cost is indefensible because no firm desires to invest at a loss.

II. CONSAD Cautions

CONSAD raised such an extended and serious list of objections to its own procedures that the reader should be convinced of the mathematical formula's lack of merit without further independent inquiry.

The formula was developed for use in describing the behavior of individual firms in manufacturing. CONSAD questioned whether the formula would be reliable if extended to the petroleum industry—see page 6.31.

CONSAD also questioned whether the historical data employed can be used to predict the future—see pages 6.12 and 6.13. In the report, it was said that "If the quantity of reserves necessary to support a certain level of output has changed during the period of the study, it will cause errors" in the estimates—page 6.13. (In fact, the ratio of proved reserves to production actually *has* declined steadily since 1960.)

CONSAD warns that reliable economic models require reliable data. In addition to the problem of finding reliable figures, it was recognized that there are massive problems in using the data. Perhaps the best example is finding costs, "the most ambiguous area in the data in this study"—page 6.16. Computing industry finding costs involves multiple difficulties, e.g., (a) the impossibility of determining from industry data when the exploration dollars for a given year's discoveries were actually spent; (b) the difficulty of estimating how much has been found until a number of years after discovery; and (c) the random variability of the amount spent per barrel found from year to year.

III. Statistical Problems

The CONSAD report points out that there are "many missing links" in the quantitative data available for making a reliable economic study—page B.1. It nevertheless proceeded with the study on the basis of estimated data and often relied on doubtful stand-in data to estimate the effects of important items for which it could not obtain direct information. Moreover, the data were used to predict the effect of a change in industry taxation for which there is no historical precedent. Such an extrapolation beyond the range of historical experience violates fundamental statistical principals.

IV. Incorrect Information

The report contains factually incorrect statements. Some involve data—even matters as basic as the current level of U.S. crude oil production. Others refer to petroleum tax provisions which do not exist.

If a research company is so unfamiliar with the petroleum industry as to err on basic data and tax provisions, it is unlikely to have sufficient knowledge of the industry to be able to develop accurate complex mathematical models for analyzing industry behavior.

V. Doubtful Petroleum Economics

Some of the premises of the CONSAD study are, in our opinion, based on unreliable assumptions about the economics of the industry. A notable example of these propositions asserts that Canadian crude reserves can "substitute" for United States reserves. However, the amount of crude oil imports from Canada is limited by agreement between the two governments. Since crude oil imports from Canada are controlled, Canadian reserves—like overseas reserves—are not substitutes for U.S. reserves. Thus, CONSAD should not have suggested Canadian and U.S. reserves in its economic model. And drawing conclusions from this model entailed the error of assuming that changes in the U.S. tax law would have the same effect on Canadian reserves as on domestic reserves.

Conclusion

No useful conclusions can be drawn from the CONSAD study because the mathematical model and the data are defective and because some of the basic premises are not appropriate. Indeed, it was predestined that CONSAD's exercise would be futile because CONSAD assumed that production would not change in the event of an increase in petroleum taxation.

Furthermore, we firmly believe that *no* aggregative mathematical model of the oil industry—no matter how sophisticated—can be used as a guide to estimating the effects of eliminating percentage depletion. Two of the most important reasons for this are:

(1) Part of the period upon which such a model must be based (the 1950's and 1960's) was one of industry readjustment to excess capacity, a readjustment now well on the way to completion.

Sound statistical theory holds that projection of a past period assumes that any changes that occurred in the base period will be repeated in the future. Since further significant adjustment to excess capacity is not likely, the 1950's and 1960's cannot be used as a base period for forecasting the future.

(2) The largest year-to-year crude oil price change since 1950 was +30¢ per barrel (1956 to 1957). Elimination of percentage depletion would be equivalent to a price reduction of about 75¢ per barrel. Thus, any prediction of the results of such a tax change based on a model reflecting the 1950's and 1960's would require extrapolation far beyond the limits of the base period data.

Sound statistical theory holds that such extrapolation is invalid because there is simply no historical basis for evaluation how firms would react to changes so far beyond the range of experience.

CONSAD admitted the existence of these problems, but it proceeded undeterred.

Our criticism is not so much that CONSAD's exercise predictably proved futile, as that CONSAD drew serious public policy conclusions from its mathematical model despite the obvious and admitted statistical problems involved in constructing any such model. The model used is especially subject to criticism because it is based on the improper assumption that industry exploration and development expenditures are not dependent on an adequate rate of return.

INTRODUCTION AND CONCLUSIONS

This paper is a review of the recently released CONSAD Research Corporation Report on *The Economic Factors Affecting the Level of Domestic Petroleum Reserves*. This report has been widely quoted as concluding that elimination of percentage depletion would cause the firms in the industry to reduce the total desired level of proved crude oil reserves by only 3%, while elimination of percentage depletion and the right to deduct intangible drilling costs in the year of drilling would, together, reduce the desired level of reserves by only 7%.

The CONSAD conclusions are based on an economic model which is inappropriate for evaluating the effect of a tax increase on desired reserve holdings. This model was estimated and applied using old and doubtful data and generally questionable techniques. Furthermore, the study contains a number of statements which can be shown to be factually incorrect, as well as a number of questionable statements on the economics of the petroleum industry. In fact, the study is not even internally consistent in several places. Given these various problems, documented in detail below, the CONSAD conclusions can be given no credence.

CONSAD set out to evaluate three models:

(1) A so-called "neoclassical" model purporting to relate the desired level of reserves in the long run to production, price, and cost;

(2) An industry "behavioral simulation" attempting to relate exploration and development expenditures to some general measure of industry performance such as rate of return; and

(3) An individual firm simulation model attempting to determine mathematically how an integrated or non-integrated producer might react to changes in petroleum taxation.

The second model "could not be developed" (3.5) [1] because of CONSAD's inability to find a "significant relationship between the rate-of-return measures and expenditures for exploration and development". (6.51) "Consequently the development of a model of this type was determined to be infeasible at this time." (6.52)

The third model was developed, and we are told at the beginning of the report that the results are "mutually supportive" (3.5) of the results of the first

[1] Figures in parentheses in this report are page numbers in the CONSAD report, which uses chapter-by-chapter pagination.

model. Later in the report, however, CONSAD admits the "lack of quantitative significance of the firm model" which is "due in part to the lack of data on which to base it." (6.53) "The outputs of this model cannot serve as quantitative estimates of the effects of tax policy changes on total reserve levels . . ." (6.52) If this model cannot provide quantitative estimates, it is clear that CONSAD has no basis for alleging that it supports the results of the first model.

In short, the whole CONSAD result depends on the theoretical and statistical viability of the (first) model which attempts to relate the desired level of reserves to price, cost, and output. This report's purpose is to appraise this model. We shall, in turn, discuss:

(1) The theoretical invalidity and general non-applicability of the so-called neoclassical model, and CONSAD's failure to consider the relevant policy questions;

(2) The warnings which CONSAD itself issues about the difficulties of formulating such a model for the petroleum industry;

(3) Problems in CONSAD's statistical analysis;

(4) Apparent factual errors in the CONSAD report; and

(5) Certain doubtful propositions which CONSAD develops about the economics of the industry.

The general conclusion of our appraisal is that the CONSAD analysis is conceptually unsatisfactory and statistically unsound. Thus, as is made abundantly clear in numerous statements in the report itself, it simply cannot provide reliable prediction of the likely reaction of petroleum firms to a substantial and unprecedented change in the basic economics of the industry. Consequently, it cannot serve as even a "base point" in the formulation or reformulation of public policy in this vitally important area.

I. THE "NEOCLASSICAL" MODEL

The source of CONSAD's conclusions, the Reserve-Reaction Forecasting or Neoclassical model, is based on arguments that were developed by Professor Dale W. Jorgenson of the University of California (Berkeley). Jorgenson's research, as reported in a series of recent papers, centered upon his attempt to apply what he has called a "neoclassical" approach to the problem of forecasting *short-term* changes in the level of investment spending. In the CONSAD report, one part of Jorgenson's model is used for the rather different problem of predicting the volume of petroleum reserves that petroleum producers will want to hold in the *long run* under different conditions.

This chapter first examines the model and its applicability to petroleum production. In the second part, emphasis is placed on those aspects of the model that are especially inappropriate in the CONSAD application. The final part covers published academic criticism of those of Jorgenson's assumptions which are both common and critical to the CONSAD analysis.

A. *CONSAD's question*

The question which CONSAD seeks to answer is this: If petroleum taxes were raised, how much reserves would the industry desire to hold at various levels of output, *assuming that those levels of output would be produced*. Specifically, in drawing its conclusions, CONSAD asked how much reserves the industry would have liked to hold in order to produce a particular level of output (the level produced in 1966): (1) with present taxation and (2) with increased taxation.

This question is almost trivial, and CONSAD itself provides an adequate answer on the very page on which it presents its basic model:

"There is a definite technological relationship (represented by the MER[2]) between the stocks held and the level of production. This limits the amount that can be produced from a given level of stocks, and requires a producer to maintain certain levels of stock to meet certain levels of production. Due to the MER, no more than a certain percentage of the total reserves can be produced during a year." (7.3)

Thus, the level of reserves required for a given output is technologically determined. *Assuming that the output will be produced come what may*, the answer to CONSAD's question is a function of the technology of the industry. As will be shown below (p. 32), U.S. crude reserves in 1968 were ten times production.

[2] MER is the maximum efficient rate at which a field can be produced.

Allowing for some excess capacity, this is the answer to CONSAD's question.

It is not surprising that CONSAD found little responsiveness of desired levels of reserve to price changes, since it assumed that the 1966 level of output *would* be produced—profitable or not. With output fixed, the level of reserves *should* remain unchanged. Thus, CONSAD's question is basically trivial and is not the question that is relevant for public policy.

The question of real public policy significance is one having two parts. First, what quantity of output would firms want to produce at various prices? And second, what level of reserves is implied by those levels of output? Put this way, the question allows for the possibility of a zero answer if production becomes unprofitable. Put CONSAD's way, a level of output (and by implication, effort to add to reserve) is assumed *regardless of profitability;* and the elaborate CONSAD procedure merely attempts to determine the amount of reserves compatible with the output—something already technologically determined.

B. The Basic Model

In its simplest terms, the CONSAD argument is that the amount of "desired reserves" which petroleum producers will want to hold in long-run equilibrium is equal to the expected level of production multiplied by the ratio of the price of output to the cost of reserves.

$$\text{Desired Reserves} = \text{Production} \times \frac{\text{Price of Output}}{\text{Cost of Reserves}} \times \text{Technological Constant}^{3}$$

The problem with this formulation can be seen by asking what happens to desired reserves if price falls so much relative to cost that the industry becomes unprofitable. If expected production remains constant, as CONSAD *assumes*, the formula indicates that desired reserves would decline and that firms in the industry would want to abandon (draw down without replacement) some, *but not all*, of their reserves. This is clearly an unrealistic result; for as long as investment is unprofitable, firms will not want to hold *any* reserves in the long run. But this theoretically inappropriate formula tells us that firms in the industry would want to develop and hold some amount of reserves at any price greater than zero—even if that price were less than cost. Only if price is *zero* can this multiplicative formula give a zero reserve answer. But any rational description of long-run economic behavior must indicate zero net investment *whenever investment is unprofitable*, not simply when price is zero. (Price less than cost is no mere academic issue here, since the price which CONSAD uses to arrive at its final conclusion *is* below cost, based on its cost data.)

Probably the main reason why the CONSAD model gives this irrational answer is that it is *incomplete*. It considers only one of the many relationships that would determine the long-run equilibrium of an industry; and, in particular, it does not explain the level of production of the industry. However, it is the level of production of the industry which determines the desired level of reserves. If the industry becomes unprofitable, firms would cease to produce and therefore would cease to invest in new reserves. The CONSAD model is unable to account for this possibility.

The formulation actually used in the CONSAD analysis is somewhat more complex than the basic relationship discussed above, but it is still subject to the same fundamental criticism. The CONSAD model requires a number of highly restrictive and unrealistic assumptions some of which are discussed below.

C. Specific Objections to the CONSAD Model

Specific objections to the CONSAD model as it is applied to the petroleum industry relate to the formulation of the model and to the various assumptions. The assumptions which are most objectionable include (1) the "Production Function" on which the model is based; (2) the assumption of perfect extensibility beyond the range of available observations; (3) the assumption of perfect knowledge; and (4) the assumption that aggregation problems are minimal.

(1) The "Production Function" on Which the Model Is Based

The basic CONSAD model rests on the assumption that competitive firms will want to add to their holdings of capital (in this case, reserves) as long as the value of the output attributable to an additional unit of capital is greater than the cost of acquiring the unit. According to economic theory, the same relationship must hold for all factors of production (land, labor, capital, etc.), so that in

[3] See the equation on page 7.3. The technological constant is omitted in the text, we believe inadvertently. It appears earlier and later.

long-run competitive equilibrium, the value of output attributable to the last unit of each factor will be equal to the cost of its acquisition.

With this as a basis, the CONSAD "neoclassical" approach assumes that we can determine the amount of capital that an industry will want to hold simply by determining how the value of the output attributable to additional units of capital varies with the amount held. This, in turn, is determined by manipulating what economists generally refer to as a "production function," a device which describes the technologically feasible alternative combinations of factor inputs which will result in various levels of output.

In an analysis such as CONSAD's, the specification of the production function is a matter of critical importance. In fact, the choice of a production function really determines the results that will be "found." For this reason, it is notable that the choice of a production function in the CONSAD analysis is essentially arbitrary with absolutely no basis in industry characteristics or technology. Thus, we are told:

"The exact relationship to be expected depends on the form of the production function which applies to the industry, and on this there is comparatively little evidence. Due to lack of strong evidence to the contrary, a first-degree constant elasticity of substitution production function was assumed . . ." (7.7)

With no evidence supposedly available, a particular function was simply "*assumed.*" Actually, however, the production function which is used for most of the computations involves a further—but no less arbitarary—assumption:

"It should be noted that although the assumption of a CES (constant elasticity of substitution) production function is common in the literature, and is reasonable on its face, the explicit assumption of constant returns (to scale) is not supported (nor made suspect) by any empirical evidence. Consequently it seemed appropriate to calibrate a CES function of degree greater than one . . ."(7.7)

Again, with no empirical evidence, it "*seemed appropriate.*" In our opinion, there *is* convincing evidence on the nature of the production function for oil and gas; and an understanding of the inappropriateness of CONSAD's arbitrarily assumed production function is vital in evaluating CONSAD's work.

CONSAD's production function assumes that labor can be substituted for capital (in this case oil reserves) to produce a particular level of output. To us, this is not a realistic description of the oil industry. With a given state of technology, the ultimate recoverable output of a field cannot be increased by applying more labor to it. With MER production, the only way to get more output of oil is to find more oil pools. Labor is not a substitute for oil in producing oil. As CONSAD itself tell us, the required amount of reserves for a given annual output is fixed by MER, which is technologically determined (see the quote from (7.3) on page 4 above).

Thus, the appropriate production function for petroleum is one allowing no substitution between labor and capital. The proper formulation of the equation explaining desired reserves should be:

Desired Reserves=Production × Technological Constant

Since labor cannot be substituted for capital, CONSAD's assumption that production will remain constant *requires* that reserves remain constant. This formulation indicates clearly the triviality of CONSAD's question.

Another questionable property of CONSAD's production function is the assumption of increasing returns to scale—i.e., as more labor *and* capital are used to increase the scale of operations, progressively larger increments in output result. The implication is that the minerals industry uses the best deposits *last*. On the contrary, to the extent to which the quality of deposits is known (and the very significant problem of uncertainty is ignored in the CONSAD analysis), the minerals industry would logically use the best deposits first; that is, the production function would show decreasing returns to scale.

(2) *The Assumption of Perfect Extensibility*

Another fundamental problem with the CONSAD analysis is the assumption that relationships observed over a particular range of historical data necessarily will hold outside that range at some point in the future. This is the assumption that allows CONSAD to predict the effect of eliminating the percentage depletion allowance (equivalent to 75 to 80¢ per barrel before taxes) on the basis of the observed reactions to changes in price that were no larger than 30¢ during the sample period.

In discussing this point CONSAD observes that—

"Since some of the possible tax policy changes evaluated are of greater magnitude than any past changes, it may well be that the adjustment of the industry to changes of this magnitude may not be completed for a period of years." (3.2)

In truth, when projecting beyond the range for which there is information and when using the projected results for public policy recommendations, the speed of adjustment—while important—is probably the *least* important concern. In fact, the dangers of extrapolation are so basic, one is led to wonder why "speed of adjustment" is stressed, while the truly significant problems are not discussed.

As soon as we attempt to go beyond the range of the available data, the *statistical* validity of any results declines precipitously. Beyond the range of observed variation, there is absolutely no way to guarantee that the observed relationships will continue to hold. In fact, if one is to predict the petroleum industry's response to a change in (effective) price that is 2½ times greater than any observed in the past, he must first refute a presumption that the actual response would be totally different. In this case, predictions from a statistical model alone are not sufficient. Clearly, little information is available to support the validity of the fitted equation or even its general form, once one ventures outside the range of sample data. These problems cannot be dismissed merely with a reference to possible delays in adjustment. Given the limited range of observations and given the presumption that the industry response would be quantitatively and qualitatively quite different, the more logical reaction would have been to dismiss the results.

(3) *Perfect Knowledge*

The assumption of perfect knowledge or complete certainty is fairly common in econometric analyses. The reason is generally one of convenience rather than "common sense or casual observation." For a small manufacturing firm renting capital *services* in a perfectly competitive capital market, the assumption may be tolerable, especially when compared to the other assumptions that are required for econometric studies. However, such an assumption is totally inappropriate where investment means searching for petroleum.

Over the years, the fundamental uncertainty of petroleum exploration has been amply documented in the public record. Additional evidence can be drawn from the record of lease bid ranges (as originally proposed by Professor James W. McKie in 1960). Lease bids in particular auctions reflect different companies' valuations of the same properties. Since, in the typical sale, each company is free to explore and study the property in question, complete certainty would suggest that the variation in bids would be small. However, as illustrated by the results in the table below, taken from public records, it is not uncommon for the winning bid in a particular sale to be many times the low bid and even double or triple the second highest. These wide variations in bids from companies with similar access to pre-bid information make it clear that the actual circumstances of oil and gas exploration are anything but perfectly certain as assumed in the CONSAD report.

LEASE BID RANGES, SELECTED AUCTIONS

	Companies	Bid per acre	Percentage of winning bid
Navaho Sale No. 90, Window Rock, Ariz. (1968)	Pan Am	$250.13	100
	Gulf	123.72	49
	Corine Grace	31.84	13
	Humble	31.10	12
	Kerr McGee	26.66	11
	Depco	17.03	7
	George Hunker	12.19	5
	Champlin	10.10	4
	Union of California	7.25	3
Corpus Christi Bay, Nueces County (1968)	King Resources	100.10	100
	J. B. Clark	61.42	61
	Tenneco	53.11	53
	Atlantic	40.31	40
Lafourche Parish (1966)	Texaco	216.68	100
	Union of California	117.00	54
	Union Products Co	60.49	28

(4) *The Assumption That Aggregation Problems Are Minimal*

Another fundamental problem is the assumption that the activities of thousands of petroleum producers can be lumped together, explained, and predicted in a simple three-variable model based on industry aggregate data.

One aspect of the problem is that the basic "neoclassical" or "desired capital" model is really applicable only for an individual firm. The importance of this particular problem is difficult to judge; but it may be worth noting that after a series of attempts to apply his version of the neoclassical model to aggregate investment expenditures, Jorgenson's most recent work deals with individual firms.

Another aspect of the aggregation problem noted by CONSAD is that "in dealing with average figures for a number of firms, *little information is usually available about the distribution.*" (6.5)

In truth, however, there is enough information in the case of the petroleum industry to make questionable any conclusions that are drawn from an analysis of aggregate industry data. Evidence on the distribution of most of the factors which CONSAD lumps together is readily available from public sources, e.g., U.S. and Canadian reserves. Moveover, a convincing demonstration of the significance of CONSAD's problem is provided by the econometric work of Professor Edward Erickson. Erickson's study (cited by the Treasury but not by CONSAD) shows that petroleum prices and the volume of exploration activity are closely related but only when the econometrician gives proper recognition to regional differences in exploration conditions and differences in the size or type of firms undertaking the exploration. Failure to take account of regional and firm differences in reserves, prices, access to capital, etc., would have restricted the usefulness of the CONSAD analysis even if the model had been somehow appropriate.

D. Academic Criticism of the "Neoclassical" Model

Before examining CONSAD's own reservations about its work, it will be of interest to inquire into what other economists have said about the "neoclassical" approach.

Jorgenson's "neoclassical" approach to investment forecasting has been the subject of considerable critical comment in the professional economic literature. Since the CONSAD formulation is too recent to have received comment and since many of the principal assumptions are the same in both, it is important to take note of the published views of some prominent economists on Jorgenson's studies.

First, on the lack of realism and the general restrictiveness of Jorgenson's assumptions, Professor Roger F. Miller of the University of Wisconsin has observed:

"I strongly doubt that the prominent neoclassicists, were they alive and well read today, would find much interest in a model which assumes away uncertainty with regard to future lags in adjustment, difficulties in aggregation and composition, discontinuities, etc."[4]

A more detailed listing of Jorgenson's assumptions, is provided by Professor James Tobin of Yale University. Citation of Tobin's list is appropriate not only because the assumptions are unrealistic but also because the complete list is never presented in the basic CONSAD document:

"In Jorgenson's world of perfect competition and perfect knowledge . . .

"(Jorgenson's firm) purchases capital *services* at a market rental, just as it purchases labor at a market wage. There is a perfect market in capital goods: capital is homogeneous in quality regardless of its vintage, and capital evaporates exponentially, so that future depreciation is also independent of vintage. Thus, any surviving capital can always be sold at the prevailing price of new capital."[5]

Additional questions relate to the assumption of equilibrium and to the restrictions which this places on the types of problems that can be addressed. This point was best expressed by Professor Zvi Griliches of the University of Chicago:

"In the Jorgenson model, one cannot answer the question of what happens to the rate of investment if the rate of interest or other prices *shift* to a new per-

manent level in one move of if a change occurs in depreciation rules. A discontinuous jump to a new accumulation path is not admissible".[6]

Note, however, that it is just such a shift in tax policy which is the problem addressed by CONSAD.

Professor Griliches has asked further:

"Are the desired capital change variables significant because they are largely equal to the change in sales or output, or does the specific 'neoclassical' deflation of these changes by the elaborate 'user' cost of capital concept really do the trick?"[7]

Professor Griliches never answers these questions, but the recent publications of Professor Eisner of Northwestern University provide some indications:

"In most critical instances, it will be found that empirical tests contradict Jorgenson's assumptions and with them the deductively derived conclusions."[8]

These criticisms of the "Neoclassical" model of investment behavior are in the literature. Surely CONSAD should have taken them into consideration and stated its reasons for believing that these criticisms do not vitiate the appropriateness of the CONSAD model.

II. CONSAD CAUTIONS

CONSAD goes to great length to point out the multiple problems associated with attemping to set up any mathematical model describing the response of petroleum exploration to changes in economic factors, affecting the industry. Our only basic quarrel with these cautionary passages in the report is that the authors do not take them to heart. Rather, they elected to move ahead undeterred and use the mathematical derivation described in the prior chapter as a basis for drawing major public policy conclusions about an industry whose continued growth is vital to the military and economic security of the nation.

CONSAD expresses three general reservations about mathematical evaluation of the responsiveness of petroleum exploration to increased taxation:

(1) Whether investment analysis developed for manufacturing firms can validly be applied to petroleum;

(2) Whether appropriate quantitative estimates of a Jorgenson-type "neoclassical" model are feasible, based on historical data; and

(3) Whether the data used for the four principal variables in the total industry formula (reserves, price, cost, and production) were reliable and appropriate.

A. *Applicability to Petroleum of Investment Analysis Developed for Manufacturing Firms*

CONSAD warns that—

"Investment analysis, as developed for manufacturing is best applied with caution to the oil industry." (6.3)

CONSAD lists three reasons for this caution: (1) the industry is assumed to be "neither growing very rapidly nor declining"; (2) the theory applies to "a single firm"; and (3) "the oil industry does not invest in quite the same way as other industries do." (6.3 and 6.5)

(1) *Static industry*

CONSAD states:

"The oil industry, and particularly its exploration sector, has so far as it is possible to tell from the sparse financial data available, been passing from a period of high and increasing demand and high profits to a period of more stable demand and lower profits." (6.3)

Where there has been a change in a fundamental factor during the base period for an historical economic model, use of that model to forecast the future implicitly assumes that the change will continue as it did in the base period. Hence, the model will give invalid results if the change has, in fact, been a transition which is complete. We agree with CONSAD that

[8] Robert Eisner and M. I. Nadiri, "Investment Behavior and Neo-Classical Theory," *The Review of Economics and Statistics*, Vol. 1 (August 1968), p. 370.

"The immediate past may well have been a period of readjustment for the industry . . .; and extrapolation from this period may thus not be entirely relevant to the future of the industry." (6.4–6.5)

We shall address this point in more detail later.

(2) *Individual Firm Decisions*

CONSAD then states:

"The behavior of an entire industry is more difficult to explain than that of a single firm, particularly since . . . Industry aggregate data may obscure some of the underlying behavior of the individual firms." (6.5 and 6.7)

This reservation about the validity of attempting to estimate the reaction to a petroleum tax increase by observing past industry aggregates rather than by examining the economics of individual firm investment decisions was what led CONSAD to attempt to develop the individual firm simulation model mentioned in the Introduction to this report—a model which "lacked quantitative significance" once it was completed.

(3) *Capital Investment Process*

CONSAD argues that the process of capital formation in oil differs from manufacturing in that a good part of the investment base is immediately deductible for tax purposes (the losses are literally sunk capital):

"This may be taken to indicate that capital has been relatively more free to move in and out of exploration and can, therefore, be sensitive to expected prqfit; or it may suggest that, since it is easier to "pull out," there is less need to be sensitive to small fluctuations in expected profits as measured by realized profits in the previous period." (6.6)

We read this to say that petroleum explorers will probably not react quickly to small changes in profits, but that they can—and will—react significantly if a profit change persists. This reaction will either be to pull out or to increase expenditures, as the case may be. The lag between profit change and reaction will be long; but the reaction will occur if the profit change proves to be other than transitory. The length of the lag will also be difficult to predict because industry reactions are the sum of individual reactions; and various firms will undoubtedly react differently to a given change.

How could a research organization which can so accurately appraise the process of petroleum capital formation in *qualitative* terms permit itself to fall into the trap of believing *quantitative* results which are, on their face, patently unreasonable?

B. Quantitative Reliability of Models Based on Historical Data

CONSAD also lists three reasons for caution on this point: (1) rational businessmen base decisions on "expectations of future values" which may not be accurately represented by historical observations; (2) historical observations "may represent transient, rather than equilibrium, conditions; and (3) historical observations may be distorted by technological change during the base period." (6.12–6.13). The second of these is the same as the first caution in (A) above.

(1) *Expectations*

CONSAD states:

"First, and perhaps most important, rational operators are basing decisions not on past values of variables but on their expectations of future values." (6.12) Of course, past experience is relevant in estimating future expectations. However, "in trying to develop quantitative results, one must explicitly consider just how these expectations might be formed." (6.12) ". . . Obtaining data on current expectations is fraught with problems, and obtaining historical data on expectations was essentially impossible." (7.12)

CONSAD recognizes that one must consider how expectations might be formed and that it was impossible to obtain any historical data on expectations. Yet CONSAD proceeded with estimating the "neoclassical" model. How? By using "some variable for which data was available and which might reasonably be assumed to reflect the expectations which existed at the time . . ." (7.12) The result was that producers' expectations were represented by: first-order exponentially weighted moving averages of costs (7.20); second-order exponential moving averages of production (7.25); and actual prices.

The matter of explorers' expectations is of critical importance in any model which seeks to predict the effect of eliminating the percentage depletion allowance. The allowance is worth about 75 to 80¢ per barrel before taxes; and the largest year-to-year price change since 1950 was +30¢ (that change was largely eroded within two years). Thus, "one of the objectives of the study was to predict the effects of changes which exceeded the range of the calibration data." (7.8)

How explorers will react to a 75¢ equivalent price decrease is impossible to predict from their reactions to very small price changes. The effect on their expectations for the future of the industry could be catastrophic, especially since the change would come via repeal of a tax provision which originated a half century ago during the formative years of the corporate income tax.

(2) *Transient Conditions in the Base Period*

CONSAD observes that there will be problems in utilizing the base period data if they reflect transient conditions rather than equilibrium. We have seen that this is crucially important in evaluating the reliability of a mathematical model of reactions to increased petroleum taxes.

In the first place, as CONSAD recognizes, the industry was reacting to excess capacity during the base years:

"There is clear evidence that excess capacity existed during the entire period studied . . ." (7.10)

Surely a base period when firms in the industry were reacting to substantial excess capacity is of dubious value for forecasting industry reactions in long-run equilibrium.

Next, CONSAD is impressed by industry structural changes as firms reacted to excess capacity, particularly after the first Suez crisis of 1956–1957: "The industry structure and pattern of expenditures changed in 1957 or thereabouts, with one pattern being exhibited prior to this time, and a second totally different pattern . . . exhibited after 1957." (6.25)

This change "will make it hazardous to use the past behavior of the total industry (over the last twenty years) to judge possible behavior of the industry in the future." (6.24–6.25)

Rather, "it is the more recent years which should be most closely modeled because of the apparent period of adjustment during the 1950's and because the later years are the only period indicating any sensitivity of expenditures to rate of return " (6.46)

Having recognized the "hazards" and the need for restricting the model to "later years," CONSAD proceeded to base its "neoclassical" model on the period 1951–1965. Not only does this model carry the figures back into a period CONSAD itself rejects, it cuts off 1966 and 1967.

(3) *Technological Change*

CONSAD states:

"The final major problem in this approach, . . . is the question of the stability of technology during the period studied. If, in fact, the quantity of reserves technologically necessary to support a certain level of output has changed during the period of the study, it will cause errors in the quantitative relationships estimated." (6.13)

There can be no question that the ratio of reserves to production has, in fact, changed. Chart A shows that the ratio may have trended up slightly until 1960 and then began a persistent decline.

Early in the report, CONSAD itself quotes a 1968 Department of the Interior statement that the ratio had dropped to 10.4:1 (2.7). However, this point is ignored in estimating the model, where the use of 12:1 is qualified only by the following remark:

"While there is evidence that such a change occurred, there exists some evidence as to the direction and magnitude of that change, thus making it possible to at least estimate its effect on the relationships." (6.13)

CONSAD clearly knew of the technological change, witness its own reference to the Department of the Interior study:

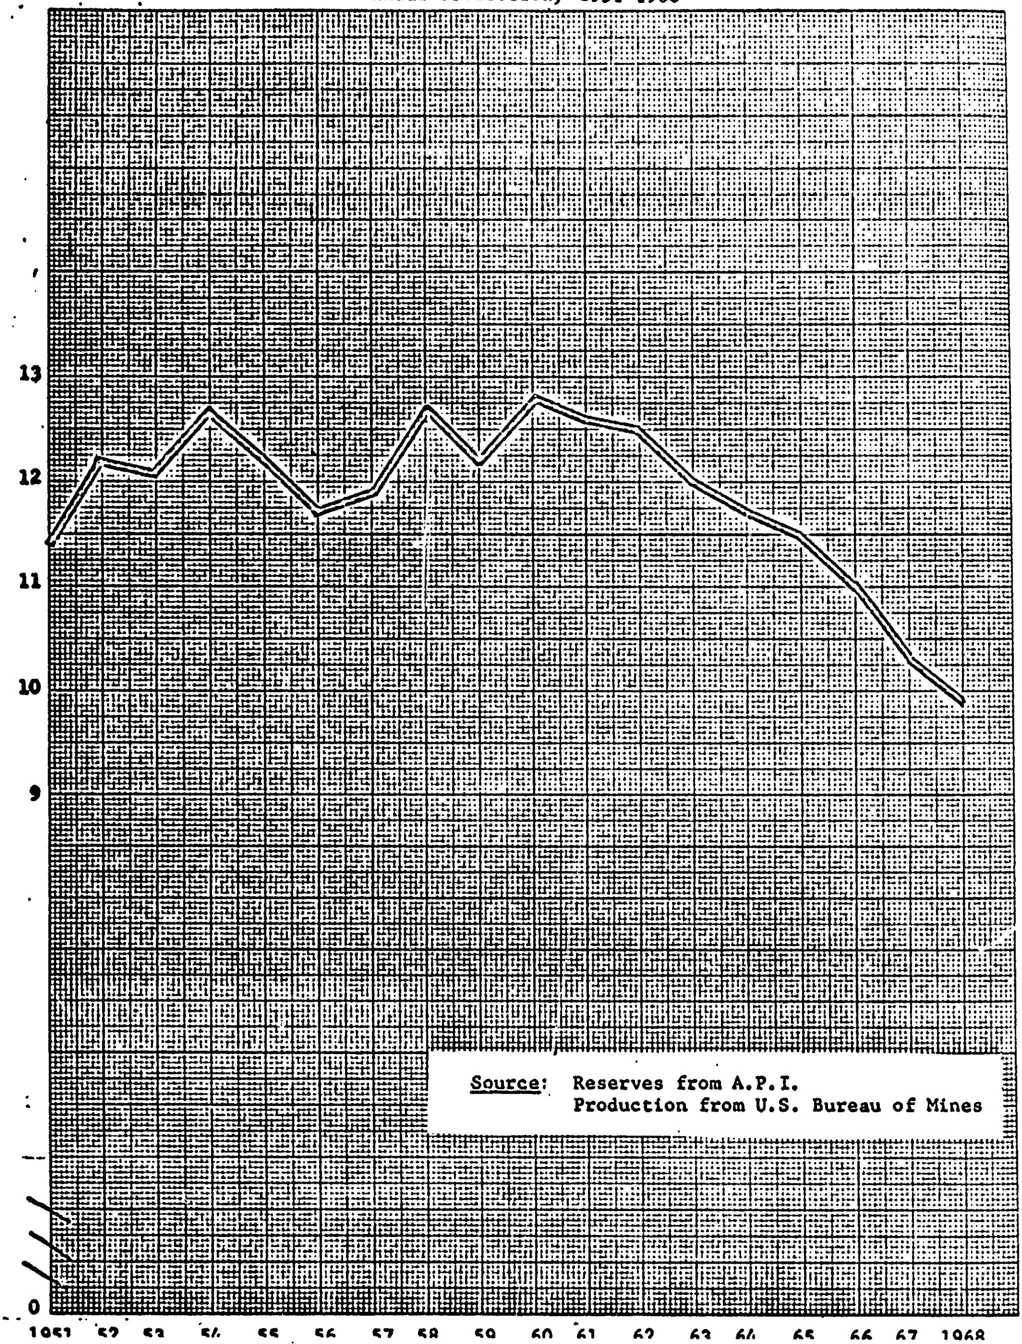
"This large increase in well productivity . . . implies that the reserves needed to support a given level of production on a technological basis have declined by 36% since the period 1944 to 1948. The economic significance of this point is stated in a Department of the Interior report:" (2.7)

Then, quoting Interior:

"In view of this fact, it no longer appears necessary to maintain a ratio of proved reserves to production in the vicinity of 12 to 1 to insure the producibility of reserves at required rates." (2.7)

In short, even though it called the reader's attention to the fact that errors "will" be caused by a reduction in the ratio, CONSAD apparently made no modification of its results to reflect the technological change.

Chart A
Ratio of Proved Reserves of Crude Oil to
Annual Production, 1951-1968



There are other examples of technological change which occurred during the base period and which cannot be expected to continue at the same pace, e.g., a rapid increase in the use of fluid injection for secondary recovery and fracturing of certain formations to increase recoverable reserves.

C. Reliability of Petroleum Data

CONSAD warns us of serious limitations in the data used to calibrate the model. We use two of these as examples:

(1) Finding Costs

"Finding" costs as used in the study are actually finding *and* development costs. According to CONSAD:

"The definition of finding cost is perhaps the most ambiguous area in the data in this study." (6.16)

There are three reasons for this (6.17):

(a) How to measure what is found;

(b) "Relatively poor data available on actual costs of exploration and development activity"; and

(c) "Discovery is . . . a random event."

The problem is this: First, one does not know how much he has found with any degree of certainty for many years after the discovery. This is a particularly serious problem when the measure of discoveries is proved reserves, since reserves only appear in these data when they are actually put in the working inventory. The time lag can be quite long. Furthermore, it is impossible to determine from aggregate industry data when the exploration dollars for a given year's discoveries were actually spent. And the amount spent per barrel found will vary considerably from year to year on a purely random basis as discoveries vary.

CONSAD finally relied on total expenditures for exploration and development divided by gross annual additions to proved reserves of oil and gas (gas converted to liquid equavalent on something like a value basis). This measure is also sometimes used in the industry. However, the measure is used *only* as a rough measure of capital requirements, not as a precise input to a mathematical model—and certainly not as a precise measure of the cost of new discoveries. Very little of the money spent in a given year is associated with the oil actually found in that year, and gross additions are *not* "discoveries," as mis-labeled by CONSAD (A.37). Gross additions are composed of extensions, revisions, and conservative first-year estimates of new discoveries. The proportions of these components change over time (see Chart B), and the new discovery component is quite small.

(2) Price

CONSAD states:

"Because of the unique nature of petroleum and natural gas reserves, the appropriate measure of price is particularly difficult to determine." (7.14)

Why?

"A price decline would be expected to lead in the long run to *lower* reserve stocks.[9] (7.15)

"In the short run, however, it might result in a cutback in production which would *increase* reserve stocks above planned levels, since the planned depletion of reserves would not occur."[9] (7.15)

In other words, observing the historical relationship between price and reserves can lead to an exactly opposite conclusion from that appropriate to a long-run model, since history is composed of a series of short-runs.

(3) Summary on Data

There were also problems with all other data used to calibrate the model. (At various points in the report, three different methods were used to estimate lifting costs—see 6.34; 8.3; and 9.13.) Using finding costs and price as examples, finding costs were "ambiguous"; and an appropriate price was "particularly difficult to determine." Yet CONSAD was not deterred from applying the "neoclassical" model to oil—even though data problems caused it to reject the other two models. And CONSAD even rejected a "neoclassical" model for natural gas because of data problems.

III. STATISTICAL PROBLEMS

This chapter deals with statistical aspects of the CONSAD report. Attention is directed to the quality of the statistical analysis including the appropriateness of the data inputs and the success of the statistical manipulations.

A. Data

As with most parts of the analysis, a critical discussion of the data inputs can best begin with CONSAD's own qualifications and cautions. Thus, in a section on problems of data collection, CONSAD states that:

"Throughout this study there have been substantial difficulties in obtaining data which would have broadened the analysis undertaken. *There are so many missing links in the quantitative evidence available that it is difficult to know which to rank first.*" (B. 1)

To overcome these "missing links" CONSAD has tailored its analysis to fit the data which are available, even when this does violence to the underlying logic:

"The purpose of this study required that the investment hypotheses chosen meet two criteria—first, that data be available to calibrate it, and, second, that it include as determining variables the magnitude which would change with changes in tax provisions." (6.3)

Both criteri are necessary, but neither should be allowed to take precedence over logic where the analysis is to form the basis for public policy.

More specific examples of this tailoring include the following:

"The approach taken here is somewhat different for two reasons. One is that the data for most of the variables of interest is available only on an annual basis. The other is that the primary objective of the study is an estimation of the long run effects of certain policy changes, and in view of the paucity of the data available, it seems advisable not to attempt the estimation of an excessive number of parameters." (7.4–7.5)

And, "the choice of a single-equation model over a multiple-equation model was based on the paucity of data available for model calibration . . ." (7.9)

A second technique employed to compensate for "missing links in the quantitative evidence" is the use of "proxy" variables—variables which stand in for the quantities actually desired. For example well head price plus the after-tax value of percentage depletion was used as a proxy for price minus income tax. Objections could be raised to each of CONSAD's proxy variables. An obvious and not atypical example, however, is the interest rate which forms one element in the important "user" cost formulation. Without explanation, CONSAD uses what purports to be the Aaa corporate bond rate (4.5% *before* taxes for 1966—actual average was 5.13%, now 7.5%). Apparently the rationale for this is that the Aaa rate is used by Robert M. Coen, the source of CONSAD's "user" cost formulation. But if this is the case, it is important to take note of the comments presented by Coen:

"Choosing an appropriate measure of "the interest rate" raises many problems regarding the definition and measure of the cost of funds to firms. (Miller and Modigliani) have found that for the electric utility industry the AAA bond yield is far superior to a weighted average yield on bonds and equities in predicting both the level of, and magnitude of changes in, the cost of funds. Whether or not this is also true in the manufacturing sector is unknown, since research in this important area is just beginning." [10]

If we are to be expected to accept the Aaa corporate bond rate as a reasonable reflection of what petroleum producers expect for their cost of capital, something more convincing is needed than a reference to Modigliana and Miller's admittedly distinguished work with electric utilities, particularly when one considers that only six companies in the oil industry have the Aaa rating. Of course, no one borrows for exploration (unless the loan is secured by other income or assets). Hence, the cost of capital for exploration must be the long-run return to equity in the United States (say, 10% *after* taxes) plus a substantial risk premium to compensate for exploration uncertainties. CONSAD, itself, uses 9% after taxes elsewhere in the report (4.30).

B. Problems of Estimation

It is characteristic of the model which CONSAD attempts to estimate, that once the particular form is specified, the regression analysis is not terribly

---

[10] Robert M. Coen, "Effects of Tax Policy on Investment in Manufacturing," *American Economic Review*, May, 1968, p. 204.

important. The reason, quite simply, is that the values of the coefficients are so constrained that whatever values are indicated in the regression analysis are of marginal significance. With this as background, one could probably ignore the regression analysis on the ground that it is unimportant, were it not for the fact that the analysis itself contains some fundamental and important errors.

The principal problem in the multiple regression analysis is the problem of interrelated independent variables, or as it is called by the econometricians, "multicollinearity." This problem is described by CONSAD as follows:

"For the model here, the question is whether any of the independent variables in the capital stock equation are in fact dependent on the other variables in the system. It might be proposed, for example, that the observed production values are functions of price, or that the current cost of new capital stock is a function of the existing quantity of capital stock. If this is true, then the single-equation model will produced biased estimates of the parameters." (7.10)

CONSAD devotes considerable effort to arguing that the independent variables in their regression, price/cost and production, are not highly correlated. At no point, however, do they provide the only suitable evidence, *the set of correlation coefficients.*

Our computation and analysis of these coefficients using the basic CONSAD data shows that the two independent variables, the price/cost ratio and lagged production, *are* highly correlated. In a situation such as this, the statistical validity of any multiple regression results accordingly must be highly suspect.

Just how suspect CONSAD's results may be can be seen if we attempt to duplicate their results using U.S. data instead of aggregated U.S. and Canadian data. Using CONSAD's data sources and model, a series of regressions was computed to relate U.S. proved reserves to the price/cost ratio and to U.S. production. As in the CONSAD analysis, the two independent variables were highly correlated, but the effect of the multicollinearity in this case was to leave the coefficient for the production variable in the multiple regression analysis statistically insignificant. This kind of result is only to be expected where multicollinearity is a problem.

C. Problems of Application

The principal problem with CONSAD's application of the model is the problem of extensibility. As explained above it is simply not legitimate to use historical data to predict how firms might react to a fundamental and unprecedented change in the basic economics of the industry—especially when the base period is atypical and when serious public policy matters are at issue.

Other problems of application suggest the pervasiveness of the theoretical and statistical problems. In this regard, it must be considered curious that in estimating and applying the model, lifting costs are never mentioned except where they are used to calculate income taxes.[11] If this version of the neoclassical model permits us to disregard labor and other costs even though these *must* affect the profitability of the industry, this point should be noted and explained. Jorgenson's original formulation had a separate equation for labor inputs—not used by CONSAD.

Equally curious is CONSAD's use of a formula to measure the cost of reserves that was designed to measure the cost of the annual services of a machine. Since this approach leads CONSAD to compare the price of a *full* barrel of reserves with the cost of only a *fraction* of a barrel, some explanation is required as to how the formula is applicable. Unfortunately, none is offered.

D. General Appraisal

Given the problems with the data inputs and given the problem of multicollinearity, the general appraisal can be brief. The essential point is that made by Professor Eisner when confronted with similar evidence in earlier Jorgenson models:

"All in all, there appears to be scant *empirical* support for the usefulness of the neo-classical model of capital accumulation."[12]

---

[11] "Lifting costs" are current well operating expenses, e.g., labor maintenance, power, etc.
[12] Eisner, *op. cit.*, p. 375.

IV. APPARENTLY INCORRECT INFORMATION

In our opinion, the following statements are factually incorrect:

CONSAD Statement	*Facts*
1. The United States is a net importer of foreign oil . . . the quantity is restricted to 12.2% of domestic demand . . . (4.4)	1968 Domestic Demand, 13,016 million barrels per day. 1968 Total Imports, 2,857 million barrels per day. Total Imports divided by Domestic Demand, 21.9%
2. Import restrictions . . . effectively limit crude imports to 12.2% of domestic crude production. (6.15)	1968 Domestic Crude Production, 8,648 million barrels per day. 1968 Crude Imports, 1,273 million barrels per day. Crude Imports divided by Domestic timated 387 billion barrels for 1965.
3. The IOCC estimate . . . is the only available estimate of oil originally in place in known fields . . . 346.2 billion barrels [1962] . . . (4.18)	The Department of the Interior has estimated 387 billion barrels for 1965.
4. The current output of crude oil is approximately 7 million barrels a day. (4.22)	1968 production: 8.65 million barrels per day.
5. The ratio of reserves to production has remained consistently in the region of 12:1. (4.23) The ratio of proved reserves to production has remained virtually constant at 1:12 (sic) for 20 years. (5.12)	1-1-1968 Reserves, 31.4 billion barrels. 1968 Crude Production, 3.17 billion barrels. Reserves divided by Production, 9.9. (See Chart A, page 4638)
6. Crude oil and natural gas are bound together . . . (4.24)	76% of U.S. gas reserves are in non-associated reservoirs (part of the remaining 24% is from non-dissolved gas caps over oil deposits).
7. Depletion is calculated for each property separately, or in certain cases, on specified aggregations. (4.38) . . . the small producer . . . has not the benefit of property aggregation to spread his deductions and avoid the net income limitation. . . . (8.9)	Since 1963, aggregation has been prohibited (except within an individual lease), regardless of the size of the producer.
8. Alternatively, a recent provision (1956) permits capitalized and accumulated intangible costs to be deferred and expended over the five years following the discovery of the well. This may allow the net income limitation to be avoided altogether. (4.40)	We know of no such provision.
9. foreign . . . depletion . . . amounted to a total of $655,000,000 in 1960. . . . This represents 23% of all depletion claimed. (5.19)	Most of this "claimed" depletion was not effective because foreign tax credits prevented payment of U.S. tax on foreign production.
10. . . . there are no direct import restrictions on natural gas. (6.16)	Federal Power Commission approval is required for all such imports.
11. Since assets result from past expenditures, an initial estimate of the assets committed to crude oil production activity was obtained by summing three years' expenditures for exploration and development (the past two years' and the present year's). . . . using [this base] . . . a rate of return was computed. (6.34)	Present cash flow comes from sale of reserves developed over a period of many years, not just the last three. Thus, the rates of return on Chart 6.5 are far too high.

CONSAD Statement—Continued	*Facts*—Continued
12. Some firms operating abroad pay up to approximately 70% in royalties. The standard domestic royalty is ⅛ although many are higher. (8.9)	In general, royalties in foreign producing countries are approximately the same as in the United States.
13. The integrated major producers . . . [may have] economic power . . . great enough to enable them to force independent producers to bear the burden of the increased taxes, by reducing field prices and thus increasing the profitability of refining operations.	Even if it had the economic power (which no producer does), an integrated company would hardly do this. Why? The action would reduce only the cost of that fraction of its crude which is purchased. However, a crude price cut would reduce the cost of *all* crude refined by it nonintegrated competitors, thereby leaving the integrated company at a competitive disadvantage in refining.

If a research company is so unfamiliar with the petroleum industry as to err on basic data and tax provisions, can it possibly have sufficient knowledge of the industry to be able to develop accurate mathematical models for analyzing industry behavior?

V. DOUBTFUL PETROLEUM ECONOMICS

The CONSAD report takes a number of positions on key petroleum economics issues which we believe to be wholly inadequate. These positions lead us to wonder whether the authors have relied on the intensive direct appraisal which should be a prerequisite to suggestions of public policy changes in any industry.

Ten examples of what are, in our view, serious misconceptions about the economics of the industry are:

(1) The substitutability which CONSAD assumes to exist between United States and Canadian reserves.

(2) The allegedly adverse resource allocation effects of petroleum taxation.

(3) The supposed insensitivity of exploratory activity to rate of return. CONSAD concluded on the basis of a defective measure of rate of return (see page 34 above) that there is no relationship between rate of return and exploration, except a weak relationship for larger companies during the period 1957–1965, (6.51).

(4) The adequacy of A.P.I. proved reserves data for use in evaluating exploratory results (see page 24 above).

(5) The picture of an industry operating as a monolith or as two groups (large and small companies) rather than as a large number of individual firms making individual decisions in reaction to price and cost.

(6) The picture of an industry "satisfied" with a modest return reflecting lackadasical operation rather than an industry pursuing vigorous technological improvement programs designed to improve profits. A realistic picture of the actual situation is provided in the National Petroleum Council Volume, *Impact of New Technology on the U.S. Petroleum Industry 1946–1965.*

(7) The industry's supposed ability to "*double*" the recoverability of oil in place (4.18). The Department of the Interior predicts only a one-fourth increase between 1965 and 1980, and that is very likely optimistic.

(8) The concept of wildcat "success" used in the report, CONSAD correctly states that "discovery value on a successful well is many times higher than actual outlays made for that particular well" (4.37) but then takes the position that one wildcat in ten is "successful"—whereas the number is more like one in fifty.

(9) The attempt to apply overseas development patterns to United States reservoirs in order to determine how many excess wells have been drilled here.

(10) The conflicting statements on the alleged economic power of large producers who are said to control a "large share of production" (2.5) and are then said to operate in an industry "which is not highly concentrated" and where the top five producers account for only "20% of the output."

In order to illustrate the problems involved with these CONSAD positions, we shall discuss our objections to the first two in some detail.

A. Substitutability of U.S. and Canadian Reserves

In estimating its "neoclassical" model, CONSAD combined United States and Canadian reserves. CONSAD's stated rationale for this surprising treatment of the data is:

"Examination of the United States-only reserve/production ratio indicates that it has been gradually declining, while the Canada-only ratio has been rising." (6.14)

From this, CONSAD reasons:

"For both of these to be due to rational decisions on the part of firms, either the expectation must be that Canadian production will be rising much more rapidly than United States production, or the firms involved consider the United States and Canada as a single market." (6.14)

CONSAD concludes that the "latter seems intuitively more plausible." (6.14) Notwithstanding CONSAD's intuition, the truth most likely is that the rise in Canadian reserves reflects normal variations in success, which is highly random in the petroleum industry, as CONSAD recognizes elsewhere. (6.17) CONSAD also recognizes elsewhere that the decline in the United States ratio reflects technological change. (2.7)

CONSAD acknowledges that foreign oil cannot ordinarily be considered a substitute for domestic oil in the United States because foreign imports are restricted. (6.15) However, "Canadian (and Mexican) crude is exempt from allocation and licensing requirements of the Oil Import Program and, consequently, can serve as a substitute for domestic reserves for the individual producers." (6.15–6.16)

This comment is typical of the misconception about the economics of an industry which can arise from a cursory examination of its institutional constraints. The premise is technically correct, but the conclusion does not follow.

It has long been common knowledge that the amount of Canadian oil exports to the United States is limited by agreement between the two governments. Prime Minister Trudeau recently described this agreement:

"We have a continental oil policy of sorts that was set up in the past . . . essentially it means that Canadian oil producers sell to Western Canada and sell to the United States an amount roughly equivalent to the amount of oil that Eastern Canada purchases overseas and notably from the Venezuelan producers. It's a deal between the American Government and the Canadian Government which is cost-saving and for both parties." (*New York Times*, March 26, 1969, p. 14)

Canadian exports to the United States are, in fact, controlled, Hence, Canadian reserves are not substitutes for U.S. reserves; and CONSAD's mathematical conclusions accordingly derive from inappropriately combined reserve data.

The importance of non-substitutability becomes apparent when CONSAD tries to decide how much of a change in reserves to allocate to each country:

"The relative decline in each country would depend on whether the tax changes implemented in Canada were the same as those implemented in the United States." (8.11)

What CONSAD does not say is that tax treatment is *already* materially different in the two countries; hence, Canadian and United States reserves cannot be perfect substitutes. Indeed, how could CONSAD validly compute the effect of a U.S. tax change on total reserves in the two countries when U.S. tax treatment does not apply in Canada? When tax treatment differs to start with, one cannot possibly have the "same" changes in the two jurisdictions.

B. Unneutrality of the Corporate Income Tax

In its study, CONSAD takes the position that percentage depletion is an economically wasteful tax subsidy which leads to a mis-allocation of resources by encouraging over-investment in oil. CONSAD gives only five lines of text to the extensive discussion in the economics literature of the non-neutrality of a flat-rate corporate income tax, e.g., the work of Professor McDonald "who holds that a standard rate of corporation tax is not necessarily neutral in its effects on resource allocation and that . . . the depletion allowance may be found to be a neutralizing rather than a non-neutralizing factor." (5.33)

In our opinion, taxation of petroleum exploration and production at the standard rate would cause an unneutral and economically wasteful shift of resources *away* from this industry—an industry vital to the economic and military security of the nation. Tax provisions which counter the non-neutral effects of a flat-rate corporate income tax on a vital industry are *not* "tax subsidies"; they are justifiable provisions which prevent what would otherwise be economic inequities.[13]

Why do we believe that application of the standard corporate income tax rate to petroleum would cause an unneutral misallocation of resources? A flat-rate corporation income tax changes the relative attractiveness of different investments depending on risk and uncertainty, asset lives, and leveraging power. Investments in oil and gas exploration are characterized by high uncertainty, long asset lives, and low leveraging power. Thus, in the absence of mitigating provisions, one would expect that imposition of a flat-rate corporate income tax would divert resources away from petroleum exploration to other industries or to liquid investments.

Consider the following example of the unneutral effect of a corporation income tax levied at the same rate on two industries, "A" and "B." A is more uncertain than B, and we assume that investors demand twice as much cash generation to invest in A as in B, where the expected return is, say 10 percent in the absence of an income tax. This extra profit requirement in the event of success in A is compensation for the greater likelihood of failure in A. In each industry, we assume $100, 10-year investments yielding a constant annual cash flow which is reinvested in that industry.

The following tabulation summarizes the effect of a 50 percent income tax on the relative attractiveness of the two investments (first two columns):

CUMULATIVE CASH ON HAND AFTER 10 YEARS[1]

	No tax	With 50 percent income tax	With 50 percent income tax and percentage depletion at 50 percent of net income for "A"
A	$518	$250	$311
B	$259	$170	$170
Ratio A to B	2.0	1.5	1.8

[1] Includes earnings on project cash flow assuming it is reinvested in the same industry at the same rate of return.

The flat-rate income tax reduces the ratio of A to B from 2.0 to 1.5, thereby making A relatively much less attractive than B. Investors would, therefore, place their funds in B rather than A *because of the flat-rate tax.*

Since this mal-allocation of resources results from the tax, it is appropriate to correct it through the tax. The third column shows what would happen if A were entitled to percentage depletion at 50% of net income. The relative deterioration in its position would be mitigated, with the ratio at 1.8. Complete restoration of the original relative profit position could be achieved by also permitting A to accelerate the write-off of part of its $100 investment.

A third possible use of funds is liquidity. If returns are not high enough relative to liquidity, investors need not invest in uncertain projects at all. The following tabulation compares "A" with liquidity, e.g., leaving the $100 in a safe deposit box:

CUMULATIVE CASH ON HAND AFTER 10 YEARS[1]

	No tax	With 50 percent income tax	With 50 percent income tax and percentage depletion for A at 50 percent of net income
A	$518	$250	$311
Liquidity	$100	$100	$100
Ratio A to liquidity	5.2	2.5	3.1

[1] Includes earnings on project cash flow assuming it is reinvested in the same industry at the same rate of return.

[13] Percentage depletion is not, of course, a subsidy in any event because it is not a direct cash payment from the U.S. Treasury.

In this case, a substantial accelerated depreciation allowance would be required to re-establish the pre-tax ratio of 5.2.

It is apparent that the outcomes in the real world will vary with project lives, required relative profit ratios, leveraging power of the industries, etc. A recent extensive study using typical manufacturing and petroleum examples has shown that with *both* percentage depletion and the expensing of intangibles allowed to petroleum, the present corporate income tax results in roughly equivalent after-tax and pre-tax ratios.[14] Hence, these petroleum tax provisions tend to offset the otherwise un-neutral effects of a flat-rate corporate income tax.

Why does the flat-rate corporation income tax discriminate in this way against high-return investments? What matters in project profitability evaluation is the net cash which flows from operations (that is, gross receipts less operating expenses). *The flat-rate corporate income tax reduces this cash flow by a greater percentage in the case of the project with the higher cash flow.* The following tabulation shows the effect of a 50% corporate income tax on the annual cash flows required to achieve the stated profitability levels of A and B in the absence of a tax:

	A	B
Annual cash flow without tax	$22.3	$16.3
Less annual depreciation	10.0	10.0
Taxable income	12.3	6.3
Tax at 50 percent	6.2	3.2
Annual cash flow after tax	16.1	13.1
Percentage change in annual cash flow	−28	−19

These −28% and −19% tax-induced changes are minimal indications of the discriminatory effect of the tax, since the loss of future (compounded) earnings on the reinvested funds would also be larger for A.

Senator HANSEN. Let me, first of all, express my appreciation to you, Dr. Wright, for your presence here this afternoon. We have heard a great many witnesses. I believe that you may be the first one to testify today who has taken exception to a line generally followed by the witnesses in finding fault and criticizing the proposals coming from the House and from the Treasury Department, and I certainly will be taking time to study your testimony very carefully.

Mr. WRIGHT. Thank you.

Senator HANSEN. Let me ask you with regard to the CONSAD report. You have read the report, have you?

Mr. WRIGHT. Yes.

Senator HANSEN. Did you find any reason to criticize it?

Was it deficient in any of its conclusions or invalid in any of the premises that it assumes, as nearly as you could discern?

Mr. WRIGHT. I did not find it deficient in any premises or in any conclusions which were derived from the materials they analyzed. With the data problems that CONSAD encountered there would be criticisms which would be of an absolute rather than a relative sort, things that they simply could not grapple with, but, aside from that sort of hesitation, I would not have any disagreement with the report.

Senator HANSEN. You are familiar with the economic model that they constructed to try to project the impact that certain changes in the tax laws would have upon the availability of crude oil in the country, are you?

---

[14] See Robert F. Rooney, *Tax Treatment and Regulation of the Domestic Crude Oil Industry*, unpublished doctoral dissertation, Stanford University, 1965.

Mr. WRIGHT. I am generally familiar with the type of model they used, yes.

Senator HANSEN. In your judgment, is there a relationship between the level of crude oil production and industry profitability? Would there be?

Mr. WRIGHT. There would be an indirect relation along with several other variables, yes.

Senator HANSEN. Generally speaking as an economist, would it be your feeling that profitability in any industry would encourage greater production and the failure to show a profit might discourage production? Would this be rather a simplification of the concept you hold, or do you subscribe to that?

Mr. WRIGHT. Well, economists think that industries which are experiencing declining profits tend to diminish in size, and those realizing high profits tend to expand, and these are the signals that the market works with, yes.

Senator HANSEN. I happen to be a cattle rancher. My experience has been that if the cow business, as an example, fails to show a profit, people will tend to leave that business and go into other areas of activity, and the net result will be diminution of production in the livestock business. On the other hand, if prices rise, breeding stock will be held back so as to encourage greater calf crop and generally will result in greater production. Would this illustration be typical in your judgment of the reaction of the business community generally, would you think?

Mr. WRIGHT. Insofar as the market is free to operate, you have stated that prices would rise if there were unsatisfied demands for this product, and this would encourage people to stop divesting themselves of full-grown stock and, then, subsequently, the supply of the industry would expand.

Senator HANSEN. Would you feel that the fact that the CONSAD report fails to take into account a relationship between the level of crude oil production and industry profitability might be reason to criticize the report?

Mr. WRIGHT. I have heard this statement in this room today for the first time, and I, frankly, do not understand what it means. Is this a particular assumption that you are talking about in the report? Is this how they failed to take this into account—I mean, the approach used did not explicitly rule out such a relationship as I recall. Could you clarify if that is what that statement means?

Senator HANSEN. I must say that I have not yet had time to read the CONSAD report word for word, but it is my understanding that the CONSAD report does fail to note and to reflect an interrelationship between industry profitability on the one hand and crude oil production on the other.

Mr. WRIGHT. The CONSAD report deals with the question of petroleum reserves and their relation, the level of these reserves, to the Federal tax program, percentage depletion, and intangibles expensing.

Now, there is some relationship, an economic relationship, between reserves and production. Perhaps, this relationship could enter through that indirect route; however, I have not felt, myself, that there was any, that this put any crimp in their style. So far as I could tell, they took adequate account of it, so that if it were not so for some reason, the results did not change that much.

Senator HANSEN. Let me ask you: Would you agree that if there was really little evidence of profit in the oil business would that tend to discourage people from going into the business?

Mr. WRIGHT. Evidence of profit as revealed in the stockholders' report, for example?

Senator HANSEN. Or in the experience of an independent oil operator?

Mr. WRIGHT. Including independents?

Senator HANSEN. Yes.

Mr. WRIGHT. Yes, if profits were declining this would indicate the sort of thing we talked about in the example of cattle ranching.

Senator HANSEN. And would it not follow that, if profits did decline, in the long haul that would tend to bring about the development of fewer rather than greater reserves?

Would this seem reasonable to you?

Mr. WRIGHT. Yes, this is what the market mechanism would be calling for.

Senator HANSEN. Thank you very much. I have no further questions.

Senator MCCARTHY. Thank you very much, Mr. Wright.

(Mr. Wright's prepared statement, with attachments, follows:)

STATEMENT OF ARTHUR W. WRIGHT, ASSISTANT PROFESSOR OF ECONOMICS, UNIVERSITY OF MASSACHUSETTS, AMHERST, MASS.

SUMMARY

States that the present tax treatment of natural resources is an important source of unfairness in the Federal tax system. Points out that the present tax rules for natural resources make it possible for many extremely wealthy individuals to pay less Federal taxes than persons living in poverty and enable corporations engaged in mineral production to pay far less Federal taxes than do other corporations.

Condemns the present tax treatment of natural resources as a wasteful and inefficient form of subsidy, the need for which has not been demonstrated. Suggests that the beneficiaries of mineral tax subsides should have more faith in the ability of the American free market economy to produce minerals and fuels without Federal aid.

Points out that the present system of mineral tax subsidies creates severe administrative burdens for government and business alike. Indicates that the areas of greatest administrative difficulty concern "economic interest" questions, depletion rate determinations, cut-off point questions, unit price computations, and the fifty percent net income limitation on percentage depletion.

Points out that the Treasury's CONSAD Report, published in March 1969 by the House Ways and Means Committee, constitutes the only thorough study, to date, of the effects of the present system of tax subsidies for mineral producers. States that the CONSAD Report shows the inefficiency of these tax subsidies. Also states that the CONSAD Report has withstood the criticisms leveled at it by the petroleum industry, and suggests that the industry should commission studies of equivalent stature and thoroughness rather than merely criticizing the CONSAD Report.

Rejects claims that natural resource producers pay their fair share of Federal taxes. States that claims of this sort often use misleading bases for comparison (such as gross income instead of taxable income) and inconsistently lump together foreign taxes, Federal taxes, local taxes, and user charges when computing the industry tax burden.

Also rejects claims that the present tax treatment of natural resources is needed to let natural resource producers recover their capital investment in mineral properties. Points out that this recovery can be accomplished through

cost depletion and that the present tax treatment is defective because it permits tax free recovery of amounts far greater than a mineral producer's original capital investment. States that this tax treatment discriminates against other industries that also must attract substantial amounts of capital investment.

Also rejects the claim that percentage depletion helps keep gasoline prices down. Points out that the Treasury recently estimated there would be a change in the price of gasoline of less than one half cent per gallon if the percentage depletion rate were reduced to 20 percent. States that retail prices of gasoline could be reduced by *several* cents per gallon by removing import restrictions and Federal support for market prorationing.

Also rejects mineral industry arguments that their tax benefits should be continued because industry rates of return on capital are low. Questions whether mineral industry rates of return are in fact low. Further states that rates of return, in the American free market economy, tend to equalize in all industries after taking into account the tax benefits granted each industry. Suggests that mineral tax benefits are often dissipated in the form of higher royalty payments to property owners.

Describes the present program of tax assistance to the natural resource industries as an inequitable, wasteful, problem-ridden government aid program. Urges the Committee to scrap the existing aid program and substtiute depletion computed on the basis of actual cost, together with capitalization of intangible drilling costs and recovery of such costs over the useful life of the property like business investment in other industries.

Praises the natural resources provisions in the House-passed tax reform bill as a step in the right direction, but criticizes both the House bill and the Administration's proposals for failing to eliminate percentage depletion entirely, and, most particularly, for failing to require full capitalization of intangible drilling and development costs.

STATEMENT

Mr. Chairman and Members of the Finance Committee:

Thank you for receiving this statement on tax reform in the area of depletable natural resources. This is an important subject, because changes in present federal tax treatment of natural resources ought to be part of any meaningful tax reform package. To facilitate my presentation, I have prepared a separate analysis in which my views on this subject are developed in more detail.* I would like to ask the Committee's permission to insert this analysis in the record following my written statement.

I represent no organization or interest group. Rather, I am writing as an economist and concerned citizen who has studied natural resource problems, including their tax treatment, for about a decade. As a result of my work, I have become increasingly worried about present federal tax policies in this area. Let me summarize the reasons for my concern.

1. *Lack of tax fairness.*—Present tax policies towards natural resources provide a major route by which wealthy individuals and corporations escape liability for federal income taxes. As a result, our tax system, judged by publicly accepted standards, is less fair than it should be. Understandably, the American public has become concerned about this situation.

2. *Waste of tax monies.*—The present tax treatment of natural resources leads to a serious waste of public funds, because we are receiving very little benefit in return for substantial tax expenditures. Moreover, our present tax policies make it harder to attain other worthwhile public goals, such as greater public confidence in our tax system.

3. *Administrative difficulties.*—Serious problems have arisen in administering the present tax provisions for natural resources. These problems have been unduly neglected in past studies of natural resource taxation. After forty years of court decisions, regulations, and rulings, these problems are now more serious than they were when the special tax benefits for mineral producers were first introduced.

I will discuss each of these points in turn.

1. *Lack of tax fairness.*—There are two standards by which to judge the fairness of the federal tax system.

First, taxpayers with similar incomes should bear similar tax burdens. The effective tax rate should not depend on the *source* of one's income: earnings from

---

*The analysis referred to will be printed in the record compiled of the hearing.

minerals and earnings from other sources should be taxed alike. Yet earnings from natural resources are now taxed at lower rates—in many cases substantially lower rates—than earnings from most other sources. Under present tax rules, natural resource incomes are shielded by percentage depletion deductions in excess of cost depletion, by accelerated writeoffs of exploration and development expenditures—including, for petroleum and natural gas, immediate expensing of intangible drilling and development costs—and by inflated foreign tax credits.

A family with an income of $50,000 from (e.g.) oil production should, in fairness, pay about the same tax as a family with $50,000 in income from ordinary salary and wages, but the Internal Revenue Code's special provisions for natural resources make this impossible. Similarly, an oil firm should pay more than a tiny fraction of the corporate tax which is paid by a chemical firm with similar receipts and profits. Yet our present tax rules permit the oil firm and other natural resource firms to avoid payment of their fair share of federal taxes.

The second standard of tax fairness is progressivity of tax rates. This means that persons with higher incomes should be taxed more heavily than persons with lower incomes. But the present tax provisions for natural resources, by providing high income groups with an easy way to reduce their effective tax rates, make it very difficult to attain this goal. So broad is the avenue of escape that a significant number of wealthy individuals, including some with incomes in excess of $1 million per year, pay less federal taxes than do individuals living in poverty. The public is understandably concerned about such unfairness. If we fail to correct this situation, we run the risk of undermining the faith of the American people in their self-assessment tax system. In order to operate well, such a system must have public confidence.

These considerations of tax fairness argue for putting an end to the special tax privileges currently enjoyed by the natural resource industries. Unless this is done, it will not be possible to produce a tax system which, because it treats all taxpayers fairly, is entitled to widespread public support.

2. *Waste of tax monies.*—In the United States, it is our policy to rely primarily on market forces to achieve our economic goals. Government intervention in the marketplace is not favored unless it is found to be absolutely necessary. At present, however, the federal government actively intervenes in our market economy by exempting the natural resource industries from taxes they would otherwise have to pay. Is this government intervention necessary?

A number of traditional arguments have been advanced in support of the existing interventionist tax treatment of natural resources. Most of these arguments lack substance. For example, we are told that our present tax policies are needed to foster "a strong mineral industry." But why should we benefit the mineral industries at the expense of everyone else? The expansion and success of *all* our industries are important, and the mineral industries should have no special claim to government favor.

We are also told that natural resource production requires advantageous tax treatment because it is highly "risky". But those who have studied the petroleum industry—supposedly the most risky of all the natural resource industries—have pointed repeatedly to the ingenious techniques developed by oil and gas producers to spread risks within the market mechanism. Most pleas from oil and mineral producers for tax assistance show a disturbing lack of faith in the ability of market processes to adapt to risks. What is needed is more faith in the American market economy, and less reliance on public expenditures through the tax system.

The only possibly valid argument for retaining existing tax aid to natural resource producers is the so-called "national security argument." The heart of this argument is the claim that extra productive capacity—referred to as "reserves"—is needed for use in the event of war or other emergency, and that special tax benefits are needed to encourage the creation of such reserves. However, the national security argument is open to serious doubt on several counts.

In the first place, we do not really know whether the national security requires greater reserves than market processes, if left to themselves, would provide; or if there is a need, how great it is in quantitative terms. Secondly, we have no proof, beyond tub-thumping assertions by industry spokesmen, that present natural resource tax provisions actually do create significant additional reserves. The evidence we do have, from several non-industry sources, indicates that the net impact of our tax policies on reserves is rather small.

The most recent evidence on this subject was provided in the Treasury report prepared by the CONSAD Research Corporation and released in March 1969. The results of this report, which in my opinion remain essentially valid in spite of attacks by the Mid-Continent Oil and Gas Association and other industry groups, suggest that our present tax policies result in additions to petrouem reserves worth, at most, $150 million per year, in return for annual tax expenditures for petroleum exceeding $1.3 billion. Spending $1.3 billion through the tax system to achieve public benefits worth $150 million is a wasteful extravagance.

It is significant that during 1969, petroleum industry publicists have begun to de-emphasize the national security argument, and to play up the notion that special tax treatment of petroleum helps maintain low prices to consumers. This notion, and its implied corollary that removing such tax treatment would cause sizable price increases, have simply not been convincingly demonstrated. Nor has the industry explained why we should use the tax system to manipulate oil prices and not the prices of such other "vital" products as milk or clothing. Nor has the industry explained why we should bother to tax consumers of oil products more heavily in order to attempt to give them lower product prices.

If the industry were serious about reducing prices to consumers, they would be asking Congress to remove or greatly relax the present restrictions on oil imports, and seeking to do away with the various state prorationing schemes—just the opposite of their stands on these programs. Clearly the "low price" justification for special tax treatment of natural resource producers can be dismissed as merely another example of the cynical scare tactics employed so often in past industry publicity.

The Honorable Wilbur Mills, Chairman of the House Ways and Means Committee, in a speech to the House in December 1967, aptly labelled tax expenditures—that is, expenditures on the revenue side of the budget—as "back door spending." In this speech, Mr. Mills pointed out several defects of tax expenditures as opposed to outright appropriations: tax expenditures are seldom reviewed by the Executive Branch or by Congress to determine whether they are still necessary; accurate data on their costs and benefits are often difficult to obtain; and too frequently they are wasted on firms which would have undertaken the intended activity without them.

These defects obviously characterize our present system of tax expenditures on the natural resource industries. The basic philosophy of the system—that is, the long-term objectives, the need for tax benefits, and the rationale of the existing set of depletion rates and cut-off points—has escaped serious examination for 40 years. Furthermore, no line items in the Administration's budget reflect our tax expenditures on natural resources. And, as the recent CONSAD study suggests, most of these expenditures are wasted.

It is important to recognize the relative magnitude of our back door spending on natural resources. According to a statement on January 17, 1969, by former Secretary of the Treasury Joseph W. Barr, the United States currently spends—through the back door—at least $1.7 billion annually to aid oil producers and other segments of the extractive industries. This sum is just $200 million short of what the federal government appropriates directly, under close scrutiny, for the same purpose.

The $1.7 billion in back door spending on natural resources is three times what was budgeted during fiscal 1969 for federal law enforcement; fifteen times as much as the cost of running our federal judicial system; three times the budgeted amount for school lunch and food stamp programs; five times as much as is budgeted for low-rent public housing; and four times the allotment for the Alliance for Progress. This $1.7 billion in back door spending rivals in size such carefully scrutinized areas as the foreign aid program, the Apollo moon program, the programs of the Office of Economic Opportunity, and federal aid for elementary schools. Tax expenditures of this magnitude should be halted in the absence of solid proof that these huge expenditures actually produce public benefits commensurate with their size.

3. *Administrative difficulties.*—Too little attention has been paid to the serious practical problems encountered in administering our present system of special tax benefits for the natural resource industries. In part, these difficulties arise from taxpayers' natural desire to expand their tax benefits to the greatest de-

gree possible, and the equally natural desire of tax administrators to limit revenue losses. Difficulties also arise from the vagueness of the existing statute, which frequently fails to identify clearly the natural resources for which tax benefits may be claimed, or the rules to be used in computing the dollar amount of the tax benefit.

These problems are not simply a matter of percentage depletion rates, as is sometimes thought. The problems actually fall into five major areas. The first of these areas involves the taxpayer's possession of an "economic interest" in a natural resource property. An economic interest is a necessary prerequisite to a depletion claim, but there is much confusion regarding the legal meaning of this vague term.

The second problem area involves the appropriate percentage rate of depletion for a particular natural resource deposit. Different ores and minerals are entitled to sharply different depletion rates under the Code. However, because the Code's definitions are vague, and because deposits vary in physical and chemical composition, it is not always clear which rate applies to a particular deposit.

Third, many difficulties arise concerning the "cut-off point," which determines the amount of processing which a taxpayer may include in his depletion base. In general, the inclusion of more processing in the depletion base increases the depletion deduction. The principles to be used in determining an appropriate cut-off point are not clear, and disputes therefore abound.

Fourth, there is the problem of determining the unit price to be used in computing gross income from a natural resource property. For instance, I understand that the Internal Revenue Service has recently encountered major difficulties in determining the price for crude oil produced by U.S. firms operating out of the Persian Gulf. Similar pricing problems affect many other natural resources.

Finally, there are rather serious problems connected with the computation of the statutory fifty percent net income limitation on percentage depletion. Allocating costs between extractive and fabricating activities, and the carryover of losses from one accounting period to another, are patricularly vexing problems in this area.

Today, after 40 years of court decisions, regulations, and rulings, the practical problems in administering the tax provisions for natural resources are more serious than they were in the 1920's when these provisions were first introduced. The accounting and legal costs incurred in trying to cope with these problems are substantial, for government and taxpayer alike. It has been necessary to create an elaborate government bureaucracy to handle these matters, and businessmen are induced to spend time and energy in protracted disputes rather than in productive endeavors. Moreover, as technology and costs change, and as new types of natural resources come into use, new problems continually arise. The complexities involved in trying to settle these administrative problems further increase the waste and inefficiency associated with the percentage depletion mechanism.

Summary and recommendations

In short, our present program of tax assistance to the natural resource industries is an inequitable, wasteful, problem-ridden government aid program. Only one responsible recommendation can be made: this program should be scrapped. Depletion on natural resource properties should be computed on the basis of actual cost, under rules similar to those set forth under section 611 of the Internal Revenue Code. Future investments in natural resource production facilities should be capitalized, and, like business investment in other industries, recovered over the useful life of the property.

Recent action by the House Ways and Means Committee, recommending reductions in percentage rates of depletion and restricting the uses of several ploys that widen the tax loopholes on natural resource incomes, constitutes a step in the right direction. In my view, however, the Committee did not go far enough; moreover, they did nothing about the unnecessary and unparalleled provisions for immediate expensing of so-called "intangible" drilling sots—a glaring omission from what is otherwise a promising package of tax reforms.

If natural resource producers actually need government aid—and this need has not been satisfactorily demonstrated—there are cheaper, more effective means of giving such aid which would avoid the inequities and administrative difficulties of the present aid system. Specifically, direct appropriations, which are more easily scrutinized and more directly tied to performance, are a superior method of granting government aid.

In conclusion, I appeal to this Committee to scrutinize carefully the arguments advanced by natural resource producers in support of the back door spending now authorized by the special mineral resource provisions of the Internal Revenue Code. It is important to remember in making this examination that all of the available evidence indicates we are wasting tax money—huge amounts of tax money each year—through these special tax provisions. We are spending big sums but receiving little in the way of public benefits. Until these wasteful back door expenditures are brought to a halt, I believe that the public will be justified in regarding much of the talk about "tax reform" and "economy in government" as empty rhetoric.

Thank you.

Federal Tax Policy and the Natural Resource Industries: Are We Getting Our Money's Worth?

(Arthur W. Wright, Assistant Professor of Economics, University of Massachusetts)

INTRODUCTION

In this paper, I propose to evaluate, with the aid of economic analysis, the effectiveness of existing federal tax policy towards the extractive (natural resource or mineral) industries. This important area of public policy deserves careful scrutiny as a prime candidate for inclusion in any meaningful program of tax reform.

Through a set of special tax benefits, this nation now in effect spends large sums of public money each year on the extractive industries. As with any public expenditure, sound public policy requires continuous review by government bodies, raising and hopefully answering questions such as these: What benefits is the nation deriving from present "tax expenditures" on natural resources? Are they benefits we want? What are the costs of obtaining them (including other possible benefits foregone)? Could we achieve the same results more effectively or at lower cost with other programs?

After much study, I have concluded that the present tax benefits to mineral producers are poor public policy. The benefits are few, the costs high. Having examined the usual rationales for continuing present tax policy in this area, I strongly doubt that tax assistance is either necessary or desirable. Should the Congress decide that some form of special treatment is justified, there exist several alternatives to the present policy that would be both cheaper and more effective.

Following a brief outline of the principal tax benefits accorded to the extractive industries, five topics receive detailed discussion: (1) taxpayer inequities; (2) economic waste; (3) administrative difficulties (all too often ignored); (4) the relation of the tax provisions specific to the extractive industries to the general capital gains option; and (5) the proposed "minimum tax" system as a tool of public policy in connection with natural resource taxation.

Tax policy is of course related to other areas of public policy towards the extractive industries. The most notable example is in the oil and gas industry, which is affected by state regulation and federal import quotas as well as federal tax provisions. Although the ideal would be a complete treatment of all facets of public policy, attention will be limited here solely to tax policy except for an occasional footnote reference to the other facets.

I. Present Special Tax Benefits for the Extractive Industries

The Internal Revenue Code contains three basic special tax benefits for producers of petroleum, natural gas, and hard minerals. These are, first, the percentage depletion deduction set forth in section 613 of the Code; second, the special provisions in section 263(c) which permit the current write-off of intangible drilling and development costs in the case of producing oil and gas wells; and, third, the provisions contained in sections 615 through 617 of the Code which permit exploration and development costs to be written off currently, subject to certain limitations. In addition, section 1.612-4(b)(4) of the Treasury Regulations on Income Tax grants oil and gas producers who have elected to capitalize intangible drilling and development costs the additional option of either expensing or capitalizing their dry hole costs.

In addition to the benefits provided directly in the Internal Revenue Code and Treasury Regulations, there are important foreign tax credit benefits which have been extended to the mineral industries by revenue rulings on the foreign tax credit provisions set forth in sections 901 through 906 of the Internal Revenue Code.

The percentage depletion provision is an extraordinary tax benefit because it permits the tax-free recovery of dollar amounts which are greater, often far greater, than the taxpayer's original investment in a depletable mineral property For this reason, the percentage depletion deduction is a subsidy, not simply a mechanism for the recovery of a taxpayer's capital investment. In addition, that portion of the percentage depletion deduction which represents ordinary tax free recovery of capital investment costs is usually recovered more rapidly than would be the case if natural resource taxpayers were required to compute depletion analogously to the computation of depreciation in non-extractive industries. Percentage depletion therefore confers a double benefit: (1) deductions in excess of initial cost, and (2) deductions of initial cost that are unusually accelerated.

The intangible drilling and the exploration-and development provisions of the Code are both extraordinary tax benefits because they permit the immediate tax-free recovery of capital investments. In contrast, the tax-free recovery of capital investments in manufacturing, transportation, and most other industries is generally geared much more closely to the actual wearing out of capital equipment; for example, a producer of automobiles must depreciate his machinery over its useful life, a railroad must depreciate its rails over their expected life, and a farmer must take annual depreciation deductions on his farm equipment. Immediate, tax-free recovery of capital, such as the mineral industries enjoy is thus the exception rather than the rule.

The special percentage depletion rule, the special intangible drilling cost rules, and the special exploration and development rules all constitute departures from normal accounting procedures. This is the main reason why giant firms can regularly report handsome profits to their stockholders while paying little or nothing in Federal income taxes.

The foreign tax credit provides another important tax benefit for U.S. firms producing natural resources in other countries In the case of genuine income taxes, and taxes levied in lieu of genuine income taxes, these provisions probably do not confer special benefits on the mineral industries relative to other industries. However, petroleum, iron ore, and bauxite producers, among others, appear to have claimed the foreign tax credit for "taxes" which are actually paid in lieu of landowner's royalties. This has occurred particularly in the Persian Gulf region, where the landowner and the taxing authority are frequently one and the same person. In that region, landowner's royalties originally charged by the feudal Arab kings have generally been converted into so-called income taxes, which have been ruled creditable for Federal income tax purposes, Revenue Ruling 55-296, 1955-1 Cum. Bull. 386, for example, held the Saudi Arabian "income tax" to be creditable against United States income taxes. The effect of rulings such as this has been to confer substantial benefits on both the oil producing nations of the Persian Gulf and the international oil companies at the expense of the United States Treasury. In addition, these benefits discriminate against domestic United States producers, because a tax credit is being allowed for an item which is actually just a normal business expense and which is not creditable against tax for domestic United States producers.[1]

There is some disagreement over whether the option of currently expensing "dry hole" costs in petroleum drilling represents special tax treatment. On the one hand, it can be contended that dry hole costs are losses which should be currently deductible like other business losses. On the other hand, they may be viewed as part of a capital investment program, the object of which is the acquisition of assets in the form of reserves. The former position seems consistent with present general corporate income tax procedures, whereas the latter is more relevant for economic theory.[2] Since this paper will focus on evaluating the special

---

[1] Domestic U.S. producers are of course protected by the reverse discrimination against foreign sources inherent in the oil import quotas imposed beginning in 1959.

tax provisions for natural resources relative to the uniform corporate income tax, we shall not regard the current expensing of dry-hole costs as a special provision.

II. Taxpayer inequities

As I read it, the generally accepted view of taxpayer equity, or fairness, implicit in federal tax policy consist of two standards: Taxpayers with similar incomes should bear similar tax burdens ("horizontal" equity). And the effective structure of marginal tax rates should be "progressive", that is, persons with higher incomes should be taxed proportionately more heavily than persons with lower incomes ("vertical" equity).[3] These principles apply to corporations as well as individuals, although the progressivity of effective corporate rates is quite weak, arising only from the lower rate applied to the first $25,000 of corporate income.

Recent studies by the U.S. Treasury Department have suggested that the present tax system, when measured against these two standards, contains numerous and large inequities. These studies make clear that the special tax treatment of the extractive industries is a major source of these inequities, for both individuals and corporations.

Horizontally, these studies find that effective tax rates vary widely among individual taxpayers having similar adjusted gross incomes.[4] Parallel variations are found between sectors of industry, although variations among corporations *within* a given sector are presumably smaller.[5] Present tax treatment of the extractive industries fosters such variations by distinguishing between *sources* of income. One's effective tax rate should not, in fairness, depend upon the source of one's income. Earnings from natural resources and earnings from other sources should be taxed alike. Yet the former are now taxed at lower rates—in many cases substantially lower rates—than earnings from most other sources. Under present tax rules, natural resource incomes are shielded by depletion deductions in excess of cost depletion, by accelerated writeoffs of exploration and development expenditures (including, for petroleum, immediate expensing of intangible drilling costs) and by inflated tax credits.

Vertically, the Treasury studies find numerous instances of sharply reduced progressivity in effective tax rates. Present tax provisions for natural resources, among other provisions, contribute in a major way to the reduction by providing high income groups with an easy way to escape higher marginal rates. So broad is the avenue of escape that a significant number of wealthy individuals, including some with incomes in excess of $1 million per year, pay less federal taxes than do individuals living in poverty.[6]

A number of objections have been raised to the charge that inequities arise from existing tax provisions for natural resources. Some representatives of the petroleum industry—which accounts for "about 80 percent of the tax relief for extractive industries"[7]—complain of "unfair tax burdening" and insist that "contrary to popular claims, oil's total tax bill equals that of other industries."[8] The complaint of unfairness, which allegedly arises from "diversion" of the proceeds from "user taxes" on petroleum products,[9] is transparently hollow: the "use" involved is use of highways, not petroleum products. (If anything, the petroleum industry benefits from the tying of gasoline and Diesel fuel taxes to roadbuilding—a privilege not extended to (say) camping equipment taxes for campsites, picnic basket taxes for picnic areas, or liquor taxes for taverns—which increases the demand for their products.)

The petroleum industry's "total tax bill" is generally computed as the sum of all domestic income taxes (including those levied on employees' incomes), foreign taxes, so-called "severance" taxes, property taxes and excise taxes. (One industry protagonist has ever proposed including excise taxes on consumer

[4] *Ibid.*, pp. 74–95.

[5] *Ibid.*, pp. 99–101. See also Senator Proxmire's speech to the Senate on January 22, 1969 (*Congressional Record*, p. S767). Note that provisions such as percentage depletion which apply only if a corporation has net income give greater tax benefits to corporations making money.

[6] *Ibid.*, p. 8; see also former Treasury Secretary Barr's statement to the Joint Economic Committee, January 17, 1969.

[7] *Ibid.*, p. 101.

[8] The first quote is from *The Oil Daily*, February 19, 1969, p. 1, and the second from *Oil and Gas Journal*, February 10, 1969, p. 27.

[9] *The Oil Daily*, February 21, 1969, p. 1.

goods purchased by industry employees.[10]) Clearly the total tax bill is a meaningless concept as it stands, and the asserted claim of equality (absolute? relative?) with those of other industries is just as meaningless. Foreign "taxes" (which in many cases used to be called royalties) do not pertain to the industry's contribution to domestic public treasuries. Excise taxes on petroleum products, generally earmarked for highway construction, seldom enter general funds, and are offset for comparative purposes by excise taxes on other industries' products. Taking away these two items, and noting the further offsets on employees' income taxes and on property taxes, we are left with the insignificant severance taxes and the industry's very low corporate income taxes.

A second, more general objection to the inequity charge is more substantial. The central idea is that the market mechanism will permit income recipients in the long run to adapt to tax provisions in such a way that the after-tax distribution of income is very similar to what it would have been without the provisions.[11] The alleged adaptation is made (for instance, in the case of the percentage depletion allowance) through the bidding up of the prices of assets whose incomes are subject to advantageous tax treatment until marginal after-tax returns are equated.

The market-adaptation argument has some validity with regard to horizontal equity, allowing for differences in peoples willingness to expend time and effort (or money, on a good tax lawyer) to study the tax laws. Such barriers as exist for one millionaire but not for another seem to be relatively insignificant. But this argument cuts two ways: While it tends to weaken the charge of horizontal equities arising from special tax provisions, it also weakens the possible objections to removing those same provisions. The market is equally good at doing and undoing.

When it comes to vertical equity, however, the market-adaptation argument is not valid. Present special tax provisions applying to natural resources (along with most other alleged loopholes) are not attractive until one enters a fairly high tax bracket, i.e., until one's income reaches a high level. (A reasonable guess at the minimum threshold might be $25,000 of gross income per year.) These provisions therefore represent an opportunity—the progressive rate structure itself providing the incentive—to higher-income groups to reduce their share of income paid in taxes relative to lower-income groups, and relative to the effective rates intended in the Internal Revenue Code. Moreover, it is precisely persons with higher incomes who can afford to strive to expand the coverage of special provisions. (The ample efforts so to widen the "loopholes" is a testimonial of sorts to the vigor of market responses in the American economy; unfortunately, under present tax rules this vigor is not channelled into producing more goods and services.)[12]

Up to now I have dealt solely with the effects of special tax benefits for the extractive industries on the size distribution of income among individuals and among corporations. Those benefits would also affect the distribution of so-called "functional" shares of total income accruing to the various factors of production and residual claimants. The fact that natural resources are extracted from the ground, together with U.S. institutions of private property makes incomes associated with land ownership—lease payments, land sales and production royalties to land owners—an important element in functional income distribution. The effect of existing tax provisions for natural resources is to raise these incomes; conversely, the effect of removing or partially reducing the dollar magnitude of the existing provisions would be to lower land incomes.[13] The quantitative extent of the change (which is of a once-for-all sort in either direction) would depend upon the distribution of possible resource-bearing lands ranked according to natural resource content and accessibility (including location in relation to markets). The fewer the good ones, the greater would be the change.

The impact of a given change in the functional share of land rent on the size distribution of income (i.e., who would benefit or suffer from more or less favorable tax provisions) would depend on the pattern of land ownership.

---

[10] Fernald in *Federal Tax Policy* 1955, pp. 427–428.

[11] For example, Henry Wallich, "Taxes and the Market," *Newsweek*, February 24, 1969, p. 78.

[12] Gray in *Federal Tax Policy* 1955, pp. 430–431, concisely documents the pressures over the years to secure more and more favorable treatment.

[13] At least in petroleum, production royalty percentages appear to be rather insensitive to changes in land values, most of the variation taking place in lease payments and land sale prices.

The same generally accepted standards of equity invoked earlier would apply to the problems raised in making the transition from preferential to equal tax treatment of mineral producers. Investors who had acquired mineral assets under the expectation of continued special tax provisions would be faced, when those provisions were rescinded, with "windfall" reductions in asset values. The remedy is simple: permit those investors to continue to receive the former special tax treatment *on those assets* until they are retired. The effective cut-off date should be set at about the time the Congress begins drafting legislation to rescind the special provisions, since subsequent to that time investors' expectations would be geared to normal provisions.

The public is understandably concerned about the unfairness created by present special tax provisions for natural resource and certain other sources of income. Their concern is increased by warnings from Budget Director Mayo of the possible need for new tax revenues over and above the ten percent surcharge still in effect.[14] Newspaper reports tells of the "millions in need of [tax] relief and the thousands who . . . enjoy tax privilege as a way of . . . life,"[15] and wonder how "such a tempting package of revenue goodies [the special tax provisions for oil and gas] survived the Vietnam tax squeeze without serious challenge."[16] Similar thoughts have undoubtedly occurred to taxpayers.

If we fail to correct the present inequitable situation, we run the risk of undermining the faith of the American people in their self-assessment tax system.[17] In order to function, such a system must have public confidence. More generally, at the present time any step that would strengthen the confidence of the people in the federal government is worthy of study.

III. *Economic Waste*

Considerable controversy has arisen over the relation of the special federal tax benefits for the extractive industries to economic efficiency. Much of the debate has been academic, confined to the pages of professional economics journals. Some of it, however, has reached the real (or near-real) world of Congressional hearings and other confrontations between the interested parties. Reading through the ample literature on the debate, I have been most impressed by the lack of communication between the contestants, be they representatives of academe, industry or the Legislative Branch.

Consequently, in the hope of clarifying the issues, hazarding some answers, but most importantly improving communication, I shall take a tack in this paper somewhat different from past presentations by economists. The approach employed here will build on the notion of public policy as set forth in the Introduction: Are we getting our money's worth from our considerable "tax expenditures" on natural resources?

Let us begin by examining how these tax expenditures work. The existing package of extractive industry tax benefits consists of tax credits. Tax credits can be called *general* policy tools, that is, benefits are paid through credits against tax liabilities which can be claimed for *any* activity that qualifies under the provisions. Expenditures from direct appropriations, by contrast, can be made as narrowly selective, or as broadly general, as the policy making body wishes.

A public policy aimed at stimulating activities that are already going on should be aimed at inducing business firms to begin operations which in the absence of the policy they would not have found worthwhile. In the jargon of economists, a policy of this sort should seek to influence business decisions "at the margin", or to be more precise, to extend the effective margin of economic operations.

Selective policies can be fairly well tailored to impart this kind of stimulus. However, general policies such as tax credits operate not only at the margin—by

---

[14] In his statement to the Joint Economic Committee on February 18, 1969, reported in *The Oil Daily*, February 19, 1969, p. 1. According to Mayo, the estimated discrepancy after the 10 percent surtax is some $2.9 billion. Almost four-fifths of this discrepancy could be made up by removing the special tax benefits for natural resources, initially worth in excess of $2.25 billion according to Treasury figures (*Tax Reform Studies* 1969, Part 3, p. 41).

[15] *Newsweek*, February 24, 1969, p. 70.

[16] William K. Wyant, Jr., in the *St. Louis Post-Dispatch*, February 1, 1969, Editorials p. 1.

[17] Representative Byrnes has warned that "the whole [tax] system will become a victim to a lack of confidence and abuse" unless steps are taken soon (quoted in *Newsweek*, February 24, 1969, p. 66). The *New York Times* has recently editorialized in the same vein (January 10, 1969).

raising the after-tax returns of some previously sub-marginal activities—but on *all* operations. The benefits from a tax credit accrue to all operations, including those that would have been undertaken without the tax credit. In effect, businesses receiving tax credits are given a tax bonus for doing what they would have done anyway.

Such a bonus may not be entirely without results. For instance, depending on the precise form of the tax credit, the time rate of operations of previously existing activities may increase. However, such results need not be consistent with the intentions of public policy.

From the preceding analysis we would expect the present package of tax credits for mineral industries to encourage the opening up of marginal deposits of natural resources which would not have been worthwhile (at prevailing prices) if normal corporate tax provisions applied. Because a tax credit is a general tool of policy, however, benefits also accrue to owners of deposits that would have been in operation without a credit. As a result, only a portion of the tax benefits paid to natural resource producers goes into net stimulation to find and open up marginal deposits.

Because the main tax deduction for the extractive industries, percentage depletion, is computed on the basis of extracted output, there is also an incentive to produce at a faster rate per unit time from a given deposit—subject to the fifty percent net income limitation and to downward pressures on product prices as a result of all producers responding to the incentive.[18] It is not clear that an increased time rate of use of natural resources is necessary or desirable from the standpoint of public policy; for at least one goal (national security—see below) it is undesirable.

Economic analysis leads us, therefore, to conclude that present special tax treatment of the extractive industries would tend to stimulate the finding and opening up of marginal deposits, but in addition it would also aid operators of deposits which would have been explored and opened up in any case. Economic analysis also tells us that this special tax treatment would tend to increase the time rate of natural resource production, thus depressing current relative to future prices, a consequence which may not be desirable. The next step is to look at the extent of the total stimulus, its cost, and therefore its relative desirability from the standpoint of public policy.

A. Magnitude of tax benefits and results in the extractive industries

This is an area about which our quantitative understanding is still rather weak. Spokesmen for the extractive industries, who presumably would have the easiest access to empirical evidence, have never to my knowledge seriously attempted to quantify either the value of their tax assistance or the worthiness, if any, to the public of its results.[18a] Several academic students of the tax treatment of natural resources (mainly petroleum) have made estimates of the size of the money stimulus *at the margin*, but have not attempted to convert that into a total by estimating the impact on output.[19]

Fortunately, several studies recently released by the U.S. Treasury provide what seem to be reliable, up-to-date estimates of the size of present tax benefits to the extractive industries generally,[20] and of the size of the stimulus to creation of new reserves of petroleum in particular.[21] Tax expenditures due to the excess

---

[18] McDonald 1967, p. 282 argues that the incentive to speed up the time rate of exploitation of mineral deposits would be "swamped" in the case of new deposits by another alleged consequence of percentage depletion, namely, a "reduction in the rate of interest . . . employed in choosing the optimum time distribution of production in newly discovered [petroleum] reservoirs." That rate of interest would, however, be determined in the capital market as a whole, not in the mineral sector alone. Hence the adjustment towards equilibrium in minerals would take the form of expanding the margins of production until marginal returns were consistent with the prevailing market interest rate and other prices.

[18a] The Mid-Continent Oil and Gas Association recently (April 1969) assembled a task force of economists to criticize the Treasury's "CONSAD report" (see note 21), but regretably did not instruct this task force to undertake an original analysis to replace CONSAD's findings.

[19] Harberger in *Federal Tax Policy* 1955; Steiner in *Tax Revision Compendium* 1959; *idem.*, 1963 and 1964. For a dissent to the Harberger and Steiner findings, see McDonald 1961, 1962, 1964 and 1967; note that McDonald's dissent has progressively weakened with time. See the next section for further discussion of this debate.

[20] Former Secretary of the Treasury Joseph W. Barr, *Statement before the Joint Economic Committee* 1969, Appendix p. 11; see also *Tax Reform Studies* 1969, Part I, pp. 101 ff.

[21] CONSAD 1969; see the comments on this report in *Tax Reform Studies* 1969, Part 3, pp. 413 et passim.

of percentage depletion over cost depletion, plus expensing of exploration and development costs are estimated to run currently at an annual rate of $1.7 billion.[22] Of this total a little over eighty percent, or about $1.4 billion, is estimated to go to the oil and gas industry.[23]

Regarding the results achieved with these tax outlays, the CONSAD study concluded that the special tax treatment of oil and gas achieved additional reserves, relative to the situation without such special treatment, worth at the most) $150 million at current prices.[24] Even allowing for a price increase of $1.00 per barrel if both percentage depletion and expensing of exploration and development costs were removed,[25] this is a poor return on tax expenditures of $1.4 billion.

As was noted earlier, percentage depletion operates directly upon current extraction but only indirectly on the finding and preparation of new reserves. Under present tax provisions petroleum is the main mineral to receive tax aid which directly affects pre-extraction outlays, namely, the privilege of immediately expensing so-called "intangible" drilling costs. There is no hard evidence here, but economic theory strongly suggests that the impetus from tax assistance as presently constituted to explore for and develop new deposits is even weaker for non-petroleum minerals than it is for oil and gas.

B. The desirability of tax assistance for the extractive industries

In the United States, government economic policy is founded on a premise of primary reliance on market forces to allocate scarce economic resources. Government intervention in the market place is reserved for instances where it is deemed highly necessary or desirable. We saw in the preceding section that at present the federal government actively intervenes in the American economy, to the tune of some $1.7 billion annually, by exempting firms in the extractive industries from taxes which they would otherwise have to pay. The public policy question should therefore be posed: Is this intervention through tax expenditures necessary or desirable?

1. The "McDonald debate" on tax neutrality

Communication will be improved between all interested parties if we clarify one potentially troublesome issue immediately. Over the past fifteen years a group of economists, led (and spurred on) by Stephen McDonald, have vigorously and at times heatedly debated whether the present tax treatment of natural resources is "neutral." [26] The neutrality at issue in this debate is whether the allocation of resources (in the economy as a whole, not just in the extractive sector) under present provisions is the same as would prevail *in the absence of any corporate income tax.*[27] Present provisions would be neutral if the two allocations are the same, and non-neutral if they differ. Note that the conclusion reached, be it neutrality or non-neutrality, is devoid of public policy significance as posed in the McDonald debate. Nothing is said about the desirability of either the no-tax or the special-tax-treatment allocation. Failure to appreciate this point, a failure to which even (or perhaps especially) economists are prone, can lead to overly hasty conclusions of "inefficiency" or "distortion".

---

[22] Barr, *op. cit.*, p. 11, Table 4. The transitional first-year revenue effect would be greater by roughly a half billion dollars.

[23] *Tax Reform Studies* 1969, Part 1, p. 101.

[24] *Ibid.*, Part 3, pp. 427–428. Even if the CONSAD estimates are off by a factor of three or four, "the payoff for the revenue foregone . . . would be low . . ." (*ibid.*, p. 42). This source terms the CONSAD findings "broadly consistent" with earlier results, employing different but not contradictory methodology, obtained by F. M. Fisher (1964) and Erickson (in an unpublished Ph.D. thesis written at Vanderbilt University.

[25] Tax Reform Studies 1969, Part 3, p. 418, gives an upper figure of $0.95 per barrel on a current price of about $3.00.

[26] The debate has dealt only with petroleum, but the various arguments apply, with appropriate modifications, to the other extractive industries.

[27] McDonald points out (1962, p. 314 n.) that this is the proper comparison, for economic analysis. Our comparison, however, has been between a uniform corporate income tax and the present set of special natural resource provisions. This is the appropriate comparison for public policy, at least in present context.

The course of the McDonald debate is too long and involved to set forth here.[28] The present state of the debate is as follows. The non-neutrality, relative to a no-tax situation, of a uniform corporate income tax, is generally accepted. It is agreed that restoration of neutrality, short of rescinding the corporate income tax, would require some mechanism whereby firms in relatively capital intensive industries would be taxed at effective rates below the uniform rate; *and* firms in relatively non-capital-intensive industries would be taxed at rates higher than the uniform rate. Most recently, McDonald has come to the view that the present level of percentage depletion deductions, *plus* the tax benefits from being allowed to expense intangibles for tax purposes, would be several times too large to restore neutrality.[29]

Two points need to be made, for present purposes. First, no-tax neutrality may or may not be a sound goal of public policy; therefore, the policy implications of the non-neutrality finding *per se* are *nil.*[30] If it were decided that tax neutrality was a desirable policy goal, and even if McDonald's initial, coincidental finding that percentage depletion restored neutrality for the petroleum industry were correct, it would still be incorrect to conclude that the percentage depletion allowance was a sound tool of public policy. This is so because, by McDonald's analysis, the corporate income tax would be non-neutral for any and all capital intensive industries, and petroleum is not the only such industry. (Nor is it the only industry plagued by high risks, but more on that score later.) Further, McDonaldesque neutrality would require counterpart *increases* in the effective rates of corporate tax applied to industries with relatively low capital intensity—the equivalent of a percentage depletion surcharge on tax liabilities in those industries. Since no practical proposals for a perfectly differentiated corporate income tax have come forward, it is safe to conclude that the present significance for public policy of the McDonald debate on tax neutrality is very small.[31]

2. Traditional arguments for special tax treatment of natural resources

Over the years the special tax benefits paid to mineral producers have come under a number of attacks. In the course of defending their special treatment, and in the course of continuously pressuring the federal government for wider and yet more favorable treatment,[32] representatives of the mineral industries have advanced a host of arguments to justify their position. It is saddening to report that these arguments, which by now have attained the status of tradition by reason of frequent repetition, show more persistence and ingenuity in defense of special privilege than evidence in support of sound public policy.[33]

---

[28] The first shots were fired, unwittingly, by Harberger (*Federal Tax Policy* 1955) and Steiner (*Tax Revision Compendium* 1959), who concluded that the distinctive tax benefits accorded to petroleum producers were non-neutral because they made it worthwhile to invest more per marginal dollar of return in petroleum than in less favored industries. The battle lines were drawn by McDonald (1961), who showed that under certain plausible (to him) assumptions, including perfect forward shifting of the burden of the corporate income tax from producers to consumers, the corporate income tax was not neutral, but rather discriminated against the more capital intensive industries and/or the riskier industries. Since petroleum is included in this group of industries, he argued, it was subject to tax discrimination. McDonald, not content with this result (with which others have concurred, e.g., M. Krzyzaniak and R. Musgrave, *The Shifting of the Corporate Income Tax* (Baltimore: Johns Hopkins Press, 1963), went on to attempt to show that the effective rate of percentage depletion enjoyed by the petroleum industry, about 22 percent, just about coincided with the reduction of the corporate income tax necessary to restore no-tax neutrality. (Intangibles expensing was not included in McDonald's calculations.) This argument elicited a critical comment by a Treasury economist, Eldridge (1962), and a major attempt by Steiner (1963) to refute McDonald's argument and to reinstate his and Harberger's finding of non-neutrality. A further exchange between McDonald and Steiner occurred in 1964. The latest published version of McDonald's position appeared in 1967.

[29] McDonald 1967, p. 286.

[30] McDonald acknowledged this point in his initial article (1961) and has since made it more explicitly and emphatically (1962, 1964).

[31] Musgrave (1962) along with others has pointed out that a value-added tax or, what comes to the same thing, a uniform *ad valorem* tax on all factor incomes, not just that of capital, would be no-tax neutral. The value-added tax has received some support, e.g., from the C.E.D., in recent years.

[32] For an account of the pressures to enlarge the scope of the percentage depletion deduction, see Gray in *Federal Tax Policy* 1955, pp. 430ff.

[33] Gray (*op. cit.*), cites the "ingenious arguments" that have gone into building an *ex post facto* rationale whose purpose is to "reconcile private privilege with the public interest." The ingenuity of oil lobbyists is reflected in their recent inclusion of the balance of payments problem in the case for restricting oil imports (*The Oil Daily*, February 24, 1969, p. 1).

(If I had to grade the industries' performance, they would receive an A for effort, B+ for ingenuity, and D+ for content.) Moreover, these arguments evidence little faith in, or else small understanding of, the prowess of the unfettered market mechanism in allocating scarce resources to their most productive uses. It is surely a rarity indeed to find an Eastern academic economist berating American businessmen for disparaging the market mechanism. But on most of the points raised by mineral industry spokesmen in support of government intervention in the market place, the market would perform the required tasks unaided, and perform them better than it can under the burden of present mineral tax policy.

The traditional justifications of tax aid to the extractive industries can be grouped into four broad categories, listed below in ascending order of substance, but descending order of frequency:

1. scare tactics
2. inflated rhetoric
3. peculiarities of natural resource production
4. national security.

The first two categories, which often overlap, need not be treated in detail here. Scare tactics range from dire warnings of having to strive "desperately for food and bare subsistence" without mineral supplies, through the risk of losing "untold millions of barrels of oil in less obvious formations" if the oil industry went "out of business," to the "ultimate nationalization of the oil industry" and an "onrushing energy gap" if percentage depletion were removed.[34] A characteristic feature of inflated rhetoric is that it can only be countered by resort to further rhetoric, or else by undertaking major research. Thus, assertions abount to the effect that the present system of tax aid to natural resources has (singlehandedly) produced a "strong, healthy" and even "dynamic" mineral industry "with a marvelous record."[35] Also, our policy of tax assistance to energy producers has "brought the American consumer the lowest energy costs in the world."[36]

The latter assertion provides enough of a handle to permit us to get a grip on it. First, note that the American consumer is also the American taxpayer, and as such he pays part of his *total* energy costs through the revenue side of the federal budget. Second, the governments of most West European countries, which have "high energy costs" (prices), achieve the high prices by imposing heavy taxes; the proceeds of these taxes go into the general fund (and not solely into a highway trust fund) to be used for the benefit of energy consumers. Third, comparing our energy costs with those of (say) the British is like a man bragging that he is stronger than an infant. We may be obtaining lower-cost energy than British coal, but doing better than one's least efficient rival is not necessarily the same thing as doing the best one can. The thrust of many remarks in this paper, along with those of other economists,[37] is that this nation does not appear at present to be buying energy at anywhere near the cheapest possible cost.

Turning to the third set of traditional arguments for tax assistance to the extractive industries, natural resource production is alleged to have two features which other industries lack, and which supposedly justify special tax relief: investments in mineral deposits yield "wasting" assets that are "nonreproducible"· and mineral resource investments, especially in exploration, are exceptionally "risky." Each feature is examined in turn.

The use of a separate term, "depletion," in place of "depreciation," to denote the using up of a natural resource asset reflects the alleged peculiarity of "wastingness." Natural resource assets, as opposed to those of other sectors of the economy, are said to waste because "the mineral sold is [physically] a part of the asset."[38] Once the natural resource is gone, there is nothing left. By contrast, the argument runs, a machine tool simply works *upon* other materials in a manufacturing process and is never actually sold as a part of normal business. But this concept of a "wasting" asset is neither economic nor accounting, but physical. One buys *any* economic asset for the time stream of productive

[34] The first three quotations are from *Federal Tax Policy* 1955, pp. 428, 481, 486 and 488 respectively; the last is from *The Oil Daily*, February 24, 1969, p. 1. Note the adaptation in the last quotation to contemporary scare-tactic usage.

[35] *The Oil Daily*, February 19, 1969, p. 1; *Oil and Gas Journal*, February 10, 1969, p. 7.

[36] *Oil and Gas Journal*, February 10, 1969, p. 7.

[37] For example, Adelman 1964; McKie and McDonald 1962.

[38] Fernald in *Federal Tax Policy* 1955, p. 419. See also Stanley in *ibid.*, p. 474.

services it will hopefully yield; whether it dwindles in physical volume or weight is of no concern whatsoever. Similarly, an accountant keeps track of the gradual wearing out of an asset's ability to contribute to saleable outputs. If the asset is a machine, as it deteriorates it begins to produce more rejects and is more costly to operate; if it is a natural resource, it begins to yield less pure material or to require larger inputs per unit extracted to obtain the mineral from less accessible areas in the deposit. A physical feature of production is a red herring so far as tax policy is concerned.

Regarding the allegation of "nonreproducibility," on the surface it is quite plausible that a mineral asset cannot be replaced or "reproduced" in the same way that a piece of equipment can. With the latter, it is simply a matter of tearing out the old and installing the new; but once a mineral deposit is "worked out," it can not be refilled with mineral. Hence, we are invited to conclude, owners of natural resource assets deserve tax assistance in replacing their assets when they are "depleted."

But such a conclusion, like the "wasting" asset argument, rests on a physical, not an economic or accounting relationship. The only sense in which any asset is "reproducible" is physical: given the blueprint, the materials and tools, and the space, it is possible to duplicate a piece of equipment within a very small range of error. But in an economic sense, one never "reproduces" an asset; rather, one buys a new or at any rate a different one: machine tool, coal mine, hot dog stand, and so on. It is possible to duplicate non-natural resource assets in every detail, including location, but the number of instances in which this happens in a modern economy, where an asset of any great size is involved, must be very few. So few, in fact, as to make any disadvantage to owners of mineral assets negligible. Furthermore, if there are disadvantages, the market will quickly pick up the appropriate signals and make an adjustment. As with "wasting" assets, so with "nonreproducibility" the conclusion is that the argument is without substance.

Let us now examine the allegation that mineral producers operate under exceptionally high risks, and therefore deserve compensatory tax relief. "Risk" refers here to all manner of multiple possible outcomes, regardless of the state of information about how those outcomes are distributed. The risk justification for special tax favors has been advanced by highly respectable people,[39] and the fact of high risk if not the justification is usually accepted uncritically by economists studying natural resource economics.[40] It therefore merits scrutiny. Looking ahead, however, after examining the various aspects of the risk justification, I have come to the conclusion that the true degree of riskiness in mineral production is greatly overstated; that where there are risks—in non-mineral as well as mineral industries—the market mechanism and the uniform corporate income tax can be relied upon (if not otherwise fettered) to spread risks successfully among different economic agents, thereby significantly reduced the risks to any single person; and that the single component of present mineral tax assistance with the largest dollar volume, percentage depletion, does not even help reduce risks. My over all conclusion is that riskiness can not be used to justify tax expenditures on natural resources.

Allegations of riskiness usually refer primarily to the exploration stage of natural resource production, and to certain specific industries: oil, natural gas, and sulfur.[41] The typical unit used in the risk allegation is the single-"shot" or "wildcat" drilling venture, which presently in the United States has a likelihood of succeeding (i.e., of finding a profitable deposit) of only 1 in 10 or 11.[42] This figure is supposed to depict the high risks associated with drilling exploratory wells.

What the figure of 1 success in 10 or 11 tries really to depict is the high risks associated with drilling a *single exploratory well*. If the Congress deems this a worthy enterprise, then more tax assistance than are provided by percentage depletion and quick expensing provisions is called for. Subsidizing the drilling of a single well would, however, be subsidizing a nonsnesical business practice. Businessmen in the riskier mineral industries seem to agree with this point, because virtually no one formulates a business plan (including financing)[43]

[39] For instance, Paley 1952, Vol. I, pp. 33ff.
[40] For instance, McDonald 1961 *et seq.*; McKie and McDonald 1962.
[41] Stanley in *Federal Tax Policy* 1955, p. 483.
[42] More correctly, only nine or ten of every hundred ventures succeed.
[43] Providing financing for a single, unaided "shot" would be a nonsensical banking practice.

consisting of a single "shoot", without first trying to assure himself of adequate cash flow to avoid liquidation if the "shot" misses. That cash flow guarantee is typically obtained by "farming out" producing "interests" in whatever discovery results from the venture—including zero commercially viable reserves.[44] Each holder of a patricipating interest presumably would purchase a number of similar farm-outs from other ventures to avoid a cash flow crisis himself. Among the participating interest holders generally is the owner or mineral rights leaseholder of the land surface into which the well is to be sunk. This fact reflects a market adjustment to risk by cutting the organizer of the venture and the other participants into the possible increase in land values (economic rent) should the wildcat prove successful.[45]

Not all exploratory wells are drilled on the basis just outlined. It is not uncommon for a large producing company or a specialized wildcat broker to put together an entire exploration program, and then sell some or all of it in shares to outside participants. The virtue of a large program is that it can be made "self-insurable;" that is, the prospect of enough successes to make the entire program pay can be made "certain" in the actuarial sense. A drilling program costing $10 million, in anticipation of finding minerals that would yield an average of $1 million in cash flow each year for a number of years is formally identical, from an economic point of view, to investing in a plant with similar costs and returns.[46]

Up to this point, the risk being discussed has in fact been what is often called "pure risk": multiple possible outcomes whose distribution characteristics (mean, variance, etc.) are known with certainty. However, "uncertainty"—highly imperfect information—about the nature of the true distribution of possible outcomes is an important element of the high-risk justification for favorable tax tretament of minerals. The important point to notice here is that information is an economic good: it is useful in the production process and costs money to obtain and utilize. In most cases, therefore, the market will assign information a price, and there is no need for government intervention unless something is wrong with that price.[47]

The entire process of exploring for and developing mineral deposits can be viewed as designed to produce and utilize information on the economic character of possible prospects. (Even "dry holes"—wells that fail to turn up economically viable reserves—yield information which can be utilized in planning further exploration and/or development.) This process typically extends over a long period of time, from a year on up, when viewed from the date of initial discovery of exploitable minerals to the beginning of extraction But far from being a defect of natural resource production necessitating a subsidy, as is sometimes argued,[48] this long period is a rational response to the basic economics of natural resources, one which is easily—and best—handled by the market mechanism.

The preceding argument should not be misconstrued. I do not intend to claim that mineral exploration is riskless and certain. The central point to be made is that, in view of the creativity and ingenuity with which operators in mineral industries have been able, through the market, to spread risks, and in view of the conventional economic nature of geological information, it is not at all clear that the risk and/or uncertainty in mineral exploration are any greater than in other forms of economic endeavor. Nor is it clear that such risk and uncer-

---

[44] The following discussion of adaptations to risks in exploratory mineral ventures draws heavily on Grayson 1960, a highly readable as well as informative book.

[45] "If everyone concerned has perfect foreknowledge of the existence, size and properties of the oil pool . . ., the landowners could exact . . . [the] rent from the developing firm in the form of lease bonuses." But in the absence of perfect information, the landowners are willing to give up some of the potential rent to the developer in return for his drilling services. The expected portion of the economic rent can be viewed as one of the returns of risk-taking. (McKie and McDonald 1962, p. 108).

[46] This statement is actually weaker than it need be. It is not unlikely that the drilling program would be *less* risky than a single plant costing $10 million and designed to produce a narrow range of consumer goods. Nelson in *Federal Tax Policy* 1955, p. 470, makes a similar point.

[47] The market may lead to a less than optimal amount of information obtained and processed if the returns cannot be captured by the individual party who would make the outlay for it. But externality in return to information is by no means peculiar to the extractive industries. One solution is to have a government or quasi-govermental organization (such as a trade association) collect the information and distribute it to individual parties. Of course, the political problem of deciding which information to gather and how to finance the task remains.

[48] For example, in Paley 1952, p. 33.

tainty as apepar to exist in the mineral industries justify special tax favors for those industries.

Two final points about risk and present tax policy. First, the percentage depletion allowance enhances the return only on successful explorations, since it depends on realized extraction; hence it would relieve costs due to the dispersion of possible outcomes ("pure risk") only tangentially.[49] In contrast, the present general provisions for the corporate income tax provide for "loss offsets" to tax liability which go a considerable distance toward relieving the burdens of the left-hand tails of the outcomes distribution.[50]

Second, the degree of risk actually *observed* in an extractive industry at any point of time depends upon how far out on the "extensive margin" operations are being carried. The further out on this margin, the greater the proportion of less likely, more uncertain prospects that will be drilled. But earlier in our discussion of economic efficiency, we saw that the present tax assistance to mineral producers tends to push them farther out on the extensive margin. To the extent this tendency is realized, therefore, we have the anomaly that present natural resource tax policy actually increases the average risk observed. Logic would seem to forbid turning around and using "high risk" to justify a subsidy which contributes to it in the first place.

* * * * *

We come now to "national security", the fourth group of arguments used to justify the present system of tax expenditures on the extractive industries. National security is a public policy goal which few would oppose, and for this reason any program which promotes it at reasonable cost is worthy of consideration. By the same token, national security is apt to be invoked by anyone and everyone seeking governmental sustenance for a pet program. The very real possibility of misuse of an important goal is sufficient reason for giving costly programs parading in the name of national security doubly careful consideration.

A recent, definitive study of national energy policy concluded that the "national security objective" has never been adequately formulated or studied in connection with general natural resource policy.[51] That this conclusion is justified so far as mineral industry arguments for tax assistance are concerned is soon obvious to anyone who dips into the literature seeking to justify our present tax treatment of minerals.[52] This literature in fact provides numerous examples of the "scare tactic" and "inflated rhetoric" groups of justifications for special tax treatment discussed earlier. Whereas by themselves such justifications are inane and even humorous, when they invoke national security they are no longer merely frivolous but downright dangerous.

Failing useful guidance from the industry sources, let us construct our own simple framework for assessing the national security policy problem as it pertains to the extractive industries. No one will dispute that natural resources are "essential" to national security. The real question for public policy, however, is how essential natural resources are in relation to all other forms of output. The only plausible answer to this question is that in general, natural resources are no more "essential" to the national security than metal goods, textiles, rubber, agriculture, and other major product groups. Note that in the age of "total war", even the consumer goods industries are highly "essential". No argument for special tax relief is to be found here.

The central economic concern in national security planning for any sector of the economy would seem to be the capacity to supply large quantities over an extended period without incurring damagingly heavy costs—a vague concept, to be sure, but one which at least provides a starting point for rational discussion. By this criterion, our present program of tax assistance to natural resources does not fare very well, since it is ineffectual in adding to productive capacity—i.e., in stimulating the holding of mineral reserves—and on top of it stimulates current output.

An often neglected aspect of the capacity criterion is the availability of substitutes. The ability of this nation to produce synthetic rubber during World War II is only the best known example of the key role substitutes can play in national

[49] *Tax Reform Studies* 1969, Part 3, pp. 429–430.

[50] Musgrave 1962, p. 206.

[51] Resources for the Future 1968, pp. 45, 143–144. However, Nelson in *Federal Tax Policy* 1955, is a good starting point.

[52] For a self-styled "unassailable" argument, which touches on the key points always raised by industry apologists, see Smith in *Federal Tax Policy* 1955, pp. 492–493.

security. Unfortunately for mineral industry apologists, the present set of tax expenditures on minerals flunks this test, too. To the extent tax subsidies on natural resources depress their prices below what they would be if the market had its way, the development of substitutes is impeded. Perhaps the most dramatic example of this effect at the moment is the lagging progress in developing oil shale and the hydrogenation of coal:[53] however, while petroleum is the largest beneficiary of federal tax largesse at present, this phenomenon is not confined to the petroleum industry.

To summarize the discussion of the national security objective, all available evidence (much of it cited in this paper) indicates that present federal tax policy towards natural resources largely fails to promote national security, and may even hinder the pursuit of a rational policy. Present tax provisions only weakly spur acquisition of mineral reserves, and work to stimulate current output—neither of which helps very much to create reserve capacity. Far cheaper, more effective alternatives are available; for example, government, "stockpiling" of developed but inactive mineral deposits,[54] or explicit appropriations directed to the creation *and holding* of new reserves of natural resources.

It is noteworthy that during 1969—a year remarkable for the intensity of public pressure to remove special tax (and other) privileges from the petroleum industry—the public relations strategy of petroleum interest groups has shifted from national security to the level of consumer product prices. The implication of the industry's Congressional testimony and of its mailings to stockholders and credit card holders is that the present special tax provisions have been "responsible" for keeping oil prices low, and that removing those provisions would "cost" consumers large sums because prices would rise substantially. Unfortunately, no convincing quantitative proof of these assertions has been forthcoming; in fact, there have been sizable price increases in 1969 *with* the present special provisions, giving rise (as Senator Proxmire and others have noted) to higher gross revenues and higher profits, *ergo* more generous depletion allowances. Moreover, the petroleum industry has failed to explain why its product prices should be manipulated through the tax system and not the prices of other "essential" products like milk and clothing. Nor has it bothered, of course, to point out that the consumers who benefit from lower prices are also taxpayers who bear greater tax burdens because petroleum incomes are so lightly taxed. (If the industry were truly serious about reducing prices to consumers, it would be asking for relaxation of oil import restrictions and the dismantling of the various state prorationing schemes—the exact opposite of their present stands on these questions.) The "low price" argument is therefore clearly seen to be just another case of industry scare tactics.

C. *Conclusions on the relation of current natural resource tax policy to economic efficiency*

The conclusions which emerge from the foregoing discussion of economic efficiency and our present tax treatment of the extractive industries are not encouraging, to say the least. This treatment, which taxes the form of tax credits does not achieve well any of the several aims supposedly set for it. Many of the benefits constitute little more than gifts to producers who are rewarded with federal funds for taking actions they would have taken without any federal reward. Furthermore, the undesirable side effects of present mineral tax policy are numerous.

Rep. Wilbur Mills, Chairman of the House Ways and Means Committee has aptly labelled tax expenditures through the revenue side of the budget "back door spending."[55] Such spending, as opposed to outright appropriations, has at least three defects, according to Mr. Mills: It is seldom reviewed by either the Executive Branch or the Congress; to determine whether it is necessary: accurate data on true costs and benefits of such spending are often difficult to obtain; and too frequently public moneys are wasted on firms which would have undertaken the intended activity without added stimulus.

One can only conclude that all of these defects plague our present back door spending program for the extractive industries. Only with these defects could

---

[53] *Tax Reform Studies* 1969, Part 3, p. 418, 433. Other facets of national oil policy, such as the oil import quotas and state "allowables" prorationing, of course work in the other direction.

[54] *Ibid.*, p. 433.

[55] In a speech to the House, December 13, 1967 (*Congressional Record—House*, p. H16890, 1967).

such a wasteful program have remained in existence for so long. It is high time those defects were corrected, and the program itself abandoned.

IV. Administrative difficulties

Past evaluations of the special tax provisions for the extractive industries have focused mainly on the subjects of equity and economic efficiency. Insufficient attention has been paid to a number of serious problems that arise when we attempt to administer those provisions. These problems deserve scrutiny for several reasons. First, the very existence of continuing and growing administrative difficulties makes tax assistance an even less effective program for aiding the mineral industries than considerations of equity and efficiency would suggest. To be an effective tool of public policy, a subsidy mechanism should be fairly simple and direct in its operation. A system shot through with administrative uncertainties is unlikely to stimulate the desired busines responses.

Second, the legal and accounting costs involved in settling disputes, the heavy demands on the federal courts, the seemingly unending need for new administrative ruling and determinations, and the federal bureaucracy required to deal with these matters, all increase the social cost of our system of back door spending on the mineral industries.

Unfortunately these problems seem to be getting worse, not better; they are certainly far more serious now than they were when percentage depletion was first introduced in the 1920's.

The problems of administering our program of tax aid to natural resources concern mainly the percentage depletion deduction. They fal linto five major categories.

The first category involves the concept of an "economic interest", possession of which is a prerequisite to claiming a percentage depletion deduction. Much ink has been spilled in learned discussion of the term "economic interest". As things stand today, there are two separate requirements which must be satisfied if one is to have an "economic interest" in a mineral deposit. First, an interest in a mineral in place in the ground must have been acquired by investment, and, second, the taxpayer must look solely to the extraction and sale of the minerals to recoup that investment.

How these requirements apply in particular cases has been the subject of endless dispute and litigation. In fact, the precise scope of the term "economic interest" is probably less clear today than it was in 1933, when this concept was invented by the Supreme Court. For example, a recent study by a special subcommittee of the American Bar Association concluded that recent court decisions have "generated considerable confusion for both taxpayers and government" and have "contributed to the view of some that the economic interest concept is so confused that tax certainty cannot be achieved in all possible situations short of statutory amendment." [56] That same study also concluded, however, that agreement on acceptable restatement of economic interest principles for incorporation in legislation was so unlikely that the only real hope for answers lay in continued resort to the courts.[57]

The second category of problems involves the appropriate rate of depletion for a particular mineral product. The Internal Revenue Code prescribes rates for dozens of minerals, but not all minerals fit easily within these statutory categories. Moreover, difficult problems of geological identification are often presented by mineral materials which blend into one another, or which consist of mixtures of several different minerals. Expert testimony is usually needed to resolve these problems satisfactorily. As the technology of the minerals industries changes, new minerals come into use, and new depletion rate classification problems arise.

Chronic depletion rate disputes raise serious questions about the rationale for the various rates of depletion applied to particular minerals. These disputes are particularly acute in connection with minerals which are sources of energy. Included in this group are petroleum and natural gas, which are depletable at a rate of 27½ percent; uranium, with a 23 percent depletion rate; oil shale and tar sand. which appear to be entitled to 15 percent depletion; and coal which is

---

[56] Report on Proposed Revision of General Counsel's Memorandum 22730, Subcommittee on Natural Resources, American Bar Association, published in *The Tax Lawyer*, 22:2 (Winter 1969), p. 263.
[57] *Ibid.*, p. 273.

depleted at a rate of 10 percent. It is hard to justify this variation in rates, because a kilowatt of electric power or a B.T.U. produced from coal will light as effectively and heat as well as a kilowatt or B.T.U. produced from uranium or oil. The likely explanation is that these varying rates are simply the accidental result of the political climate which surrounded the grant of percentage depletion to these minerals. That is simply another way of saying that there is no rational economic justification for the present rate structure.

The third problem area concerns the "cut-off point", that is the amount of processing which can be treated as mining or extraction and thus included in the depletion base. Percentage depletion is computed by multiplying the selling price for a particular mineral product by a percentage which, generally, is set forth in the Internal Revenue Code. For example, in the case of natural gas, percentage depletion is computed by multiplying the selling price of raw gas by 27½ percent. The result of this computation is the taxpayer's depletion deduction. But what is "raw gas"? Is it gas in the form in which it emerges from the mouth of the well, without any processing at all? Or is it gas which has been desulphurized, dehydrated, and compressed for introduction into pipelines? A customer might pay only 10¢ or 12¢ for m.c.f. for raw gas at the wellhead, but might pay twice as much for processed gas which has been brought to pipeline quality. Consequently, a gas producer's percentage depletion deduction can be doubled by computing depletion in terms of the value of processed gas, rather than in terms of gas at the well mouth. Similarly, if pipeline transportation of gas can be treated as part of the extractive process, so that depletion is computed in terms of the selling price of gas at the far end of a pipeline, the depletion deduction can be trebled or quadrupled. Cut-off point problems of this sort are very common, and are extremely difficult to resolve because there are few rational economic principles which can be applied to these questions.

The fourth problem category concerns the unit price to be used at a given cut-off point to compute the gross income on which percentage depletion deductions are based. Sometimes a wide range of prices are charged to different customers for the same mineral product. If the highest of these prices is used when computing percentage depletion with respect to that portion of the output which a producer retains for his own use, a producer can sometimes as much as double his depletion deduction. Even small price increases can be highly beneficial. For example, if an oil company produces most of its own crude, and buys the rest, the firm can increase its depletion deduction substantially by simply raising the price which it pays for the purchased crude because that is generally the price which is used to compute percentage depletion for the firm's own production. Paying more for crude can therefore result in a net after-tax saving!

But suppose there are no market prices available for use in making comparisons—what then? This is a very common situation. For example, in the copper industry, there are few open market sales of copper concentrate (that industry's depletable product) and some other method of establishing prices for computing gross income must therefore be adopted. Similarly, American companies produce petroleum in many areas of the world such as the Persian Gulf, in which there are no reliable market prices for crude petroleum. And, in a number of cases, Congress has established the "cut-off point" for depletion purposes at a point at which nothing is sold; an example is the kiln feed cut-off point for portland cement. Obviously, some substitute valuation formula must be used in these cases, but what formula? And how, in detail, should the formula work? All these problems remain in dispute, because it is difficult to substitute a formula for a market price.

The fifth problem area is the computation of the statutory fifty percent net income limitation on percentage depletion deductions. It is simple enough to state that the percentage depletion deduction shall not exceed half the net income from a mineral property. But what is "net income" for this purpose? Do normal accounting rules apply in computing "net income"? Does "net income" for depletion purposes mean the same thing as "net income" for general tax purposes? What costs are to be taken into account when computing net income? How are overhead and other indirect costs to be allocated between mining and manufacturing when computing this limitation? All of these questions are being actively disputed today, even though the fifty percent net income limitation has been part of the law for more than forty years.

V. The special tax provisions for the extractive industries and the general capital gains option

It has been pointed out that the beneficial effects of repealing the present special tax provisions for natural resources would be limited by the use of the capital gains option as an alternative escape route from federal taxation.[58] This argument seems to be correct: The developer of a deposit would sell his successful find, being taxed at the favorable gains rate, and the purchaser of the deposit would use the high sales price as the basis for cost depletion. While the value of the deposit would tend to be lower than if percentage depletion were still available, the prospective buyer would be willing to pay a higher price because he can use the purchase price for cost depletion deductions.[59]

This interrelationship has been used by both sides in the debate over whether to change the present special tax treatment of natural resources. My own conclusion is that it does not alter the need for rescinding that special treatment, for two reasons: (1) the capital gains option is a less than complete substitute for the percentage depletion allowance; and (2) even if it were a perfect substitute, getting rid of the percentage depletion allowance would clean up the administrative mess documented in the preceding section, thereby clearing the air for possible consideration of the capital gains option as a tool of public policy. Each of these reasons is examined in turn.

It is sometimes alleged that percentage depletion is merely a "substitute" for the capital gains option, designed to permit a mineral producer to receive "fair" tax treatment without being "forced" to sell his entire property.[60] This superficially plausible argument overlooks the fact that adding the depletion allowance to the capital gains option enhanced the tax benefits from the latter: capital values would tend to rise with percentage depletion, by making the ownership of a deposit for production purposes more profitable. Conversely, removal of percentage depletion would tend to depress capital values. The capital gains-cost depletion mechanism outlined earlier provides only a floor, not a complete compensation, for capital values, since electing percentage depletion generally results in far greater tax savings than cost depletion. Thus there would very likely be some net cutback in tax spending on the mineral industries if percentage depletion were removed, even if the capital gains option were still available. A small additional piece of circumstantial evidence on this score is the willingness of the mineral industries to spend considerable time and money persuading the Congress and the Executive Branch that it still needs and deserves percentage depletion.

The second reason for preferring to rescind our present special tax provisions for minerals even if the capital gains option would reduce the impact, is the social saving in reduced administrative costs. Not only would lawyers, accountants, engineers and economists, in both industry and government, be freed for productive work, but the court system would be relieved of a large burden and at least a small reduction in the federal bureaucracy could be effected.

In short, the possibility of substituting the capital gains for the percentage depletion route to tax benefits is a real one, but on balance it does not constitute an acceptable argument for postponing action on the latter provisions.

VI. The proposal for a "minimum tax" system

Proposals have at various times been mooted for a "minimum tax" system that would reduce the inequities and wastes of the present income tax system.[61] On the face of it, a minimum tax would in fact serve to blunt the incentives to seek tax relief, including the special tax provisions for natural resources, and thereby weaken the inequities and waste. However, serious examination indicates that a minimum tax system would be at best an imperfect substitute for direct action on the root causes of the current troubles; as I have indicated earlier, one of these causes is the special set of tax benefits for mineral producers.

---

[58] For example, S. L. McDonald, *Federal Tax Treatment of Income from Oil and Gas* (Washington: The Brookings Institution, 1963), p. 5.

[59] Smith in *Federal Tax Policy* 1955, p. 487.

[60] For example, Stanley in *Federal Tax Policy* 1955, p. 476. He cites a court opinion, West v. Commissioner of Internal Revenue 150 F. 2nd 723, to the effect that depletion "may be regarded as a substitute for the capital gains allowance . . ."

[61] Most recently, in *Tax Reform Studies*, especially Part 2, pp. 173ff., and in the House Ways and Means Committee's recommendation of July 23, 1969 (*New York Times*, July 24, 1969, p. 1, columns 2–3).

First, enactment of a minimum tax as currently proposed would in effect create a new income tax system parallel to the original one enacted in 1913. This is a major defect in the proposal, since it would only compound the already considerable administrative difficulties of the present system. Instead of one statute, with all its problems, we would have two, and the resulting extra problems, including co-ordination of the two statutes, could well make present administrative difficulties seem like child's play.

The second defect of a minimum tax system is its doubtful effectiveness. For instance, why should we suppose that the mineral producers who successfully escape taxation under the present income tax laws would be any less successful in escaping the minimum rate? If, on the one hand, the minimum tax is levied at a rate which produces a sizeable amount of revenue, we can be sure that mineral producers will be anxious to avoid payment of that tax; their success in avoiding existing income taxes gives us no basis for believing that they would be any less persuasive in avoiding the minimum tax. On the other hand, if the minimum tax is levied at a rate which is so low that it makes no difference to mineral producers whether they pay this tax, then a minimum tax system would be little more than a cruel joke, designed to make wage earners think that others are bearing a fair share of the nation's tax burden. In short, if the minimum tax is to be a real tax, then it will present the same political problems as does the existing income tax. And if the minimum tax is not intended as a real tax, there seems to be no justification for enacting it.

Consequently, the minimum tax proposals are not really a satisfactory substitute for genuine tax reform. In fact, the cause of tax reform will probably be better served by rejecting the minimum tax proposal in favor of a more determined effort to reform the existing tax system. The extremely limited nature of the Treasury's minimum tax proposals lends support to this argument. For example, under the Treasury's proposal, some intangible drilling costs would continue to be expensed, as under existing law. Similarly, exploration and development costs would continue to be expensed, and foreign tax credit abuses would remain largely untouched. Furthermore, the type of minimum tax proposed by the Treasury would not apply to corporations. Consequently, the only mineral tax abuse importantly affected by the proposed minimum tax would be the deduction of percentage depletion in excess of cost depletion in the case of individuals.

Accordingly, the Treasury's minimum tax proposals would fail to do anything at all about the bulk of the serious revenue loss which occurs as a result of our special tax provisions for the minerals industries. A toothless proposal of this sort is not a proper substitute for tax reform.

VII. Summary and conclusions

In this paper I have attempted to evaluate the effectiveness of our special tax policy toward the extractive industries, which consists of the percentage depletion allowance and various provisions for current expensing of exploration and development outlays. My conclusion is that there is little or no justification for retaining this special tax policy. On the contrary by standards of sound public policy there are a number of good reasons for scrapping this policy.

First, the present special tax provisions for minerals lead to serious inequities both between similarly situated taxpayers and between taxpayers at different levels of income. Such inequities may gravely undermine public confidence in our federal tax system if they are permitted to continue.

Second, those special provisions constitute a large waste of federal tax monies. They only weakly accomplish what they are supposed to accomplish, and hand out generous rewards where they are neither justified nor necessary. These monies could be spent much more productively at the present time (and for the foreseeable future.)

Third, present special tax treatment of minerals, especially the percentage depletion allowance, gives rise to a tangle of costly, unproductive and frustrating administrative difficulties. Not the least benefit of removing special mineral tax treatment would be to clean up this administrative mess.

It is true that the general capital gains option would provide an alternative route for escaping taxes on mineral incomes, and hence would dilute the benefits that would be realized if we closed the existing escape route. But this fact does not reduce the desirability of rescinding what by all the evidence is a poor public policy program. The dilution of effects would be only partial. What is more, having only the capital gains option to worry about, for other industries as well as the extractive sector, would greatly clarify and simplify the public policy problem of how much aid, if any, should be given to the extractive industries. At the same time, we would get rid of the serious difficulties of administering the present set of special tax aids.

Some form of minimum tax system could in theory help relieve the inequities and waste associated with current natural resource tax policy. But it would be only a very imperfect substitute for direct action aimed at the real underlying causes of the inequities and waste. One of those causes is the special tax provisions for the mineral industries.

The time is ripe for serious consideration of improving the federal tax system. It is my firm conviction that removing the mineral percentage depletion allowance and the various provisions permitting the current expensing of exploration and development costs represents a golden opportunity for improvement. The recommendations of the House Ways and Means Committee, in July 1969, to reduce percentage depletion rates and restrict a number of devices for widening the tax loopholes on natural resource incomes, are a step in the right direction. But in my opinion the Committee stopped short of the full solution. Moreover, they did nothing about the current-expensing provisions for exploration and development costs. If any change is worthwhile—and I believe it is—the logic behind it requires basic, i.e., complete change if tax reform is to be meaningful.

Comments on the Mid-Continent Oil and Gas Association's Critique of the CONSAD Report

(Arthur W. Wright, University of Massachusetts)

The Mid-Continent Oil and Gas Association has recently circulated a critique of the CONSAD report.[1] This critique runs to 41 pages and required a large group of analysts—a "task force," as *The Oil Daily* put it[2]—to prepare. Because the Mid-Continent critique of the CONSAD report raises several general issues which pertain to my earlier remarks before the Ways and Means Committee—in testimony (March 21, 1969), in a supporting paper, and in supplementary responses to Committee members' questions—it seems appropriate for me to make a few brief comments regarding that critique. At a later date, perhaps, others can invest the time and resources which would be needed to make a point by point evaluation of the Mid-Continent presentation.

Shift of emphasis in petroleum industry arguments

Up to now, the main theme of industry arguments for retaining percentage depletion and intangibles expensing has been the claim that extra reserves are created and held against a national emergency as a result of these tax provisions.[3] In the Mid-Continent critique, however, reserves reduced to a mere "technological" relationship to production. If this is the case (which is doubtful, given the changes in reserve-production ratios which Mid-Continent itself points out), it is difficult to argue at the same time that special tax provisions will build up reserves relative to production, and thus insure sufficient reserves for national security. In short, the Mid-Continent critique of CONSAD actually has the effect of denying the traditional national defense argument for the special tax provisions enjoyed by the petroleum industry. Instead, Mid-Continent argues that the rate of current output and its cost are the main variables affected by the special tax provisions for petroleum. This is a highly significant change of emphasis.

I personally welcome the shift of emphasis, since the new argument is more amenable to thorough economic analysis. What is needed is a study which looks at both output and reserves[4] in relation not only to tax policy but also to oil imports, state production restrictions, and other petroleum policies.[5] In such a study, the public policy problem could be formulated properly, with national security one, but only one, of the possible desirable goals in deciding on national policy toward the petroleum industry. As I will indicate in greater detail below, the petroleum industry should do its part by sponsoring an independent study of the costs and benefits of present public policies towards petroleum.

---

[1] "Analysis and Comment relating to the CONSAD Report on the Influence of U.S. Petroleum Taxation on the Level of Reserves," dated April 25, 1969; the courtesy of the Mid-Continent Oil and Gas Association in furnishing me a copy of this criticique is gratefully acknowledged. The CONSAD report appeared as Part 4 of the House Ways and Means Committee's *Tax Reform Studies and Proposals, U.S. Treasury Department* (Washington, 1969).

[2] April 28, 1969, p. 1.

[3] Indeed, the Treasury initially commissioned the CONSAD study to test this claim.

[4] Surely the relationship of reserves to output, in connection with price movements and other economic variables, is more complex and more interesting than the simplistic formula on page 9 of Mid-Continent's criticique.

[5] Shifting the emphasis to output and costs leads us directly to the import and production restriction issues, which, if we can believe the overwhelming preponderance of recent testimony before the Senate Subcommittee on Antitrust and Monopoly, make special petroleum tax provisions pale in quantitative significance.

"Perfectionist" Criticisms of the CONSAD Report

The Mid-Continent task force's critique of the CONSAD report raises a number of important issues. Unfortunately, the thrust of their argument is lost, because the discussion of these important issues is buried among many trivial issues and needless details. So apparently eager were the authors of the critique to discredit the CONSAD report that they threw in every conceivable objection.

Another serious problem with Mid-Continent's critique is that its attack on CONSAD's statistical methodology is perfectionist. If we took to heart every one of Mid-Continent's criticisms, the economics profession should close up shop and retreat to its ivory tower to work on pure theory. However, tax policy, like day-to-day business policy, must depend on decisions taken now, on the basis of the best data and analysis available, rather than waiting for absolute theoretical perfection.

Quantitative economic analysis, like business decisions, is plagued by problems of reconciling ideal methodology with available data. The reconciliations almost always involve choices which are "costly" relative to the ideal situation. CONSAD made certain choices as a result of constraints imposed by the limited availability of data; these choices, and some idea of the "cost" involved, were made fairly clear in their report to the Treasury. One choice for which Mid-Continent's critique severely attacks CONSAD—the use of aggregative data rather than individual oil-district data such as Erickson used in his recent study of new crude oil discoveries[6]—was in fact forced upon CONSAD by limitations of data. Instead of carping that the CONSAD Report is not absolutely perfect, Mid-Continent should undertake to assist in furnishing the data which will assist in eliminating the Report's imperfections.

Who has the burden of proof?

The last sentence brings me to what I consider the most important point: In its critique of the CONSAD report, the Mid-Continent Oil and Gas Association, a major petroleum industry spokesman, was able to assemble a task force of economists to write a lengthy detailed critique of the CONSAD report in a mere month and a half. This task force was clearly quite capable of applying economic analysis to federal tax treatment of the petroleum industry. It also included people versed in the statistical and econometric methods necessary to pose and answer public questions in a meaningful way. It is to be regretted that this task force did not attempt to set forth a reasoned justification of the petroleum industry's traditional arguments in favor of percentage depletion and other special tax benefits enjoyed by the industry. Instead, the task force was content merely to react to the CONSAD report, without advancing any positive arguments of its own.[7]

If the Mid-Continent Oil and Gas Association does not like the CONSAD report—a reasonable inference from their critique—why do they not set this task force or a similar group to work on a study which seeks answers to the tax policy questions posed in the CONSAD report and in the Association's critique of that report? Sponsorship by the Association of such a study would be a responsible reply to the critique that the industry does not collect and disseminate adequate data for use in investigating important public policy questions in which the industry has a big stake. Special tax treatment of the magnitude currently enjoyed by the petroleum industry certainly requires justification; it seems only fair that the principal beneficiary of such treatment should pull its own weight in providing the justification.[8] The petroleum industry cur-

[6] Edward Erickson, *Economic Incentives, Industrial Structure and the Supply of Crude Oil Discoveries in the U.S.*, 1946–1958/59 (unpublished Ph.D. dissertation, Vanderbilt University, 1968).

[7] A minor exception to this statement is the discussion of the "McDonald debate" on "tax neutrality," which is appended to the critique of the CONSAD report. However, as I pointed out in the paper supporting my testimony before the House Ways and Means Committee on March 21, 1969, economists working on tax policy—Professor McDonald included—generally agree that "tax neutrality" is a dubious public policy goal. Moreover, many people now argue that it is virtually impossible to define "tax neutrality," taking into account differential elasticities of demand for output and other important considerations, for purposes of empirical testing.

[8] The industry could at least assist the federal government in collecting and processing the necessary data, by permitting detailed inquiries and co-operating in data reporting programs.

rently spends large sums on public relations to publicize what are, at present, unsupported arguments for continuing the present special tax treatment of petroleum. Some of these outlays could and should be diverted to ascertaining whether or not there is any rational support for these arguments, e.g., through a study such as the one proposed above.

In short, in assessing the relative merits of present federal tax policy toward the petroleum industry, a major share of the "burden of proof" falls on the industry itself. That burden is not being borne simply by criticizing the work of others, as is done in the Mid-Continent critique of the CONSAD report.

Senator McCarthy. The hearing will resume at 9:30 tomorrow.

(Whereupon, at 3:45 p.m., a recess was taken until 9:30 a.m. Thursday, October 2, 1969.)

TAX REFORM ACT OF 1969

THURSDAY, OCTOBER 2, 1969

U.S. SENATE,
COMMITTEE ON FINANCE,
Washington, D.C.

The committee met, pursuant to recess, at 9:30 a.m. in room 2221, New Senate Office Building, Senator Herman H. Talmadge presiding.

Present: Senators Long (chairman), Talmadge, McCarthy, Gore, Byrd, Jr. of Virginia, Ribicoff, Williams of Delaware, Bennett, Curtis, Miller, Jordan of Idaho, Fannin, and Hansen.

Senator TALMADGE. The committee will come to order.

The first witness is the distinguished Senator from Oklahoma, the Honorable Henry Bellmon.

We are delighted to have you with us, Senator. You may proceed as you see fit.

STATEMENT OF HON. HENRY BELLMON, A U.S. SENATOR FROM THE STATE OF OKLAHOMA

Senator BELLMON. Thank you, Senator Talmadge. I will not read the whole statement.

Senator TALMADGE. At this point the full statement will be inserted in the record and you may proceed to summarize your statement orally or as you see fit, sir.

(Hon. Henry Bellmon's prepared statement follows:)

STATEMENT OF HON. HENRY BELLMON

Mr. Chairman, Members of the Finance Committee, I appreciate the opportunity to appear to testify regarding HR 13270 and wish to thank you for the courtesy which you have extended to me.

In the short time available, I have attempted to review HR 13270, particularly as to four aspects of the legislation. These are the provisions of the bill that affect the agricultural and petroleum industries, those provisions that relate to municipal bonds, the personal exemption allowed individual taxpayers, and certain administrative procedures of the Internal Revenue Service. I have prepared a statement which I will not read. I ask unanimous consent that it be included in the Record, and I will limit my oral testimony to a brief summary of this statement.

I believe that the main purpose of our tax system should be to raise revenue. During the period since the 1930's, the idea of using our revenue-raising laws to accomplish certain social aims has complicated and caused great confusion in the administration of these laws.

With the passage of a vast quantity of social legislation in other fields, with the increased socially oriented activities of the United States Supreme Court, and with the creation of many additional federal programs to deal with social problems, it occurs to me that any tax reform legislation passed by the present Congress might well take note of the fact that the need for using our tax system for social purposes may no longer require the same high priority.

If this concept can be adopted, the law can be vastly simplified. It can be much more easily understood and followed by individual taxpayers, and it can be much more effectively enforced by those who are charged with its administration.

In a recent conversation with an official at the Internal Revenue Service, I was amazed when he told me that, "if the taxpayers of this country ever discover that the Internal Revenue Service operates on 90% bluff, the entire system will collapse." He further went on to tell me that when he first joined the Service in the 1940's, his reference manuals occupied thirteen inches of shelf space. At the present time, he must rely upon books of instructions and interpretations that make up a total of thirty-three feet of shelf space in his office. Plainly, simplifying of our tax laws should have a high priority. Much of the statement I have prepared for the Record is aimed in this direction.

There seems to be danger, that in its efforts to administer the present complex and confusing law, the Internal Revenue Service is resorting to tactics which frequently seem to border on coercion. Many innocent taxpayers who are accused by the International Revenue Service of irregularities, find it less costly to pay the additional taxes and penalty than to go to court and prove their innonce. Therefore, I would recommend that a tax reform law include a provision which would allow a taxpayer who goes to court and successfully proves his innocence to recover the costs of such litigation from the Federal Government.

When the present Internal Revenue Code was first put into effect and the $600 personal exemption was established, the purchasing power of our currency was far in excess of what it is today. The present $600 exemption is totally inadequate to meet the living costs of even the most modest American citizen. It is well below the "poverty level" set forth in many federal programs.

Therefore, out of a sense of equity, I believe Congress should immediately adjust the personal income tax exemption upward. If the total adjustment cannot be made in one year, it should be made in stages that will not unduly upset the Nation's economy, but that will assure the American taxpayer that the equity will be established within a reasonable time.

H.R. 13270 contains provisions which strike heavily at the two industries which have done far more than their share in keeping this Nation strong, in holding the line against inflation, and in making us the best-fed people on the face of the earth. I refer to the agricultural, mineral and energy industries which are of such vital importance to the strength, security, and prosperity of this Nation and which are of particular importance to my own State of Oklahoma.

The fact is that agriculture, since World War II and even before, has been in serious financial trouble. As one who has spent most of his adult life in agriculture, I can assure you that except in unusual circumstances, most food and fiber producers have been selling their products at or near the costs of production.

As a result, agricultural operations have not produced the financial resources farmers and ranchers need to improve and conserve our soil, drain or clear new land for production, or develop improved livestock, or new plant varieties. These developments are needed to keep our agricultural production ahead of the demands of our growing domestic population and the food requirements of our customers and friends in other nations. Therefore, agriculture must attract outside capital if it is to continue meeting the needs of our Nation.

Many provisions of HR 13270 will have the effect of driving outside capital away from agriculture and thereby freezing our agricultural production capacity into its present pattern.

It is ironic that such changes would be proposed at this time when there is growing concern for world hunger and a greater than ever need for maximizing the agricultral productive capability of this country for the future. Unless these agricultural development efforts continue year after year, the improvements will not be available as they are needed. As a result, our abundance may disappear and our food prices may be forced upward, sharply, as our population grows. In the Nation's interests, the Congress cannot afford to adopt changes in our tax laws which will drive outside capital away from agriculture.

Much of the same arguments can be made for the mineral and energy industries. I have before me a statement made by Mr. Andrew Fletcher, Honorary Chairman of the St. Joseph Lead Company, when he appeared before the Subcommittee on Minerals, Materials, and Fuels of the Senate Interior Committee. I would like to quote briefly from his remarks.

"The United States is a prodigious consumer of minerals and fuels. The startling truth is that we have consumed more of these resoruces in the last 30 years than the entire peoples of the world in all previous history. In the single decade from 1965 to 1975, it is estimated that our mineral consumption will have climbed 40 percent. Today, the worldwide per capita consumption of iron and copper is about one sixth that of the U.S., and for lead it's about one eighth. Looking further into the future, we can see that not only will our own growing appetite continue, but other nations and particularly underdeveloped nations will increase their demand at an even more rapid rate than ours.

"It is becoming somewhat trite, I know, to cite expectations about the year 2000. But it is also sorbering to realize that the millenium is about as far ahead of us as the beginning of World War II is behind us. With this in mind, let's look at the statistics. Comparing the figures for 1965 and estimates for the year 2000, based on Bureau of Mines projections, we find:

U.S. zinc consumption will increase by almost 375 percent; the worldwide total by about the same.

U.S. lead consumption will increase by over 200 percent; the worldwide total by more than 250 percent.

U.S. iron consumption will increase by nearly 175 percent; the worldwide total by more than twice that much.

U.S. coal consumption will increase by over 250 percent; the worldwide total by over 575 percent.

U.S. copper consumption will increase by over 200 percent; the worldwide total by nearly 375 percent.

"It will be no easy task to meet these soaring demands, and it is notoriously difficult to estimate the resources we will have at our command. This is not only because we cannot foresee what geological discoveries may lie ahead. It is also because the exploitation of orebodies depends on so many factors: location, quality, technology, marketability, etc. Nevertheless, a study by Resources for the Future, Inc. has concluded that over the next three decades, the U.S. will be largely dependent on imports for such vital metals as manganese, chromium, nickel, and tungsten. More ominously, it believes that total world demand will begin to outstrip the known mining potential of copper, lead and zinc in all parts of the globe.

"Given this situation, there are those who argue that the U.S. should sharply curtail its domestic mining production, relying on imports for as long as possible and husbanding its own resources. In our judgment, this would be extraordinarily shortsighted.

"First, it is fatuous to believe that good foreign relations could survive this sort of behavior, with us carting home foreign treasure while carefully hoarding our own. This would become increasingly impossible as the rest of the world experienced a constant narrowing between supply and its own growing demand.

"Second, it would make us dangerously reliant on our present stockpiles or would call for a vast increase in those stockpiles. Moreover, once we allow mines and machinery and men to fall into disuse, it can take a long time—in the case of a national security emergency, a perilously long time—to restore them to productivity.

"Third, this is simply not a sound way to increase our command of mineral resources. Essentially there are only two ways to do that: either by exploration that leads to the discovery of new resources, or by developing the technologies that will permit more effective and economic exploitation of the ones we already know about.

"Exploration is no longer a matter of a lonely prospector with a pick and a mule. Today it is often a search for deeply buried deposits, requiring aerial photography; geochemical, aeromagnetic, electromagnetic, and ground magnetometer surveys; induced polarization; gravity surveys; and eventually diamond drilling or trenching. It is an expensive, arduous and frightfully risky enterprise. Even when an economically viable discovery is made, there can ensue a long period of huge capital expenditures before the minerals can begin to flow to the marketplace. For example, it will be in the mid-1970s, after a decade of development and costs of about $200 million, before American Metal Climax, Inc., will bring its new molybdenum mine in Colorado into production.

"Besides new discovery, we can expect to increase our available resources through improved exploitation. For example, at the turn of the century the grade of copper mined in the U.S. was around five percent. The profitable mining of lower-grade ore has become possible only because of immense investments of capital and ingenuity. There may be unbounded riches in what we now consider dross, if we can but find a way to win its value."

As far as future needs of petroleum are concerned, Secretary of Interior Udall probably summed up the situation best in an address before the National Petroleum Council in March of 1966 when he said:

"In the case of oil, if domestic sources continue to supply approximately the same relative proportion of our total demand for liquid hydrocarbons as they now do and if we elect to hold to the historic reserve-to-production ratio at 12:1, we will have to add 83 billion barrels to our proved reserves between now and 1980. This begins with a requirement of 4.7 billion barrels for the year 1966, and ends with a need for 6.9 billion barrels for the year 1980, with a yearly average for the period of 5½ billion barrels. This will not be easy. In only one year—1951—has the industry been able to record a gross addition of as much as 4½ billion barrels of liquid hydrocarbons to its proved reserves. Of more significance, the average of the yearly additions since 1955 has been 3.3 billion barrels.

"For gas, under the same basic assumptions and choosing to maintain a reserve-to-production ratio of 18:1, we shall need to add 450 trillion cubic feet to our proved reserves. This is an average of 30 trillion cubic feet a year. At no time in its history has the petroleum industry ever added as much as 25 trillion cubic feet to its reserves of gas in any one year. The average since 1955 has been 20 trillion. The meannig of these figures becomes even more clear if we compare our recent past experience with a comparable period of time in the immediate future.

". . . My point is simply that there is enough evidence at hand now to suggest strongly the need for us to consider more carefully than we have so far done, the question of how these enormous future demands for petroleum energy will be supplied."

Secretary Udall further stated to the National Petroleum Council in July 1968:

"The implications of this imbalance are for a gradual deterioration in the nation's capabilities to supply itself with crude oil. No precipitate, near-term crisis is in prospect, and the deficits could go on accumulating for several years. But it is clear that sooner or later the account must be balanced; no industry can go on indefinitely shortening its stocks in the face of a steadily rising demand for its products."

As is well known, my own State of Oklahoma has made a generous contribution to the energy needs of this nation over the years and our economy has come to depend heavily upon the oil and gas industries. The distinguished Chief Executive of the State of Oklahoma, Governor Dewey F. Bartlett, has appeared before the Committee and introduced compelling testimony relating to the critical needs of the oil and gas industry, and I do not propose to take the Committee's time to reiterate his position. I would like to emphasize and associate myself with his remarks.

These proposed changes in the tax provisions applicable to the oil industry will, without doubt, reduce the industry's incentive and ability to explore and drill. A recent study made by the Bureau for Business and Economic Research at the University of Oklahoma indicates that during a recent two-year period, independent oil producers drilled 86.5% of the exploratory wells and 20% of the development wells completed in the State of Oklahoma. In terms of the risk capital employed, the survey showed that 70% of the capital employed by independent operators is obtained from outside investors who are not connected in any other way with the independents' oil operations. Thus, it is clear that the independent oil producer in the State of Oklahoma relies heavily on outside investment funds as a source of capital to supplement his own funds obtained through capital recovery. Anything that will adversely affect the value of the ventures considered by the oil operator will also adversely affect the ability of the operator to attract the capital needed to continue drilling for new oil. If this results in a reduction in the activities of the independent oil operators as a group, it will have an adverse impact on the economy within which he operates.

The degree to which changes in tax legislation will affect the economy of the State depends upon the changes themselves. If the current write-off of intangible drilling costs is restricted and the proposed reduction in the depletion allowance to 20% is carried out, the survey to which I referred indicates that the drilling operations of independent oil producers in Oklahoma might be reduced by as much as 45%.

I have concentrated on the provisions in the House Bill and the Treasury proposals which affect domestic oil operations, particularly those of the independents. With respect to the foreign area I certainly support the Treasury in urging that Section 501, which would eliminate depletion on foreign oil and gas production, be deleted.

In considering the Tax Reform Bill of 1969, I feel that the key point, as it relates to the mineral, fuel, and agricultural industries is whether or not this Nation wishes to maintain a strong position of self-sufficiency in these vital areas. If it is the determination of the Congress that we want our Nation to become dependent upon imported minerals, fuel, and food then there could be justification for some changes proposed by HR 13270. If, on the other hand, we desire our Nation to be well fed with a reserve to be shared with other nations, if we desire a dependable low-cost source of energy from domestic sources for the citizens of our urban centers, and if we desire to have available on this continent the sources of the minerals which are vital to our industrial society, then there is need to attract capital into the development and operation of these economically hazardous occupations. Present tax laws provide such incentives. They must be retained and strengthened.

I do not wish to offer myself as an expert on tax matters. I recognize that many of the distinguished members of this committee have devoted much of their careers in government to study our tax matters, and that in addition, they have the counsel of highly qualified members of congressional staffs and governmental departments. However, I would like to suggest one possibility, so far as helping this Nation retain a strong supply position in minerals and fuels. As many of you know, I am a land owner, and if I sell a portion of my land, our present law allows me to treat the income as the sale of a capital asset and to pay taxes under the terms of our capital gains law.

On the other hand, if the owner of an ore body sells a quantity of the ore, he must show the income from this source as current income and pay tax after deducting a certain amount for "depletion allowance."

Over the years the depletion allowance, particularly as related to the petroleum industry, has come under sharp and in many cases totally unjustified attacks. As has been stated here, these depletion allowances have not been excessive since reserves of both minerals and energy sources have not kept up with our growing needs. Additional incentives are needed. I believe one way they could be provided would be for the Congress to pass legislation providing that the sale of mineral, or petroleum production be treated as the sale of a capital asset and taxed under the terms of our present capital gains laws. I would suggest that the depletion allowance be left at the present level and that the above approach be allowed as an option.

As a former Governor of the State of Oklahoma, I am fully aware of the growing needs of state and local governments, and I know from first-hand experience how many of these needs for additional services and facilities are met with funds made available by the sale of tax-exempt municipal bonds. Our own State of Oklahoma and its many sub-divisions could not come close to meeting our needs for hospitals, sewers, water systems, highways, airports, educational facilities, and many other necessary governmental services without the frequent sale of municipal bonds. Such sales would become virtually impossible under the provisions of HR 13270, and I would like to add my voice to the others you have heard opposing these changes.

As I said in the beginning of my statement, I strongly favor the passage of "tax reform legislation." There is great need for such legislation and a great impatience among the citizens of this country for more equitable and less complex tax law.

Senator BELLMON. I want to begin by saying that along with many others I am very much in favor of tax reform. I believe there is a considerable demand across the country that we do undertake to reform our taxes which have become entirely too complex and too difficult to understand, not only for the people who pay them but for the people who have to prepare the returns and those who administer the law, but I believe we should take note of the fact that the main reason for having a tax system is to raise revenue.

It seems that over the years we have let a lot of social concepts get into our tax system, and since we have been able to pass a great deal of social legislation in recent years, I believe it would be wise to review some of the social concepts of our tax law to see whether or not these are still so necessary.

If we can agree to accomplish our social objectives in other ways then certainly we can simplify our tax laws and make them much more easily understood and less difficult to administer.

I had a recent conservation with an administrative officer of the Internal Revenue Service and he finally let his hair down and told me that if the taxpayers of this country ever discover that the Internal Revenue Service operates 90 percent on bluff, that the whole system is going to come crashing down.

He went on to show me that when he first became associated with the Internal Revenue Service that his whole shelf reference manuals had occupied only 13 inches on his bookshelf at that time when I was visiting with him it took 33 feet of shelf space just to hold the manuals that he had to use in administering the law.

So it seems to me that it is time we tried very intently to simplify the law and make it so that it is not so difficult for those who administer and those who pay the taxes.

Also I would like to comment on the fact that it seems that in the present situation, our law is so difficult, so complex, so confusing, and so hard to administer that the Internal Revenue Service sometimes resorts to tactics that seem to border on coercion.

There are a lot of people that are charged with not paying the taxes due who find it less expensive and less troublesome to go ahead and pay the assessment than go to court and prove their innocence.

I would like to see the law changed so that when a taxpayer is accused of a tax irregularity and chooses to go to court and prove his innocence that if he succeeds in winning his case that he be allowed to recover the costs of the litigation from the Federal Government.

If this is done, I believe that a number of taxpayers will defend their rights, and we will see less opposition to the enforcement of the law than we presently witness.

Another point I would like to make is that when the present Internal Revenue Code was put into effect and the $600 personal exemption was established, that $600 went a lot further than it does now. I have a table showing what has happened to these personal exemptions over the years. The present $600 level was established in 1948, and it needs to be sharply adjusted upward in order to establish the same relative position that the taxpayer had when that level was established.

I realize this probably could not be done all at once, but it needs to be undertaken, and we should be able to make the adjustments year by year until we reestablish the position that the taxpayers enjoyed back in the late 1940's.

I would recommend that the committee consider tying personal income tax exemption to the cost of living, so that as the value of our money goes down, this personal income tax exemption would be adjusted upward.

Now, then, there are two industries that I feel the law, as written or passed by the House, are particularly damaged. These happen to be the two industries that are most important to my own State of Oklahoma, and I refer to agriculture and to the mineral and energy industries. Both these industries have done a remarkably good job, during these recent years of inflation, of holding down their prices.

Many foods are selling at or near the levels of 1950. We 'have not seen costs of gasoline go up nor fuel costs go up substantially. They have not kept pace with other increasing costs in our society, and yet this tax bill would place very heavy additional burdens on these two industries, and probably result in higher food costs and higher fuel costs.

First of all, so far as agriculture is concerned, the plain fact is, and I speak from personal experience, that agriculture has not been a profitable enterprise for the last 15 or 20 years. We just have not been able to generate the capital that we need to continue developing our lands, conserve our soil and water, and develop the new plant varieties and the new breeds of livestock that a prosperous and progressive agricultural industry needs. If we drive away the outside capital that is presently attracted into agriculture, we are going to tend to freeze our productive capacity and make it impossible for agriculture to keep up with the growing food needs of our Nation as well as the nations that depend upon us for a part of their food supply.

You can say about the same thing so far as the mineral and energy industries are concerned. I have in my testimony a quotation from Mr. Andrew Fletcher who is the owner, chairman of the St. Joseph Lead Co. This is testimony he made before the Subcommittee on Minerals, Materials and Fuels of the Senate Interior Committee, and I would like to refer to some of the things he said.

He says, "In the last 30 years that this country has used more of these resources"—that is minerals and fuels—"than were consumed by the entire people of the world during all previous history."

He says, "In the decade from 1965 to 1975 it is estimated that our mineral consumption is going to decline by 40 percent."

He cites the fact that it is only the same distance ahead to the year 2000 as it is back to the beginning of World War II but that if we look ahead to the year 2000 we will find that our consumption of zinc is going to go up by 375 percent, our lead consumption will go up by 200 percent, iron consumption will go up 175 percent, our coal consumption will increase 250 percent, and copper consumption is going to go up over 200 percent.

He makes the point that it takes a fantastic amount of money for a company to find and develop these resources and that unless we do make it possible for companies to have the capital they need, that we are not going to be able to provide for our need now or provide for the future.

Now, the same thing can pretty well be said about the petroleum industry. There was a time when it was reasonably easy to find oil in this country, and deposits once they were discovered were shallow and fairly inexpensive to develop. But when you look ahead, we face an entirely different situation.

In my own State of Oklahoma recently a well was completed out in what is called the Anadarko Basin and the cost of this well was something over $6 million. At the same time another company completed a well in the same general area. It was a dry hole. The first one was a producer but the second one was dry. The dry hole cost more than $10 million, so I believe this shows the fantastic demands for capital that the industry must have as it looks for these more difficult deposits that are located at such great depths.

Secretary Udall very succinctly summed up the situation we face as far as petroleum is concerned in a speech he made before the National Petroleum Group Council in March of 1966. I would like again to quote from some of his remarks. He says:

We are going to have to add 82 million barrels to our proven reserve between now and 1980.

He claims that we will need 6.9 million barrels of oil per year in 1980, and he shows that the most we have ever been able to add to our reserves in any one year was back in 1951 when we added 4.5 billion barrels and that over the average during the year between 1955 and 1965 was 3.3 billion barrels, so the only conclusion you can reach is that we are using our oil much faster than we are finding it, and the day is rapidly approaching when we will not have the reserves we need to produce for our own consumption.

He mentions the same case so far as natural gas is concerned, showing that we need about 30 trillion feet a year, and we have been finding about 23 trillion feet a year so we are using gas much more rapidly than new reserves are being found.

He concludes by saying that, "The implications of this imbalance are for a general deterioration of the Nation's capacity to supply itself with crude oil."

He says "No precipitate near-term crisis is in process and the deficits could go on accumulating for several years but it is clear that sooner or later the accounts must be balanced. No industry can go on indefinitely shortening its stocks in the face of a steady rising demand for its products."

So far as my own State of Oklahoma is concerned, we have contributed a great deal to the energy needs of this Nation, and as a result our State and our economy depends heavily upon these two industries, so anything that cuts back on the incentive to locate, develop, and produce new energy reserves is certainly going to damage our economy as well as the economy of many other States, and certainly the economy of the whole Nation.

We have a study, and I do not believe that it should be all printed in the record, but I would like to present it so that the committee can have it in its files, that we made by the Bureau for Business and Economic Research of the University of Oklahoma.[1]

It shows the impact of changes in the intangible drilling cost and depletion allowance on the independent oil producer in Oklahoma, and these same facts would fit other States where independents are important.

It shows that if these changes which are in the House-passed bill were to go into effect, that it would cut back the operations of independents in our State by 45 percent, and since the independents find something like 70 percent of our oil, this means that within a very

[1] The study referred to was made a part of the official files of the committee.

short time we would see a sharp reduction in the reserves that are available for the use of the consumers of this country.

I believe that the thing the committee ought to consider, so far as minerals and fuels and agricultural industries are concerned is whether or not we want to see this Nation maintain a strong position of self-sufficiency in these vital areas. If the Congress, if the committee and the Congress decide that we want our Nation to become dependent upon imported minerals, fuel and food, then we might want to consider some of the changes that are in H.R. 13270.

On the other hand, if we want our Nation to continue to be well fed and if we want to have the reserve of food that we can export to needy nations, if we desire to have a low cost source of energy from domestic sources for the citizens of our urban centers, and if we want to have available on this continent the sources of minerals which are so vital to our industrial economy, then I believe there is a need to attract more capital in the development and operation of these economically hazardous industries.

Our present tax laws provide incentive for this sort of risk-taking, and I believe that they need to be maintained, and in fact should be strengthened.

Now, I do not want to offer myself as an expert on tax matters, because plainly the members of this committee know much more about this than I do, and certainly they have the access to a very well-qualified staff, but I would like to suggest one possibility so far as helping this Nation retain a strong positions in minerals and fuels.

Some of you gentlemen are landowners and you know that if you sell a portion of your land that our present law allows you to treat the income from the sale of this land as the sale of a capital asset and you pay taxes under the terms of our capital gain law, but if on the other hand you are the owner of an ore body, and if you sell a quanity of your ore, you must show the income from this source as current income, and pay the tax after deducting a certain amount for depletion allowance.

Now I believe that one way that the Congress could provide for a stronger national position so far as minerals and fuels are concerned would be to allow the treatment of sale of petroleum or ore from a reserve to be treated as the sale of a capital asset and tax the income from these sales under the terms of our present capital gain law. I would like to suggest that the committee leave the depletion allowance where it is and make a provision so that if the taxpayer chooses as an option that he could treat the sale of these products as sales of part of his capital, because they certainly are in that category.

One other point, and that is having served as Governor of a State as some of the rest of you have, I am fully aware of the growing needs of States and local governments, and I know from first-hand experience how frequently our local and State governments use the funds they receive from the sale of tax-exempt municipal bonds.

I do not believe that our State could come close to providing for its needs if we did not have access to this capital. We could not build our hospitals or sewers or educational facilities or provide any of the other services that our citizens demand. I am very much opposed to the Federal Government putting a tax on municipal bonds under any pretext. I believe that we should encourage States to meet more responsibilities and not make it impossible for them to meet the ones they already have.

To conclude my remarks, I would like to suggest that the committee do everything it possibly can to simplify and clarify our laws and accelerate the development of the country. I feel that H.R. 13270 has exactly the opposite effect, and I believe that the Senate can do a very great service to the Nation by changing the direction and the emphasis of this proposed legislation.

That is all, Mr. Chairman.

The CHAIRMAN. Thank you very much, Senator. I appreciate your testimony here today.

Now it seems that I am playing musical chairs with the junior Senator from Maryland, Representative Charles McC. Mathias, Jr. I just came from a hearing where I was presiding as the subcommittee chairman, and Senator Mathias was testifying in favor of confirmation of one of his valued constituents. I am pleased to see he is here.

I do not know whether he beat me to the committee room or not. This is not my first appearance in the room today. We are pleased to have you.

Senator HANSEN. Mr. Chairman, if I could be permitted I would like to ask our distinguished colleague, the junior Senator from Oklahoma one question. I think he has made an excellent statement. May I ask one?

The CHAIRMAN. Go right ahead.

Senator HANSEN. I would like to ask you, Senator Bellmon, do you have any direct knowledge of what might happen in this country if we were to begin to depend substantially upon imported oil and minerals for our industrial needs? It has been proposed that we could lower the price, that there is good reason to look toward outside sources for these energy needs, and those who propose it see no danger at all. In your experience have you any reason to arrive at any fixed conclusion in this respect?

Senator BELLMON. Senator, there are several examples of what happens to our country or any other country when they become dependent on critical strategic materials from outside sources. We all know what happened in this country when the Suez crisis shut off supplies of petroleum. I had a little personal experience in this same field.

When I left the Governor's office I became involved with a small company that makes parts from copper, and just after we got into business and took our first contract, there was a copper strike so that there was no longer a source of copper from domestic sources.

The Government at that time turned loose a substantial amount of the copper we had stockpiled here, but even so, we had to import a lot of copper. The first order we bought, which was before the strike began, the particular compound we were using cost us 74 cents a pound. That was on the 5th of November 1967.

Then the strike came along, and on the 8th of March 1968 we had to buy another order, and by that time the price had jumped exactly 50 percent. It had gone up to $1.11 a pound. Then the next time we bought was in November of 1968, by which time the strike was settled and our own mines were back in production and the price had gone back down to 78 cents a pound. So during this period of time when suppliers of some other countries knew that we had to buy copper, they proceeded to raise the price 50 percent, and we of course lost heavily in our balance of payments, but I believe exactly the same thing would happen if we became dependent upon other outside sources for any mineral that was not available domestically.

I also believe that if we become dependent particularly for energy, that one of three things would happen. We would see these other nations raise their prices, or they might propose to use their position for bargaining in such a way that it would be very disagreeable to us, or we would have to raise the price of petroleum here in our own country so that we could bring the oil shales or the tar sands into production. In either case our customers would be very seriously hurt.

Senator HANSEN. Thank you.

Thank you, Mr. Chairman.

The CHAIRMAN. I am not going to ask any questions, because we have 15 more witnesses to hear in this morning's session, but I want you to know that I am basically in agreement with your testimony. I hope that you are able to save the petroleum industry for the benefit of the great State of Oklahoma. If you cannot save it for their benefit I hope you will try to save it for the benefit of Louisiana.

Senator BELLMON. Senator, I think we are saving it for the benefit of the customers more than the people that produce it. We will manage in our State. We will have enough oil to keep our houses warm and our cars running. The people who ought to be concerned are the ones who live in the cities who are a long way from the oil and gas fields.

If our pipelines begin to go dry we will take care of ourselves but the customers who are quite a ways from home ought to look to this.

The CHAIRMAN. Thank you very much.

Senator Mathias.

STATEMENT OF HON. CHARLES McC. MATHIAS, JR., A U.S. SENATOR FROM THE STATE OF MARYLAND

Senator MATHIAS. Thank you very much, Mr. Chairman. It is an honor to follow Governor Bellmon at the witness table here. I regret that I have to impose myself upon you twice in one morning in different characters, but I am very grateful, Mr. Chairman, to you and to members of the committee for a few moments to discuss some of the problems of this tax bill.

Before I do that, I would just like to express to the committee on the record my appreciation to Mr. Vail and to the members of this committee's staff who have been extraordinarily kind and cooperative during the last few months, when taxes have been so enormously important to all of our constituents. I am sure our office has put an unusual burden on your committee staff with questions and requests for information. Every member of the staff has been exceedingly helpful to us, and I want to thank both the committee and the staff.

Mr. Chairman, I approach this opportunity to discuss taxes with you with some diffidence. I used to know something about taxes when

I earned a living practicing law. At one time I was Assistant Attorney General of Maryland in charge of the comptroller's office. I thought then that I knew a little about the theory and practice of tax law, but that has been a long time ago, and so it is with some diffidence that I appear here today.

I have prepared a statement which, with your permission, I will simply file with the committee.

The CHAIRMAN. Senator, we have printed all the statements. As a matter of fact, I am pleased to say that your statement is in the record starting at page 8–A. I do not know why it should be 8–A rather than just 8, but there it is. It starts at that point, and it is our duty to read the statement. Anybody who has not read it should read it by now.

Senator MATHIAS. Since it is there I am not going to read it today. I would like to flesh it out very informally.

The CHAIRMAN. I am pleased to say it is not a very long statement. Anybody who has any intellectual curiosity at all can read it in a hurry which I think is a credit to you. You do not just waste a lot of time shooting up the landscape without hitting a target.

Senator MATHIAS. It is the barebones of what I have to say.

Senator GORE. You are not opposed to shooting up the landscape, are you, if it is necessary?

Senator MATHIAS. It all depends on the circumstances.

Senator GORE. I thought I noticed some scattergun tendencies of yours now and then.

Senator MATHIAS. I do not like my tactics to show that much.

Mr. Chairman, I have selected just a few points that I want to comment on here today. As I noted in the statement, these are by way of illustration of my concern rather than by way of limitation of it.

Let me say that on the question of philanthropy and how the tax bill is going to affect it, we have to approach the changes in H.R. 13270 with enormous caution. For example, the whole character of the city of Baltimore is set by several institutions which are products of philanthropy:

The Johns Hopkins University and Johns Hopkins Hospital, the Enoch Pratt Library, the Walters Museum, and the Peabody Institute & Conservatory, just as examples.

Now the character of the city of Baltimore has for several generations benefited from these institutions which are the results of philanthropy.

Now, granted they were all established before there was an income tax, but they are maintained today over and above the original endowments in substantial part by philanthropy. If we discourage philanthropy, as I believe the House bill does, we are going to cut off these enormously important institutions which deal with our minds, our bodies, and our spirits, and I think we are going to change a very fundamental aspect of the American character.

We are going to undermine the maintenance of old philanthropic institutions, and I think we are going to virtually prohibit the establishment of new ones.

I talked to a man yesterday who said to me that it had been his habit in recent years to give about $50,000 a year to charity, and he said he was about ready to stop if this bill went through, that he would have to stop.

I would call particular attention to those provisions of the bill which affect foundations which are esta' lished primarily with the stock of closely held corporations. If the provisions of the House bill with respect to those family foundations based on family corporations are to stand unchanged, you will never again have a Ford Foundation. You will never again have a foundation of that character. It could not be done.

I think that there is a considerable social question involved here that can be resolved without totally destroying the concept of getting away from closely held family foundations. We should, however, allow a sufficient period of time, a breathing space in which to move out of that kind of a closely held picture.

Senator GORE. Mr. Chairman, could I ask a question now?

Senator, I agree with you that tax treatment of foundations raises profound social and political questions. In fact, not only does the tax bill raise such questions, the simple proliferation of foundations alone raises them. In a very real sense, today, the dead are ruling the living, and the perpetuity which we have accorded foundations is a violation of tenets which our country earlier found necessary to establish, and which the English, the Romans, the Greeks, and the Hebrews found necessary to establish. We simply must do something to curb the tendency of the rich and the vain and the privileged to undertake to accomplish permanent entailment of a large part of this country's wealth.

Senator MATHIAS. If the Senator will allow me to respond to that, I agree 100 percent with what he has said. In fact the statute of Mortmain is law in Maryland today; when I was a member of the Maryland Legislature we annually had to pass an act to exempt charitable bequests that had been made in Maryland from the statute of Mortmain. This is an ancient principle of the law. I am not for leaving all the tax law unchanged in this respect, but as I have set forth in my statement, I think we ought to do so with some regard for the social impact and for the necessity of cushioning the requisite changes.

The CHAIRMAN. Senator, I think I will get in my one statement now. You know, I am a civil lawyer. I come from Louisiana where we are still going by the old Napoleonic Code. What in the devil is the statute of Mormain? What is that?

Senator MATHIAS. That is a statute of the British Parliament which is in effect in Maryland because it has not been altered or repealed by the legislature since 1776. It prohibits the accumulation of what we today call foundations, but it was primarily originally directed at accumulation by the church in medieval days. Mortmain, deadhand, refers to the dead hand of the church which prevented any alienation of land. Great globs of land lay inert, and it became recognized as a social ill.

Senator GORE. This is indeed one of the great landmarks of Anglo-Saxon jurisprudence.

Senator MATHIAS. That is right.

Senator GORE. It was the culmination of many years of conflict between the church and the Crown.

Senator TALMADGE. Will you yield at that point?

Is that what was known as the rule in Shelley's case?

Senator GORE. Not the rule in Shelley's case but——

Senator MATHIAS. Both of them have the object of preventing the removal of large bodies of property.

Senator GORE. Perpetual entailment.

Senator MATHIAS. From being alienated in some way.

Senator GORE. But the point I wish to make to you, Senator, is that by the device of the foundation, the rich and the vested and the vain and the self-righteous have now found a way to circumvent these landmarks of social jurisprudence, and we must eliminate this circumvention.

Senator MATHIAS. I think it is our object, if I may respectfully submit, to find ways to apply these time-tested principles in wise and prudent ways for the future.

Very briefly on the question of municipal bonds, Mr. Chairman, I know that has occupied your attention.

The CHAIRMAN. If I may say, Senator, I had to ask the question because we Frenchmen never let that mess start to begin with so we did not have to pass a law like that.

Senator BENNETT. Isn't it ironical that the words mortmain are French words?

The CHAIRMAN. They are Latin.

Senator BENNETT. They are French.

The CHAIRMAN. Just look up the spelling of it. You will find it is spelled one way in French and another way in Latin. That is Latin. Go ahead.

Senator MATHIAS. I am not going to get into that argument.

Senator WILLIAMS. I might give the witness assurance that when the lawyers get through with this we laymen will settle the issue for you.

Senator MATHIAS. Mr. Chairman, as far as municipal bonds go, of course, obviously we do create ways of making it possible for very wealthy individuals or for institutions that control large amounts of capital to get this kind of tax-free income, and I recognize the need for some reform in this area.

I would just voice this caution. In attempting to make things more equal, we may not be simply throwing the burden on the millionaire's mansion. The changes proposed in H.R. 13270 may well be felt in every bungalow and rowhouse which has to pay a higher local tax rate because every local improvement is going to cost more because of the higher cost of financing.

With respect to pensions, I urge the committee to give serious consideration to Secretary Kennedy's request for deferring any action with respect to changes in the law affecting nonqualified plans.

Again, I think we are cutting close to the quick of the national character in this field, and I do not say that we ought not to make some changes, but I do say they ought to be considered changes.

You are touching the traditional American quality of industry and frugality and thrift, and these, of course, are personal qualities. But I think we also have to consider the collective impact. The pension plans today and the capital that they accumulate form a pool for the expansion of the American economy. If you dry that pool up, I simply ask the question where will we get the money to continue the growth of our economy in the future? Who is going to provide it?

We built a lot of our initial industrial empire on foreign capital, on money that came from Europe in the 19th century. In the 21st century where will it come from if we dry up our own sources? I do not know.

Finally, Mr. Chairman, and I do not want to take the time of the committee any further, but let me just say a word about livestock. I say that in the State of Maryland we have quality quadrupeds of every kind, horses, cattle, sheep. We have got the best. And I say that with all due respect to Governor Jordan and Governor Hansen and all the fine cattle country that they represent. We have got the best quadrupeds in America, but we are not going to have them if the House version of the tax——

Senator TALMADGE. Don't leave out Senator Bennett. They raise cattle in Utah.

Senator MATHIAS. I do not want to leave out anybody. I do not even want to leave out Senator Williams' chickens.

The CHAIRMAN. If you are talking about the best cattle you can leave out Louisiana. What I raised down there was not worth bragging about so you can just leave us out.

Senator TALMADGE. Tennessee produces some mighty fine Black Angus.

Senator MATHIAS. Just last night I talked to the dean of agriculture of the University of Maryland, and he said that some of the finest cattle herds in Maryland are already planning dispersal sales, and they look forward only to recovering about 20 cents on the dollar, because of the economic impact of what the tax bill would do to the cattle industry.

Maryland was the birthplace of the thoroughbred horse in America. Out here Governor Ogle of Belair just east of Washington brought the first thoroughbred to America.

Senator TALMADGE. Mr. Chairman, may I ask a question at that point?

You know the House bill provides that if you have farm losses of $25,000 in 3 years out of 5, and then nonfarm income $50,000 or more, you cannot deduct the losses. Now, Senator Gore here is in the Black Angus business. As a Senator he has a salary of $42,500 a year, and he may have some other income in addition to that. Do you think that Senator Gore ought to be put out of the livestock business because he is a U.S. Senator?

Senator MATHIAS. Let me preface anything I have to say on that by referring to the——

Senator GORE. I am more concerned with being put out of the Senate.

Senator MATHIAS. That reminds me a little bit when Chick Forrester and Carl Vinson were over the House 1 day and they were talking about farming down in Georgia and Chick said you know Carl only stays in Congress just to support that farm he has down there.

But let me say in prefacing the remark I made that in the Congressional Record I have filed a personal statement of net worth which includes livestock. I have got a few Angus too. I do not know that they compare with Senator Gore's. But I think a farming operation ought to sit on its own bottom, in this respect.

However, mine is of such a small nature that it has no hope of ever reaching the limits that the Senator has described as being disqualifying. I do think it ought to sit on its own bottom.

Senator GORE. Could I interject a remark since our mutual livestock enterprises have been mentioned. It is true that I produce on my farm pure-bred Angus cattle.

Senator MATHAIS. I am a grade man myself. I only produce for the butcher.

Senator GORE. But my business is not in any sense a tax shelter. I have been a breeder of Angus cattle now for 31 years, so you can hardly call this fly-by-night. Mine is a legitimate operation. I raise and sell cattle.

The tax shelter in this field is something with which I think the Congress must deal. The tax shelter is taken advantage of by certain people, many of whom have never been, and do not plan to be, and are not in fact, legitimate breeders or farmers or producers of cattle. We must do something about this, and I am anxious to try to do something about it. But I would not like to see the legitimate farmer and legitimate pure-bred industry so penalized that it cannot continue to provide the improvement of livestock and quality meat in this country as well as other pure-bred enterprises.

Senator MATHIAS. Well, I think perhaps I ought to add a word of personal explanation too, now. The farming operation in which I am engaged is one in which I was associated with my father from the time I got out of the Navy at the end of World War II until my father's death. I have been limping along since that time. It is one out of which I get a great deal of personal satisfaction. I bought my first Angus when I first got out of the Navy from some war bonds I had bought when I was in the Pacific. It is no tax shelter and no gimmick that I have got. I do not disagree with the Senator that this kind of farming ought not to be limited, because it does seem to me that this preys upon the interest of people who are legitimately interested and concerned with a serious farming operation, and creates a kind of artificial competition which I do not think any of us want to preserve.

But I do think that the House bill, particularly with respect to depreciation on livestock, would have an adverse effect on legitimate agriculture, on the horse industry.

I want to get back just one second to the horse industry, because that is important to Maryland. It is important to everybody in Maryland because everybody in Maryland participates in the State's partnership share in State regulated racing, and if the rules of depreciation, the holding period are all changed, it will have a detrimental effect on racing and it could very seriously affect the State's share as a partner in that business.

I am very proud of what we have in the way of livestock farming and animal husbandry in Maryland. As I say we have quality quadrupeds in all departments, and I think this bill will be very detrimental to the quality, to the quality, because I do not think you can keep it up when you pull the economic base out.

Senator GORE. Mr. Chairman, since the distinguished Senator is a lawyer with a great deal of experience in tax law and a farmer, I suggest that we invite him to submit to the committee some practical suggestions as to how we can deal with this problem.

(The following letter was subsequently received from Senator Mathias:)

U.S. SENATE,
COMMITTEE ON THE JUDICIARY,
Washington, D.C., October 16, 1969.

Hon. RUSSELL B. LONG,
Chairman, Committee on Finance, U.S. Senate,
Washington, D.C.

DEAR MR. CHAIRMAN: On October 2, 1969, at the Hearings on H.R. 13270, you asked me to "work something out" for submission to the Finance Committee regarding the controversial questions raised in the "Farm Loss Area" (Transcript Vol. 17, pp. 2565–66.) It seems clear that we must protect the legitimate farmer, while at the same time eliminating the "in-and-outer," *i.e.*, the non-legitimate "farmer-taxpayer" who gets into farming for quick tax deducations and sells out for profitable capital gains tax advantages.

After reviewing various proposals, I commend the following suggestions to the Committee:

1. Include livestock in depreciation recapture, *i.e.*, recapture at ordinarly income rates depreciation taken or allowed in previous years.
2. Extend the holding period for cattle and horses for capital gains purposes from:
   (*a*) 12 to 18 months or 24 months, or
   (*b*) Provide the holding period for all livestock for capital gains purposes be six months from time of first normal use for draft, breeding, dairy or race purposes.
3. Prevent tax-free exchange of male calves for female calves.
4. Require taxpayer proof that said animal or animals were actually held for breeding purposes in order to claim capital gains.
5. Where farm land is held for less than ten years, require a sliding scale recapture at ordinary income rates of land improvement expenses which had previously been deducted.

By proposing that all livestock be included in the depreciation recapture provisions of the code, livestock will be put on a par with all other depreciable business assets. I believe this provision will eliminate the tax profit from those tax avoidance schemes which are designed to trade depreciation deductions during the early part of the useful life of an animal against capital gains on its premature sale.

If a breeding animal is held to its full useful life there should not be *any* gain on its sale since it will normally be sold at salvage value. Thus, most of the legitimate stockmen who remain in the business and retain their purchased animals for their full useful life will not be affected. But the "in-and-outer" is *directly* affected because most of the gain realized at his premature sales will be taxed at ordinary income rates.

By increasing the holding period of cattle and horses from twelve months to eighteen or twenty-four months, the tax profit of the "in-and-outer" will be substantially reduced or almost eliminated. This would discourage the "tax profiteer" from getting into the livestock business solely to build up a breeding herd over a period of a few years, deducting currently the expenses of raising the animals against outside high tax bracket income, and then selling out the entire herd at the end of the period at capital gains rates. Under this proposal the tax gimmick investor would be "locked in" for several years to realize any capital gains, while other investments would be much more appealing to him since only a six or twelve month holding period would be required for capital gains treatment. Alternate proposal (2.b) above would also reduce the tax profit incentive for the typical tax profiteer while still protecting *all* legitimate livestock farmers from discriminatory tax treatment.

By requiring that the exchange of male calves for female calves is not a tax-free transfer, the tax gimmick promoter would be deprived *by statute* of one of his often used tax promotion schemes. (There is at least one court case which has upheld such transfers as being tax-free, thus lending support to this tax gimmick scheme.)

By *statutorily* requiring that the taxpayer has the burden of proving that he really held the livestock for breeeding purposes for the required length of time, the tax gimmick investor has a burden which will discourage, if not prevent, his continued search for Farm Loss tax avoidance schemes.

Where farm land is held for *less than ten years*, by requiring a sliding scale recapture at ordinary income rates of land improvement expenses previously deducted, the "in-and-outer" is further discouraged from entering this business for tax gimmick advantages. This provision also directly affects the "in-and-outer" tax dodgers of the *citrus industry*. Most legitimate farmers hold their land for periods exceeding ten years.

The above provisions seem *simple*, *understandable* and *easy to enforce* and *administer*. While they might not meet with 100 percent approval of every legitimate farmer, over 90 percent of the livestock and horse industry would probably support them. The provisions go further than the Farm Loss provisions of Senator Gore's Bill (Sec. 13 of S. 2645) to *ensure* the plugging of the "tax gimmick" or "tax profiteer" loopholes of existing law.

The adoption of these provisions would, of course, delete Sec. 211 (The Excess Deductions Account) and Sec. 213 (the new Hobby Loss Presumption) from H.R. 13270. I believe they should be eliminated because:

(*a*) They are too complicated and discriminate against and amongst legitimate farmers.

(*b*) They would require millions of farmers to keep two sets of books (cash and accrual) which is an impossible burden to put on the legitimate farmer.

(*c*) They are unnecessary if the other provisions are adopted by the Committee. I believe the suggested provisions would eliminate the tax gimmick operator, the "in-and-outer," from the farm and ranch business completely and permanently.

I have enclosed copies of statements by E. Brooke Lee, of Damascus, Maryland, and the Upper Montgomery County (Maryland) Farmers Club, which I would appreciate your placing in the official Hearing Record.

Let me reiterate my compliments for the outstanding and thorough job the Committee has been doing in the massive task of tax reform.

With best wishes.

Sincerely,

CHARLES McC. MATHIAS, Jr.,
U.S. Senator.

The CHAIRMAN. I think that, if the Senator from Tennessee would get his head together with the Senator from Maryland about taxing cattle and horses, I would think that they could work something out.

As far as I am concerned, I do not own any. I own one horse. At least I once owned a horse.

Senator GORE. Can I sell you another?

The CHAIRMAN. I learned my lesson the hard way. But if you could get together with the Senator to find some way to get some money out of these horse-and-cattle farmers why that would please a lot of us who found we could not make any money in that business.

Senator MATHIAS. Let me say I have not found any way to make any money out of it, either, and I have no horses. I have no personal interest of any sort in horses, but it is a matter of concern not only to the individual Marylanders, but it is a matter of concern to the State, because the State is a partner in the horse business.

Senator GORE. We are not talking about our personal interests. We are talking about the problem of people who are engaged in this industry.

Senator MATHIAS. Absolutely.

Senator GORE. I will be glad to talk with you and try to work this out.

Senator MATHIAS. I appreciate the Senator's invitation.

The CHAIRMAN. I want the record to show that just bceause Senator Gore manages to make some money in cattle it does not mean that everybody can do it.

Thank you very much. Senator Miller?

Senator MILLER. I just want to find out from my colleague whether the main thrust of his concern with the House bill concerning livestock has to do with the proposed changes on capital gains recapture, rather than with the attempt, not necessarily the language of the House bill but the attempt to do something about the writing off of farm losses agains high-bracket nonfarm income.

Senator MATHIAS. The Senator perceives what I was attempting to do. My concern is primarily with the capital treatment of livestock of all kinds, notwithstanding shelters which are built up by farm losses, which I agree should be limited and should be segregated from other activities.

Senator MILLER. I share my colleague's feelings about this very strongly. Thank you.

(Senator Mathias, Jr.'s prepared statement, with attachment, follows:)

STATEMENT OF SENATOR CHARLES McC. MATHIAS, JR.

SUMMARY

I. PHILANTHROPY

H.R. 13270 is a severe challenge to spirit of philanthropy. Reported abuses of tax exemptions justify better oversight and auditing but not a wholesale assault on the voluntary sector.

A. Limit on charitable deductions should be raised to 50 percent of adjusted gross income as in H.R. 13270. Administration's recommendations on charitable trusts and gifts of appreciated property are substantial improvements over House bill but more modifications should be considered. Gifts of appreciated property to foundations should not be in separate, prejudicial category.

B. In regard to foundations:

1. Proposed tax on investment income should be reduced to 2 percent, as recommended by the Administration, and explicitly imposed as a user charge or fee to defray auditing programs.

2. Provisions requiring 5 percent yield are unrealistic and could be mischievious. More flexibility should be permitted.

3. Stock ownership limitations of H.R. 13270 would impose real hardships on private foundations whose assets consist of stock in closely-held family corporation and whose major contributors are family members. If attribution rules remain so broad, such foundations would have to dispose of all such stock even if non-voting stock. Legislative mechanisms are needed to permit redemption by the issuing corporaton in such cases without adverse tax effects to the foundation, the corporation, its stockholders or the original donor of the stock.

4. Rules restricting foundations' activities in public policy fields should be clarified and rationalized.

II. STATE AND MUNICIPAL BONDS

H.R. 13207's proposals have already caused chaos in the load markets. Congress should not make any changes which would increase difficulties for state and local governments in financing needed capital improvements.

III. PENSION PLANS AND DEFERRED COMPENSATION

A. Present tax treatment of lump-sum distributions from qualified pension plans should not be changed.

B. As recommended by Secretary Kennedy, changes in tax treatment of deferred compensation plans, proposed in sections 331 and 541 of H.R. 13270, should be dropped pending further study of overall economic impact.

IV. LIVESTOCK

Proposed changes in capital treatment of income from sales of livestock would create havoc in an industry already beleagured with economic problems.

STATEMENT

Mr. Chairman, it has been said that a real opportunity for tax reform comes only once to each generation. If this is true, this is our opportunity and we must use it well.

H.R. 13270 is undoubtedly the most far-ranging bill we shall consider this year. As the mail pouring into our offices testifies, there is great public concern over the growing weight of taxation—Federal, state and local—on the nation's wage-earners. As the mail also indicates, each section of this bill will have a lasting impact on some segment of our economy and society. Thus our task is the difficult one of balancing general concepts and specific complaints, and producing an equitable and durable bill.

I claim no special expertise across the whole spectrum of taxation, and I would therefore like to confine my remarks today to four areas which are of deep concern to me and to many Marylanders: philanthropy, state and local bonds, pension plans, and livestock. I choose these subjects not out of any limitation of interest and concern, but out of a limitation of your time.

I. CHARITABLE CONTRIBUTIONS AND FOUNDATIONS

The House-passed bill constitutes a severe challenge to the philanthropic activities which have been a uniquely American asset throughout our history. As far back as the 1830's, Alexis de Tocqueville noted the tendency of Americans to form voluntary associations to meet public needs. This week the launching of annual United Givers Fund campaigns across the nation reminds us again of the tremendous contributions which the voluntary sector has made to our social health and national welfare.

The spirit of philanthropy has built and sustained many of our greatest educational and medical institutions. It has founded and supported many of our finest libraries, museums and orchestras. It has enriched our cultural life and underwritten many valuable community services, such as scouting and the Red Cross, which otherwise would have to be provided by government or not at all.

Private foundations have been a vital expression of this philanthropic spirit. As HEW Secretary Robert Finch wrote recently:

> In every area of thought and action—in all the arts and sciences, in basic research, in public health, in scholarship and creativity, in the building and preserving of independent social institutions—the catalogue of foundation-supported efforts provides many benchmarks in the progress of recent civilization.

It is true that a few individuals have used charitable contributions or created foundations to reduce their tax burdens excessively. Also, a few foundations have abused their tax-exempt status. Such excesses do justify improvements in the laws and far more extensive oversight and auditing of tax-exempt activities. But they do not justify, in my judgment, a wholesale assault on the voluntary sector—especially at a time when government's social burdens are already vast, or when diversity and innovation should be promoted rather than squelched.

A. In regard to charitable contributions, therefore, I support the House provision which would increase the limit on charitable deductions from 30 percent to 50 percent of adjusted gross income. I am concerned, however, about other provisions of the House bill which could discourage very large contributions, the creation of charitable trusts, and gifts of appreciated property, including works of art and literature. The Administration's recommendations to this Committee represent a substantial improvement over the House bill, but further modifications should be considered.

In particular, I cannot understand any justification for placing in a separate and prejudicial category gifts of appreciated property to private foundations as opposed to similar gifts to other types of tax-exempt entities.

B. In regard to foundations, I am especially troubled by four aspects of H.R. 13270:

1. The proposed tax of 7½ percent on the investment income of foundations is to me excessive and unwarranted. I therefore support, as a compromise, the Administration's recommendation to reduce this to 2 percent. To maintain the traditional tax-exempt status of foundations and other philanthropic institutions, moreover, I believe that such a levy should be clearly and explicitly imposed as a user charge or fee, earmarked to defray the administrative expenses of auditing

and examining exempt institutions. Such an approach would support a fully adequate IRS auditing program. It would also avoid encouraging states and localities to follow the Federal lead by attempting to tax this one portion of the universe of tax-exempt institutions.

2. The "income equivalent" provisions requiring a minimum 5 percent yield for foundations is unrealistic and could be mischievous. Foundation managers were obliged to maintain a prudent investment portfolio which would, presumably, include a mixture of growth and income-producing investments. The House bill would upset this management concept and could lead foundation managers to chase the vagaries of the stock market in pursuit of a 5-percent return, rather than concentrating on their philanthropic responsibilities. Far more flexibility should be permitted.

3. The stock ownership limitations of section 101 of H.R. 13270 would impose special hardships on private foundations whose assets consist wholly or primarily of stock in closely-held family corporations, and whose major contributors are members of that family. Even where these holdings are of non-voting stock, the extremely broad attribution rules of the House bill would require such a foundation to dispose of all its securities in the family corporation, because of the stock held by family members. Presumably the funds received in return would then be reinvested by the foundation in other securities not usbject to the 20-percent limitation.

I am not convinced of the necessity of such complete divestiture where the stock involved is non-voting stock. However, I am more concerned by the fact that in such cases, compliance with these provisions would be extremely difficult since no ready market would exist for the non-voting stock other than the family or the issuing corporation. Realistically, only redemption by the issuing company would provide the foundation with a reasonable value for the securities held.

While the House bill does not forbid such redemption by the issuing company, the Internal Revenue Service has sometimes taken the position that where a corporation redeems shares which have been received by a foundation as a gift, the redemption amounts to a dividend taxable to the persons who made the gift. As far as the redeeming corporation is concerned, there is a possibility that the IRS would assert the penalty tax for unreasonable accumulations of income. The uncertainty of this situation is extremely dangerous and could effectively prohibit redemption as a practical matter.

At the very least, therefore, an explicit leigslative mechanism should be provided to allow redemption by the issuing company in such cases over the 10-year period with no adverse tax effects to the foundation, the redeeming corporation, its stockholders or the original donor of the stock involved. In related areas, too, I would encourage this Committee to provide the required assurances to permit such foundations to comply in good faith with the concept of divestiture without incurring penalties for their compliance.

4. Finally, I urge this Committee to clarify the highly confusing and ambiguous language of the House bill restricting the permissible activities of foundations in public policy fields. The line between lobbying and educational activities is a delicate and elusive one, but—as Secretary Finch has stated—a rational definition must be found. It would be a real mistake, I feel, to discourage foundations from sponsoring innovative efforts in education or medical research, or to deny legislators and public administrators the benefits of the experience and knowledge of many eminent Americans simply because those individuals are connected with foundations. For example, under some interpretations of the House bill, public officials could discuss the Heller-Pechman revenue-sharing proposals with Dr. Heller, who is at a university, but not with Mr. Pechman, who is associated with a foundation. Such inane situations should be precluded by clarification of these provisions.

II. STATE AND MUNICIPAL BONDS

A second area of special concern to me is the proposed change in the treatment of interest on previously tax-exempt state and local bonds.

In 1968, $16 billion in such bonds was issued to finance a portion of the vast capital needs of our nation. The tax bases on which state and local governments depend are already overburdened. In this context, I believe we should be extremely cautious in considering measures which could make it even more difficult for states and localities to finance much-needed improvements such as schools, hospitals, streets, libraries, and water systems.

The mere discussion in Congress of removing the traditional exemption from these bonds and of including such income in the LTP and allocation of deductions provisions has engendered chaos in the market. In the period from February to August 1969, the Bond Buyers' Index of 20 representative municipals rose from 5.04 percent to 6.02 percent, a considerably larger jump than occurred in federal and corporate debt financing. As our colleague from New York pointed out before this Committee, the market rate of return on state and local bonds has been steadily rising. It would appear that the revenue effect of the proposed changes may not be great, but that the market effect could be catastrophic.
but that the market effect could be catastrophic.

If we are to design a true tax-reform measure, we must not force local governments to abandon bonds and turn to increases in regressive sales, property and utility taxes.

Protracted litigation to test the limits of the doctrine of "intergovernmental immunity," regardless of the eventual outcome, promises to keep the municipal market in confusion for years if changes similar to those in H.R. 13270 are ultimately enacted.

Federal grants-in-aid for capital purposes in F.Y. 1970 will total some $6.5 billion. The bulk of the required matching funds will be raised through bond issues. As the Federal government holds out promises of revenue sharing, a mass transit fund, and welfare reform on the one hand, it must not seriously erode a significant source of state and local government financing on the other.

III. PENSION PLANS

Since 1942 lump-sum distributions from qualified pension plans and similar sources have been accorded capital gains treatment. The House bill would prospectively limit such treatment to the amount in excess of employer contributions.

The fact that these distributions involve receipt in one year of funds accrued over a number of years suggests that the entire amount should continue to be taxed at special rates. I am confident that this Committee will carefully examine the relevant portions of H.R. 13270 to insure that the reasonable expectations of the numerous employees participating in such plans are not thwarted.

I am concerned that other changes in pension treatment called for in H.R. 13270 may have broader ramifications than initially appear. Future growth in the private sector of our economy is dependent upon the availability of a large pool of capital which will enable older businesses to expand and new ventures to be created. Any narrowing of this pool of capital should be regarded with concern if we are to keep what will soon be a trillion-dollar economy growing in a healthy manner. Profit-sharing and pension funds have increasingly become important sources of capital for investment in the private sector.

Before any further limitations are placed on deferred compensation plans, considerable study should be given to the effect of such limitations upon this pool of investment capital. I therefore endorse the request of Secretary Kennedy that changes in deferred compensation plans proposed in Section 331 as well as in Section 541 (referring to subchapter S corporations) be dropped from the bill for further study.

IV. LIVESTOCK

Finally, I am concerned about proposed changes in present capital gains treatment of income from the sale of livestock. Lengthening the required holding period and including livestock in the depreciation recapture rule could create considerable havoc in an industry already beleaguered with economic problems. Here, as in the case of foundations, we must avoid penalizing the vast number of legitimate operations to reach alleged abuses by a small number of taxpayers.

Mr. Chairman, in conclusion, I wish to congratulate you and this Committee and its staff for the intensive scrutiny you are giving to this massive bill and the hospitality you have shown to all witnesses. I look forward to working with you toward the enactment of tax reform legislation which will promote the interests of tax equity and our national economic health.

I have enclosed a copy of a statement of E. Brooke Lee, of Damascus, Maryland, with an attached resolution of the Upper Montgomery County (Md.) Farmers Club.

STATEMENT OF E. BROOKE LEE, OF DAMASCUS, MD.

The development in this nation in recent decades (with the past 30 years operating under the present provisions of the federal income tax laws) of greatly improved American dairy cattle and beef cattle have furnished the American people with better products of these two most essential foods. Cattle improvement has helped through increased food production per pound of cattle feed and per head to keep these basic foods abundant and to limit their increased cost to the American consumer more than has been the case of most other essential consumer foods or needs.

The present tax bill now pending in the Senate will greatly damage most farmers, most dairy farmers, and most beef cattle producers. The terms of the House bill will, in all probability, drive from the American beef production business those breeders of the half dozen major American beef breeds who have non-farm income of over $50,000 a year. This group has throughout the past century made a most important contribution to the improvement of American beef herds from which all Americans have benefitted.

Several of the provisions which will drive such breeders out of the beef production and beef improvement business are largely punitive because the same tax reform law, as passed by the House, does not propose to apply such harsh terms to other types of American producers of essential products; and further because in several of the most burdensome proposed punitive measures the yield in estimated new taxes by the Treasury is small and out of all proportion to the proposed damage and expense to the farm producers. For example, the pending bill requires at least three times as long a holding period for a beef animal sold for breeding purposes to entitle that sale to capital gain treatment as it proposes to continue to require for a share of stock or a structure.

The bill ignores completely the basic requirement in the production of improving beef cattle, which is to put together a combination of genes, of feed, of pasture, of exercise, of sanitary conditions, of inoculations against many modern diseases and several dozen other factors, before a producer or breeder can offer an animal of an improved beef producing type of any breed of American beef cattle or of any combination of cross-breeding.

When such a result is accomplished, it is a marked benefit to all animals within range of that result. Very clearly any improved type of beef animal good enough to be sold for breeding purposes has earned consideration from beef consumers or beef producers and the owner who has spent the money and done the work to produce the improved beef animal has earned an equitable position from which he should be allowed to sell such a type improvnig beef animal on a capital gain basis with a similar holding period as required for stocks or structures. The improved beef animal is much more difficult to produce and is capable of much more general benefit to more citizens.

Contrary procedure is so discriminatory as to be a reversal of all previous concepts of American taxation and will undoubtedly drive from the business of helping improve all types of American beef animals those individuals who have any substantial non-farm income. Sensible men will not be willing to take the risks concerning improved cattle production which the Treasury has caused to be written into the pending tax bill as it passed the House.

Animals raised for slaughter should continue to be classified as producing ordinary income at time of sale and animals sold for breeding should continue to be classified as entitled to sale on a capital gain basis or both future dairy and beef improvement will be badly hurt by the action of the Congress.

Certain provisions of the tax reform bill, as it passed the House of Representatives, are highly detrimental to the livestock industry. Certain others are largely punitive and also highly detrimental to the livestock industry and in the estimates furnished by the Treasury to the House Ways and Means Committee produce relatively small amounts of probable increased tax. Among such items are—

A. The excess deductions account (EDA) which eliminates capital gains on farm assets.

B. The change in the "hobby" loss farm provision which cuts it from $50,000 and five years to $25,000 and two years.

Since the bill strictly limits the amount of farm loss that can be considered to offset non-farm income, the amount that a breeder of registered cattle losses in any year or in any several years does not seem to be a question of federal taxation. The loss is that of the citizen who engages in the business of producing registered beef cattle and the loss does not affect materially the total amount of tax that such a citizen will pay. Consequently the purpose of this provision appears to be largely punitive.

C. The limitation on tax preference that is familiarly known as LTP.

Few farm operators who produce different types of farm produce or who produce cattle with several types of tax status can determine the exact cost of either type of product or cattle. That is, cost can only easily be determined when cattle are bunched up as in feed lots or are runing in one herd with one status or destination, or wheat in a wheat operation, or milk in a dairy operation, etc. Consequently the principal requirement of this limitation is regarded as most difficult to fulfill and extremely expensive to accomplish and so largely punitive in nature. For example, such accounting would require the break-down into hourly allocations of farm workers. The Treasury estimates only indicate an expected increased revenue of from $5,000,000 to $20,000,000. The cost to farmers is estimated to greatly exceed the larger estimate.

D. The allocation of deductions.

The combination of items A, C and D, if enacted, is expected to be fatal to the continuation in the cattle busines of a vast number of present beef producers and to be practically certain to eliminate a larger proportion of the continuation of the individuals who have during the past 30 years have produced the registered improved beef strains that have made the American beef cattle the best and the most economical producers of good beef in the world.

Actually the combination of A, C and D appears principally to be a determination on the part of the Treasury to force farmers to keep separate accrual sets of books even when operating on a cash basis. It is believed that few can keep accrual books for most farming operations and that the cost of such an effort will run into the tens of millions of dollars.

The procedure proposed to be forced in this maner is discriminatory against farmers in general and cattle producers in particular, due to the continuing fact that under the tax reform bill other producers are not so proposed to be driven off their long-established cash accounting systems.

UPPER MONTGOMERY COUNTY (MD.) FARMERS CLUB RESOLUTION UNANIMOUSLY PASSED SEPTEMBER 27, 1969

Be it resolved, That the United States Senators and Members of Congress from Maryland be petitioned to use their best efforts to eliminate from the now pending tax bill a series of discriminatory and even punitive provisions against farmers and livestock producers which include the following:

1. The tax bill as it passed the House of Representatives includes a particularly punitive program against operating farmers described in the bill as the Excess Deductions Account provisions, through which proposed procedure many new additions are made to the operating cost schedule of farmers who are on a cash account basis (as nearly all farmers are), and which new charges to farmers continue to stand under the same bill as tax deductions rather than tax charges to Americans engaged in other occupations or industries. For example, interest on borrowed money against the farm or the farmer will for the first time be added to the accumulative Excess Deductions Account with an effort to ultimately recapture same as taxes as part of Federal taxes against the sale of the farm land or future farm production.

In the case of any commercial structure, manufacturing operation or individual business venture interest continues as a straight deduction before the calculation of any tax. Yet against the farm value in the reform bill it is to be set up as a recapture weapon should the farm value increase at ultimate sale.

Another punitive feature of the Excess Deductions Account is the demand made through that procedure to treat the value of unsold livestock, cattle or horses, as accrued and taxable income before the animals in question are sold. Such a rule generally does not apply to other merchandise and in the case of livestock the uncertainties both of prices and survival plus the small margin of profit to the producer are such that this presale method of taxation will, we are sure, prove an unbearable burden to the farmer and producer.

We respectfully petition the members of the Senate and Congress to work to eliminate these new destructive and even punitive discriminations against farmers in general and livestock producers in particular.

For example, it would be equally logical and equitable for the Internal Revenue Service to insist that each bushel of grain or ton of hay be considered as taxable income when harvested and not when sold, with date of sale prevailing in other walks of American industry. Such a provision of course would increase the confusion and the injustice to farmers but it would be no more illogical, inequitable or punitive than the present proposals concerning the producers of cattle and horses.

2. Substantial reductions in the portion of the sales price of a farm or of livestock that can be treated as capital gains as compared to the rules concerning same that have prevailed since the income tax was attached to these types of property.

In this connection we observe that the principal substantial profit that most farmers or farm families are able to make in the United States today is represented by the value of the farm property. These farms are generally held for many years and even generations in the ownership of the operating family. To change the law to treat so much a larger patr of any profit that may appear in the sales price of such a farm as ordinary income, and taxable at the highest rate authorized by the Congress, will work a great hardship on the heirs and, owners of all farm property and will greatly discourage the efforts of countless families to work to hold their farms and will most definitely discourage a most substantial portion of any nationwide interest to invest in farm lands.

We regard these provisions as extremely detrimental to the values and the stability of the ownership of the farming sections of Maryland and of the Nation.

3. The bill as it passed the House practically eliminates the long existing opportunity to sell breeding cattle or horses on a capital gain basis through the discriminatory expedient of requiring the selling owner to hold the animal in question for an arbitrary period of a year or more beyond the age at which most similar animals are now customarily sold and apparently for the sole purpose of denying the producer the opportunity to sell cattle or horses on a capital gain basis. The arbitrary, unrealistic and punitive period set up for this purpose in the bill as enacted by the House is some three to five times longer than continues to be required for the holding of market stocks to classify their period of ownership as justifying sale on a capital gain basis.

4. A markedly punitive feature of the bill as it passed the House is the definition of a "hobby farmer" which the bill states is open to rebuttal, the proof and expense of which would be high and the result doubtful. The penalties for being declared a "hobby farmer" are to have all costs for labor, feed, equipment, gasoline, oil, electricity, fertilizer, etc., disallowed for a five year period should the unfortunate cattle or horse breeder be forced into that definition by the new regulations and should he also have $50,000 a year non-farm or outside income.

Since the other portions of the House bill prevent such a "hobby farmer" from setting up any large farm loss to cover non-farm or outside income beyond a minimum figure, there does not seem to be much of a question of taxation or Federal revenue involved in this punitive provision, but rather a prejudice on the part of the Treasury Department against such citizens who seek to improve the quality of registered cattle or horses by incurring substantial losses in their production.

The penalties set up in the punitive provisions of this definition are so substantial that we believe that very few citizens with outside income will continue in the business of breeding registered cattle or registered horses.

We believe that the present excellence of American breeds of beef cattle and the large numbers of thoroughbred horses now produced are in large part due to the work and expenditures of breeders with other non-farm income.

We fail to see why the Treasury should object if their losses cannot by law serve as a cover for non-farm income.

This provision will be particularly destructive to most of the citizens who now breed thoroughbred horses and we respectfully suggest that thoroughbred racing is today an important part of the Maryland way of life, furnishes a substantial amount of State income, and will undoubtedly be severely dislocated should the definition of "hobby farmer" be enacted into law in the language in which it passed the House of Representatives.

(The committee subsequently received the following statement relative to the statement of Senator Mathias:)

STATEMENT OF PIERCE S. MCDONNELL, ESQUIRE, OF WARRENTON, VA., AND CLEVELAND HEIGHTS, OHIO

My name is Pierce S. McDonnell of Warrenton, Fauquier County, Virginia. I am a practicing lawyer, a Member of the Virginia Supreme Court of Appeals, and of the Bar of the United States Supreme Court.

Also, in regard to financial expertise as an economic expert, re certain non-Federal bond issues which are now exempt from Federal taxation under existing statutes, I have also been retained as a consultant.

After graduating from Case Western Reserve University, I completed my legal education at Yale; Graduate Business—Harvard; M.A. in Economics, Georgetown, and did my PhD work in Business Administration at Columbia University.

This morning I listened to the testimony and interrogation of the Honorable Charles McC. Mathias, Jr., of Maryland. My position is identical in many ways to the views presented by Senator Mathias with two major exceptions.

I. AGRICULTURE

He spoke of the importance of the cattle and horse industry in the State of Maryland. I wish to point out to your Committee the horse and cattle industry is very important to the Commonwealth of Virginia, particularly in Fauquier County. The quality of the breeding of our fine horses is known throughout the world sales market.

Farms owned and operated by Admiral Lewis L. Strauss, of Culpeper, and Judge Howard Smith, of Broad Run, are famous throughout the United States.

This witness urges your Committee not to destroy by the pending legislation before you what Virginians have worked so hard for so many generations to build up and operate with financial success under the free enterprise system.

May I strongly recommend that no changes be made in the existing law re capital gains from income from the sale of livestock.

2. BONDS

This section of my testimony deals with the proposed removal of the present tax exemption of non-Federal bonds issued by quasi-government and other political units below the state level as political subdivision thereof.

A. I oppose the provisions of H.R. 13270 for the same sound reasons as outlined by previous witnesses. The mere threat that the Congress may pass the pending provisions has depressed the bond market. It is now playing havoc with the traditional method that sales of certain Federal tax-exempt bonds, particularly state and municipal.

B. Other non-Federal tax bonds exempt from Federal taxation. In 1961 (privately distributed) and in 1964 I wrote a book entitled, "The Law of Turnpikes". Both were published by the National Academy of Sciences.

The statutes of 37 states provide that the bonds issued by these authorities shall be at fixed statutory rate and have been exempt like State and Municipal bonds from Federal taxation.

These business entities . . . turnpikes, toll bridges, etc. . . . are self-financed through the sale of revenue bonds. Senator Long's State had a successful pioneer program in this field; Senator Williams' State (in contact with Pennsylvania) also were early entrants in the program to build fine transportation facilities for the American public of the Eastern Seaboard area. All projects, in both these States, were financed by tax-exempt bonds.

As an individual who has been associated for over twenty years professionally in some of the problems raised by H.R. 13270, I believe that your Committee should not be politically maneuvered into a position where you will force another self-supporting industry into a financial jam where it will be almost practically unable . . . or absolutely unable . . . in terms of current bond sales conditions . . . to sell their low rate tax-exempt revenue bonds.

In closing, a word about the foundations proposals legislatively suggested by the Administration. I agree that the proposed tax on investment income be reduced to 2%.

Senator GORE. Thank you, Senator.

The committee will now hear from Mr. Dan Throop Smith.

STATEMENT OF DAN THROOP SMITH, PROFESSOR OF FINANCE EMERITUS, HARVARD UNIVERSITY, BOSTON, MASS.

Mr. SMITH. Thank you, Senator Gore.

I appreciate and welcome this opportunity to appear before the committee. For identification and for the record, I am Dan Throop Smith, professor emeritus, Harvard University, lecturer. Stanford University.

During the Eisenhower administration I was the Deputy Secretary of the Treasury for Tax Policy, past-president of the National Tax Association, the Tax Institute of America.

Needless to say, I speak only for myself. I think anyone familiar with professors know that they speak only for themselves.

I appreciate the fact that my prepared statement has been submitted in the record. I shall, even at the expense of being ungrammatical, highlight those few points which I particularly wish to express before this committee.

Because so many witnesses have come to object to provisions of the bill, I shall for about 2 minutes at the beginning, if I may, comment very favorably on provisions which I believe are major reform items which are long overdue in spite of the fact that many of them have been criticized by many other witnesses here.

I note specifically the Clay-Brown provisions, the extension of the unrelated business income tax to tax-exempt institutions not now subject to it, the extension of the provisions on farm losses and hobby losses. On that, if I may interject, I am referring to the extension of the limitation on losses, though on the basis of the discussion of the last 10 minutes, I recall well, back in 1953, being very much in the middle of the application of the rule regarding cash basis accounting for livestock growers which is now proposed to be changed by statute. I will be glad to comment on that if you so desire.

In general I am very much in favor of recapture provisions all the way across the board.

The extent of the tighter rules on multiple corporations, are again long overdue, as are recapture of depreciation on real estate, which is essential to justify realistic depreciation allowance on real estate, and the tighter rules on various peculiar forms of stock dividends, and separate classes of stock.

The Treasury has been moderately successful through regulation in stopping some of the things that can only be described as tax gimmicks, but it needs to be fortified by statute.

In general, I think the provisions with respect to mergers are also eminently desirable. The balance between the good and the bad of mergers is an extremely subtle one which I tried to spell out in my prepared statement. I particularly commend the provisions which will remove the opportunity to treat securities received in mergers as installment sales; the idea that those could be installment sales is really a travesty of the whole concept.

Now, turning to other points, and I shall again be very brief, on the tax-exempt bond provisions I feel that the proposal in the House bill with respect to future issues, to give the option to issuers to issue taxable or tax-exempt bonds with a Treasury payment related to interest if the choice is taxable, is a very good one.

It seems to me that on that basis there will not be a higher burden on the borrowers and the property owners and other taxpayers in the debtor communities.

The point of the proposal is that there will be a payment from the Federal Treasury to the borrowing governments, which will more than make up for the difference in interest cost.

As the markets have operated for the last generation, the savings to investors have vastly exceeded the savings from lower interest to the borrowers, and this proposal is a way to remove a tax differential from the capital markets with both levels of government, Federal, and State and local, being better off.

I think it is most unfortunate that the bill as passed in the House included tax-exempt interest in the so-called limitation on tax preference. I think that was bad in principle because it smacked of a retroactive treatment. It was, I suspect, a major unstablizing factor in the market, because it meant that some holders of present bonds would be disposed to unload them. That is in distinction to the provision for future issues of bonds.

I note that the Treasury has recommended that the limitation on tax preferences be removed from the bill, and I would merely urge that the sooner that can be done, the better, thereby removing the uncertainty that now hangs over the market.

Senator GORE. Mr. Smith, as I see it, the provision in the House bill neither solves the problem nor provides a satisfactory substitute for the communities. Interest would be taxed only through the L.T.P. It does not apply to the corporate holders of municipal bonds. It does not apply to trust holders. It does not apply in fact to even an individual holder unless that person has a majority of his income from a tax-exempt source. So it seems to me that this is particularly inadvisable. Its only result has been to thoroughly demoralize the market and raise a question as to the value of outstanding municipal, State and county securities.

Now you have suggested, as I understand it, that we not deal retroactively at all, that, beginning only with new issues the provision in the House bill apply, giving to the communities a choice of issuing tax-exempt securities or Government-subsidized securities. Is that a correct statement?

Mr. SMITH. You have stated my position better than I could, Senator Gore. That is precisely the point I make.

Senator GORE. That is the greatest compliment I have been paid in a long time. Thank you.

Could I ask you out of your learning to comment on a suggestion I advanced to people in my own State for consideration. I have not reached any conclusion as to whether it should be advanced legislatively, but taking into consideration the things which you have said. I suggest that we start now.

My father always taught me, "Son, always start from where you are," and here we are. Maybe we erroneously arrived at tax exemption but here we are, and I do not thing tax exemption can be withdrawn without some satisfactory substitute. I would hesitate to disrupt the market and the values of the present holders of municipal bonds.

I suggested, again beginning where we are, that we consider Government guarantee of State, county and municipal bonds with the payment by the Federal Government of one-half of the interest thereon on new issues. This came to my mind out of the experiences of government-owned corporations, who issued securities with Government guarantee. I notice that the rate, for instance, on TVA bonds is now only a fraction of a percentage point higher than that of the Government's bonds.

I do not know why it should be any larger.

Of course, the guarantee of such bonds could only be made on those local bonds which met local law, and which were not in contravention of Federal law. Now would you comment on that?

Mr. SMITH. It is certainly worth considerable study and exploration. I had not heard of it before precisely in that form, Senator Gore, so I am a little bit reluctant to give a categorical statement. My own feeling is that it is useful to start on fairly known steps, sure things, and then see if that is perhaps not enough. The proposal as you have stated it involves two things, the guarantee, and the payment of the Federal Government of part of the interest.

Now, the House bill with respect to future issues takes one of those, the partial payment of the interest, not your 50 percent figure, not a flat figure, but a sliding scale which would be more or less related to the market differential. This will be something which changes over the years. I think I would slightly prefer the sliding scale thing, not to have either a subsidy or a penalty vis-a-vis the Federal Government, and the States and localities on that.

On the guarantee feature, you state of course, that the bonds would have to be consistent with State law and not in contravention of Federal law.

I do not know precisely what concerns me but there is a little bit of an element of a blank check in that, as it is described. I believe that the partial interest payment will go so far on future issues, will go so far in dealing with the problem effectively, that I would be inclined to stop with that as a first step in the reform in this area. But yours is a very interesting point that I will certainly want to think about further.

Senator GORE. Thank you very much. I would appreciate any further thoughts you have on it.

Senator MILLER. Would my colleague permit a question on this particular point?

Senator GORE. Yes.

Senator MILLER. I am a little concerned about your statement that the proposed inclusion of tax exempt municipal bond interest in the limit on to tax preferences has an unsettling and disturbing impact on the municipal bond market.

As I understand the Treasury, at the end of 10 years this would amount to $35 million additional revenue, because the inclusion is phased in over a 10-year period. That would mean I would think that we are talking about $3½ million of impact, tax impact in the first year.

We have also received testimony from the Treasury that about $2 billion of tax exempt interest is paid out to individuals, and I must say that it taxes my imagination to believe that a proposed tax impact of $3½ million out of a $2 billion pay-out would have the unsettling effect on the market to which you refer. I can certainly understand the impact of the proposed ordinary income treatment to banks which are the primary customer, but I just cannot understand this impact of $3.5 million on $2 billion of income from this source on individuals.

Mr. SMITH. Two points, Senator Miller. First, I certainly did not mean to imply that this particular provision of the bill was the principal cause of the disturbances in the market. We have a great many disturbances. This is merely one additional factor.

My second point, I think, is that I believe the markets are very sensitive to symbols, to principles, if one likes, and since in the very way that Senator Gore indicated there is an element of retroactivity in the application of the limited tax preference to particular individuals who hold some of the bonds, if that willingness to breach what is a good faith acceptance of a present treatment is accepted by the full Congress, then I would suppose that a good many other high-bracket investors will say, "Let's unload before something worse happens."

Now this is a very subtle point. Your statistics certainly are absolutely right. It is a judgment factor.

Senator MILLER. You understand that this is the only way we can get at the situation where some people can have a large amount of income without paying any income tax at all?

Mr. SMITH. That is absolutely correct, but I have had occasion as a student and as a participant in government at one time or another to be involved in various approaches to this tax-exempt-bond interest problem over generations, and my impression is that every time there has been a really serious or useful approach, it has lost, I believe, because it has gone too far. I of course from the outside have no idea what is likely to come out of this, but when the proposal first came, when I first saw it in the House bill, and I saw the two parts, I said wonderful for the future, and then I wondered to myself is the thing in some way being jeopardized? Is this basic reform being jeopardized by trying to go a little bit too far in getting what is in effect a retroactive application?

Senator MILLER. Well, then, in view of that would you favor the LTP approach with respect to prospective issues?

Senator GORE. With respect to what?

Mr. SMITH. Prospective issues.

Senator MILLER. Prospective issues, yes. That would obviate the concern. Let everybody buy knowing the results of the game and do not change them in retrospect.

Senator BENNETT. Mr. Chairman, I hate to be the so-and-so on this committee. We have got 13 more witnesses. We have taken an hour and we have just started on our third witness.

Senator GORE. Senator Bennett, you ——

Senator BENNETT. You will remember the chairman's proposal that if we wanted to talk details with the witness, we had the privilege of going into the back room and continuing the discussion.

Senator GORE. Well, this is true, but this man is very learned, very experienced in this field, and the purpose of this hearing as long as I am here is to inform the committee, and this man is full of information.

Senator BENNETT. The back room is full of opportunity, and a stenographer.

Senator GORE. I will violate the rule once more if I may. Just to respond to Senator Miller about the effect of the House bill on the market. I think there are two things. One is precedent, overwhelming passage of the bill taxing in part income from so-called tax-exempt securities.

Second, once the principle is established retroactively what justification is there to applying it only to individuals? What about banks? Vaults are full of tax-exempt securities. I see no justification for exempting the banks and taxing individuals.

Rather than solving the problem, or even dealing with it meaningfully, the result of the House bill in this regard has been to thoroughly upset the present situation. Now this does not mean, as I see it, that we should abandon search for solution. I think we need to seek a solution. I will not interrupt any further.

Mr. SMITH. I shall proceed as rapidly as I can, even without using full sentences.

As regards private foundations, the provisions with respect to self-dealing seem reasonable and good. Provisions with respect to the use of assets are in the same category.

The so-called tax on investment income again seems to introduce a principle which would be unfortunate. The Treasury's proposal that there be a charge related to the cost of policing was eminently desirable, and I trust will be adopted. I have heard suggestions even that that might better be referred to as an excise than an income tax, and that to my layman's point of view makes sense also.

The point which is of great public concern with respect to foundations is what seems to many of us to be too tight a rule on this so-called influencing legislation. The provisions of the House bill, as they stand, would seem in a variety of ways, for instance, to prevent grants for such things as antipollution control, the population problem and the like.

There has been much staff study I know. There have been many discussions, many witnesses. It seems there is a fair prospect of developing language which will prevent the abuses of participating in particular elections, voter registration drives and the like but not having the great restrictions that the House bill has. The language of the House bill would be so restrictive I think that it would be little less than tragic if that were adopted.

With respect to restricted properties, that is restricted stock options, yes, one might say, why not put it in, but really why bother to put it in, because with the 50 percent maximum rate on earned income which I shall refer to later, the advantages of stock options of all sorts will be so much reduced that this whole area will probably wither away in importance.

On deferred compensation I have somewhat the same feeling. With a reasonable ceiling and the maximum rate, the advantages of deferral will not be sufficiently great to make it important.

I do note further with respect to deferred income, that there are very difficult problems of definition, and to adopt the House provisions will inevitably open up a great deal of litigation and uncertainty in the law.

With respect to percentage depletion on foreign oil production, as the report of the House committee indicates this will not bring in any revenue to the Treasury. In the long run in effect what will happen will be that other countries will raise their taxes and U.S. companies will be at a tax disadvantage, not for the benefit of the U.S. Treasury but for the benefit of foreign treasuries.

I would very much hope that that would be dropped.

With respect to capital gains, a general tightening in the definitions and concepts is long overdue, but I take the liberty of reading three sentences if I may from my prepared statement. This has to do with the general treatment and concept of capital gains.

Though the so-called net accretion concept of income is popular in much of the theoretical writing on public finance the distinction between capital and income is basic in corporate accounting and law, in trust law and indeed in family management.

A family, a corporation or a trustee which is so imprudent as to fail to recognize this distinction is headed for trouble. A government which fails to recognize the distinction and by its tax law encourages its citizens to disregard the distinction seems imprudent to a high degree.

I do believe there is a profound difference between capital gains and ordinary income, and for that reason I think it is most unfortunate that the alternative tax rate is being dropped. But it would seem to me vastly better to go back to what was in the law in the 1930's for a few years and that is to have a sliding scale for the inclusion of capital gains. Specifically I suggest up to 1 year full inclusion, 1 to 2 years 75 percent, 2 to 5, 50 percent, over 10 years, 20 percent.

In that case there would of course not be a need for an alternative tax rate on capital gains.

I have always felt with the 6 months holding period, that it was unreasonably short, that it jeopardizes the whole concept of capital gains. I support the provision of the House bill to extend the holding period to 1 year.

I note that the Treasury has proposed that it go back to 6 months, but I do not agree in that respect. There may, however, be a matter of appropriate timing for this change.

With respect to charitable contributions, the matter of appraisal on art objects has been the subject of so much abuse it has become really a tax gimmick. I thought the House bill was wise in including the limitation of the charitable deduction to cost.

I note the Treasury has proposed that that be modified by going back to market value. In principle I think market value is right, but this is an area where the law is in a sense coming into disrepute because of the abuses that have been engaged in by some individuals.

So I felt that the limitation to cost was a reasonable one, so long as it is not an entering wedge to applying that rule to all forms of gifts.

The principal damage from the proposed changes regarding charitable contributions, however, comes from the attempt to include in the limitation on tax preferences in the allocation of deductions the appreciation, the unrealized appreciation, on contributed property. I note that the Treasury has proposed that that be dropped from both the limitation on tax preferences and allocation of deductions. My statement indicates the reasons why, I think that is particularly important and I cannot overemphasize it. This recommendation of the Treasury is extremely important for universities, and here I will speak as the vice chairman of the trustees of a small middle western college, Iowa Wesleyan.

We are all concerned, those of us in education very much concerned, that the flow of major gifts not be interrupted. The Treasury recommendation for modifying the House provision is extremely important in this sense. The House bill would have tragic consequences.

I have comments on the accumulation trusts which are in the record. I shall not take the committee's time on that.

The investment credit should never have been put in. It might as well go out. But there had better be, in my opinion, more liberal depreciation in a variety of ways.

I would like to comment, however, on the special amortization of pollution control facilities. Special amortization may be justified because of the overwhelming importance of the subject, that is pollution control, but this is both an inadequate and incorrect solution to the problem. Severe fines and other penalties are necessary and appropriate. When costs are imposed on society by industrial processes which pollute the environment, those costs should be thrown back on the producers and, in the last analysis, borne by the consumers of those products rather than absorbed by society generally.

Special tax treatment in a sense shifts to other taxpayers part of the costs which should be borne by the industry and its consumers.

Let us not think that special amortization for pollution facilities is going to solve this problem. I think it is a poor way to get at it, but it needs much more severe treatment than it has here.

Now in conclusion on the general balance of the bill, and that is the general subject for today, I should like to make a few points. I have tried to choose my words as carefully as I can to be effective and will ask for the liberty of reading something that will take not over 3 minutes. Though many, probably most of the substantive changes are desirable on their merits, any major tax legislation must be appraised on its overall balance.

On this basis H.R. 13270 seems seriously deficient as dramatically shown in tables 3 and 6 in Secretary Kennedy's presentation to your committee on September 4.

A reduction in individual tax burdens of $7.3 billion, and an increase in the corporate tax burden of $4.9 billion, does not seem wise in a country which needs continuing new investment in order to increase labor productivity, and thereby make wage increases somewhat less inflationary than they have been, to strengthen our position in international competition, and help to provide funds to finance the innovations which are essential to maintain the vitality of our economy.

The distribution of tax burdens between individuals and business unfortunately may come to have political overtones. It should always be remembered that the Kennedy administration—I refer to President Kennedy, not Secretary Kennedy—the Kennedy administration in its first set of tax recommendations in 1961 proposed relief solely, and I emphasize solely, to encourage investment through the investment credit.

Though many of us regretted that particular form of tax relief, preferring as we did more liberal depreciation, the wisdom of recognizing that investment is important along with consumption was notable, especially when it was shown in an administration which might have been presumed on political grounds to favor consumption.

The present lack of balance involving as it does an actual increase in taxes on the principal sources of funds for investment and on the returns from investment is a sorry contrast indeed. It will be unfortunate if circumstances prevent the adoption of a better balance in this first tax legislation of new administration in the present Congress.

The adoption of a maximum marginal rate of 50 percent on earned income is probably the most important single change which could be made to reduce the continued search for new tax loopholes and restore an atmosphere conducive to truly productive work.

The 50-percent figure is particularly important. It has a symbolic significance in terms of an even break, or 50–50 partnership, in the taxpayer's relationship to his government. It is unfortunate that a similar maximum was not set up for all income. In view of the probable redirection of efforts and removal of constraints any revenue estimate of these changes is conjectural. The 50-percent maximum may, in fact, increase revenue. Without the 50-percent ceiling on the marginal rate of tax on earned income, H.R. 13270 would be even more seriously unbalanced.

The reasons for the 50-percent ceiling are spendidly stated in the report of the House Committee on Ways and Means. The same arguments apply to investment income as well. A general top marginal rate of 50 percent would cleanse the tax atmosphere more thoroughly than any other feature of tax reform legislation.

The net effect of the bill will be to make the tax system much more progressive than it is now, even with the 50-percent ceiling. This result is shown conspicuously in table 3 of Secretary Kennedy's statement of September 4. The percentage of the relief descends steadily from the smaller to the larger incomes thereby shifting the burden to the larger incomes. And in the top bracket shown in the table, incomes over $100,000, there is an actual increase of 4.7 percent in total taxes.

Though most of us have a quasi-intuitive acceptance of progressive taxation as fair, progression can be pushed too far and an absolute increase in taxes at the top when individuals generally are being given over $7 billions of relief seems unfair. Only the 50-percent ceiling on earned income makes it acceptable without deep resentment.

One final point cannot be ignored in connection with any legislation making extensive changes in the individual income tax. I have saved it for the last for emphasis. The tax law has thus far included no provision relevant to the world's greatest social and economic problem—the overwhelming expansion of the population.

Uncontrolled population growth has finally been recognized as leading to the doom of civilization as we know it—even to the doom of mankind.

I call your attention to the New York Times today. Almost every day we are getting wonderful momentum in approaches to this problem. Though the tax law may now be one of the least effective ways to attempt to deal with this problem, one change could be made to dramatize its importance and in a small way reinforce the more significant approaches. Reductions for dependent children should be limited to two at a high enough income level to prevent hardship for larger families now in existence.

The choice of the income level is not important. It might be $15,000 or $50,000. The important thing is to set a standard and symbolically help to refute the strange claims by some opponents of population control that it represents selective genocide or counterinsurgency. This is probably the first time testimony on tax legislation by a tax specialist has included reference to the population problem. I am sure it will not be the last. I would welcome an opportunity to develop the subject at length.

Thank you very much, Senator Gore, for the opportunity to appear before the committee.

Senator GORE. Thank you very much.

Senator HANSEN. May I ask one question, Mr. Chairman? In your testimony, you say the special amortization of pollution control facilities may be justified because of the overwhelming importance of the subject, but that this is both an inadequate and incorrect solution to the problem.

Mr. SMITH. Yes.

Senator HANSEN. Would I infer from this that if there is a thermal pollution problem in connection with the generation of electrical energy, it would be your recommendation that the cost of pollution abatement machinery should properly be borne by raising the cost of electrical energy to the consumer, rather than to subsidize it by the Government?

Mr. SMITH. That is precisely my point, Senator.

Senator HANSEN. Thank you, Mr. Chairman.

Senator MILLER. May I ask a question, Mr. Chairman?.

Do I understand that you endorse the House bill provisions regarding the nondeductibility of interest in certain corporate applications?

Mr. SMITH. I do, sir.

Senator MILLER. The thing that troubles me about it is that I thought a very good point was made the other day by one of the witnesses when he said What is the difference between using this debt approach or equity approach in external expansion as against internal expansion? What is the difference if one corporation, not a very large one, uses that approach to acquire another relatively small corporation, and a very large corporation uses this approach to take on some assets for internal expansion? It seems to me that what we ought to be doing here is we ought to be drawing some guidelines between debt and equity across the board, and we do not do that.

Mr. SMITH. I think this is certainly a temporizing action, Senator. I quite agree that the law is illogical in the distinctions that it does make between debts and equity. There are some very fundamental reforms that need to be made in that respect.

My concern about mergers, and in my fuller text I elaborate on this, is that some of the forms of acquisitions have brought to the forefront a wheeler-dealer type of activity in the country, which is in my opinion confirming the worst but unjustified suspicions of many of the young people that the whole business system is made up of wheeler-dealers.

Now, this is a strange thing to bring into the tax law you may say, but I am very much in touch with young people in two universities, and when they see in many instances where acquisitions involve capital structures to which the new debt, the interest charges on the new debt exceeds the before-tax income of the company being acquired, as has been done sometimes, they think that business consists of shenanigans rather than really being constructive.

I develop this at some length in my testimony. I feel that there have been two things wrong. One, abuses in the forms of acquisitions, predatory rather than constructive, and many mergers are constructive but many of them also are predatory, and secondly that the capital structures of some of these companies are, as I say, unduly reminiscent of the sort of capital structure that we had in the late 1920's, the inverted pyramid-type thing.

So I think it is time for the tax law to try to help and call a halt until we can work out a better approach.

Senator MILLER. I share your concern about the attitude of young people and I share your concern about wheeler-dealer situations, but I must say that it seems to me that that concern ought to be placed over in the Antitrust Division of the Department of Justice, and over in the Securities and Exchange Commission, or in the appropriate committees here on Capitol Hill, rather than to single out this one particular area for the concern of the Finance Committee.

Now if we were going to draw a line across the board setting a guideline between equity and debt capital that is something else, but I do have a reluctance for us to start getting into the other department's business. Certainly I think you would agree that they should be on top of this, too?

Mr. SMITH. I quite agree and I am in a strange position because I have so often urged when I was in the Government that we should stick to revenue matters, but this is to me an overwhelmingly important topic.

Senator MILLER. Thank you. It is always good to see you, Mr. Smith.

Mr. SMITH. Thank you, Senator.

Senator GORE. Thank you very much.

(Mr. Smith's prepared statement follows:)

STATEMENT OF DAN THROOP SMITH

Mr. Chairman and Members of the Senate Committee on Finance, it is a pleasure and honor to have this opportunity to appear before you with reference to H.R. 13270 which would make the most extensive revisions in the tax laws since the adoption of the Internal Revenue Code of 1954. Many of the substantive revisions are long overdue. They will prevent abuses which have developed under the letter of the existing law but seem rather clearly to flout its spirit and the intent of the Congress. In that category, one may readily include the Clay-Brown provisions and the extension of the unrelated business income tax to the exempt organizations to which it does not yet apply; the tighter rules on farm and hobby losses; the prevention of tax benefits through a proliferation of multiple corporations; the tighter rules for taxation of cooperatives: the recapture of depreciation on real estate; the rules for peculiar forms of stock dividends and separate classes of common stock and the proposed limitations on certain aspects of mergers, which are discussed subsequently. The reasons for the foregoing changes are all well stated in the Report of the House Committee on Ways and Means.

Other substantive provisions represent new departures, some of which seem unduly complicated and questionable from the standpoint of economic or social policy.

STATE AND MUNICIPAL BOND INTEREST

The proposal for an option to states and localities to issue taxable bonds, with a Federal Interest subsidy which would more than offset the higher interest costs is the best approach thus far devised to deal with a problem which each year becomes more perverse in its effects. The issues of state and local bonds have become so large that they can be absorbed only by offering yields which do not reflect their tax advantage to most holders. The interest savings to borrowers are far less than the revenue losses to the Federal government; under the proposed new procedure both levels of government would be better off, a distorting element in the flow of investment funds would be removed and the highest-bracket taxpayers would no longer have an opportunity for a large intramarginal tax benefit.

But any change in the treatment of municipal taxes should be made only with respect to future issues. The inclusion of municipal bond interest in the limit on tax preferences would be a form of retroactive legislation. And it has already disturbed the bond market. The Treasury recommendation to remove this item from the limitation on tax preferences should be accepted—and the sooner the better for our hard-pressed state and local governments.

PRIVATE FOUNDATIONS

As regards private foundations, the prohibitions on self-dealing seem thoroughly reasonable and desirable. There have been significant abuses and the proposed constraints would not appear to hamper any reasonable objectives of foundations. The same statement seems valid with respect to the limitation on stock ownership and the use of assets, through a long period should be allowed for divestment. It should also be recognized that in a good many cases companies in which foundations hold a large interest will become vulnerable to raids by other corporations seeking mergers.

The imposition of a tax on investment income, by contrast, seems to be an undesirable and uncalled for penalty. Tax-exempt charitable and educational organizations have been a source of real strength in our society and their continued activity will help to maintain diversity in areas where there is danger of excessive uniformity through expanded government programs. Once adopted, the applicable tax rate is likely to be increased as a response to unpopular programs financed by one or a few foundations, thereby depleting the strength of all foundations. It would be much more desirable to impose necessary restrictions directly as is done in other parts of the applicable sections and to confine any tax to a fee sufficient to cover the costs of administering returns of tax-exempt foundations as has been proposed by the Treasury.

Furthermore the line of demarcation between permitted and forbidden activities concerning legislation is too vague and would almost certainly prevent outlays on such important subjects as the population explosion and the prevention of further pollution of the environment. Some constraints are necessary, especially those related to expenditures for a particular candidate or selective voter registration, but revision in the statutory language or some very strong and clear examples of exemptions in the Committee Reports seem necessary if the country is not to lose the benefit of leadership of foundations in dealing with social problems which almost inevitably involve legislation of one sort or another. Specifically, the prohibition of expenditures "to carry out propaganda, or otherwise attempt to influence legislation" in section 4945(b)(1), described further as "any attempt to influence legislation through an attempt to affect the opinion of the general public or any segment thereof" in section 4945(c) is much too comprehensive. I repeat for emphasis that programs to alert the general public to the problems of the population explosion and the pollution of our environment would appear to be ruled out. Governments have been very slow to develop their own programs in these two most vital areas; society needs all the leadership and education it can get on subjects such as these, and tax legislation which prevents bold action would be little short of tragic.

RESTRICTED PROPERTY

Options in restricted stock will probably not be used to any appreciable extent in the future if the proposed changes in their tax treatment are adopted. Options in this type of stock have developed in recent years to circumvent some of the limitations imposed on qualified stock options which are given special favorable treatment in the tax law. Since options in restricted stock may be used to secure more favorable tax treatment, it is not unreasonable that their value should be taxed fully as ordinary income.

Though the subject of options is controversial, there is a good deal to be said for long-term stock ownership by management in the companies for which they are responsible. Unfortunately, stock options have too frequently been abused, with quick sales as soon as stock qualifies for capital gains treatment. The present law on qualified stock options might well require a longer holding period and permit a longer period for options to run before exercise.

But the maximum marginal tax rate of 50 percent on earned income will significantly change the relative attraction of options and cash compensation for both executives and corporations in favor of cash compensation. The use of options of all sorts will probably decrease in any case, and the new provisions on options in restricted stock will turn out to be relatively unimportant.

DEFERRED COMPENSATION

The 50 percent maximum marginal rate on earned income will also very substantially reduce the advantages of deferred compensation contracts. The difference in the tax rate applicable to pre-retirement and post-retirement income will be much less for executives with large salaries, and they will tend to find that the advantage of immediate receipt of income, with opportunities for immediate investment, will outweigh the advantages of postponed receipt for relatively minor tax differentials. Thus the use of deferred compensation contracts may be expected to diminish considerably.

One of the reasons for the existing revenue ruling in 1960 was to remove an annoying area of uncertainty in the tax law. There are many ways to write compensation contracts to make income payments after normal retirement appear to be related to continuing advisory services. Extensive litigation occurred and skilled tax practitioners were usually able to construct a contract which ostensibly related later payments to later years. The proposed legislation would throw into the courts again this whole subject with an advantage given to those who sought the advice of specialists. In view of the probably substantial reduction in the use of deferred compensation contracts, it seems doubtful that it would be worthwhile to recreate this area of uncertainty.

When the revenue ruling was adopted in 1960, it was feared that large established companies whose credit was unquestioned might have an unfair tax advantage over small or new companies with which a defined compensation contract would be of questionable value. There is no evidence that the ruling has had this effect and the only issue thus has become one of equity which, as noted above, will be minimal in the future. Certainly would seem to be more important than a minor refinement of equity. The Treasury recommendation to postpone action in this area is reasonable.

If legislation is adopted now, it would appear to be unreasonable to exclude deferred compensation from earned income to which the 50 per cent maximum marginal rate applies. Though compensation is deferred it is still compensation and should be treated like all other forms of earned income.

PERCENTAGE DEPLETION OF FOREIGN PRODUCTION

As the House Committee Report indicates, any revenue gain from the repeal of foreign percentage depletion will be eliminated in the long run by increased foreign taxes. This change in the law is thus not only pointless but actually perverse in its effects. The profits of U.S. companies will be reduced by higher foreign taxes. Our balance of payments will be hurt because there will be smaller foreign profits to be repatriated. And to the extent that foreign countries impose higher taxes selectively on U.S. companies, American oil companies will be at a competitive disadvantage in comparison with corporations of other countries. In view of the importance of income from foreign oil operations for our balance of payments, it seems contrary to our national interest to invite other countries to put U.S. companies at a tax disadvantage. The Treasury has wisely recommended that this provision be dropped.

CAPITAL GAINS AND LOSSES

Though the tigher definitions of capital gains are generally reasonable, the removal of the 25 per cent maximum rate under the alternative tax is undesirable and, in the minds of many people, unfair. The U.S. tax law has recognized the special status of capital gains for almost 50 years. Though the net accretion concept of income is popular in much of the theoretical writing in public finance, the distinction between capital and income is basic in corporate accounting and law, in trust law and indeed in family financial management. A family, a corporation, or a trustee which is so imprudent as to fail to recognize this distinction is headed for trouble. A government which fails to recognize the distinction, and by its tax laws encourages its citizens to disregard the distinction, seems imprudent to a high degree.

The economic and equity arguments regarding the taxation of capital gains are all familiar and need not be repeated here. The 25 per cent maximum has been in the law for many years and it seems quite inappropriate to single out this one rate for such substantial increase to 35 percent for those in the top bracket (and higher if one takes account of the surcharge). In fact, to put this rate up by 10 percentage points while reducing the maximum rate by only 5 percentage points seems extremely unfair in a bill which purports to give general relief to all income levels.

It should be noted further that the realization of a capital gain is an indefinitely postponable act. Though there is no magic in the 25 per cent maximum, a large increase in the rate may so reduce transactions that it will actually reduce both revenue and mobility of capital funds.

The extension of the holding period from six months to a year to qualify for long-term capital gains treatment is appropriate; gains on short-term holdings may be expected to represent trading profits regarded as available for consumption rather than true capital appreciation embodied in an individual's capital fund. The longer holding period will probably reduce total transactions in the security markets, but it is questionable whether rapid turnover does not represent mere churning in the markets with little benefit with regard to mobilization of savings or corporate financing.

However, the extension of the holding period suggests the reintroduction of a series of steps for percentage of inclusion of capital gains. This seems reasonable both from the standpoint of equity and economic policy. As a matter of equity, the longer-term gains are more likely to be regarded as a part of one's capital, and a tax on a shift in the particular investments held thus becomes a capital levy rather than a tax on income. From the standpoint of economic effects, as noted above, short-term gains represent trading activity rather than investment, and though a certain amount of trading is necessary to assure liquidity in the market, excessive trading may involve mere churning and even lead to greater fluctuations in security prices which on balance will repel rather than induce investment.

Specifically, I urge that consideration be given to a sliding scale with a range of percentage inclusions such as:

Up to 1 year	Full inclusion.
1 to 2 years	75 percent.
2 to 5 years	50 percent.
5 to 10 years	30 percent.
Over 10 years	20 percent.

With a sliding scale such as this, there would of course be no need for an alternative tax to keep a reasonable maximum rate on those capital gains which are most likely to be the capital gains in which the proceeds, net of tax, are kept embodied in capital investments.

CHARITABLE CONTRIBUTIONS

Some aspects of the proposed change in the treatment of charitable contributions of appreciated property seem reasonable to prevent artificially high deductions. Apparently there has been a good deal of abuse in claims of high values for art objects, with recipient museums and galleries having no adverse interest against excessive valuations. In spite of the Treasury's statement that the abuse has been brought under control by new administrative procedures, a limitation of the charitable contribution for art objects to cost would not be unreasonable nor should it, in the long run, prevent ultimate gifts to museums. Ownership by successive generations would be likely to be prevented by estate taxes.

However, this should be the only exception to the general rule of charitable deductions measured by value, without any general attempt to tax appreciation directly or indirectly. The Treasury's recommendation to remove the appreciation on contributed property from the limit on tax preferences and the allocation of deductions was most welcome. If this is not done, many educational institutions and hospitals will be badly hurt in their drive for funds. There is little if any room for abuse through artificially high valuations in gifts of securities. The pattern of private gifts for education and charities is so important to maintain our pluralistic society that the tax laws should not be changed to curtail them.

ACCUMULATION TRUSTS

The proposed new rules on accumulation trusts are exceedingly complicated. Secretary Cohen's merciful and wise recommendation that they be made to apply prospectively should be adopted to avoid the imposition of a really impossible task of reconstructing for past years the income of young people for whom no income records were kept because it was known that they would have no tax to pay. Even when applied prospectively, the task is a formidable one. To assure an accurate tax on termination of a trust, records will have to be kept for even a few dollars of income for every infant who may turn out to be the beneficiary of a trust which has accumulated income.

On various occasions, I have proposed a change in the law to deal with abuses under accumulation trusts which I believe would be both tighter and simpler than the present proposal. The alternative approach would tax income of an inter vivos trust to the grantor unless it was distributed and taxed to a living beneficiary and require the consolidation of income from all testamentary trusts and inter vivos trusts after the death of the grantor. If the proposed change in H.R. 13270 is adopted, it would seem reasonable to make it apply only to accumulations after the beneficiary has come of age by which time a young person may be expected to keep adequate income records anyway. There are many trusts established by grandparents for grandchildren with no thought of tax avoidance.

In 1954, when this Committee approved new rules permitting double personal exemptions for dependent children and their parents, one of the reasons was to prevent young people from discovering that the income tax law was irrational and perverse in its effects at the time of their first personal contact with it. The new rule on accumulation trusts, unless modified to apply only to accumulations after a beneficiary comes of age, is likely to become a horrifying example of complexity and destroy respect for the tax law, which is the mainstay of our revenue system, on the part of another generation of young people.

INVESTMENT CREDIT AND AMORTIZATION

The investment credit should never have been adopted and its repeal is no loss. But at the same time the reserve ratio test in the use of the depreciation guidelines should be removed by administrative action or, if that is not deemed possible, by statutory authorization. This test will place severe limitations on the use of the guidelines in the future. No other major industrial country has any similar constraints. If it is continued, the United States tax law will put U.S. business at a significant disadvantage compared to foreign competition in maintaining modern plant and equipment which is essential to increase productivity and thereby justify noninflationary wage raises, increase the real national income and strengthen our balance of payments.

The special amortization of pollution control facilities may be justified because of the overwhelming importance of the subject. But this is both an inadequate and incorrect solution to the problem. Severe fines and other penalties are necessary and appropriate. When costs are imposed on society by industrial processes which pollute the environment, those costs should be thrown back on the producers, and in the last analysis borne by the consumers of those products (or products produced by those processes), rather than absorbed by society generally. Special tax treatment in a sense shifts to other taxpayers part of the costs which should be borne by the industry and its consumers.

CORPORATE MERGERS

A balanced judgment on the economic significance of mergers, especially the recent rapid increase of conglomerate mergers, cannot now be made. A great deal more study is necessary, and only with the passage of time can we accumulate evidence on the effects of the new large and virtually random types of acquisitions.

In many instances mergers may strengthen individual firms and increase their competitive effectiveness. New management may be provided to a small or family-dominated company and additional financing made available to a company which is too weak or too small to tap capital markets economically. Centralized staff services may permit an innovative manager to pursue ideas without being bogged down in administrative work for which he has little taste or talent. Well matched companies and individuals may develop new strengths from their complementary attributes. And the threat of a merger through a take-over may scare a lethargic management into activity.

But mergers may also reduce competition. They may lead to a dominance by financial manipulators instead of truly constructive managers. The threat of raids may divert attention from long-run growth to defensive actions. New ownership under a holding company may repel innovators and lead to a substitution of unimaginative organization men. And the capital structures of some of the new conglomerates are uncomfortably reminiscent of some of the holding company inverted pyramids of the late 1920's. When the fixed charges on new securities issued in acquisitions exceed the pre-tax income of the companies acquired it seems likely that leverage is being pushed too far, and that a tax law which discriminates against equity financing is leading to unstable financial structures.

Perhaps the most serious result of the conglomerate merger movement is the prominence it gives to the wheeler-dealer type of entrepreneur whose well-publicized manipulations confirm the worst suspicions of the many young people who are disposed to regard the business establishment as predatory. Though there are numerous thoroughly constructive individuals in merger activity, there are a considerable number who would in fact be regarded as at best neutral, and at the worst, truly predatory under most people's standards, including the majority of business executives. The disenchantment of young people with our present economic structure is so widespread that society can ill afford to permit continuation of an aspect of business which, even though it may be minor and unrepresentative, is so prominent and distasteful to many people that it strengthens their disposition to reject the entire system.

In the absence of detailed studies on mergers, it is difficult to be sure of the soundness of the specific changes in the tax law contained in the bill. They seem reasonable, however, and if anything perhaps too lenient rather than too stringent. Certainly the denial of the installment sale provisions to sales of companies in return for securities is necessary to protect the legitimacy of the concept. The very idea that such transactions could qualify as installment sales was a travesty of the principle.

GENERAL COMMENTS ON BALANCE OF PROVISIONS IN H.R. 13270

Though many, probably most, of the substantive changes are desirable on their merits, any major tax legislation must be appraised on its over-all balance. On this basis, H.R. 13270 seems seriously deficient, as dramatically shown in Tables 3 and 6 in Secretary Kennedy's presentation to your Committee on September 4. A reduction in individual tax burdens of $7.3 billions and an increase in the corporate tax burden of $4.9 billion does not seem wise in a country which needs continuing new investment in order to increase labor productivity (and thereby make wage increases somewhat less inflationary than they have been), to strengthen our position in international competition, and help to provide funds to finance the innovations which are essential to maintain the vitality of our economy.

The distribution of tax burdens between individuals and business unfortunately may come to have political overtones. It should always be remembered that the Kennedy Administration in its first set of tax recommendations in 1961 proposed relief solely—and I emphasize *solely*—to encourage investment through the investment credit. Though many of us regretted that particular form of tax relief, preferring, as we did, more liberal depreciation, the wisdom of recognizing that investment is important along with consumption was notable especially when it was shown in an Administration which might have been presumed on political grounds to favor consumption. The present lack of balance, involving as it does an actual increase in taxes on the principal sources of funds for investment and on the returns from investment, is a sorry contrast indeed. It will be unfortunate if circumstances prevent the adoption of a better balance in this first tax legislation of the new Administration and the present Congress.

The adoption of a maximum marginal rate of 50% on earned income is probably the most important single change which could be made to reduce the continued search for new tax loopholes and restore an atmosphere conducive to truly productive work. The 50 per cent figure is particularly important; it has a symbolic significance in terms of an "even-break" or "50–50 partnership" in the taxpayer's relationship to his government. It is unfortunate that a similar maximum has not been set up for all income. In view of the probable redirection of efforts and removal of constraints, any revenue estimate of these changes is conjectural. The 50 per cent maximum rate may, in fact, increase revenue. Without the 50 per cent ceiling on the marginal rate of tax on earned income, H.R. 13270 would be even more seriously unbalanced.

The reasons for the 50 per cent ceiling are splendidly stated in the Report of the House Committee on Ways and Means. The same arguments apply to investment income as well. A general top marginal rate of 50 per cent would cleanse the tax atmosphere more thoroughly than any other feature of tax reform legislation.

The net effect of the bill will be to make the tax system much more progressive than it is now, even with the 50 per cent ceiling. This result is shown conspicuously in Table 3 of Secretary Kennedy's statement of September 4. The percentage of tax relief descends steadily from the smaller to the larger incomes thereby shifting the burden to the larger incomes. And in the top bracket shown in the Table, incomes over $100,000 there is an actual increase of 4.7 per cent in total taxes! Though most of us have a quasi-intuitive acceptance of progressive taxation as fair, progression can be pushed too far and an absolute increase in taxes at the top when individuals generally are being given over $7 billions of relief seems unfair. Only the 50 per cent ceiling on earned income makes it acceptable without deep resentment.

One final point cannot be ignored in connection with any legislation making extensive changes in the individual income tax. I have saved it for the last for emphasis. The tax law has thus far included no provision relevant to the world's greatest social and economic problem—the overwhelming expansion of the population. Uncontrolled population growth has finally been recognized as leading to the doom of civilization as we know it—even to the doom of mankind. Though the tax law may now be one of the least effective ways to attempt to deal with this problem, one change could be made to dramatize its importance and in a small way reinforce other more significant approaches. Deductions for dependent children should be limited to two at a high enough income level to prevent hardship for larger families now in existence. The choice of the income level is not important. It might be $15,000 or $50,000. The important thing is to set a standard and symbolically help to refute the strange claims by some opponents of population control that it represents selective genocide or counter-insurgency. This is probably the first time testimony on tax legislation by a tax specialist has included reference to the population problem. I am sure it will not be the last. I would welcome an opportunity to develop the subject at length.

Senator Gore. The committee will next hear Mr. George S. Koch. Mr. Koch, we will be glad to hear from you at this time, sir.

STATEMENT OF GEORGE S. KOCH, CHAIRMAN OF THE FEDERAL FINANCE COMMITTEE, COUNCIL OF STATE CHAMBERS OF COMMERCE; ACCOMPANIED BY EUGENE F. RINTA, EXECUTIVE DIRECTOR OF THE COUNCIL

Mr. Koch. We have submitted material to you as you can see from the printed booklet. We have summary pages to begin with, but my oral statement, which is designed to take no more than our allotted time, appears at the beginning of our statement after the summary.

My name is George S. Koch. I am a practicing attorney in New York, and am chairman of the Federal Finance Committee of the Council of State Chambers of Commerce.

Mr. Eugene F. Rinta is the executive director of the council, and he is here with me.

We represent 31 State chambers of commerce within our council. They are listed in my prepared statement.

Our statement actually includes only 24 endorsements. Our principal problems was one of timing, because these chambers have their boards of directors and other controlling bodies which had to consider the views in the statement. Our statement was prepared and sent to them, but by the time it went through this process, we were simply unable to get the other commitments.

We are a group of business and chambers of commerce representatives who deal with Federal finance and taxes, and we believe we have a good basis for our opinions on these matters. As you can see from our paper, we frankly do not like the bill.

I think in general we should say that it is oriented against business, it is oriented against capital formation, and it is oriented against investment. We feel that under our capitalistic system this is the wrong direction to take. As a matter of fact, I think the council's position over the years has simply been that we should improve the situation rather than be regressive.

Now the bill in a sense is regressive in a number of ways, since it changes so many things adversely to the economy, and it is regressive especially in respect to its retroactivity.

We met on the 11th and 12th of September as a committee to formulate our views, and it was my experience that our membership has never been so dismayed or unhappy or thought we had a wrong situation as in this tax bill. This was a unanimous opinion.

Another position coming from this group was simply that there are too many proposals in that bill which are not improvements in the true sense. and consequently we feel should be rejected.

In our time a new principle has emerged. It is that high income taxation is so vital a consideration of business and individual decisions that its application must be understood and be predictable. For instance, take a look at what has happened to the State municipal bond market, and the confusion that exists with respect to the proposed repeal of the 7 percent investment credit.

Now, of course, Congress can change the tax law. That is certainly axiomatic. But it seems that such changes must be tempered by what is best for the Nation as well as by an awareness of and adherence to the rules of the game, and this requires a thorough understanding of how the changes will work. This bill certainly fails to meet these principles in our opinion.

Now, what we would like to suggest is that this bill be given further time for consideration. I know that we are confronted with an October 31 date, I believe it is, when the committee is supposed to bring a bill to the floor of the Senate. But we think that it is too important to the country for us to run through any such bill, and we think that there is a lot of work that the Senate Finance Committee can do on this bill before it is presented for action by the Senate.

We think that the tax proposals in the House bill for State and local bond interest, the oil industry, the capital formations market, contributions to schools and other institutions, the obvious trend toward a gross income tax, the attacks on the foreign credit and so on all are wrong for the Nation and our economy. Because of a few isolated and frequently misrepresented cases, the whole Nation should not be penalized.

Take the case of State and local bond interest. There is according to my research still an outstanding and valid, although questioned by many, Supreme Court decision holding that State municipal bond interest is not subject to Federal income tax. We do not hear much about constitutional arguments any more in respect of taxes, but I notice that the Treasury Department alludes to it in its statement. But I just want to point out that with respect to such interest, the statute does exempt it or until last year exempted it fully and then changed it with respect to industrial development bonds to some extent, but basically the constitution says we should not tax it according to the Supreme Court decision.

This no doubt accounts for indirect ways in which this bill attacks exempt interest. It is worth repeating that recipients of such interest do in effect pay something to the local governments involved by taking less return on their investments. Thus the local taxes of others are less.

Take capital gains. Some tax systems do not treat such gains as income at all, for which a good case can be made.

Senator GORE. Off the record.

(Discussion off the record.)

Mr. KOCH. The percentage depletion has been repeatedly shown to be something that the Nation should have.

Now as to retroactivity, which is our basic remaining point, we feel that in fairness these retroactive elements should be eliminated from the final bill in any event. For instance, increased capital gains on individuals and corporations that would apply to increments of property accruing prior to the change, inclusion of State and municipal bond interest in the LTP and allocation of deduction provisions is retroactive as to existing bonds. This is also true of the application of the LTP and allocation of deductions to capital gains, to appreciation in donated property, to excess depreciation of real estate and so on. And it also is a criticism of any application of reduced depletion rates to existing reserves in properties. Such new rates if enacted should apply only to reserves or properties discovered hereafter.

Since my time has expired, thank you very much.

Senator GORE. Thank you.

Senator Bennett?

Senator BENNETT. No questions.

Senator CURTIS. In the interests of time I will ask no questions.

Senator GORE. Thank you for your testimony.

Mr. KOCH. Thank you, sir.

(Mr. Koch's prepared statement follows:)

STATEMENT OF GEORGE S. KOCH, COUNCIL OF STATE CHAMBERS OF COMMERCE

SUMMARY

1. If the Congress should repeal the investment credit, compensatory adjustment should be made in the tax burden on corporations through adequate rate reduction or by liberalized depreciation allowances. Such action is necessary to maintain capital investment levels needed for economic growth.

2. All reasonable and legitimate costs incurred by employees in moving to a new job assignment should be recognized in the tax provisions relating to moving expenses.

3. Present rules relating to restricted stock plans should be continued but with a provision that would prohibit issuance to employees of stock other than stock of the employer corporation or of its subsidiaries.

4. The complex provisions in the bill relating to other deferred compensation should be deleted pending completion of a current Treasury study of all deferred compensation arrangements.

5. Revisions in existing provisions relating to the foreign tax credit should be deleted and the subject should be considered in relation to the overall subject of foreign source income taxation on which the Treasury plans to submit recommendations to Congress at a later date.

6. Percentage depletion allowances have served the nation well, both as to defense and consumer costs, and have not resulted in unwarranted aftertax profits to etxractive industries. Present allowances should be retained.

7. The objective of reform provisions in the bill relating to depreciation of buildings can be accomplished through the recapture provisions which would eliminate capital gain treatment with respect to all depreciation claimed in excess of straight line depreciation. Accelerated depreciation should not be denied to any facilities which are used in the trade or business.

8. Certification of pollution control facilities for rapid amortization should be limited to appropriate State authorities rather than both State and Federal. Election by the taxpayer to write off the cost in any period shorter than five years would be desirable.

9. Elimination of the 25% alternative capital gains tax and extension of the holding period to 12 months would inhibit transfers of capital and new investments and should not be enacted. The 25% capital gains rate for corporations should not be increased.

10. Both the limit on tax preferences and the allocation of deductions are moves toward taxation of individual gross income and should not be enacted. The allocation is especially onerous because it discriminates between taxpayers with the same amount of income.

11. Steep progression and existing high rates for taxation of individual incomes are the real cause of many of the problems this bill seeks to meet through a maze of complicated provisions. The new individual rate schedules and the maximum rate of 50% on earned income are commendable, but this maximum should apply to all income without distinction.

12. The taxation of interest on state and local bonds through the tax preference and allocation of deductions provisions in the bill should be eliminated. Such taxation can only add to bond interest rates and increased state and local taxes.

13. Retroactive application of several provisions in the bill is inequitable and should be modified.

Statement

My name is George S. Koch. I am an attorney-at-law in New York and am Chairman of the Federal Finance Committee of the Council of State Chambers of Commerce. Mr. Eugene F. Rinta, the Executive Director of the Council, is with me today.

We are submitting a statement of our views on H.R. 13270 and ask that it become a part of the record of these hearings. Our specific views on particular provisions of the House Bill are expressed in the statement and, because of the number of subjects on which we submit our views, I shall limit my oral presentation to a general summarization.

The Council of State Chambers of Commerce is an organization which studies and formulates views on national issues for the use of its 31 member State chambers of commerce throughout the nation. As you will note at the end of the statement, 24 of such chambers have endorsed the statement which represents a virtually unanimous consensus of our Committee. The fact that some of the member State Chambers have not endorsed the statement is primarily due to lack of time for its consideration by their policy making bodies, not disagreement with the views it expresses.

The Federal Finance Committee of th Council is composed of financial and tax oriented people from numerous business enterprises and the chambers of commerce. These men are all capable of understanding the problems of Federal finance as well as the tax law since much of their time is devoted to these subjects. From these men come expressions of deep concern regarding H.R. 13270.

Never has the membership of our Committee seen in a single tax bill so much that is in their judgment wrong for our nation.

The bill would enact the "Tax Reform Act of 1969." The key to each provision, therefore, is presumably reform. When one thinks of reform the usual impression is of improvement. The basic definition of the term in Webster's Dictionary is "the amendment of what is defective." Conceding that our income tax law contains defects, changes are not justified unless they are improvements. Our position is simply that too many of the proposals in H.R. 13270 are not improvements in the true sense and should be rejected.

In our time a new principle has emerged. It is that high income taxation is so vital a consideration of business and individual decisions that its application must be understood and be predictable. Look at the market for State and Municipal bonds. Look at the confusion surrounding the 7% investment credit. While Congress can, of course, change the tax law, such changes must be tempered by what is best for the nation as well as by an awareness of and adherence to the rules of the game. This requires a thorough understanding of how the changes will work. H.R. 13270 certainly fails to meet these principles.

One needs to reflect on the fact that the objects of the so-called reforms proposed in H.R. 13270 were passed by Congress over a long period of time. May I say that they have, by and large, been put into the law over the years because they were needed. The inordinately high graduated tax rates applicable as a taxpayer's income increases have required safety valves in order to work. Capital formation and investment are imperative in order to provide jobs so people can work and be productive. But the bill attacks the very people who provide the capital. If they are eliminated, who provides it? We can guess that only the Federal Government could do it. This is, we hope, not what is wanted or expected, not to mention its inadequacy.

Generally speaking, we think that the tax proposals in the House bill for state and local bond interest, the oil industry, the capital formation markets, contributions to schools and other institutions, the obvious trend toward a gross income tax, the attacks on the foreign tax credit, and so on, all are wrong for the nation and our economy. Because of a few isolated and frequently misrepresented cases, the whole nation should not be penalized.

For example, the Supreme Court has ruled that the Federal government cannot constitutionally tax interest on state and municipal bonds. No doubt, this accounts for the indirect ways in which this bill attacks exempt interest. It is worth repeating that recipients of such interest do in effect pay something to the local governments involved by taking less return on their investment. Thus the local taxes on others are less. Take capital gains. Some tax systems do not treat such gains as income at all, for which a good case can be made. Then there is percentage depletion which repeatedly has been shown to be in the best interests of our nation quite aside from the fact that depletion at the existing rates is thoroughly integrated into the economies of the nation and industry so that no windfall from it can be identified except for the consumer. In the case of the recipients of donated property, great advantage to the nation and its people has resulted from the donor's giving up his property.

A curious factor pervades numerous provisions of the House bill. This is the frequent absence of any meaningful revenue effect or gain. With small, relatively insignificant revenue effect, how can these changes be justified as against the predictable serious and adverse effects on our economy that many foresee.

The bill passed by the House has a number of retroactive features which in fairness should be eliminated in any event from the final bill. Here are some examples. The increased capital gains tax on individuals and corporations applying to increments in property accruing before the change. Such increment often is in fact nothing but inflation and does not represent real growth in value. Inclusion of state and municipal bond interest in the tax preference provisions is retroactive as to exisitng bonds. This is also true of the application of the limit on tax preferences and allocation of deductions to capital gains, to appreciation in donated property, to excess depreciation on real estate, and so on. Any reduction in depletion rates would inequitably apply to existing reserves and properties and thus be retroactive. Such new rates, if enacted, should apply only to reserves or properties discovered hereafter.

We urge this Committee to delay its decisions on this bill so as to provide the time needed for everyone, including Congress, the Administration, taxpayers and tax specialists, to study the bill and be more nearly certain of its effects on the economy and the nation's institutions. We would suggest that at least the balance of this year is not too much time for this purpose. Given such added time, much better leigslation could be developed. What is right in fact for the nation should be right as well for political reasons.

Before concluding my oral presentation, on behalf of our Committee I wish to commend several provisions of the bill which are constructive. They include a start toward rate reduction for individuals, more realistic rules regarding moving expenses, a more equitable approach to taxing co-operatives, accelerated depreciation for pollution control items and improved income averaging.

We appreciate this opportunity to present our views to you. Our more detailed comments on specific provisions of the bill follow.

Bias against business in H.R. 13270

The estimated impact of H.R. 13270, when fully effective, would be a net reduction of $7.3 billion on an annual basis for individuals and a $4.9 billion increase for corporations. This shift in favor of consumption and against investment could produce serious economic consequences in the years ahead.

We submitted a statement to the House Ways and Means Committee in opposition to repeal of the investment credit, and we continue to believe that the credit should be retained. It helps to offset in part the adverse effect of inflation on capital recovery and, because of high labor costs, it or equivalent relief to corporate tax burdens is needed by American businesses to permit their competing in foreign markets. If the Congress should decide that repeal of the credit is desirable, compensatory adjustment should be made in the tax burden on corporations through adequate reduction in the tax rate or by liberalized depreciation allowance.

The Treasury has recognized the imbalance between corporate and individual tax burdens resulting from the House bill. The Secretary recommends a partial correction of this imbalance by lowering the corporate tax rate one percentage point in 1971 and an additional point in 1972 while at the same time reducing the net tax reduction for individuals. We commend the Administration for this action. But even with these adjustments the relative tax burden for corporations would be substantially greater than before the tax reducions of 1964 were enacted.

Individual income taxes were reduced 20% by the 1964 Revenue Act while corporation tax liabilities were cut 8%. This smaller reduction in corporation taxes was justified on the ground that corporations had the additional benefits of the investment credit and the new depreciation guidelines. Now it is proposed in H.R. 13270 that the investment credit be repealed at an annual cost of $2 billion to corporations and that individual income tax rates be reduced an average of 5% in addition to other significant reductions in individual tax burdens.

We urge the Finance Committee to weigh with care the economic consequences of the shift in relative tax burdens between corporations and individuals that would be effected by enactment of the House bill in its present form.

Moving expenses

Liberalization of existing provisions relating to employee moving expenses as provided in the bill is a step in the right direction. But the $2,500 overall limit on deduction of indirect moving expenses is not realistic when the sale and acquisition of homes are involved and on foreign moves.

In our view the reimbursed costs of employee transfers are in no sense economic income to the employees and, consequently, should be subject to income tax. In recognition of this fact, and because all but the "bare bones" expense reimbursements are now taxed to the employee, some employers provide an additional reimbursement to cover the employee's income tax on the basic reimbursement. Many employers, however, do not and may not be able to absorb this extra cost of employee relocations.

We believe it is only fair and proper that all legitimate costs incurred by new or existing employees in moving to a new job assignment be recognized in the tax provisions relating to moving expenses. Where the employer reimburses the relocated employee for loss in connection with sale of his home by reason of the job transfer, the reimbursement should properly be considered as a capital transaction rather than ordinary income.

We fail to see why a dollar limit should be included in any improvement in this area. Limiting the recognition to legitimate or normal items should suffice.

Restricted stock plans

Existing provisions relating to these plans provide for taxation of the stock only when the restrictions upon its sale, or other restrictions, expire. The value of the stock when received by the employee is treated as ordinary income and appreciation in value to the time the stock is sold is treated as capital gain. Under the bill a tax is imposed when the employee receives the stock unless it is subject to substantial risk of forfeiture. In the latter case a tax at ordinary rates is imposed when the stock becomes nonforfeitable. Present rules should be continued, but with a requirement that would prohibit issuance to employees of stock other than stock of the employer corporation itself or of its subsidiaries. This will insure an ownership as well as employment interest of the employee in the employer company and so meet the basic purpose of the plan.

The Treasury has recommended that the highly complex provisions in the bill relating to other deferred compensation be deleted pending completion of a current Treasury study of all deferred compensation arrangements. We support this recommendation.

Foreign tax credit

Inasmuch as the Treasury plans to submit comprehensive proposals to Congress relating to the U.S. taxation of foreign source income, revisions in existing provisions relating to the foreign tax credit should be deleted from the bill. The foreign tax credit should be considered in relation to the other proposals on taxing source income which will be submitted by the Treasury. Any urgency for action on the credit at this time is not apparent. In any event the provisions of the House bill do not conform to the basic reason for the foreign tax credit, which is to avoid double taxation.

Natural resources

Depletion allowances have served the nation well as an incentive for exploration and development of oil, gas, and mineral resources. Because of depletion, the availability of these resources has been far greater than would have been the case without depletion. The greater availability and supply has been an important defense asset and has held down costs to the consumer. There is no evidence that the petroleum or other extractive industries have been earning unreasonable after-tax profits. Instead, their net earnings on investments are in the same range as that of manufacturing companies generally. For these reasons the reductions in depletion allowances provided in H.R. 13270 should be deleted. Moreover, the present oil development incentives of depletion and intangible drilling expenses should not be penalized by the LTP and allocation of deductions provisions.

Real estate depreciation

The provisions in the bill revising depreciation of buildings is an example of a broad sweep approach in attacking a special problem related to investments in rental properties. In response to persistent complaints from the business community about the inadequacy of depreciation allowances, Congress in the 1954 Revenue Act liberalized depreciation for buildings as well as for machinery and equipment. Now in order to close the door to use of these provisions by high income investors in real estate ventures, the House bill would eliminate the accelerated depreciation provisions of 1954 with respect to all buildings except new residential housing. If we can accept the reduction of construction activity that would result, it would seem that the objective of the reform in this area could be fully accomplished through the recapture provisions in the bill which would eliminate capital gain treatment on the sale of real estate to the extent of all depreciation claimed in excess of straight line. In no event should present accelerated depreciation be denied to any facilities, owned or leased, which are used in the trade or business.

Cooperatives

The provisions tightening up on the taxation of cooperatives are an improvement over present law. However, the pay-out provision requiring payment in cash on patronage allocations over a 15-year period is unduly liberal.

Pollution control facilities

Accelerated amortization of pollution control facilities, as provided in the bill, is highly desirable because such facilities do not ordinarily contribute to efficiency of production. The House provision allowing five year amortization could be improved by permitting election by the taxpayer to write off the cost in any shorter period. The certification that would be required to permit rapid amortization should be limited to appropriate State authorities, rather than both State and Federal, so that certification would be more expeditious and less cumbersome.

Income averaging

Changes in present income averaging provisions in the bill are a significant improvement and simplification. While these new provisions should be adopted, with possible additional improvement in the Senate, the Treasury should continue to study the matter with the objective of still further improvement and simplificaion.

Capital gains

In our testimony before the House Ways and Means Committee on April 2, 1969, we urged that no action be taken with respect to capital gains taxation that would tend to impair the savings and capital formation that will be needed in increasing amounts for job creation and more efficient production in the years ahead. We pointed out that special treatment of capital transfers, as distinct from income, serves several important purposes.

First, the present special treatment of capital gains recognizes the distinction between capital and income, and it helps to preserve and expand the former so that the latter can continue to grow. It provides incentives for savings and investment which are basic to economic growth, and it helps to channel investment to the best uses of resources by encouraging mobility of capital. Finally, it is partial recognition that the appreciation in many assets sold is largely, if not wholly, the result of inflation rather than true increase in value.

The House bill, however, adversely attacks present treatment of capital gains in several provisions. These include elimination of the 25% alternative tax for individuals, extension of the holding period to 12 months from the present 6 months, inclusion of one-half of net long-term capital gains as a tax preference item, and increasing the capital gains rate on corporations from 25% to 30%. The Treasury has recommended that the provisions eliminating the 25% alternative tax and extending the holding period be deleted from the bill. We certainly concur with this recommendation. But we further recommend that the corporation capital gains rate be retained at 25% and that one-half of capital gains not be included as a tax preference item if Congress should enact provisions for allocation of deductions.

The bill would also eliminate capital gains treatment for the employer contributed portions of lump-sum distributions from approved pension, profit sharing, and savings programs. It appears from the Ways and Means Committee report on H.R. 13270 that an important consideration in the Committee's action was its understanding that the present provision is of primary benefit to taxpayers with income in excess of $50,000. While we do not agree that this is a valid reason for the change, we point out that this is a gross misunderstanding. The fact is that the provisions can and do benefit very large numbers of employees at modest as well as higher income levels, as testimony submitted to your Committee by employers clearly indicates.

The House provision would adversely affect all employees who look forward to a lump-sum payment upon retirement. Even though the special 5-year averaging provision might provide for an eventual refund, the amount would be unknown and, in the meantime, the taxpayer would be deprived of the use of his money. The present capital gains treatment was adopted originally to provide a fair averaging method which has the advantage of being positive and immediately known, as well as being fair. The House bill would create impossible problems for most retirees. For these reasons and because of the relatively insignnficant revenue effect, we urge that the present treatment of lump-sum distributions be continued.

Limit on tax preferences and allocation of deductions

Two related provisions in the bill—limit on tax preferences and allocation of deductions—are designed to reduce the tax benefits which are now available from certain so-called tax preferences. These preferences include tax-exempt

State and local bond interest, one-half of net long-term capital gains, appreciation in property donated to charity, depreciation claimed in excess of straight-line depreciation, and farm losses under certain circumstances. Both the LTP and the alloction of deductions are a move toward taxation of individual gross income and should not be enacted. The allocation of deductions provision is especially onerous because it discriminates between taxpayers with the same amount of income.

Maximum tax on earned income and individual income tax rates

Limiting taxation of earned income to a maximum of 50% and the new individual rate schedules proposed for all income both are commendable. They move in the direction of lessening the impact of the steep progression of the deadening present income tax rate schedule. Existing high rates are the real cause of many of the problems this bill seeks to meet through a maze of complicated provisions. We suggest that the maximum rate on all income without distinction should be 50%.

State and local bonds

Interest on state and local bonds should not be subjected to Federal income tax. The House bill does not provide specifically for taxing such interest but it does indirectly by including this interest as a tax preference item in both the 50% limit on tax preferences and the allocation of deductions provisions. Thus interest on presently outstanding state and local bonds, as well as future issues, would be taxed when the taxpayer's tax preference items including such interest exceed 50% of total income as a result of the LTP. Further, when the taxpayer's preference items exceed $10,000, his interest on state and local bonds will contribute to a loss of deductions under the allocation of deductions provision.

It is obvious that the unprecedented needs of state and local governments for debt financing will continue to grow in the years ahead. Even under the best of circumstances, including the present exemption of bond interest, the financing problems of these governments will be substantial. Clearly, the provisions of the House bill affecting exempt interest will aggravate their problems. In addition to the direct adverse impact that these provisions will have on interest rates of state and local bonds, the fear on the part of investors that the exemption may be further eroded by future Congressional action will add to interest costs. The end result can only be increased taxes at the state and local levels to cover the higher financing costs.

The Treasury has recommended deletion of state and local bond interest as a preference item in the LTP provision but supports its inclusion in the computation for allocation of deductions. We urge its deletion from both.

Retroactivity

The bill in several instances in effect calls for retroactive application of proposed changes. Such retroactivity is objectionable and inequitable, and should be eliminated. Among the major provisions in which retroactive application is involved are the following: application of increased capital gains tax on individuals and corporations to appreciation in property accruing before the change in tax rate; inclusion of exempt interest on presently outstanding bonds in the limit on tax preferences; application of the LTP and allocation of deductions to prior appreciation in property sold or donated; and application of reduced depletion rates to existing reserves and properties. No doubt there are other significant instances of retroactivity in the bill.

The following State Chamber organizations have expressed basic agreement with Mr. Koch's statement:

Alabama State Chamber of Commerce
Arkansas State Chamber of Commerce
Colorado Association of Commerce & Industry
Connecticut State Chamber of Commerce, Inc.
Delaware State Chamber of Commerce, Inc.
Florida State Chamber of Commerce
Georgia State Chamber of Commerce
Idaho State Chamber of Commerce
Indiana State Chamber of Commerce
Kansas State Chamber of Commerce
Kentucky Chamber of Commerce
Maine State Chamber of Commerce

Montana Chamber of Commerce
New Jersey State Chamber of Commerce
Empire State Chamber of Commerce (New York)
Ohio Chamber of Commerce
Pennsylvania State Chamber of Commerce
East Texas Chamber of Commerce
South Texas Chamber of Commerce
West Texas Chamber of Commerce
Virginia State Chamber of Commerce
West Virginia Chamber of Commerce
Wisconsin State Chamber of Commerce
Michigan State Chamber of Commerce

In endorsing Council statements, such as this one, dealing with many issues and considerable technical detail, the member State Chambers reserve the right to take exception in one or more particulars.

The Connecticut State Chamber wishes to be recorded on the percentage depletion question as supporting adequate depletion allowances to assure essential supplies of oil and gas for energy purposes, but without specifying the appropriate percentage allowances.

The Delaware State Chamber had not resolved a position on the natural resources issues discussed in this statement.

Senator BENNETT. Mr. Chairman, there is among the list of witnesses a very good personal friend of mine from Salt Lake City, Mr. Adrian Pembroke who is down as No. 12. I must go down to the Department of the Interior to a signing ceremony, and I would like to hear Mr. Pembroke before I go. I will not have to leave here for another 20 minutes, but if it is all right at this point I would appreciate it if you would call Mr. Pembroke.

Senator GORE. Mr. Pembroke, we are very pleased to have you, and particularly since you are a friend of Senator Bennett.

We shall be glad to hear from you, sir.

STATEMENT OF ADRIAN H. PEMBROKE, REPRESENTING THE NATIONAL OFFICE PRODUCTS ASSOCIATION AND THE BUSINESS PRODUCTS COUNCIL ASSOCIATION

Mr. PEMBROKE. Thank you, Mr. Chairman.

I will not take too much time introducing the people.

Senator BENNETT. Mr. Pembroke as I said is a long-time personal friend. I suppose I might say that Adrian and I are classmates of sorts, having taken a special economic training course back in 1948 and 1949. He is the operator of a small wholesale-retail office supply and stationery business in Salt Lake. He is a past president of the National Office Products Association and past president of the National Business Products Council Association. The first is a general association with 5,000 members, the second has about 65. These are all small independent dealers in the field in which Mr. Pembroke works, and I understand he is speaking for these two groups here today.

Mr. PEMBROKE. Thank you very much, Senator Bennett and Mr. Chairman.

I am pleased to be here to speak for these over 5,000 small independent businesses scattered across the country. We are in a very fast-moving industry, the office products industry. Growth and the necessity of growth is the reason we are here.

Our competition includes such giants as Xerox, IBM, Kodak, and others. Our statement requests either the repeal or the amendment of sections 531 through 537. I will try to summarize.

No. 1. This part of the code deals with the accumulated earnings tax, and we contend that this tax is really a penalty. It is too complex to be coped with by small corporations.

The accumulated earnings tax is applied only to closely held corporations which are for the most part small businesses. Large corporations have few problems with this particular part of taxation.

As a result, it gives them a very definite competitive urge.

Thirdly, growth for us must be financed through retained earnings. Financing growth with borrowed capital is unfeasible, especially in the present high-interest-rate money market.

Fourthly, we touch quickly on a recent decision of the Supreme Court in *U.S.* v. *the Donruss Company* which has made our taxpayers' life under this accumulated earnings tax even more difficult.

I do not speak as an expert on accumulated earnings taxes or on any other provisions of Federal tax law. However, as a layman who has studied the accumulated earnings tax, as it has affected my own business and those of the 5,000 for whom I speak, I have concluded it is indeed quite unlike other tax.

Neither the U.S. corporate income tax return, No. 1120, nor the instructions for its completion, contains any reference to the retained earnings tax, and there is no separate form for its reporting.

In the unlikely event that a corporation should desire to pay this tax voluntarily, its management would be hard put to find out how to do so. This lack of procedure for self-assessment clearly indicates that no corporation is expected to pay the tax voluntarily. It suggests in reality that it is not a tax but a penalty.

Our burden with this taxation is even more severe because of the complexity of the language of the parts of the code I refer to. The test for determining what is proper or improper earnings retention are so varied and complex that only the most general guidelines can be made available by the Internal Revenue Bureau.

Point 2: This tax or penalty for over-accumulation is only imposed upon small corporations. Its taxation applies to only one segment of the economy, and that part of the economy is least able, resourcewise, to defend itself.

Justices Harvey, Douglas, and Stewart, in dissenting from the decision in the case of *U.S.* v. *Donruss Co.*, said:

"In practice the accumulated earnings tax provisions are applied only to closely held corporations, those controlled by relatively few shareholders."

It can be considered unjust because it is confiscatory in nature. Despite the heavy penalty that can be suffered, many executives of small corporations learn of the existence of this earnings tax only when its imposition is proposed by the Internal Revenue Act.

Whatever the reasons for past circumstances in which our owners first learn of the tax, their reaction is sharp disbelief. They have difficulty in understanding a naturally confiscatory tax which will be imposed if they are unable to make the shows which are necessary under the statute.

The contemplation of such a procedure, and the possible result can be bitter when the Government has already taken more than half of the corporation's earnings for the year in question, and is demanding a large slice of what was left because it was not distributed as dividends and subjected to further tax by the shareholders.

Growth for us must be financed through retained earnings. Financing growth required capital is unfeasible especially with the high interest rates. Our members report that they have now been paying these high interest rates of 14 months.

The small, closely held corporation can retain profits only within certain ill-defined limits, and at the peril of being subjected to a confiscatory additional tax.

Large business has no problem with this particular section of the code.

This is a definite disadvantage in our competition with our larger competitors.

In 1958 Congress recognized the inflationary problem and increased the tax credit from \$60,000 to \$100,000. Since 1958, as you know, the dollar has declined in value 20 percent. Using 1939 as a benchmark, the present tax credit is actually worth \$38,000. That \$38,000 would not cover one month's operating expenses for many of our members. And, that \$38,000 is a real poor down payment for the kind of new buildings and facilities we require for growth, when we find out, those of us who have to build new buildings, that the costs of building have gone up at the rate of about \$20,000 to \$40,000 in the last 3 or 4 years.

Now the Supreme Court, in *U.S.* v. *the Donruss Co.*, changes the entire game for the small corporation.

In this case, the Supreme Court reversed the U.S. Court of Appeals for the Sixth Circuit. It said:

> It is not necessary that the avoidance of shareholders' tax be the sole purpose for the unreasonable accumulation of earnings.

This decision was rendered in favor of the Internal Revenue Service. It essentially shifted the burden of proof back to the taxpayer. Again our defender, Mr. Justice Harlan, in writing the dissent said:

> My difficulty with the instruction approved by the Court is that in most instances it will effectively deny to the taxpayer the last clear chance which Congress clearly meant to afford and substitute a very chancy deed.

Mr. Chairman, in conclusion, we place ourselves in the hands of this committee. We respectfully appeal to you to have someone seriously review this statute, including sections 531 through 537. If it is unfair and it is unjust, then we would recommend that it be repealed.

If it cannot be repealed, we hope you will in part overrule the decision of the Supreme Court in *U.S.* v. *Donruss Co.*. and again to shift the burden of proof back to the Internal Revenue Service.

Second, of even greater urgency, we urge your support. We need a sharply increased amount of tax credit. We should like \$100,000 of tax credit based on 1939 dollars. Hopefully we ask you to restate your intent that small growing business should and can keep adequate rainy-day reserves, and that they can build up liquidity which is absolutely essential if they are to be able to borrow money from the banks.

Thank you very much.

Senator BYRD. Any questions?

Senator BYRD. Mr. Chairman, I have no questions. I appreciate the fact that Mr. Pembroke has brought to us questions which many of us were unaware of, and I think his presentation has been very timely and I assure him the committee will look into it.

Senator BYRD. Senator Curtis?

Senator CURTIS. No questions.

Senator BYRD. Senator Miller?

Thank you very much, Mr. Pembroke.

Mr. PEMBROKE. Thank you very much, Mr. Chairman.

(Adrian H. Pembroke's prepared statement follows:)

STATEMENT OF ADRIAN H. PEMBROKE, REPRESENTING THE NATIONAL OFFICE PRODUCTS ASSOCIATION AND THE BUSINESS PRODUCTS ASSOCIATION

SUMMARY

1. Accumulated earnings tax is really a penalty, the liability for which often arises from ignorance, bad advice, misunderstanding, or mistakes in business judgment. It is too complex to be coped with by small corporations. It should be repealed.

2. The accumulated earnings tax is applied only to closely-held corporations which are for the most part small businesses. Large, publicly-held corporations with which small businesses must compete don't have the problem. This gives a competitive advantage to big business in addition to all of its other advantages.

3. Growth must be financed through retained earnings. Financing growth with borrowed capital is unfeasible, particularly in the present high-interest rate money market.

4. The recent decision of the Supreme Court in *U.S.* v. *The Donruss Company* has made the taxpayer's life under the accumulated earnings tax even more difficult.

5. If the statute cannot be repealed, amend it to make it easier for small business to live with it.

(a) Overrule in part the *Donruss Company* decision.

(b) Do something further to alleviate the taxpayer's burden of proof.

(c) Increase the amount of the minimum accumulated earnings credit to reflect the changes in the value of the dollar due to inflation since such credit was fixed at $100,000.

STATEMENT

My name is Adrian H. Pembroke. I live in Salt Lake City, Utah, where I own and operate a small business. I am a Past President of the National Office Products Association, of Washington, D.C., and a Past President of Business Products Council Association, of Chicago, Illinois. The first of these associations, as its name indicates, represents business organizations engaged in the manufacture, distribution and sale of office products. It has more than 5,000 members. The second association has about 65 member organizations which are dealers in 100 cities in the United States in the products, including office equipment, of a major manufacturer. All the members of each association are independent dealers. Most of them are small, family-owned or otherwise closely-held corporations. The office products sales business which I operate in Salt Lake City is conducted through a corporation owned by me and my family. It is a member of both of the associations which I have named, and it would be middle-sized among the membership of each association.

I have been authorized by each association to present on its behalf views opposing the retention in the Internal Revenue Code of the provisions relating to Corporations Improperly Accumulating Surplus, Sections 531 to 537, inclusive,, or, in the alternative, if such provisions must be retained, some recommendations for changes.

I do not and could not speak as an expert on the accumulated earnings tax or on any other provision of the federal tax laws. However, as a layman who has studied the accumulated earnings tax as it has affected my own business and similarly situated businesses among our membership, I have concluded that it is indeed quite unlike any other tax. Neither the U.S. Corporation Income Tax Return (Form 1120) nor the accompanying instructions for its completion contains any reference to the accumulated earnings tax and there is no separate form for its reporting, nor, unlike the personal holding tax imposed by section

544 of the Code, any schedule for its computation or reporting. In the unlikely event that a corporation should desire to pay the tax voluntarily, its management would be hard put to find out how to do so. This lack of procedure for self-assessment clearly indicates that no corporation is *expected* to pay the tax voluntarily, and suggests that it is really not a tax but a penalty. And it appears that, too often, liability for the penalty arises from ignorance, bad advice, misunderstanding or mistakes in business judgment rather than from the type of abuse that the provision is designed to prevent. Federal taxation is inherently complex, but a businessman can, on his own or with professional assistance, determine with some degree of certainty the probable tax consequences under many sections of the Internal Revenue Code. Not so with the accumulated earnings tax.

A small, closely-held corporation is more often than not confronted with uncertainty about the consequences of a proposed retention of the earnings of a given year for what he considers to be the reasonable needs of the business. The tests for determining what is a proper or an improper accumulation are so many and varied, and complex, that only the most general and obvious guidelines can be made available by the Internal Revenue Service in its regulations or by the advice of private practitioners of tax law.

Despite the heavy penalty that can be suffered, many executives of small corporations learn of the existence of the accumulated earnings tax only when its imposition is proposed by an Internal Revenue Agent or through information disseminated by trade associations such as ours. Whatever the reason for past ignorance or the circumstances in which such executives first learn of the tax, their reaction is one of shocked disbelief, which is followed quickly by consternation. They have difficulty in appreciating a nearly confiscatory tax which will be imposed if they are unable to make the showings which are necessary under the statute, the Income Tax Regulations and the judicial decisions, if the presumptions against the taxpayer are to be overcome. The contemplation of such a procedure and the possible result can be particularly bitter when the Government has already taken more than half of the corporation's earnings for the year in question and is demanding a large slice of what was left because it was not distributed as dividends and subjected to further tax at the shareholder level.

When the executives of a small corporation learn further that the accumulated earnings penalty is rarely, if ever, imposed on any of the large, publicly-held corporations but has to be coped with only by corporations the ownership and control of which are in a small group of stockholders, there is understandable indignation. The independent dealers in office products who are members of our two associations must compete directly with the giants in the office products manufacturing business who sell their products through company-owned stores. Such corporations have no problems with respect to the retention of earnings for the financing of expansion of facilities or other growth. Retained earnings are the principal source of their financing and, in addition, they have great borrowing power, both with lending institutions and with the public. In contrast, small corporations do not have ready access to the money markets. Such borrowing as they can arrange is frequently, in reality, borrowing by the shareholders who must guarantee repayment of the loan which is made to the corporation. Such borrowing is ordinarily short-term. The retention of earnings is essential for the growth of any business. The large, public-held corporation retains its earnings with immunity from any Government action comparable to the accumulated earnings tax and with responsibility only to its shareholders. The small, closely-held corporation can retain profits only within certain ill-defined limits, at the peril of being subjected to a confiscatory additional tax.

The competitive disadvantage is obvious. Such disadvantage is particularly acute at times such as these with the high-interest rate money market which has persisted for some 14 months. This, for practical purposes, precludes even the financing of growth with borrowed capital. It is not surprising that many dealerships in all lines of merchandising have recently been taken over by the manufacturer.

The executives of a small corporation may also be faced with a major problem in the area of planning for the future of the business. Inability to get capital from normal capital sources necessitates primary reliance upon the resources of the corporation or the personal assets of its stockholders. These executives must plan in advance for future expenditures because the amount of capital that is necessary to make, for example, a major modification in a building, in a product line, or to accomplish any sizeable expansion, is more than can be obtained in a short period of time. Thus, the accumulation of capital must be made over a period of years.

Executives who look back over the last several years have reason to be very discouraged. This has been a period of almost constant inflation which has recently accelerated. The small businessman whose corporation needs a new building must consider carefully the fact that if it is to be built four years from now, the business must save not what is indicated by present cost estimates, but the additional amount necessary to cover the inevitable price increases with which he will be confronted when construction is commenced.

A building which could be built today for $100,000 may cost $130,000 or $140,000 four or five years from now. We have all watched the price increases in labor generally and in the construction industry specifically, in the cost of money, in the cost of materials, and in the cost of land. This is all very discouraging to the small corporation with aspirations to become larger; and the possibility of being faced with a substantial penalty if the Internal Revenue Service does not agree with his approach in planning for potential future expenditures or obligations adds to the discouragement.

As the small businessmen operating in the corporate form for whom I speak learn more about the scope of section 531 and its administration, they see it rightly or wrongly as a statutory license for Revenue Agents to second-guess the business judgment of management. Many of the questions requiring exercise of business judgment are of an indeterminate nature. For example, management may believe that it is facing a period of industrial upswing when the corporation can expect to do a much greater volume of business which will require more cash, more inventory and the carrying of more accounts receivable. The corporation retains the earnings of a particular year upon the basis of these business forecasts. The upswing does not materialize. Instead, there is a recession which results in lower inventory and receivables and greater liquidity. The working capital forecasts have proved to be wrong. The Revenue Agent, examining the return for the particular year—two or three years later—says, "It is clear that your corporation didn't need the earnings that it retained," and proposes the imposition of the accumulated earnings tax. Thus, the small businessman has to be *right* in his business forecasts and judgments, even though most of the economists in the country, including the President's economic advisors, may have been wrong at the same time.

Or, take the case of a retention of earnings for a planned plant expansion or for necessary improvements or repairs. The need may be obvious but management may be doubtful as to when the need should be fulfilled because of rising costs, labor problems, and fears, doubts and uncertainties, shared perhaps by many of the Nation's economists, concerning the general business outlook. Revenue Agents are not at all sympathetic about these fears, doubts and uncertainties, however real and justified. They are interested in seeing evidence of actual commitments, well documented both in the corporate minutes and in contractual arrangements. Again, the small businessman has to be certain or at least venturesome when everyone else is uncertain or cautious about commitments.

Then there is the case of the small corporation which distributes the earnings of a profitable year because of the ever-present threat of the accumulated earnings tax and its heavy penalties. A sharp drop in prices occurs subsequently and the potential profits in current inventories are dissipated. This may lead to insolvency which could have been avoided by the retention of profits which would have provided an adequate cushion.

Take the actual case of one association member. Fortunately, its management was timely advised that there would be vulnerability to the accumulated earnings tax at the end of the then-current year. The corporation distributed the earnings of that year as dividends and elected to be taxed thereafter under the provisions of Subchapter S of the Code. It is now being told by the manufacturer of the products which it sells that it must prepare for a doubling of sales, which will require the doubling of facilities and of capital requirements. Independent dealerships are continued only by ability to grow and fulfill the demands of the manufacturer. Management of the corporation now wishes that it had a cushion of accumulated earnings at the corporate level to meet this development which was unforeseen at the time it became aware of approaching vulnerability to the section 531 tax.

The operation of the statute under its administration and interpretation does not permit the putting aside of amounts for unforeseen developments or in anticipation of a "rainy day." The pitfalls inherent in the retention of earnings without any real purpose to avoid the imposition of tax on shareholders are simply too formidable and complex for the management of small corporations of the type represented by our associations. After a corporation has retained earnings of more than $100,000 it must be prepared to prove with considerable precision what the reasonable needs of the corporation were at the end of any year when all or a substantial part of the year's earnings were not distributed as dividends. It must now, after the decision of the United States Supreme Court in *U.S. v. The Donruss Company*, 393 U.S. 297 (1969), establish by a preponderance of the evidence, whatever that means, that tax avoidance with respect to shareholders was not "one of the purposes" for an accumulation. The practical effect of this decision, I am informed by counsel, is that a family corporation such as is typical among the members of our associations, must document in its records such overwhelming proof of the business need for the retention of earnings, and of the plans and commitments for satisfying the need, that avoidance of imposition of tax on shareholders which would have resulted if the earnings had been distributed will clearly appear to have been of minor significance. But, of course, every shareholder is aware that he will pay more tax individually if he receives a dividend than if he does not receive it, and if an amount that has been retained for a purpose which is subsequently determined not to be a reasonable need of the business is large enough, it will be difficult to say honestly that the tax effect at the shareholder level should be disregarded as a purpose which was not significant in the determination of dividend policy.

I am also informed by counsel that the activities of Revenue Agents in the section 531 area have increased substantially since the handing down of the *Donruss Company* decision by the United States Supreme Court. From the point of view of the Revenue Agent, this is as it should be and if one should voice objections to the unfairness of a particular application of the accumulated earnings tax, the obvious answer by the Revenue Agent would be that the objection is one that should be made not to him or to the Internal Revenue Service but to the Congress. That is our purpose in making this appearance.

We sincerely believe that this tax, as it applies and as it is administered, is unfair to small, closely-held businesses which must compete with big businesses unaffected by this tax; that it stifles expansion in prosperous times; that it is an obstacle to sound planning and fiscal policy; and that the harm that it does to small business is not compensated for by the prevention of the abuse at which it is aimed. We recommend its repeal.

We are aware that repeal of the statute has been urged at various times since the enactment of the first accumulated earnings tax by the Revenue Act of 1913. Since it has been kept on the books, it is obvious that it has been the belief of the Congress that the accumulated earnings tax performs a legitimate and necessary function in our tax policy. We would hope that the changes in our economy that have been occurring in recent years, particularly due to inflation and increases in interest rates, the increasing disadvantages under which small business competes with big business, the increasing confusion created by judicial decisions and Internal Revenue Service positions, the decrease in the disparity between corporate rates and individual rates which may be decreasing even further, may be considered valid reasons for repeal of the penalty tax. However, if the Congress, in its wisdom, decides to retain the provision, we would like to see it modified in ways that will make it easier for the executives and other representatives of small corporations to live with it, to make predictions concerning vulnerability to the tax, and to avoid its pitfalls in the never-ending potential of expensive, time-consuming and frustrating controversies with the Internal Revenue Service.

First, we would like to see the statute amended to overrule in part the decision of the Supreme Court in the *Donruss* case. As herein previously indicated, and as indicated in the dissent by Mr. Justice Harlan in that case, it will be extraordinarily difficult for a taxpayer to prove that the knowledge of tax savings, which will almost always be present when earnings are retained instead of being distributed as dividends, did not play some part, however slight, in the decision not to distribute. The statute should be amended to provide a "but for cause" test which would allow the Government to prevail if it can show, with the aid of the section 533(a) presumption, that taxpayer would not have accumulated the earnings if it had not been for the tax saving at the shareholder level, and which would permit the taxpayer to escape the tax if it can show that the earnings would have been accumulated even had no tax saving been possible. Such an approach would give effect to the section 533(a) presumption and enable the imposition of a penalty upon a taxpayer which had a "purpose" to avoid the tax, and, on the other hand, it would afford the taxpayer an opportunity to prove the existence of a purpose "to the contrary."

Without specifying how it may be accomplished, we strongly believe that something further should be done about the burden of proof in accumulated earnings tax litigation, and that the application should not be restricted to Tax Court proceedings. A proceeding which leads to litigation of an accumulated earnings issue starts with a statutory notice which simply states that it has been determined by the Commissioner that earnings of a particular year in excess of the reasonable needs of the business have been retained by the taxpayer (or words to that effect). There is no specification of the facts or conclusions upon which such determination is based. The taxpayer must take it from there and is placed in the position of having to negate the existence of all the possible facts or circumstances upon which the Commissioner may have based his determination. This is too great a burden, particularly for the small corporation with limitations upon the amounts it can spend for legal advice and assistance in so complex an area of the law.

At the very least, we recommend that the amount of the minimum accumulated earnings credit provided for by section 535(c)(2) of the Code be increased substantially. The value of the dollar has been decreased so greatly by inflation since the credit was raised from $60,000 to $100,000 in 1958 that the necessity for a further increase is clearly indicated. When this increase occurred in 1958, the House Committee Report (85th Cong., 2d Sess., H.Rep No. 2198 (1958) 6) which accompanied H.R. 8381, amending section 535(c) of the 1954 Code, stated as follows:

"Your committee has increased this $60,000 minimum accumulated earnings credit to $100,000. The accumulated earnings tax has presented an especially serious problem for small business, because the absence of specific plans frequently makes it difficult for small business to establish the reasonable needs of the business for accumulated earnings. It was in fact this which initially led to the $60,000 minimum credit in prior years. By raising this amount to $100,000, your committee makes allowances for rising costs since this figure was first established and also provides a slightly wider margin of accumulation with respect to which business can be free of worry concerning the accumulated earnings tax. It should be made clear, however, that this increase in the minimum credit is not in any way intended as an indication that accumulated earnings in excess of $100,000 are necessarily subject to this special tax."

The foregoing reasons, which prompted the increase from $60,000 to $100,000 in 1958, apply with even greater force today after ten years of inflation. The amount which a corporation should be permitted to retain with no questions asked should be equated to the decrease in the value of the dollar.

If the higher brackets of the individual income tax rates are to be lowered, it is assumed that there would be a correlative change in the 27½ percent rate for imposition of the accumulated earnings tax on accumulated taxable income not in excess of $100,000 and in the 28½ percent rate on accumulated taxable income in excess of $100,000, provided by sections 531 (1) and (2).

I appreciate very much this opportunity to present views of our association members concerning the accumulated earnings tax.

Senator BYRD. The next witness will be Stanley Nitzburg, tax counsel, Commerce and Industry Association of New York.

We shall be glad to hear from you, sir.

STATEMENT OF STANLEY NITZBURG, TAX COUNSEL, COMMERCE AND INDUSTRY ASSOCIATION OF NEW YORK

Mr. NITZBURG. Thank you.

Commerce and Industry Association is the largest service chamber of commerce in the Nation. Our membership consists of companies in every field of endeavor and range in size from the small family corporation to the Fortune 500. The viewpoint I will present is the viewpoint of the majority of New York business.

We believe that the House, in its efforts to meet public clamor to tax 155 wealthy taxpayers, has produced a bill with three major failings.

The first is the bill is inflationary rather than anti-inflationary. The provisions for tax reduction are untimely. They are inconsistent with other provisions in the bill which are intended to curtail inflation, such as the surcharge extension.

They generate additional funds for consumer spending at a time when every effort is being made to reduce spending and tighten the supply of money.

The second failing is that the bill attempts to fragment the prosperity of the economy. Even if the bill generated as much revenue as is lost from the reductions in individual tax, it is done by trading business tax dollars for individual tax dollars.

The bill does this directly. Section 461 increases the alternative capital gains tax on corporations from 25 to 30 percent, with an estimated revenue increase of $175 million, and it does it indirectly by termination of the investment credit with an estimated revenue increase of $1.35 billion in 1970 rising to $3.3 billion when it is fully effective.

The repeal of the credit is done ostensibly because it contributes to inflationary pressure. However, President Nixon, in requesting the repeal said:

"The repeal of the investment credit will permit relief to every taxpayer through relaxation of the surcharge earlier than I had contemplated."

We believe that the credit encourages modernization and permits increased production at a lesser cost, and actually has had an anti-inflationary effect. We do not see this time as an appropriate time for political meddling in economic problems, namely trading off economic growth for voter approval.

Moreover, we do not understand how middle-income and other persons are going to prosper if the competitive position of business in world markets is burdened by higher taxes and lost incentives. The sales lost through higher prices means reduced production and that in turn will mean lost jobs.

While this bill makes competition more difficult for American business, other legislation is pending which will impose protective barriers in an effort to maintain domestic sales, and in addition to protective legislation, there are bills such as H.R. 13715 which will preserve the drawback on duties and extends the drawback concept to indirect taxes.

So there seems to be an awareness of the increased pressure from foreign markets, but H.R. 13270 is inconsistent with this effort to sustain the position of American business in international commerce.

The third major failing of the bill is that it sacrifices simplicity. Some of the formulas and interrelated provisions contained in the bill seem so complex that we question whether they are completely understood even by the draftsmen. We certainly do not think that it is possible to create a greater sense of tax equity and fairness with provisions that cannot be understood.

It is interesting to note that when the problem requiring reform is faced, the bill manages both equity and simplification, and that would be a section such as 311, income averaging, but when the problem is avoided, you have a complex provision such as 302 allocating deductions, which makes a backward attempt to cope with tax reference income and manages to ignore basic tax principles as well as establish principles of existing law.

We feel that unless reform is achieved with relative simplicity we are only deceiving ourselves by trading in an old problem for a new problem.

I would like to comment on two specific sections. The first is moving expense. When Congress originally passed section 217, it recognized the need to have a mobile labor force. Obviously one reason was to encourage unemployed labor to move to an area of job opportunity.

Equally important was recognizing that modern business operations are multistate operations, and it is often necessary to shift employees from one location to another.

Section 231 of the bill attempts to bridge the gap between the current treatment of moving expense and reality. The present law ignores the fact that the transferred employee must find a place to live at his new employment location. It ignores that when a move is made, some temporary living accommodation is necessitated by delay in occupancy or by a misdirected moving van.

The third factor is the expenses incidental to the sale and purchase of a home. These items are all real costs of a move both for the newly employed and the transferred employee. They represent the financial burden which is added on to the emotional disruption that is involved in every family move.

Although the bill would permit deduction of these indirect moving expenses, it imposes an inadequate dollar limit, and that amount is $1,000 on both the cost of seeking a new residence and the cost of temporary accommodations. A company reimbursing its employees will limit the expense that a husband and wife incur in searching for a residence at a new location. But when a low dollar limit on the deductible expense is set by legislation, you are in effect saying that the house-hunting expense is not deductible, if you get a job or get transferred too far from where you are currently living, or in other words, do not move from West Virginia to California. Move from West Virginia to Pennsylvania and then you will be all right.

Business in New York has had problems in transferring men into the area. The cost of living is high and a number of problems are presented which are not answered by additional compensation. But when a man is transferred in, and he and his family are awaiting the arrival of a moving van which was last heard from somewhere in Indiana, you cannot expect by New York City standards to house a family of four or five for 30 days at a cost which when added to the house-hunting cost will still be within this $1,000 limitation.

We suggest that no limit be set for these expenses. They should be kept within the concept of reasonableness that pervades the entire section.

We also believe that temporary storage charges should be allowed as a deductible expense, not subject to a dollar limitation, but as a general expense under the (b)(1)(A) provision. Neither of these changes should result in a significant revenue loss.

Just a word on section 331 which imposes a tax on so-called deferred compensation. By not defining deferred compensation you are interfering with valid contract arrangements for postemployment consulting as well as the agreements that affect noncompetition and retention of trade secrets. They may very well be included now as taxable items where they are not within the gamut of problems with which the section purportedly is attempting to cope.

I might note that revenue gain from section 331 is minimal. It is only $5 million in 1972, and the section does not really serve the purpose that it is intended to serve.

In conclusion, I would like to express our association's support of this committee's effort. We trust it will result in a true tax reform bill that will benefit the entire economy without penalizing the business and investment community.

Thank you for the opportunity to express the position of the New York business community.

Senator BYRD. Senator Bennett?

Senator Curtis?

Senator CURTIS. You do not favor the passage of the House bill?

Mr. NITZBURG. No, sir.

Senator CURTIS. That is all.

Senator BYRD. Senator Williams?

Senator WILLIAMS. No questions.

Senator BYRD. Thank you.

Mr. NITZBURG. Thank you, Mr. Chairman.

(Stanley Nitzburg's prepared statement follows:)

STATEMENT OF STANLEY NITZBURG, COMMERCE AND INDUSTRY ASSOCIATION OF NEW YORK, INC.

SUMMARY

1. Tax incentives are not "loopholes" but a proper part of the socially and economically justifiable dynamics of a free enterprise system.
2. Raising corporate taxes and reducing incentives for technological advancement and new plant construction adds to the competitive burden of United States business with foreign trade and will aggravate our trade and payments problem.
3. Tax relief will be attained through tax reform. Tax reduction at this time is an inappropriate response to continued inflation.
4. Our inequitable and complex system of taxation requires both reform and simplicity.
5. Approve § 121 restricting business activities of tax-exempt organizations by subjecting their unrelated business income to tax at ordinary corporate tax rates.
6. Approve § 231 which would liberalize deduction of moving expenses, but disapprove unreasonable dollar limitation imposed.
7. Disapprove § 301 which would restrict the amount of tax preference income which an individual could earn without being subject to tax.
8. Disapprove § 302 which requires the allocation of expenses between taxable income.
9. Approve § 311 which would liberalize income averaging by reducing the qualifying percentage to 120% and by including capital gains in the computations.
10. Disapprove § 331 which would impose an additional "minimum tax" on deferred compensation payments.
11. Disapprove § 401 which would penalize small business by changing the tax treatment of multiple corporations.

12. Approve § 412 which limits the application of the election to have an installment sale.
13. Disapprove § 413 which requires a pro-rata portion of original issue discount to be included in a bondholder's annual income and requires a corporation to file an information return recording the amount of discount earned by each bondholder.
14. Disapprove § 414 which limits the deduction paid by a corporation on repurchase of its convertible securities.
15. Approve § 421 which restates the existing law making stock distributions taxable where the stockholders not accepting cash or other property receive a proportionate corporate interest.
16. Disapprove § 461 which would increase the alternative capital gains rate for corporations from 25% to 30%.
17. Disapprove § 515 which would eliminate capital gain treatment on total distributions from qualified plans made to an employee in one year.
18. Disapprove § 521 which eliminates the use of the double declining balance and sum of the years digits methods of accelerated depreciation on new buildings but approve the provision encouraging rehabilitation of low-income housing.
19. Approve §§ 801–804 which would afford tax relief to individual taxpayers with a reservation as to fiscal soundness of enacting such provisions at this time.
20. Disapprove all provisions of the bill which woald have retroactive application.

STATEMENT

Commerce and Industry Association is the largest service chamber of commerce in the United States. Its more than 3,500 members represent a true cross-section of American business and industry both as to size and nature of enterprise.

We commend the effort that produced the Tax Reform Act of 1969 (H.R. 13270). Tax reform has been too often neglected, to difficult to face, and virtually impossible to effect. It should not, however, be attained by sacrificing other equally commendable objectives of government or by disavowing basic principles inherent in our economy.

The 1968 Republican Party platform stated the "imperative need for tax reform and simplification". The 1968 platform of the Democratic Party promised the elimination of corporate and individual preferences "that do not serve the national interest". H.R. 13270 meets neither objective. The ingeniously complex formulae and interrelated provisions contained in the bill are virtually incomprehensible and can only result in taxpayer confusion and administrative headaches. The restriction and repeal of so-called "loopholes" may satisfy public clamor, but such action does not take into account the effect on the national economy.

Incentives are not "loopholes"

The capitalistic system we know, has made this country a world leader in social and economic achievement. It will sustain our continued effort to eliminate poverty and raise our national standard of living. Such a system must allow and encourage the accumulation, investment and reinvestment of capital. Such a system must encourage individual initiative, creativity and work, providing a higher reward for the greater accomplishment. Our tax laws often encourage and support some of these activities.

Enforcement of private investment and private philanthropy is clearly preferable to expanded government activity. Accelerated depreciation, the investment credit and other tax relief provisions now under attack, actually provide the impetus for new plants, technological improvement and expanded productivity at reduced cost. This is essential for real growth and is the cornerstone of our vitality. Such provisions do not constitute "loopholes". They are the safety valves on high tax costs and a proper part of the socially and economically justifiable dynamics of a free enterprise system.

Aggravating our trade and payments problem

The pending legislation is politically expedient rather than economically sound. Shifting the individual's tax burden to corporations will have a short-lived beneficial effect. The prosperity of this nation cannot be fragmented. Labor cannot prosper unless business prospers, and the prosperity of business is not determined solely by its ability to sell in domestic markets. International trade must be in balance for true economic growth to take place, and the balance has been askew.

The primary reason for United States business having less of a share in world markets is simply the higher price of our products. Cost increases in the form of exorbitant wage rises has been a major contributing factor. Contracts with wage increments of more than 30% over three years are no longer rare and 60% hikes have been won by building trade unions.

Higher tax costs and inadequate inducements to export are other factors. Yet this bill raises corporate taxes, reduces incentives for technological advancement and new plant construction and in other respects adds to the competitive burden of business. In doing so the bill intensifies the pressure on rising prices.

Higher priced United States goods will be less welcome in foreign markets while the domestic market will be inundated by imports. The aggravated imbalance of trade will result in a new spate of demands for remedial legislation. Corrective legislation cannot be effective so long as the source of the problem is ignored, namely, higher costs due to higher wages and lost tax incentives.

The existing incentives are inadequate and should be expanded rather than restricted. This was the conclusion reached in a study published by the Department of Commerce:

"Increasing the investment tax credit from 7 to perhaps 14 percent either for trade-sensitive industries or for all industries would provide a powerful added incentive to modernize manufacturing plants and could significantly increase U.S. competitiveness in international trade both on the import and export sides. Such a step, however, would have to be carefully weighed against the loss of U.S. tax revenue and other economic considerations, and might be put forward when tax reduction becomes possible. If, however, the U.S. trade balance continues to worsen, the proposal should be given urgent consideration." (U.S. Department of Commerce, "A Five Year Outlook With Recommendations for Action", April, 1969, p. 76.)

Tax relief through tax reform not tax reduction

The need for tax relief at both the individual and corporate level is inappropriately achieved at this time by tax reduction. Tax relief will be attained by true tax reform. Reform, however, does not call for the repeal of incentives. It demands the elimination of abuses and distortions of the intended purpose of existing provisions. It demands reestablishing the statutory broad tax base and the consistent application of effective rates. This will in turn produce tax relief in that tax revenue will be maintained, if not increased, and the tax burden will be properly distributed.

The case for tax reduction at this time is based on emotionalism. It is unquestioned that net income after taxes buys less today than it did five years ago, but this is the result of inflation and not of higher taxes. The Revenue Acts of 1962 and 1964 reduced tax rates for individuals. Except for the surcharge, the rates have remained the same and the amount of tax has been a stable cost in the taxpayer's budget.

The family budget can only be brought back into balance by the successful continuation of the fight against inflation. This bill attempts to check inflation by extending the surcharge, repealing the investment credit and imposing restrictions on accelerated depreciation. It inconsistently fuels inflation by contributing new money to the flow of commerce in excess of the amount generated by all the restraints and so-called reforms combined. Clearly, curtailment of capital expenditure by business while stimulating consumer spending can only result in continued inflation and crisis.

Although Congress is appropriately responsive to demands of the electorate for tax reform, it is inappropriate to accept a demand for tax reduction which cannot be enacted if we are to have fiscal integrity. Increased spending and reduced taxes are incompatible and cannot be achieved. If taxes are reduced, government spending at present levels cannot be sustained without creating another monetary crisis. The Viet Nam conflict still takes its toll in human and financial resources and, even with the surcharge in effect, a balanced budget is hard to maintain. Federal programs of proven value have been curtailed because of insufficient funds. New and innovative programs to cope with long-standing domestic problems have been shelved because revenue is lacking. This is reality.

Tax reduction is wishful thinking and not todays reality. The people of this country are mature enough to accept in government the same responsibilities they accept in their own households, namely, sound budgeting and fiscal integrity. Borrowing affords only temporary relief before it adds to the burden. At the national level the annual interest expense to carry debt is in excess of $16 billion. It is time to reassert and follow the principle that only one dollar is to be spent for each dollar earned, rather than burden future generations with our fiscal follies.

Tax equity and simplicity

We should seriously question whether there ever can be a truly equitable system of taxation. It is unlikely that historical research will uncover a prototype tax system which we can adopt or adapt. We might also question whether there is any ultimate good to be obtained in working toward a theoretically equitable system if it will be so unwieldy and complicated that, except for the creative originators, and a handful of skillful practitioners, it will not be understood. Moreover, an equitable system might not receive the expected acclaim if work incentives are stultified, if capital investment is discouraged, if persons on a poverty level are required to bear a minimum burden of taxation in exchange for the privilege of voting and enjoying the basic benefits of national government, etc. Such a system may, in fact, cause substantial economic disruption and political unrest.

A more basic question is whose sense of equity is to provide the guideline for taxation. The divergence of opinion amongst just and equitable men as to what is equitable may never be resolved. Resolution is further complicated by dynamic changes in economic conditions.

We acknowledge that our present tax system is not equitable. An extra exemption is afforded a blind person, but not a deaf person, quadruple amputee or other equally handicapped person. This is an accepted part of our tax code, but lacks reason and equity. No one would suggest removing this additional exemption, yet the revenue strain and administrative difficulty of extending an additional exemption to all handicapped persons prevents such "reform."

Stockholders are still subjected to double taxation on their investment return, once as corporate income and again as dividend income. Hardly equitable, but a part of our tax law.

We begin, therefore, with an inequitable system of taxation which is overly complex, difficult to follow and difficult to enforce. Clearly, there are many improvements which can be made to further the sense of fairness and further simplicity in administration.

But fairness and simplicity are equally important objectives that complement each other. Nothing is to be gained by sacrificing one to the other. The complexities of our tax system are, in part, the progeny of inequity. Simplification and reform are possible when we deal with the cause rather than the symptom of inequity. H.R. 13270 fails to do this. Its complexities challenge the intellect of the expert tax practitioner. There are too few such experts available to help implement these provisions. Tax paying and tax practice will become more of a challenge than it is now. Ignorance and inadvertence will play an increased part in tax avoidance and further undermine public confidence.

We believe that every individual who has substantial income also has a responsibility to pay a fair share of tax. In an attempt to reach this objective, the present bill wreaks havoc with established tax concepts, basic individual freedoms, the formation of capital and the future growth of this nation's economy. If the present bill is enacted, we will face a situation in which the proverbial forest will be destroyed in an effort to cut down the unpruned growth of 155 trees.

The positions contained in this paper further the objectives of simplification and greater equity in our tax law. They affirm the tenets of capitalism and are directed toward the continued orderly development of our national economy.

Approve § 121—Tax on unrelated business Income

The "Clay-Brown" type of transaction is an abuse of the intent of existing code provisions. Allowing such deals contributes nothing to the national interest while it reduces tax revenue. It is this type of tax avoidance which undermines taxpayer confidence. We approve of the provision requiring an exempt organization to treat as unrelated business income that portion of income which the indebtedness on acquired property bears to the total value of the property.

Many tax exempt organizations receive income from business activities unrelated to their exempt purpose. Churches, civic leagues, etc. are now permitted to enjoy such business income without paying normal corporate income tax. This constitutes a distortion of the exemption concept and results in improper government financing of the activities of the exempt organization.

Permitting unrelated business income of exempt organizations to escape tax places comparable private business endeavors at a disadvantage. Moreover, new private business undertakings are discouraged since they cannot expect to compete successfully with an established business that operates free of income tax. The revenue gain from enactment of this provision may be higher than estimated, since creating a truly competitive situation will increase business activity. It is equally appropriate to restrict an exempt organization from engaging in business through a controlled subsidiary corporation.

Recreation and family entertainment is an expanded part of our national living pattern. Clearly a personal expense, it should be paid for with after-tax dollars. To the extent that certain social clubs have been able to shelter passive investment income, they are able to provide facilities with pre-tax dollars. This is inequitable and we approve of the corrective provision which would tax such income.

We approve of the new definition of "trade or business" which treats as unrelated business income advertising revenue in excess of publication costs received by an exempt organization. The competition for advertising dollars is intense. Recently a number of national magazines have discontinued publication as a result of inadequate advertising revenue. Neither the advertiser seeking exposure, nor the subscriber reading an ad, considers the tax status of the publisher as a factor in the ad's effectiveness. Hence, there is no basis for giving favored tax treatment to the exempt publication.

Approve § 231—Moving expense

A high level of national employment is made possible by a mobile labor force. Mobility is also essential for the internal growth of nationwide business. Although Congress has recognized this in principle, the existing restrictive moving expense deduction is unrealistic and must be brought up to date.

Facilitating an employee's effort to advance his family's standard of living is in the national interest. In those cases where the move permits a dependent family to become a wage earning family, the cost of providing government assistance is avoided. A family move motivated by higher income results in an increased tax contribution.

In business today single site operations are as much a thing of the past as "mom and pop" grocery stores. Corporate employees must endure a number of moves as part of their development. In these situations, where the move is required by an employer, the employee does not necessarily receive a salary increment Even when his salary is increased his unreimbursed moving costs often will result in a net financial loss that cannot be deducted from taxable income. Full reimbursement results in some taxable income and the after-tax situation will still be a net loss.

These problems are recognized and partially treated in § 231. However, to the extent that the dollar limitations imposed are not commensurate with actual costs in today's market, the bill falls short of providing the necessary relief.

A family of four occupying temporary quarters in a metropolitan area can easily expect to spend more than $1,000 in a thirty-day period. Searching for a new home can take a few days. Hotel costs plus air fare can easily add another $600 disbursement. There should be no dollar limitation on this provision.

Although delayed occupancy of a new residence is considered, no provision is made for deducting the temporary storage charges which will have to be paid during this same period. Temporary storage charges should be included as a (b)(1)(A) expense which is not subject to limitation.

The section provides for inclusion in gross income as "compensation for services" any reimbursed moving expense Thus, the employer will have withheld those taxes normally taken on wages paid. This will result in an out-of-pocket cash loss to the employee that will not be replaced until he receives a refund on filing his annual return. Another problem is presented in a situation where the employee does not use itemized deductions. In this case, the deduction would actually be lost while the amount of reimbursement would remain in income. We recommend that reimbursed moving expenses, to the extent that they are deductible, should not be treated as "compensation for services" and should be omitted from gross income.

Disapprove § 301—Limit on tax preferences
Disapprove § 302—Allocation of deductions

We disapprove of both of these provisions as arbitrary, extremely complex and contrary to establish principles of tax law.

The bill classifies certain income as tax preference income, namely, tax-exempt interest on state and local bonds; the deduction allowed individuals of one-half of net long-term capital gains, charitable contributions of property which has appreciated in value, the allowance of accelerated depreciation on real estate and the treatment of farm loss. Section 301 introduces the new and entirely novel concept of placing an overall limitation on these so-called tax preferences for individuals. This overall limitation is imposed even though the propriety and extent of safeguards with respect to each "preference" item has been separately dealt with in other parts of the bill.

The objective of §§ 301 and 302 is to impose a higher tax on a comparatively small group of wealthy taxpayers who make extensive use of existing tax provisions and thereby pay a relatively small amount of tax. The "preference" items are still considered sound and, as safeguarded by present and proposed law, will be available in full to the average taxpayer. Hence, the socially and economically desirable effects of these provisions are retained while the politically expedient step is taken of imposing a greater tax on wealthy persons.

Creating new taxpayer classifications is contrary to the concept of equal treatment before the law. If an item is deductible, such deduction is now available to all taxpayers. Allowing deductions and permitting tax incentives to same taxpayers and not others, proposes a method of tax discrimination which has no place in our system. As precedent for future legislation, treating taxpayers differently although the taxable event is the same, marks the accelerated decline of taxpayer confidence and promises further complexity in our tax law.

Section 302 has a similar limitation provision applying to deductions and is equally novel in our federal tax system. This provision segregates non-business deductions and requires them to be allocated between taxable and tax preference income. The amount allocated to preference income is disallowed under a complicated formula. The theory apparently is that one having both taxable income and tax preference income could have paid these expenses proportionately out of both sources. Hence, it is arbitrarily presumed that he has done so regardless of any connection between income and expenses. We find such presumption to be unreasonable.

An example of tax distortion resulting from the application of this provision would be present in a situation where a taxpayer, having some preference income, realizes a substantial capital gain, i.e., on the sale of his wholly-owned business. Here the infusion of a large amount of "preference" income will result in the disallowance of otherwise deductible expenses even though the proceeds from such long-term gain were not available to pay these expenses. This formula attempt at "reform" will actually produce new inequities which will certainly require further "reform."

The most serious and significant criticism of § 302 is that it will affect the treatment of deductions that arise out of transactions completed well in advance of any proposal now embodied in the current legislation. The orderly planning and predictability of business and investment, which has always been a part of our tax laws, is unceremoniously discarded.

Both provisions create the problem of unintended tax consequences arising through the application of the formulae. Neither formula serves a sufficiently useful purpose to justify such result. The bill deals specifically with each of the "tax preference" items. We submit that the tax treatment of preference items and deductions should be made head-on. The direct handling of tax events permits taxpayers to evaluate the consequences of their transactions.

There should be no overall limitation on any kind of income nor should there be an overall arbitrary allocation of deductions. The complexity of the proposed formulae makes an exhaustive analysis of their effect impossible. This alone should be sufficient reason not to enact them.

Approve § 311—Income averaging

We approve this proposed amendment as a step toward equality amongst taxpayers and as a striking demonstration of how tax simplicity is attainable when the primary problems are faced.

Eliminating the distortion of tax liability resulting from the timing of income was the primary objective of the existing section. Excluding capital gains and certain other income from the average was done in order to avoid manipulation and because of certain misconceptions. These exclusions, however, resulted in complexity and limited use of the provision by taxpayers.

The House Committee Report stated, after discussing the amendments, "these changes will permit the elimination of 21 lines out of the 43 lines presently on the income averaging tax return form". This combination of reform and simplicity is an example of constructive tax legislation.

Liberalizing the averaging provision encourages taxpayers to take their income currently and avoids deferral schemes. It advances equity and furthers confidence in our tax system.

Disapprove § 331—Deferred compensation

The proposed change in the taxation of deferred compensation introduces two new formulae: The application of one formula requires extensive recordkeeping and places a burden on the taxpayer, matching deferred payments to income years, that can only encourage litigation. The alternative formula arbitrarily provides that if you aren't willing or able to comply with the recordkeeping requirement you must pay a higher tax since the deferred payment is related back to peak income years.

This involved procedure is intended to equate taxation of funded deferred payment arrangements with non-funded arrangements on the erroneous premise that the two are the same. The premise is incorrect since it assumes that a corporate promise of payment is equivalent to money set aside. The bankruptcy and reorganization of publicly-held corporations is not a unique occurrence. Moverover, financial misfortune in closely held companies often results in unfilled compensation promises.

A significant problem in applying the proposed section is the absence of a definition of "deferred compensation". Compensation agreements with executive personnel often include legitimate provisions for post-employment consulting. Many contracts are dependent on a post-employment, non-competition and nondisclosure of trade secrets provision. These clauses have real value to the company and are usually assigned an equivalent dollar amount. To change the timing of income by relating these negotiated payments back to the year of active employment is tax distortion and not tax reform.

We disapprove of this provision as unnecessarily complex, too vague in application, and inappropriately based on an inaccurate premise.

Disapprove § 401—Multiple corporations

This subject is almost a perennial in the annals of tax reform. Congress has repeatedly weighed the pros and cons of allowing multiple exemptions to a "controlled group" of corporations and the present law reflects this exhaustive study. No new development in the past five years warrants any change in the treatment of multiple corporations. Adequate controls are contained in our law to prevent abuse of existing provisions.

The proposed amendment will effectively restrict the competitive ability of small business and discourage new business endeavors. For example, if Mr. A now successfully runs a single unit, take-out food store and forms a new corporation to operate at another location, he is placed at a competitive disadvantage in operating at the new location. His competitors will have less tax to pay on the same income and can maintain a fair return on investment using a lower selling price. The same result would obtain if Mr. A sought to enter an entirely unrelated field.

It is unquestioned that important business reasons exist for the operation of multiple corporations: limiting new venture capital to a set amount and protecting the capital of the original business from exposure to excess losses; limiting tort liability in the same way; permitting managerial incentive through stock participation in the operating unit; permitting labor and general business practice to conform easily to local standards. A corporation pursuing sound business and management objectives, via the multiple corporate route, would be paying a tax penalty under the proposed amendment. This is true for the smaller as well as the larger controlled group.

The independent operation of retail outlets, whether part of a regional or national chain, have as much need for individual corporate status as business in a small controlled group. Each store requires competent management and appropriate incentives. The economic success of each store is determined by its local competitive position. Once again there should be tax equality between two competitors selling the same products in the same area. Changing the tax "cost", because of the legalism of ownership, upsets the free market balance and creates inequity rather than reform.

APPROVE § 412—Installment method

The formula contained in existing law to avoid the arbitrary allocation of installment payments between return of principal and profit has proved to be equitable. We disapprove of the way in which the provision has been literally read and applied to situations that are not true installment sales.

We support the proposed amendment which restricts the installment provision to sales in which payments are actually made periodically. The treatment of a readily marketable debenture as a cash equivalent accords with generally accepted concepts, and should be approved.

DISAPPROVE § 413—Original issue discount on bonds etc.

Objection is raised to this proposed change both on the theory advanced as well as the practical application of the amendment. There is no inherent virtue in parallel tax treatment between individuals and corporations. Attempting to assert parallelism as an objective that is preferable to maintaining the integrity of the cash and accrual accounting methods is to embark on a course of independent special tax rules that contravene existing accounting principles. The wisdom of further divergence of tax principles from accounting principles is questionable but totally unnecessary in the absence of a favorable revenue change. No revenue change is expected from this amendment.

The Report of the Ways and Means Committee observed that there is no basis for maintaining the current treatment of original issue discount. Overlooked is the fact that the earned discount on the retained bond is similar to be appreciation on a capital asset. Until the time of redemption or sale the taxpayer has nothing more in hand than an evidence of debt (ownership if it were stock) and no taxable event has occurred to fix the time or amount of income. What is the equitable tax treatment when the market value of the bond declines more than the amount of the "earned discount? It can't be paying tax on the later and having no deduction for the former, but that's what would happen under this amendment.

The extremely complex nature of the computations which will be required of bondholders, especially holders other than the original owner, will cause hardship and result in an unjustified recordkeeping expense. The burdensome administrative expense which enforcement would demand is avoided by shifting it to the issuing corporation. This situation provides no justification for saddling corporations with the costs of additional recordkeeping and preparing and mailing thousands of information returns.

Disapprove § 144 Limitation on deduction of bond premium upon repurchase

The proposed treatment of the premium paid upon repurchase of a convertible indebtedness does not sufficiently clarify the current situation. It limits deductibility to a "normal call premium" on non-convertible bonds except when the corporation demonstrates that a larger premium was paid as a cost of borrowing. This allegedly provides the flexibility necessary to take into account market and credit conditions. In effect it provides that unless the corporation and the Service agree upon the deduction, they can litigate the issue, and this hardly qualifies as tax reform.

This provision continues the practice of setting a value on the conversion feature of a convertible debenture which is issued for a price above par while denying any value to such feature on a bond issued at par or at a discount. Since such treatment is not consistent it should not be extended.

Approve § 421—Stock dividends

This proposed amendment to the existing provisions of law dealing with stock dividends is necessary to carry out the section's intended purpose. It frustrates the tendency to resort to complex financing and tax maneuvers in an effort to avoid the existing statutory provision. We approve of this amendment and the principle that receiving a proportionately increased stock interest in lieu of cash is taxable as equivalent to a cash distribution.

Disapprove § 461—Increase alternative capital gains rate for corporations

This provision simply raises corporate income taxes and has no relationship to anything akin to "reform". As a higher tax levy it is unwararnted and constitutes an ill-conceived method to assist in balancing the politically expedient individual rate reductions.

The reasoning advanced for this provision is specious. It is said that having proposed an increase in individual capital gains, corporations should be taxed similarly. It would be equally valid to suggest that corporations be allowed to include one-half their capital gain in income subject to tax at a 48% rate. There are many places in the Code where individuals and corporations are treated differently and trying to find parity in rates alone is neither equitable nor economically realistic.

It is also suggested that capital gains for a corporation is essentially the same as ordinary business income. This just is not true. The sale by a manufacturing company of a minority stock interest in another corporation is the sale of a capital asset and bears no relationship to the ordinary income derived from manufacturing.

Disapprove § 515—Total distribution from qualified pension etc. plans

The existing treatment of lump-sum distributions from qualified plans encourages an employee to take his capital on retirement and put it into a business or other investment situation. This stimulates the economy and encourages continued individual productivity.

The proposed change imposes an unnecessary hardship on retirement if an election is made to take a lump-sum payment. A more severe result is obtained when the lump-sum payment is made as a result of involuntary termination of service during normal income years. In the latter situation the extra tax burden is faced from the unenviable position of unemployment. In a case where the termination occurs after an employee receives nearly a full year's ordinary income, the amount of tax due would be substantial.

Furthermore, this section will apply to plans covering more than five million employees most of whom are not high income individuals. The tax return preparation tasks of these people will be made horrendously complicated. Moreover, many of them who have kept their savings and employer contributions in such plans to obtain capital gain treatment may, where possible, withdraw from the plans. This would be an unfortunate, and certainly an unintended, consequence of this section.

We believe the present provision works well and carries out long-range economic objectives. It should be retained. Amending the existing provision will result in strained planning techniques which, in turn, will evoke demand for tax reform.

Disapprove § 521—Depreciation of real estate

Any alleged abuse in the use of accelerated depreciation should be corrected, but the proposed amendment does not constitute reasonable remedial legislation. It eviserates the construction industry and in the process creates unintended hardship for all business.

The currently allowable depreciation rates have been a strong stimulus for new construction. To the extend that it remains available for residential housing it will continue to spur new building. The proposed restrictions, in the light of current mortgage conditions, would further curtail modernization of manufacturing facilities. The lack of ready mortgage money has already forced business to either postpone new plant construction or provide a greater portion of the required capital. This setback in modernization comes at a time when rising labor costs are squeezing profit margins and pressing price levels. Only through modernization has industry managed to compensate for higher unit costs and hold down price increases. We see no justification for discouraging modernization, which will occur if business cannot take accelerated depreciation and retrieve badly needed investment capital.

The proposal will also increase the cost of commercial rental space and, in turn, add to the cost of doing business. The net short-term result of this provision is inflationary and contrary to current objectives. We urge that the status quo be maintained at this time.

Approve §§ 801–804—Tax relief provisions

These four sections of the bill afford tax relief in a variety of ways but the relief proposed is actually a tax reduction. As previously stated, we support the proposed reductions but do not believe that our present inflationary economy or our budgetary problems permit such reductions at this time. If any priority is to be given to some of these proposals our attention would focus on the low-income allowance formula and the maximum rate on earned income. The former would bring taxable income above the poverty level and set a realistic minimum level for levying an income tax. The latter corrects the confiscatory nature of our present graduated system and thus relieves the constant pressure for tax gimmickry. Both go a long way toward achieving greater equity in our tax law.

We urge the enactment of these provisions as soon as such legislation can be reconciled with our fiscal policy and a balanced budget.

Disapprove of all provisions having retroactive application

A number of proposed provisions will apply to investments made and transactions concluded prior to the time that H.R. 13270 was introduced. The tax effects considered at the time these transactions were undertaken were reasonably based on the then existing law. Taxpayers have a right to enter into long-range business and investment plans that offer a calculated return. Predictability of action based on existing law is one of the basic principles sustaining the integrity of our system of laws. It is unfair to change the results of irrevocable contracts etc. by changing the treatment of existing income or deductions. Although this is generally recognized, not all provisions of the present bill limit their impact to prospective events.

We urge that equity requires all amendments of existing law to be limited in their application to taxable events and conditions which occur after the date of enactment.

CONCLUSION

No inference is to be drawn from the fact that certain provisions of H.R. 13270 have not been discussed in the foregoing remarks. The extensive nature of the proposed changes exceeded our ability to do a complete analysis of the entire bill. Our efforts were limited to those provisions having the greatest effect on the majority of our diversified membership.

We trust that this Committee will report a tax reform bill that will benefit the national economy and neither attempt to provide short-lived advantages for individual taxpayers nor penalize the business and investment community. The prosperity of our nation cannot be fragmented. We expect legislation that will preserve a free enterprise system and foster the economic and social development of this nation for the good of all our citizens.

Senator BYRD. The next witness will be Arthur J. Packard, Chairman of the American Hotel and Motel Association Governmental Affairs Committee.

Mr. Packard, we will now hear from you, sir.

STATEMENT OF ARTHUR J. PACKARD, CHAIRMAN, GOVERNMENTAL AFFAIRS COMMITTEE, AMERICAN HOTEL & MOTEL ASSOCIATION, ACCOMPANIED BY PAUL F. WOLFE

Mr. PACKARD. For the record, if you please, I am Arthur Packard, the president of the Packard Hotel Co. and the chairman of the Governmental Affairs Committee of the American Hotel & Motel Association.

Also, for the record, the association is a federation of hotel and motel associations located in the 50 States and the Virgin Islands, Puerto Rico, District of Columbia. We represent about 7,000 hotels and motels and about 800,000 rooms. We maintain offices in Washington at 777 14th Street, and in New York at 221 West 57th Street.

I am accompanied—my colleague is Mr. Paul V. Wolfe of the national hotel and motel accounting firm of Harris, Kirk, Foster, and Co., who will summarize and present the views of the association on the tax areas important to the hotel-motel industry, and which are part of these tax reform hearings.

With your indulgence, Mr. Wolfe.

Mr. WOLFE. Thank you, Mr. Packard.

At the outset, gentlemen, I want to express my deep thanks and appreciation for this opportunity to address you briefly concerning this tax reform bill. There is a full statement that we have submitted and I will try within the time limit to cover in a highlight way the observations I would like to make in behalf of the industry.

First, with respect to the proposed increase in corporate alternate capital gains rates from the present 25 percent to 30 percent. The American Hotel & Motel Association feels that this proposed change under section 461 of the bill should be deleted because it is grossly unfair.

Corporations having taxable income are taxed thereon and the same income is taxed again to its stockholders as dividends at normal tax rates. It can therefore be seen that the beneficial owners of a corporation, that is, the stockholders, are taxed twice on the same income. Where a corporation realizes a capital gain, and pays tax thereon at corporate gains rates, such gain when distributed to stockholders as an ordinary dividend is taxed again at normal tax rates.

For this reason we feel there is enough of an imposition already imposed upon corporations with regard to capital gains and we do not feel as though it should be extended any further under the proposed bill.

Second, with regard to the retention of alternative methods of depreciation provided in section 167 of the Internal Revenue Code, section 521 of H.R. 13270 proposes changes in the use of the accelerated methods of depreciation. These proposed changes are objectionable for the reason that they are unrealistic.

While section 521 of the proposed bill allows use of the 150-percent declining balance method on new construction of hotel and motel properties, older properties purchased do not share such treatment, yet the depreciable factors remain the same. There is a difference, however, between the depreciation on newly constructed properties as compared with used properties purchased. It is a fact that more depreciation occurs in the case of newly constructed properties than in used properties during the early years of their useful lives.

This fact has been recognized by the provisions of section 167 of the code which permits the 200-percent declining balance and the sum-of-the-year digits methods, in the case of newly constructed properties and a maximum of 150-percent declining balance method for used properties, and these provisions should be maintained.

Retention of present rules regarding recaptured depreciation as provided in section 1250 of the Internal Revenue Code:

Another part of section 521 of H.R. 13270 provides for a tax at ordinary rates on any gain realized on the disposition of depreciable real property to the extent of the excess of depreciation claimed on any accelerated method over the amount of depreciation which would be allowed computed on the straight-line method with respect to depreciation to taxable years ending after July 24, 1969.

No matter how long a depreciable asset has been used in trade or business, no consideration is given to the fact which inflation plays in fixing the selling price of an asset. As a consequence, income tax is imposed on the increase in value due to inflation, with the result that the asset disposed of cannot be replaced with an asset of equal value without borrowing funds to replace the income tax paid.

The current law gives some effect to the inflationary aspect of the economy. It is respectfully submitted that to convert what would in whole or in part be presently taxed as capital gains into ordinary income to individuals and taxed to them at their highest surtax bracket is drastic and excessively burdensome. Since the beneficial owners of corporations, that is, the stockholders, in effect pay double taxes, to convert the corporate gain from capital gain status to ordinary income tax classification is equally offensive.

Effect of earnings and profits of depreciation:

The association is opposed to section 452 of H.R. 13270 dealing with the effect on earnings and profits of accelerated depreciation on the basis that is introduced a double standard (1) for the determination of taxable net income, and (2) for the computation of earnings and profits.

It is submitted that when depreciation is computed in accordance with the provisions of the law, such depreciation equates that which is proper, reasonable, and just; otherwise, such depreciation method should not be allowed in the first instance. If depreciation is considered correct, and recognized in the determination of net income to be taxed, then such depreciation should be accepted in computing earnings and profits.

Elimination of multiple surtax corporate tax exceptions and other benefits:

The Association objects to the provisions of section 401 of H.R. 13270 which would eliminate the multiple corporate surtax exemption and other related benefits and such objection is on the broad basis of inequality.

Section 401 of the bill discriminates among taxpayers. This observation is predicated on the fact that two or more separate business activities owned by different interests will pay less income tax than if the same business were owned by common control. It is clear, therefore, that a penalty is being imposed on a multiplicity of business activities which cannot only be labeled as repressive and discriminatory. There should be no tax penalty imposed upon the business community in conducting business activities in a multiplicity of corporate forms that are found essential and desirable in the ordinary course of business.

All members of the community should be given an equal opportunity to conduct their business activities in a corporate setup found to be desirable and competitive without being penalized for doing so by our tax laws.

Unrelated business tax sections 511 and 513 of the I.R.C.:

We are in general agreement with the provisions contained in section 121 of H.R. 13270 which would extend the "unrelated business income tax" to virtually all exempt organizations and would also impose a tax on the investment income of such organizations. We request, however, that the bill be amended so as to exclude from "unrelated trade or business" the activities of a trade show sponsored by a business league coming under section 501 (c) (6).

The final IRS regulations regarding certain activities of 501 (c) (6) organizations, as issued on December 12, 1967, and section 278 (c) of the bill would seem to imply that a trade show of a type common to the hotel/motel industry represented an "unrelated trade or business," as defined in section 513, and that the gross income derived therefrom was taxable as "unrelated business income" as provided for in section 511.

In Rev. Rul. 67-219 and the regulations, the IRS takes the position that income from trade shows is not unrelated income where the exhibits are for products or services utilized by the sponsoring organization's members.

We respectfully wish to point out that if the IRS approves of trade shows at which individual members of a tax-exempt business league display their products to their potential customers, then surely the display at an industry trade show by suppliers of products used in the industry is within the activities and purposes of the industry's business league.

It is, therefore, requested that section 513(a) of the Internal Revenue Code be amended to exclude from the category of unrelated trade or business the conduct of a trade show sponsored by a business league exempt from tax under 501(c)(6).

That completes my prepared statement.

Senator BYRD. Thank you, sir.

Senator Williams? Senator Bennett? Senator Curtis?

Senator CURTIS. One question.

In regard to recapturing, I believe that my memory is correct that some of the builders and the owners of real property have previously testified that if that is to be imposed, it should not be impoesd if the property was held for a reasonable period of years. Apparently directing the impact of change more on the in-and-outer rather than the investor or operator of a business who intends to say for sometime.

Do you have any comment on that?

Mr. WOLFE. Well, this is a special perhaps comment or consideration that they have given it with respect to the building industry. Of course our comments have been directed primarily to hotels and motels which are long-term investors in property. We think that the present bill is sufficient to take care of it, and to convert the recapture and depreciation now into ordinary income tax is grossly repressive.

Senator CURTIS. You think the present law, not the present bill?

Mr. WOLFE. That is right, the present law we feel is all right as far as we are concerned.

Senator CURTIS. That is all I have, Mr. Chairman.

Senator BYRD. Thank you, Mr. Packard and Mr. Wolfe.

Mr. WOLFE. Thank you.

(The prepared statement of the Hotel and Motel Association follows:)

STATEMENT OF AMERICAN HOTEL AND MOTEL ASSOCIATION

SUMMARY

Proposed increase in corporate alternate capital gains rates from the present 25 percent to 30 percent

The American Hotel & Motel Association contends that the proposed change under Section 461 of H.R. 13270 should be deleted because it is grossly unfair. Corporations having taxable income are taxed thereon and the same income is taxed again to its stockholders as dividends at normal tax rates. It can therefore be seen that the beneficial owners of a corporation, i.e., the stockholders, are taxed twice on the same income. Where a corporation realizes a capital gain, and pays tax thereon at corporate gains rates, such gain when distributed to stockholders as an ordinary dividend is taxed again at normal tax rates.

Retention of alternative methods of depreciation provided in section 167 of the Internal Revenue Code

Section 521 of H.R. 13270 proposes changes in the use of the accelerated methods of depreciation. These proposed changes are objectionable for the reason that they are unrealistic.

While Section 521 of the proposed bill allows use of the 150 percent declining balance method on new construction of hotel and motel properties, older properties purchased do not share such treatment, yet the depreciable factors remain the same. There is a difference, however, between the depreciation on newly constructed properties as compared with used properties purchased. It is a fact that more depreciation occurs in the case of newly constructed properties than in used properties during the early years of their useful lives. This fact has been recognized by the provisions of Section 167 of the Code which permits the 200 percent declining balance and the sum-of-the-year digits methods, in the case of newly constructed properties and a maximum of 150 percent declining balance method for used properties, and these provisions should be maintained.

RETENTION OF PRESENT RULES REGARDING RECAPTURED DEPRECIATION AS PROVIDED IN SECTION 1250 OF THE INTERNAL REVENUE CODE

Another part of Section 521 of H.R. 13270 provides for a tax at ordinary rates on any gain realized on the disposition of depreciable real property to the extent of the excess of depreciation claimed on any accelerated method over the amount of depreciation which would be allowed computed on a straight-line method with respect to depreciation applicable to taxable years ending after July 24, 1969.

No matter how long a depreciable asset has been used in trade or business, no consideration is given to the part which inflation plays in fixing the selling price of an asset. As a consequence, income tax is imposed on the increase in value due to inflation, with the result that the asset disposed of cannot be replaced with an asset of equal value without borrowing funds to replace the income tax paid.

The current law gives some effect to the inflationary aspect of the economy. It is respectfully submitted that to convert what would in whole or in part be presently taxed as capital gains into ordinary income to individuals and taxed to them at their highest surtax bracket is drastic and excessively burdensome. Since the beneficial owners of corporations, i.e., the stockholders, in effect pay double taxes, to convert the corporate gain from capital gain status to ordinary income tax classifications is equally offensive.

EFFECT ON EARNINGS AND PROFITS OF DEPRECIATION

The Association is opposed to Section 452 of H.R. 13270 dealing with the effect on earnings and profits of accelerated depreciation on the basis that it introduced a double standard (1) for the determination of taxable net income, and (2) for the computation of earnings and profits.

It is submitted that when depreciation is computed in accordance with the provisions of the law, such depreciation equates that which is proper, reasonable and just; otherwise, such depreciation method should not be allowed in the first instance. If depreciation is considered correct, and recognized in the determination of net income to be taxed, then such depreciation should be accepted in computing earnings and profits.

ELIMINATION OF MULTIPLE SURTAX CORPORATE TAX EXEMPTIONS AND OTHER BENEFITS

The Association objects to the provisions of Section 401 of H.R. 13270 which would eliminate the multiple corporate surtax exemption and other related benefits and such objection is on the broad basis of inequality.

Section 401 of the bill discriminates among taxpayers. This observation is predicated on the fact that two or more separate business activities owned by different interests will pay less income tax than if the same business were owned by common control. It is clear, therefore, that a penalty is being imposed on a multiplicity of business activities which can only be labeled as repressive and discriminatory.

There should be no tax penalty imposed upon the business community in conducting business activities in a multiplicity of corporate forms that are found essential and desirable in the ordinary course of business. All members of the community should be given an equal opportunity to conduct their business activities in a corporate setup found to be desirable and competitive without being penalized for doing so by our tax laws.

UNRELATED BUSINESS TAX SECTIONS 511 AND 513 OF THE I.R.C.

We are in general agreement with the provisions contained in Section 121 of H.R. 13270 which would extend the "unrelated business income tax" to virtually all exempt organizations and would also impose a tax on the investment income of such organizations. We request, however, that the bill be amended so as to exclude from "unrelated trade or business" the activities of a trade show sponsored by a business league coming under Section 501(c)(6).

The final I.R.S. regulations regarding certain activities of 501(c)(6) organizations, as issued on December 12, 1967, and Section 278(c) of the bill would seem to imply that a trade show of a type common to the hotel/motel industry represented an "unrelated trade or business," as defined in Section 513, and that the gross income derived therefrom was taxable as "unrelated business income" as provided for in Section 511.

In Rev. Rul. 67-219 and the regulations, the I.R.S. takes the position that income from trade shows is not unrelated income where the exhibits are for products or services utilized by the sponsoring organization's members. We respectfully wish to point out that if the I.R.S. approves of trade shows at which individual members of a tax-exempt business league display *their* products to *their* potential customers, then surely the display at an industry trade show by suppliers of products used in the industry is within the activities and purposes of the industry's business league.

It is, therefore, requested that Section 513(a) of the I.R.C. be amended to exclude from the category of "unrelated trade or business" the conduct of a trade show sponsored by a business league exempt from tax under 501(c)(6).

STATEMENT

I am Arthur J. Packard, President of the Packard Hotel Company and Chairman of the Governmental Affairs Committee of the American Hotel & Motel Association.

The Association is a federation of hotel and motel associations located in the fifty states, the District of Columbia, Puerto Rico, and the Virgin Islands having a membership in excess of 6,800 hotels and motels containing in excess of 750,000 rentable rooms. The American Hotel & Motel Association maintains offices at 221 West 57th Street, New York, New York, and at 777 14th Street, N.W., Washington, D.C.

I am accompanied by Mr. Paul V. Wolfe of the national hotel and motel accounting firm of Harris, Kerr, Forster & Company, who will testify on behalf of the Association on tax areas important to the hotel/motel industry which are a part of these tax reform hearings.

My name is Paul V. Wolfe, a partner in the national accounting firm of Harris, Kerr, Forster & Company, which is headquartered at 420 Lexington Avenue in New York City.

I am appearing today on behalf of the American Hotel & Motel Association to testify on portions of H.R. 13270 which are of primary interest to the Association.

GENERAL COMMENTS REGARDING HOTELS AND MOTELS

In considering the comments I am going to make regarding the taxation of capital gains and accelerated depreciation, I feel it is important to have in mind that hotels and motels are required to invest very substantial sums in land, structures and equipment and they actually operate a business. They are not passive investors. In addition, they employ vast numbers of unskilled and semi-skilled help consisting of maids, bellboys, waiters, maintenance personnel and similar service employees. Hotels and motels, besides being a very important segment of our social and business community, play a very important role as host to foreign travelers in our country. This role of host to foreign travelers will be stepped up very substantially in the near future by reason of the fact there is on the horizon mass inter-continental transportation due to the construction of larger jet planes. In view of this observation it can be expected that hotels and motels should be encouraged to fulfill their destined role as a contributor to the improvement of our balance of payments program.

PROPOSED INCREASE IN CORPORATE ALTERNATE CAPITAL GAINS RATES FROM THE PRESENT 25 PERCENT TO 30 PERCENT

The American Hotel & Motel Association contends that the proposed change under Section 461 of H.R. 13270 is grossly unfair to corporations. It must be borne in mind that corporations having taxable income are taxed thereon and that the same income is taxed again to its stockholders as dividends at normal tax rates. It can therefore be seen that the beneficial owners of a corporation, i.e., the stockholders, are taxed twice on the same income. Where a corporation realizes a capital gain, and pays tax thereon at corporate gains rates, such gain when distributed to stockholders as an ordinary dividend is taxed again at normal tax rates.

One of the reasons given for the increase in the alternate capital gains rates from 25 percent to 30 percent is the alternate capital gains tax for individuals is being eliminated. It is submitted that the alternate capital gains rate on individuals and corporations are not opposite since as pointed out above corporate capital gains are taxed twice whereas individual capital gains are taxed once.

By reason of the foregoing analysis, it is felt that the changes in the corporate alternate capital gains tax proposed in Section 461 should be eliminated, and that the present tax provisions of our Code dealing with alternate corporate capital gains rates should be retained.

RETENTION OF ALTERNATIVE METHODS OF DEPRECIATION PROVIDED IN SECTION 167 OF THE INTERNAL REVENUE CODE

Section 521 of H.R. 13270 proposes changes in the use of the accelerated methods of depreciation. These proposed changes are considered by the American Hotel & Motel Association to be objectionable for the reason that they are unrealistic and unfair. With respect to proposed changes in the use of the 200 percent declining balance and sum-of-the-years digits method contained in Section 167 of the I.R.C., it is desired to highlight the observation that these methods are economically sound and factually realistic.

The purpose of depreciation is to allow a taxpayer to recoup its tax basis over its economic useful life. It is a fact that an asset depreciates more in the earlier years of its useful life and less in later years. Repairs are less in the earlier years of the life of an asset and increase at an accelerated rate as the asset gets older. Accelerated depreciation, therefore, gives effect to physical realities and results in equalizing charges against income over the useful life of a depreciable asset. This result is accomplished by a larger write-off for depreciation with small repair incidents in earlier years and larger repairs and smaller depreciation as useful life progresses.

While Section 521 of the proposed bill allows use of the 150 percent declining balance method on new construction of hotel and motel properties, older properties purchased do not share such treatment, yet the depreciable factors remain the same. There is a difference, however, between the depreciation on newly constructed properties as compared with used properties purchased. It is a fact that more depreciation occurs in the case of newly constructed properties than in used properties during the early years of their useful lives. This fact has been recognized by the provisions of Section 167 of the Code which permits the use of the 200 percent declining balance and the sum-of-the-years digits method in the case of newly constructed properties and a maximum of 150 percent declining balance method for used properties.

Factually, it would be unjust and improper to cut down the present permissible rates on newly constructed hotel and motel properties from the 200 percent declining balance method or the sum-of-the-years digits method to the 150 percent declining balance method and to also cut down the present rate of depreciation on used properties from the 150 percent declining balance method to the straightline method. The changes proposed in the permissible use of accelerated methods of depreciation would be completely at variance with the true loss of economic value in the form of depreciation in computing taxable net income.

The retention of the present allowable 200 percent declining balance and the sum-of-the-years digits method enables business organizations to repay their loans quicker, thereby reducing interest expense. In addition, the presently allowed accelerated methods help hotel and motel industries to cope to some extent with inflationary costs. This is accompanied by an earlier larger cash throwoff being payable through the use of such methods.

In view of the foregoing, it is requested that Secton 167 of the Internal Revenue Code be left unrevised.

RETENTION OF PRESENT RULES REGARDING RECAPTURED DEPRECIATION AS PROVIDED IN SECTION 1250 OF THE INTERNAL REVENUE CODE

Another part of Secton 521 of H.R. 13270 provides for a tax at ordinary rates on any gain realized on the disposition of depreciable real property to the extent of the excess of depreciation claimed on any accelerated method over the amount of depreciation which would be allowed computed on a straight-line method with respect to depreciation applicable to taxable years after July 24, 1969.

The American Hotel & Motel Association is firm in its opinion, under our present inflated economy, that any gain realized on the disposition of hotel and motel properties should not be taxed at all, but feels that if a tax must be imposed, the tax provision of the present law should be retained and applied.

On the sale or taxable exchange of depreciable assest, gain or loss is computed on the difference between adjusted tax cost and the sales price. Adjusted tax cost is origininal cost less depreciation allowed or allowable. No matter how long a depreciable asset has been used in trade or business, no consideration is given to the part which inflation plays in fixing the selling price of an asset. As a consequence, income tax is imposed on the increase in value due to inflation, with the result that the asset disposed of cannot be replaced with an asset of equal value without borrowing funds to replace the income tax paid.

The current law gives effect to the inflationary aspect commented upon by giving some relief at capital gains rates on the gain realized on the sale of depreciable real estate held over 20 months on declining rates with full capital gains tax on profits derived from the sale of such assets held more than 10 years.

It is respectfully submitted that to convert what would in whole or in part be presently taxed at capital gains rates into ordinary income to individuals and taxed to them at their highest surtax bracket is drastic and excessively burdensome. Since the beneficial owners of corporations, i.e., the stockholders, in effect pay double taxes, to convert the corporate gain from capital gain status to ordinary income tax classification is equally offensive.

In view of the foregoing, it is recommended that the present provisions of Section 1250 of the I.R.C. be retained as presently constituted.

EFFECT ON EARNINGS AND PROFITS OF DEPRECIATION

The Association is opposed to Section 452 of H.R. 13270 dealing with the effect on earnings and profits of accelerated depreciation on the basis that it introduces a double standard (1) for the determination of taxable net income, and (2) for the computation of earnings and profits.

It is submitted that when depreciation is computed in accordance with the provisions of the law, such depreciation equates that which is proper, reasonable and just; otherwise, such depreciation method should not be allowed in the first instance. If depreciation is considered correct, and recognized in the determination of net income to be taxed, then such depreciation should be accepted in computing earnings and profits. For the reasons stated, it is urged that Section 452 of the proposed bill be deleted.

ELIMINATION OF MULTIPLE CORPORATE SURTAX EXEMPTIONS AND OTHER BENEFITS

The Association desires to express its objection to the provisions of Section 401 of H.R. 13270 which would eliminate the multiple corporate surtax exemption and other related benefits and such objection is on the broad basis of inequality.

Presently, in order to obtain a mutiple surtax exemption, an election must be made by each member of a controlled group of corporations. As a consequence of this election, each corporation in the controlled group is required to pay an added 6 percent tax on the first $25,000 of their taxable net income pursuant to Section 1562 of the Internal Revenue Code. This privilege carries with it other concomitant benefits which are propsed to be eliminated together with the multiple surtax exemption under the proposed bill.

It is submitted that Section 401 of the bill discriminates among taxpayers. This observation is predicated on the fact that two or more separate business activities owned by different interests will pay less income tax than if the same business were owned by common control. It is clear, therefore, that a penalty is being imposed on a multiplicity of business activities which can only be labeled as repressive and discriminatory. There should be no tax penalty imposed upon the business community in conducting business activities in a multiplicity of corporate forms that are found essential and desirable in the ordinary course of business. All members of the community should be given an equal opportunity to conduct their business activities in a corporate setup found to be desirable and competitive without being penalized for doing so by our tax laws. The provisions of Section 401 would have that effect. All members of the business community should be given an opportunity to expand and diversify their business activities without being hampered by penalty taxation.

UNRELATED BUSINESS TAX SECTIONS 511 AND 513 OF THE IRC

We are in general agreement with the provisions contained in Section 121 of H.R. 13270 which would extend the "unrelated business income tax" to virtually all exempt organizations and would also impose a tax on the investment income of such organizations. We request, however, that the bill be amended so as to exclude from "unrelated trade or business" the activities of a trade show sponsored by Section 501(c)(6) organizations.

(*a*) *Section 511 of the I.R.C. should be extended to cover Section 501(c)(4), 501(c)(7), and 501(c)(8) organizations.*

The Association has been constantly alerted by its members to the "business" activities of various organizations which have been granted tax-exempt status. This is especially true of organizations which come under Sections 501(a) and 501(c) of the Code. Evidence of such activity is most often in the form of either public invitations from the organizations or published information of the activities after they have occurred.

It has been our regular practice to forward evidence of such "business" activity to the I.R.S. To date we have seen little curtailment of the activities which form the basis of our objections. If anything, the volume of "business" by such organizations appear to be on the increase.

Most often this activity—which we prefer to term "unfair competition"—consists of solicitations on behalf of tax-exempt organizations for the business of the general public. Organizations which have been granted a tax exemption under Sections 501(c) (4), (7) and (8) openly seek and obtain business which would otherwise be available to tax-paying hotels and motels. More specifically, civic organizations, social and recreation clubs, and fraternal beneficiary societies "open their doors to the public" in the solicitations of lodging and food service business.

Under the provisions of the Code and the regulations thereto, Section 501(c)(4), civic organizations, must be neither organized nor operated for profit; Section 501(c)(7), social and recreation clubs, must be organized and operated exclusively for pleasure, recreation and other non-profitable purposes and must not make their facilities available to the public; and Section 501(c)(8), fraternal beneficiary societies, must be operated in furtherance of their fraternal purposes and may not engage in business activities of a kind carried on with nonmembers for a profit.

In 1964 the I.R.S. issued Revenue Procedure 64–36 regarding certain activities of Section 501(c)(7), social and recreation clubs. In these so-called "guidelines" the Service stated that advertising or other solicitations for business by such organizations would be prima facie evidence that such a club is engaging in business and is not being operated exclusively "for pleasure, recreation and other non-profitable purposes." This portion of the guidelines merely reiterated past I.R.S. regulations.

The guidelines further stated that 501(c)(7) organizations would be allowed annual gross receipts from business activities of $2500 or less without jeopardizing its exemption. Where such receipts exceeded $2500, they must have been 5 percent or more of the organization's total receipts before tax-exempt status would be jeopardized. The guideline further noted that member sponsorship arrangements would not circumvent the gross receipt limitation. If the organization's members constituted less than 75 percent of the total number of persons utilizing the organization's facilities on a particular occasion, all of the receipts received therefrom would be considered nonmember receipts unless the organization can properly apportion such receipts between members and nonmembers.

Revenue Procedure 64–36 appears on the surface to be a recognition by the I.R.S. that 501(c)(7) organizations do, in fact, often extend their activities to those who are outside their membership and their guests. We submit that Revenue Procedure 64–36 has not deterred such activities which are in addition to a club's purpose and are, therefore, unrelated and should be taxed as such.

In view of the similarity in both the manner in which tax-exempt status is granted to 501(c)(4) and 501(c)(8) organizations and the methods employed by such organizations in soliciting business from the general public, we request that the provisions of Section 511 of the Code be likewise extended to these organizations.

By complying with the request to have 501(c)(4), 501(c)(7) and 501(c)(8) organizations covered by Section 511 of the Code, such organizations will be contributing a proper share to the revenue from the profits realized on activities that are foreign to purposes for which they were formed.

(*b*) *Section 513(a) of the I.R.C. should be amended to exclude from Unrelated Trade or Business the Activities of a Trade Show Sponsored by Section 501(c)(6) Organizations.*

The final I.R.S. regulations regarding certain activities of 501(c)(6) organizations, as issued on December 12, 1967, *implied* that a trade show of a type common to the hotel/motel industry represented an "unrelated trade or business," as defined in Section 513, and that the gross income derived therefrom was taxable as "unrelated business income" as provided for in Section 511.

Numerous regional, state or city hotel and motel associations sponsor a trade show no more than once a year. Space is assigned to various exhibitors desirous of participating, for which they pay a consideration. There are numerous exhibitors at the show whose products are normally used in hotel and motel operations. Some exhibitors may sell their products or services at trade shows whereas others merely display or advertise their wares. No hotels or motels participate in these trade shows as exhibitors.

Normally, these trade shows are held at the time of the year when there is an annual meeting of the membership, i.e., when the members gather to discuss the affairs of the association, lay out future programs of the association, have quest lecturers on subjects of hotel/motel interest and business promotion, and elect officers. In short, at the annual meetings, there are many programs presented representing a common interest to the members of the association. In view of the fact that the members meet annually, it is felt a most appropriate time to infuse into such meetings a program of education for the membership, as well as to call to their attention the developments in various fields relating to the products which they use in the conduct of their hotel or motel business; hence, the trade show.

It can, therefore, be seen that these trade shows are an essential and integral part of the purpose for which the state and city associations have been formed. Through the trade shows the overall economy of a multitude of different types of businesses are represented and in the this regard there is no isolated interest in one particular industry, but a wide divergency of industry activity and services. Through the means of such trade shows the membership of the various state or city hotel and motel associations are kept abreast of the improvements in various industries that are essential to their operations and an integral part of our national economy.

At such trade shows the public is generally not admitted, and it is only in an exceptional case, where there is some relationship to a hotel or motel activity, that a member of the general public may be admitted. The membership of the hotel or motel association that sponsors the trade show normally pay a registration fee to attend the annual meeting and its auxiliary activities include the trade show.

It is submitted that the foregoing described activities fall directly within those permitted a trade association which is exempt from income tax per Section 501 (c) (6). Such a trade show is clearly not the conduct of an "unrelated trade or business" within the meaning of Section 513. The receipts from such an activity should be clearly exempt from the tax on "unrelated business income" imposed by Section 511.

In Rev. Rul. 67-219 and the regulations, the I.R.S. takes the position that income from trade shows is not unrelated income where the exhibits are for products or services utilized by the sponsoring organization's members. We respectfully wish to point out that if the I.R.S. approves of trade shows at which individual members of a tax-exempt business league display *their* products to *their* potential customers, then surely the display at an industry trade show by suppliers of products used in the industry is within the activities and purposes of the industry's business league.

Trade shows sponsored by Section 501(c) (6) organizations for the purpose of enabling their members to keep up with current product and service development all toward making more efficient and profitable the member's business activities is one of the universal purposes of Section 501(c) (6) organizations. In view of this fact, all trade show activities so sponsored and conducted should be classified as related to the purposes and objectives of such organizations and any income realized from such trade shows so classified.

It is, therefore, requested that Section 513(a) of the I.P.C. be amended to exclude from the category of "unrelated trade or business" the conduct of a trade show sponsored by a business league exempt from tax under 501(c) (6).

Senator BYRD. The next witness will be Carl A. Beck, who is chairman of the board of trustees, National Small Business Association.

STATEMENT OF CARL A. BECK, CHAIRMAN OF THE BOARD OF TRUSTEES, NATIONAL SMALL BUSINESS ASSOCIATION; ACCOMPANIED BY JOHN L. KILCULLEN, COUNSEL FOR CONFERENCE OF AMERICAN SMALL BUSINESS ORGANIZATIONS, CHICAGO, ILL.

Mr. BECK. Good morning.

My name is Carl A. Beck. I am chairman of the board of trustees of the National Small Business Association representing some 35,000 small businesses of the United States.

I am also president of the Charles Beck Machine Corp. of King of Prussia, Pa., and I am therefore a small businessman myself (the adjective small, of course, refers to the business—not to the businessman).

In furtherance of the committee's request for maximum consolidation of testimony, with me today is Mr. John L. Kilcullen, counsel for the Congress of American Small Business Organizations, headquartered in Chicago, also representing some 35,000 small businesses which organization would like to join with us in support of the five points that we are making, relative to corporate tax rates.

I would like to congratulate the committee on its businesslike method of receiving testimony, and in accordance with your request I will confine my few remarks to a summary of the five basic points which are amplified in the statement which we have submitted.

I would like to call to your attention, first, to our innate conviction and concurrence in the need for fiscal soundness. The items we are suggesting for consideration, taken together, should not reduce Federal revenues, but will, on the contrary, significantly increase the total amount of Federal receipts.

Secondly, we were disappointed to read in section 452 of the proposal that all businesses—other than farming—be forced to use straight-line depreciation methods. Ever since the Revenue Act of 1962 we have been trying to encourage the Internal Revenue Service to establish workable and permanent guidelines for depreciation.

This proposal in H.R. 13270 obviously would eliminate the need for such guidelines—and this then becomes a matter of throwing out the baby with the bath water. Flexibility of depreciation methods is extremely important to the small businessman. In a small- or medium-size company, any single investment is a large proportion of his total assets—he cannot buy 10 percent of a lathe or one-half of a milling machine, regardless of how small his incremental needs may be.

The large company, on the other hand, having an on-going program of annual purchase of tens, or hundreds of even thousands of machine tools, has a resulting depreciation schedule which tends to remain relatively constant, year to year.

In addition, technological advancement, particularly in manufacturing, demands increasing expenditure for tooling, well beyond what was required two or three decades ago, if business is to remain competitive today. Up until now a company has had the choice of accelerated depreciation or obtaining the investment tax credit. Under the proposed bill they will have neither.

At yesterday's hearings one of the witnesses was questioned about his unfortunate use of the words "breach of faith," and if we are to assume that the investment tax credit, which at enactment was to be permanent, and after suspension and reinstatement was again meant to be a permanent part of the tax structure (not to be "handled like a yo-yo," as someone said), if indeed the investment tax credit is again to be lost, then the matter of depreciation options becomes doubly important to the small business economy.

The next item is in reference to section 121, relative to the taxation of currently tax-exempt, profit making businesses. The extreme unfairness of past practices was vividly brought to our attention by one of our own trustees, who showed us an offer made to him, whereby a church would buy his business, totally with the tax dollars which were not paid to the Federal Government, and as they outlined in great detail, with substantial monetary gains to both the church and the small business present owner.

We presented information on these matters when bills were before the 89th Congrss, and are happy to see that such provisions have been included in the tax bill now under consideration.

Next, we would strongly recommend that the committee consider the inclusion of section 5 of S. 2646, introduced by your committee member Senator Abraham Ribicoff, which deals with Imposition of Tax on Income of Cooperative Corporations, as an integral part of the overall tax reform program.

I call to your attention that, for over three decades, the National Small Business Association has been urging Congress to have those profit making operations, masquerading as co-ops, pay their own fair share of Federal taxes. In these days of emphasis on "equal opportunity for employees" (an admittedly sound principle) might we also encourage equal opportunity for employers?

Just as with tax-exempt profitmaking business operations referred to above, so also is it unfair that profitmaking co-ops are permitted to compete "tax free" with those businesses which are bearing their own fair share of Federal corporate taxes.

The last item that we would like to recommend for your consideration is that the level at which the corporate surtax applies, be raised from $25,000 to $100,000. As we have stated in our formal statement, the $25,000 figure goes back to the days of the "notch tax" in the 1930's, and yet we know what has happened to the value of the dollar over three or four decades.

We have investigated, to the best of our ability, the impact on Federal revenues of such proposal. In the "Statistics of Income for 1965, Corporation Income Tax Returns" published by the Internal Revenue Service, is a breakdown of corporate income by size of company. As best we can, by averaging, extrapolating, and estimating with figures available under "All Industrial Divisions" section on page 123, we have come to the following conclusions:

1. Under our proposal, 713,658 companies (we estimate) would not be affected by this proposal since their before-tax incomes are apparently under $25,000.

2. We estimate that 181,944 companies are in the income bracket of $25,000 to $100,000 before Federal income taxes, and these companies would thus have tax reduction, and hence revenue loss to the Federal Government, totaling $910 million.

3. The third group of companies, numbering 29,709 apparently have net income before taxes of more than $100,000. The revenue loss from these companies by having the normal corporate tax rate of 22 percent continuing from $25,000 to $100,000 would be $580 million.

4. The total revenue loss to the Federal Government we thus estimate to be $1,490 million for the industrial division—915,311 of 1,296,847—approximately three-quarters of all companies reporting.

To demonstrate this visually we have prepared a graph which shows present corporate income tax (the green line) change in income tax resulting from this proposal (the orange line) labeled "Increased Surtax Exemption," and change in tax through Treasury proposal (the red line), as related to income before taxes.

You will note that if a 2-percent across-the-board reduction in the corporate tax were enacted, the loss of revenues to the Federal Government would be somewhat higher, which we calculate to be $1,530 million for the industrial divisions.

This compares with the estimate of Secretary of the Treasury Kennedy of approximately $1,600 million for all corporations. However, our proposal is of benefit and potential benefit to 895,000 small- and medium-sized industries, although of little benefit to the 30,000 largest businesses in the industrial category. Similar proportions hold for the other categories of businesses.

In essence, what we are proposing is fiscal soundness, coupled with an increase in Federal revenue, through a program which provides incentives to that sector of the economy which is most disadvantaged and constrained by the economic environment of business in today's ecology.

May I emphasize that we are not asking for special dispensations, but only for an end to unfair, discriminatory treatment of the small and medium taxpaying enterprise.

Congress has continually reaffirmed the importance of small business to the economy. We appreciate this opportunity to put before you concepts which will, in a meaningful way, accomplish basic congressional objectives.

I thank you.

(Carl A. Beck's prepared statement follows:)

STATEMENT OF CARL A. BECK FOR THE NATIONAL SMALL BUSINESS ASSOCIATION

SUMMARY

1. The concept of a "normal" corporation income tax on profits of $25,000 goes back to the "Thirties." Since that time the dollar has lost almost 75% of its value. Today's technology requires proportionately larger investments by small business in plant and equipment. We believe tax equity demands that the "normal" corporate tax be applied to the first $100,000 of corporate taxable income because of (1) the depreciation of the value of money and (2) the added capital requirements of small business. The fiscal effect of increasing the level of surtax exemption from $25,000 to $100,000 is almost exactly equal to lowering the tax rate 2% on the first $1 million dollars of corporate profits.

2. Sec. 452 of H.R. 13270 restricting the use of accelerated depreciation by all corporations unduly penalizes the smaller firm. In the case of small business, investments are sporadic and any single purchase of equipment is a large percentage of the total capital invested in the business. In the case of large corporations the effect of Sec. 452 would be relatively minuscule compared with the smaller corporation. Rapid depreciation more nearly reflects the actual—and true—rate of depreciation of plant and machinery. Accelerated depreciation is vital to small business in that it allows the entrepreneur a return of capital to be reinvested thus permitting the smaller business to expand and keep modern.

3. Meaningful tax reform with respect to cooperatives is presented in S. 2646 (Ribicoff) as it places the co-ops on the same tax basis as other business enterprises, making them fully taxable on the profits which they earn. We support the provisions of S. 2646 with respect to cooperatives, and urge their substitution for Sec. 531 of H.R. 13270.

4. We support in principle, the provisions of Sec. 121 of H.R. 13270 relating to the business income of now tax-exempt organizations. Income derived by such organizations from commercial transactions in direct competition with taxpaying business should *not* be tax exempt.

5. Our proposals strengthen fiscal soundness of our nation—a basic objective of National Small Business Association—by encouraging a sound long-range build-up of a vital productive sector of our economy.

STATEMENT

Mr. Chairman and Members of the Committee:

My name is Carl A. Beck. I appear as Chairman of the Board of Trustees of National Small Business Association. I am President of the Charles Beck Machine Corporation, King of Prussia, Pa.

1. We urge that the *corporate surtax exemption be increased from $25,000 to $100,000.*

2. We recommend that Section 452 *be amended to permit the use of accelerated depreciation by small and medium-sized businesses.*

3. We endorse the *provisions of S. 2646* (Ribicoff) *with respect to cooperatives, and urge their substitution for Sec. 531 of H.R. 13270.*

4. We support, in principle, the provisions of H.R. 13270 relating to *taxation of the business income of now tax-exempt organizations.*

I. SMALL BUSINESS COMMUNITY IS BEING OVERLY PENALIZED IN PROPOSED TAX REVISION

A. *Corporate surtax exemption should be increased from $25,000 to $100,000*

Secretary of the Treasury Kennedy in his statement of September 4, 1969 to the Committee pointed out that H.R. 13270 is "weighted in favor of consumption to the potential detriment of the nation's productive investment." To his statement we would add that the detriment to the nation's productive investment would be concentrated to a large degree in the small business sector. The cumulative effect of monetary and fiscal controls with associated high interest rates, loss of the 7% investment credit, the proposed 2% increase in corporate tax rates, and the current 10% surcharge on tax rates, will be to restrict substantially investments by small business in new plant and equipment.

The competitive position of small manufacturing, wholesale and retail establishments *vis-a-vis* their big business counterparts will be adversely affected. In order to remain competitive with big business in this period of rapidly advancing technology, small business needs to modernize plant and equipment to keep pace with the giants. Incentives to investment are there—but small business must find the capital for investment either through moneys withheld in the form of profits or by borrowing. I do not think it is necessary to tell the Committee that, for all practical purposes, the credit now available to small business is both too little and too expensive. Sources of funds for small business expansion, except for money generated by the business itself, have just about dried up. SBA funds except for disaster loans and loans to minority businesses are practically non-existent at the present time. Bank loans a under 10% are all but impossible and for obvious reasons preference is given to the large borrower.

Equity financing by floating stock or bond issues in the current depressed market is not attractive because of the high premium which the small corporation must pay in brokerage fees, legal fees, high interest and low stock prices.

What is left? Reinvestment of the profits from the business.

We believe that as a matter of tax equity and long-range social and economic policy, this Committee must make an adjustment to the proposed Tax Reform Act to make it possible for small business to generate sufficient capital from income to be able to continue to make investments in new plant and equipment. "Free enterprise" in this time of economic readjustment must not be made to absorb disproportionately the government-imposed disincentives to economic growth, efficiency and modernization. We would prefer, obviously, that the 7% investment credit be retained up to say $50,000 per year, but since the Administration is determined that the investment credit be sacrificed, we most urgently recommend to the Committee that relief in the form of an adjustment to the corporate surtax structure be adopted.

The concept of giving small business preferential treatment by permitting it to retain a larger proportion of its income to be reinvested for growth is not new. The concept of a "normal" corporation income tax on profits of $25,000 or less with a surtax on corporate profits of over $25,000 goes back to the "Thirties." Since that time the dollar has lost almost 75% of its value. In addition today's technology requires proportionately larger investments by small business in plant and equipment.

Therefore, the depreciation of the value of money plus the added capital requirements of small business, argue that the surtax should not apply until the $100,000 level is reached.

We believe that in the light of the current surcharge of 10% and the repeal of the investment credit, tax equity demands that the small corporation be given some additional tax advantages. We recommend that the "normal" corporate tax be applied to the first $100,000 of corporate taxable income in lieu of restructuring the corporate surtax currently in the law.

The fiscal effect of increasing the level of surtax exemption from $25,000 to $100,000 is almost exactly equal to lowering the tax rate 2% on the first 1 million dollars of corporate profits. In the first case the government would lose *approximately $19,500 in taxes (that is, $75,000×26%=$19,500); in the latter case the government would lose $20,000 (2%×$1 million=$20,000).*

From the standpoint of the small business community, we believe it is in the national interest to have an additional $20,000 become available for investment to each corporation making less than $100,000 in profits rather than having it available to the corporation making $1 million. Corporations with incomes in excess of $1 million, from the standpoint of tax equity, should not be given under the Tax Reform Bill a tax position preferable to that which they currently enjoy. Disincentives to investment and expansion should fall most heavily on those corporations best able to absorb them. Incentives to investment and expansion should be given to those corporations most needful of them, and this would be accomplished by increasing the level of surtax exemption from $25,000 to $100,000.

B. Accelerated Depreciation Is Needed by Small Business to Keep Growing and to Keep Competitive

In addition to the possible loss of the investment tax credit and the continuation of the tax surcharge, additional hardships on the small business community would be created by enactment of H.R. 13270 in its present form.

The effect of Sec. 452 of the Tax Reform Bill restricting the use of accelerated depreciation by all corporations would be to severely penalize the logical and legitimate objectives of investor-owners of small business corporations to grow and keep modern through reinvestment of equity capital.

In the case of small business, investments are sporadic and any single purchase of equipment is a large percentage of the total capital invested in the business. The "return of capital" in excess of earnings and profits in essence makes more of the small entrepreneur's capital investment available for reinvestment in his company. This provides a source of self-generated growth capital for small business, which otherwise must seek to obtain the capital from some other source, or do without it.

In the case of large corporations, there is constant long-range investment of new capital and the effect of Sec. 452 of the Bill would be relatively minuscule compared with the effect on the smaller corporation. The averaging of depreciation rates by the large corporation results in long-term depreciation which is not substantially different than straight-line depreciation. However, there will be the transitional effect of adjustment of accelerated depreciation to straight-line depreciation.

Rapid depreciation methods were adopted originally in the interest of the small business man to permit quick recoupment of capital for reinvestment, because accelerated depreciation methods more nearly reflect the actual—that is, the true—rate of depreciation of plant and machinery. To keep growing and to keep competitive, the small business rate of reinvestment should at least reflect, or exceed, the true rate of depreciation of plant and machinery.

Congress and Internal Revenue need to be reminded continuously that no one has ever suggested that more than 100% of the value of an investment should be depreciable. To the extent that rapid depreciation rates are offset against profits and income in early years the "piper" must be paid in later years, unless, in fact profits and income generated by substantially-depreciated assets decline in proportion to the depreciation taken. In the latter case no one can really complain. In the former case the government ultimately collects its pound of flesh in the shape of an increased taxable income base.

Now we have no great argument that large corporations, real estate investment trusts, and certain other business ventures may be able to convert some ordinary income into long-term capital gains by use of accelerated depreciation, and that such income may not as "return of capital" normally find its way into capital reinvestment. However, we feel that the tax equity in such situations is being achieved and is better achieved through recapture provisions (such as those now contained in IRC Sections 1245 and 1250) than by the shot-gun approach of the Tax Reform Bill. The shot-gun approach destroys the valid objectives of accelerated depreciation as a device to permit timely modernization and replacement of capital assets by growing businesses.

II. ORGANIZATIONS COMPETING WITH PRIVATE ENTERPRISE IN THE MARKET PLACE SHOULD BE SUBJECT TO THE SAME TAXES AS PRIVATE ENTERPRISE

A. Enactment of section 121 of H.R. 13270 would help stop discrimination against tax-paying business

The earnings of tax-sheltered businesses are indistinguishable in principle from the earnings of an ordinary tax-paying corporation. The earnings are derived from precisely the same activities, and with precisely the same profit motives.

When government provides tax shelters for the profits of these exempt organizations, the government is fostering and supporting unfair competition against the tax-paying business firm.

It is not fair to permit the tax-exempt organization to run in the same competitive race with private enterprise, yet require private enterprise to drag a ball and chain.

The fact that most private enterprisers have more than held their own in such an uneven race attests to the strength of the private enterprise system. But how many private enterprisers have been forced to give up because of the unfair conditions under which they were forced to compete?

Section 121 of H.R. 13270 is a constructive step because it strengthens private enterprise, the economic foundation of this nation.

B. Taxing profits of co-ops

Meaningful tax reform with respect to cooperatives is presented in S. 2646 (introduced by Senator Ribicoff). It puts the co-op on the same tax basis as other business enterprises, making the co-op fully taxable on the profits which it earns. We endorse the provisions of S. 2646 with respect to cooperatives. We urge their substitution for Sec. 531 of H.R. 13270.

The impact on private enterprise from cooperatives is staggering. The Cooperative League of the USA boasts that:

Co-ops are the source of about 20% of supplies for farmers;

Mutual insurance is growing at about twice the insurance-industry rate;

Credit unions account for about 12%—$9.2 billion—of the installment credit outstanding in the United States;

In addition farmers market about 30% of all their products through cooperatives;

The co-op share *of all marketing* of farm products is—

67% of dairy products
38% of grain, soybeans
29% of fruit, vegetables
25% of cotton and products
14% of livestock and products
9% of poultry and products.

The co-ops account in this country for

31% of all sales of fertilizer and lime
28% of all sales of petroleum products
22% of all sales of seed
19% of all sales of feed
16% of allsales of pesticidies.

Five co-ops are among the 500 largest U.S. corporations.

They are:

Name of Cooperative	Ranking among country's corporations	Annual volume (millions)
Agway Inc., Syracuse, N.Y.	188th	$580
Farmland Industries, Kansas City, Mo	244th	372
Land O'Lakes Creameries, Minneapolis, Minn	251st	367
Cotton Producers Association, Atlanta, Ga	312th	272
Farmers Union Central Exchange, St. Paul, Minn	471st	153

A partial indication of the growth of the co-op movement is reflected in the following compilation prepared by The Cooperative League of the USA.

NUMBERS, MEMBERS, AND BUSINESS VOLUME OF COOPERATIVE AND MUTUAL ORGANIZATIONS

[Figures are for latest available year]

Kind of co-op	Purpose	Number of co-ops	Individual members	Dollar volume (thousands)	Remarks and significant trends
Consumer goods centers	Food and home supplies	[1] 826	572,501	753,844	Smaller co-op stores will be found throughout the Nation, but especially in the Great Lakes area of Minnesota and Wisconsin.
Credit unions	Thrift and credit	23,207	19,070,000	[2] 11,100,000 [3] 9,900,000	Credit unions are expanding to provide full financial services, including travelers checks, money orders, even government securities. Number of credit unions increased by 515 in 1967.
Electric co-ops	Rural electricity	924	5,000,000	896,930	About 91 percent of the co-ops' meters are on farms and in churches, schools, and business and industries. Rural electric co-ops are leading the battle to achieve rural-urban balance.
Farm credit system:					
Banks for co-ops	Credit for co-ops	13	[4] 3,000	1,700,000	Volume figures represent loans made during fiscal year 1968, an increase of 11.3 percent over fiscal 1967. At the close of the fiscal year the system's net worth was $2,000,000,000, only 6.5 percent of which was government capital.
Federal land bank associations	Long-term farm credit	686	400,000	1,300,000	
Production credit associations	Production credit	459	546,000	5,400,000	
Farm marketing	Higher returns for producers	5,100	3,760,000	12,850,000	About ¾ of all farmers are members, marketing through co-ops 25 to 30 percent of all they produce at some stage. Figures projected for 1967.
Farm purchasing	Production and home supply savings	2,900	3,060,000	3,225,000	Farmers purchase 20 percent of all farm production supplies from co-ops. Nonfarm persons also join to purchase home, garden supplies. Figures projected for 1967.
Farm service	Trucking, storage, ginning, grinding, other services.	180	35,000	330,000	In addition to co-ops primarily performing services, 68 percent of farm marketing and 53 percent of supply co-ops perform one or more services. Figures projected for 1967.
Group health plans	Prepaid health care	180	7,000,000	[illegible]0,000	These include community, consumer, union, and employee-employer sponsored plans. "Members" refers to individuals.
Housing	Homes	680	173,000	250,000	The $250,000,000 contains some payments for playgrounds, pools, and other community facilities. "Members" refers to family units.
Insurance, co-op oriented	Financial security	15	11,850,000	776,200	In addition, there are hundreds of farmers' mutuals, workmen's benefit societies, and other groups serving additional millions of members. Dollar volume is annual premium income.
Memorial societies	Dignified last rites	101	300,000	1,300	Dollar volume represents estimated savings to families. Some co-ops operate their own funeral facilities, but most contract with funeral directors or simply represent their members' wishes.
Nursery schools	Preschool child care	1,440	72,000	6,840	Parents usually do part of the work in these cooperatives, thus sharing in child-raising experiences as well as saving money.
Student co-ops	Room and board, books, social activities.	400	400,000	29,660	These estimates include cooperative bookstores, as well as the houses in which students get room or board or both.
Telephone co-ops	Rural telephone service	232	632,000	65,000	With 80 percent of America's farms now enjoying telephone service, phone co-ops emphasize upgrading service—reducing the number of party lines and parties on a line, providing dial service.

[1] Stores.
[2] Savings.
[3] Loans outstanding.
[4] Co-ops.

Source: Co-op report, September 1968.

The "big business" diversification aspect of the co-op is reflected in this report on one of the regional farm supply co-ops:

"Midland Cooperatives' membership now numbers 300,000 families through 700 affiliated co-ops. *Petroleum continued to be a major line*, with refineries producing at almost 100% capacity. *Fifty-one new wells were drilled.* Fertilizer, seed and chemical sales showed a 20% jump. *Midland's 170-unit trucking fleet is one of the nation's largest private carriers.*" (Source: Co-op Report, Sept. 1968. Emphasis supplied.)

The shelter now provided special privilege organizations, such as the co-op, is leading to the destruction of the economic tax base of this country. The exemption is a cancer feeding on tax-paying business and on the federal revenue. The Wall Street Journal in discussing farm co-ops gave this correct analysis:

"Thus the Government has created a kind of Gresham's tax law; the people who don't pay taxes drive out of business the people who do.

"Aside from the economic unfairness of saddling one group of people with high taxes and granting another group of people the right to do the same business with no like taxes to pay, there is a question about the economic soundness of any such government policy.

"Actually it comes down to this question: If all the taxpayers were driven out of business by non-taxpayers, who'd pay the taxes?" (Source: Editorial, Wall Street Journal, 4-10-58.)

We favor the placing of co-ops on the same tax basis as other business enterprises, making them fully taxable on the income which they earn. Where those earnings are subsequently distributed to owner-patrons, the owners should be taxed the same as corporate dividends are now. Senator Ribicoff has proposed this in S. 2646, and we recommend your favorable consideration of his approach to the co-op problem.

In letters to the Washington Post published on Sept. 21, 1969, spokesmen for The Cooperative League of the USA and the National Council of Farmer Cooperatives criticized Sec. 531 of H.R. 13270 as "a punitive measure (which) takes away the right of co-op members to leave some of their funds in their co-op for growth needs and to provide development capital."

The Washington Post is to be commended for putting the taxation of co-ops in proper focus. In an Editor's Note, it correctly said:

"Co-operative corporations, under present law, avoid all tax liability by paying 20 per cent of their patronage dividends to members in cash. This gives the co-ops a competitive advantage because 80 per cent of earnings can be retained for reinvestment. But the member is liable on his personal income tax report for 100 per cent of his share of the earnings. The House, therefore, proposed that the co-ops be required to pay out an additional 30 per cent in cash (phased out over a 10-year period). This would make it more likely that the patron would have enough cash to cover the tax liability on his total earnings, and at the same time would reduce the co-ops' retained earnings advantage. *But what is actually needed beyond this first step toward equity is something like the Ribicoff bill, which would levy a tax on co-ops themselves, plugging a $200 million loophole.*" (Source: WASHINGTON POST, 9-21-69. Emphasis supplied.)

We believe the Washington Post has understated considerably the size of the loophole.

The public has the right to know how many tax dollars are being avoided by co-ops and other exempt organizations in direct competition with tax-paying businesses.

The facts—not guesstimates—are available to your Committee from the Treasury Department, the Internal Revenue Service, the Farmers Cooperative Service of the Department of Agriculture, the Bureau of Federal Credit Unions, and other governmental agencies.

C. How Can Congress Justify a Policy That Perpetuates Unfair Competition and Promotes Monopoly?

Regardless of the size of the loophole, there is a more important reason for plugging the loopholes now being exploited by exempt organizations, and that reason is: how can Congress justify on a factual basis a policy that is perpetuating unfair competition and promoting monopoly?

Our Association consists of 35,000 small business units.

They are taxpayers in more than 500 categories of business—manufacturing, wholesaling, retailing, professional, and service.

Exempt organizations are competing with these taxpaying business units for the same consumer's dollar. They perform the same commercial function as the taxpaying business unit. But because of their tax loophole, they pay relatively no taxes. Thus they can afford to cut prices to gain a greater stranglehold on the market; or they can use their profits for expansion; or they can use their profits to acquire competitors (primarily small business units). The end result is the same: less competition and a trend toward monopoly.

The immediate damage to small business, and to the public welfare, is obvious. The long-range damage to the private enterprise system, the economic foundation of this country, can be disastrous.

III. OUR PROPOSALS PROMOTE FISCAL SOUNDNESS

Although precise figures are unavailable to us, it is our belief that plugging only those loopholes mentioned in this statement would more than offset raising the surtax exemption from $25,000 to $100,000.

Fiscal soundness is essential to our nation and we propose nothing to weaken it.

On the contrary, we believe our proposals will strengthen fiscal soundness by encouraging a sound long-range build-up of a vital productive sector of our economy.

Thank you for the opportunity to present our views.

The CHAIRMAN. Thank you very much, sir.

Senator CURTIS. Mr. Chairman, one question.

Do I understand that what you are proposing is that the deduction be put on the normal corporate tax and not the surtax?

Mr. BECK. No, sir. We are proposing that the point at which the surtax applies first be raised from $25,000 to $100,000, and that only the normal 22-percent tax apply up to $100,000, and the 26-percent surtax begin to take over from $100,000 up.

Senator CURTIS And no change in the rates?

Mr. BECK. No, sir; we are recommending no change in the rates at this time. Like everyone, we are for tax reduction, but we do not feel that this is the time that tax reduction should be encouraged.

Senator CURTIS. That is all.

The CHAIRMAN. Thank you very much.

Senator MILLER. Mr. Chairman, I just want to make a comment. I think the suggestion is a very constructive suggestion. I like the idea that you have of a tradeoff which nets the same revenue to the Treasury, and I think that is something that we ought to consider very carefully.

Mr. BECK. May I just add to that please Senator Miller. You are correct that the proposal to increase the surtax exemption to $100,000 would be almost an exact tradeoff for lost revenue from the Treasury proposal to decrease corporate tax rates 2 percent. However, in addition, our proposal to close tax loopholes now afforded to tax-exempt cooperatives, would generate, we believe, sufficient additional revenue to offset the estimated $1.49 billion revenue loss entailed in either our own proposal or the Treasury proposal. We have no way of estimating the amount of revenue from tax-exempt cooperatives, but we well think it would be at least equal to if not greater than $1.49 billion.

Senator MILLER. I understood that your reply to Senator Curtis indicated that it did amount to a tradeoff, by increasing the point for the surtax exemptions to apply from $25,000 to $100,000, we are going to lose some revenue, but on the other hand by not lowering the overall rate by one point and then two points as Treasury has recommended, we are going to gain some revenue, and so that the net amount to the Treasury is going to be the same.

Mr. BECK. Except, sir, that in addition closing the tax loopholes for the cooperatives and the tax-exempts will, we think, provide an additional amount of extra revenue of perhaps $1.5 billion, but we have no figures available as your committee undoubtedly does, as to what these figures might be. So we are saying that there is more gain than just a tradeoff.

Mr. KILCULLEN. May I have just one moment to make a point. As Mr. Beck said I represent the Conference of American Small Business Organizations which is somewhat of a sister organization to the National Small Business Association. We would like to express this particular point, and I have a statement which I would like to offer. It is a very short statement.

If genuine tax reform is to be accomplished by the present Congress recognition must be given to the need for tax relief for small business. This important segment of our national economy has been all but ignored throughout the lengthy deliberations on H.R. 13270 in the House of Representatives, and the Senate now has the opportunity and the duty to correct this grave oversight.

The accelerating trend in recent years toward concentration of business activities in large corporate entities has resulted in a steady erosion of the small business community. Among the factors responsible for this are the excessive burden of taxes imposed by Federal, State, and local governments, and the diminishing amount of reinvestment capital available to the small businessman to keep his business going.

The tax burden of the American small businessman is disproportionately greater than that of his counterparts in other countries. In addition to the massive Federal income tax which takes away roughly 50 percent of every profit dollar, he must also pay State income taxes, State and local taxes on equipment and property, business franchise taxes, payroll taxes, including social security and unemployment compensation taxes, various excise taxes and use taxes, and any other form of tax that the fertile minds of the taxing authorities can invent.

While large corporations can pass the tax burden along to the consumer in the price of goods and products produced it is frequently impractical or economically unfeasible for small business firms to increase the price of their goods and services, and all too often the small firm ends up absorbing additional taxes through a reduction of its level of return.

For sound business reasons most small business firms must adopt a corporate form although this necessarily carries with it somewhat heavier tax consequences than would an individual proprietorship or partnership. Without a corporate form it would be impossible in most instances to obtain equity financing, or other forms of capital required. All businesses today must continually modernize their plant and equipment and improve their business technology in order to remain competitive. The need for investment capital for such purposes is a continuing and vital problem for the small businessman, but his sources of capital are much more limited than those of the large corporations. Because of this the costs of modernizing and improving his business technology must come largely from reinvestment of the profits from the business.

H.R. 13270 not only fails to take into account the small businessman's continuing need for reinvestment capital but would accentuate his present problems by eliminating the relatively small advantage of the 7-percent investment credit. In our view this is the exact reverse of the direction the Congress should be taking to accomplish sound and equitable tax reform.

The most direct and uncomplicated method of providing equitable tax relief to small business would be to raise the corporate surtax exemption base from its present level of $25,000 to a substantially higher level. This level should, we feel, be $100,000 if it is to provide any substantial tax relief to that segment of small business which needs it most. At present a firm with net taxable income of $100,000 pays a whooping $45,650 in Federal income tax (including the 10 percent surcharge), and several thousand dollars more in State income taxes. This is such an unfair tax burden that its effect is to discourage initiative and effort by the small entrepreneur. After he has taken all the risks, invested his time and skill, and done all the work, his noncontributing partner, the Government, comes along and takes half of all the earnings. Such a grossly unfair arrangement would have shocked the conscience of previous generations of Americans, but we now accept and tolerate it as a built-in condition of business life.

By any fair measure the Government's share of the small businessman's earnings should not exceed 25 percent of the first $100,000. A business with earnings above that level can, for the most part, support a higher percentage of tax, although we cannot agree that the present 48 percent rate is fair and reasonable. Our immediate concern, however, is that some relief be given in the lower brackets of small business earnings, and we urge this committee and the Senate to accomplish this by raising the present corporate surtax exemption.

Thank you, Mr. Chairman.

The CHAIRMAN. Thank you, sir.

The next witness is Mr. Robert G. Skinner, executive committee, division of federal taxation, American Institute of Certified Public Accountants.

Mr. Skinner, you have a statement here that is over 100 pages in length which I do think we ought to carefully study. I regret that you are limited to 10 minutes to summarize the statement because I know that you are in a position to give us some very fine advice.

Our staff has carefully studied what you have prepared for us, and it will be considered, but unfortunately I think you understand our predicament. We are committed, at least I am, to try to report a bill by October 31, and under the pressure of the circumstances we will have to hear you briefly.

STATEMENT OF ROBERT G. SKINNER, EXECUTIVE COMMITTEE DIVISION OF FEDERAL TAXATION, AMERICAN INSTITUTE OF CERTIFIED PUBLIC ACCOUNTANTS, ACCOMPANIED BY HERBERT FINKSTON

Mr. SKINNER. Thank you. We will keep our remarks to 10 minutes.

The CHAIRMAN. As a matter of fact, our staff has summarized your statement and the summary runs four pages itself.

Mr. SKINNER. I am a member of the executive committee of the American Institute of Certified Public Accountants. I am accompanied by Mr. Herbert Finkston, who is a member of the institute's tax staff.

We are appearing today, of course, on behalf of the institute.

As you may know, the AICPA is the sole national organization of professional certified public accountants. It was established in 1887, and it currently has approximately 70,000 members.

As the others have stated, we also appreciate this opportunity to express our views on the vital issue of tax reform. We have prepared for consideration by your committee a detailed analysis and a summary of our comments on selection provisions of the tax reform bill.

In addition, we firmly believe that any continuing effort in pursuit of tax reform at this time should also include consideration of substantive technical amendments of the Internal Revenue Code which perpetuate inequities, which give unintended benefits and which create unintended hardships.

The tax division of the institute has prepared a booklet entitled "Recommendations for Amendments to the Internal Revenue Code," which lists and explains a number of substantive technical proposals which we believe should be enacted into law.

We would appreciate it if both our summary and our detailed presentation together with our booklet and these oral comments are included in the record of these hearings.

While there was some disagreement within our tax division on the merits of the various provisions of the House bill, there was one conclusion on which agreement was unanimous—the incredible complexity of the legislation.

Provisions such as those dealing with private foundations, farm losses, the foreign tax credit and the limit on tax preferences will prove to be very difficult to apply and to administer. In many cases proposed changes contained in the bill do not replace current sections of the law. Instead, the new proposals would further complicate an already too complex self-assessment tax system.

One of the services performed by our institute members in their accounting practices is tax return preparation. CPA's probably prepare the bulk of tax returns filed in the United States which are not considered simple. We are very seriously concerned that the overall effect of this reform bill as it now stands will be overwhelming, and it may even lead to some noncompliance.

We urge your committee to carefully weigh the reform objectives sought here in light of the burden that the House proposals would impose on this Nation's taxpayers, as they seek to interpret and comply with them.

In the remaining time available for us today, we would like to emphasize three additional measures that we feel should be included in any tax legislation approved by your committee this year.

There has been a significant and widespread increase in the efforts of revenue agents to tax advance payments and deposits for both goods and services, without regard to the matching of related costs and without regard to whether these advances are refundable. Adjustments of this nature proposed by revenue agents have been stimulated by a series of recent court cases, in which the Commissioner has been sustained in taxing advance payments from the sale of goods rather than just the income from these sales.

In effect, these cases hold that upon receipt of the sales price, or any part of it, the amounts so received must be included in taxable income. Only when the merchandise is subsequently shipped or delivered, or when title passes to the customer, is a deduction allowed for the related costs.

The fact that these two events take place in different years, distorting the income of both years, has been disregarded. One circuit court has held that inclusion in gross income of the entire amount of advance payments, without an allowance for related cost of goods sold, would constitute taxation of the return of capital. Nevertheless, the circuit court affirmed the decision of the Tax Court because the taxpayer did not establish an amount for the cost of goods sold applicable to the advance payments.

The treatment that the courts have approved in this area violates the annual accounting concept which requires the matching of revenue with related costs and expenses. The courts have, in effect, completely disregarded this principle.

The seriousness of this problem should not be underestimated. It is altogether possible that unless relief is granted in this connection, some manufacturers could be taxed out of existence.

Several years ago Congress assisted in the resolution of a similar problem. Automobile clubs had been accounting for dues revenue ratably over the period to which the dues applied. The Commissioner proposed that dues revenues should be recognized in the year received and that the related expenses should not be deductible until later years when they were actually incurred.

The courts supported the Commissioner's treatment which was completely contrary to the accounting principle of matching revenue with related costs and expenses. As a result, section 456 was eventually enacted to remedy the problem. Section 455 provides similar treatment for prepaid subscription income.

Our tax division urges Congress to take similar action regarding the taxation of advance payments for merchandise. We propose that section 451 of the code be amended by adding a new subsection which would simply provide that payments received for goods sold by a taxpayer in the ordinary course of his trade or business should be included in income in the year in which the sale takes place.

For this purpose the method of accounting regularly employed by the taxpayer in keeping his books should be determinative.

Alternatively, section 451 could be amended to make it clear that gross income from the sale of merchandise or other property is the gain from such a sale and not the gross receipts from the transaction.

Section 367 of the code provides that certain provisions of subchapter (c) (covering liquidations of controlled subsidiaries, transfers to controlled corporations and specified reorganization exchanges and distributions) will not be applicable to foreign corporations unless, prior to the transaction, the Secretary of the Treasury or his delegate determines that the transaction is not in pursuance of a plan having as one of its principal purposes the avoidance of Federal income taxes.

The Secretary of the Treasury or his delegate should be given statutory authority to make a determination after an exchange that the exchange was not in pursuance of a plan having as one of its principal purposes the avoidance of Federal income taxes.

Notwithstanding the similarity of purpose and structure of code section 367 and sections 1491 and 1492, section 1494(b) provides that the tax otherwise imposed by section 1491 may be abated, remitted or refunded if, after the transfer, it is established to the satisfaction of the Secretary or his delegate that the proscribed tax avoidance purpose did not exist. Legislative history discloses no reason for withholding similar relief from the impact of section 367 which, because it requires a ruling in advance of the exchange has been and continues to be a trap for the unwary.

Moreover, recent experience has indicated that rulings under section 367 have been delayed for 6 months and longer, even where the Internal Revenue Service has agreed to expedite the case, resulting in expensive hardships for taxpayers.

The cost of purchased goodwill, trademarks, trade names and other similar intangible assets should be amortizable over a stated period fixed by statute to the extent that these costs are not otherwise deductible under other sections of the code.

Under present law a taxpayer can amortize costs of this nature only if a definitely determinable useful life can be established, or failing that, upon proof of the abandonment of the asset. Many court decisions and Internal Revenue Service rulings have held that no amortization is allowable where these tests are not met, even though the value of the intangible asset obviously has been impaired.

We recommend an amendment of the code provide that if a definite life cannot be determined for a purchased intangible asset, its cost can be amortized over a period of 10 years or, at the election of the taxpayer, over a longer period.

Section 1245 should provide, if it does not now do so, for recapture of amortization when the intangible asset is sold or otherwise disposed of in a transaction covered by that section.

We have presented our recommendations, both oral and written, with the hope that they will prove helpful. If it should appear that our tax division could assist you or your staff in your analysis of the various proposals, we would be pleased to do so in any way that you might wish.

Thank you for giving us this opportunity to present our comments to you.

The CHAIRMAN. Thank you very much. We have quite a bit of testimony concerning what you are saying.

I am impressed that you represent the group that ought to be able to understand all of the complexities of the tax law as well as anybody because you work with it every day. I made the statement in opening these hearings that what the House has sent us is 368 pages of bewildering complexity. Is that what you find?

Mr. SKINNER. I would agree with that. We say without any regard to selfinterest, although we probably can understand it almost as well as anyone can, that we think it is wrong for a self-assessment system to require so much professional assistance by the people who are assessing themelves.

The CHAIRMAN. The old people came in here trying to explain their retirement income and they said no two accountants or two lawyers could figure out what some poor old man owes and arrive at the same conclusion. You are aware of that statement?

Mr. SKINNER. I am not aware of it specifically but I can understand and sympathize with it.

The CHAIRMAN. That reminds me of the compromise we finally worked out when we were trying to tax foreign income some years ago. By the time we got through with it some of the best lawyers in America told me you could take any team of lawyers and accountants and put them to work on any corporation's tax problems, and no two sets of lawyers and accountants who could arrive at the same dollars and cents figure. They said there is no way on earth you could read that language and have two inteligent men working independently arrive at the same conclusion.

Mr. SKINNER. I think that is a perfect example of the results that you achieve with the complexities that we have. I agree with that.

Senator CURTIS. I have a question or two.

I noticed by the summary you support clarification of the provision relating to farm losses?

Mr. SKINNER. Yes, sir.

Senator CURTIS. Are you willing to apply it to all businesses?

Mr. SKINNER. Certainly we would.

Senator CURTIS. To all businesses. In other words, you will apply the rule to all businesses that over a period of years and have continued losses, that those losses be disallowed?

Mr. SKINNER. No. Perhaps I misunderstood the question. I thought you said clarification and simplification of the areas. The thrust of our comments in the farm loss area was with reference to complication and clarification.

Senator CURTIS. I think it is without question that the farmers are treated in the way that no other business is by the House bill.

I would like to also ask you this question. I know of a college fraternity that its national office has an endowment fund that every member makes a contribution to when he belongs to the fraternity. This money is used predominantly to make loans, to build chapter houses, chapters located on the college or university campuses.

These local chapters pay interest for the use of this money. We are in a situation where the Federal Government is spending money and making loans for college housing, that here we have a fraternal organization, but do I understand your statement that you would tax that fraternal organization even though no profit accrues to anybody?

Mr. SKINNER. I do not know that our statement covers that. Is this in the exempt organizations area?

Senator CURTIS. I find right here it says "taxation of investment income of social, fraternal and similar organizations" that you support it.

Mr. SKINNER. We would support generally the unrelated business income proposals to the extent——

Senator CURTIS. No, this is an investment income. Now maybe the summary is wrong, I do not know. It is found on page 10.

Mr. SKINNER. On page 44 of our prepared testimony we state this: that "(t)he bill provides for the taxation (at regular corporate rates) of investment income and other unrelated income of social clubs, fraternal beneficiary associations, and voluntary employees' beneficiary associations. This will not apply, however, to such income of fraternal beneficiary associations and voluntary employees' beneficiary associations to the extent it is set aside to be, used only for the exempt insurance function of these organizations and for charitable purposes. If in any year an amount is taken out of the set-aside and used for any other purpose, the amount taken out will be subject to tax in such year."

Our executive group is made up of nine people. We require a two-thirds vote to act. Our executive group agreed to support the House proposals in this area without specific comment.

Senator CURTIS. What you have submitted here is arrived at by nine people?

Mr. SKINNER. Yes. These are the members of our executive group. However, they have the authority under the organization of our institute to evaluate comments.

I might add that the comments were studied in detail by subcommittees and special groups of tax specialists who spend their full time in working with tax measures.

Senator CURTIS. I will ask you personally. Do you favor the taxation this college fraternity as I mentioned where their sole investment is helping their chapters acquire housing for students to live in, and in turn they pay interest on it? Now, would you tax that?

Mr. SKINNER. Personally, I would see no reason why that should not be taxed, provided it was offset by all related expenses. I am speaking now of a fraternity as separate and apart from the educational institution itself.

Senator CURTIS. That is all.

Senator MILLER. I would like to ask a question on these comments of yours relating to corporate mergers and the interest deduction matter. I am inclined to agree with your observations. But as I understand it, on some of these transactions the investor receives not only a debenture but he receives a warrant. Now, he is content to receive the debenture paying a lower rate of interest than some other kind of debenture which is not convertible, because that warrant could be sold and of course if he held it long enough he gets capital gains, so it offers a gimmick whereby he can in effect convert interest income into capital gain.

In a situation like that, whether it is with respect to a merger or any other type of financing, it is an across-the-board approach, would you support a provision which would require that any profit made from the sale of such warrant shall be treated as ordinary income?

Mr. SKINNER. Senator Miller, I observed your comments earlier here, and I might add that I think that a big part of the solution to problems in this area would be a much clearer definition of the differences between equity capital and borrowed capital or debt.

Senator MILLER. This would be one way to tackle that?

Mr. SKINNER. That is right. I agree with that, and I agree with you, or I think I agree with you, that an approach to the objections to conglomerate mergers, wheeling and dealing, and mergers and acquisitions in our society today ought to be tried somewhere other than through the tax laws before we resort to this.

Senator MILLER. Yes; but do you agree with me that in the example I gave you, that the sale of that warrant could well be taxed as ordinary income?

Mr. SKINNER. Yes; I think that this would be appropriate under those circumstances.

Senator MILLER. Whether it is involved in a merger or something else?

Mr. SKINNER. Yes.

Senator MILLER. It does not make any difference?

Mr. SKINNER. It gets again down to the essence of what the nature of the asset is. Is it equity or is it debt?

Senator MILLER. Thank you.

The CHAIRMAN. Thank you.

(Robert G. Skinner's prepared statement with attachment follows. Oral testimony of the next witness commences at page 4846.)

STATEMENT OF ROBERT G. SKINNER

My name is Robert G. Skinner. I am a member of the Executive Committee of the Division of Federal Taxation of the American Institute of Certified Public Accountants. I am accompanied by Herbert Finkston, a member of the Institute's tax staff. We are appearing here today on behalf of the Institute.

The AICPA is the sole national organization of professional CPAs. It was established in 1887 and currently has approximately 70,000 members.

We appreciate the opportunity to express our views on the vital issue of tax reform. We have prepared for consideration by your Committee a detailed analysis and a summary of our comments on selected provisions of H.R. 13270. In addition, it is our firm belief that any continuing effort in pursuit of tax reform at this time should also include consideration of substantive technical amendments of existing provisions of the Internal Revenue Code which perpetuate inequities, give unintended benefits and create unintended hardships. The Tax division of the Institute has prepared a booklet entitled "Recommendations for Amendments to the Internal Revenue Code" which lists and explains a number of substantive technical proposals which we believe should be enacted into law.

We would appreciate it if both our summary and detailed presentation together with our booklet and these oral comments are included in the record of these hearings.

While there was some disagreement within our Tax Division on the merits of various provisions of the House Bill, there was one conclusion on which agreement was unanimous—the incredible complexity of the legislation. Provisions such as those dealing with private foundations, farm losses, the foreign tax credit and the limit on tax preferences will prove to be very difficult in application and administration. In many cases proposed changes contained in the Bill do not replace current sections of the law; instead, the new tax reform proposals would further complicate an already too complex self-assessment tax system.

One of the services performed by Institute members in their accounting practices is tax return preparation. CPAs probably prepare the bulk of tax returns filed in the United States which are not considered simple. We are seriously concerned that the overall effect of this reform Bill will be overwhelming and may even lead to noncompliance. We urge your Committee to carefully weigh the reform objectives sought here in light of the burden that the House proposals would impose upon this nation's taxpayers as they seek to interpret and comply with them.

In the remaining time available today, we would like to emphasize three additional measures that we feel should be included in any tax legislation approved by your Committee this year.

TAXATION OF PAYMENTS FOR MERCHANDISE OR OTHER PROPERTY RECEIVED PRIOR TO THE OCCURRENCE OF SALE

There has been a significant and widespread increase in the efforts of Revenue Agents to tax advance payments and deposits for both goods and services without regard to the matching of related costs and without regard to whether these advances are refundable. Adjustments of this nature proposed by Revenue Agents have been stimulated by a series of recent court cases in which the Commissioner has been sustained in taxing advance payments from the sale of goods rather than just the income from these sales.

In effect, these cases hold that upon receipt of the sales price, or any part of it, the amounts so received must be included in taxable income. Only when the merchandise is subsequently shipped or delivered, or title passes to the customer, is a deduction allowed for the related costs. The fact that these two events take place in different years, distorting the income of both years, has been disregarded. One Circuit Court has held that inclusion in gross income of the entire amount of advance payments, without an allowance for related cost of goods sold, would constitute taxation of the return of capital. Nevertheless, the Circuit Court affirmed he decision of the Tax Court because the taxpayer did not establish an amount for the cost of goods sold applicable to the advance payments. The treatment that the courts have approved in this area violates the annual accounting concept which requires the matching of revenue with related costs and expenses. The courts have, in effect, completely disregarded this principle. The seriousness of this problem should not be underestimated. It is entirely possible that unless relief is granted in this connection, some manufacturers could be taxed out of existence.

Several years ago Congress assisted in the resolution of a similar problem. Automobile clubs had been accounting for dues revenue ratably over the period to which the dues applied. The Commissioner proposed that dues revenue should be recognized in the year received and that the related expenses should not be deductible until later years when they were actually incurred. The courts supported the Commissioner's treatment which was completely contrary to the accounting principle of matching revenue with related costs and expenses. As a result, section 456 was eventually enacted to remedy the problem. Code section 455 provides similar treatment for prepaid subscription income. Our Tax Division urges Congress to take similar action regarding the taxation of advance payments for merchandise.

We propose that section 451 of the Code be amended by adding a new subsection which would simply provide that payments received for goods sold by a taxpayer in the ordinary course of trade or business shall be included in income in the year in which the sale takes place. For this purpose the method of accounting regularly employed by the taxpayer in keeping his books shall be determinative.

Alternatively, section 451 could be amended to make it clear that gross income from the sale of merchandise of other property is the *gain* from such a sale and not the *gross* receipts from the transaction.

RELAXATION OF REQUIREMENTS FOR ADVANCE RULINGS REGARDING TRANSACTIONS INVOLVING FOREIGN CORPORATIONS

Section 367 of the Code provides that certain provisions of Subchapter C (covering liquidations of controlled subsidiaries, transfers to controlled corporations, and specified reorganization exchanges and distributions) will not be applicable to foreign corporations unless prior to the transaction the Secretary of the Treasury or his delegate determines that the transaction "is not in pursuance of a plan having as one of its principal purposes the avoidance of Federal income taxes."

The Secretary of the Treasury or his delegate should be given statutory authority to make a determination *after* an exchange that the exchange was not in pursuance of a plan having as one of its principal purposes the avoidance of Federal income taxes.

Notwithstanding the similarity of purpose and structure of Code section 367 and sections 1491 and 1492, section 1494(b) provides that the tax otherwise imposed by section 1491 may be abated, remitted or refunded if, after the transfer, it is established to the satisfaction of the Secretary or his delegate that the proscribed tax avoidance purpose did not exist. Legislative history discloses no reason for withholding similar relief from the impact of section 367 which, because it requires a ruling in advance of the exchange, has been and continues to be a trap for the unwary.

Moreover, recent experience has indicated that rulings under section 367 have been delayed for six months and longer—even where the Internal Revenue Service has agreed to expedite the case—resulting in expensive hardships for taxpayers.

AMORTIZATION OF INTANGIBLE ASSETS

The cost of purchased goodwill, trademarks, trade names, secret processes, formulas, licenses and other similar intangible assets should be amortizable over a stated period fixed by statute to the extent that these costs are not otherwise deductible under other sections of the Code.

Under present law, a taxpayer can amortize costs of this nature only if a definitely determinable useful life can be established or, failing that, upon proof of the abandonment of the asset. Many court decisions and Internal Revenue Service rulings have held that no amortization is allowable where these tests are not met—even though the value of the intangible asset obviously has been impaired.

We recommend an amendment of the Code to provide that if a definite life cannot be determined for a purchased intangible asset, its cost can be amortized over a perid of 120 months or, at the election of the taxpayer, over a longer period.

Section 1245 should provide, if it does not now do so, for recapture of amortization when the intangible asset is sold or otherwise disposed of in a transaction covered by that section.

We have presented our recommendations with the hope that they will prove helpful. If it should appear that our Tax Division could assist you or your staff in your analysis of the various proposals, we would be pleased to do so in any way that you wish. We appreciate this opportunity to present our comments to you.

SUMMARY OF COMMENTS ON H.R. 13270, THE TAX REFORM ACT OF 1969

This summarizes our views on selected provisions of H.R. 13270. The Division of Federal Taxation supports many of the provisions of the Bill. This summary will be confined to those provisions where difficulties are perceived.

PRIVATE FOUNDATIONS

While we agree with the intention of the Bill to curb abuses by private foundations, we are unable to express a consensus of opinion on the provisions of the Bill regarding private foundations. However, we do support the prohibitions on self-dealing.

The Bill in this area is comprehensive and extremely complex. So much so that it is difficult to determine whether the abuses sought to be corrected will be accomplished without unnecessarily restricting the appropriate activities of private foundations. Equally difficult to determine without extensive analysis are the socio-economic consequences which may result from the enactment of the present provisions of this Bill.

Notwithstanding our inability to express a consensus of opinion on the private foundation provisions of the Bill, we hope that the following suggested modification will assist your Committee to properly evaluate the House proposals in this area.

1. The tax on investment income should be limited to the extent it is intended to raise revenue. It should not be imposed as a "user" fee.

2. While it is difficult to object to the imposition of the proposed tax on termination of exempt status for willful repeated acts or for a willful and flagrant act (proposed Code section 507), the computation of the aggregate past tax benefits is too complicated and seems unnecessary in view of the circumstances under which the tax would be imposed.

3. The tax on failure to distribute (proposed Code section 4942) requires that allowance for amounts set aside for future projects be established to the satisfaction of the Internal Revenue Service at the time they are set aside. In view of the penalties for failure to distribute, the Service will be able to prevent the setting aside of amounts merely by failing to act on applications or through the manner in which information supporting the amounts set aside

is required to be filed. Foundations should be permitted to support these "set-asides" later.

4. The Bill limits to 20 percent the combined ownership of the corporation's voting stock which may be held by the foundation and all disqualified persons. We believe that this percentage limitation should be 35 percent.

5. The tax on investments which jeopardize charitable purposes (proposed Code section 4944) is too punitive considering the subjective nature of the act that would give rise to the tax. Any investments that experience a loss in value would be regarded by some as having jeopardized the exempt purposes. As a minimum, there should be a "correction period" as provided in proposed Code section 4941(e)(4).

6. The attribution rules included in proposed Code section 4946(a)(3) for determining "disqualified persons" should be modified to follow the rules of section 318(a) rather than Code section 267(c), or section 267(c)(3) should be modified to apply only to partners having an interest of 10 percent or more.

OTHER EXEMPT ORGANIZATIONS

1. Clay B. Brown Case

Section 121(d) of the Bill is intended to deal with the *Clay B. Brown* problem. However, it seems unnecessarily harsh in attempting to tax all debt-financed income. As an alternative, the present exemption from the unrelated business income tax for rents from personal property leased with realty could be eliminated. This would prevent *Clay Brown*-type transactions by taxing the rent from any lease for whatever term where personal property constitutes more than an incidental or insubstantial portion of the property subject to the lease.

2. Extension of Unrelated Business Income Tax

The Bill would extend the tax on unrelated business income to additional exempt organizations, including churches, social welfare organizations, social clubs and fraternal beneficiary societies. To the extent these organizations operate business enterprises that are unrelated to their exempt purposes, they are permitted to compete unfairly with taxable entities. We support the extension of the tax in these circumstances; however, we recommend that the specific deduction allowed in the determination of unrelated business income be raised from $1,000 to $5,000. This should eliminate much of the burden of compliance by the organizations and audit by the Internal Revenue Service.

In the case of social clubs, the Bill proposes that income from nonmember activities should be taxed. Allocation of income and expenses between member and nonmember activities will present difficult accounting and definitional problems that should be provided for more clearly.

3. Advertising Income Derived From Periodicals of Exempt Organizations

Section 121(c) of the Bill proposes to make clear that the regulations promulgated in December 1967 by the Treasury Department are in accordance with the intent of the present Congress. We believe that these regulations, in which the advertising activities of a periodical published by an exempt organization are singled out for treatment as an unrelated business, are unrealistic in concept. Further, we believe that it is possible for both the advertising and editorial content of certain of these periodicals to be functionally related to the exempt purposes of the organization. Accordingly, we believe that section 512 or 513 should be amended to incorporate the following concepts:

a. A trade or business should be defined along vertically integrated lines so that advertising activity, alone, cannot constitute a trade or business.

b. If the activities of such defined trade or business are functionally related to the purposes for which an organization has been granted exemption, this trade or business should not be characterized as unrelated to the exempt purposes of the organization.

This approach should prevent the unfair competition that was in the original target of Congress in enacting the tax on unrelated business income.

CHARITABLE CONTRIBUTIONS

With respect to sections 201(c) and (d) of the Bill regarding charitable contributions of appreciated property, we do not favor the distinction drawn between gifts to public and gifts to private foundations. It is our view that contributions of such property should be treated in the same manner without regard to the type of charitable recipient.

FARM LOSSES

We agree with the intended purpose of the proposed legislation to curb abuses of capital gain provisions coupled with the use of losses from farming operations. On the other hand, we believe that the language of section 211 of the Bill is so sweeping that it will affect more taxpayers than intended.

To illustrate, section 211 applies to all taxpayers who, with respect to any taxable year, (1) incur a farm net loss, *or* (2) have a balance in the excess deductions account at the close of the taxable year. An addition to the excess deductions account for a current year's farm loss is not required if (1) nonfarm adjusted gross income is $50,000 or less, and (2) the farm net loss is $25,000 or less. However, it appears that the $50,000/$25,000 de minimis exceptions do not apply to excuse application of section 211 in the face of a current year's loss, no matter how small (proposed Code section 1251(a)(1). Should this be the case, section 211 would apply to all taxpayers incurring a current farm loss, with the result that a great many farmers would be faced with loss of capital gain benefits if they did not elect to adopt certain accounting methods.

To remedy this apparent defect, we recommend that the Bill be clarified so that there is no doubt that the $50,000/$25,000 de minimis exceptions apply also in the case of farm net losses for the current taxable year.

HOBBY LOSSES

We agree with the intended purpose of the proposal for dealing with so-called hobby losses. In our judgment, however, the proposed provisions should be modified to the following extent:

1. The $25,000 excess of deduction over gross income should be changed to $50,000 (proposed Code section 270(b)).
2. Wherever it appears throughout the section, the term "activity" should be changed to "trade or business."
3. The application of this proposal should be limited to individual taxpayers.

LIMITATION ON DEDUCTION OF INTEREST

We do not agree with the proposed limitation on the deduction of interest on funds borrowed for investment purposes. It has long been an established general principle of economics, accounting and taxation that express incident to the production of income are deductible from such income. This legislative proposal in a sense represents an artificial and arbitrary mutation of this principle which would tend to discourage the assumption of risk and the investment of capital—both of which have been important factors in the growth and development of our economic system. Furthermore, it would constitute an inconsistent exception to the cash receipts and disbursements method of accounting under which expenses are deducted when they are paid and income is taxed when it is received.

If, however, this proposed amendment of the Code is enacted in basically its present form, it is suggested that the limitation be made applicable at both the corporate and the shareholder level in the case of Subchapter S corporations.

MOVING EXPENSES

The Bill modifies the present treatment of job-related moving expenses by broadening the categories of deductible moving expenses, by providing that reimbursed employees are to be treated in the same manner as unreimbursed old employees and new employees, and by refining the requirements which must be met for the deduction to be available. We believe that the dollar limitations on amounts of certain of these deductions are unrealistic in today's economy and that they should be increased. We also believe that the deductions provided for should be extended to self-employed taxpayers and to partners.

Furthermore, we urge that the moving expense proposals be made effective for taxable years beginning on or after January 1, 1964.

LIMIT ON TAX PREFERENCES

The provisions of the Bill placing a limit on tax preferences would impose a tax by indirect means on amounts which presently are fully or partially tax exempt. We agree that public confidence in our self-assessment system is undermined by the ability of individuals to realize large amounts of disposable income with little, if any, payment of tax. However, we recommend that the tax preference items be dealt with through direct legislation. If this is not practicable, then we would support the provisions of the Bill with one modification. The tax preference item regarding the excess of accelerated depreciation over straight line depreciation should likewise provide for a reduction when straight line depreciation exceeds accelerated depreciation.

INCOME AVERAGING

Section 311 of the Bill would liberalize current law by reducing the requirements regarding the amount of income which qualifies for averaging and also, by broadening the types of income which are eligible for averaging.

We support this provision of the Bill but take exception to the proposed effective date of taxable years begining after December 31, 1969. We note that the provisions of the Bill dealing with the repeal of the alternative tax on capital gains for individuals (section 511) are to be effective with respect to sales and dispositions occurring after July 25, 1969. The effective dates of these two provisions coupled with the 10 percent tax surcharge now in effect subjects any long-term capital gain realized by individuals in the brief period from July 26 to December 31 to a severe and inequitable tax penalty. We believe equity dictates that the effective dates for eliminating the alternative capital gains tax and introducing the new averaging provisions be the same.

RESTRICTED PROPERTY

Section 321 of the Bill provides that a person who receives a beneficial interest in property by reason of services performed is to be taxed with respect to the property at the time it is received if he can transfer the property and if it is not subject to substantial risk of forfeiture. The tax will be on the amount by which the fair market value of the property exceeds the amount the employee paid for it.

At present the treatment of restricted property is governed by regulations which provide for no tax when the employee receives the restricted stock. When the restrictions lapse, the value of the stock at the time of transfer to the employee (determined without restrictions) is treated as compensation provided it has increased in value. If the value decreases, then the lower value is considered the compensation.

We support this provision on condition that any legislation finally approved continues to provide for the 50 percent maximum rate on earned taxable income. This provision, coupled with the capital gain provisions in the Bill, reflects a recognition of equality of tax treatment between earned income and capital gain income. We believe that these provisions, taken together will continue to provide incentive for those who have contributed much to our economic progress and will also lessen the search for transactions motivated by tax avoidance.

ACCUMULATION TRUSTS, MULTIPLE TRUSTS, ETC.

We generally support the provisions of the Bill applicable to trusts except for effective dates. We recommend that the restrictive changes proposed with respect to accumulation trusts be made applicable only to those trusts established or additions made to the corpus of existing trusts after April 23, 1969.

With respect to eliminating the exceptions available under the definition of "accumulation distribution" as contained in present section 665(b) of the Code, it is recommended that for those accumulation trusts which cannot qualify under these exceptions, the effective date with respect to full or maximum throwback apply only to accumulations in fiscal years ending after April 23, 1969.

CORPORATE MERGERS

We disagree with section 411 of the Bill, which provides that a corporation is not to be allowed an interest deduction with respect to certain types of indebtedness. It is our view that any restrictions on the "tide of conglomerate mergers" should be imposed outside the tax law.

More specifically, we feel that the criteria contained in proposed Code sections 279 (b) and (c) are arbitrary and of doubtful validity, and the $5 million amount contained in proposed section 279(a) is discriminatory. Other difficulties may involve tracing problems and the question of what constitutes a "plan" of acquisition. Finally, the proposal will adversely affect persons who for valid business reasons may desire to sell their businesses. Such persons may be unable to realize a proper price because of the depressing effect of the proposal.

We disagree with section 412 of the Bill to the extent proposed section 453(b)(3) will disqualify from installment sale treatment transaction which presently have good business purpose. It would add more uncertainties to an already difficult area. Furthermore, problems presented by extensions, calls or other modifications are not covered. It is our view that proposed section 453(b)(4), with which we concur, is adequate to cover present abuses of the installment method.

We also do not agree with section 413 of the Bill regarding the tax treatment of original issue discount on bonds. We feel that the proposed changes violate the well-established rules of the cash method of accounting and further that they will add to complexity and information reporting difficulties far out of proportion to the problem which section 413 is designed to solve.

We recommend as an alternative solution of the problem that present Code section 1221 be amended to exclude from the definition of a capital asset all corporate nonconvertible debt (sometimes referred to as "straight" debt). Such a provision would make all gains and losses on sales of nonconvertible corporate debt ordinary income or ordinary deductions, respectively.

Nonconvertible corporate debt is acquired by an investor for the principal purpose of realizing a yield on the money invested. It appears that the market value of nonconvertible corporate debt obligations fluctuates in large measure with reference to prevailing interest yields. Accordingly, it seems reasonable to tax as ordinary income or allow as ordinary deductions gains or losses on disposition of the obligations which are primarily mere adjustments of yields.

We recognize that changes in market value of nonconvertible corporate debt can also be attributable to a change in the credit rating of the issuer, and it is true that it might be appropriate to reflect this element as capital gain or loss. However, on balance, we feel that the treatment of nonconvertible corporate debt as a noncapital asset will eliminate or reduce the importance of many complexities, including those resulting from sections 171 and 1232 of the Code.

NATURAL RESOURCES—MINERAL PRODUCTION PAYMENTS

We recommend that an exception to the treatment of mineral production payments as loans be made for production payments used to equalize the investment of participants in a unitization.

NATURAL RESOURCES—MINING AND EXPLORATION EXPENDITURES

We support the provisions of the Bill dealing with exploration expenditures. We suggest, however, that a provision be added to permit taxpayers who have made elections under present law to have additional time to make new elections. Present section 615(f) may prohibit this.

CAPITAL GAINS AND LOSSES

Section 514 of the Bill provides that long-term capital gain is to be a gain from the sale or exchange of a capital asset held for more than 12 months rather than the present 6 months. Gains realized on the sale or exchange of capital assets held for not more than 12 months are fully taxable as ordinary income.

Admittedly, the proposed 12 month holding period is arbitrary. We do feel however, that it is desirable to lengthen the six month period. We believe that a holding period beyond six months would more accurately indicate the intention to invest and thereby serve more closely Congressional intent that special tax treatment be afforded gains from investment as distinguished from speculative gains.

The effective date for the capital gain and loss provisions of the Bill is generally July 25, 1969. This date can impose serious tax penalties for those sales or dispositions which are made after July 25, 1969 pursuant to action taken prior to that date. We therefore suggest that the effective date be established at December 31, 1969, or, in the alternative, eliminate from the provisions of the Bill any transactions to which the seller was committed in writing on or before July 25, 1969. Further, we suggest that insofar as the repeal of the alternative capital gains tax for individuals and the character of the gain is concerned, collections or other dispositions in connection with transactions in which the installment method was elected should be treated as if they occurred on or before July 25, 1969.

SUBCHAPTER S CORPORATIONS

We have previously expressed our support for the principle of conforming the treatment of Subchapter S corporations more closely to that accorded partnerships, and we believe that an overall revision of the Subchapter S rules is desirable. The Bill's treatment of contributions to retirement plans in our judgment is an improper approach to only one Subchapter S corporation tax policy matter. We suggest that a better policy would be to amend the H.R. 10 rules to conform them more closely with those accorded corporations. Alternatively, no action should be taken on this matter until the overall revision of Subchapter S is further considered.

We suggest a more convenient method be provided for handling forfeitures applicable to contributions for years beginning after 1969.

* * * * * * *

DETAILED ANALYSIS AND COMMENTS ON SELECTED PROVISIONS OF H.R. 13270

The detailed analysis contains our comments on selected provisions of H.R. 13270. Our failure to comment on certain sections of the Bill does not mean that we approve them. Generally, absence of comment means that we have not been able to arrive at a consensus.

SECTION 101 OF THE BILL—PRIVATE FOUNDATIONS

Proposed change

The Bill would provide rules for dealing with the following: tax on investment income, prohibitions on self-dealing, distributions of income, stock ownership limitation, limitations on use of assets, other limitations, disclosure and publicity requirements, change of status, changes in definitions, private operating foundation definition, and hospitals.

AICPA comments

While we agree with the intention of the Bill to curb abuses by private foundations, we are unable to express a consensus of opinion on the provisions of the Bill regarding private foundations. However, we do support the provision regarding self-dealing.

Generally, the provisions of the Bill regarding private foundations are so comprehensive and extremely complex that it is difficult to determine whether the abuses sought to be corrected will be accomplished without unnecessarily restricting appropriate activities of private foundations. Equally difficult to determine without extensive analysis are the socio-economic consequences which may result from enactment of the present provisions of this Bill.

Notwithstanding our inability to express a consensus of opinion on the private foundation provisions of the Bill, we hope that the following suggested modifications will assist your Committee as it considers these provisions.

SECTION 101(a) OF THE BILL; PROPOSED CODE SECTION 506

Tax on investment income

New section 506 of the Internal Revenue Code would provide for the imposition of a tax on the net investment income of every private foundation in an amount equal to 7½ percent of such income. The House Committee Report states that since the benefits of government are available to all, the costs should be borne at least to some extent by all of those able to pay and that this concept is as applicable to private foundations as it is to taxpayers generally. The Committee then goes on to state that appropriate assurances are needed that private foundations will promptly and properly use their funds for charitable purposes. This tax in their view is deemed in part as being a user fee.

If we accept the concept that this tax is needed for purely revenue purposes, it might be difficult to argue against its imposition. But, if we are more concerned with "assurances that private foundations will properly use their funds for charitable purposes," such aims can be attained by proper supervision, administration and review; and there is no need to impose any tax. If we accept the latter view, such a tax should not be imposed as it would deprive private foundations of funds that would otherwise be available for charitable purposes.

SECTION 101(a) OF THE BILL; PROPOSED CODE SECTION 507

Tax on the termination of private foundation status

Proposed Code section 507 provides in part that where there are willful repeated acts or a willful and flagrant act, the Internal Revenue Service can terminate the exemption of a private foundation. Under these circumstances there is a tax imposed on such an organization, the lower of either the "aggregate tax benefit" or the value of the net assets of such foundation. While it is difficult to object to the imposition of the proposed tax, where the foundation has been in existence for a number of years it would be a massive job to prepare all of the required computations for all the different years with the different tax brackets and tax rates in order to determine the "aggregate tax benefit." Subsection 507(e) provides for abatement, which under proper circumstances should provide sufficient protection against undue taxation.

SECTION 101(b) OF THE BILL; PROPOSED CODE SECTION 4942

Distributions of income

The tax on failure to distribute (proposed Code section 4942) requires that allowance for amounts set aside for future projects be established to the satisfaction of the Internal Revenue Service at the time they are set aside. In view of the penalties for failure to distribute, the Service will be able to prevent the setting aside of amounts merely by failing to act on applications or through the manner in which information supporting the amounts set aside is required to be filed. Foundations should be permitted to support these "set-asides" later.

SECTION 101(b) OF THE BILL; PROPOSED CODE SECTION 4943

Excess business holdings

There may be a conflict of interest in some situations where stock of a closely-held corporation is donated to a private foundation. This situation generally does not exist in a 20 percent ownership situation. Even if a 20 percent interest constitutes effective control, there is not necessarily any more conflict of interest between the donor and the foundation than between the donor and the other shareholders.

We believe, as did the Senate in 1950, that the loss to charity which will result from this approach will exceed any tax avoidance which may be eliminated. Elimination or extended deferral of income and estate tax deductions in the instances indicated will not only remove a factor which encourages contributions, but will also eliminate the ability of some individuals, such as business men who own little of value outside of their business interest, to make contributions.

Tables 10 and 11 (on pages 79 and 83) of the Treasury Department's Report on Private Foundations dated February 2, 1965 disclose that this proposal could affect 8 out of every 10 foundations in existence. Of more importance, these tables show that the performance of foundations with more than 20 percent donor-related influence over investment policy is generally just as good as that of foundations with a lesser degree of control. The following are some relevant ratios:

PERCENT OF DONOR-RELATED INFLUENCE OVER INVESTMENT

	Not over 20 percent	Over 20 percent	Over 50 percent
Ratio of market value of net assets to book value	144.0	141.0	132.0
Ratio of ordinary income to market value of net assets	4.0	3.5	3.5
Ratio of contributions received to market value of net assets	3.1	7.7	9.8
Ratio of grants made to market value of net assets	6.0	6.9	7.8
Ratio of grants made to ordinary income	151.0	197.0	222.0

We suggest that any rule restricting investment holdings be limited to 35 percent or more interests.

SECTION 101(b) OF THE BILL; PROPOSED CODE SECTION 4944

Investment jeopardizing exempt purpose

The prohibited transaction covered by this proposed new section of the Code substantially paraphrases the language contained in the present Code section 504(a)(3). In both cases the language is not precisely definitive and inadvertent violation could occur, since an investment that jeopardizes the exempt purpose is a highly subjective concept. The proposed penalty for an inadvertent error is too punitive and such a penalty should only be imposed after the expiration of a "correction period" of a nature similar to that set forth in proposed Code section 4941(e)(4).

SECTION 101(b) OF THE BILL; PROPOSED CODE SECTION 4946(a)(3)

Attribution rules

This proposed subsection provieds for the attribution rules of Code section 267(c) to apply to indirect stockholdings for the purposes of determining who is a "disqualified person" within the meaning of proposed Code section 4946(a). These attribution rules, and more specifically those of Code section 267(c)(3), are probably to broad and could result in violations from relatively minimal relationships. For example, Corporation A is a substantial contributor to Foundation F; X owns 50 percent and Y owns 1 percent of the combined voting power of A; X and Y, both individuals, are each 1 percent partners in a widely-held joint venture. Y has no other relationship with X, A or F, and yet it appears that he would be considered to be a "disqualified person" with respect to F.

It is suggested that the attribution rules of Code section 318(a) be substituted for those of section 267(c). In the alternative, it is suggested that the attribution rules of section 267(c)(3) only apply to partners with a partnership interest of 10 percent or more.

SECTION 121 OF THE BILL—PROPOSED AMENDMENTS TO CODE SECTIONS 512 AND 514

Exempt organizations debt-financed property

Present law.—Under present law, charities and some of the other types of exempt organizations are subject to tax on rental income from real property to the extent the property was acquired with borrowed money. However, this provision does not apply to all tax-exempt organizations and there is an important exception which excludes rental income from a lease of 5 years or less. Nor does the tax apply to income from the leasing by a tax-exempt organization of assets constituting a going business.

As a result some tax-exempt organizations have used their tax-exempt privileges to buy businesses and investments on credit.

Proposed change

The Bill amends the Code to provide that all exempt organizations' income from "debt-financed" property is to be subject to tax in the proportion the property is financed by dept. Thus, for example, if a business or investment property is acquired subject to an 80 percent mortgage, 80 percent of the income and 80 percent of the deductions are taken into account for tax purposes. As the mortgage is paid off, the percentage taken into account diminishes. Capital gain on the sale of debt-financed property is also taxed. The amendment makes exceptions for property to be used for an exempt purpose within a reasonable time, and also for property acquired by gift or inheritance under certain conditions.

AICPA comments—General

The Supreme Court desicision in the *Clay B. Brown* case has focused attention on an abuse of tax exemption for foundations through their activities in debt financing of acquisitions.

The problems which may arise in borrowing by foundations for investment purposes are:

1. Private parties are able to shift a substantial measure of the financial benefit of the foundation's tax exemption to themselves (the so-called "bootstrap" sale); and

2. The private foundation can convert its tax exemption into a self-sufficient device for the production of capital, thereby serving itself from reliance upon contributions and eliminating the healthful scrutiny of its activities which is implicit in such reliance.

It is believed that H.R. 13270 goes significantly beyond what is necessary to deal with a Clay Brown-type transaction. It embraces the concept that virtually *any* type of income derived by an exempt organization from the use of borrowed funds should be taxed differently than the same or similar income derived from the use of corpus.

We urge that the scope of the Bill be limited to the avowed purpose of extending the unrelated business taxable income concept to income arising from Clay Brown-type transactions. Thus, the present exemption from tax on unrelated business income for rents from personal property leased with realty could be eliminated assuming the personal property constitutes more than an incidental or insubstantial portion of the property subject to the lease. In effect, the leasing of personal property wold be treated as an unrelated trade or business.

The following comments are submitted in the event that your Committee believes the "Clay Brown" provisions of H.R. 13270 should be enacted substantially as passed by the House. As indicated above, we believe that the general scope of this legislation is too broad.

Specific comments

Proposed code sections 514(a)(1), 514(b)(1) and 514(c)—General

The proposed rules may subject an exempt organization to a tax liability under circumstances where no tax avoidance or genuine "debt-financed" acquisition is involved, and where we are sure no tax is intended to apply. Assume that an individual owns stock (or land, or any other property) with a basis of $3,000, subject to a loan (less than 5 years old) of $3,000, with a current value of $10,000. He makes a charitable contribution of the property subject to the loan. The recipient charity puts the property up for sale promptly. In due course it is sold, the loan paid, and the remaining proceeds (the charitable contribution received) applied to charitable purposes. There will be a basis of $3,000 and an acquisition indebtedness of $3,000. The percentage described in section 514(a)(1) will be 100 percent. The gain of $7,000 ($10,000 proceeds less $3,000 basis) will therefore be fully taxable—surely an unintended result. The same result might even follow in the frequently arising situation where a charitable donor sells property, to a charity at a bargain price. The purchase price itself, if it remains unpaid for only a few days, could be "acquisition indebtedness." To prevent this result, it should be provided that property acquired by gift, inheritance or bargain purchase shall not be treated as "debt-financed property" if the exempt organization, within a short time after acquisition, takes bona fide steps to dispose of the property and does in fact dispose of it within a time which is reasonable, taking into account the nature of the property.

PROPOSED CODE SECTION 514(C)(7)

Acquisition indebtedness

In computing the percentage of any gain or loss to be taken into account upon a sale or other disposition of debt-financed property, the term "average acquisition indebtedness" should be defined in a manner parallel to that in which it is defined for other purposes, i.e., the average amount of the acquisition indebtedness during the 12-month period ending with the date of the sale or other disposition. It appears inequitable to use the highest amount of acquisition indebtedness during the 12-month period.

PROPOSED CODE SECTION 514(B)(2)

Definition of debt-financed property

The requirement that the tax be paid currently subject to later refund if the conditions of proposed section 514(b)(2)(B) are met, may harm some exempt organizations. For example, a university may be struggling under the financial burden of relocating its campus, or may be establishing another campus, and cannot meet the "neighborhood test." It does actually satisfy the "use test" within ten years. If the university must pay tax on income earned from the property, it may be seriously handicapped if it depends upon the earnings to help finance the project. The later refund does not make the university whole, because it may have needed the money earlier. It is suggested that where the circumstances contemplated by subparagraphs (B) and

(D) arise, provision be made for disclosure requirements, for holding open the statute of limitations for assessment and for payment of the tax if the conditions are ultimately not met. Interest at the rate of 6 percent would, of course, be payable.

PROPOSED CODE SECTION 514(b)(2)(D)

Definition of debt-financed property

If this section is not revised in accordance with the immediately preceding recommendation, the rate of average amount of the acquisition indebtedness during the 12-month period ending with the date of the sale or other disposition. It appears inequitable to use the highest amount of acquisition indebtedness during the 12-month period.

PROPOSED CODE SECTION 514(b)(2)

Definition of debt-financed property

The requirement that the tax be paid currently subject to later refund if the conditions of proposed section 514(b)(2)(B) are met, may harm some exempt organizations. For example, a university may be struggling under the financial burden of relocating its campus, or may be establishing another campus, and cannot meet the "neighborhood test." It does actually satisfy the "use test" within ten years. If the university must pay tax on income earned from the property, it may be seriously handicapped if it depends upon the earnings to help finance the project. The later refund does not make the university whole, because it may have needed the money earlier. It is suggested that where the circumstances contemplated by subparagraphs (B) and (D) arise, provision be made for disclosure requirements, for holding open the statute of limitations for assessment and for payment of the tax if the conditions are ultimately not met. Interest at the rate of 6 percent would, of course, be payable.

PROPOSED CODE SECTION 514(b)(2)(D)

Definition of debt-financed property

If this section is not revised in accordance with the immediately preceding recommendation, the rate of organization as to which nonrelated rentals are incidental and possibly temporary in nature. Therefore, we recommend that the word "substantially" be inserted before the word "all" in the first line of proposed section 514(b)(1)(A).

SECTION 121 OF THE BILL—PROPOSED AMENDMENTS TO CODE SECTIONS 511 AND 513

Exempt organizations—Extension of unrelated business income tax

Present law.—Under present law the tax on unrelated business income applies only to certain tax-exempt organizations. These include:

1. Charitable, educational, and religious organizations (other than churches or conventions of churches);
2. Labor and agricultural organizations;
3. Chambers of commerce, business leagues, real estate boards, and similar organizations;
4. Mutual organizations which insure deposits in buildings and loan associations and mutual savings banks; and
5. Employees' profit sharing trusts and trusts formed to pay (nondiscriminatory) supplemental unemployment compensation benefit.

Proposed change.—The Bill extends the unrelated business income tax to all exempt organizations (except United States instrumentalities created and made tax exempt by a specific act of Congress). The organizations which will newly be made subject to this tax include churches and conventions or associations of churches, social welfare organizations, social clubs, fraternal beneficiary societies, voluntary employees' beneficiary organizations, teachers' retirement fund associations, benevolent life insurance associations, cemetery companies, credit unions, mutual insurance companies, and farmers cooperatives formed to finance crop operations.

As under present law, in general this tax does not apply unless the business is "regularly carried on" and therefore does not apply for example in cases where income is derived from an annual athletic exhibition. Under the amendments made by the Bill, in the case of any membership organization, any income resulting from charges to the members for goods, facilities, and services supplied in carrying out the exempt function is not subject to tax.

The Bill contains several administrative provisions including one providing that no audit of a church is to be made unless the principal Internal Revenue officer for the region believes that the church may be engaged in a taxable activity. Churches will not be subject to tax for six years on businesses they now own.

AICPA comments.—We believe that the principal aim of any reform in the tax treatment of exempt organizations should be to make sure that they shall have neither an advantage nor a handicap in those operations in which they are competing with taxpaying organizations. The Congress has long recognized that a tax-exempt organization has an inherent advantage over a taxpaying organization if both are competing in the same field. Therefore, in 1950, Congress enacted a tax on the unrelated business income of some but not all exempt organizations.

H.R. 13270 provides that the unrelated business income tax be extended to apply to a number of additional types of exempt organizations. These include churches (or associations of churches), social welfare organizations, social clubs, and fraternal beneficiary societies. Certain exceptions and limitations are provided in each case to protect exempt activities from taxation.

We support these provisions. There appears to be no reason why a church, for example, should be permitted to engage in activities not related to its exempt purposes so as to compete on a tax-exempt basis with a taxpaying enterprise. Any such tax preference tends to impair the proper working of our free market economy which is based on open and fair competition.

Section 121(b) of the Bill; Proposed Code Section 512(a)(3)

Social clubs.—At present social clubs are not subject to the unrelated business income tax. An incidental sale of property will not deprive the social club of its exemption, but a club which regularly receives income from sources other than its membership will generally lose its exemption regardless of whether the outside income is from investments or from a business activity. Thus, social clubs which receive any nonmembership income are currently in an all-or-nothing quandary. If the outside income is an incidental item the club remains exempt and the outside income escapes taxation. If the item is more than incidental the club becomes fully taxable. It is often hard to draw the dividing line.

The Bill provides that social clubs be taxed on all their income, whether from investments or other sources, except that which is derived from the members in return for the club's services as a social club. The proposed taxation of investment income is intended to prevent untaxed investment income from indirectly inuring to the members' benefit by subsidizing the club's services to the members.

We support this provision subject to the following recommendations:

1. The Bill would allow as deductions, items *directly* connected with an activity generating income subject to tax. This could give rise to considerable controversy as to what is directly connected. In any case it is inequitable because clearly a portion of the indirect or overhead expenses of the club are also connected with the income subject to tax. Accordingly, the deductible items should be defined as including direct expenses and allocable portion of the indirect or overhead expenses.
2. It should be made clear that a club is entitled to the same deductions as any other taxpayer with respect to its income subject to tax. Thus, it should be entitled to deductions for depreciation, interest, taxes, repairs, etc., with respect to rental income; the dividends received deduction; and to deduct all expenses connected with income-producing property. It should also be made clear that clubs are entitled to the benefit of the tax-free exchange provisions and the involuntary conversion provisions.
3. If a club disposes of the property used in its social functions, either to move to a new location or to construct new facilities, it should not be taxed on the gain from such disposition so long as the proceeds are reinvested in other facilities to be used in its social functions.

Section 121(b) of the bill; proposed code section 512(b)(12) limit on specific deduction

We recommend that the specific deduction under section 512(b) (12) be raised from $1,000 to $5,000. This will recognize the inflation that has occurred since enactment of the tax on unrelated business income and eliminate the compliance burdens of exempt organizations having similar amounts of unrelated income.

(See Technical Information Release No. 899, April 14, 1967, which announced the proposed regulations under sections 512 and 513 and indicated that the Internal Revenue Service would consider the appropriateness of a legislative recommendation to make the tax inapplicable where only "small" amounts of unrelated income are involved.)

Section 121(b) of the bill; proposed code section 512(b)(15) special rules for certain organizations

Under proposed Code section 512(b)(15), passive type income received from organizations over which the recipient exempt organization has control (as defined in section 368(c)) are included in the exempt organization's unrelated taxable income. This 80 percent control requirement may not be sufficiently stringent to carry out the Congressional purposes since it may permit easy avoidance. A lower percentage may be appropriate.

SECTION 121—PROPOSED AMENDMENT TO CODE SECTION 512

Exempt organizations—Taxation of investment income of social, fraternal and similar organizations

Present law.—Under present law the investment income of social clubs fraternal beneficiary societies and voluntary employees' beneficiary associations are exempt from income tax.

Since the tax exemption for social clubs, fraternal beneficiary societies and voluntary employees' beneficiary associations is designed, at least in part, to allow individuals to join together to provide recreational or social facilities without tax consequences, the tax exemption operates properly only where the sources of income of the organizaiton are limited to receipts from the membership. Where an organization receives income from sources outside the membership, such as income from investments, upon which no tax is paid, the membership receives a benefit from the tax-exempt funds used to provide pleasure or recreational facilities.

Proposed change.—The Bill provides for the taxation (at regular corporate rates) of the investment income and other unrelated income of social clubs, fraternal beneficiary associations, and voluntary employees' beneficiary associations. This will not apply, however, to such income of fraternal beneficiary associations and voluntary employees' beneficiary associations to the extent it is set aside to be used only for the exempt insurance function of these organizations and for charitable purposes.

If in any year an amount is taken out of the set-aside and used for any other purpose, the amount taken out will be subject to tax in such year.

We support this proposed amendment to the Code.

SECTION 121 OF THE BILL—PROPOSED AMENDMENT TO CODE SECTION 512

Exempt organizations—interest, rent and royalties from controlled corporation

Present law.—Under present law, rent, interest and royalty expenses are deductible in computing the income of a business. On the other hand, receipt of such income by tax-exempt organizations generally is not subject to tax.

Some exempt organizations "rent" their physical plant to a wholly-owned taxable corporation for 80 percent or 90 percent of all the net profits (before taxes and before the rent deduction). This arrangement enables the taxable corporation to escape nearly all of its income taxes because of the large "rent" deduction.

Proposed change.—The Code would be amended to provide that in any case in which an exempt organization owns more than 80 percent of a taxable subsidiary, interest, annuities, royalties and rents are to be treated as "unrelated business income" and subject to tax. The deductions connected with production of such income are allowed.

We support this proposed amendment of the Code.

SECTION 121 OF THE BILL—PROPOSED CODE SECTION 278

Exempt organizations—limitation on deductions of nonexempt membership organizations

Present law.—Some courts have held that taxable membership organizations cannot create a "loss" by supplying their members services at less than cost.

Other courts have held instead that such a "loss" is permissible. The expenses of providing such services at less than cost will offset from taxation additional income earned by the organization from investments or other activities.

Proposed change.—The House Bill provides that in the case of a taxable membership organization the deduction for expenses incurred in supplying services, facilities or goods to members is allowed only to the extent of the income from such members.

We support this proposed amendment of the Code.

SECTION 121 OF THE BILL—PROPOSED AMENDMENT TO CODE SECTION 513

Exempt organizations—Income from advertising, etc.

Present law.—Late in 1967 the Treasury promulgated regulations under which the income from advertising was treated as "unrelated business income" even though such advertising appeared, for example, in a periodical related to the educational or other exempt purpose of the organization.

The statutory language on which the regulations were based was sufficiently unclear so that substantial litigation could have resulted from these regulations.

Proposed change.—The House Bill provides that income from advertising (or a similar activity) is included in unrelated business income even though the advertising is carried on in connection with activities related to the exempt purpose.

AICPA comments—General

The primary purpose of the tax on unrelated business income originally was to deal with the problem of unfair competition. The tax-free status of certain exempt organizations enabled them to use their tax-free profits to expand operations, while their competitors could expand only with profits remaining after taxes. (See House Committee Report No. 2319, Eighty-first Congress, Second Session, accompanying the Revenue Act of 1950, which initially introduced the statutory predecessor of section 513 of the current Code, 1950-2 C.B. 429.)

While the 1950 House Report makes it clear that the intent of section 513 was to meet the problem of unfair competition, the statute itself is not in terms of unfair competition, but rather imposes a tax on the "unrelated business income" of certain organizations. Thus, Congress, in 1950, seems to have concluded that a business that is unrelated to the exempt purposes of an organization presents unfair competition. Conversely, a business that is related to the exempt purposes should not be regarded as presenting unfair competition. Nevertheless, the Treasury Department concluded otherwise when it adopted regulations under section 513 on December 11, 1967. The House Committee on Ways and Means agrees with that conclusion and with the purpose of the regulations. On page 50 of its report, (No. 91-413-Part 1) the Committee makes this statement: "In general, it (the Committee) is in agreement with the purpose of the regulations. Your committee believes that a business competing with taxpaying organizations should not be granted an unfair competitive advantage by operating tax free unless the business contributes importantly to the exempt function. It has concluded that by this standard, advertising in a journal published by an exempt organization is not related to the organization's exempt functions, and therefore it believes this income should be taxed." Accordingly, the House apparently agrees with the Treasury's Example (7) in Regulation Section 1.513-1(d)(4)(iv), which states that advertising income derived by an exempt organization is taxable under the following circumstances:

1. The organization is formed to advance the interests of a particular profession and draws its membership from members of that profession.
2. A monthly journal is published containing articles and other editorial material which contribute importantly to the accomplishment of the purposes for which exemption has been granted.
3. The journal's advertising promotes *only* products which are within the general area of professional interest of the organization's members.

The Treasury Department concedes that income from the sale of subscriptions to members and others, in accordance with the organization's exempt purposes, does not constitute gross income from an unrelated trade or business. However, the following fallacious conclusions are drawn with respect to the income from the limited type of advertising described in item 3, above:

"Although continuing education of its members in matters pertaining to their profession is one of the purposes for which Z is granted exemption, the publication of advertising designed and selected in the manner of ordinary commercial advertising is not an educational activity of the kind contemplated by the exemption statute; it differs fundamentally from such an activity both in its governing objective and its method. Accordingly, Z's publication of advertising does not contribute importantly to the accomplishment of its exempt purposes; and the income which it derives from advertising constitutes gross income from unrelated trade or business. . . ."

We believe that this interpretation and the conclusions of the House Ways and Means Committee, quoted above, suffer from inaccurate analysis on the following three counts:

1. Advertising that promotes *only* products or services of professional interest is functionally the same as editorial content that is concerned only with matters of the same professional interest (including, of course, articles that may discuss certain of these products or services). Since such editorial content is acknowledged to contribute importantly to the accomplishment of exempt purposes, the same characterization can be attributed to such functionally related advertising. They are both *related* to the activities of the organization.

2. It is highly unrealistic to categorize an *interdependent* economic activity, such as the sale of space in a publication, as a trade or business.

3. Unfair competition, which was the problem intended to be solved by the Revenue Act of 1950, appears to be completely absent under the illustrative facts.

Specific legislative recommendations

We believe that Code section 512 and/or section 513 should be amended to incorporate the following concepts:

1. A "trade or business" should be defined along vertically integrated lines so that advertising activity, alone, cannot constitute a trade or business.

2. In order to avoid characterization as unrelated business income, *all* activities of such defined trade or businesses must be functionally related to the purposes for which an organization has been granted exemption.

Advertising income should not give rise to unrelated business income under the following circumstances:

1. The income is derived from magazines and other periodicals published by exempt organizations.

2. The publication's editorial matter and advertising are substantially related to purposes for which the organization has been granted exemption.

These criteria should considerably ease any anticipated enforcement burdens of the Internal Revenue Service since compliance with such standards could be easily observed by Service office personnel. For example, a centralized unit of the Service should be furnished with all exempt organization publications and could determine, through physical inspection, whether the necessary editorial and advertising policies are being maintained.

The *de minimis* rule provided by Code section 512(b)(12), allowing a $1,000 specific deduction, should be expanded in order to eliminate the tax where annual unrelated business income does not exceed $5,000. (See Technical Information Release No. 899, April 14, 1967, which announced the proposed regulations under sections 512–513 and indicated that the Internal Revenue Service would consider the appropriateness of a legislative recommendation to make the tax inapplicable where only "small" amounts of unrelated income are involved.)

In addition, where the unrelated business income tax is imposed, net operating loss carrybacks and carryovers should be allowed to the same extent as in the case of nonexempt entities conducting competitive operations. Compare the limitations set forth in Regulations Section 1.512(a)-1(d)(2)(ii) and (e), Example (2).

The following three examples are provided to illustrate the effect of the concepts which we propose be incorporated into the statute to deal with the tax treatment of advertising income derived by exempt organizations:

Examples of effect of legislative recommendations

Example (1): No unrelated business income resulting from related editorial and advertising content.—Z is an association exempt under section 501(c)(6), formed to advance the interests of a particular profession and drawing its membership from the members of that profession. Continuing education of its members in matters pertaining to their profession is one of the purposes for which Z is granted exemption.

Z publishes a monthly journal containing articles and other editorial material which contribute importantly to the accomplishment of purposes for which exemption is granted the organization.

The advertising in Z's journal promotes products which are within the specialized area of professional interest of Z's members. Since the advertisements contain information dealing with professional interest and development, their informational function is identical to the function of the editorial content. Accordingly, the publication of advertising designed and selected in this manner, pursuant to Z's advertising policies, is an educational activity of the kind contemplated by the exemption statute.

Therefore, Z's publication of advertising also contributes importantly to the accomplishment of its exempt purposes; and the income which it derives from its publishing business, attributable to *both* literary and advertising activities, does not constitute gross income from an unrealted trade or business.

Example (2): Unrelated business income resulting from unrelated literary activity.—Assume the same facts as in the preceding example, except that the editorial content of Z's journal is not exclusively devoted to professional matters since news and features covering domestic politics, foregn affairs and sports events are also published. This nonprofessional content is of a general nature, appealing to members of the particular profession involved as well as to the laity comprising the balance of our national population. Accordingly, the publication of this type of literary material is not designed nor selected to further Z's exempt purposes and would thus compete with other generalized magazines published by taxable organizations. Such editorial content is not an educational activity of the kind contemplated by the exemption statute.

Therefore, Z's publication of such literary material does not contribute importantly to the accomplishment of its exempt purposes: and the income which it derives from its publishing business, attributable to *both* literary and advertising activities, constitutes gross income from an unrelated trade or business.

Example (3): Unrelated business income resulting from unrelated advertising activity.—Assume the same facts as in Example (1), except that Z also derives income from the sale of space in its journal for general consumer advertising, including advertisements of such products and services as soft drinks, automobiles, wearing apparel, home appliances and vacations arranged by travel agencies.

The publication of such advertisements does not contribute importantly to the accomplishment of any purpose for which exemption is granted and would thus compete with the advertising activity of magazines published by taxable organizations. Consequently, the income derived from Z's publishing business, attributable to *both* literary and advertising activities, constitutes gross income from an unrelated trade or business.

SECTION 201(A) OF THE BILL—PROPOSED AMENDMENT TO CODE SECTION 170(B)

Charitable contributions—50-percent charitable deduction limitation

Present law.—Under present law, the charitable contributions deductions allowed individuals generally is limited to 30 percent of the taxpayer's adjusted gross income. In the case of gifts to certain private foundations, however, the deduction is limited to 20 percent of the taxpayer's adjusted gross income.

Proposed change.—The bill increases the general limitation on the charitable contributions deduction for individual taxpayers from 30 percent of adjusted gross income to 50 percent of their contribution base. The 20-percent charitable contribution deduction limitation in the case of gifts to certain private foundations is not increased by the Bill. Also, contributions of appreciated property (which property, if sold, would be treated as giving rise to capital gain) is to be subject to the 30-percent limitation.

We support this proposed amendment to the code.

SECTION 201(A) OF THE BILL—PROPOSED REPEAL OF CODE SECTION—170(B)(1)(C)

Charitable contributions—Repeal of unlimited charitable deduction

Present law.—An individual taxpayer is presently allowed an unlimited charitable deduction if in the current taxable year and in 8 of the preceding 10 taxable years the total of the taxpayer's charitable contributions plus income taxes (determined without regard to the tax on self-employment income) exceeds 90 percent of his taxable income (computed without regard to the charitable contributions deduction, personal exemptions and net operating loss carrybacks).

Proposed change.—The bill would phase out the unlimited charitable contributions deduction over a 5-year period covering taxable years beginning in 1970 through 1974.

We support this proposed amendment to the code.

SECTION 201(a) OF THE BILL—PROPOSED AMENDMENT TO CODE SECTION 170(b)

Disallowance of charitable deduction for gift of use of property

Present law.—Presently a taxpayer may take a charitable deduction for the fair-rental value of property which he owns and gives to a charity to use for a specified time period. In addition he excludes from his income the income he would have received had the property been rented.

Proposed change.—H.R. 13270 provides that a charitable deduction is not to be allowed unless the taxpayer's entire interest in the property is donated. Therefore, no deduction will be allowed for the right to use property for a period of time. The taxpayer, however, will continue to be able to exclude from income the value of the right to use property so contributed.

We support this proposed amendment to the code.

SECTION 201(c) OF THE BILL—PROPOSED AMENDMENT OF CODE SECTION 170 AND ADDITION OF NEW SECTION 83

Charitable contributions of appreciated property

Present law.—A taxpayer who contributes to charity property which has appreciated in value generally is allowed a charitable contribution deduction for the fair market value of the property at the time of contribution (subject to certain technical recapture provisions), and no income tax is imposed on the appreciation in value of the property at the time of the gift.

Proposed change.—H.R. 13270 proposes to eliminate some of the present tax advantage of contributing appreciated property to certain private foundations by requiring the donor of such property to elect either to reduce his charitable contribution deduction to the amount of his cost or other basis for such property *or* to take a charitable contribution deduction based on the fair market value of the property but to include in his tax base the untaxed appreciation with respect to the property involved. The charitable donee's basis for the property would be the donor's adjusted basis (for purposes of determining gain increased by the amount of gain recognized by the donor with respect to the contribution).

Under the bill, the same treatment would be applicable without regard to the type of charitable recipient, to:

1. All gifts of property if any portion of the gain on the property (had it been sold) would have resulted in either ordinary income or short-term capital gain;
2. All charitable gifts of works of art, collections of papers and other forms of tangible personal property (fixtures which are intended to be severed from real property are to be treated for this purpose as tangible personal property); and
3. All charitable gifts of future interests in property.

AICPA comments.—Although we have not been able to reach a consensus on all of the bill's proposals with reference to charitable contributions of appreciated property, we do agree contributions of such property should be treated in the same manner without regard to the type of charitable recipient.

SECTION 201(d) OF THE BILL—PROPOSED AMENDMENT OF CODE SECTION 1011

Charitable contributions—Bargain sales to charitable organizations

Present law.—If property is sold to a charity at a price below its fair market value, the proceeds of sale are considered to be a return of the cost and are not required to be allocated between the cost basis of the "sale" part of the transaction and the "gift" part. The seller is allowed a charitable contribution deduction for the difference between the fair market value of the property and the selling price.

Proposed change.—The bill provides that the cost or other basis of the property is to be allocated between the portion of the property "sold" and the portion of the property "given" to the charity on the basis of the fair market value of each portion.

We support this proposed amendment of the code.

SECTION 201(f) OF THE BILL—PROPOSED AMENDMENT TO CODE SECTION 642(c)

Charitable contributions for estates and trusts

Present law.—A nonexempt trust (or estate) is allowed a full deduction for any amount of its gross income which it pays or which it permanently sets aside for charitable purposes. There is no limitation on the amount of this deduction.

H.R. 13270 provides that an individual who establishes a trust to pay the income to a private person for a period of years with the remainder to go to charity is to be allowed a charitable deduction with respect to the charitable remainder interest only if the trust qualifies as a charitable remainder trust. It is also provided that no deduction is to be allowed for a charitable gift of an income interest in trust unless the individual making the gift is taxable on the trust income.

It would be inconsistent with these rules to continue to allow a trust a deduction for amounts set aside for charity. Such a deduction is unnecessary in the case of a charitable remainder trust since such a trust is to be tax exempt. In other cases, the allowance of a set-aside deduction would be inconsistent with the limitation to be placed on charitable gifts in trust.

Proposed change.—For the reasons discussed above, the bill eliminates the so-called set-aside deduction presently allowed trusts (or estates). However, in computing its taxable income, a non-exempt trust will still be allowed to deduct any amount of its gross income, without limitation, paid as a charitable contribution. In addition, to enable the trustee to act after he knows the income for the year precisely, the bill allows a trustee to make a contribution in the next following taxable year and elect to treat such contribution as made during the taxable year. As under existing law, proper adjustment is to be made for charitable contributions paid out of capital gain income and the deduction is not to diminish the unrelated business income of the trust, if any. Furthermore, the nonexempt trust is to be subject to the same restrictions as a private foundation if it makes charitable contributions.

We support this proposed amendment to the code.

SECTION 201(g) OF THE BILL—PROPOSED AMENDMENT TO CODE SECTION 673(b)

Charitable contributions—Repeal of 2-year charitable trust rule

Present law—Under present law, an individual may establish a trust to pay the income from his property, which he transfers to the trust, to a charity for a period of a least 2 years, after which the property is to be returned to him. Although the individual does not receive a charitable contribution deduction in such a case, the income from the trust property is not taxed to the individual. This 2-year charitable trust rule is an exception to the general rule that the income of a trust is taxable to the person who establishes the trust where he has a reversionary interest in the trust which will or may be expected to take effect within 10 years.

The effect of the special 2-year charitable trust rule is to permit charitable contribution deductions in excess of the generally applicable percentage limitations of such deductions.

Proposed change.—In order to prevent circumvention of the generally applicable percentage limitations on the charitable contribution deduction, the House Bill would repeal the 2-year trust provision of Code section 673(b). Accordingly, an individual no longer will be able to exclude income from property placed in a trust (to pay the income to a charity for a period of at least 2 years) from his income. As a result, a person who establishes a trust will be taxable on its income, whether or not the income beneficiary is a charity, where the individual has a reversionary interest which will or may be expected to take effect within 10 years from the time the income-producing property is transferred to the trust.

We support this proposed amendment to the Code.

SECTION 210 (a) AND (h) OF THE BILL—PROPOSED AMENDMENTS TO CODE SECTIONS 170(b) AND 2522(c)

Charitable income trusts with noncharitable remainder

Present law.—Under present law, a taxpayer who transfers property to a trust to pay the income to a charity for a period of years with the remainder to go to a noncharitable beneficiary, such as a friend or member of his family, is allowed a charitable contribution deduction for the present value of the income interest given to the charity. In addition, neither he nor the trust is taxed on the income earned by the trust.

A taxpayer receives a double tax benefit where he is allowed a charitable contribution deduction for the present value of an income interest in trust given to charity and also is not taxed on the income earned by the trust. In fact, this double benefit allows a taxpayer to increase his after-tax cash position by postponing a planned noncharitable gift

Proposed change.—The bill provides that a charitable contribution deduction is not to be allowed for an income interest given to charity in trust, unless the grantor is taxable on the income of the trust or unless all the interests in the trust are given to charity. The effect of this is to deny the double benefit of a deduction and exemption from taxation which is available under present law.

The bill also provides that a charitable deduction will not be allowed for an income interest given to charity in trust unless either the interest is in the form of a guaranteed annuity or the trust instrument specifies that the charitable income beneficiary is to receive a fixed percentage annually of the fair market value of the trust property (as determined each year). The purpose of this rule is to assure that the amount received by the charity in fact bears a reasonable correlation to the amount of the charitable contribution deduction allowed the taxpayer.

If a taxpayer, who is allowed a charitable deduction under the above rules for an income interest transferred in trust to charity, subsequently ceases to be taxable on the trust income, he would receive a double tax benefit with respect to the future trust income—he would not be taxed on that income but would have received a charitable deduction with respect to it. To prevent this result, the bill, in effect, provides for the recapture of that part of the charitable contribution deduction previously received by the taxpayer with respect to the income of the trust which will go to the charity but on which he will not be taxed.

We support these proposed amendments to the Code.

SECTION 201(e). (h) AND (i) OF THE BILL—PROPOSED AMENDMENTS TO CODE SECTIONS 170(h), 2055(e), 2106(a) AND 2522(c) AND PROPOSED CODE SECTION 664

Charitable contributions—Charitable remainder trusts

Present law.—An individual may now make a charitable contribution by transferring property to a trust and providing that the trust income be paid to designated private persons for a period of time with the remainder to go to a charity. The amount of the deduction is based upon the present value of the remainder interest at the time of the gift.

Under the present rules it is possible for a taxpayer to receive a deduction for a contribution of a remainder interest to a charity which may be greater than the amount the charity ultimately receives. This is possible because the trust assets may be invested in a manner which maximizes income at the expense of capital.

Proposed change.—To prevent the above situation the Bill provides that no deduction will be allowed for gifts of a remainder interest unless the trust specifies that the noncharitable income beneficiary is to receive either a stated annual dollar amount or a fixed percentage of the value of the trust assets.

We support these proposed amendments to the Code.

SECTION 211 OF THE BILL—PROPOSED CODE SECTION 1251

Farm losses

Present law.—Under present law, income or losses from farming may be computed under more liberal accounting rules than those generally applicable to other types of businesses. A cash method of accounting under which costs are deducted currently may be used, rather than an inventory and ~~accrual method~~ under which the deduction of costs would be postponed. In addition, a taxpayer in the business of farming may deduct expenditures for developing business assets (such as raising a breeding herd or developing a fruit orchard) which other taxpayers generally have to capitalize. Furthermore, capital gain treatment often is available on the sale of farm assets.

The combination of current deductions of farm expenses of a capital nature from ordinary income with future capital gain treatment on the sale of farm assets may produce significant tax savings.

Proposed change.—The bill generally provides that gain on the sale of certain farm property is to be treated as ordinary income to the extent of the taxpayer's previous farm losses. For this purpose, a taxpayer must maintain an excess deductions account to record his farm losses. In the case of individuals, farm losses must be added to the excess deductions account only if the taxpayer has more than $50,000 of nonfarm income for the year and, in addition, only to the extent his farm loss for the year exceeds $25,000. The amount in a taxpayer's excess deductions account would be reduced by the amount of farm income in subsequent years.

The amount of farm losses recaptured on a sale of farm land would be limited to the deductions for the taxable year and the four previous years with respect to the land for soil and water conservation expenditures and for land clearing expenditures.

To the extent gain on the sale of farm property is treated under these rules as ordinary income, this would reduce the amount in the taxpayer's excess deductions account.

The recapture rules provided by the bill would not apply if the taxpayer elected to follow generally applicable business accounting methods (i.e., if he used inventories and capitalized capital expenditures).

AICPA comments.—We agree with the intended purpose of the proposed legislation which is to curb abuses of capital gain provisions in the farming segment of the economy.

Section 211 of the bill seeks to solve this problem by denying capital gain benefits in the case of the disposition of farm property unless the taxpayer (1) accounts for inventories, and (2) capitalizes all expenditures properly chargeable to a capital account. The de minimis exception (later commented on) appears to be reasonable to limit the application of Section 211 to taxpayers who could otherwise abuse capital gain benefits.

On the other hand, we believe that the language of Section 211 is so sweeping that it will affect more taxpayers than intended. Section 211 applies to all taxpayers who, with respect to any taxable year, (1) incur a farm net loss, *or* (2) have a balance in the excess deductions account at the close of the taxable year. Addition to the excess deductions account for a current year's farm loss is not required if (1) nonfarm adjusted gross income is $50,000 or less, and (2) the farm net loss is $25,000 or less. However, it appears that the $50,000/$25,000 de minimis exceptions do not apply to excuse application of Section 211 in the face of a current year's loss, no matter how small (proposed Code section 1251(a)(1)). Should this be the case, Section 211 would apply to all taxpayers incurring a current farm loss, with the result that a great many farmers would be faced with loss of capital gain benefits if they did not elect to adopt certain accounting methods. To remedy this apparent defect, we recommend that the bill be clarified so that there is no doubt that the $50,000/$25,000 de minimis exceptions apply also in the case of farm net losses for the current taxable year.

In order not to discourage taxpayers from changing to the accounting methods described in proposed Code section 1251(b)(4)(A), it is suggested that section 1251(b)(4)(C) provide that additions to taxable income resulting from the change could be spread over a 10-year period, at the election of the taxpayer. This type of provision has been helpful in Internal Revenue Service administration of other changes in accounting methods and practices, and should be advantageous to both taxpayers and the Government in this connection.

SECTION 213 OF THE BILL—PROPOSED AMENDMENT TO CODE SECTION 270

Hobby losses

Present law.—Present law contains a so-called hobby loss provision which limits to $50,000 per year the amount of losses from a "business" carried on by an individual that he can use to offset his other income. The limitation only applies, however, if the losses from the business exceed $50,000 a year for at least five consecutive years. Moreover, certain specially treated deductions are disregarded in computing the size of the loss for this purpose.

Proposed change.—The bill replaces the present hobby loss provision with a rule which provides that items attributable to an activity shall be allowed only to the extent of the gross income from such activity unless such activity is carried on with a reasonable expectation of realizing a profit. If the deductions attributable to an activity exceed the gross income from such activity by $25,000 or more for any 3 of 5 consecutive years ending with the taxable year, then unless the taxpayer establishes to the contrary, the activity shall be deemed to have been carried on without a reasonable expectation of realizing a profit.

AICPA comments.—We agree with the intended purpose of the proposals which are aimed at making the application of Code Section 270 (as amended) more effective.

It does appear, however, that the proposed provisions should be modified to the following extent:

1. The $25,000 excess of deduction over gross income should be changed to $50,000. (section 270(b)).
2. Wherever it appears throughout the section, the term "activity" should be changed to "trade or business."
3. The application of this section should be limited to individual taxpayers.

It is our belief that the disallowance of losses using the $25,000 limitation is too harsh considering that the entire loss would be disallowed. Moreover, in these times of inflation, the $25,000 limitation does not seem realistic where new business ventures are undertaken. Small taxpayers often lose more than $25,000 in three out of five years (particularly the early years of an undertaking).

The statutory word "activity" is bound to cause much controversy in the administration of the law. This word is not defined in the Bill; in fact, it would be difficult to define. An activity can embrace an entire trade or business, it can be a functional part of a business, or it can be a segment of a taxpayer's financial activities. For example, a taxpayer operating a manufacturing enterprise may have several plants, warehouses and sales outlets. Is each an activity? Where a taxpayer operates two businesses such as a drug store and an automobile agency, may each be an activity? Is the purchasing arm of a retail establishment an activity? Where a taxpayer operates a crop farm in conjunction wtih a livestock farm, is each an activity or must both be combined as one activity? Where individual taxpayers enter into financial transactions such as investments in securities, acquiring interests in real estate, etc., are each of these "an actvity" for the purposes of the proposed legislation?

In order to avoid unnecessary uncertainty and confusion and to deal in an equitable manner with what is probably intended, we suggest that the term "trade or business" be substituted for "activity." This term already has an established meaning under present law and under numerous court decisions. It embraces a set of activities that make up a "whole concept" as distinguished from dealing with possibly meaningless fragments of operations which could cause difficulties in tax accounting, allocations and administration.

It seems from the wording of the proposed amendment that it would apply to all taxpayers. We have seen no suggestion in the Reports of the Committee on Ways and Means nor do we know of any abuses by corporations, trusts, estates and other taxpayers in the area for which correction is sought. Accordingly, it is urged that this proposed amendment be limited to individual taxpayers.

SECTION 221 OF THE BILL—PROPOSED AMENDMENT TO CODE SECTIONS 163 AND 1202

Limitation on deduction of interest

Present law.—Under present law, individual taxpayers are allowed an itemized deduction, without limitation, for all interest paid or accrued during the taxable year.

Proposed change.—The bill would limit the deduction allowed individuals and other noncorporate taxpayers for interest on funds borrowed for investment purposes. The limitation would not apply to interest incurred on funds borrowed for other purposes, such as home mortgages, installment purchases, consumer goods, personal or student loans, or in connection with a trade or business.

Under the limitation, the taxpayer's deduction for investment interest would be limited to the amount of his net investment income, plus an amount equal to the amount by which his net long-term capital gain exceeds his net short-term capital loss, plus $25,000 ($12,500 in the case of a separate return by a married individual).

Interest for which a deduction was disallowed in a year as a result of the limitation could be carried over to subsequent years and used to offset net investment income (including capital gains) arising in the later years to the extent allowable under the limitation in such a year.

In the case of partnerships, the limitation would apply at both the partnership and the partner levels.

AICPA comments.—We do not agree with this proposed amendment of the Code. It has long been an established general principle of economics, accounting and taxation that expenses incident to the production of income are deductible from such income. This legislative proposal in a sense represents an artificial and arbitrary mutation of this principle which would tend to discourage the assumption of risk and the investment of capital—both of which have been important factors in the growth and development of our economic system. Furthermore, it would constitute an inconsistent exception to the cash receipts and disbursements method of accounting under which expenses are deducted when they are paid and income is taxed when it is received.

If, however, this proposed amendment of the Code is enacted in basically its present form, it is suggested that the limitation be made applicable at both the corporate and the shareholder level in the case of electing small business corporations as defined in Code section 1371(b).

SECTION 231 OF THE BILL—PROPOSED CODE SECTION 82 AND PROPOSED AMENDMENT TO CODE SECTION 217

Moving expenses

Present law.—A deduction from gross income is allowed for certain moving expenses related to job-relocation or moving to a first job.

Two conditions must be satisfied for a deduction to be available. First the taxpayer's new principal place of work must be located at least 20 miles farther from his former residence than his former principal place of work (or, if the taxpayer had no former place of work, then at least 20 miles from his former residence). Second, the taxpayer must be employed full time during at least 39 weeks of the 52 weeks immediately following his arrival at the new principal place of work.

Job-related moves often entail considerable expense in addition to the direct costs of moving the taxpayer, his family and his personal effects to the new job location.

Moreover, the 20-mile test allows a taxpayer a moving expense deduction even where the move may merely be from one suburb of a locality to another, and the 39-week test denies the deduction where a taxpayer is prevented from satisfying the test by circumstances beyond his control.

Proposed change.—The bill extends the present moving expense deduction to also cover three additional types of job-related moving expenses:

1. Travel, meals and lodging expenses for premove house-hunting trips;
2. Expenses for meals and lodging in the general location of the new job location for any period of up to 30 consecutive days after obtaining employment; and
3. Various reasonable expenses incident to the sale of a residence or the settlement of a lease at the old job location, or to the purchase of a residence or the acquisition of a lease at the new job location.

A limitation of $2,500 is placed on the deduction allowed for these three additional categories of moving expenses. In addition, expenses for the house-hunting trips and temporary living expenses may not account for more than $1,000 of the $2,500.

The bill also increases the 20-mile test to a 50-mile test, and provides that the 39-week test is to be waived if the taxpayer is unable to satisfy it due to circumstances beyond his control. Finally, the bill requires that reimbursements for moving expenses must be included in gross income.

AICPA comments—General.—The bill provides a maximum deduction of $2,500 for three additional types of job-related expenses: (1) travel, meals and lodging expenses in connection with house-hunting trips; (2) expenses for meals and lodging in the new job location area for any period of up to 30 consecutive days after obtaining the new job; and (3) expenses concerning the sale of a residence or settlement of a lease at the old job location or comparable expenses at the new job location. The deduction for the first two types of expenses may not exceed $1,000 of the maximum $2,500.

We do not believe these amounts are realistic. Many persons transferred own a house which has a market value of $30,000 or more. The average real estate agent's fee for the sale of such a house is 6 percent, or $1,800. In such a situation the allowable deduction for the first two types of expenses would be limited to $700. Thus, a taxpayer transferred to an area of 100 miles from his present location would probably not be out-of-pocket; however, a taxpayer transferred 1,000 miles would probably be out-of-pocket because of the additional transportation costs for himself and his family. We recommend that there be no limitation on the amount allowed as a deduction for these three types of expenses or, in the alternative, that the $1,000 be increased to $2,000 and the $2,500 be increased to $5,000.

Code section 217, as amended, refers to a deduction by a taxpayer as an employee. We recommend that this section also authorize such a deduction by a self-employed taxpayer or by a partner of a partnership. There is no reason why such taxpayers should not be entitled to the same benefits as an employee.

The proposal requires as a condition to allowance that the new place of work be 50 miles further from the old residence than the place of former employment. The requirement is excessive. An employee formerly commuting 20 miles to his old employment in some cases could not qualify for the deduction unless the new employment was 70 miles from his former residence. This is not realistic even in our largest metropolitan areas. The 20-mile rule should be retained, although an alternative provision of 20 miles or 50 percent farther, whichever is greater, might provide some restriction on the supposed favored treatment of a person originally commuting a substantial distance.

Section 231(d) of the bill should be changed to make the effective date applicable to taxable years beginning on or after January 1, 1964, and should permit the filing of claims for refund within one year from the date the Bill becomes law for those taxable years for which the three-year statute of limitations has expired. It is patently unfair to taxpayers who have moved in prior years and suffered a cash loss not to permit them to file claims for refund.

SECTION 301 OF THE BILL—PROPOSED CODE SECTION 84

Limit on tax preferences

Present law.—Under present law, there is no limit on how large a part of his income an individual may exclude from tax as a result of the receipt of various kinds of tax-exempt income or special deductions.

Proposed change.—The bill would impose a 50 percent ceiling on the amount of a taxpayer's total income (adjusted gross income plus tax preference items) which can be excluded from tax. This limitation would not be applicable if an individual's total tax preferences for the year did not exceed $10,000, or $5,000 for a married person filing a separate return.

AICPA comments.—The provisions of the bill placing a limit on tax preferences would impose a tax by indirect means on amounts which presently are fully or partially tax exempt. We agree that public confidence in our self-assessment system is undermined by the ability of individuals to realize large amounts of disposable income with little, if any, payment of tax. However, we recommend that the tax preference items be dealt with through direct legislation. If this is not practicable then we would support the provisions of the bill—with one modification. The tax preference item regarding the excess of accelerated depreciation over straight line depreciation should likewise provide for a reduction when straight line depreciation exceeds accelerated depreciation.

SECTION 302 OF THE BILL—PROPOSED CODE SECTION 277

Allocation of deductions

Present law.—Under present law an individual is permitted to charge his personal income tax deductions entirely against his taxable income without charging any part of these deductions to his tax-free income. As a result, taxpayers with substantial tax preference amounts and personal deductions can eliminate much or all of their tax liability on substantial amounts of otherwise taxable income.

Proposed charge.—To prevent individuals with tax preference amounts from reducing their tax liabilities on their taxable incomes by charging all their personal deductions to their taxable incomes, the Bill provides that individuals (and estates and trusts) must allocate most of their itemized personal deductions proportionately between their taxable income (adjusted gross income less non-allocable expenses) and their tax preference amounts. Only the part of these personal deductions which is allocated to taxable income is to be allowed as a tax deduction and the personal deductions allocated to the tax preference amounts to be disallowed. Tax preference amounts are taken into account only to the extent they exceed $10,000 ($5,000 for a married person filing a separate return).

We support this section of the bill.

SECTION 311 OF THE BILL—PROPOSED AMENDMENTS TO CODE SECTIONS 1301–1305

Income averaging

Present law.—Income averaging permit a taxpayer to mitigate the effect of progressive tax rates on sharp increases in income. His taxable income in excess of 133⅓ percent of his average taxable income for the prior 4 years generally can be averaged and taxed at lower rates than would otherwise apply. Certain types of income such as net long-term capital gains, wagering income, and income from gifts are not eligible for averaging.

The exclusion of certain types of income from income eligible for averaging complicates the tax return and makes it difficult for taxpayers to determine easily whether or not they would benefit from averaging. In addition, taxpayers with fluctuating income from these sources may pay higher taxes than taxpayers with constant income from the same sources or fluctuating income from different sources. Finally, the 133⅓ percent requirement denies the benefit of averaging to taxpayers with a substantial increase in income and reduces the benefits of averaging for those who are eligible.

Proposed change.—The bill extends income averaging to net long-term capital gains, income from wagering and income from gifts. It also lowers the percentage by which an individual's income must increase for averaging to be available from 133⅓ percent to 20 percent.

AICPA comments.—We support this provision of the Bill but take exception to the proposed effective date of taxable years beginning after December 31, 1969. We note that the provisions of the Bill dealing with the repeal of the alternative tax on capital gains for individuals (Bill section 511) are to be effective with respect to sales and dispositions occurring after July 25, 1969. The effective dates of these two provisions coupled with the 10 percent tax surcharge now in effect subjects long-term capital gain realized by individuals in the brief period from July 26 to December 31 to a severe and inequitable tax penalty. We believe equity dictates that the effective dates for eliminating the alternative capital gains tax and introducing the new averaging provisions be the same.

(NOTE.—Please refer to our comments in the summary regarding the effective dates of capital gains and losses.)

SECTION 321 OF THE BILL—PROPOSED CODE SECTION 85 AND PROPOSED AMENDMENTS TO CODE SECTIONS 402(b) AND 403

Present law.—Restricted property: At present the treatment of restricted property is governed by Treasury regulations which provide for no tax when the employee receives the restricted stock. When the restrictions lapse, the value of the stock at the time of transfer to the employee (determined without restrictions) is treated as compensation provided it has increased in value. If the value decreases then the lower value is considered the compensation.

Proposed change.—Section 321 of the bill provides that a person who receives a beneficial interest in property by reason of services performed is to be taxed with respect to the property at the time it is received if he can transfer the property and if it is not subject to substantial risk of forfeiture. If there is a substantial risk of forfeiture a tax is imposed when the risk lapses. The tax will be on the amount by which the fair market value of the property exceeds the amount the employee paid for it.

AICPA comments.—We support this provision on condition that any legislation finally approved continues to provide for the 50 percent maximum rate on earned taxable income. This provision, coupled with the capital gain provisions in the Bill, reflects a recognition of equality of tax treatment between earned income and capital gain income. We believe that these provisions, taken together will continue to provide incentive for those who have contributed much to our economic progress and will also lessen the search for transactions motivated by tax avoidance.

SECTIONS 341 AND 342 OF THE BILL—PROPOSED AMENDMENTS TO CODE SECTIONS 665–669 AND 677

Accumulation trusts, multiple trusts, etc.

Present law.—If a grantor creates a trust under which the trustee is either required or is given discretion to accumulate the income for the benefit of designated beneficiaries, then to the extent the income is accumulated, it is taxed at indiivdual rates to the trust.

When the trust distributes accumulated income to the beneficiaries, in some cases they are taxed on the distributions under a so-called throwback rule. The throwback rule treats the income for tax purposes as if it had been received by the beneficiaires in the years in which it was received by the trust. The beneficiary recomputes his tax for these back years, adding the trust income to it and taking credit for the tax which had been paid by the trust on that income, and pays the additional tax due in the current year.

In addition to the limitation of its application to the 5 years preceding the year of distribution, the throwback rule does not apply to several types of distributions.

The progressive tax rate structure for individuals may be avoided when a grantor creates trusts which accumulate income taxed at low rates, and the income in turn is distributed at a future date. This result occurs because the trust itself is taxed on the accumulated income rather than the grantor or the beneficiary.

Proposed change.—H.R. 13270 provides that beneficiaries are to be taxed on distributions received from accumulation trusts in substantially the same manner as if the income had been distributed to the beneficiaries currently as earned, instead of being accumulated in the trust. The Bill, in effect, eliminates the 5-year limitation and all exceptions to the throwback rule, and provides an unlimited throwback rule with respect to accumulation distributions. However, only distributions of income accumulated by a trust (other than a foreign trust created by a U.S. person) in years beginning after April 22, 1964 are to be subject to the throwback rule.

In the case of these accumulation trusts, all of their accumulated income, other than income distributable currently, is to be taxed to the beneficiaries upon its distribution to them. The amounts distributed are to be treated as if they had been distributed in the preceding years in which income was accumulated but are includible in income of the beneficiaries for the current year.

The bill also provides that in the case of a trust created by a taxpayer for the benefit of his spouse, the trust income which may be used for the benefit of the spouse is to be taxed to the creator of the trust as it is earned. However, this provision is not to apply where another provision of the Code requires the wife to include in her gross income the income from a trust.

AICPA comments.—We agree with these provisions of the Bill in principle. However, it is wholly inconsistent for the equitable administration of the income tax law to provide effective dates for implementation of proposed restrictive changes which are retroactive in effect and impact. Thus, we disagree with the proposal that the changes embodied in Bill section 341 should be reflected for distributions made subsequent to April 23, 1969 based on amounts accumulated since April 23, 1964. Many trusts were set up on the basis of the exception to throwback available in section 665(b) of the Code (prior to the proposed changes). These include so-called minors' trusts which terminate at age 21 and payment of amounts as final distributions by trusts which are made more than nine years after the date of last transfer to such trust. In many cases by the terms of the trust instrument, distributions could not take place prior to April 23, 1969 and in many other situations taxpayers could not be on notice that action had to have taken place prior to the proposed effective date in order to avoid adverse tax impact.

Therefore, it is proposed that the changes set forth in section 341 of the Bill be applicable only to those trusts established or additions made to existing trusts after April 23, 1969 with respect to eliminating the exceptions available under Code section 665(b). Concomitantly, it is suggested and recommended that for those accumulation trusts which cannot qualify under these exceptions, the effective date with respect to full or maximum throwback apply only to accumulations in fiscal years ending after April 23, 1969.

SECTION 401 OF THE BILL—PROPOSED AMENDMENTS TO CODE SECTIONS 46, 179, 821, 823, 1561–1563 AND PROPOSED CODE SECTION 1564

Multiple corporations

Present law—Under present law, corporations generally are taxed at the rate of 22 percent on the first $25,000 of taxable income and at 48 percent of taxable income in excess of $25,000. The lower tax rate on the first $25,000 of taxable income is commonly referred to as the surtax exemption.

Present law limits to some extent the ability of a taxpayer to split his business enterprise into a number of corporations so as to obtain multiple surtax exemptions by providing that a "controlled group" of corporations is limited to one surtax exemption. Instead of claiming one surtax exemption for the group of corporations, however, a controlled group may elect for each member to take a surtax exemption if each of the corporations pays an additional 6 percent tax on the first $25,000 of its taxable income.

Although the surtax exemption was designed to help small businesses, large organizations have been able to obtain substantial benefits from the exemption by dividing the organization's income among a number of related corporations.

In addition to the surtax exemption, there are other provisions of present law designed to aid small businesses. These other provisions are: (1) the provision which allows a corporation to accumulate $100,000 of earnings without being subject to the penalty tax on earnings unreasonably accumulated to avoid the dividend tax on shareholders; (2) the life insurance company small business deduction of 10 percent of the company's net investment income (this deduction is limited to $25,000 per year); (3) the exception to the general 50 percent limitation on the investment credit which allows 100 percent of tax liability up to $25,000 to be taken into account, and the investment credit provision which allows up to $50,000 of used (as distinct from new) equipment to qualify for the credit; (4) the provision which allows an additional first year depreciation allowance equal to 20 percent of the cost of the property (limited to $10,000 per year); (5) the provision which grants mutual insurance companies (other than life and marine) benefits similar to the surtax exemption; and (6) the provision which exempts mutual companies (other than life or marine) from tax if their investment income does not exceed $150,000.

Proposed change.—H.R. 13270 provides that a controlled group of corporations is only to be allowed one surtax exemption and in addition is not to be allowed to receive multiple benefits under other provisions of the law designed to aid small businesses. Generally, the limitation provided by the Bill is to be phased in over an 8-year period and is to be fully effective for 1976 and later years.

A controlled group of corporations is limited to one $25,000 surtax exemption and one $100,000 accumulated earnings credit after an 8-year transition period. This is accomplished by gradually reducing the amount of the special provisions in excess of one which is presently being claimed by a controlled group over the years 1969 to 1975 until these excess special provisions are reduced to zero for 1976 and later years.

The limitation on multiple benefits from the investment credit and first year additional depreciation, becomes fully effective with taxable years ending on or after December 31, 1969. To ease the transition, controlled corporations are allowed to increase the dividend received deduction from 85 percent to 100 percent at a rate of 2 percent per year.

Under the present consolidated return regulations, preconsolidation losses for a corporation in a group claiming multiple surtax exemptions may be carried over after consolidation only against the income of the corporation which sustained the losses. The Bill modifies these present regulations so as to permit net operating losses for a taxable year ending on or after December 31, 1969, to be taken as a deduction against the income of other members of such group in the same proportion as the additional surtax exemptions of such group.

The bill also broadens the definition of a controlled group of corporations.

We support these proposed amendments to the Code.

SECTION 411 OF THE BILL—PROPOSED CODE SECTION 279

Corporate mergers—Disallowance of interest deduction in certain cases

Present law.—Under present law a corporation is allowed to deduct interest paid by it on its debt but is not allowed a deduction for dividends paid on its stock or equity.

It is a difficult task to draw an appropriate distinction between dividends and interest, or equity and debt. Although this problem is a long-standing one in the tax laws, it has become of increasing significance in recent years because of the increased level of corporate merger activities and the increasng use of debt for corporate acqusiton purposes.

There are a number of factors wheih make the use of debt for corporate acquisition purposes desirable, including the fact that the acquiring company may deduct the interest on the debt but cannot deduct dividends on stock.

Proposed change.—In general, the bill disallows a deduction for interest on bonds issued in connection with the acquisition of a corporaton where the bonds have specfied characteristics which make them more closely akin to equity.

The disallowance rule of the bill only applies to bonds or debentures issued by a corporation to acquire stock in another corporation or to acquire at least two-thirds of the total value of the assets of another corporation. Moreover, the disallowance rule only applies to bonds or debentures which have all of the following characteristics; (1) they are subordinated to the corporation's trade creditors; (2) they are convertible into stock; and (3) they are issued by a corporation with a ratio of debt to equity which is greater than two to one or with an annual interest expense on its indebtedness which is not covered at least three times over by its projected earnings.

An exception to the treatment provided by the bill is allowed for up to $5 million a year of interest on obligations which meet the prescribed test.

Ths provision of the bill also does not apply to debt issued in tax-free acquisitions of stock of newly formed or existing subsidiaries, or in connection with acquisitions of foreign corporations if substantially all of the income of the foreign corporation is from foreign sources.

AICPA comments.—We disagree with section 411 of the bill, which would add new section 279 to the Code. It is our view that any restrictions on the "tide of conglomerate mergers" should be imposed outside the tax law. In any event, we feel that the criteria contained in proposed Code sections 279 (b) and (c) are arbitrary and of doubtful validity. Furthermore, the $5 million amount contaned in proposed section 279(a) is discriminatory. Other difficulties will involve tracing problems and the question of what constitutes a "plan" of acquisition. Finally, the section will adversely affect persons who for valid business reasons may desire to sell their businesses in that they may be unable to realize a proper price because of the depressing effect of proposed section 279.

SECTION 412 OF THE BILL—PROPOSED AMENDMENT TO CODE SECTION 453(b)

Corporate mergers—Limitation on installment sales provision

Present law.—Under present law, a taxpayer may elect the installment method of reporting a gain on a sale of real property, or a casual sale of personal property where the price is in excess of $1,000. The installment method, however, is available only if the payments received by the seller in the year of sale (not counting debt obligations of the purchaser) do not exceed 30 percent of the sales price.

The Internal Revenue Service has not ruled as to whether the installment method of reporting gain is available where the seller receives debentures. The use of the installment method of reporting gain where debentures are received by a seller of property may result in long-term tax deferral. Present law does not specify the number of installments which are required if a transaction is to be eligible for the installment method of reporting. In other words, it is not clear whether the installment method may be used when there is only one or a limited number of payments which may be deferred for a long time.

Proposed change.—The bill places two limitations on the use of the installment method of reporting gain on sales of real property and casual sales of personal property.

First, bonds with interest coupons attached, in registered form, or which are readily tradable, in effect are to be considered payments in the year of sale for purposes of the rule which denies the installment method where more than 30 percent of the sales price is received in that year.

The second limitation is contained in proposed Code section 453(b)(3). It would deny the use of the installment method unless the payment of the loan principal, or the payment of the loan principal and the interest together, are spread relatively evenly over the installment period. This requirement would be satisfied if either payments are made at least once every two years in relatively even or declining amounts over the installment period, or at least 5 percent of the loan principal is to be paid by the end of the first quarter of the installment period, 15 percent is to be paid by the end of the second quarter, and 40 percent is to be paid by the end of the third quarter.

AICPA comments.—We disagree with section 412 of the Bill to the extent that it would add proposed section 453(b)(3) to the Code. It is our concern that proposed section 453(b)(3) will disqualify from installment sale treatment transactions which presently have good business purpose. It would add more uncertainties to an already difficult area. Furthermore, problems presented by extension, calls or other modifications are not provided for. It is our view that proposed section 453(b)(4), with which we concur, is adequate to cover present abuses of the installment method.

SECTION 413 OF THE BILL—PROPOSED AMENDMENT TO CODE SECTION 1232

Corporate merger—Original issue discount

Present law.—Under present law, original issue discount arises when a corporation issues a bond for a price less than its face amount. The owner of the bond is not taxed on the original issue discount until the bond is redeemed or until he sells it, whichever occurs earlier.

The corporation issuing the bond, on the other hand, is allowed to deduct the original issue discount over the life of the bond.

This results in a nonparallel treatment of original issue discount between the issuing corporation and the bondholder. The corporation deducts a part of the discount each year. On the other hand, the bondholder is not required to report any of the discount as income until he disposes of the bond.

Proposed change.—The bill generally provides that the bondholder and the issuing corporation are to be treated consistently with respect to original issue discount. Thus, the Bill generally requires a bondholder to include the original issue discount in income ratably over the life of the bond. This rule applies to the original bondholder as well as to subsequent bondholders.

Corporations issuing bonds in registered form should be required to furnish the bondholder and the Government with an annual information return regarding the amount of original issue discount to be included in income for the year.

AICPA comments.—We do not agree with section 413 of the bill. We feel that the proposed changes violate the well-established rules of the cash method of accounting and further that they will add to complexity and information reporting difficulties far out of proportion to the problem which section 413 is designed to solve.

We should like to recommend an alternative solution to the problem. We suggest that Code section 1221 be amended to exclude from the definition of a capital asset all corporate nonconvertible debt (sometimes referred to as "straight" debt). Such a provision would make all gains and losses on sales of nonconvertilbe corporate debt ordinary income or ordinary deductions, respectively. Nonconvertible corporate debt is acquired by an investor for the principal purpose of realizing a yield on the money invested. It appears that the market value of nonconvertible corporate debt obligations fluctuates in large measure with reference to prevailing interest yields. Accordingly, it seems reasonable to tax as ordinary income or allow as ordinary deductions gains or losses on disposition of the obligations which are primarily mere adjustments of yields.

We are cognizant of the fact that changes in market value of nonconvertible corporate debt can also be attributable to a change in the credit rating of the issuer, and it is true that it might be appropriate to reflect his element as capital gain or loss. However, we feel on balance that the treatment of nonconvertible corporate debt as a noncapital asset will eliminate or reduce the importance of many complexities, including those resulting from Code sections 171 and 1232.

SECTION 414 OF THE BILL—PROPOSED CODE SECTION 249

Corporate mergers—Convertible indebtedness repurchase premiums

Present law.—Under present law, there is a question as to whether a corporation which repurchases its convertible indebtedness at a premium may deduct the entire difference between the stated redemption price at maturity and the actual repurchase price. The Internal Revenue Service takes the position that the deduction is limited to an amount which represents a true interest expense (i.e., the cost of borrowing) and does not include the amount of the premium attributable to the conversion feature. This part of the repurchase is viewed by the Internal Revenue Service as a capital transaction analogous to a corporation's repurchase of its own stock for which no deduction is allowable. There are however, two court cases which hold to the contrary in that they allowed the deduction of the entire premium. Other court cases have been filed by taxpayers to test the validity of the Service's position on this matter.

Proposed change.—In order to clarify the treatment of premiums paid on the repurchase by a corporation of its indebtedness which is convertible into its own stock (or the stock of a controlling or controlled corporation), the Bill provides that the amount of the premium which may be deducted is to be limited to an amount not in excess of a normal call premium for nonconvertible corporate indebtedness. The amount of the premium paid by the corporation upon the repurchase is to be the excess of the amount paid over the issue price of the indebtedness (plus any amount of discount previously deducted and minus any amount of premium previously reported as income).

It is further provided by the bill that a larger deduction may be allowed with respect to the premium where the corporation can demonstrate to the satisfaction of the Secretary or his delegate that the amount of the premium in excess of that otherwise allowed as a deduction is related to the cost of borrowing and is no attributable to the conversion feature of the indebtedness. This exception is designed to allow for changes in the interest rates and to permit market and credit conditions to be taken into account.

We support this proposed amendment to the Code.

SECTION 421 OF THE BILL—PROPOSED AMENDMENTS TO CODE SECTIONS 301 AND 305

Tax treatmnt of stock dividends

Present laws.—In its simplest form, a stock dividend is commonly thought of as a mere readjustment of the stockholder's interest, and not as income. For example, if a corporation with only common stock outstanding issues more common stock as a dividend, no basic change is made in the position of the corporation and it stockholders. No corporate assets are paid out, and the distribution merely gives each stockholder more pieces of paper to represent the same interest in the corporation.

On the other hand, stock dividends may also be used in a way that alters the interests of the stockholders. For example, if a corporation with only common stock outstanding declares a dividend payable, at the election of each stockholder, either in additional common stock or in cash, the stockholder who receives a stock dividend is in the same position as if he received a taxable cash dividend and purchased additional stock with the proceeds. His interest in the corporation is increased relative to the interests of stockholders who took dividends in cash. Under present law, the recipient of a stock dividend under these conditions is taxed as if he had received cash.

Sometimes, by means of such devices as convertible securities with changing conversion ratios, or systematic redemptions, the effect of an election to receive cash or stock can be achieved without any actual distribution of stock dividends and therefore without any current tax to the stockholders whose interests in the corporation are increased.

Proposed change.—The bill provides that a stock dividend is to be taxable if one group of shareholders receives a distribution in cash and there is an increase in the proportionate interest of other shareholders in the corporation. In addition, the distribution of convertible preferred stock is to be taxable unless it does not result in such a disproportionate distribution.

The Bill also deals with the related problem of stock dividends on preferred stock. Since preferred stock characteristically pays specified cash dividends, all stock dividends on preferred stock (except antidilution distributions on convertible preferred stock) are a substitute for cash dividends, and all stock distributions on preferred stock (except for antidilution purposes) are taxable under the bill.

We support this section of the bill.

SECTION 501 (b) OF THE BILL—PROPOSED CODE SECTION 636

Natural resources—Mineral production payments

Present law.—A mineral production payment is a right to a specified share of the production from a mineral property (or a sum of money in place of the production) when that production occurs. Depending on how a production payment is created, it may be classified as a carved-out production payment, or retained production payment which may then be used in a so-called "ABC" transaction.

The use of carved-out production payments can be used to circumvent the limitations on the depletion deduction and the foreign tax credit and to distort the benefits that the net operating loss provisions were designed to provide. In addition, in ABC transactions, taxpayers are able to pay off what is essentially a purchase money mortgage with before-tax dollars rather than after-tax dollars.

Proposed change.—The bill provides in general that carved-out payments and retained payments (including ABC transactions) are to be treated as a loan by the owner of the production payment to the owner of the mineral property.

In the case of a carved-out production payment, the bill provides the payment is to be treated as a mortgage loan on the mineral property (rather than as an economic interest in the property).

This treatment is not to apply to a production payment carved out for exploration or development of a mineral property if, under existing law, gross income is not realized by the person creating the production payment.

In the case of retained production payments (that is, the sale of mineral property subject to a production payment), the Bill provides that the production payment is to be treated as a purchase money mortgage loan (rather than as an economic interest in the mineral property).

AICPA comments.—We recommend that an exception be made to the treatment provided for in section 501(b) of the Bill for production payments used to equalize the investment of participants in a unitization. Producing properties are often unitized in the interest of conservation of natural resources and more efficient production. Some of the owners in a unit may have done more to develop production than others. In order to recognize the greater investments of those who have already done more development work than their share in the unit, adjustments have to be made when the unit is organized. Sometimes these adjustments take the form of cash payments which generally produce an immediate tax impact to the recipient. Therefore, often those parties who have expended more than their share of the costs of development are permitted to retain a larger share of production from the properties until they have recouped their excess investment. This has the effect of spreading the adjustment over the period of time during which the funds are realized from production and also will tend to allow greater percentage depletion to the owner of the more highly developed properties and correspondingly less to the owner of the less developed properties. The revenue is not hurt since the income is bound to be reported by one of the participants or the other. Inasmuch as the unitization of mineral properties ought to be encouraged because it leads to more efficient and less expensive production, an exception for production payments used in connection with poolings and unitizations of mineral properties to adjust the pro rata investments of participants seems justified.

SECTION 501 (C) OF THE BILL—PROPOSED AMENDMENTS TO CODE SECTIONS 615 AND 617

Natural resources—Mining and exploration expenditures

Present law.—Present law allows a taxpayer to elect to deduct, without dollar limitation, mining exploration expenditures (that is, exploration expenditures for any ore or mineral other than oil or gas) which are made prior to the development stage of the mine. The availability of this deduction is limited to mines located in the United States or on the outer continental shelf. When a mine reaches the producing stage, the exploration expenditures previously deducted are recaptured, generally by disallowing the depletion deduction with respect to the mine.

A taxpayer who does not elect this unlimited mining exploration expenditure deduction is allowed a limited deduction for exploration expenditures (whether on domestic or foreign mines) without the recapture rules applying. The total deduction under this limited provision for all years may not exceed $400,000.

The allowance of a current deduction for exploration expenditures without applying the recapture rules in the case of expenditures for which the limited deduction is available provides more generous treatment than in the case of most mineral producers which are under the unlimited deduction provision.

Proposed change.—The bill provides that the general recapture rules of present law are to apply to mining exploration expenditures which are deducted under the limited provision of present law. Thus, a deduction will continue to be allowed for foreign or oceanographic explorations under the limited provision, but the general recapture rules will apply with respect to these expenditures.

AICPA comments.—Section 501(c)(1) of the Bill would amend Code section 615 to provide that all expenditures after July 22, 1969, to which section 615 applies would be subject to the recapture provisions of Code section 617. Expenditures made prior to July 23, 1969, are included in determining the $400,000 limitation under section 615. Section 501(c)(2) of the Bill would amend Code section 617 to permit in the case of foreign and oceanographic explorations deductions to the extent the expenditures do not exceed $400,000, reduced by the total of expenditures previously deducted under Code sections 615 and 617.

We support the approach of the bill. However, present Code section 615(f) provides that a taxpayer who has elected either section 615 or section 617 and has not revoked the election cannot elect to apply the other section. The present bill if enacted may cause inequities to taxpayers who made an election under either Code section 615 or section 617 whereas if they had known of the proposed amendments, they might have elected otherwise. Although the time within which to revoke the elections under section 615 or section 617 has not yet expired (see section 615(e)), provision should be made in the proposed amendments to protect those taxpayers who have made elections. The amendments should permit new elections to be made, and provide that this right does not expire until after the final regulations with respect to the bill section 501(c) amendments have been published in the Federal Register (last day of the third month following publication, for example). The reason for such a lengthy period of time to make the new election rests on the fact that the new election should be made only after the taxpayer is fully informed of the position the Internal Revenue Service may take in the final regulations.

SECTION 512 OF THE BILL—PROPOSED AMENDMENTS TO CODE SECTIONS 1211 AND 1212

Capital losses of individuals

Present law.—Under present law, both individual and corporate taxpayers may deduct capital losses to the extent of their capital gains. In addition, if an individual's capital losses exceed his capital gains, he may deduct up to $1,000 of the excess loss against his ordinary income. Any remaining loss may be carried forward for an unlimited number of years and deducted against ordinary income provided it is not offset by capital gains. On the other hand, where an individual has a net long-term capital gain rather than a net capital loss, a maximum of only one-half of the net long-term capital gain is subject to tax.

If a husband and wife each have capital transactions and a joint return is filed, their respective gains and losses are treated as though they had been realized by only one taxpayer and are offset against each other. On the other hand, when both spouses have capital losses and file separate returns, each spouse is allowed to deduct up to $1,000 of net capital losses from ordinary income. Thus, by filing separately, a married couple may receive a total capital doss deduction against ordinary income of $2,000.

The present treatment of long-term capital losses is inconsistent in the case of individuals with the treatment of their long-term capital gains. Although a maximum of fifty cents of each dollar of long-term capital gains is subject to ordinary tax, when capital losses exceed capital gains, the excess loss is deductible dollar-for-dollar against ordinary income (up to a maximum of $1,000).

In addition, when it is more advantageous to them, married couples can file separate returns, be treated as two separate taxpayers, and each be allowed to deduct up to $1,000 of capital losses from ordinary income. This treatment is permitted even though married couples are generally treated as one taxpayer.

This treatment of losses tends to provide an advantage for people living in community property states because all gains and losses from community property are attributable in equal amounts to each of the spouses by operation of community property law and, therefore, they are automatically eligible for the benefit of the double deduction. On the other hand, spouses living in noncommunity property states must have separate losses in order to claim this advantage—hence, they must either sell assets held in their joint names or each must sell his own assets.

Proposed change.—The bill provides that only 50 percent of an individual's long-term capital losses may be offset against his ordinary income. (Short-term capital losses, however, would continue to be fully deductible.) In addition, the deduction of capital losses against ordinary income for married persons filing separate returns is limited by the House Bill to $500 for each spouse.

We support this section of the bill.

SECTION 513 OF THE BILL—PROPOSED AMENDMENT TO CODE SECTION 1221

Capital gains and losses—Letters, memorandums, etc.

Present law.—Under present law, copyrights and literary, musical or artistic compositions (or similar property) are not treated as capital assets if they are held by the person whose personal efforts created the property (or by a person who acquired the property as a gift from the person who created it). Thus, any gain arising from the sale of such a book, artistic work or similar property is treated as ordinary income, rather than as a capital gain. Collections of papers and letters prepared and collected by an individual (including papers prepared for the individual), however, are treated as capital assets. Therefore, a gain from the sale of papers of this nature is treated as a capital gain, rather than as ordinary income.

The rationale underlying the treatment provided in present law for copyrights, artistic works and similar property in the hands of the person who created them (or in the possession of a person who received the property as a gift from the person who created it) is that the person is, in effect, engaged in the business of creating and selling the artistic work or similar property.

The collections of papers and letters are essentially simliar to a literary or artistic composition which is created by the personal effort of the taxpayer and should be classified for the purposes of the tax law in the same manner.

Proposed change.—The bill provides that letters, memorandums and similar property (or collections thereof) are not to be treated as capital assets if they are held by a taxpayer whose personal efforts created the property or for whom the property was prepared or produced (or by a person who received the property as a gift from such a taxpayer). For this purpose, letters and memorandums addressed to an individual are considered as prepared for him. Gains from the sale of these letters and memorandums, accordingly, are to be taxed as ordinary income, rather than as capital gains.

We support this section of the bill.

SECTION 514 OF THE BILL—PROPOSED AMENDMENT TO CODE SECTION 1222

Holding period of capital assets

Present law.—Capital gains on assets held longer than six months are considered long-term gains.

Proposed change.—The bill provides that a long-term capital gain is to be a gain from the sale or exchange of a capital asset held for more than 12 months.

AICPA comments.—Admittedly, the proposed 12 month holding period is arbitrary. We do feel however, that it is desirable to lengthen the six month period. We believe that a holding period beyond six months would more accurately indicate the intention to invest and thereby serve more closely Congressional intent that special tax treatment be afforded gains from investment as distinguished from speculative gains.

SECTION 515 OF THE BILL—PROPOSED AMENDMENTS TO CODE SECTIONS 402, 403 AND 72

Capital gains and losses—Total distribution from qualified pension, etc., plans

Present law.—An employer who establishes a qualified employee pension, profit-sharing, stock-bonus or annuity plan is allowed to deduct contributions to the trust, or if annuities are purchased, the employer may deduct the premiums.

The employer contributions to, and the earnings of, a tax-exempt trust generally are not taxed to the employee until the amount credited to his account are distributed or "made available" to him. Retirement benefits generally are taxed as ordinary income under the annuity rules when the amounts are distributed, to the extent they exceed the amounts contributed by the employee. Thus, employee contributions to a pension, etc. fund are not taxed when received since these amounts were contributed from after-tax dollars of the employee.

An exception to the general rule of ordinary income treatment of pension benefits, however, provides that if an employee (except a self-employed person) receives his total accrued benefits in a distribution within one taxable year on account of separation from service or death, the distribution is taxed as a capital gain, rather than as ordinary income.

If part or all of this total distribution consists of employer securities, the employee is not taxed on the net unrealized appreciation in the securities at the time of distribution but instead only when the stock is subsequently sold by the employee. The employee is taxed only on the portion of the employer securities attributable to the employer's cost at the time of the contribution to the trust. Furthermore, this portion is taxed at the long-term capital gain rate, rather than at ordinary income rates.

The capital gain treatment of lump-sum pension distributions was originally enacted in the Revenue Act of 1942 as a solution to the so-called bunched-income problem of receiving an amount in 1 taxable year which had accrued over several years.

The capital gain treatment afforded lump-sum distributions from qualified pension plans usually allows employees to receive deferred compensation at a more favorable tax rate than other compensation received for services rendered.

Proposed change.—The bill limits the extent to which capital gain treatment will be allowed for lump-sum distributions from qualified employees' trusts made within 1 taxable year. Capital gain treatment is to be limited to the amount of the total distribution in excess of employer contributions.

The bill also provides for a special 5-year "forward" averaging of the amounts to be treated as ordinary income. The taxpayer computes the increase in tax as a result of including 20 percent of the ordinary income amount of the distribution in his gross income for the taxable year in which the total distribution is made, and then multiplies the increase in tax by 5 to obtain his tax liability on the ordinary income portion. The bill further provides that the taxpayer may recompute his tax on the ordinary income portion at the end of 5 years by adding 20 percent of the amount in the gross income in each of the 5 taxable years, and if this method results in a lower tax than previously paid, he is entitled to a refund.

We support this section of the bill.

SECTION 516(b) OF THE BILL—PROPOSED AMENDMENT TO CODE SECTION 1231

Capital gains and losses—Certain casualty losses under section 1231

Present law.—Generally, under present law if the gains on the disposition of certain types of property exceed the losses on this same type of property, in effect, the excess is treated as long-term capital gain. On the other hand, if the losses exceed the gains, then the net loss is treated as an ordinary loss. The types of property subject to this provision generally are depreciable property and real estate used in a trade or business and capital assets which are involuntarily converted.

An exception to this general provision is provided for uninsured losses resulting from casualty or theft in the case of property used in a trade or business (or capital assets held for the production of income). These uninsured losses are deductible in full against ordinary income rather than being required to be netted with other gains and losses under Code section 1231.

The exception to the general section 1231 rule has led to anomalous results. A business taxpayer with a casualty loss on two similar business properties, one of which is insured and one of which is not, is allowed to deduct the uninsured loss in full against ordinary income and at the same time is allowed to treat the gain on the insured property (the excess of the amount of insurance received over his adjusted basis in the property) as a capital gain. In other words, the gain and loss do not have to be netted under section 1231. On the other hand, the netting is required where the business taxpayer only partially (perhaps 5 percent) insures a business property.

Another problem that has arisen under section 1231 is whether it is applicable to casualty losses on uninsured personal assets.

Proposed change.—Casualty (or theft) losses on depreciable property and real estate used in a trade or business and on capital assets held for the production of income are to be consolidated with casualty (or theft) gains on this type of property. If the casualty losses exceed the casualty gains, the net loss, in effect, will be treated as an ordinary loss (without regard to section 1231). On the other hand, if the casualty gains exceed the casualty losses, then the net gain will be treated as a section 1231 gain which must then be consolidated with other gains and losses under section 1231. This rule is to apply where the casualty property is uninsured, partially insured or totally insured.

The bill also clarifies the fact that uninsured casualty losses on personal assets are subject to the basic section 1231 provisions.

We support this proposed amendment to the Code.

SECTION 516(c) OF THE BILL—PROPOSED CODE SECTION 1252

Capital gains and losses—Transfers of franchises

Present law.—The substantial growth of franchising throughout the United States in recent years has raised two significant problems: first, whether transfers of franchises are sales or licenses or, more particularly, whether the retention of powers, rights or a continuing interest in the franchise agreement is significant enough to preclude a sale; and, second, whether franchisors are selling franchises in the ordinary course of business.

The first problem is not dealt with specifically under present law, and must be resolved under general tax principles. Although section 1221 of the Code deals with property held for sale to customers, it does not appear that its relation to franchises has been fully explored by the courts.

Since present law does not specifically deal with these matters, and since there appears to be considerable diversity of opinion among the courts as to whether the transfer of a franchise constitutes a license or a sale and whether part or all of sale of a franchise constitutes the sale of a capital asset, the bill attempts to clarify these problems.

Proposed change.—The bill adds a new section to the Code providing that the transfer of a franchise is not to be treated as a sale or exchange of a capital asset or of property to which section 1231 applies, if the transferor retains any significant power, right or continuing interest with respect to the subject matter of the franchise.

The general rule is not to apply with respect to amounts received or accrued, in connection with a transfer of a franchise, which are attributable to the transfer of all substantial rights to a patent, trademark or trade name (or the transfer of an undivided interest therein which includes part of all such rights), to the extent the amounts are separately indentified and are reasonable in amount. These amounts, as is the case with the transfer of a patent under Code section 1235, would be entitled to capital gains treatment.

We support this proposed amendment to the Code.

Capital gains and losses—Effective date

General comment.—The effective date for the capital gain and loss provisions of the Bill is generally July 25, 1969. This date can impose serious tax penalties for those sales or dispositions which are made after July 25, 1969 pursuant to action taken prior to that date. We therefore suggest that the effective date be established at December 31, 1969, or, in the alternative, eliminate from the provisions of the Bill any transactions to which the seller was committed in writing on or before July 25, 1969. Further, we suggest that insofar as the repeal of the alternative capital gains tax for individuals and the character of the gain is concerned, collections or other dispositions in connection with transactions in which the installment method was elected should be treated as if they occurred on or before July 25, 1969.

SECTION 521 OF THE BILL—PROPOSED AMENDMENTS TO CODE SECTIONS 167 AND 1250

Real estate depreciation

Present law.—Under present law, the first owner may take depreciation allowances for real property under the double declining balance method or the sum of the years digits-method. These rapid depreciation methods generally permit large portions of an asset's total basis to be deducted in the early years of the asset's useful life. A subsequent owner is permitted to use the 150 percent declining balance method which also provides more rapid depreciation than straight line in the early years.

Depreciation is allowed on the total cost basis of the property (minus a reasonable salvage value), even though the property was acquired with little equity and a large mortgage.

Net gains on sales of real property used in a trade or business are, with certain exceptions, taxed as capital gains and losses are treated as ordinary losses. Gain on the sale of buildings is taxed as ordinary income to the extent of depreciation taken on that property after December 31, 1963, if the property has been held more than 12 months. If the property has been held over 12 months, only the excess over straight-line depreciation is "recaptured". That amount is reduced after 20 months, at the rate of 1 percent per month, until 120 months, after which nothing is recaptured.

The present tax treatment of real estate has been used by some individuals as a tax shelter to escape payment of tax on substantial portions of their economic income. The rapid depreciation methods now allowed make it possible for taxpayers to deduct amounts in excess of those required to service the mortgage during the early life of the property.

Proposed change.—Under the Bill the most accelerated methods of real estate depreciation (the 200 percent declining balance and the some of the years digits-methods) are limited to new residential housing. To qualify for such accelerated depreciation at least 80 percent of the income from the building must be derived from rentals of residential units. Other new real estate, including commercial and industrial buildings, is to be limited to the 150 percent declining balance depreciation method. In general the new rules will not apply to property if its construction began before July 25, 1969, or if there was a written binding contract to construct the building before July 25, 1969.

Only straight line depreciation is to be allowed for used buildings acquired after July 25, 1969. A special 5-year amortization deduction is provided under certain conditions in the case of expenditures after July 24, 1969, however, for the rehabilitation of buildings for low-cost rental housing.

Finally, the Bill provides for the recapture of the excess of accelerated depreciation over straight line depreciation on the disposition after July 24, 1969, of depreciable real property (but only to the extent of depreciation taken after that date). Thus, to the extent of this excess depreciation, the gain on the sale of the real property will be treated as ordinary income rather than as capital gain.

We support this section of the bill.

SECTION 541 OF THE BILL—PROPOSED CODE SECTION 1379

Subchapter S corporations

Present law.—Subchapter S of the Code was enacted in 1958 to provide tax relief for small business corporations. These provisions do not deal with employee retirement plans; consequently, Subchapter S coporations may estbalish corporate retirement plans for the benefit of shareholders who are also employees of the corporation.

Prior to 1962, self-employed persons (proprietors and partners) were not able to establish such plans to benefit themselves. In 1962, however, Congress enacted the Self-Employed Individuals Retirement Act (H.R. 10), permitting self-employed persons to be treated as employees of the businesses they conduct so that they may be covered under qualified employees retirement plans in much the same manner as their employees. These provisions, though, contain certain specific requirements as to proprietors and partners which limit contributions to 10 percent of the proprietor's or partner's earned income, or $2,500, whichever is less.

The H.R. 10 limitations on retirement income plans described above do not apply to corporations.

Proposed change.—The bill provides limitations, similar to those contained in H.R. 10, with respect to contributions made by Subchapter S corporations to the retirement plans for those individuals who are "shareholder-employees," defined as employees or officers who own more than 5 percent of the corporation's stock. Under the Bill, a shareholder-employee must include in his income the contributions made by the corporation under a qualified plan on his behalf to the extent contributions exceed 10 percent of his salary or $2,500, whichever is less.

AICPA comments.—We strongly support the objective of achieving similarity of tax treatment as between shareholders of electing corporations and partners. If parallel treatment of retirement plans is required to attain this goal, it would be acceptable. However, we believe that the rules governing self-employed retirement plans presently are overly restrictive and that a change to align the treatment of electing corporations with them would be a move in the wrong direction. Rather, we urge that the rules governing self-employment retirement plans be amended to make them more nearly comparable to those covering corporate executives.

In the event the principle of the Bill is accepted in its present form by your Committee, we believe that modification in the treatment of forfeitures should be included.

A separation will have to be made between forfeitures applicable to contributions made, while an electing small business corporation, in years beginning prior to January 1, 1970 and those forfeitures applicable to contributions made on or after that date. This imposes an adminisrative burden on the trustees but it is one that is necessary to prevent a shareholder-employee from receiving a greater contribution than allowable under proposed Code section 1379(b). An alternative plan which we suggest and which could reduce this burden would be to allow forfeitures to be credited to the shareholder-employee with any excess of the aggregate share of forfeitures applicable to contributions for years beginning after December 31, 1969 plus the share of contributions for such years over the lesser of (A) 10% of compensation or (B) $2,500 limitation being included in gross income by the shareholder-employee.

In connection with forfeitures, the Bill simply refers to forfeitures attributable to contributions, with no mention made of the earnings (or loss) applicable to such contributions. We believe that the term forfeitures should apply to contributions adjusted for earnings (or losses) since the dates of such contributions.

Proposed section 1379(c) prohibits carryovers of unused contributions from Subchapter S years to nonsubchapter S years. Code section 404(a)(3)(A) should be amended to conform.

SECTION 801 OF THE BILL—PROPOSED AMENDMENT TO CODE SECTION 141

Increased in standard deduction

Present law.—Under present law, a taxpayer may deduct his personal exemptions and also either his itemized deductions or the standard deduction in order to determine his taxable income. The standard deduction is the larger of the 10-percent standard deduction (10 percent of adjusted gross income) or the minimum standard deduction, but in neither case may it exceed $1,000 ($500 in the case of a married individual filing a separate return).

The 10 percent standard deduction was introduced in 1944 to reduce the complexity of the income tax for the vast majority of taxpayers. Instead of keeping records of deductible personal expenditures and itemizing deductions on their tax returns, more than 82 percent of taxpayers were able to use the simpler standard deduction when it was first introduced.

The combined effect of increased personal expenses and rising incomes has reduced the proportion of taxpayers using the standard deduction from over 82 percent in 1944 to an estimated 58 percent in 1969.

Proposed change.—It is desirable to simplify the preparation and auditing of individual income tax returns by increasing the number of taxpayers using the standard deduction. For this reason and to provide tax reduction to middle-income taxpayers the bill increases the standard deduction to 15 percent with a $2,000 ceiling in three stages.

The bill provides that the standard deduction will be 13 percent with a $1,400 ceiling in 1970, 14 percent with a $1,700 ceiling in 1971 and 15 percent with a $2,000 ceiling in 1972.

We support this proposed amendment to the Code.

SECTION 801 OF THE BILL—PROPOSED AMENDMENTS TO CODE SECTIONS 3 AND 141

Low income allowance

Present law.—The minimum standard deduction was enacted by Congress in 1964 to relieve from income tax persons with low incomes. While the action taken in 1964 providing for the minimum standard deduction provided some relief for low-income individuals, it still left some 5.2 million returns at or below the recognized "poverty level" who are still paying income taxes.

Proposed change.—The bill supplements what in the past has been called the "minimum standard deduction" to raise the minimum amount of exempt income for a family unit to $1,100, plus the number of $600 exemptions available to the family unit.

Under the bill for 1970, the new "low income allowance" consists of an amount called the "basic allowance" (formerly known as the minimum standard deduction) and the "additional allowance" (the new feature added by this bill). The basic allowance (as is true of the minimum standard deduction under present law) generally amounts to $200, plus $100 for each personal exemption allowed to the taxpayer up to a total of $1,000.

Thus, in the case of a single person entitled to one exemption the amount added to the $300 basic allowance is $800; in the case of a family unit of two members, the amount added to the $400 available under the basic allowance, is $700. As the amount of the basic allowance increases (by $100 for each exemption), the additional allowance added by this bill (in order to maintain a uniform $1,100 of tax-free income per family unit) decreases (by $100).

In 1970 only, the bill provides a phase-out of the low income allowance, to the extent it exceeds the present minimum standard deduction. This excess is to be reduced by $1 for each $2 that the taxpayer's gross income exceeds the nontaxable income level. The phase-out is repealed after calendar year 1970.

We support this proposed amendment to the Code.

SECTION 802 OF THE BILL—PROPOSED CODE SECTION 1348

Maximum tax on earned income

Present law.—Under present law, the individual income tax rates reach a maximum of 70 percent for taxable income in excess of $100,000 for single persons and $200,000 for joint returns. The 70 percent rate is applicable to all taxable income other than capital gains subject to the alternative rate of 25 percent.

The high rates are, in part, responsible for attempts to shelter income from tax and for the diversion of considerable time, talent and effort into "tax planning" rather than economically productive activities.

Proposed change.—The bill provides that the maximum marginal tax rate applicable to an individual's earned income is not to exceed 50 percent. This is, in effect, an alternative tax computation for earned income under which earned taxable income in the taxable income brackets where the tax rate would otherwise be greater than 50 percent is subject to a flat 50 percent rate.

We support this section of the bill.

RECOMMENDATIONS FOR AMENDMENTS TO THE INTERNAL REVENUE CODE

CONTENTS[1]

DETERMINATION OF TAXABLE INCOME

---

[1] For convenience, the recommendations are listed by Code section in the Contents and by subject in the Index.

265(2). Interest Relating to Tax-Exempt Income.
269. Carryover of Operating Losses—Acquisition of New Businesses.
269. Acquisitions to Evade or Avoid Federal Income Tax.
274. Deduction of Certain Entertainment, Etc., Expenses.

CORPORATE DISTRIBUTIONS AND ADJUSTMENTS

301(b)(1)(B), 301(d)(2)(B). Recognition of Gain to Distributor Corporation.
302. Lost Basis—Redemption of Stock Taxed as Dividend.
302(c)(2). Constructive Ownership of Stock.
303(b)(2)(B). Distributions in Redemption of Stock to Pay Death Taxes.
304. Acquisitions by Related Corporations.
332(c)(2). Satisfaction of Indebtedness of Subsidiary to Parent.
333(e)(2). Liquidating Distributions Acquired Before December 31, 1953.
334. Basis of Property Received in Liquidation.
334(c). Basis of Property Received in a One-Month Liquidation.
336. Effect on Liquidating Corporation of Distribution of Property in Liquidation.
337(a). Gain or Loss on Sales or Exchanges in Certain Types of Liquidations.
337(c)(1)(A). Collapsible Corporations—Application of Section 337.
337(c)(2). Liquidation of Subsidiaries in Section 337 Transactions.
341(a). Treatment of Short-Term Gain.
341(d)(2). Clarification of Over-70 Percent Test.
341(f). Certain Sales of Stock of Consenting Corporations.
351. Securities Received in Exchange.
351. Control.
355.
368(c).
351. Transfers to Controlled Corporation.
357(c).
356(a)(2). Treatment of "Boot".
362(b) Basis to the Acquiring Corporation of Stock Received in a B-Type Reorganization.
367. Foreign Corporations.
368(a)(1)(B). B-Type Reorganizations—Exchange of Cash.
381(a). Tax Attributes in Intercorporate Transfers.
382. General Comment—Carryover of Operating Losses.
269.
269. Carryover of Operating Losses—Acquisition of New Businesses.
382. Acquisitions Through Reorganizations—Percentage Reduction Rules.
382(a)(1). "Continuity of Business" Test.
382(a)(1). Period Over Which Changes in Stock Ownership Are Measured.
382(a)(1). Limitation on Denial of Net Operating Loss Carryover.
382(a)(4). Definition of "Purchase"—B-Type Reorganization.

DEFERRED COMPENSATION, ETC.

404(a)(5). Contributions to Nonexempt Employees' Trusts.
422(c)(3)(C). Stock Option for More Than 5 Percent Shareholder-Employee.

ACCOUNTING PERIODS AND METHODS

452. Taxation of Unearned Income and Allowance of Deductions for Estimated Expenses.
462.
453(b). Clarification of the Term "Payment" in Taxable Year of Sale.
453(c). Elimination of Double Taxation Upon Change From Accrual to Installment Basis.
482. Mitigation of Statute of Limitations in Related Taxpayer Cases.

PERSONAL HOLDING COMPANY

543(a)(6). Use of Corporate Property by Shareholder.

ESTATES, TRUSTS, BENEFICIARIES AND DECEDENTS

642(h). Separate Shares—Partial Termination.
642(h). Unused Investment and Foreign Tax Credits on Termination of an Estate or Trust.
643(a). Distributable Net Income.
663. Separate Shares—Estates.
663(a). Corpus Distributions.
691. Income in Respect of Decedents.

REGULATED INVESTMENT COMPANIES

852(a)(1). Deficiency Dividends for Regulated Investment Companies.

REAL ESTATE INVESTMENT TRUSTS

857(a)(1). Deficiency Dividends for Real Estate Investment Trusts.

TAX BASED ON FOREIGN INCOME, ETC.

862. U.S. Partners Stationed Abroad.
904.
911.
902(b). Deemed Foreign Tax Credit.
904(b). Revocation of Election of Overall Limitation.

904(d) Carryback and Carryover of Excess Tax Paid.
904(d). Carryback of Excess Foreign Taxes.
911(a)(2). Exclusion of Earned Income From Sources Without the United States.
958. Controlled Foreign Corporation Defined.

GAIN OR LOSS ON DISPOSITION OF PROPERTY

1091. Wash Sales.

CAPITAL GAINS AND LOSSES

1201. Capital Gains: Alternative Tax.
1211(b). Capital Loss Limitation—Joint Returns.
1232. Capital Loss Treatment of Bad Debts.
1244. Qualification as Section 1244 Stock.

READJUSTMENT OF TAX BETWEEN YEARS AND SPECIAL LIMITATIONS

1321. Involuntary Liquidation of LIFO Inventory.

ELECTION OF CERTAIN SMALL BUSINESS CORPORATIONS AS TO TAXABLE STATUS

1371–1378. General Comment—Subchapter S.

ESTATE AND GIFT TAXES

2014(b). Credit for Foreign Death Taxes.
2031. Valuation of Property for Estate and Gift Tax.
2032.
2512(a).
2042. Reversionary Interests—Insurance.
2503(c). Exclusion for Gifts of Certain Future Interests.
2504(c). Valuation of Gifts Made in Prior Years.

PROCEDURE AND ADMINISTRATION

6081. Automatic Extension of Filing Time for Certain Individual Returns.
6405(a). Reports of Refunds and Credits.
6405(c).
6411. Tentative Carryback Adjustments—Foreign Tax Credits.
6511(d)(2). Statute of Limitations on Refunds Arising From Net Operating Loss Carry-backs.
6601. Interest on an Underpayment on Form 7004.
6672. 100 Percent Penalty for Failure to Collect and Pay Over Tax.

Determination of Taxable Income

SECTION 61(a)(1)

1. Compensation for Services

Such items as commissions earned by an insurance agent on policies on his own life and real estate commissions received by a salesman on a purchase of real estate for his own account represent a reduction in cost and should not be treated as compensation for services rendered.

In *Sol Minzer* v. *Commissioner*, 279 F. 2d 338, it was held that a broker's commission on policies on his own life was income to him and in *Kenneth W. Daehler* v. *Commissioner*, 281 F. 2d 823, it was held that the commission received by a salesman on real estate purchased for his own account was compensation for services.

No economic income can be derived from services rendered to one's self and, therefore, no taxable income should arise.

SECTION 162

2. Deduction for Expenses in Securing Employment

Individual taxpayers should be allowed to deduct expenses under Section 162 which are directly related to securing specific employment, whether or not employment is actually obtained.

There are two aspects of this problem: first, the deductibility of the expenses of securing specific employment and, second, the section under which the expenses should be deductible.

The deductibility question received considerable attention when Revenue Ruling 60–158 (1960–1 CB 140), holding fees paid to employment agencies by employees nondeductible, was published and subsequently revoked by Revenue Ruling 60–223 (1960–1 CB 57). The latter ruling states that IRS "will continue to allow deductions for fees paid to employment agencies for securing employment" but does not mention other expenses in connection with securing employment. The same compelling reasons for the change in the Service's stand with regard to employment agency fees justifies the deductibility of other similar expenses.

When a search for employment is unsuccessful, the expenses should also be made specifically deductible. (See *Francois Louis*, TC Memo, 1966-204, which holds that employment agency fees incurred in an unsuccessful employment search were not deductible.) The economic status of an unemployed taxpayer is usually at a low point. It is equitable that expenses incurred in seeking employment at such a time be deductible.

Expenses incurred in connection with the search for employment are within the concept of business expenses of Section 162 and should be so treated. In Revenue Ruling 55-600 (1955-2 CB 576) the IRS expressed this concept by saying, "Salaries and fees received by a taxpayer as compensation for services rendered represent income from a trade or business. . . ." This ruling followed the Tax Court's decision in *Joe B. Luton*, 18 TC 1153.

SECTION 162(a)(2)

3. *Application of "Overnight Rule" For Business Expenses*

A deduction should be allowed for meal expenses on business trips whether or not the taxpayer is away from home overnight.

Section 162 permits a deduction for business expenses while away from home on business trips. The Internal Revenue Service has consistently disallowed such expenses unless the taxpayer is away from home overnight except where business needs require that rest be obtained during released time.

Until 1967, the courts did not support the Internal Revenue Service, stating, in effect, that the word "overnight" does not appear in the Code and, therefore, has no application. However, in 1967 the Supreme Court of the United States (in *U.S.* v. *Correll* et ux., 389 U.S. 299) held that daily trips not requiring rest or sleep are "not away from home." Thus, business expenses incurred during such trips are not deductible. This decision disregards the basic economic fact that an abnormal expense is incurred in many such situations.

Legislation should be enacted to make it clear that the taxpayer is required neither to be away from home overnight nor to rest or sleep to claim this deduction.

SECTION 165(g)(3)(A)

4. *Worthless Securities in Affiliated Corporation*

An ordinary deduction should be permitted with respect to worthless securities in any corporation in which the degree of ownership required for consolidated returns exists.

Present law provides a deduction for worthless securities in an affiliated corporation in which at least 95 percent of each class of stock is owned directly by the taxpayer corporation.

This provision dates back to a provision enacted in 1942. In Report No. 1631 (77th Congress, 2nd Session) the Senate Committee on Finance stated that this provision would permit such losses to be taken in full as an ordinary deduction by the parent corporation if it owned directly 95 percent of each class of stock of the subsidiary. The Report further states that: "Such a parent and subsidiary corporation may file consolidated returns and to this extent the corporate entity is ignored. Thus, the losses of the one may be offset against the income of the other. It is deemed desirable and equitable, therefore, to allow the parent corporation to take in full the losses attributable to the complete worthlessness of the investment in the subsidiary." At that time the law required the ownership of 95 percent of stock for the filing of a consolidated return.

The Internal Revenue Code of 1954 reduced the percentage of ownership required for the filing of a consolidated return to 80 percent.

To be consistent with the premise on which the worthless security provision was originally enacted, Section 165(g)(3)(A) should be amended to reduce the required percentage of ownership of stock from 95 percent to 80 percent, and the percentage ownership requirement should relate only to stock other than preferred stock which is nonvoting and limited as to dividends.

7. Amortization of Intangible Assets

The cost of purchased goodwill, trademarks, trade names, secret processes, formulae, licenses, and other similar intangible assets should be amortizable over a stated period fixed by statute to the extent that such items are not otherwise deductible under other sections of the Internal Revenue Code.

When cerain intangible assets are developed the costs:

1. May be deducted as paid or incurred, or at the election of the taxpayer, amortized over a period of not less than 60 months if the expenditures are research and experimental expenditures (Section 174).

2. May be amortized over a period of not less than 60 months if the expenditures are in connection with a trademark or trade name (Section 177).

It is inequitable to treat the costs of intangible assets purchased by a taxpayer differently from those incurred in the development of intangible assets. A taxpayer who purchases certain intangible assets can amortize their costs if a definitely determinable life can be established for them or, failing that, upon proof of abandonment of the asset.

For various reasons it may be difficult or impossible to demonstrate with reasonable certainty either a definitely determinable life or abandonment. The difficulty is complicated further where the value of intangible assets is subject to erosion from various causes, such as changes in technology, obsolescence, changes in public buying habits, deterioration of business conditions in geographic areas, or other shifts in social and business habits. Many court decisions and IRS rulings have held that no amortization is allowable in these circumstances because the total useful life of the intangible asset cannot be estimated, even though its value obviously was impaired.

The House Ways and Means Committee Report (Report No. 1337, 83rd Congress, 2nd Session) which accompanied H.R. 8300 stated that one of the reasons for the enactment of Section 174 was to "eliminate uncertainty and to encourage taxpayers to carry on research and experimentation." Equally important reasons exist for encouraging the mobility of capital by providing that taxpayers who purchase intangible assets (which resulted, in most instances, from expenditures by the seller which were deductible under Section 174 or 177) should be permitted to amortize those costs over a reasonable period of time.

The Code should be amended to provide that the cost of all purchased intangible assets such as those listed above should be amortizable:

1. Over the actual life of the intangible asset if a definite life can be determined; or

2. If a definite life cannot be determined, over a period of 120 months or, at the election of the taxpayer, a longer period.

Section 1245 should provide, if it does not now do so, for recapture of amortization claimed when the intangible assets are sold or otherwise disposed of in a transaction covered by Section 1245.

SECTION 166(f)

5. Bad Debt Deduction for Guarantor of Corporate Obligations and for Lenders of Business Loans

Section 166(f) should be amended to provide uniformity of treatment in the deduction of a bad debt regardless of whether the borrower is incorporated or unincorporated or whether the unincorporated taxpayer is a direct lender or guarantor.

The payment by a noncorporate guarantor, endorser or indemnitor of a noncorporate debt in discharge of his obligation qualifies as an ordinary deduction if the proceeds of the loan were used in the trade or business of the borrower. In *Max Putnam* v. *U.S.*, 352 U.S. 82, the Supreme Court held that a payment by an individual in discharge of his obligation as guarantor of a corporate debt constituted a nonbusiness bad debt deductible only a short-term capital loss. Furthermore, a noncorporate lender, not in the business of lending money, who lends directly to a corporate or noncorporate borrower when the funds are used in the borrower's trade or business is limited to short-term capital loss treatment for bad debts arising from such loans.

Small business development should be fostered by allowing ordinary deductions to unincorporated taxpayers regardless of whether the loss is sustained as a direct lender, guarantor, endorser or indemnitor and regardless of whether the borrower is corporate or noncorporate. This treatment would not be allowed where a corporate borrower exceeded specified limits as to equity capital (similar to the provisions of Section 1244(c) (2)).

SECTION 167

6. Depreciation of Leasehold Improvements

Leasehold improvements should be considered depreciable property even though the estimated economic life of the property is longer than the term of the lease.

Under the provisions of Section 167, taxpayers are permitted various accelerated methods of depreciation providing the asset is property used in the trade or business of the taxpayer or property held for the production of income. On the other hand, amortization deductions under Section 162 are only allowable in equal annual amounts over the life of the least.

Regulations Section 1.167(a)-4 indicates that capital expenditures for improvements on leased property are recoverable through allowances for either depreciation or amortization. If the useful life of the improvements is equal to or shorter than the remaining period of the least, the allowances take the form of depreciation under Section 167. Where the useful life of the improvements is longer than the term of the lease, Regulations Section 1.162-11(b) (1) provides that an annual amortization deduction is allowed which is equal to the total cost of the improvements divided by the number of years remaining in the term of the lease.

The Supreme Court has held in *Hertz Corporation*, 364 U.S. 122, and *Massey Motors, Inc.*, 364 U.S. 92, that for purposes of depreciation "useful life" is the period over which the assets may reasonably be expected to be useful to the taxpayer in *his* trade or business, and not the period of the economic life of the assets. If a taxpayer has made improvements on leased property where the term of the lease is shorter than the economic life of the improvements, the useful life to that taxpayer is the term of the lease. This taxpayer should therefore be entitled to an accelerated depreciation deduction and not be restricted to straight-line amortization. In determining the term of the lease, Section 178 would, of course, be applicable.

SECTIONS 167, 611, 642

8. Depreciation and Depletion—Estates

Allocation of the dedutcion for depreciation and depletion should be made according to distributable net income only where alloction is not provided by the will.

In the case of an estate, the allowable deductions for depreciation and depletion are apportioned between the estate and the heirs, legatees and devisees on the basis of the income of the estate allocable to each, regardless of any provisions to the contrary in the will. This requirement does no seem reasonable and should be amended so it will apply only where no allocation is provided by the will. Moreover, the suggested change would conform the rules for estates to those applicable to trusts.

SECTION 172(b)

9. Eight-Year Carryover of Initial Losses

A minimum carryback-carryover period of eight years in the case of new corporations should be allowed.

It frequently happens that new corporations, particularly small businesses, undergo a substantial period of operating losses at the beginning of their existence, and may find that the inability to carry back such losses, coupled with the five-year carryover limitation, causes an insufficient period to permit taxable income to reach a level where initial losses can be fully absorbed.

In order to provide relief to new corporations it is recommended that a combined carryback and carryover period of eight years be provided. Thus a loss sustained in the first year should be eligible as a carryover for eight years following the loss year; a loss sustained in the second year should be eligible for a one-year carryback and a seven-year carryover and so forth. This would provide equality of treatment with existing corporations in that an eight-year period would be available to all.

SECTION 172(d)(4)(D)

10. H.R. 10 Plan Contributions: Self-Employed Individuals

Section 172(d)(4)(D) provides that a deduction otherwise allowable for contributions to an H.R. 10 plan for the benefit of self-employed individuals and owner-employees is not to be treated as being applicable to the trade or business of the individual for purposes of computing a net operating loss. This is an unwarranted restriction on the deductibility of such a contribution and should be eliminated.

Section 172 establishes the rules for computing the amount of operating loss, operating loss deduction, and operating loss carryback or carryover. Operating loss is defined as the excess of the deductions allowed by Chapter 1, with certain exceptions, over the gross income. One exception for an individual is that expenses which are not attributable to the taxpayer's trade or business are allowed only to the extent that the taxpayer has gross income not derived from such trade or business.

The statute now provides (Section 172(d)(4)(D)) that contributions to an H.R. 10 plan on behalf of self-employed individuals and owner-employees are deemed not to be attributable to a trade or business for purposes of computing a net operating loss.

Assume the situation of a taxpayer who conducted a business having an H.R. 10 plan which operated at a profit in 1968 after a contribution to the H.R. 10 plan and who had a casualty loss substantially in excess of the profit from the business. If the taxpayer had no nonbusiness income, it would be necessary to reduce the net operating loss for 1968 by the contribution to the H.R. 10 plan for the benefit of the owner-employee in determining the amount to be carried back to prior years.

In such a case the contribution to the H.R. 10 plan is an expense of the taxpayer's trade or business and should be so treated for the purposes of determining the net operating loss deduction. Otherwise, the effect is the disallowance of a portion of the casualty loss.

Section 172(d)(4)(D) should be repealed so that an H.R. 10 plan contribution is treated as a business deduction in determining a net operating loss.

SECTION 177

11. Deduction for Trademark and Trade Name Expenditures

Trademark and trade name expenditures should be allowable as amortizable deductions free of any election.

Section 177 provides that at the election of the taxpayer any trademark or trade name expenditure may be treated as a deferred expense and amortized over a period of not less than 60 months. If this election is not made the item is capitalized.

Section 177 and the regulations thereunder require that the items to which the election to defer and amortize applies must be specifically itemized and identified in an election filed with the return. This requirement creates problems because the election may be overlooked where items are not identified in the accounts to indicate that they are subject to deferral and amortization. For example, defense of a trademark may be carried on by the taxpayer's regular counsel and the related legal expense may not be indicated in the invoices from the attorney. Thus the election to amortize the trademark defense costs may not be made.

The election requirement of Section 177(a) constitutes an unnecessary complication of the Code. The deductibility of an item should be determined by the nature of the item rather than by strict compliance with the requirements of an election. Trademark and trade name expenditures should be deductible over a period of not less than 60 months free of any election.

SECTION 212

12. Deduction for Preliminary Investigation of Business or Investment Opportunities

Expenses paid or incurred by an individual during a taxable year with respect to expenditures incurred in search of a prospective business or investment should be deductible regardless of whether the proposed transaction was consummated.

Prior to 1957 the Internal Revenue Service followed I.T. 1505 I-2 (CB 112) in permitting a deduction for expenses incurred in determining whether or not an investment should be made. The ruling held that such an investigation constituted a transaction entered into for profit and that upon abandonment of the enterprise the expenses incurred became a loss deductible in the year of abandonment.

I.T. 1505 was based upon Section 214(a)(5) of the Revenue Act of 1921 and the related regulations. This section of the 1921 Act corresponds to Section 165 (c)(2) of the Internal Revenue Code of 1954, which allows a deduction by individuals for "losses incurred in any transaction entered into for profit, though not connection with a trade or business. . . ."

Revenue Ruling 57-418 (1957-2 CB 143) revoked I.T. 1505 after reviewing the history of the application of the rule and established a new rule that "a loss sustained during a taxable year with respect to expenditures incurred in search of a prospective business or investment is deductible only where the transaction has actually been entered into and the taxpayer abandons the project."

Expenditures made in connection with a preliminary investigation of business or investment opportunities should be deductible even if a taxpayer abandons the prospective project before entering into a material amount of activity in connection with it. Such preliminary expenditures should be equivalent to those which are admittedly deductible where the taxpayer *has* engaged in material activity. See *Charles T. Parker*, 1 TC 709, distinguished by the IRS in Revenue Ruling 57-418.

There appears to be no equitable justification for limiting the deduction of investigatory expenses to situations where the prospective business or investment was actually entered into and subsequently abandoned. If a taxpayer makes a good faith investigation of a business prospect which is clearly identifiable and incurs expenditures reasonable and necessary thereto, then ordinary standards of equity and fairness should permit deduction of those expenses. The requirement of material activity in the business before deduction of those expenses is permitted places an arbitrary and unbusinesslike burden on individuals interested in development of new economic opportunities.

SECTION 217

13. Moving Expenses

The definition of moving expenses should be expanded to cover additional out-of-pocket expenses directly related to employee relocations and relocations of the businesses of self-employed persons.

The deduction for moving expenses enacted in the Revenue Act of 1964 should be expanded to improve labor mobility, to relieve the substantial economic burden on employee-taxpayers who relocate and to promote business growth and opportunity.

Specific statutory recognition should be given to additional out-of-pocket costs directly related to employee relocations, including necessary expenditures during a reasonable period of search for housing at the new location and out-of-pocket costs of acquisition and disposition of ownership, leasehold or other interests in residential property. Costs of this nature may present a more serious financial problem to the individual being moved than the transportation expenses of the move. All such reasonable costs and expenses should be deductible.

It should be made clear that any expanded definition of moving expenses applies also to "old" employees who may be reimbursed by their employers.

With respect to reimbursement, the Code should be amended to eliminate the current burdensome requirement that employers withhold tax on such payments when there is reason to believe the employee cannot deduct the costs as moving expenses.

To facilitate business growth and opportunity, a similar deduction should also be allowed to self-employed persons for expenses incident to the moving of their businesses from one location to another.

SECTION 245(b)

14. Certain Dividends Received From Wholly-Owned Foreign Subsidiaries

The 100 percent dividend-received deduction should be liberalized by reducing the required percentage of ownership by the domestic corporation from 100 percent to 80 percent and permitting this deduction to U.S. corporations whose foreign subsidiaries have less than all of their gross income effectively connected with a U.S. trade or business.

Section 245(a) provides that, if a foreign corporation is engaged in trade or business in the United States for a 36-month period, and if 50 percent or more of its gross income for such period is effectively connected with the U.S. trade or business, a corporate recipient of dividends paid by the foreign corporation is entitled to the 85 percent dividend-received deduction to the extent the dividend is paid out of earnings and profits attributable to gross income effectively connected with the foreign corporation's U.S. business.

Section 245(b) provides that, in lieu of the 85 percent deduction of Section 245(a), a 100 percent deduction will be allowed if (1) the foreign corporation is a 100 percent-owned subsidiary and (2) *all* of its gross income for the year out of the earnings and profits of which the dividend is paid was effectively connected with a U.S. trade or business. The 100 percent deduction is only available if a Section 1562 election for the parent was not effective either in the year the earnings arose or in the year the dividend is received.

Section 245(b) is generally comparable to Section 243(b), which allows a 100 percent dividend-received deduction for certain domestic intercorporate dividends. However, Section 243(b) requires only the 80 percent ownership needed for affiliated group status to qualify the dividend for the special deduction, rather than the 100 percent required in Secton 245(b).

Further, the requirement that *all* gross income of the foreign corporation be effectively connected with a U.S. business seems extremely harsh. The benefits of the 100 percent dividend-received deduction could be lost entirely in situations where as little as $1 of the gross income of the foreign corporation is not effectively connected with a U.S. business.

It does not appear that there is any logical reason why the rules of Section 245(b) should be more restrictive than those of Section 245(a) as long as conditions comparable to those of Section 243(b) are met. Accordingly, Section 245(b) should be amended to permit a 100 percent deduction in an appropriate case as long as there is 80 percent ownership by the domestic corporation and at least 50 percent of the gross income of the foreign corporation for a 36-month period is effectively connected with a U.S. trade or business. The amount of this deduction would be computed on the same basis as is now provided for the deduction under Section 245(a).

The result of these changes would be that, if the domestic parent could have made a Section 243(b) election with respect to a foreign corporation's dividends if the foreign corporation had been a domestic corporation, it would be permitted the same tax treatment as if such an election had been made, but only to the extent that the dividends are paid out of earnings and profits already subjected to full U.S. tax. In cases where a Section 243(b) election would not be permissible if the subsidiary were domestic, either because of less than 80 percent ownership or the existence of a Section 1562 election, the 85 percent deduction would continue to apply.

SECTION 246(b)

15. Limitations on Deductions for Dividends Received

The limitation on the amount of the dividends-received deduction to 85 percent of taxable income should be amended to allow a deduction of 85 percent on all dividends received from domestic corporations.

Section 243(a)(1) allows a deduction to a corporation of an amount equal to 85 percent of the dividends that it receives from domestic corporations, but Section 246(b)(1) limits the 85 percent deduction to 85 percent of taxable income. Section 246(b)(2) provides that the limitation in Section 246(b)(1) does not apply for any taxable year for which there is a net operating loss. The limitations imposed on the dividends-received deduction by Sections 246(b)(1) and (2) cause needless complexity and sometimes provide an illogical result when the existence of an insignificant amount of net operating income causes a substantial curtailment in the dividends-received deduction which would not have occurred if a net operating loss (no matter how small) had existed.

The Revenue Act of 1964 amended the Code to allow a 100 percent deduction in the case of qualifying dividends received (from related companies), and the 2 percent tax applicable to consolidated income tax returns was repealed. These amendments should facilitate the free flow of funds between related corporations. Elimination of the limitation on the 85 percent dividends-received deductions provided in Sections 246(b)(1) and (2) would improve the situation further.

SECTION 248

16. Deductions for Organizational and Reorganizational Expenditures

Organizational expenditures should be allowable as amortizable deductions free of any election and such deductions should be expanded to cover stock issuance and reorganization expenses (including stock dividends and stock splits), registration and stock listing costs.

Section 248(a) provides that organizational expenses may, at the election of the taxpayer, be amortized over a period of not less than 60 months to be selected by the taxpayer. The regulations require that this election be made in the return for the taxable year in which the taxpayer begins business and that all of the expenditures subject to the election be specifically identified.

The election requirement of Section 248(a) constitutes an unnecessary complication of the Code. The deductability of an item should be determined by the nature of the item rather than upon strict compliance with the requirements of an election. Organizational expenses and expenses of a like or similar nature should be deductible over a period of not less than 60 months free of any election.

In addition, the deduction under Section 248 should be expanded to cover stock issuance and reorganization expenses, including the costs of stock registration and stock listing and the costs of printing certificates whether for original issue, stock dividends, or stock splits. There should be no statutory distinction between creating the legal corporate entity and its reorganization or recapitalization, however accomplished, nor in obtaining the capital with which to carry out the corporate purposes initially or subsequently.

SECTION 265(2)

17. Interest Relating To Tax-Exempt Income

Dealers in municipal bonds should be permitted to make an annual election to include municipal bond interest in gross income and be allowed a deduction for all their interest expense or, in the alternative, be denied a deduction for interest expense only to the extent of their income from municipal bond interest.

Under present law the Internal Revenue Service uses certain formulas to disallow interest expense. In the case of municipal bond dealers, an excess of interest expense over interest income may be necessary to make a profit on the sale of securities—which profit is taxed at ordinary income tax rates. If Section 265(2) is amended as suggested herein, municipal bond dealers, like other taxpayers, would then be taxed on their true business profits.

SECTION 269

18. Carryover of Operating Losses—Acquisition of New Businesses

It should be made clear that in the absence of a change of ownership of 50 percent or more of an existing corporation, carryover of operating losses should not be denied merely because of the acquisition of new businesses.

For an explanation of this recommendation refer to the explanation of recommendation number 46 on p. 34.

SECTION 269

19. Acquisitions to Evade or Avoid Federal Income Tax

Section 269(a)(1) should include an exception for acquisitions of control of one corporation by another corporation where both corporations were controlled by the same stockholders immediately before the acquisition.

Section 269 provides for the disallowance of deductions, credits or other allowances in the case of certain acquisitions where the principal purpose of the acquisition is the evasion or avoidance of federal income tax. The section covers two types of acquisitions:

1. Acquisition of control of a corporation.
2. Acquisition of property of another corporation, the basis of which is determined by reference to the basis of such property in the hands of the transferor corporation.

In the case of the acquisition of property (2 above), there is an exception where the transferor corporation and transferee corporation were controlled by the same shareholders immediately before the acquisition. The exception insures that deductions, credits or allowances will not be denied due to transfers within a single economic group.

A similar exception should apply in the case of acquisition of control of a corporation. As presently constituted, Subsection 269(a)(1) can operate to deny losses or other deductions sustained within a single economic group. The Congressional Committee Reports under Section 129, Internal Revenue Code of 1939 (predecessor of Section 269), do not indicate that this was intended. To the contrary, the reports cite the abuses of purchasing corporations with current, past or prospective losses for the purpose of reducing income taxes.

Further, rulings published by the Internal Revenue Service have permitted the utilization of tax benefits through statutory mergers (or equivalent thereof) of controlled corporations, since the mergers constituted acquisitions of assets rather than acquisition of control or corporations. See Revenue Ruling 66-214 (1966-2 CB 98) and Revenue Ruling 67-202 (1967-1 CB 73). There is no reason for a distinction.

Accordingly, it is recommended that Subsection 269(a)(1) be amended to provide an exception where a corporation acquires control of another corporation if both corporations were controlled by the same stockholders before the acquisition.

SECTION 274

20. *Deduction of Certain Entertainment, Etc., Expenses*

Entertainment, amusement and recreation expenses which are ordinary and necessary business expenses should be deductible.

Section 274 should be amended to provide for the deductiblity of entertainment, amusement or recreation expenses for both an activity and a facility the extent they are incurred to further the taxpayer's trade or business. The taxpayer would, of course, be required to substantiate such expenses by adequate records or other sufficient evidence.

Corporate Distributions and Adjustments

SECTIONS 301(b)(1)(B), 301(d)(2)(B)

21. *Recognition of Gain to Distributor Corporation*

All gain recognized to a distributor corporation upon the distribution of property to a corporate distributee should be taken into account in determining the amount of the distribution and the basis of the distributed property.

The present statute specifically refers to those sections of the law that provide for recognition of gain to distributor corporations from the distribution of LIFO inventory, properties subject to indebtedness in excess of basis, and gains recognized under Sections 1245 and 1250. It is recommended that the language in Section 301(b)(1)(B) and 301(d)(2)(B) be changed to take into account all gain recognized to a distributor corporation, regardless of the particular sections that might create authority for such recognition, and reference to selected sections should be eliminated. For example, the distribution of installment obligations to a corporate distributee, which creates gain recognized under Section 453(d), should also be included under Sections 301(b)(1)(B) and 301(d)(2)(B).

SECTION 302

22. *Lost Basis—Redemption of Stock Taxed as Dividend*

Basis should not be lost when redemptions of stock are taxed as dividends.

It is recommended that specific statutory provisions be enacted along the following lines:

1. Where the proceeds of stock which is sold or redeemed are taxed as ordinary income, the allocation of basis to other stock held by the taxpayer, if any, should be permitted.
2. If the taxpayer has been taxed on account of direct attribution (through family partnership, estate, corporation, or trust), the basis of his stock should be allocated to the stock that was the basis of the attribution.
3. The taxpayer to whose stock basis is allocable hereunder should be allowed at least one year from the date of final determination (that a redemption is to be treated as a dividend) to file claim for refund if the statute of limitations would otherwise foreclose that right.

4. With respect to Section 302(c)(2)(A), if during the ten-year period in which the reacquisition rules apply, the taxpayer should acquire an interest in the corporation, provision should be made to prevent the loss of the basis of the stock surrendered in the redemption distribution which is subsequently treated as a dividend.

A taxpayer should not lose tax benefit from the basis of shares surrendered in a redemption transaction that is subsequently treated as a dividend. The statute should clearly state what happens to the basis of stock surrendered in such a transaction and should extend the statute of limitations for filing a refund claim if the taxpayer to whom basis is allocated under the statutory rules would otherwise be deprived of tax benefit. If there is a reacquisition during the ten-year period, the statute of limitations is left open for assessment under present law. Similar protection should be extended for the basis of the stock redeemed.

SECTION 302(C)(2)

23. Constructive Ownership of Stock

If a decedent (immediately before his death) could have qualified for a complete termination of shareholder's interest under Section 302(b)(3) then his estate should also qualify.

Section 302(c) permits a distribution in complete termination of a shareholder's interest, as described in Section 302(b)(3), to be treated as a distribution in full payment in exchange for stock even though the terminating shareholder may be related to another shareholder under the attribution rules described in Section 318(a)(1).

However, if that same shareholder were to die prior to terminating his interest, and the stock were later redeemed from the estate, whose beneficiary was not a shareholder but whose beneficiary was related to another shareholder within the meaning of Section 318(a)(1), the Internal Revenue Service would hold that complete termination did not take place. See Revenue Ruling 59–233 (1959–2 CB 106). While that specific ruling involved attribution through a trust, the ruling has been cited by the Internal Revenue Service as applying also to estates.

It is suggested that the exception to the attribution rules contained in Section 302(c)(2) be broadened to include estates as well as family members.

SECTION 303(b)(2)(B)

24. Distributions in Redemption of Stock to Pay Death Taxes

The present provisions of Section 303(b)(2)(B), permitting the benefits of Section 303(a) in situations where the decedent's estate includes stockholdings of two or more corporations, seem unduly restrictive. The percentage of ownership as to the stock of each corporation required in order for the 35–40 percent tests to apply should be calculated using constructive ownership rules.

This section of the Code now provides for aggregating the values of stock in two or more corporations if the estate owns more than 75 percent in value of the outstanding stock of each of such corporations. In *Estate of Otis E. Byrd* v. *Commissioner*, 388 F. 2d 223, it was held that this test applies only to directly owned stock. Thus it is possible for an estate to own beneficially most of the stock of several corporations and yet not qualify for aggregation of the values, simply because some of the stock might be held by other corporations in the same group. It seems equitable that the constructive ownership rules of Section 318 be applied for determining qualification under Section 303(b)(2)(B). These rules now apply to redemptions under Section 302 and there is no logical reason why they should not also be considered in Section 303 redemptions.

SECTION 304

25. Acquisitions by Related Corporations

1. The present statute seems unclear and possibly conflicting in its wording. It is recommended that in a brother-sister acquisition, even though the constructive ownership rules of Section 318 might indirectly create a parent-subsidiary relationship, the transaction should clearly be governed by Section 304(a)(1) rather than Section 304(a)(2).

2. The statute now provides that, in the case of brother-sister redemptions, the stock acquired is treated as a contribution to capital, regardless of whether

the distribution itself is treated as a dividend or as a sale or exchange. It is recommended that the statute be amended to provide contribution to capital treatment only in cases where the distribution is treated as a dividend.

Section 304(a)(1) presently set out rules for acquisitions of stock by related corporations other than subsidiaries. Section 304(a)(2) provides rules for acquisitions by subsidiaries. Under the constructive ownership rules of Section 318, stock of a sister corporation can be attributed indirectly to the brother corporation, or vice versa, thereby creating indirectly a parent-subsidiary relationship. A literal interpretation might then require that this type of acquisition (brother-sister) be construed under the provisions of Section 304(a)(2) rather than 304(a)(1). Since there is some difference in treatment under the sections, the statute should be amended to state clearly that acquisitions in brother-sister situations be governed solely by Section 304(a)(1).

Section 304(a)(1) now provides that stock acquired in an acquisition governed by its terms shall be treated as having been transferred by the person from whom acquired, and as having been received by the corporation acquiring it, as a contribution to the capital of such corporation. Apparently, this rule applies regardless of the tax treatment of the acquisition to the shareholder. The rule should apply only to situations where the distribution is treated as a dividend. Where the acquisition is treated as a sale or exchange, it seems more logical and equitable that the acquiring company's basis be equal to the amount paid by it for the stock.

SECTION 332(c)(2)

26. Satisfaction of Indebtedness of Subsidiary to Parent

The rule now stated in this section regarding the satisfaction of indebtedness of a subsidiary to its parent should be amended to provide nonrecognition of gain or loss to the distributing corporation by virtue of distributions of property and discharge of indebtedness created after adoption of the plan of liquidation.

Present law provides only for nonrecognition of gain or loss as to distributions of property in satisfaction of indebtedness existing on the date of adoption of the plan of liquidation. Occasionally, it may be necessary to create similar indebtedness after a plan of liquidation is adopted but before the liquidation is completed. There appears to be no logical reason why the nonrecognition rule should not also apply to distributions of property in satisfaction of this type of indebtedness.

SECTIONS 333(e)(2), 333(f)(1)

27. Liquidating Distributions Acquired Before December 31, 1953

The cut-off date with respect to the acquisition of stock or securities distributed by a corporation liquidating under Section 333 should be revised.

In determining the amount of realized gain that is to be recognized by a shareholder in a Section 333 liquidation, present law provides that realized gain may be recognized to the extent that the shareholder receives money or stock or securities acquired by the liquidating corporation after December 31, 1953. Originally, this cut-off date was necessary in order to prevent the investment of cash in stock or securities in anticipation of a liquidation under Section 333. The date is now unrealistic. The statute should be changed to fix a cut-off date five years prior to the date on which the corporation adopts its liquidation plan.

During the 1st Session of the 90th Congress, Senator Magnuson introduced S. 614 and Representative Adams introduced H.R. 185 to accomplish the objectives of this recommendation.

SECTION 334

28. Basis of Property Received in Liquidation

Uncertainty exists regarding the term "cash and its equivalent" as used in Regulations Section 1.334-1(c)(4). The phrase should be defined by statute in order to simplify the determination of basis to be allocated to assets received in corporate liquidations.

Because of uncertainty resulting from administrative practice and the regulations under Section 334, Congress should establish statutory meaning for the term "cash and its equivalent" as used in allocating basis to assets received in corporate liquidation. In Revenue Ruling 66-290 (IRB-1966-40, 8), the IRS applied the term to certificates of deposit and savings and loan association accounts, as well as cash deposits. The ruling stated, however, that the term does not include accounts receivable, inventories, marketable securities, and other similar current assets.

The interpretation placed on the term "cash and its equivalent" by the IRS seems unduly restrictive and statutory guidelines for taxpayers are most desirable. The basic concept that should apply is the liquidity of the particular assets involved and whether or not they can be converted to cash in a short period of time. Certainly, marketable securities meet this test and should be included within the meaning of the term. In most cases, trade accounts receivable will be converted into cash in a relatively short period of time and should be similarly treated.

Section 334(b) (2) is automatic rather than elective for subsidiaries that are liquidated within a two-year period, and taxpayers presently have little guidance as to the allocation of basis to assets received in such liquidations.

SECTION 334(C)

29. Basis of Property Received in A One-Month Liquidation

Section 334(c), which applies to the allocation of the adjusted basis of stock to property received in a liquidation under Section 333, should be amended to provide for allocation in the following order:

1. To assets which can be converted into cash in a relatively short period of time in an amount equal to their fair market values;
2. To section 1245 and 1250 assets to the extent such gain is recognized, and
3. The residue, if any, to other assets (including Section 1245 and 1250 assets but not in excess of their fair market values) received according to their respective net fair market values.

The present Section 333 basis rules contained in the regulations provide for the allocation of the adjusted basis of the shareholders' stock to the property received according to the respective net fair market values of the property. Since the shareholders' basis is generally less than the fair market value of the property received, the present basis rules can result in double taxation.

For example, assume a company, with no earnings and profits, has two assets, a trade account receivable and a building, each with a fair market value of $50,000. The sole shareholder, with a $60,000 stock basis, reports no gain upon liquidation under Section 333. The trade receivable and building will each receive a basis of $30,000. Upon collection of the receivable, the $20,000 of proceeds in excesst of basis will be taxed as ordinary income, irrespective of the fact that the company previously reported the receivable as income. Similarly, assume instead of the receivable, the company had appreciated post-1953 stock with a basis of $30,000 and a fair market value on $50,000. In this situation, the shareholder would be subject to a $20,000 gain upon liquidation and a $10,000 gain ($50,000–$40,000) upon the sale of the stock.

The recapture rules of Section 1245 and 1250 can result in double taxation as a resulr of a Section 333 liquidation. The company is required to recognize recapture income on the liquidation. In turn, the taxpayers earnings and profits will be increased and additional recognized gain to the shareholder on liquidation may result.

To alleviate these harsh results, Section 334(c) should be amended to provide that the adjusted stock basis be allocated in the following order:

1. To assets which can be converted into cash in a relatively short period of time in an amount equal to their fair market values;
2. To Sections 1245 and 1250 assets to the extent such gain is recognized in proportion to the respective amounts of recapture gain recognized, and
3. The residue, if any, to other assets (including Sections 1245 and 1250 assets but not in excess of their fair market values) received according to their respective net fair market values.

SECTION 636

30. Effect on Liquidating Corporation of Distribution of Property in Liquidation

Section 336 presently provides that no gain or loss be reognized to corporations upon their liquidation. The section should be amended to conform to the provisions of Sections 47, 1245 and 1250, which do provide for the recognition of gain under certain limited circumstances in corporate liquidation transactions.

Due to the fairly recent enactment of Sections 1245 and 1250, under certain conditions, gain will be recognized to the distributing corporation on distributions of property in partial or complete liquidation. This seems directly contrary to the present language of Section 336. It is recommended that Section 336 be amended so as to set out clearly situations where gain will be recognized. Furthermore, some reference should be made to Section 47, covering the recapture of the investment tax credit with respect to certain distributions of Section 38 property. The basic thrust of this recommendation is directed toward clarifying Section 336 so that in addition to its stating the general rule for axing the disributing corporation on distribution of property in liquidation, it will clearly state the exceptions to that rule.

SECTION 337(a)

31. Gain or Loss on Sales or Exchanges in Certain Types of Liquidations

Section 337(a) should be amended to include involuntary conversions within the definition of "sale or exchange."

This section should be amended to specifically include all involuntary conversions within the definition of sale or exchange. In Revenue Ruling 64–100 (1964–1 CB 130), the Internal Revenue Service held that an involuntary conversion resulting from complete destruction by fire or explosion constituted a sale for purposes of Section 337(a), but it has not yet included condemnation awards. All types of involuntary conversions should be treated as a sale for purposes of Section 337.

Furthermore, in connection with any involuntary conversion, the taxpayer should be given a minimum period of 60 days after occurrence of the event within which to adopt a plan of liquidation and obtain the provisions of Section 337.

SECTION 337(C)(1)(A)

32. Collapsible Corporations—Application of Section 337

The nonrecognition of Section 337 should apply to sales made by an otherwise collapsible corporation if any of the limitations of Section 341(d) would prevent the application of Section 341(a) to all of the shareholders of such corporation.

At the present time the benefits of Section 337 are denied to a *corporation* which falls within the general definition of a collapsible corporation as prescribed by Section 341(b). This is true even though the limitations contained in Section 341(d) may prevent the application of Section 341(a), the operative portion of the section, to any of the *shareholders*. There is no logical reason for prohibiting Section 337 treatment in any case where Section 341 is inoperative. Section 337(c)(1)(A) should be amended to eliminate this defect and, at the same time, to refer to the special provisions of Section 341(e)(4).

SECTION 337(C)(2)

33. Liquidation of Subsidiaries in Section 337 Transactions

Section 337 should be amended to include the liquidation of subsidiaries within the benefits of Section 337, if both subsidiaries and their parent are liquidated within the twelve-month period now provided.

As now worded, Section 337(c)(2)(A) denies the benefits of Section 337 in certain parent-subsidiary situations where the subsidiary is liquidated into the parent during the 12-month period required by Section 337(a)(2) and Sections 332 and 334(b)(1) apply to the liquidation. Under present rules there are available several indirect ways to avoid this result (e.g., liquidate the subsidary prior to having the parent adopt its plan of liquidation). However, to meet this problem directly an amendment to Section 337(c)(2) is necessary.

The amendment should extend nonrecognition treatment under Section 337 to the liquidation of a subsidiary if the subsidiary and its parent are liquidated within the 12-month period beginning on the first date of adoption of a plan of liquidation by the subsidiary or the parent.

SECTION 341(a)

34. Treatment of Short-Term Gain

The literal language of this section makes it applicable only to gain that would otherwise be treated as long-term capital gain were it not for the holding period. It is recommended that gain on sale or exchange of all collapsible corporation stock be treated as gain from the sale or exchange of property not a capital asset, regardless of the holding period.

In the event of the sale of, distribution in partial or complete liquidation of, or related distribution with respect to stock held for six months or less, present language would provide that the gain be considered as capital gain even though the corporation was collapsible. Under these circumstances, capital losses could be applied to offset such gain. This does not appear to be consistent with the intent of the collapsible corporation provisions.

SECTION 341(d)(2)

35. Clarification of Over-70 Percent Test

The extent to which "gain is attributable to the property" for purposes of the over-70 percent limitation test should be clarified.

Realization on sale of Section 341 assets in prior years or in the current year up to the date of sale or redemption or distribution in partial or complete liquidation should not be treated as collapsible asset gain. If the corporation has paid or will pay tax on gain realized on previous sales of collapsible assets, it is inequitable to continue to treat the gain as collapsible asset gain.

SECTION 341(f)

36. Certain Sales of Stock of Consenting Corporations

Section 341 should be amended to protect the shareholder who purchases stock in a corporation which has consented to the treatment provided in Section 341(f) where, subsequent to such purchase, it is determined that the corporation was not in fact a collapsible corporation.

This subsection was enacted in August 1964 to provide some relief in connection with sales of stock of corporations which might, at the time the stock sale occurs, be collapsible corporations. This subsection should be amended to provide that the election will not be effective if the corporation is determined not to have been collapsible at the time the sale of stock occurred which necessitated the election. This would prevent an election made out of a superabundance of caution from trapping an unwary purchaser of the stock who had nothing to do with making the election in the first place.

SECTION 351

37. Securities Received in Exchange

The nonrecognition provisions of Section 351 extend to transfers of property to a corporation solely in exchange for stock or "securities" in such a corporation. The term "securities" should be defined by statute to include a note, bond or other evidence of indebtedness with a maturity of five years or more.

One of the problem areas under Section 351, in view of divergent court decisions, is to determine the meaning of the term "securities." A statutory definition is necessary to provide guidance to taxpayers and eliminate unnecessary conflict. The definition should provide that a note, bond, or other evidence of indebtedness with a maturity of five years or more would qualify as a security under Section 351.

SECTIONS 351, 355, 368(C)

38. Control

Legislation is needed to clarify a conflict existing between the statutory definition of corporate control for purposes of Sections 351, 355 and 368(c) and that contained in Revenue Ruling 59–259.

For purposes of these sections, control is defined (Section 368(c)) as "the ownership of stock possessing at least 80 percent of the total combined voting power of all classes of stock entitled to vote and at least 80 percent of the total number of shares of all other classes of stock of the corporation."

Revenue Ruling 59–259 (1959–2 CB 115) interprets the above definition to require ownership of at least 80 percent of the total number of shares of *each* class of outstanding nonvoting stock. The language of the Code should be corrected if this ruling properly reflects Congressional intent.

SECTIONS 351, 357(C)

39. Transfers to Controlled Corporation

Accounts receivable and accounts payable transferred from an unincorporated cash-basis transferor to a controlled corporation should result in income to the transferee upon collection of the receivables and a deduction to the transferee upon payment of the payables.

The Internal Revenue Code provides special rules for carrying over various tax attributes in certain types of tax-free transactions. These have the effect of continuing the status of the items carried over even though a new corporation may own the business. However, incorporation of a partnership or sole proprietorship is not covered specifically, and this can cause questions as to the tax results, particularly where the partnership or proprietorship uses the cash-basis of accounting.

For example, a professional partnership may have accounts receivable for work performed and accounts payable for unpaid expenses. Under the cash basis, taxable incomes does not arise until the receivables are collected, and deductions do not occur until expenses are paid. When the partnership incorporates, a question arises as to whether the receipt of the corporation's stock causes a realization of income from the receivables. Likewise, income might be considered to be realized, under Section 357(c) on the transfer of accounts payable where such liabilities exceed the adjusted basis of the receivables transferred.

Equitable treatment would be to permit the transferee to report the income when the receivables are collected and to obtain a deduction when the accounts payable are paid. It should be provided that the transferor does not realize income on a Section 351 transfer of accounts receivable as described above, and that the transferee corporation takes the receivables with a zero basis and is taxed on the subsequent collection. It should also be provided that (similar to the treatment in Section 381(c)(16)) if payment of a liability would have been deductible by the transferor then payment of the assumed liability by the transferee would also be deductible, and that Section 357(c) does not apply in such a situation

SECTION 356(a)(2)

40. Treatment of "Boot"

Section 356(a)(2) as presently worded should be eliminated and replaced by provisions that would:

1. Treat as a dividend for all purposes of the Code any distribution of "boot" which has the effect of the distribution of a dividend within the principles of Section 301.
2. Treat as a partial liquidation under Section 346 such part of the "boot" received which has that effect, and
3. Treat as a redemption of stock under Section 302 such part of the receipt of "boot" which has that effect, determined by reference only to stockholdings of the shareholders of the acquired corporation immediately prior to the reorganization.

With few exceptions, the courts and the Internal Revenue Service have treated the "boot" provisions of Section 356(a) as requiring that any gain attributable to the "boot" first be treated as a dividend to the receiving shareholder to the extent of accumulated earnings and profits. Only the balance of any gain then results in capital gain. There is no sound reason for the apparent inconsistency between Section 356(a)(2) on one hand and Sections 301, 302 and 346 on the other. It is difficult to justify the different language under Section 356, based upon accumulated earnings and profits, rather than first out of current earnings and profits, as under Section 301. It is equally difficult to justify the requirement that the distribution of "boot" in every reorganization will always result in dividend income unless the distributing corporation has a deficit, without regard to whether or not the shareholder has in substance received a distribution in partial liquidation or a distribution arising from a disproportionate redemption of some of his shares.

SECTION 362(b)

41. Basis to the Acquiring Corporation of Stock Received in a B-Type Reorganization

The determination of basis of the acquired company's stock in a B-type reorganization should be simplified in a manner similar to that in a C-type reorganization.

It is often quite difficult to obtain the basis for the acquired company's stock in a B-type reorganization, particularly where it is widely held. To overcome this problem, the Code should be amended to provide that where in a B-type reorganization 80 percent or more of the stock of the acquired company is acquired during a 12-month period, a substituted basis for the stock acquired should be allowed equal to the excess of the basis of the assets in the hands of the corporation being acquired over its liabilities, just as if there had been a C-type reorganization. This would place the transaction in a similar position to a C-type reorganization and should simplify operation of the statute.

SECTION 367

42. *Foreign Corporations*

The Secretary of the Treasury or his delegate should be given statutory authority to make a determination, after an exchange, that such exchange was not in pursuance of a plan having as one of its principal purposes the avoidance of federal income taxes.

Section 367 provides that in determining the extent to which gain shall be recognized in the case of any of the exchanges described in Sections 332, 351, 354, 355, 356, 361, a foreign corporation shall not be considered as a corporation unless, *before* such exchange, it has been established to the satisfaction of the Secretary or his delegate that such exchange is not in pursuance of a plan having as one of its principal purposes the avoidance of federal income taxes.

Sections 1491 and 1492, enacted at the same time and for a similar purpose, provide that an excise tax of 27½ percent shall be imposed on transfers of stock or securities to a foreign corporation unless, *before* such transfer, it has been established to the satisfaction of the Secretary or his delegate that such transfer is not in pursuance of a plan having as one of its principal purposes the avoidance of federal income taxes.

Notwithstanding the similarity of purpose and structure of these sections, Section 1494(b) provides that the tax otherwise imposed by Section 1491 may be abated, remitted or refunded if *after* the transfer it has been established to the satisfaction of the Secretary or his delegate that the prescribed tax avoidance purpose did not exist. The legislative history discloses no reason for withholding similar relief from the impact of Section 367, which has been and continues to be a trap for the unwary.

To correct this situation it is suggested that the first sentence of Section 367 be amended as follows:

"In determining the extent to which gain shall be recognized in the case of any of the exchanges described in Section 332, 351, 354, 355, 356 or 361, a foreign corporation shall not be considered a corporation unless it is established that such exchange is not in pursuance of a plan having as one of its principal purposes the avoidance of federal income taxes."

SECTION 368(a)(1)(B)

43. *B-Type Reorganizations—Exchange of Cash*

In an exchange of stock for stock in a B-type reorganization, the issuance by the transferee of cash to avoid fractional shares, or the assumption by the transferee of reorganization expenses or transfer taxes, should not deny qualification for reorganization treatment.

In Revenue Ruling 66-365 (CB 1966-2 176), the Internal Revenue Service recognized some court decisions (e.g., *Mills et al.* v. *Commissioner*, 331 F. 2d 321 (1964)) and stated that the "solely for voting stock" requirement is met where the acquiring corporation pays cash in lieu of issuing fractional shares and the cash is not a separately bargained-for considertion but merely represents a rounding-off of the fractions. Even as so modified, the rule requiring "solely" voting stock seems too stringent. It should be relaxed to permit limited exchanges of cash or other property for legitimate business purposes and to eliminate doubt as to the qualification of a particular transaction as a reorganization. While some departure from the strict language of the Code has been permitted, a statutory "de minimis" rule should be enacted limiting the amount of cash and other property to perhaps 5 percent of the total consideration.

SECTION 381(a)

44. *Tax Attributes in Intercorporate Transfers*

Inheritance by a successor corporation of the various tax attributes of a predecessor corporation should also apply to intercorporate transfers and to transfers to a subsidiary.

The Code should be amended to provide that inheritance by a successor corporation of the various tax attributes of a predecessor corporation should also apply to intercorporate transfers and to transfers to a subsidiary.

Without this amendment, it may be possible for a corporation to terminate previous adverse elections by transferring all or part of its business to a newly formed corporation which can then make new elections that will be more advantageous in the future.

SECTIONS 382, 269

45. General Comment—Carryover of Operating Losses

The whole structure of the Internal Revenue Code as it relates to the taxation of corporations and stockholders is founded on the proposition that the corporation is a separate taxable person. In this connection the concept of "continuity of interest" has been understood as justifying recognition of the identity of a corporate person despite certain changes in its structure. If continued recognition of this concept is desirable, and it seems that it is, there does not appear to be any justification for denying access to carryover deductions except where changes of *both* ownership and business result in the creation of a new business person.

Where stockholders have pooled their capital in a corporation for the purpose of engaging in business for profit but have sustained losses, it is illogical to assume that the stockholders should not seek to recoup those losses by improving the operations of the losing business or by engaging in another business which might be more profitable. If the latter course is taken, and a new business is acquired, the operating loss carryovers should be available as though the recovery were from improved operations.

In the absence of a change of ownership sufficient to interrupt the continuity of interest, the continuing tax identity of the corporate person should be recognized. To do otherwise would be to place fiscal expediency ahead of reasonable tax policy.

For the same reasons, continuation of the separate corporate person should be recognized, as at present, when there is a change of ownership but no significant change in business activities.

Where there is a significant change of business activities coupled with a significant change in ownership, the law should recognize that the effect is the same as formation of a completely new taxable person and the carryover of loss deductions in such circumstances should be denied.

Revenue Ruling 63–40 (1963–1 CB 46) is a step in the right direction in that it provides that operating loss carryovers will not be denied in instances in which a new business is acquired and there is *little or no* change in stock. The conclusion is too narrow, however, and does not take care of the other existing inconsistencies in the statutory sections dealing with operating loss carryovers.

With certain modifications, but within the present basic structure of Sections 269 and 382, the foregoing objectives can be attained. The following recommendations are suggested to accomplish that result.

SECTION 269

46. Carryover of Operating Losses—Acquisition of New Businesses

It should be made clear that in the absence of a change of ownership of 50 percent or more of an existing corporation, carryover of operating losses should not be denied merely because of the acquisition of new businesses.

Revenue Ruling 63–40 (1963–1 CB 46) indicates that if a new business is acquired or after the period in which losses were incurred, the corporation will not be barred from using prior losses against the profits of a newly acquired business. The ruling also states that if there is more than a minor change in stock ownership of a loss corporation which acquires a new business enterprise, the IRS may continue to contest the deductibility of the carryover of the corporation's prior losses against the income of the new business enterprise.

It should be made clear that carryover of operating losses against the profits of a newly acquired business should not be denied unless there is a change of 50 percent or more in the ownership of the company.

SECTION 382

47. Acquisitions Through Reorganizations—Percentage Reduction Rules

The percentage reductions in Section 382(b) applicable in the case of reorganizations of loss companies should be replaced by rules similar to those applicable to purchases under Section 382(a). That is, where shareholders of the loss company do not retain an interest of 50 percent or more in the continuing company, the operating loss should be denied unless a "continuity of business" test is met. There should also be a provision under which substantially all the assets received from the loss company could be transferred to a subsidiary, if the subsidiary meets the continuity of business test.

There seems to be no basis for distinguishing between a sellout accomplished by means of a taxable transaction and one accomplished by a reorganization even though the selling shareholders retain an interest. In either case the "continuity of business" test should be applied. The alternative of allowing the carryover to remain in a subsidiary is necessary to permit use of the loss against profits from a continuation of the loss corporation's business even though the acquiring corporation has other types of business.

SECTION 382 (A) (1)

48. "Continuity of Business' Test

Where there has been a change in ownership of a loss company, a reasonable but more specific "continuity of business" test should be applied. Expansion of existing lines of products or services, including the acquisition of a business having the same or similar products or services, should be permitted. In addition, the company should be permitted to develop a natural growth of the existing business provided that the new activity is not a major portion of the whole. The loss company should not be prevented from dropping unprofitable lines or from moving its location or changing its personnel in an effort to earn profits against which it may offset the loss carryover.

The purpose of Section 382(a) (1) is to prevent new owners from acquiring a loss company and using its loss against profits from an unrelated business undertaken under the new management. However, it also prevents new owners from discontinuing or radically changing unprofitable lines of business and hampers normal expansion and diversification of products or services. These effects are unreasonable and undesirable and should be corrected.

A company in the electronics business, for instance, which is manufacturing a device for a specific kind of measurement should be permitted to:

1. Discontinue its manufacture when technological changes make some other device better.
2. Add to its list of products devices for any other kinds of measurement, either by the company's own research and development or through the acquisition of an existing business.

SECTION 382 (A) (1)

49. Period Over Which Changes in Stock Ownership are Measured

In making a comparison of stock ownership for purposes of Section 382(a), the earlier date should be "twenty-four months before the end of the taxable year."

Section 382(a) provides a period of time over which a change in ownership is measured. This period should be a uniform period, such as 24 months, and should not be shortened merely because a taxpayer has a short taxable year. Short years may arise from entering into or withdrawing from a consolidated group or from a change in fiscal year, neither of which should result in a reduction in the period of time for testing changes in stock ownership.

SECTION 382 (A) (1)

50. Limitation on Denial of Net Operating Loss Carryover

The denial of carryover loss should be restricted to losses which occurred before the change in stock ownership and the change in business.

Because of the present wording in Section 382(a) (1) (A) (ii), if there were a change in ownership and a change in business at the beginning of a taxable year and the changed business showed a net operating loss in that year, that net operating loss could be denied as a carryover to succeeding years. This result probably was not intended and is inequitable. The denial should be limited to losses which occurred prior to the change in stock ownership.

SECTION 382 (A) (4)

51. Definition of "Purchase"—B-Type Reorganization

The definition of "purchase" for the purpose of determining changes in ownership under Section 382(a) should be expanded to include acquisitions of stock for stock in B-type reorganizations.

At present, control of a loss corporation can be acquired by another corporation issuing its own stock in a reorganization that qualifies under Section 368(a)(1)(B) without becoming subject to the restrictions on use of the loss carryover contained in either Subsections (a) or (b) of Section 382. This should not be permitted, and this type of transaction should be brought within the provisions of Section 382(a).

Deferred Compensation, etc.

SECTION 404(A)(5)

52. Contributions to Nonexempt Employees' Trusts

Taxpayers making contributions to a profit-sharing or pension trust not exempt under Section 401 should be allowed a deduction from net income for such payments in the year the amounts are paid to the employees by the trust even though the rights of the employees were forfeitable when the contributions were made.

An employer is allowed to deduct his contributions to an employees' pension trust or annuity plan as provided in Section 404(a)(5) even if the trust to which the contributions are made has not qualified under Section 401, provided the rights of the employees under the plan are vested when the contribution is made. If the employees' rights are forfeitable, the taxpayer is not allowed a deduction in any taxable year, as provided in the Regulations Section 1.404(a)-12.

This limitation forbidding the deduction in any taxable year is inequitable. Where contributions are made to a profit-sharing or pension trust not qualified under Section 401, and the rights of the employees are forfeitable when the contributions are made, the employer should be allowed a deduction (subject to the limitations of reasonableness outlined in Section 162(a)(1)) in the year the amounts are paid to the employees by the trust.

The employees should be required to report as income only the portion of the distribution which was not previously taxed to the trust, and the employer should be allowed a deduction only for the portion of the distribution which is taxed to the employees. The procedure for the allocation should be defined in the regulations.

SECTION 422(c)(3)(c)

53. Stock Option for More than 5 Percent Shareholder-Employee

Options outstanding to all employees should be taken into account in determining whether an employee owns more than 5 percent of the stock of the employer corporation for purposes of Section 422(c)(3)(C).

Section 422(c)(3)(C) provides that in determining whether or not an employee owns more than 5 percent of the stock of the employer corporation, the stock which he may acquire by exercise of the specific option being granted is treated as owned by him.

If there are other options to other employees outstanding, the stock which may be acquired by them upon exercise of their options apparently is not considered as outstanding for purposes of determining whether or not an employee meets the 5 percent test. There appears to be no reason why such other options should not be taken into account.

Accounting periods and methods

SECTIONS 452, 462

54. Taxation of Unearned Income and Allowance of Deductions for Estimated Expenses

The accounting principles originally recognized in Sections 452 and 462 of the Internal Revenue Code of 1954 should be reenacted. Section 452 related to deferral of income received for performance or delivery of service extending beyond the end of the taxable year in which such income is received. Section 462 allowed a deduction for reasonable additions to reserves for estimated expenses.

Unearned income. One of the basic principles of accounting is that income is validated by the delivery of goods or services accompanied by the receipt of cash or a claim for cash. Clearly, equity dictates that a business should not have to pay tax on money which is received but not yet earned, that is, where such receipt is burdened with an obligation to render service, etc., beyond the taxable year of the receipt. The present provisions of Section 455 dealing with prepaid subscription income and Section 456 dealing with certain prepaid dues income, although not completely adequate, do recognize this important principle.

A statutory provision should apply to receipts which carry a definite liability to furnish goods or services in the future. There should be no requirement as to any particular length of time subsequent to the end of the taxable year in which the liability to perform must be satisfied. If a maximum deferral period is considered necessary it should not be less than five years.

Taxpayers should be permitted the option of electing the deferral treatment as to classes of unearned receipts. This would permit immaterial items to be treated on a nondeferral basis.

It is recognized that an adjustment may be required during a transitional period in order to prevent substantial distortion of income.

Estimated expenses. For taxpayers on the accrual basis, another basic accounting principle concerns the matching of deductions and expenses of a fiscal period with the revenues applicable to such period even when it is necessary to estimate the amount of such deductions and expenses.

At the time Section 462 was repealed (originally enacted in the Internal Revenue Code of 1954), Congress expressed its endorsement of the basic principle of allowing taxpayers deductions for reasonable additions to reserves for estimated expenses, with adequate safeguards to prevent the possible abuses which were feared under Section 462 as originally enacted.

A new provision allowing deductions for estimated expenses should now be enacted, with the following limitations to make the provision workable and to gain additional experience with the problems that might be encountered:

1. The categories of estimated expenses for which reasonable additions to reserves would be deductible should be limited at the outset to liabilities to customers, to employees, and for multiple injury and damage claims. Provision for estimated liabilities to customers would include, for example, liabilities for cash and trade discounts, advertising allowances, allowances for defective merchandise, etc. Liabilities to employees would include, among other things, liabilities for vacation payments, workmen compensation claims, etc. Liabilities for multiple injury and damage claims should be restricted to the potential liability on an estimated basis arising out of events which happened before the close of the taxable year of the taxpayer.

2. Taxpayers should be permitted the option of electing to deduct additions to reserves for estimated expenses on an item-by-item basis. A requirement for an all-inclusive treatment covering every conceivable item of eligible estimated expense would carry the danger of a greater revenue impact and of attempts by taxpayers to claim deductions for items which may ultimately be held to be improper in an effort to protect the validity of their election. An item by item election would permit taxpayers to deduct only those estimated expenses which are substantial in amount and which the taxpayers reasonably feel are contemplated within the scope of deductibility of estimated expenses.

3. In order to prevent any immediate unfavorable effect on tax revenues, a transitional adjustment may be required.

SECTION 453(b)

55. Clarification of the Term "Payment" in Taxable Year of Sale

Payments in the initial period should not include a liability assumed by the purchaser unless it exceeds the basis of the property.

Section 453(b)(2) limits the use of the installment sales method to situations where payments in the year of sale do not exceed 30 percent of the selling price. Regulation Section 1.453-4(c) indicates that in the case of the disposition of real estate a mortgage assumed shall not be included as a payment unless it exceeds the basis of the property. Nothing is mentioned about other liabilities assumed. Disputes have arisen where liabilities are assumed by the purchaser. The Tax Court (See *I. Irwin Jr.*, 45 TC 544; and *Horneff*, 50 TC 63) has maintained a position that liabilities assumed are included as payments if actually paid during the year of sale. This Court has also questioned, in dicta, the provision in the Regulations relating to mortgages assumed. It has stated that the provision refers only to mortgages assumed but not paid in the year of sale. On the other hand, two Courts of Appeal have taken the position that an assumption of any liabilities should not be included as an initial payment unless it exceeds basis (See *I. Irwin Jr.*, (CA5) 390 F. 2d 91, and *Marshall* (CA9) 357 F. 2d 294).

Considering the conflict in the area, the Code should be changed to clarify the point. Since the assumption of debt does not provide funds to pay the tax and there would be administrative problems in determining if and when an assumed liability has been paid, it is suggested that the term "payment" be defined to exclude an assumed obligation unless it exceeds the basis of the property sold.

SECTION 453(C)

56. Elimination of Double Taxation Upon Change From Accrual to Installment Basis

Upon a change from the accrual to the installment basis of reporting taxable income from installment sales by dealers in personal property, installment payments actually received during the year on account of sales made in a taxable year before the year of change should be excluded in computing taxable income for such year of change and for subsequent years.

Under the Internal Revenue Code of 1939 a taxpayer changing from the accrual method to the installment method was not permitted to exclude from gross income for the year of change and subsequent years the gross profit which had been included in income and taxed in an earlier year when the taxpayer was on the accrual basis. The result was that such taxpayer was taxed twice on the same income.

The Committee Reports accompanying the Internal Revenue Code of 1954 state that with the intention of eliminating this double taxation, Congress enacted Section 453(c) of the Internal Revenue Code of 1954. Unfortunately, that section does not go far enough, for it still requires that the gross profit from installment payments received after the change to the installment method be included in gross income in the year of receipt even though it had previously been taxed under the accrual method.

Actually, Section 453(c) does not accomplish its intended purpose. Only limited relief is provided from the double tax penalty. Even if it is assumed that the tax rate and gross income is the same for the earlier year and the year of change, the net income and the final tax in the earlier year would probably have been smaller because the expenses of sale would have been deducted in the earlier year under the accrual method. Thus, the Section 453(c) adjustment will not eliminate all the tax in the second year resulting from the inclusion of the gross profit.

In order to accomplish equity between taxpayers who change from the accrual to the installment method of accounting for installment sales and taxpayers who adopted the installment method originally, and in order to bring about the expressed intent of the Congress, Section 453(c) should be amended to permit a changeover to the installment method without double taxation.

It is recognized that an adjustment will be necessary during a transitional period in order to prevent distortion of income.

SECTION 482

57. Mitigation of Statute of Limitations In Related Taxpayer Cases

Whenever the Secretary of the Treasury exercises his right to reallocate income or deductions between or among two or more taxpayers, either the party whose income is decreased or whose deductions are increased by such reallocation should be permitted to pick up the effect of the adjustment without regard to the statute of limitations, or no reallocation should be made under Section 482.

Section 482 permits the Secretary to reallocate income and deductions among related taxpayers where, in his opinion, action is necessary to reflect properly the income of the respective related taxpayers. Where such allocations are made, correlative adjustments to the income of related taxpayer involved in the allocations are required by Regulations where not otherwise barred by law. Often, an increase in taxable income of one of the parties is determined at a time when the statute of limitations with respect to one of the related taxpayers has already expired. This bars a tax refund for such other party which otherwise would be obtainable. Thus, after having collected the tax from one taxpayer, the Secretary can refuse a refund of tax to the other taxpayer affected. In this situation the same income is taxed twice.

The party whose income is decreased or whose deductions are increased by a reallocation under Section 482 should be accorded the right of a correlative adjustment without regard to the statute of limitations. Alternatively, the Section 482 adjustment should not be permitted if the correlative adjustment is barred by the statute of limitations.

Personal Holding Company

SECTION 543(A)(6)

58. Use of Corporate Property by Shareholder

Section 543(a)(6) should be repealed so that all rent income is treated in a consistent manner under Section 543(a)(2). Until enactment of the 1964 amendments, the section prevented the incorporation of private property to protect investment income from personal holding company penalty. The present rent section prevents any appreciable sheltering of investment income with rents from any source. Thus, the need for 543(a)(6) as a special class of personal holding company income has disappeared. Its continued existence presents difficulties and problems unrelated to the avoidance sought to be forestalled.

The original impetus for the enactment in 1937 of the predecessor to Section 543(a)(6) was that shareholders, in order to bring the percentage of investment income of their corporations below the 80 percent personal holding company test, would transfer to a corporation a yacht, city resident or country home, and pay sufficient rent to take the corporation out of the personal holding company classification. Further, the rent paid would usually be less than the actual cost of maintaining the property and frequently less than would have been received from an outsider in a bona fide transaction. By including as a separate category of personal holding company income amounts received from shareholders for the use of corporate property, Congress eliminated this method of tax avoidance.

This provision, which was designed to reach situations in which private property was incorporated to avoid personal holding company classification, resulted in inequities where property was leased by a corporation to stockholders for use in a business operation.

Accordingly, in 1950, this section was amended to provide that rents received between 1945 and 1950 for use by the lessee in the operation of a bona fide commercial or mining enterprise should not be included in personal holding company income. In 1954, the provision was further changed so that the rent received from a shareholder was not personal holding company income if the corporation had less than 10 percent of other perosnal holding company income.

During the period from 1937 to 1964, personal holding company income included rent, unless rent constituted 50 percent or more of total gross income. However, "rent" for the purpose of this test was defined to exclude amounts received for the use of corporate property by shareholders. (Section 502(g), 1939 Code; Section 543(a)(7), 1954 Code.) Until 1964, therefore, the provision relating to a shareholder's use of property (Section 502(f), 1939 Code; Section 543(a)(6), 1954 Code) had significance in preventing tax avoidance due primarily to the rent exclusion as then defined.

Enactment of the new personal holding company provisions in 1964 changed this long standing relationship. The new section departed from the 50 percent gross receipts test for rent and substituted a 50 percent of "adjusted ordinary gross income" test. In computing the adjusted income from rents for purposes of this test, gross rents are reduced by depreciation, interest, taxes and rent paid on the rental property. The new law included an additional test which requires other personal holding company income to be negligible or distributed as dividends. The only pertinent change made in respect to the shareholder's use of property was to apply the 10 percent test to "ordinary gross income" instead of "gross income."

The present tests for all practical purposes require a corporation to be engaged primarily in the rental business in order to avail itself of the rental exclusion. It is practically impossible to shelter investment income in a rental corporation in any significant amount under the present law.

The Internal Revenue Code then has come full circle in respect to a shareholder's use of corporate property. Prior to the enactment of this section in 1937, investment income could be sheltered by placing personal property in corporate form. From 1937 to 1964, it could be sheltered only by other rental property. Now, for all practical purposes, no rental property can shelter other investment income. The need for this special definition has now disappeared.

The 10 percent test under the present rent Section (543(a)(2) is the same as applied in the shareholder's use of corporate property (Section 543(a)(6)), except that, in the latter case, investment income cannot be reduced by the dividends paid. This difference in treatment seems illogical since the abuse sought to be forestalled is the same in both cases.

Elimination of an unneeded special definition from an already extremely difficult statute and its integration with the general rent definition would be helpful. In addition, it would eliminate problems of the type highlighted by Revenue Ruling 65-259 (1965-2 CB 174). The Service's attempt in this ruling to expand the definition of rents received from shareholders seems unnecessary if its objective is to prevent sheltering of investment income, but it seems to represent an effort to force more corporations, regardless of their activity, into the personal holding company net. The intent of Section 543(a)(6) when enacted and as subsequently amended clearly indicates an attempt to alleviate a specific abuse and not hamper normal commercial enterprise. The belated attempt to extend the definition does not appear to be based on these precepts.

The personal holding company provisions should be considered apart from other abuses which can arise due to control of corporations.

Estates, Trusts, Beneficiaries and Decedents

SECTION 642(H)

59. *Separate Shares—Partial Termination*

The deduction carryover provisions of Section 642(h) should be extended to the termination of a single beneficiary's entire interest in a trust having different beneficiaries where such interest represents a separate share as determined under Section 663(c).

The deduction carryover provision of Section 642(h) applies only upon the final termination of an estate or trust. The provision should be extended so as to include an apportionment of such deductions when there is a final termination as to a single beneficiary's separate share in a trust where there are several beneficiaries.

SECTION 642(H)

60. *Unused Investment and Foreign Tax Credits on Termination of an Estate or Trust*

The investment and foreign tax credits not used by the estate or trust should be available as a carryover to the beneficiaries succeeding to the property of the estate or trust.

Present law provides for the carryover of a net operating loss, a capital loss and the excess of deductions over gross income in the last taxable year to the beneficiaries succeeding to the property of the estate or trust. It is equitable for the beneficiaries also to be allowed the benefit of the unusued investment and foreign tax credits.

SECTION 643(A)

61. *Distributable Net Income*

Only the excess of corpus deductions over corpus "income" should be deductible in computing distributable net income.

A limiting factor in the amount of estate and trust income taxable to the income beneficiary is "distributable net income" as defined in Section 643(a). The effect of this definition is that all items of deductions (whether charged to corpus or to income) other than the personal exemption are deductible in computing distributable net income.

Thus, for example, the income taxable to the beneficiary of a simple trust (which requires that all income—as distinguished from corpus—be distributed currently), using the following assumed annual income and deductions, would be computed as follows:

Dividends and interest income (credited to income for trust accounting purposes)	$5,000
Short-term capital gain (credited to corpus for accounting purposes)	1,000
Gross income	6,000
Deductions:	
Legal expenses (charged to corpus)	500
Taxable income before deduction for distributions to beneficiary	5,500

Under Section 643(a) the deduction for distributions to beneficiaries is limited to \$4,500 (the \$5,000 dividend and interest income, less the \$500 legal expenses paid) and this is the only amount the income beneficiary would be taxed on, even though he was paid \$5,000, the full annual income for trust accounting purposes.

It can thus be seen that expenses paid which are charged to corpus for estate and trust accounting purposes normally reduce the amount of income taxable to the *income* beneficiaries. This is true even though corpus may be taxed in full on such items as capital gains. In the above example, the entire \$1,000 capital gain realized by *corpus* would be taxed (subject to allowance of the deduction for the trust's personal exemption) even though the \$500 legal expenses had paid by *corpus* during the year.

It is recommended that the definition of "distributable net income" be amended so that corpus deductions first be used to offset items of income taxable to corpus; only the excess should be deductible in computing distributable net income which is a measure of the amounts taxable to the income beneficiaries.

SECTION 663

62. Separate Shares—Estates

The separate shares rule should be extended to apply to estates as well as trusts when the estate has more than one beneficiary and the beneficiaries have substantially separate and independent shares in the assets of the estate.

Where any beneficiary of a trust having more than one beneficiary has a substantially separate share in the trust, each such beneficiary's share will be regarded as a separate trust for the purposes of determining the amount of income distributable to the beneficiary. As presently constituted, this provision applies only to trusts. It should be extended to include estates.

SECTION 663(a)

63. Corpus Distributions

The definition of the types of gifts and bequests which are excluded from the gross income of beneficiaries of estates and trusts should be liberalized.

Payments of certain specific bequests or gifts of specific sums of money or specific property are not deductible from distributable net income of the estate or trust. Such payments are not includable in the income of the recipient. However, other distributions of the same nature and character result in a distribution taxable income, and are taxed to the recipient, because they fail to meet the test of the exclusion in the Code. The Section 663 exclusion test should be liberalized to permit exclusion from income of a beneficiary of:

1. All bequests or gifts, unless payable solely from income, if paid all at once or within one taxable year of the estate or trust, or, in the case of installment payments, if distributed before the close of the 36th month after the death of the testator.
2. Any real property, tangible personal property (except money) or stock in a closely held corporation which is properly distributed within the 36 months following the death of the decedent.

SECTION 691

64. Income in Respect of Decedents

The income tax deduction for the estate tax attributable to income in respect of a decedent should be replaced by an estate tax deduction for the income tax attributable to such income.

The purpose of this Section 691(c) deduction is to relieve a double tax situation and place the decedent's estate or heir in the same position as the decedent would have been had he realized the income during lifetime and paid the income tax thereon. Present law provides for a deduction of an attributable portion of estate tax as an income tax deduction rather than an attributable portion of income tax on this income as a deduction for estate tax purposes. The provision of a deduction for income tax purposes, rather than an income tax deduction for estate tax purposes, appears to have been made for administrative expediency; it results in difficult and complicated computations, and can produce inequitable results.

It is recommended that the deduction permitted by Section 691(c) to persons who include in gross income, income in respect of a decedent under Section

691(a). should be replaced by rules which would permit a deduction for estate tax based upon the amount of income tax which would be deemed attributable to all items includible as income in respect to a decedent under Section 69(a), less deductions allowed under Section 691(b).

REGULATED INVESTMENT COMPANIES

SECTION 852(a)(1)

65. Deficiency Dividends for Regulated Investment Companies

If the taxable income of a regulated investment company is increased by the Internal Revenue Service, resulting in failure of the taxpayer to meet the requirement that 90 percent of its taxable income be distributed, the dividends-paid deduction should include deficiency dividends. similar to those determined under Section 547, if the taxpayer would have met the 90 percent requirement were it not for such increase.

Section 852(a)(1 requires payment of dividends amounting to 90 percent or more of the ordinary taxable investment income of a regulated investment company. An increase in the ordinary taxable investment income by the Internal Revenue Service could be of such an amount that 90 percent of the corrected ordinary taxable investment income will not have been distributed as a dividend. Under present law the regulated investment company would be disqualified in such case.

Where the regulated investment company did pay dividends of 90 percent or more of its ordinary taxable investment income without regard to the increase made by the Internal Revenue Service, thereby demonstrating good faith. provisions, such as those of Section 547, regarding deduction for deficiency dividends, should be made applicable.

Real Estate Investment Trusts

SECTION 857(A)(1)

66. Deficiency Dividends for Real Estate Investment Trusts

Where a real estate investment trust has acted in good faith in distributing 90 percent of its taxable income, the dividends-paid deduction also should take into account deficiency dividends, similar to those determined under Section 547, if the taxpayer's taxable income is increased upon examination so that the 90 percent requirement is not met.

Section 857(a) provides that a real estate investment trust must distribute 90 percent of its taxable income in dividends. It is possible that an examination by the Internal Revenue Service may change the taxpayer's taxable income significantly, resulting in a tax liability because, as a result of the increase in taxable income, the taxpayer does not meet the 90 percent requirement.

The provisions, such as those of Section 547, regarding deduction for deficiency dividends, should be made applicable with respect to situations in which a Service examination causes a real estate investment trust to fall below the 90 percent requirement when prior to the examination the trust had, in good faith, distributed 90 percent of its taxable income.

Tax Based on Foreign Income, Etc.

SECTIONS 862, 904, 911

67. U.S. Partners Stationed Abroad

Guaranteed payments to a U.S. citizen who is a member of a partnership and is stationed abroad should be treated as made to one who is not a member of the partnership under Section 707(c) for purposes of Sections 862, 904, and 911.

Section 911 of the Internal Revenue Code provides that a U.S. citizen employed abroad who meets the tests of Section 911(a)(1) or (a)(2) is permitted to exclude up to $20,000 or $25,000 of earned income as the case may be, regardless of where his employer derives his income. The source of the employee's earned income is the place where the services are performed. If all of his services are performed outside the United States his entire compensation is treated as foreign source income for purposes of Sections 862 and 904, as well as for the exclusion under Section 911. On the other hand, a partner who performs his services without the United States is not considered by the Treasury Department to earn his income at the place where the services are performed, but rather the source of his distributive share of partnership profits is determined where the partnership earns its income. If the partnership income is earned both within and without the United States, then the Treasury Department contends the partner has received a proportionate part of his partnership share from sources within the United States even though all of his services are perfromed outside the United States. (See *Foster*, 329 F. 2d 717, and *Foster*, 42 TC 974). The usual result of this approach is that the Section 911 exclusion is effectively lost even though there is nothing in the legislative history of Section 911 which reveals a purpose to discriminate between partners and employees.

The problem is further aggravated by the fact that a U.S. citizen employee in a foreign country will report his income in excess of the $20,000 or $25,000 limit as foreign source income since his services are performed abroad, subject to a foreign tax credit under Section 901. In contrast, a partner is frequently faced with double taxation where the country of residence imposes its income tax on his full distributive share of partnership profits. To the extent that his distributive share is considered derived from U.S. sources he is denied a foreign tax credit in the United States.

There is no justification for the different tax treatment of income earned from the performance of personal services abroad depending solely upon whether the individual is an employee or a partner.

To remedy this situation, it is recommended that Section 707(c) be amended to provide that guaranteed payments to a partner for services shall be considered as made to one who is not a member of the partnership, not only for purposes of Section 61(a) and Section 162(a) as presently provided, but also for purposes of Sections 862, 904, and 911. Thus, a partner who receives a stated salary for performing services outside the United States could, for that portion of his income from the partnership, receive U.S. tax treatment similar to that accorded employees.

SECTION 902(b)

68. Deemed Foreign Tax Credit

The deemed foreign tax credit should be liberalized by (1) permitting the credit with respect to foreign corporations lower than the second tier, and (2) lowering the 50 percent ownership requirement for any lower-tier corporation to 25 pecent, but with the requirement that the domestic corporate shareholder have at least a 5 percent ultimate beneficial ownership of voting stock in any lower-tier corporation.

A U.S. corporate shareholder may claim a deemed foreign tax credit in the situation where it owns 10 percent of the voting stock of a first-tier foreign corporation and the first-tier corporation owns at least 50 percent of the voting stock of a second-tier foreign corporation. Credits from tiers lower than the second are now not considered regardless of the degree of ownership.

Because of the business conditions that exist today it is necessary in many cases to have local nationals own more than 50 percent of the stock of foreign corporations. Furthermore, the corporate structures of foreign investments are becoming increasingly complex as the result of such factors as circumstances existing at the time of acquisition and specialized business arrangements. In situations such as these, it seems unfair that the U.S. corporate shareholder should lose the foreign tax credit.

To remedy this condition, it is suggested that the deemed foreign tax credit should be permitted with respect to any lower-tier foreign corporation which has at least 25 percent of its voting stock held by a corporation in the tier above it.

It is recognized that this proposed rule could, as the result of numerous successive tiers, result in a deemed foreign tax credit in a situation where the ultimate beneficial ownership by the U.S. corporate shareholder is insignificant. To avoid this possibility, there should be a requirement that the U.S. corporate shareholder have at least a 5 percent ultimate beneficial ownership of voting stock in any lower-tier corporation. This 5 percent is the same as the minimum ultimate beneficial ownership which is required under present law with respect to a second-tier subsidiary (10 percent of 50 percent).

SECTION 904(b)

69. Revocation of Election of Overall Limitation

A taxpayer should have the right to an annual election to use the overall limitation or the per-country limitation on the foreign tax credit. In addition, a change in the original election should be permitted at any time within the statutory period of limitations applicable to the taxable year of such election.

Section 904 allows a taxpayer to elect an overall limitation effective with any taxable year beginning after December 31, 1960. Once a taxpayer has made an election to use the overall limitation, that election is binding in all subsequent years, except that it may be revoked with the consent of the Commissioner of Internal Revenue. There is one exception. For the first year for which an election can be made, the taxpayer may make the election to use the overall limitation or may revoke an election previously made for that year, if such election or revocation (as the case may be) is made before the expiration of the period prescribed for making a claim for credit or refund of the tax imposed for such taxable year.

The election of the overall limitation or the per-country limitation on the use of the foreign tax credit is not a method of accounting but rather a means of computing tax liability. Since a method of accounting is not involved, there is no reason to require the consent of the Commissioner before a change in the election may be made. There are a number of reasons why a change may be necessary after the original election is made; for example, where substantial losses are realized with respect to existing investments because of nationalization, expropriation or war or where a taxpayer expects to enter substantial operations in a new foreign country and anticipates such operations will result in a loss for a number of years.

In the interest of equity and simplicity, it seems preferable that taxpayers be given the right to an annual election to use the overall limitation or the per-country limitation on the foreign tax credit. However, the prohibition of Section 904(e)(2) on carrybacks and carryovers between per-country and overall limitation years would continue to apply. A change in the original election should be permitted at any time within the statutory period of limitations applicable to the taxable year of the original election, without first securing the consent of the Commissioner.

SECTION 904(d)

70. Carryback and Carryover of Excess Tax Paid

The definition of the amount of carryback and carryover of foreign tax credit should be changed so that the amount involved is the difference between the foreign tax paid or accrued and the foreign tax used as a credit. As presently defined the amount involved is the difference between the foreign tax paid or accrued and the applicable limitation under Section 904(a).

Due to the formula provided in Section 904(d) for the determination of the amount of foreign taxes paid or deemed to have been paid which can be used as a carryback or carryover, taxable income derived from two or more foreign countries can be subjected to double taxation. This will occur when the taxpayer has a loss from U.S. operations and uses the per-country foreign tax credit limitation. It does not occur when the overall limitation is used. Such double taxation results from a portion of the foreign taxes not being available for use either as a current credit or a carryback-carryover credit.

In the following example the foreign source income as reduced by the U.S. loss is taxed at an effective rate of 64 percent. This would not occur if the amount of an unused foreign tax credit available as a carryback or carryover was defined to be the difference between the foreign tax paid or accrued and the foreign tax used as a credit.

	Income (loss)	U.S. tax	Foreign tax
Foreign country A	$100		$60
Foreign country B	100		55
United States	(50)		
Total foreign tax			115
Total income per U.S. return	150		
U.S. tax at 48 percent before foreign tax credit		$72	
Foreign tax credit per-country limitation ($)—			
Country A: 100/150×72 equals	48		
Country B: 100/150×72 equals	48		
Credit limitation	96		
Foreign tax credit (lesser of $72 or $96)		72	72
U.S. tax payable		0	
Unused foreign tax			43
Available credit carryback—carryover under sec. 904(d):			
Country A ($60—$48)			12
Country B ($55—$48)			7
Total available			19
Erosion of unused foreign taxes available for foreign tax credit ($43—$19)			24
Effective combined tax rate on net taxable income of $150 (U.S. tax of $72 plus eroded foreign taxes of $24=$96÷$150) (or U.S. tax rate of 48 percent plus rate of unavailable foreign taxes of 16 percent ($24÷$150) (percent)			64

SECTION 904(d)

71. Carryback of Excess Foreign Taxes

The two-year carryback of the excess of foreign income, etc., taxes paid over the applicable limitations in Section 904 should be changed to three years.

Section 904(d) provides that any excess of foreign income, etc., taxes paid over the applicable limitations contained in other parts of Section 904 is carried back two years and then forward five years.

The carryback and carryover principle is employed in other parts of the Internal Revenue Code. Widespread application occurs in the areas of the net operating loss and the unused investment credit. In both of these situations, a nine-year business cycle has been deemed by Congress to be most appropriate (i.e., the taxable year, three years back and five years forward). It appears that the same nine-year cycle would also be most appropriate in connection with excess foreign income taxes. Such conformity would be achieved by changing the foreign tax carryback from two years to three years.

SECTION 911(a)(2)

72. Exclusion of Earned Income From Sources Without the United States

The exclusion from gross income of earned income from sources without the United States attributable to presence in another country for seventeen months granted by Section 911(a)(2) should be allowed for resident aliens.

In general, the tax laws do not distinguish between *resident aliens* and United States citizens. In one important respect, there is a difference in treatment which results in an inequity to the resident alien.

A resident alien is taxed on his global income just as a citizen. However, if the alien works for an extended period of time outside the United States, he is taxed more severely than any citizen since he is not permitted the earned income exclusion under Section 911(a)(2). There is no basis in reason or equity for this distinction.

The section should be amended to permit the exclusion for resident aliens as well as for citizens.

SECTION 958

73. Controlled Foreign Corporation Defined

Section 958 should be amended so that it is not possible for second-tier and lower-tier subsidiaries to be controlled foreign corporations where the first-tier foreign corporation is not a controlled foreign corporation.

Section 957(a) defines a "controlled foreign corporation" (CFC) as any foreign corporation of which more than 50 percent of the total *voting power* of all classes of stock is owned or considered as owned within the meaning of Section 958 by U.S. shareholders. Therefore, a first-tier foreign corporation is not a CFC where more than 50 percent *in value* of its stock is owned by U.S. shareholders, provided the U.S. shareholders do not meet the *voting power* test. However, in such a case, although the first-tier foreign corporation is not a CFC, foreign subsidiaries in which the first-tier foreign subsidiary owns more than 50 percent of the total voting power are CFCs. This result, apparently contrary to Congressional intent, is determined as follows:

1. Section 958 provides that for purposes of determining whether a corporation is a CFC under Section 957, the constructive ownership rules of Section 318(a), as modified, shall apply.

2. Section 318(a)(2)(C) as modified by Section 958(b)(3) provides that if 10 percent or more in value of the stock of a corporation is owned, then the owner shall be considered as owning any stock owned by that corporation in the proportion which the *value* of the stock owned in the first corporation bears to the *value* of all of the stock of such corporation.

3. When applying Section 318(a)(2)(C), Section 958(b)(2) provides that if a corporation owns more than 50 percent of the voting power of all classes of stock entitled to vote, it shall be considered as owning 100 percent of the stock entitled to vote.

An example to illustrate the application of the cited Code sections follows. Assume foreign corporation F owns 60 percent of the one class of outstanding stock of foreign corporations X and Y, and Y owns 60 percent of the one class of outstanding stock of foreign corporation Z. The ownership in F is as follows:

	Number of shares			Percent of ownership	
	Total	Class A (nonvoting)	Class B (voting)	Voting	Value
U.S. shareholder	550	150	400	48	55
Foreign shareholders	450	25	425	52	45
Total	1,000	175	825	100	100

The application of the various sections is as follows:

1. F is not a CFC since U.S. shareholders do not own more than 50 percent of its voting power.

2. Under Section 958(b)(2), F is considered to own 100 percent of X and Y, and Y is considered to own 100 percent of Z when applying Section 318(a)(2)(C).

3. The U.S. shareholder under Section 318(a)(2)(C) is considered to own 55 percent of the stock of corporations X, Y and Z; thus, they are CFCs.

To remedy this condition, Section 958(b)(3) should be modified to read: "In applying subparagraph (C) of Section 318(a)(2), the phrase '10 percent' shall be substituted for the phrase '50 percent' and the phrase 'voting power' shall be substituted for the word 'value' used in subparagraph (C)."

Gain or Loss on Disposition of Property

SECTION 1091

74. *Wash Sales*

The wash-sale provision should apply to security traders (but not to dealers) whether or not incorporated.

Section 1091, as presently written, disallows wash-sale losses incurred by taxpayers other than corporations only if such losses would be deductible under Section 165(c)(2). Section 165(c)(2) provides for the deductibility of "losses in curred in any transaction entered into for profit, though not connected with a trade or business." It is clear that, for such taxpayers, security losses incurred in a trade or business, deductible under Section 165(c)(1), are not affected by the wash-sale rule.

It has been held that taxpayers whose business it is to buy and sell securities for a speculative profit may deduct their losses under Section 165(c)(1) and are, therefore, exempt from Section 1091. Such taxpayers are called traders and are to be distinguished from security dealers who maintain an inventory and sell to customers in the ordinary course of their trade or business. Traders, although holding their securities for sale, are not merchants and may not inventory their positions because they sell them through brokers and not to customers (Regulations Section 1.471-5). It is also pertinent to note that, in the case of corporations, Section 1091 is operative except as to losses incurred in the ordinary course of the business of a corporate security dealer.

The special treatment given to noncorporate traders is not warranted and gives such taxpayers an unfair advantage over noncorporate investors and over corporations active in the purchase and sale of securities. Even though this exemption is of long standing, a persuasive case can be made for the position that it arose in the first place as a result of a misunderstanding. For a complete discussion of the background of this section, see S. Walter Shine, "Wash-Sale Losses—A Gift to Security 'Traders,'" *Taxes*, June 1954, p. 455. The article indicates that the original intention was to limit the exemption to dealers because they could inventory their positions. Since dealers may, under an appropriate inventory method, avail themselves of unrealized losses in their inventory, the application of the wash-sale rule to them is unnecessary. This interpretation of the original intent is logical, while the extension of the exemption to traders who may not inventory their positions is not. Furthermore, the distinction between corporate and noncorporate traders is similarly illogical and casts doubt upon the correctness of the latter's exemption.

It should also be noted that the factual determination of who is or is not a trader has caused considerable difficulty at administrative levels of the Internal Revenue Service. Inequitable decisions are bound to occur because of the problem of determining whether or not a particular taxpayer's buying and selling activities are sufficient to constitute the carrying out of a trade or business. This administrative burden, with necessarily varying results among taxpayers in borderline cases, is not warranted in administering a law that appears to be illogical. For these reasons, Section 1091 should be amended so that it is applicable to all taxpayers except with respect to transactions in the ordinary course of the trade or business of security dealers.

Capital Gains and Losses

SECTION 1201

75. *Capital Gains: Alternative Tax*

Section 1201 should be amended to provide that the alternative tax should not exceed 25 percent of the amount of net taxable income when such net income is attributable to net long-term capital gains.

The tax liability of an individual or a corporation having an excess of ordinary deductions over ordinary income (an ordinary loss), and a net long-term capital gain in excess of such ordinary loss, is based upon the lesser of:

1. Tax computed by applying the regular rates to taxable income (net long-term capital gain reduced by ordinary loss); or
2. The alternative tax which is 25 percent of the net long-term capital gain.

Irrespective of which calculation provides the lower tax, the ordinary loss is absorbed by the net long-term capital gain. In some instances, this results in the taxpayer's receiving no benefit from the ordinary loss.

The following example illustrates the point:

A corporation has net taxable income of $75,000 for 1968 comprised of net long-term capital gain of $100,000 and an ordinary operating loss of $25,000. Its tax (before computation of the tax surcharge and adjustments for credits against the tax, etc.) is $25,000, which represents the lesser of the alternative tax of 25 percent on the entire net long-term capital gain, or the normal tax and surtax of $29,500 on its net taxable income. If the corporation had realized only the net long-term capital gain (zero ordinary operating income or loss), its tax would also be $25,000. Clearly, therefore, it has had no tax benefit from its ordinary operating loss of $25,000.

The 25 percent maximum alternative tax should be applied to net taxable income if such income is less than the net long-term capital gain. In the foregoing example, this treatment would result in an alternative tax of $18,750 (25 percent of $75,000).

SECTION 1211(b)

76. *Capital Loss Limitation—Joint Returns*

Section 1211(b) should be amended to extend the limitation on capital losses deductible on joint returns to $2,000.

Under section 1211(b) individuals are presently limited in deduction of capital losses to the amount of their gains from the sales of capital assets plus the taxpayer's taxable income or $1,000, whichever is the lesser. Husband and wife who file a joint return presently have their income and deductions aggregated and for purposes of Section 1211(b) are treated as one taxpayer.

For married taxpayers in noncommunity property states the capital loss limitation is $1,000, except in rare instances where spouses in fact have essentially equal income and separately taxable gains and losses from capital assets. By contrast, in community property states whenever a capital loss is incurred by the community, a husband and wife can obtain a current year deduction of $2,000 for capital losses against ordinary income by filing separate returns.

The filing of separate returns by husband and wife in community property states for the purpose of obtaining the current deduction of capital losses against community income creates inconvenience and difficulty for both the Internal Revenue Service and the taxpayers. Compliance, enforcement and data processing are hampered by the year to year change from joint to separate returns which often occurs.

Even more to the point is the contention that Section 1211(b) speaks of the "taxpayer" of which there are in fact two on any joint return. If the Internal Revenue Code is to fully recognize income splitting for spouses in both community and noncommunity property states, as it otherwise has been doing since 1948, then extension of the capital loss limitation to $2,000 on joint returns is the only logical recourse.

As the allowable term during which a capital loss may be carried over to subsequent years is essentially unlimited under present Section 1212(b) the entire loss will eventually be deductible in noncommunity joint returns. Any acceleration of this deduction through an increase to the proposed $2,000 limitation would not cause any significant loss of revenue to the Treasury Department over the long term.

SECTION 1232

77. *Capital Loss Treatment of Bad Debts*

Section 1232 should be amended to exclude any loss resulting from partial uncollectibility of an advance to a company which is an affiliate as defined in Section 165(g)(3).

Section 1232 provides for capital gain or loss treatment on the retirement of indebtedness issued by any corporation or government or political subdivision thereof. Under the 1939 Code, the treatment was limited to indebtedness issued with interest coupons or in registered form. The 1954 Code dropped this requirement and extended the capital gain or loss treatment to all corporate and government "bonds, debentures, notes, or certificates or other evidences of indebtedness" issued on or after January 1, 1955, which are capital assets to the taxpayer.

Because of the 1954 change, certain items that could previously be deducted as bad debts under Section 166 may now be capital losses under Section 1232. For example, if Corporation A, for good business reasons, makes a loan to Corporation B, which is evidenced by a note, and Corporation B is subsequently able to repay only a portion of the loan, Corporation A might have a capital loss on the retirement of the indebtedness (assuming that the note is a capital asset in the hands of A). Although the Committee Reports on the 1954 Code give no indication one way or the other, it seems unlikely that this result was intended in the case of affiliated corporations. Therefore, Section 1232 should be made inapplicable to loans to affiliates, as defined in Section 165(g)(3), which otherwise would qualify as business bad debts under Section 166.

SECTION 1244

78. *Qualification as Section 1244 Stock*

The requirement that Section 1244 stock be issued according to a plan should be eliminated.

Several court decisions have denied ordinary loss treatment to shareholders of small business corporations. In these cases, the stock qualified as Section 1244 stock within the meaning of Section 1244(c), except that the corporation records did not document the existence of a plan at the time of issue.

The limitation of the benefits of Section 1244 to taxpayers who insert certain phraseology in corporate records undue emphasis on form and is inconsistent with the objectives of the Small Business Tax Revision Act of 1958. Stock otherwise qualifying under the terms of Section 1244(c) should be treated as Section 1244 stock regardless of the existence of a plan.

Readjustment of Tax Between Years and Special Limitations

SECTION 1321

79. Involuntary Liquidation of LIFO Inventory

Rules regarding involuntary liquidation of LIFO inventories should be permanently extended to cover all conditions and circumstances beyond the reasonable control of the taxpayer which, directly or indirectly, prevent the acquisition of inventory.

The LIFO inventory method is based on the realistic business fact that a going business must maintain a "fixed" minimum inventory position in order to continue functioning effectively. Based on this assumption, Congress has provided special rules covering LIFO inventories involuntarily liquidated during wartime and similar emergency periods. In these circumstances, the liquidation must have been the result of the prevailing emergency conditions in order to invoke the special rules providing for replacement of the liquidated LIFO inventory at a tax cost basis equivalent to that of the inventory formerly held.

Similar conditions completely beyond the reasonable control of the taxpayer may exist in periods other than those of national emergency which may effectively prevent maintenance of the normally required inventory by a particular taxpayer. Such conditions, for example, might include events such as fires and floods, as well as economic happenings such as strikes, peculiar to the particular taxpayer.

In view of this, the Code should be amended to provide permanent rules covering the involuntary liquidation of LIFO inventory caused by circumstances and conditions beyond the reasonable control of a taxpayer. Sufficient safeguards should be enacted to make certain that the liquidation is the result of such circumstance or condition, and that it is not simply a coincidental event.

Election of Certain Small Business Corporations as to Taxable Status

SECTIONS 1371–1378

80. General Comment—Subchapter S

The Subchapter S election has proved to be substantially less useful than was originally intended because of execessively complex and restrictive rules within the statute itself and because of narrow and rigid interpretation by the Treasury Department. There is a need for major revision of the Subchapter S provisions in order to make them of more general benefit to those for whom the election was intended.

On February 5, 1969, the House Ways and Means Committee and the Senate Finance Committee jointly published a three-volume work entitled "Tax Reform Studies and Proposals—U.S. Treasury Department." Included in the work is a proposal regarding Subchapter S corporations resulting from a joint study undertaken by the Treasury Department and the Committee on Partnerships of the American Bar Association's Section of Taxation. On April 22, 1969, the identical proposal was presented to the Ways and Means Committee by the Treasury Department as part of President Nixon's tax program.

In general, this proposal presents a very useful approach to the problem. It has the highly desirable basic aims of treating Subchapter S corporations as much like partnerships as is possible and of removing unnecessary restrictions and complications. Certain modifications, however, are desirable. These are as follows: greater flexibility should be granted Subchapter S corporations in the use of fiscal years; the treatment of retirement plans for partners of partnerships and shareholders of Subchapter S corporations should conform with that presently provided for corporate executives; and, the separate character of certain items of income and deductions should be retained in the hands of Subchapter S corporation shareholders in order to bring the tax treatment of Subchapter S corporations still closer to that of partnerships.

Estate and Gift Taxes

SECTION 2014(b)

81. *Credit for Foreign Death Taxes*

The limitation on the amount of foreign death taxes creditable against federal estate tax should, at the option of the taxpayer, be determined on an overall basis.

Section 18 of the Revenue Act of 1962 amended prior law to eliminate the exclusion from the gross estate of real property situated outside of the United States. This increase in the ambit of federal estate taxation focuses attention on the goal of avoiding double taxation of estates.

The amount of foreign death taxes creditable against federal estate tax is the lesser of two amounts under limitations computed on a per-country basis. In 1960 Congress amended the foreign income tax credit provision in order to give taxpayers an election to compute that credit on either a per-country basis or an overall basis. The same election should be available to fiduciaries of estates with assets in more than one foreign country.

SECTIONS 2031, 2032, 2512(a)

82. *Valuation of Property for Estate and Gift Tax*

The value of property for estate and gift tax purposes should never be greater than the amount that could in fact be realized by the donor or decedent's estate.

The Internal Revenue Code bases the gift tax on the value of the gift. This has been defined in the regulations as the price at which such property would change hands between a willing buyer and a willing seller, neither being under any compulsion to buy or to sell, and both having reasonable knowledge of relevant facts.

Regulation Sections 20.2031-8(b) and 25.2512-6(b) now provide that for gift tax purposes (as well as for estate tax purposes) shares of an open-end investment company (mutual fund) are to be valued at the "public offering price" (asked price), which generally includes a loading charge. These regulations have been held valid by the courts in *Estate of Frances F. Wells*, 50 TC 871 and *Howell*, 290 F. Supp. 690, respectively. However, these holdings appear to be unreasonable. The valuation should be based on the "redemption price" (bid price) quoted for such shares by the company, which is all the donor (or the executor) could realize on disposal.

The Treasury has also amended the Gift Tax Regulations (and the Estate Tax Regulations) in regard to the definition of the value of gifts of property if the item of property is generally obtained by the public in the retail market. The fair market value is then the price at which the item or a comparable item would be sold at retail. This provision is inequitable for the same reason cited for mutual fund shares in that it could impose a higher valuation for gift and estate tax purposes than could be realized by the donor (or the decedent's estate).

It is recommended that the provisions of Section 2031, 2032 and 2512(a) be clarified to provide that in no instance could the value of property subject to estate or gift tax be greater than the amount that could in fact be realized by the donor or decedent's estate.

SECTION 2042

83. *Reversionary Interests—Insurance*

The provisions relating to the 5 percent reversionary interest should be limited to those situations where the decedent retained a reversionary interest. Any interest that arises through inheritance or operation of law should be excluded from applicability.

Present law provides for the inclusion of the value of insurance receivable by beneficiaries other than the executor in the gross estate of the decedent where the decedent had any of the incidents of ownership in the policy. "Incident of ownership" includes a reversionary interest if its value is more than 5 percent of the value of the policy immediately before death. In determining the value of the reversionary interest, the possibility that the policy or its proceeds may revert to the decedent by reason of operation of law should not be considered since he decedent would have no control over this factor.

SECTION 2503(c)

84. Exclusion for gifts of certain future interests

The annual $3,000 gift tax exclusion should be extended to all gifts of a future interest where the property will be used solely for the benefit of a specified donee during his life and the remainder of the property, if any, will on his death be included in his gross estate.

Section 2503(c) provides the conditions under which a transfer for the benefit of a donee under age 21 on the date of the gift will not be considered a gift of a future interest in property, and for which, therefore, the annual $3,000 gift tax exclusion will be allowed. Basically, these conditions are that the corpus of the gift, together with any undistributed income, be completely distributed to the donee at age 21. Criticism of Section 2503(c) has been directed to the requirements that the donee must be under age 21 and that there must be complete distribution of undistributed income and corpus at age 21.

It is proposed that Section 2503(c) be amended to permit a transfer to a donee, without regard to age, that income need not be distributed currently and that corpus may be retained in the trust, provided that to the extent that income and corpus are not distributed to or expended for the benefit of the donee during his life, they be payable on his death either to his estate or as he may appoint under a general power of appointment as defined in Section 2514(c). The retained income and corpus thus will be included in the beneficiary's gross estate on his death, eliminating any possible loss of estate tax revenue.

SECTION 2504(c)

85. Valuation of gifts made in prior years

The prohibition of an adjustment of the value of gifts made an exclusions allowable in prior years where the statute of limitations has expired should not depend upon the payment of a gift tax.

Section 2504(c) now provides that the value of a gift made in a prior year cannot be readjusted in subsequent years if the gift tax was actually paid on the gift made in the prior year and the period of limitations for assessment has expired for such year. This requires that taxable gifts (gifts in excess of the allowable exclusions and deductions) must have been made in the prior year in order for the prohibition against the adjustment in value to be applicable.

It appears illogical not to permit the same prohibition to apply where no tax was payable because the allowable exclusions and deductions equalled or exceeded the value of the annual gifts made. It, therefore, is proposed that this section be amended to prohibit the adjustment of the value of the taxable gifts made in prior years as well as the amounts excluded, if any, with respect to such gifts, so long as a gift tax return has been timely filed.

Procedure and Administration

SECTION 6081

86. Automatic Extension of Filing Time for Certain Individual Returns

A provision similar to that now available to corporations for automatic extension of time for filing corporation income tax returns should be enacted to cover certain individual and fiduciary income tax returns.

The increasing complexities of the tax laws, the greater burdens of compliance caused by the complex tax laws, expanded use of electronic data processing, and the growing problem of securing professional help have made it difficult for many taxpayers to file a professionally prepared return on a timely basis.

Senate Report No. 1622 (83rd Congress, 2nd Session) accompanying H.R. 8300 (Internal Revenue Code of 1954) states that the postponement to April 15 of the date for individuals to file their income tax returns would "greatly relieve the difficulties taxpayers now have in preparing their returns by the present filing date," (i.e., March 15). The Report also provided that the postponement " . . . should also result in the filing of more carefully prepared returns . . . and should be beneficial to those who aid taxpayers in making out their returns." Unfortunately, this was not to be, the result.

All statistical information available indicates that the number of individual taxpayers who encounter some complexities in preparing their returns has increased substantially over the past few years and is expected to increase at an even more rapid rate in the future.

The time required for the preparation of a personal income tax return increases year by year. Present returns require details of dividend and interest income; there are now special forms for such items as exclusion of sick pay, employee business expenses, moving expenses, etc.; if there is an indicated underestimation of tax, Form 2210 should be attached; if income averaging is applicable, additional computations and schedules are required; the instructions call for substantial data in support of deductions for contributions of property.

With the expanded use of ADP by the Service, taxpayers are very anxious, and properly so, that amounts reported on all types of information returns agree precisely with amounts reflected in their returns. However, since Forms W-2 and 1099 are not required to be furnished to taxpayers until the end of January or February, the period in which returns must be prepared is significantly shortened.

Under Section 6081(a), the Secretary or his delegate *may* grant a reasonable extension of time for the filing of an individual income tax return. Regulations Section 1.6081(b) provides that a taxpayer must submit an application for such extension containing, among other things, "a full recital of the reason for requesting the extension." The Service must then determine whether the cited reasons merit the granting of the extension required.

The Internal Revenue Service has co-operated to the extent possible, administratively, to assist taxpayers by providing a policy for handling requests for extensions of time for filing individual returns. This administrative policy, while helpful, is still inadequate.

The majority of cases where extensions are needed for filing individual returns are those involving income from the operation of a trade or business, income from farming, income from business partnerships, joint ventures, pools or syndicates, and income from electing small business corporations (Subchapter S corporations). Similar problems may affect income tax returns filed by estates and trusts. The filing problems arising in these situations frequently are more acute than those affecting many corporations.

Section 6081(b) added to the Internal Revenue Code in 1954 provides for an automatic three-month extension of time for the filing of a corporative income tax return, merely upon application on a prescribed form (Form 7004) properly executed, timely filed, and accompanied by a remittance of estimated tax as prescribed in Regulations Section 1.6081-3(a)(2).

The existing situation with respect to certain individual and fiduciary returns can only be remedied adequately by legislation similar to that enacted in 1954 regarding automatic extensions of time for filing corporate income tax returns.

Provision for a two-month extension for the individual returns noted above involving business income would be contingent upon the filing of an application on a form comparable to Form 7004 accompanied by a remittance of the full amount of tax estimated to be due (except for returns filed by estates where present law permits quarterly payment of tax).

SECTIONS 6405(a), 6405(c)

87. Reports of Refunds and Credits

Section 6405(a) and (c) of the Internal Revenue Code should be amended to increase the dollar limitation therein to $250,000.

Section 6405(a) and (c) provides, in effect, that reports must be submitted to the Joint Committee on Internal Revenue Taxation whenever tax refunds or credits exceed $100,000. Legislative history reveals that a $75,000 limitation was first imposed under the Revenue Act of 1928. It was raised to $200,000 in 1949 and reduced to $100,000 in the Internal Revenue Code of 1954. Committee reports are silent as to the 1954 reduction in the limitation.

The preparation and review of Joint Committee reports are costly and time consuming procedures. The requirement of these reports in the present framework of the Internal Revenue Service's activities as a necessity for equitable administration of the tax law should be reexamined. In view of present economic conditions it is unrealistic to maintain a dollar limitation enacted 15 years ago. This dollar limitation should be raised to $250,000.

SECTION 6411

88. Tentative Carryback Adjustments—Foreign Tax Credits

Tentative carryback adjustments should be permitted for unused foreign tax credits, in the same manner as now provided for loss and investment credit carrybacks.

Section 6411 now permits taxpayers with net operating loss or unused investment credit carrybacks to file applications for tentative carryback adjustments (so-called "quick" claims) within 12 months of the close of the year in which the carryback arose. The amount of tax decrease resulting from the carryback must be refunded or credited within 90 days, subject to the right of the Service to disallow the application in the case of material errors or omissions. The tentative allowance is subject to adjustment upon audit of the taxpayer's return. This provision originally applied only to net operating loss carrybacks, and was extended to unused investment credit carrybacks in 1966.

The tentative adjustment procedure is designed to relieve taxpayers entitled to tax refunds from the economic burden of waiting until the audit of their tax returns is completed. Since examination of returns involving foreign income and tax credits is likely to be even more protracted than the usual audit, it appears logical that tentative adjustments of unused foreign tax credits also be permitted.

SECTION 6511(d)(2)

89. Statute of limitations on refunds arising from net operating loss carrybacks

Claim for refund with respect to a net operating loss carryback should be timely if filed within three years from due date, *including extensions*, of the return for the loss year.

If a taxpayer secures an extension for filing the tax return for a loss year, the statute of limitations on assessment will be extended to three years following the extended due date. Under Section 6511(d)(2), however, claim for refund based on carryback of the net operating loss must be made not later than three years following the *original* due date of the return for the loss year. Thus a gap is created during which assessment may be permitted but adjustments giving rise to additional refunds are barred.

This gap should be eliminated by providing that a refund claim based on a net operating loss carryback will be timely if filed not later than the expiration of the statute of limitations for assessment of tax with respect to the loss year.

SECTION 6601

90. Interest on an underpayment on form 7004

It should be made clear that, where a corporation has obtained an extension of time for filing its income tax return under Section 6081(b), interest will be charged on an underestimate only to the extent that the correct first installment exceeds the amount actually paid as a first installment.

A corporation is entitled to an automatic extension of time for filing its income tax return upon the filing of Form 7004 and the payment of one-half the estimated amount of its tax. Interest is quite properly charged where the corporation's estimate of its tax is less than the tax which is ultimately shown on is return. However, the amount of such interest is computed on a basis which is inequitable. The Internal Revenue Service takes the position that interest should be computed as if the Form 7004 were a final return. Thus, it computes interest on the excess of the final tax over that shown on Form 7004 just as if the Form 7004 were a return. The historical practice, before the enactment of Section 6081(b) was to charge interest only on the difference between the correct first installment and the amount paid as a first installment. This historical practice should be the present law.

The effect of the present practice is that an interest charge would be asserted under the following circumstances where no actual underpayment was involved:

Tax estimate per form 7004	$100,000
Installment paid with form 7004	75,000
Tax per form 1120 (final tax)	150,000

Under these circumstances, the Treasury's position is that interest should be computed for three months on $25,000 (the difference between half the final tax and half the amount shown on the Form 7004).

SECTION 6672

91. 100 Percent penalty for failure to collect and pay over tax

The enforcement of collection of a penalty under Section 6672 should be stayed during a period of judicial review and determination if the taxpayer posts a bond equal to 150 percent of the unpaid amount of the penalty sought to be assessed and collected.

The penalty imposed by Section 6672 applies only to the collection, accounting for, or payment over of all taxes imposed on a person other than the person who is required to collect, account for and pay over such taxes. The Secretary of the Treasury or his delegate is given the right to assess and collect such taxes without judicial review. Judicial review cannot be hed until at least a partial payment is made and suit instituted for recovery of the amount so paid.

Extreme hardships could result from the application of this section. It is possible that appreciated assets would have to be sold, resulting in the payment of income taxes on the profit, when a court might hold that there was no liability on the taxpayer for the penalty. Equity would demand that a person from whom amounts are sought to be collected under Section 6672 should have a right to post bond until such time as his liability is determined by judicial process. The posting of a bond of one and one-half times the amount of the tax would fully protect any loss of revenue which could be occasioned by delay in collection procedures.

The CHAIRMAN. The next witness is Mr. Richard Goldman, tax counsel for the Association of Mutual Fund Plan Sponsors, Inc.

STATEMENT OF RICHARD L. GOLDMAN, TAX COUNSEL, ASSOCIATION OF MUTUAL FUND PLAN SPONSORS, INC.

Mr. GOLDMAN. Mr. Chairman and members of the committee, I appreciate the privilege of appearing before you.

I am Richard L. Goldman of New York.

You are preparing a tax reform bill. I appear to call your attention to a reform, a perfecting amendment involving no revenue loss which is badly needed, and by many small and unsophisticated investors. There are nearly 2 million of them.

The amendment could be added as section 517 of your bill after "Other Changes in Capital Gain Treatment."

It relates to capital gains too. There is a threat of two capital gains taxes on one gain, and perhaps one gains tax on no gain due to a technical snarl, but this could be reformed easily.

I am talking about mutual fund investors who do not have large capital to invest, and so buy shares of a mutual fund under a periodic payment plan paying perhaps $25 a month for a period of years.

Each group of people making periodic payments to invest in a particular mutual fund are imagined to be an association equivalent to a corportion, and that is why there is trouble. They are regarded as an association because they all pay their money to a bank custodian which buys the fund's shares for them. The bank is regarded as if it were a central management like the management of a real corporation. Actually it does not manage. It couldn't just switch the investor's money into a different mutual fund. It is there because it is required by the SEC rules as a watchdog for the investors to act in emergency. For example, if the mutual fund stopped making shares available for purchases.

Nevertheless, an association is imagined to exist, and corporate rules are applied to it. The troubles that result involving double capital gain taxes are these.

When a periodic payment investor wants to liquidate his interest, he normally tells the bank to sell his shares back to the fund and send him the cash including the gain. He pays taxes on the gain. The other investors continuing in interest are threatened with being taxed on gain, too. Technically the sale of his shares back to the fund is regarded as having been made by an association, and it is regarded as having realized a gain.

If it is regarded as taxable, in fact the bank custodian would have to charge the tax to the accounts of the investors remaining in the periodic payment plan, and not entitled to the gain.

The association tax can be avoided since an election can be filed for the association to have it treated as a regulated investment company, if the gain can be regarded as distributed. A regulated investment company is not taxed on a gain that is distributed. Of course, it is distributed here. That is the whole idea, to pay the liquidating investor's interest to him, so a deduction for distributions paid should be allowed. But the distribution is threatened with being disregarded as if it were not made at all.

In 1963 the distribution was threatened with being disregarded on the ground that it was preferential. It would not have been preferential if the liquidating investor's gain had been disrtbuited pro rata to all the other investors. That was not possible. It would have been criminal, as a matter of fact.

Your committee corrected this by doing away with the preferential rule in the 1964 Revenue Act, and indicating that a liquidating investor's gain should not result in tax to the other investors continuing in the plan.

Now it has lately been indicated that most of the gain attributed to this imaginary association still can be regarded as not distributed. Only a fraction would be regarded as distributed, that is, equal to the fraction which the liquidating investor held of all the mutual fund shares held under the plan by all periodic payment investors.

For example, if he held 1 percent, then only 1 percent of his gain could be regarded as paid out to him even though it all is paid to him. The other 99 percent would remain subject to association tax chargeable to the other investors.

The last investor would be wiped out by taxes on other people's gains. Perhaps worse, if an investor merely withdraws his fund's shares from the custodian bank, he may be regarded as ending an equity interest in an association equivalent to a corporation like ending a stock interest in a real corporation. It might be a technical stock redemption, in other words, and he could have a capital gain to pay tax on even though he would be taking no cash, and his fund's shares still could go up or down in value, and he would be in the same position as any other shareholder of the fund not under a periodic payment plan.

All this can be cured easily by a perfecting amendment not involving revenue loss doing away with the association concept here. Each investor would be regarded as owning his own mutual fund shares with the bank custodian disregarded as merely a nominee or custodian for him. The law could be amended easily in a new section 517 after the other capital gain changes.

We have submitted such an amendment to the Treasury, and Dr. Woodworth's staff, and met no opposition. We have also submitted it to Mr. Tom Vail, chief counsel of your committee. (See p. 4852.)

The CHAIRMAN. May I ask you a question about this, because what you are suggesting is complicated. Our staff says you are probably right about what you are saying. The Treasury proposed to analyze this and give you a letter saying whether they are agreeing or disagreeing. Has Treasury reached a conclusion on this matter yet?

Mr. GOLDMAN. No, sir. There is a draft, and Mr. John Nolan said that he would try to get it out to the Congress so that it could be used one way or another.

The CHAIRMAN. Well, they ought to make up their mind, because they have a lot more people working for them than we have working for us, and if we are going to arrive at a conclusion they ought to be able to. If they cannot arrive at any conclusion, I for one expect to vote with you on this matter, because our best information is that you are right about it.

Mr. GOLDMAN. Sir, I would rather that you had the Treasury's opinion before you——

The CHAIRMAN. I am going to vote to report this bill out October 31 ready or not, and as far as your problem is concerned I will be voting on it at that time. So if they cannot make up their mind by that time as to what their position is I think we will just have to go ahead and take care of it based on our own best advice.

Mr. GOLDMAN. Senator Long, I have come here today and I came here once before purely as a tax technician. When I called several years ago about this problem of Senator Williams', I had occasion to say that I was a tax technician, I was coming here on something on the merits as a technical matter. I told him in fact I was not a professional lobbyist. I said I did not own a loud-checked suit or a Derby hat or smoke a cigar. Senator Williams said that was not required uniform for lobbyists anymore.

I would like to say in conclusion the amendment is only a perfecting amendment. It is simple and involves no revenue loss. It really is badly needed, and it will help large numbers of very little people—up to 2 million families. I would like to thank you very much.

The CHAIRMAN. Since you brought the subject up, on the 4th of July in Louisiana, at least on every second year the legislature is in session, they usually take time off to have a little fun. One year when I was there, they decided on the 4th to legislate on a bill to regulate lobbyists, to require that they wear a special uniform, and also to require that they contribute something to the legislator's entertainment fund, and arrange for both the meeting place and the refreshments so that the legislators could meet with the lobbyists and do their business in the open, where everybody would know about it.

We need people like you to come in here and explain to us some of the very difficult technical parts of this thing and how it will affect your clients. Thank you very much for this. It is very complicated, but we do hope to arrive at the proper conclusions.

Mr. GOLDMAN. Thank you very much.

(Richard L. Goldman's prepared statement with a suggested amendment follows:)

STATEMENT OF RICHARD L. GOLDMAN, TAX COUNSEL ASSOCIATION OF MUTUAL FUND PLAN SPONSORS, INC.

SUMMARY

A proposed Sec. 517 is needed in the Tax Reform Bill, after "other changes in capital gain treatment".

It is needed to avoid threat of two capital gain taxes on one gain, and perhaps one tax on no gain. It is a perfecting amendment, involving no revenue loss.

It would protect small and unsophisticated investors who accumulate mutual fund shares under a perodic payment plan (by which they may invest, for example, $25 a month for a period of years).

When one investor liquidates his interest under the plan (his shares being sold back to the issuing fund by the bank custodian to give him his cash), his gain is taxed to him, as is proper. But it may be taxed a second time because the investors are considered an "association" equal to a corporation for tax purposes and the "association" is regarding as having sold the fund shares and realized a gain. The association, electing to be a "regulated investment company", should not be taxable on the gain because it is distributed. But the gain is threatened with being treated *as if* not distributed, for techical tax reasons. The second tax would be borne in effect by the other, continuing investors not interested in the gain. A prior threat of double tax was done away with in 1964, and Congress indicated that one person's liquidating gain should not be taxed to others.

In another instance, there could be a gain tax on no gain at all.

The perfecting amendment would abolish "association" status for such investors. They are unrelated and the action of one should not affect the tax status of the rest.

STATEMENT

Introduction

Mr. Chairman, and distinguished members of the Committee, I appreciate the privilege of making this Statement to you.

I am Richard L. Goldman. I am tax counsel to the Association of Mutual Fund Plan Sponsors, Inc. The Assoication is an organization of mutual fund underwriters which sponsor periodic-payment plans for the accumulation of mutual fund shares. Under each plan, investors make monthly payments to accumulate shares of a designated fund. Typically, an investor may pay $25 a month for 10 years. The payments are made to a bank custodian, which buys shares of the issuing fund from the fund and holds them for the respective accounts of the investors.

There are nearly 2,000,000 such investors. Usually, they are small investors and unsophisticated ones.

Need for corrective amendment

A perfecting amendment is needed because these investors are threatened with *two capital gain taxes on one gain*—one of the taxes being levied, still more remarkably, on investors other than the one who is entitled to the gain—and, conceivably, they are threatened with *one gainst tax on no gain at all.*

In a tax reform bill, there should be room to reform such a situation. A draft of amendment is submitted with this Statement.

No revenue loss

No revenue loss would result, and no opposition has been encountered. We have submitted the draft of amendment to the Treasury, and to Dr. Woodworth and his staff. There has been some study by each office, and we have responded to questions.

Nature of the investors' tax trap: "association" status

At present, periodic-payment investors, though unrelated and having nothing in common, are lumped together for tax purposes as an "association" equivalent to a corporation, required to file corporate returns and subjected to certain corporate rules. The corporate rules are inappropriate, when applied here, and can lead to unbelievably wrong results. This is so even though "regulated investment company" treatment is elected and should avoid such results.

For example, suppose that an investor wishes to liquidate his interest under the periodic-payment plan. Let us assume his fund shares have a cost of $2,000 and present value of $5,000. He terminates his periodic-payment program, ordering the bank custodian to sell his shares back to the fund and distribute the proceeds to him including his gain of $3,000. He is taxable on the gain, of course, and rightly so. But the "association", regarded as acting through the bank, has sold the shares technically realizing a gain to it of $3,000. Tax on the gain at the association level can be avoided, under the so-called "pass-through" treatment allowed to a regulated investment company, but only if the gain is honored as having been distributed. This is because a regulated investment company gets a deduction for distributions paid (Code Sec. 852(b)(3)) so as to be taxed only on gains which are not distributed. Unfortunately, our "association" may not get this deduction even though the gain actually is distributed.

This would leave the gain subject to tax, not only to the liquidating investor, but again at the association level to be borne by the other, continuing investors who are not entitled to his gain.

Thus in 1964, it was suggested that the gain could not be regarded as distributed—that is, the deduction would not be allowable to the association—because the distribution, though actually made, was "preferential" unless made pro rata to all the investors under the periodic-payment plan including those not entitled to the gain. It may be explained that the deduction itself was conceived originally for "personal holding company" purposes, and for those purposes was not to be allowed if made "preferentially" to one shareholder instead of all. (Secs. 561, 562.) But these rules have been extended into the regulated investment company area, to afford pass-through treatment. As extended into this area, they work imperfectly. It seemed to do no good to suggest to the Service that one person's gain could not be divided among the others as well, and that the others had no gains which could be the subject to a pro rata distribution to them, too. This, as just stated, threatened to leave the liquidating investor's gain taxable also to the other, non-liquidating investors.

That view seemed senseless. Indeed, the last investor would have lost his entire investment through taxes on other people's gains.

Fortunately, the Revenue Act of 1964—by action initiated by this Committee—corrected the situation by adding to the Code Section 852(d), which provides against disregarding a distribution as "preferential" where an investor is liquidating his interest under a periodic-payment plan.

The same problem has cropped up again, in another form. It has been indicated, at the Internal Revenue Service, that the distribution to the liquidating investor still may be disregarded, in spite of the 1964 legislative record reflecting, in so many words, Congress' intention that a liquidating investor's gain is not to be taxed to the continuing investors too.

The theory now suggested is that if the liquidating investor owns, for example, 1% of all the fund shares held under the periodic-payment plan, then only 1% of his gain could be regarded as distributed to him because (likening his case to that in a real corporation) there is a sort of redemption of his equity interest in the "association" and, under rules applicable to real corporations, when a corporation redeems a fraction of its outstanding stock only the same fraction of its profits can be regarded as distributed. The balance remains on the books, for tax purposes, so as to give rise to dividend treatment upon future distribution. This would mean, where periodic-payment investors in a mutual fund are imagined to be an "association", that 99% of the liquidating investor's gain would be regarded as undistributed—leaving that 99% subject to tax at the association level as well as to the liquidating investor, but this time to be borne by the other investors.[1]

Thirdly, it has been suggested that an investor merely withdrawing the fund shares credited to his account—that is, terminating his periodic-payment pro-

---

[1] 1% of the *dividends* received during the year by the "association" would have to be regarded as distributed to the liquidating investor, too. He would still get only capital gain treatment, under the analogy to corporate stock-redemption rules. But this would mean that although 100% of dividends received by the bank custodian are distributed to the periodic-payment investors, as required under the plan, the imaginary association would be regarded as having a lesser amount in profits—so that the excess of dividends over profits would have to be treated as a return of capital, avoiding dividend tax.

gram and taking out his fund shares in kind—would be terminating a sort of "stock" interest in the association, this time for a distribution in kind, but nevertheless equivalent to a stock redemption by a real corporation. Under stock redemption rules (Code Sec. 302), that would mean that he would be taxed on the value of his fund shares in excess of his cost basis—on the appreciation in the shares he would be withdrawing—even though he would merely be in the same position as shareholders directly holding shares in the fund. He would not have cashed in his investment, which might fall in value (or rise further), yet he would be regarded as if he had closed out his investment and be taxed.

Such threatened tax treatments do not comport with economic reality; or with the public's understanding; or with a sensible reading of the Internal Revenue Code in light of Congress' underlying policies. They make no sense, in short.

Solution afforded by the proposed amendment

These problems arise repeatedly. They arise because of flaws in the law, as administered, growing out of the imagined assumption that total strangers have been "associating" with each other like people who knowingly invest in a real industrial corporation.

Our amendment would do away with "association" treatment: the corporate rules would not apply.

Instead, each investor would be regarded as owning his fund shares directly, through the bank custodian as a mere nominee. It would be the same as if the shares were held by a brokerage house in "street name", for the investor as real owner.

This would simplify the tax law, and—

(1) save the investors from threat of unintended double taxes on capital gains, or single taxes on no gains;

(2) save the Service from having to administer a technical maze of rules producing no revenue; and

(3) conform the tax law to reality as the public knows it, and to the policy intended by Congress.

Why unrelated investors are treated as an "association"

The technical reason for treating periodic-payment investors as an "association" equivalent to a corporation is that the bank, serving as custodian as required under SEC rules, is regarded as if it were a central management like the President and Board of Directors of a real corporation.

In fact, the bank custodian does not manage at all. The fund is specified in the prospectus of the periodic-payment plan as the investment medium and it cannot be changed except, under SEC rules, in an emergency.[2]

Investors not to be re-classified after the amendment as some other entity, such as "trust" or "partnership"

The proposed amendment would, if adopted, prevent any imaginary form from being imputed to the periodic-payment investors. No association or corporate form would be imagined, as already discussed. Also, there would be no "partnership" or "trust".

This is because our hope is to have done with this imaginary-entity problem once and for all. We do not want to have to come back and bother this Committee a third time, having been here in 1963–64 and again now.

Also, in a very few cases the investors seem to be regarded as a large group "trust". The Service view is that an investor liquidating his interest in such a group trust can have a deductible loss even if he merely withdraws his fund shares.[3] This implies a threat that he could have a taxable gain by merely withdrawing the fund shares, even though he would not really be ending his investment.

---

[2] Such as failure of the mutual fund, or its ceasing to offer shares. No change to a new fund could be made for an investor if he objected.

The sponsor company (that is, the underwriter distributing shares of the fund under the periodic-payment plan) contracts to make the fund's shares continually available. If it fails to act, the bank has to step in. The bank serves as a watchdog for investors presumed to be unable to act readily for themselves. The bank would have to find another sponsor company or itself act as sponsor; or if the fund shares were no longer available to be purchased, it would select a different fund—giving the investor notice and an opportunity to object. An objection would have to be honored.

[3] Rev. Rul. 68–633, 1968–50 I. R. B. 15.

Limited scope of amendment

The amendment is intended only for periodic-payment plans for the purchase of shares of a single mutual fund, not various funds. The amendment would apply if some emergency requires discontinuing purchasing shares of one fund, and switching to another.

But it would not apply to any so-called "fund of funds" in which a portfolio is actively managed, and which is set up on a periodic-payment basis. There has been indication of Treasury concern over this, and of a desire to limit the scope accordingly. (Of course, in our usual case, a single fund is designated in the prospectus and S. E. C. rules would prevent shifting to other funds on an actively managed basis.)[4]

Effective dates

The proposed perfecting amendment should apply in 1969, to do the job best.

No taxable event would result from enactment of the perfecting amendment. Periodic-payment investors would no longer be regarded as in a plan "association" for tax purposes. But there would not be any actual event, of liquidating the "association", so as to give rise to tax.

Place of amendment in the bill

The perfecting amendment could be added as Sec. 517 of the Tax Reform Bill, immediately after "Other Changes in Capital Gain Treatment" (Sec. 516, at page 300).

That positioning would be appropriate, since the corrective effect will be on capital gain treatment.

Text of Amendment

SEC. 517. PERIODIC PAYMENT PLANS TO INVEST IN MUTUAL FUNDS.

(a) Section 852 of the Internal Revenue Code of 1954 (relating to special rules for the income tax treatment of regulated investment companies and their shareholders) is amended by adding at the end thereof the following new subsection:

"(e) For purposes of this title:

"(1) the terms 'corporation,' 'partnership,' and 'trust' shall not be construed to mean or include a unit investment trust (as defined in the Investment Company Act of 1940)—

"(a) which is registered under said Act and issues periodic payment plan certificates (as defined in said Act), and

"(b) substantially all of the assets of which, or of each series of which, consist of securities issued by a management company (as defined in said Act) or issued by a single other corporation;

"(2) notwithstanding that such assets shall be held by and/or registered in the name of (or in the name of a nominee of) a trustee, or custodian, contemplated by section 26(a)(1) of said Act, each holder of an interest in such unit investment trust, to the extent of such interest, shall be regarded as owning such assets directly through such trustee, or custodian, as mere nominee acting on behalf of such holder;

"(3) the basis of such assets to such holder shall be the same as that of such interest; and

"(4) in determining the period for which such holder has held such assets, there shall be included the period for which he held such interest if such assets have the same basis, in whole or in part, in his hands as such interest under paragraph (3) of this subsection."

(b) *Effective Date.* The amendments made by subsection (a) shall apply with respect to taxable years of such unit investment trust ending after December 31, 1968 and with respect to taxable years of such holder in which such ending date shall be included. No taxable event shall be deemed to result from such application.

---

[4] Similarly, the amendment should not apply where the investment medium of the periodic-payment plan is a managed portfolio of industrial stocks. A few mutual funds are set up on this basis, rather than as a corporation, and there is no occasion to change their tax treatment.

However, there are a few plans for the accumulation of shares of a designated industrial corporation, specified in the governing prospectus. (Sponsors of such plans are not members of our Association.) Covering those plans in this amendment appears appropriate, and has, therefore, been provided.

MEMORANDUM

PROPOSED TECHNICAL TAX AMENDMENT: FOR THE RELIEF OF INVESTORS ACCUMULATING MUTUAL FUND SHARES THROUGH PERIODIC PAYMENT PLANS

This memorandum has to do with adding to the tax reform bill a technical tax amendment relating to mutual funds. I have discussed the amendment with (1) Mr. John Nolan of the Treasury who has said he would give a favorable report; (2) Dr. Laurence N. Woodworth and several of his Joint Committee staff, who I understand to be preparing a report; and (3) Mr. Thomas Vail of the Finance Committee staff.

The amendment, which would stop unrelated people from being treated as an "association" required to file corporate returns and be subject to certain corporate tax rules, is purely technical.

No revenue loss is involved.[1] The amendment would simplify the tax law and conform it to the understanding of the public.

The intention is to enable people who invest in mutual fund shares to be treated taxwise in the same way, even if they do not merely buy shares in the usual way but under a program of periodic payments (for example, $25 a month for 10 years) to a custodian bank which, as required by the S.E.C. buys the shares and holds them for the investors' respective accounts. A maze of complex tax rules prevents giving such uniform treatment to periodic payment plan investors now.

The Internal Revenue Service treats the people accumulating shares of one or another mutual fund through a periodic payment program as an "association" equivalent to a corporation. The technical reason is that the bank custodian serves as a central entity analogized to a corporation's management, even though in fact the bank is a mere title-holding entity for investors who really are not in any sort of joint venture and generally are unaware that they are treated as if they were, for tax purposes.

Our draft of amendment (attached hereto) would do away with "association" status for tax purposes here, so that people investing in a designated fund under a periodic payment program[2] would be treated in the same way, taxwise, as people buying shares of that fund by the more traditional means of making a single payment. Each person would be regarded, as a result of the amendment, as owning the fund shares credited to his account, with the bank custodian being disregarded as a mere nominee (like a stockbroker who holds shares "in street name" for his customer).

This would eliminate filing corporate returns for the aggregated, but unrelated, investors as an "association" and would eliminate applying inappropriate corporate-tax rules.

No revenue would be lost because even today, as indicated above, the association can elect to be treated as a "regulated investment company" and obtain tax exemption for dividends and capital gains received from the plan's designated mutual fund and passed through to the investors.[3]

But our amendment would correct a situation in which pass-through treatment is threatened constantly by the application of technical rules by the Internal Revenue Service in a manner inconsistent with Congress' basic policy against extracting a corporate tax from investment income when the investors are earning the income through a mutual fund. Not a year goes by without threat of technical use of the tax rules in such a wrongful way. Thus, for example:

1. A prior amendment enacted in 1964 at our request (adding Sec. 852(d) to the Code) was needed because the Service threatened to extract *two* capital gain

---

[1] The "associations" can opt to be treated as regulated investment companies, which means that dividends and gains have to be distributed currently but then are not taxed to the association—if, but only if, the rules are applied properly.

[2] Only the shares of *one* fund—the one designated in the periodic payment plan certificate and the prospectus—are purchased for all the investors under any particular "periodic payment plan". No change can be made except in case of emergency and indeed the custodian bank has no discretionary function except in an emergency. Use of a bank is required under S.E.C. rules precisely for emergency protection of periodic payment plan investors, usually small investors.

[3] Periodic payment plan investors may be classed, rarely, as a group "trust" not subject to corporate tax rules, hence free of corporate or other tax at the trust level. (Our amendment would do away with the trust (or partnership) characterization too, in order by eliminating fictitious-entity concepts to let the investor be taxed entirely as owner of his fund shares.)

taxes on each capital gain of an investor liquidating his interest. Thus, he would instruct the bank custodian to sell the fund shares credited to his account back to the issuing fund and distribute the cash to him including, of course, any gain. Any gain would be taxed to him, quite properly, just as if he owned the shares outright. But the Service, looking at the *remaining* investors under the periodic payment program for the same fund as an "association", indicated that the gain would be subject also to a capital gain tax payable by the "association", for the remaining investors, even though they were not entitled to any portion of the gain of the departing investor who had liquidated his interest. The indication was that the gain would not be regarded as distributed by the "association", avoiding tax at that level, because (under Secs. 561 and 562 of the Code) it was a "preferential" distribution, not having been made ratably to all the investors including those not entitled to it. We suggested that the public could hardly stand a 50% extraction of taxes from capital gains in such circumstances, and the law was amended in the Revenue Act of 1964 so as to provide that the distribution of such gains should not be disregarded by being called "preferential".

In other words, we thought that this reaffirmation of Congress' "pass-through" policy, of not taxing the liquidating investor's gain except to himself, had corrected the situation. More recently, however, conversations with the Service staff have revealed that even that amendment did not do the job. The reason offered was that when an investor liquidates his periodic payment plan investment, amounting (for example) to 1% of all the fund shares held by investors under that plan (the bank custodian selling his shares to the fund and remitting the proceeds including gain to him), only the same fraction—only 1%, in the example—of the gain could be charged off as distributed on the "association's" corporate tax return, saving tax on the gain at that level to that extent. The other 99% of the gain, *though in fact distributed,* would be treated as not distributed—with resultant failure of "pass-through", hence leaving the gain taxable a second time at the "association" level. The technical theory for this was that when a conventional corporation (such as AT&T) redeems a fraction—say, 1%—of its outstanding shares, only the same fraction of the earnings and profits can be regarded as distributed. The evidently inappropriate application of this theory to a pass-through situation would leave the second tax, payable with the "association's" return, to be borne in effect by all the other—the continuing—investors even though they would not be entitled to any of the gain belonging to, and paid out in fact to, the liquidating investor.

2. As another example, it has been suggested that an investor would be taxed on the appreciation in his fund shares if he were merely to withdraw the shares from his custodian bank. Of course, in such a case he would simply be putting himself in the same position as people already owning their fund shares directly, rather than having them held by a custodian bank by reason of the periodic payment plan. He would not be ending his investment, and so it is too soon to mark gain or loss, recognizable for tax purposes. Nevertheless, the theory has been suggested that technically the withdrawal would constitute the "association's" corporate-type redemption of the individual's equity in the association, generating tax to him on the appreciation in his fund shares even though he would not be cashing in his investment. Yet to treat the situation like redemption of stock of a real corporation would not comport with economic reality; or with the understanding of the public itself; or with Congress' policy to avoid double taxes where people invest through a mutual fund.

These are only examples. Other problems, too, have confused the administration of the tax laws and threatened to give rise to tax solely because of flaws in the law growing out of the imagined assumption that total strangers are "associating" like people who knowingly form conventional corporations.

Our proposal, that "corporation" treatment not extend to investors accumulating shares of a mutual fund under a periodic payment program, but that instead they be regarded as owning directly the shares credited to their accounts, will avoid the recurrent problems.

It will save the investors from threat of unintended double taxes on capital gains. It will save the Service from administering a technical maze of rules producing no revenue. And it will conform the tax law to reality as the public understands it, and to serve the policy which Congress always intended.

TEXT OF AMENDMENT

A BILL Relating to the income tax treatment of certain regulated investment companies and their shareholders

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SEC. 1.—PERIODIC PAYMENT PLANS TO INVEST IN MUTUAL FUNDS.—

(a) Section 852 of the Internal Revenue Code of 1954 (relating to special rules for the income tax treatment of regulated investment companies and their shareholders) is amended by adding at the end thereof the following new subsection:

"(e) For purposes of this title:

"(1) the terms 'corporation,' 'partnership,' and 'trust' shall not be construed to mean or include a unit investment trust (as defined in the Investment Company Act of 1940)—

"(a) which is registered under said Act and issues periodic payment plan certificates (as defined in said Act), and

"(b) substantially all of the assets of which, or of each series of which, consist of securities issued by a management company (as defined in said Act) or issued by a single other corporation;

"(2) notwithstanding that such assets shall be held by and/or registered in the name of (or in the name of a nominee of) a trustee, or custodian, contemplated by section 26(a)(1) of said Act, each holder of an interest in such unit investment trust, to the extent of such interest, shall be regarded as owning such assets directly through such trustee, or custodian, as mere nominee acting on behalf of such holder;

"(3) the basis of such assets to such holder shall be the same as that of such interest; and

"(4) in determining the period for which such holder has held such assets, there shall be included the period for which he held such interest if such assets have the same basis, in whole or in part, in his hands as such interest under paragraph (3) of this subsection."

SEC. 2.—EFFECTIVE DATE.—

The amendments made by Section 1 shall apply with respect to taxable years of such unit investment trust ending after December 31, 1968 and with respect to taxable years of such holder in which such ending date shall be included.

The CHAIRMAN. The next witness is Dr. Norman Topping, president of the University of Southern California on behalf of California Independent Colleges.

Is Dr. Topping here?

Senator Murphy is very anxious that we hear from him.

[No response.]

The CHAIRMAN. We will call the next witness. That would be Mr. John Rinaldo of Rinaldo & Associates, Long Beach, Calif.

May I advise the other witnesses that after we hear from Mr. Rinaldo we will quit until 2 o'clock and the other witnesses will be heard starting at 2 o'clock. They can make their plans accordingly.

STATEMENT OF JOHN RINALDO, REPRESENTING RINALDO & ASSOCIATES, LONG BEACH, CALIF.

Mr. RINALDO. Mr. Chairman, Senator Hansen, I would like to express my gratitude for the privilege of testifying before you today. I am a preparer of tax returns for middle-income taxpayers. My average client or 50 percent of my clients have adjusted gross incomes less than $10,000. Seventy-five percent of them have incomes less than $15,000. Last year we prepared close to 10,000 income tax returns.

Every year we are used to hearing the outcry in regards to the problems of Federal income taxation, the problems of complexity of their tax returns, and certain inequities in the tax law, and last year, last spring I think it kind of reached a crescendo, and I think this crescendo of taxpayer malcontent I think was heard at Capitol Hill, too.

I think that this is one of the reasons for the tax reform bill as I understand it as a layman.

The problem with the new tax bill seems to be that it is a very complex bill. I have been here all morning and have listened to much expert testimony, and most of the testimony has indicated that the bill is extremely complex. I have done some analysis of how it would affect my clients, and have found that the one provision which is section 801, is the provision that would provide for some simplicity in the preparation of their tax returns.

However, the middle-income taxpayer will receive very little benefit or at least my clients will receive very little benefit from section 801. There would only be a crossover of roughly 11 percent of my taxpayers who file itemized deductions who would then use the standard deduction.

Therefore, I feel that you may consider the fact that the bill, even for those who probably need it the most, is going to provide so little simplicity in the preparation of their tax returns. As a matter of fact, I think that there is testimony here today that would indicate even the middle-income taxpayer is going to be faced with more complex tasks in preparing his tax returns. He too has capital gains. He too, especially in my area in Long Beach, has oil royalties. He, too, frequently has a small-income unit behind his own residence where he may be depreciating a dwelling that he rents to his tenants, so I believe that the law will provide some complexity for the middle-income taxpayer.

I feel that there will be very little simplification in the preparation of his return, and I therefore have made a suggestion that in lieu of simplifying his tax return you might consider the inclusion of section 804, which allows a limited amount of tax relief in a reduction of tax rates.

The CHAIRMAN. I think you have a good idea, and we do appreciate your statistical analysis. You tell me that very few clients would be benefited by this bill based on your study?

Mr. RINALDO. I believe that the middle-income taxpayer will receive very little benefit. He will receive very little benefit as far as simplicity is concerned, and as far as tax relief is concerned, if there is any question about this, I believe he is going to wind up paying more taxes.

The CHAIRMAN. Thank you very much, sir.

Mr. RINALDO. Thank you.

(Mr. Rinaldo's prepared statement follows:)

STATEMENT OF JOHN RINALDO, LONG BEACH, CALIF.

Our firm prepares tax returns for 10,000 middle income taxpayers per year. Based on the proposed 1969 Tax Reform Bill (HR 13270) our clients would receive only a very limited tax relief by the increase in the standard deduction. Further using the statistics available through the Internal Revenue Service the average taxpayer who itemized deductions would receive no benefit, in either simplicity of filing or in reduction of taxes.

DESCRIPTION OF STATISTICAL TECHNIQUES USED

Using an IBM 1130 computer all data on all our clients was analyzed according to the effect of the adoption of the proposed standard deduction. Our clients are divided according to adjusted gross income as follows:

	Percent		Percent
0 to $1,000	0.5	$13,000 to $14,000	5.6
$1,000 to $2,000	2.0	$14,000 to $15,000	7.5
$2,000 to $3,000	3.4	$15,000 to $16,000	1.5
$3,000 to $4,000	3.0	$16,000 to $17,000	2.8
$4,000 to $5,000	4.7	$17,000 to $18,000	3.9
$5,000 to $6,000	8.1	$18,000 to $19,000	3.5
$6,000 to $7,000	8.5	$19,000 to $20,000	3.0
$7,000 to $8,000	9.1	$20,000 to $21,000	1.5
$8,000 to $9,000	5.6	$21,000 to $22,000	0.5
$9,000 to $10,000	4.3	$22,000 to $23,000	1.2
$10,000 to $11,000	5.0	$23,000 to $24,000	1.2
$11,000 to $12,000	5.3	$24,000 plus	2.1
$12,000 to $13,000	5.8		

Data cards for all clients were analyzed to determine the number of clients who used the percentage standard deduction in 1969. This represented 7.2% of all clients. Using the same data cards from 1969 we analyzed the number of clients who would have used a 13% (1400.-maximum) standard deduction. The percentage thus using the standard deduction increased from 7.2% to 9.0%. Using the same method we determined the percentage of clients who would use the 14% ($1700.-maximum) standard deduction. The percentage thus using the standard deduction would be 11.7%. Finally we analyzed the number of clients who would have used the 15% ($2000.-) standard deduction. The resultant percentage was 18.2%. According to our data there would be a cross over of 11% of our clients from itemized deductions to the new 15% standard deduction, all other data remaining constant.

Using the same data cards we then computed the total income tax, before credits and surtax, paid by all our clients in 1969. This total tax figure was $9.578,280.- We then proposed the same question allowing for the 15% ($2000.) standard deduction where such deduction would be greater than that used in 1969. In other words projected the tax revenue from our clients for 1972 under section 801: HR 13270. The total revenue. before credits and surtax, would be $9,480,180. The difference would represent less than one percent tax reduction for our total clients. It should further be noted that the treasury statistics based on adjusted gross income broken down into categories as follows $5–6M; $6–7M: $7–8M; $8–9M; $9–10M; $10–15M; $15–20M; $20–50M; and $50–100M all had average itemized deductions greater than 15%.

Therefore we recommend to the Committee that the tax rates for individuals Sec. 804 be retained in order that the middle income tax payer receive some limited tax relief from the 1969 Tax Reform Law.

STATEMENT OF THOMAS G. WALTERS, PRESIDENT, NATIONAL ASSOCIATION OF RETIRED CIVIL EMPLOYEES

Mr. Walters. Could I just file a statement. It is a very short statement. I would like permission to make a part of the record a letter addressed to you by one of your constituents, Matt Creed, which in a very few words sums up the position of the National Association of Retired Civil Employees even better than I could sum it up.

The Chairman. Might I see the letter?

Senator Hansen. Mr. Chairman, who is our witness?

Mr. Walters. Thomas G. Walters, president of the National Association of Retired Civil Employees.

The CHAIRMAN. We will print your statement in the record, Mr. Walters, and I want to see the letter from Mr. Creed. I know him personally and have a high regard for what he says.

Mr. WALTERS. Briefly, Mr. Chairman, we represent only the retired people, Senator Hansen, of the Federal Government. We think an across-the-board tax exemption for these people, especially those in low-income brackets, would be much better than any complicated method, and that is the gist of my statement that is printed on page 377 of the printed report. We feel that these people are—and I know that you are going to give them serious consideration to try to do something for the low-income people who are being hit very hard by the high cost of living, and of course one other thing we mentioned in here is the amendments to medicare, which would permit the payment of prescription drugs that is not now covered, and that is something that needs to be done very badly.

The CHAIRMAN. May I say that I find Mr. Creed's letter especially appealing, and I am certainly going to see that it is printed in the record for obvious reasons. If Senator Hansen will look at the last paragraph you will see why.

He is a very fine man.

Mr. WALTERS. He is not only a fine man in my opinion; he is a well-versed man and a man with a lot of knowledge and knowhow. That has been my observation, and I am sure the same with yourself.

Senator HANSEN. Mr. Walters, if I may, let me say that the respect that is evidenced in the letter that you show me here from Mr. Creed goes far beyond the borders of the State of Louisiana. The distinguished chairman of this committee has a very dedicated following in my State of Wyoming.

Mr. WALTERS. I think that is true all over the country.

Senator HANSEN. I am sure it is.

Mr. WALTERS. And that is one reason I wanted this letter in the record, because I knew the Senator would not put it in the record unless somebody else did, but I wanted to see it in there. Thank you very kindly.

The CHAIRMAN. Thank you so much.

(Thomas G. Walters' prepared statement and the letter referred to follow:)

MATT H. CREED REALTY, INC.,
Hammond, La., September 13, 1969.

HON. RUSSELL B. LONG,
Chairman, Senate Finance Committee,
Old Senate Office Building, Washington, D.C.

MY DEAR SENATOR LONG: After reading the Congressional Record of September 4th, pages S10143 and S10144, I want to let you know that I greatly appreciate your interest in the membership of the National Association of Retired Civil Employees.

Senator, wouldn't it be easier for our people to understand and make out their tax returns if they had across the Board tax exemption? NARCE resolutions from time to time have asked for a $5,000 tax exemption.

According to the latest statistics issued by the Civil Service Commission, there were only 986 annuitants on the annuity rolls receiving $1,000 and over per month, and that 548,819 annuitants were receiving less than $500 a month; and 249,965 survivor annuitants receiving less than $300 a month; and that 191,232 annuitants were receiving less than $150 per month; and 209,574 survivor annuitants receiving less than $150 per month.

As an old friend of yours, and one that retired after 37½ years of honorable Civil Service, I request that you give serious consideration of across the Board exemption, with proper dividing lines, to eliminate the inequity you listed in the Congressional Record of September 4th.

Many old annuitants like myself have to work at other jobs to pay for medicine and living costs that continues to go up.

As I travel the state of Louisiana, I run into many of yours and my old friends, and often we speak of you. Like myself, as voters we believe in you. As an annuitant and an old friend of yours, I am asking you to do something for us. NARCE has nine Chapters in Louisiana as well as a State Federation of Chapters. I want to be able to tell these Old Folks that you are still working for them.

With kindest personal regards and thanks for your concern for us, I am

Sincerely yours,

MATT H. CREED.

P.S.—I am still a Realtor in order to supplement my annuity.

STATEMENT OF THOMAS G. WALTERS, PRESIDENT, NATIONAL ASSOCIATION OF RETIRED CIVIL EMPLOYEES

SUMMARY

The National Association of Retired Civil Employees, of which Thomas G. Walters is President, is a 48-year old non-profit and incorporated organization whose 135,000 plus members are retirees of the United States Government Civil Service.

The Committee is urged to consider, in its deliberations on tax treatment of the elderly, the following items:

Exemption of the elderly from any surcharge tax.

Exclusion from the gross income of the first $5000 for a family and the first $3600 for a single person received as Civil Service annuity from the United States Government or any agency thereof.

Re-establishment of the provision to deduct drug and medical expenses for persons 65 years and older. (Deleted in 1967). S. 1564 introduced by former Senator Everett McKinley Dirksen and now before this committee provides for this restoration for income tax purposes.

Amendment of Medicare to provide for the payment of prescription drugs outside-of-hospital.

Amendment of Medicare to provide that provisions (a) and (b) be made available to all Federal annuitants and their survivors.

STATEMENT

Mr. Chairman and Members of the Committee, my name is Thomas G. Walters, President of the National Association of Retired Civil Employees (NARCE). This organization was formed February 19, 1921, and has been in continuous operation since that date. We now have over 135,000 members with more than 1100 chapters in every State in the Union, Puerto Rico, Canal Zone, and the Philippines. Our membership is made up exclusively of retirees from the Federal Government and their survivors, and I appear this morning on behalf of our membership plus all other Civil Service annuitants and their dependents in the interest of tax reforms which relate to the treatment of these retired people.

As near as humanly possible, equalization of tax benefits has been the goal of our organization for many years, and I congratulate you, Mr. Chairman, and your committee, for your desire to bring about tax reforms and equalize the tax burden. I am happy that these hearings are being held and that representatives of NARCE are permitted the privilege of appearing before this committee to present the views of our members. We strongly believe that some sectors of our economy can help, but we believe that the elderly should be exempt from any surcharge tax and that taxes should be based on ability to pay.

The members of the House and Senate, especially the members of the House Ways and Means Committee and Senate Finance Committee, are to be congratulated for giving serious consideration to a tax reform bill. We sincerely appreciate the attempt by the House Ways and Means Committee and the membership of the House in endeavoring to make beneficial changes, but we strongly believe that an across-the-board exemption would be more easily understood and would make filing of income tax reports much simpler than any other method of tax relief, especially for the older person.

In the 91st Congress many bills have been introduced to grant across-the-board tax exemptions, and we are firmly convinced that a resolution unanimously adopted at our National Convention in San Francisco, California, in 1968, endorsing the exemption of the first $5000 of Civil Service annuity from Federal income tax was a good one.

Our Association believes that a retiree's family should have a Federal tax exemption of $5000, and a single retiree a tax exemption of $3600. As we grow older, we require more medical attention, more drugs and hospitalization, and with the ever increasing cost of living and maintaining a home, in our opinion the figures of $5000 and $3600 are not unreasonable. Much has been said in the press and by public officials that a family living on less than $3000 per year is living in poverty.

Most annuitants and their survivors are in the low income bracket. According to the latest statistics issued by the United States Civil Service Commission only 986 annuitants receive a monthly annuity of $1000 or more. 281,435 annuitants received less than $200 per month and 231,958 survivor annuitants received less than $200 per month. 110,436 annuitants received less than $100 per month; and 168,288 survivor annuitants received less than $100 per month.

Mr. Chairman and Members of the Committee, we receive hundreds of letters and we are convinced that we are not asking for anything unreasonable when we ask for a tax exemption under Federal Income Tax for retirees in the amount of $5000 for a family and $3600 for a single individual. Because of age and infirmities most of our members find it impossible to secure supplementary employment and to put it bluntly, at the age of most of our retirees, due to mental and physical deterioration many must be placed in nursing homes for which most of the health benefits programs are very limited in their coverage. We can furnish you with hundreds of names and addresses, but for the record I am quoting from two letters that came in the mail to NARCE recently:

"My husband's annuity is $264 a month and he is 88 years old and I am 82, and due to his mental condition, the doctors have placed him in a nursing home, and the $264 per month nothing like covers the cost". This letter from Alabama.

From the State of Colorado: "With 15 years of service . . ." this lady receives "$107 per month."

It is generally understood that drug and hospital expense for those over age 65 are, on the average, three times higher than those for all Americans, and approximately one-half of all Americans over age 65 are living at or near the poverty line. We have hundreds of cases of members writing us that though they can see the doctor, they can not afford to have their prescriptions filled. To aid these low income retirees, we are urging early consideration of a measure to have prescription drugs covered by Medicare.

With all of our members being retired Federal employees or survivors, we also meet with the problem that many of them are not eligible for Part A or the Hospitalization portion of Medicare. We should greatly appreciate seeing the Medicare law amended so that all persons over 65 would be eligible for both portions of Medicare coverage. I would be happy to furnish any additional information along this line that you desire.

We realize that you have a most complex problem in attempting to bring forth legislation to equalize the great tax burden of this country, but we do feel that the younger people and those that have their life before them, and the larger companies and individuals with tremendous salaries should bear the greater burden of the taxes and make it as light as possible for the senior citizens who have over the years worked hard and paid all taxes required of them. I believe most people are of the opinion that the people of this country who work for a reasonable or small salary, pay a greater percentage of the taxes than any other group. The retirees of the Federal Government paid taxes on their salaries during their working careers and we strongly recommend that we now have some tax relief. We believe that if we had a $5000 tax exemption for a family and $3600 for a single individual it would be a step in the right direction.

Until 1967 we were able to deduct our drug and medical expenses provided we were 65 years of age. We strongly recommend that this provision be re-established as this would mean a great deal to all senior citizens. S. 1564 introduced by the late Senator Dirksen, and referred to this Committee would achieve this.

Mr. Chairman and Members of the Committee, we would like very much to summarize our suggestions as follows:

Exemption of the elderly from any surcharge tax.

Exclusion from the gross income of the first $5000 for a family and the first $3600 for a single person received as Civil Service annuity from the United States Government or any agency thereof.

Re-establishment of the provision to deduct drug and medical expenses for persons 65 years and older. (Deleted in 1967). S. 1564 introduced by former Senator Everett McKinley Dirksen and now before this committee provides for this restoration for income tax purposes.

Amendment of Medicare to provide for the payment of prescription drugs outside-of-hospital.

Amendment of Medicare to provide that provisions (a) and (b) be made available to all Federal annuitants and their survivors.

Thanks so much, Mr. Chairman, for giving us the privilege and opportunity of appearing before your Committee.

The CHAIRMAN. Perhaps it would be well to include also at this point in the Record, a letter expressing concern over the exclusion of foreign service retirees, and statements that have been submitted by the Government Employees Council of the AFL-CIO and the National Conference of Public Employee Retirement Systems.

(The letter and statements referred to follow:)

CHEVY CHASE, MD., *September 12, 1969.*

Hon. J. WILLIAM FULBRIGHT,
U.S. Senate,
Washington, D.C.

MY DEAR SENATOR FULBRIGHT: Reference is made to HR 13270, known as The Tax Reform Act of 1969, which passed the House of Representatives and is now before the Senate Finance Committee.

It appears that this bill will be of very little help to middle income taxpayers—a class into which I, a Foreign Service retiree, falls—and that this help will be delayed until 1971.

It is my understanding that the National Association of Retired Civil Employees will present to the Senate Finance Committee a proposal that the first $5,000 of *Civil Service Annuity* not be counted as income for Federal tax purposes.

This proposal does NOT include *Foreign Service Retirees.* It is, therefore, requested that appropriate steps be taken to give similar exemptions to Foreign Service retirees.

Your assistance in this matter will be greatly appreciated.

Sincerely yours,

(MISS) NONA L. GARDINER.

STATEMENT OF THE NATIONAL CONFERENCE OF PUBLIC EMPLOYEE RETIREMENT SYSTEMS

The National Conference of Public Employee Retirement Systems represents about 200 organizations including state, school, and municipal public employee retirement systems, and their affiliated organizations. The total number of individual members of organizations represented by the Conference is approximately 4,000,000.

This statement is limited primarily to the tax treatment of retired persons.

The Conference urges the enactment of S. 2968, introduced by Senator Ribicoff, *at this session of the Congress*, either as a separate amendment to Section 37 of the *Internal Revenue Code* or as a part of the Tax Reform bill.

GENERAL COMMENTS

As members of this Committee are well aware, our organizations have long supported equitable tax treatment for the retired. In 1953 many of the organizations we represent supported an exemption of up to $1,500 of retirement income.[1]

---

[1] H.R. 5180 introduced by Representative Noah Mason in the 1st session of the 83rd Congress and referred to the Committee on Ways and Means.

Instead of an exemption, the Retirement Income Tax Credit was enacted in 1954. We supported this change to the Retirement Income Tax Credit and have often worked for its improvement. The Credit has not been improved since 1962, and we note with regret no proposal to improve it is included in H.R. 13270, the Tax Reform bill.

The purpose of the Retirement Income Tax Credit is to provide tax equity to those public employees who are not covered by Social Security, but only by their local or state public employee retirement systems. Employees under Social Security pay no taxes on Social Security benefits. Public employees pay taxes on benefits from their retirement systems. It is this inequity among retired persons the Retirement Income Tax Credit is designed to reduce or eliminate.

A large number of the public employees we represent—such as firefighters, policemen, and a substantial number of teachers—are not covered by Social Security. It is estimated that about 400,000 to 500,000 retired public employees presently use the Retirement Income Tax Credit.

At present, the Tax Credit is 15% of $1524, with reductions for earned income and any Social Security benefits received.

The base figure ($1524) is the key to maintaining equity. If it is set at the average maximum payable under Social Security each year, the result will be that those who may use the Tax credit will receive about the same tax treatment as those who receive tax-free Social Security benefits.

At present, this base figure is too low, having last been increased in 1962. The base should be increased to at least $1,872 to be equal to the average maximum payable under Social Security.

RECOMMENDATIONS

Retirement Income Tax Credit

The $1524 base of the Retirement Credit should be increased to at least $1,872 (as proposed in S. 2968), effective for the 1969 tax year. Since the Credit has been falling behind Social Security maximums for seven years, there is an urgent need to effect the increase now. Many of those we represent have already paid more in taxes the last few years than they should have. To delay further compounds the inequity.

S. 2968 also increases the earnings limit to assist those older citizens who must supplement their retirement income with modest earnings. The Conference strongly supports this increase.

Other Tax Reform Proposals

The Conference is aware that many of the provisions of the present tax reform bill will be helpful to many of our members. The low-income allowance and the increase in the standard deduction will be beneficial to many who are retired on low incomes. The new Intermediate Tax Rate will apply to many of our retired members since a large percentage of them are single, or widows and widowers.

CONCLUSION

In conclusion, we urge the Congress to up date the Retirement Income Tax Credit by enacting S. 2968, amending Section 37 of the *Internal* Revenue Code. We respectfully point out that this proposal is not a new provision of the tax law, but is one which has been been on the books since 1954. The proposal is intended only to make the Tax Credit provision do that which was intended to do: provide equity among retired persons.

Submitted for the Conference by,

JACK E. KENNEDY,

President and Executive Secretary of the Colorado Public Employees Retirement System.

GOVERNMENT EMPLOYES COUNCIL—AFL–CIO,

Washington, D.C., July 15, 1969.

STATEMENT OF THE GOVERNMENT EMPLOYES COUNCIL, AFL–CIO

The Government Employes Council and its 34 member AFL–CIO unions, which represent more than 1 million classified, postal and wage board Federal employes

desires to express its appreciation to you and your colleagues for arranging this series of hearings on a subject of vital concern to every citizen of our country.

For some years, the Council has advocated removal of income taxes on civil service annuities.

There is pending before this Committee S-422 by Senator Joseph M. Montoya, which would accomplish this objective in part. We recommend sympathetic consideration by the committee.

Recipients of pensions under the Railroad and Social Security Acts are relieved of payment of income tax on these benefits. The exemption was included specifically in the railroad retirement system when that statute was enacted in the 1920s. Application by the Internal Revenue Service of a Supreme Court decision to the social security law in the 1930s resulted in the income tax exclusion on these benefits.

Underlying these actions was the valid premise that income taxes should be based on "ability to pay." We submit, Mr. Chairman, that this rationale applies today with equal logic to the pensions of retired Federal workers.

Of the 581,000 civil service annuitants, 41,000 (7%) have monthly benefits below $50. There are 250,000 survivor annuitants. One quarter receive less than $50 monthly.

The number of retirees receiving less than $100 monthly is 110,000 (18%). Payments below $100 are made to 168,000 (67%) survivors.

Put another way, almost half the individuals on the retirement rolls are entitled to payments of less than $100.[1]

Certainly, the conclusion is justified that these men and women have a very limited "ability to pay" under the philosophy of our income tax statute.

The Labor Department's Bureau of Labor Statistics periodically publishes a "Retired Couple's Budget for a Moderate Living Standard."

The study based on Autumn, 1966, figures (Bulletin No. 1570-4) revealed a husband age 65 or over and his wife, who are self-supporting and live independently, required $3,869 to maintain a decent level of living. The range varied from $4,434 in Honolulu to $3,236 in smaller cities in the South.

Updated to June, 1968, the overall figure moved to $4,049.

We do not maintain that each and every civil service annuitant and survivor must receive monthly payments to meet this precise figure. But BLS finding does indicate clearly the inadequacy of benefits paid to almost half the present civil service retirement beneficiaries and their consequent inability to pay income taxes without sacrificing essential needs.

In a restricted sense, Congress recognized the limited "ability to pay" of these individuals some years ago by approving a retirement income credit for Civil Service annuitants equal to the lowest tax rate on $1,200. Currently, the credit is approximately $1,524.

For these reasons, Mr. Chairman, the Council recommends that the Committee approve removal of the Federal income tax on civil service pensions.

The CHAIRMAN. Mr. Sadler?

STATEMENT OF CARL K. SADLER, LEGISLATIVE DIRECTOR, AMERICAN FEDERATION OF GOVERNMENT EMPLOYEES; ACCOMPANIED BY STEPHEN A. KOCZAK, DIRECTOR OF RESEARCH; AND JAMES H. LYNCH, JR., ASSISTANT LEGISLATIVE REPRESENTATIVE, AMERICAN FEDERATION OF GOVERNMENT EMPLOYEES (AFL-CIO)

Mr. SADLER. I am Carl Sadler, legislative director scheduled to appear this afternoon. I wonder if I, too, could not submit my statement for the record?

The CHAIRMAN. We will be glad to print your statement. We will have it printed and if you want to briefly tell us about your statement we will hear you right now.

[1] Source—U.S. Civil Service Commission Annual Report on Civil Service Retirement for the fiscal year ended June 30, 1967.

Mr. SADLER. I will take just 1 minute, if I may.

Certainly, I agree with Mr. Walters. Our approach is much the same. We would just say that we think that the retirees of the Federal Government should be accorded the same benefits as those under Social Security and those under the Railroad Retirement System who pay no tax on their annuities, and we would hope that this committee would give consideration to making their annuities tax-exempt as well.

The CHAIRMAN. Thank you very much.

(Carl K. Sadler's prepared statement follows:)

STATEMENT SUBMITTED BY CARL K. SADLER, LEGISLATIVE DIRECTOR, AMERICAN FEDERATION OF GOVERNMENT EMPLOYEES

THE EXEMPTION FROM INCOME TAX OF CIVIL SERVICE ANNUITIES

In the name of the American Federation of Government Employees, I wish to express gratitude to the distinguished Chairman of the Senate Committee on Finance and to its other members for this opportunity to testify on the important subject of tax reform as it affects Federal employees.

Our organization which now has more than 320,000 dues-paying members and which represents more than 560,000 Federal employees in exclusive recognition units, is composed, of course, of taxpayers. Every one of our members has the Federal income tax deducted at the time he receives his Federal pay check.

These employees have become increasingly aware that certain major inequities, certain vestiges of serious tax injustice, continue to exist in current tax practices. These injustices exist in our general tax policy; they also exist in specific discrimination and selective injustice suffered by Federal employees, especially in the continuing unfair Federal practice of income taxes levied on their Civil Service annuities.

Your Committee has already received testimony from George Meany, the President of the American Federation of Labor and Congress of Industrial Organizations, regarding certain grave injustices in our general Federal tax policy, especially the failure of the "loophole set", as he described them, to bear their fair share of the tax burden. As a member of the American Federation of Labor and Congress of Industrial Organizations, we endorse the position taken by Mr. Meany and associate ourselves with him. For the sake of brevity, however, I shall not dwell upon or repeat what he has already said and I shall restrict my comments to those matters which he did not touch but which are of especial significance to us.

Tax justice, like every other kind of justice, must be based on the principle that the persons affected will be granted equitable treatment in law and in practice. Whatever the law grants to one class of citizens, the same should be granted, in similar manner, to all comparable classes.

Moreover, tax justice, like every other kind of justice, should reflect the general standards and norms of contemporary society. As we know, in our society it has been accepted that it would be improper to place a heavy taxation burden on persons who are on the fringes of poverty.

Yet I must come before you today to inform you that these noble precepts of our contemporary society are not being carried out in the case of more than 870,000 human beings who were either Federal employees and are now retired or who are the survivors of Federal employees.

Annuitant beneficiaries of the Social Security system, for example, and of the system established by the Railway Retirement Act pay no income tax whatsoever on their annuities. Yet retired Federal employees and their survivors must pay this tax in full on that portion of their annuities which is derived from contributions by their Federal employer.

Our organization favors, of course, the exemptions granted so wisely by our government to pensioners of the Social Security system. When one looks at the amounts of these pensions, it is obvious that this is a humane and just course for our nation to pursue.

Our organization likewise favors and supports the provisions of the Railway Retirement Act. We are gratified that the Congress specifically exempted all income received by these annuitants from income taxation.

We must ask you, however, the following question: Are not annuitants under the Civil Service Retirement system entitled to the same kind of humane and wise consideration from their Congress and from their Federal government as beneficiaries of the Social Security system and the Railway Retirement Act?

In our judgment, the answer is obviously "yes".

Let us look at the facts.

Participation in the Social Security system is mandatory for all categories of persons covered. Participation in the Railway Retirement Act is also mandatory. But so is participation in the Civil Service system.

The Civil Service system, just like the Social Security and the Railway Retirement systems, is a mandatory system. It is not a voluntary system.

Even though the mandatory payroll deductions from earnings in the Civil Service System are technically called "contributions", the fact is that the deductions are mandatory for both the employee and the employer.

If we were to call things by their right name, we must recognize that these "contributions" are in fact a tax. And, as you know, under the terms of another Bill before the Senate, the rate of these mandatory "contributions" might soon be raised from 6.5% respectively by employee and employer to 7.0% each. Therefore, the current total tax of 13.0% of payroll may soon be 14.0%. This compares with a total current tax in the Social Security system of only 9.6% of payroll, shared equally at 4.8% each by employer and employee.

As these facts show, one can really find no meaningful legal distinction between the three systems, Social Security, Railway Retirement and Civil Service so far as mandatory contributions are concerned or the financial sharing of the burden by the employer and employee. Yet, the Civil Service annuitant must pay an income tax on that portion derived from the Federal employer's "contribution".

We believe this is discrimination, discrimination unworthy of our contemporary society with its great emphasis on equal rights.

There are some persons who have been saying that Civil Service annuitants are in such a favorable economic position that they do not need tax justice, that they do not need tax relief.

I wish those people were right.

But they are very, very wrong.

The most recent comprehensive figures, compiled by the Civil Service Commission, show that on June 30, 1968, almost 100,000 Federal employee annuitants and survivor annuitants received less than $50.00 a month in annuities. This is less than $600.00 a year. Moreover, this amount was subject to income tax.

The statistics also show that 276,073 employees annuitants and survivor annuitants received less than $100.00 a month. This is less than $1,200 a year. Moreover, this was subject to income tax.

Almost 400,000 employee and survivor annuitnats received less than $150.00 per month, or less than $1,800.00 per year. This too was subject to income tax.

Of the total number of 871,072 persons on the Civil Service retirement rolls on that date, 514,863 received less than $200.00 per month, or less than $2,400.00 per year. Moreover, the overwhelming number of these persons had wives or other dependents. Yet, the annuities were subject to income tax.

Other people have argued that this is largely the inheritance from the past and that the economic conditions of Federal employees currently entering the annuitant rolls are much better.

Again, I must state that they are very, very wrong. Again, I say, let us look at the facts, let us look at the statistics of those Federal employees and survivors newly added to the annuity rolls in fiscal year 1968.

During the fiscal year 1968, the following persons were added to the rolls:

A.—19,262 widows, with an average age of 61.2 years, who receive an average annuity of $138.00 per month or $1,656.00 per year. On this income, these widows paid an income tax.

B.—10,347 children, with an average age of 14.6 years, who received an average annuity of $50.00 per month, or $600.00 per year. On this income, the parent or guardian had to pay income tax.

C.—52,579 employee annuitants, with an average age of 60.3 years, who received an average annuity of $291.00 a month or $3,492.00 per year. The very great majority of these employee annuitants, totally 35,045, had wives and other dependents. Yet their annuities were subject to income tax. Distinguished members of this Senate Committee, that is the very sad picture of the financial state of affairs of those Federal employees and survivor annuitants who came onto the rolls of the Civil Service annuity system for the first time in fiscal year 1968.

Yet every one of these persons must pay income tax on that portion of his or her retirement income which comes out of funds contributed by the employer.

In my presentation, I have chosen up to now only the most representative statistics in order to illustrate the injustice suffered by Federal annuitants as a class. I could have chosen, of course, large numbers of cases of a far more pathetic and pitiable nature. There are, for example, over 1,000 widows with an average age of 75.2 years who receive a grand total of $51.00 per month, or $612.00 per year. There are, for example, widows over 75 years of age who receive $31.00 per month, or exactly $1.00 per day. Their total annual income is thus $365.000. Yet, this is subject to income tax.

I shall not burden you here with more statistics and examples. Instead, I request your permission to place into the record four tables giving the facts. The first table shows the grand total of all annuitants on the Civil Service retirement rolls as of June 30, 1968, by monthly rates of annuity. The second table shows the total number of survivor annuitants as of that date. The other two tables show the numbers of employee annuitants and survivor annuitants added to the Civil Service retirement roles during the fiscal year ending June 30, 1968.

SUMMARY AND CONCLUSION

A comparison of the Social Security, the Railway Retirement Act and the Civil Service retirement systems shows that, although all are mandatory, the Civil Service employee suffers discrimination because his annuities are subject to income tax payment on income derived from contributions of the Federal employer.

An analysis of the annual income of both the Civil Service employee and survivor annuitants reveals that an overwhelming majority are living at the poverty level. Children are receiving $600.00 per year as total income; some widows, aged 75 and over, are receiving as little as $365.00 annually or one dollar per day. Over 514,000 annuitants receive less than $200.00 per month and many of these must support wives and other dependents.

The precepts of tax justice require that we extend to Civil Service annuitants the same tax policy that now applies to Social Security and Railway Retirement Act annuitants—total exemption from all income tax.

In the name of the American Federation of Government Employees, I again petition you to remove this vestige of tax discrimination which has been endured too long by our retired Federal employees, by their dependents and by their survivors. The great majority of them are now living at or near the poverty level and they are in urgent need of tax relief.

In conclusion, I wish again to express my appreciation for the kind courtesy you have shown to my organization by allowing me to appear before you today and for the thought and deliberation you will be giving to my petition.

The CHAIRMAN. If there is someone else who will not be able to attend this afternoon we will hear them right now. (No response.)

The CHAIRMAN. All right. We will start at 2 o'clock this afternoon. Thank you very much.

(Whereupon, at 12:20 p.m. the committee recessed, to reconvene at 2 p.m. on the same day.)

AFTERNOON SESSION

Senator TALMADGE. The committee will please come to order.

The next witness is Mr. Ernest Giddings, special legislative representative, American Association of Retired Persons, National Retired Teachers Association.

Will you please come around, Mr. Giddings. I hope you will understand the Senate is in session. We have two bells. That was a quorum call. If it is one, we have to go to the Senate and vote. We have your full statement in the record of these proceedings, so if you would summarize your statement and make it as brief as you possibly can, it would be greatly to the credit of the committee.

STATEMENT OF ERNEST GIDDINGS, SPECIAL LEGISLATIVE REPRESENTATIVE, AMERICAN ASSOCIATION OF RETIRED PERSONS, NATIONAL RETIRED TEACHERS ASSOCIATION; ACCOMPANIED BY JACK BOSTICK, CHAIRMAN, LEGISLATIVE COMMITTEE, INTERNATIONAL ASSOCIATION OF FIRE FIGHTERS; AND PETER W. HUGHES, LEGISLATIVE REPRESENTATIVE, NATIONAL RETIRED TEACHERS ASSOCIATION, AMERICAN ASSOCIATION OF RETIRED PERSONS

Mr. GIDDINGS. Thank you, Senator.

Mr. Chairman, my name is Ernest Giddings. I am the legislative representative of the National Retired Teachers Association, and the American Association of Retired Persons.

Our organization has a membership of about 1,800,000 persons. Accompanying me on my left is Mr. Peter Hughes, also legislative representative of our association, and on my right is Mr. Jack Bostick of Fort Worth, Tex., who is vice president of the International Association of Fire Fighters. Mr. Bostick and myself are members of the Legislative Committee of the National Conference on Public Employee Retirement Systems.

The National Conference consists of about 100 different organizations of retired or active public employees, firemen, police, teachers, and municipal employees, civil service employees, and so forth.

On this I am speaking for our own association and the National Conference.

When your committee in 1954 enacted section 37 of the retirement income credit section of the revenue code, you removed an outstanding inequity in the tax treatment between social security and railroad retirement, which is tax exempt, and the nonexempt retirement income. Then you updated it in 1962 by amending section 37, and by doing that, you again preserved the principle of equal tax treatment of various forms of retirement income.

Since this issue has not been before your committee in 6 years, I will just make a few comments about the early history of this section of the tax code. In 1964 the retirement income credit was passed by the Congress, and at that time it was done in order to remove the discrimination which existed in the tax law between persons who were under social security or railroad retirement, and those who were receiving other forms of nonexempt retirement income.

In view of that situation, the committee at that time pointed out that they were justified in passing the retirement income credit, and it has been updated. It was updated in 1962, as I mentioned. Now, the forms of retirement income, as you know, are pensions, that is public and private pensions, and annuities, interest, rent, and dividends.

When the retirement income credit base was updated in 1962, it was increased from the $1,200 base to the present $1,524 base. That is the base upon which the credit is computed, at the lowest bracket rate. The figure $1.524 at that time was computed, recommended to your committee by the staff of the Joint Committee on Internal Revenue taxation.

Since 1962, some increases in social security benefits have been made, the principal one of course being the 13-percent increase in 1967. But since 1962, no increase has been made in the base on which the retirement income credit is computed.

To again equalize the retirement income credit, then with social security benefits, these are the changes that should be made. First, the amount on which the retirement income credit is computed should be increased from $1,524 to $1,872. If you had acted last year or the year before, this is the figure that you probably would have written into the law to replace the $1.524 figure, because it represents the maximum primary benefit now available under the social security program to any individual.

Of course, to determine the credit the $1,872 is multiplied by the lowest bracket rate. If it were 15 percent, that would amount to a maximum credit of $280.80 per person as contrasted to the $228.10 under the law as it is at the present time. This would make a tax credit then of $52.70.

If and when this is done, an increase presumably would be made also in the reduction due to earned income, and that reduction is described on page 4 of my testimony in this way. The reduction made in the retirement income credit on account of earned income should be changed to correspond with the changes made in the earned income reduction provided in the social security law.

Thus, while under the present law, earnings between $1,200 and $1,700 a year reduce the tax credit by $1 or $2 earned, under a really conforming amendment, earnings between $1,680 and $2,880 reduces the tax credit, by that same formula, that is $1 for every $2 earned.

The bill introduced by Senator Abraham Ribicoff on September 29 is a bill which will restore the tax equity that I am talking about, and restore the tax equity to those persons who depend upon public pensions or other forms of retirement income in lieu of social security or railroad retirement. That bill is designed to remove the discrimination, then, which has arisen gradually in the 6-year period as changes have been made in the social security program. In that time no improvement has been made by the Congress in the retirement income credit.

Now, S. 2968 introduced by Senator Ribicoff does no more and no less than to again adjust counterpart section 37 provisions to conform with existing social security laws. It would increase the retirement income ceiling from the present $1,524 to $1,872, thus conforming it with the present social security primary benefit ceiling.

In the most extreme case, the increase in benefit to one individual would be $52.70. Generally, however, it would not amount to that much, and a fair estimate we believe is that it might over all of the taxpayers affected amount to possibly half that figure.

The other point to be made in that connection is that it seems to us as it did 6 years ago that the retirement income credit is certain to affect fewer people as the years go along.

In summary, I would point out that while the dollar benefit in the Senator's bill is important to every retired person, the prinicpal of tax equity under the tax laws of the Nation is of equal importance, and the passage of that bill will again reassure retired persons that they will not be discriminated against by the tax-writing committees of the Congress.

Our association and the conference urges your committee to write the Ribicoff amendment into the tax reform bill.

Now, I would like to comment on three other items, and in speaking on these, I am speaking only for my own organizations the National Retired Teachers Association and the American Association of Retired Persons.

One is the full medical and drug deductibility. Mr. Chairman. we hope the committee will take action this year to restore the right of every person over age 65 to take the full Federal income tax deduction on his unreimbursable medical and drug costs.

As long as the medicare program contains the present exclusions. deductibles and co-insurance provisions, the several million taxpayers over age 65 should have this protection, we believe. This point is not included in the House bill.

The other point I would call to your attention is the exclusion of low-income older people from income tax liability. It has been our belief that there is a block of older people who should be granted this protection, this benefit, and my association went on record a year ago recommending that single persons over age 65 with incomes up to $3,500 a year, and married couples over 65 with incomes up to $6,000 a year, should be exempt from paying a Federal income tax.

By the way, that point that I have just mentioned is in substance, but to a lesser degree in the House-passed bill.

The other point I wish to comment on is the expansion of the head-of-household tax treatment. Widows, widowers, and unmarried individuals who do not support dependents in a household cannot qualify for head-of-household treatment under the present law. The House-passed Tax Reform Act does provide a substantial improvement in the tax treatment of these people, and it is our hope that your committee will adopt the House-passed provisions or something equally protective to older people. This provision is in the House bill.

That concludes my statement.

Senator McCARTHY. Thank you very much. Do you have any questions, Senator?

Senator FANNIN. No, Mr. Chairman.

You have certainly made an impressive statement. I was not here for the full time, but I will carefully read your statement. I was just wondering if we do have the information as to what the cost would be if this were approved.

Mr. GIDDINGS. It is probable that people in the Treasury would come up with a figure. I just checked the committee report that was made in 1962 under the chairmanship of Senator Byrd, and at that time, the comparable increase was made from a $1,200 base to a $1,524 base, and the committee report at that time said that the estimate was that the loss of revenue might be about $30 million.

Our estimate at that time was a somewhat lesser figure than that, but that was the figure in the report.

Senator FANNIN. On that amount, but you don't have an estimate of the figure, what would be involved in your recommendation of $1,524 to $1,872.

Mr. GIDDINGS. No. Well, the point I was making is that I assume that the Treasury might say that it would be a comparable figure, because the updating we are recommending is from $1,524 up to $1,872 which is quite similar in amount to the adjustment you made in 1962.

Senator FANNIN. A comparable increase.

Senator MCCARTHY. From $1,524?

Mr. GIDDINGS Yes.

Senator MCCARTHY. Roughly, the same amount.

Mr. GIDDINGS. About the same amount.

Senator FANNIN. Mr. Chairman, I have just been informed that it might cost as much as $160 million.

Mr. GIDDINGS. I have not seen any figures that were anywhere near that level.

Senator FANNIN. We can obtain that information.

Mr. GIDDINGS. Yes.

Senator FANNIN. Thank you very much.

Senator MCCARTHY. Everybody has to have his own statistician today.

Thank you very much.

Senator RIBICOFF. You are trying to put yourself on the same equality as social security beneficiaries, is that right?

Mr. GIDDINGS. That is right.

Senator RIBICOFF. And the people that you represent, schoolteachers, firemen, policemen, public employees, have had separate retirement systems apart from social security; is that correct?

Mr. GIDDINGS. That is right.

Senator RIBICOFF. Under social security, and what do you find the lot to be of the retired teacher, policemen and firemen today, in view of the inflationary pressures?

Mr. GIDDINGS. They are suffering considerably from increased prices and from inflation generally, and for that reason we believe that the people who have established their own retirement systems which is not in this case tax-exempt, should be granted this benefit.

Senator RIBICOFF. In other words what you are trying to do, you want to put yourself exactly on the basis of equality with social security retirees?

Mr. GIDDINGS. That is right. That was the basis on which the legislation was passed originally, and the basis on which we believe this adjustment should be made.

Senator RIBICOFF. Thank you very much.

Senator MCCARTHY. Thank you, Mr. Giddings.

The next scheduled witness is Miss Vivien Kellems of East Haddam, Conn.

STATEMENT OF MISS VIVIEN KELLEMS, EAST HADDAM, CONN.

Miss KELLEMS. I am not quite sure of the procedure, Senator McCarthy, I have here thousands of names on petitions that have come from all over the country. I don't know if I may submit these to the committee. How is this handled?

Senator MCCARTHY. We will make them a part of the file, but not a part of the record. You may present them.

(The petitions referred to were made a part of the official files of the committee.)

Miss KELLEMS. If you don't mind, I am going to sit on a book. I am so short I get an inferiority complex.

Senator MCCARTHY. There is something to be said for that. Is that book all right?

Senator RIBICOFF. Of course, Senator McCarthy, I get a great charge out of your being so solicitous of Miss Kellems.

Senator MCCARTHY. All short people.

Senator RIBICOFF. All I can tell you, when it comes to speaking to a group, to a committee, or on radio or television, she has no peer, and I don't think Vivien Kellems needs any lessons on how to address anybody, especially U.S. Senators.

Senator MCCARTHY. I think that Congressional Record volume improves on the World Almanac. Most short people have an advantage when they sit down to those microphones compared to those who are tall. We are glad to have you.

Miss KELLEMS. Thank you. I do better on my feet, but the microphones are so low, and if you knew how nervous I was, Senator Ribicoff, you would not make such a statement.

Senator RIBICOFF. Nobody can speak for Vivien Kellems.

Senator MCCARTHY. You should formally identify yourself for the record.

Miss KELLEMS. I am Vivien Kellems from East Haddam, Conn., and I wish to testify in support of Senate bill 2794, which would remove the penalty tax on single people.

The income tax is like a pregnancy. They both start small but soon swell to alarming proportions. Eventually they both must terminate. We are just about ready for that terminal "happening" now. Ever since Joseph sold the Egyptians into slavery with their own money, the unbridled, uncontrolled income tax has ruined every country that has adopted it. Because of it, England is down the drain and we are just a couple of laps behind.

The income tax is the one basic cause of inflation. The higher the tax the greater the inflation. Reduce taxes and prices will automatically follow.

The first income tax passed under the 16th amendment in 1913 contained 40 pages. The latest published in 1968 is 1,593 pages, and I show it to you gentlemen because I think very often an actual exhibit is better than to just state how many pages it is. Its titles, sub-titles, texts, tables, cross-references, special rules, miscellaneous information, all in very fine print is one vast labyrinth of gobbledegook. Can any brilliant lawyer, can any accountant, can any of you gentlemen on the committee possibly grasp the monstrosity of this tax?

And this does not include court decisions, regulations, special rulings and other paraphernalia.

The Congress now proposes to reform this hydra-headed monster and add 400 pages more. When it is finished, the whole mess is going to be more incomprehensible and hopeless than it is now. Naturally, the whole thing is shot through with favoritism, injustice and inequities.

The most blatant and unconstitutional of them all is the penalty against single people.

There is no law that says single people must pay higher income taxes just because they are single. Congress never has passed such a law, and I very much doubt that Congress would pass such a law. The Supreme Court would have to declare it unconstitutional.

Then how is it possible that over the past 21 years the Federal Government has sucked into its cavernous maw billions of dollars from American citizens on the pretext that it is legal to penalize people for not being married?

It was done in 1948 with a slight-of-hand trick called the community property law, which was not a community property law at all. This was the excuse given for the wholesale robbery of millions of helpless people.

Now to thoroughly understand this law, a short history should be given of it, but unfortunately it is not possible to do this and stay within the 10-minute limit, and I am a garrulous old woman once I get started, so if you wish to give a history of it or to describe it, you could ask me afterwards, but I will leave it out of this testimony, but it should be made quite clear that this was not a community property law.

Not one property law or any other law was changed one iota. Not one piece of property or penny of income changed hands under this law. No wife anywhere received one thing except as she benefited by the tax savings. Everything remained precisely as it was, and the husband still owned his income. It was a straight tax gimmick, class legislation and discrimination of the most flagrant sort.

There was absolutely no pretense. It was a rich, married taxpayer's bill, the higher the income the greater the percentage of saving. Poor married couples, those receiving $5,000 or lower, didn't save a dime. The single taxpayers were left holding the bag. They had to pay at the confiscatory rates of World War II without a penny of relief. Never has a law been passed saying they must pay at these exorbitant rates, but under this so-called community property law, the Internal Revenue Service has arrogated to itself the power to illegally collect billions and billions of dollars from these helpless people.

But more than this, the law gave the rich, married people in the community property States something they had not had before, and this is not generally known. Under this law passed in 1948, these married people could now split all income, including that derived from premarital estates.

If I might diverge for a minute, I could explain. Take a case like Doris Duke, who had an income of $3 million. Had she lived in California and married a man who was making, let's say, $50,000, they could split the $50,000 before the passage of the law in 1948. But under this law in 1948, they could now split the entire $3,050,000. Then on top of this was passed the estate law, which taxed the whole estate of single people but only half of the estate of married people.

Then, finally, to finish it off, before the sad demise of the individual single taxpayer, there was one more indignity, the surtax. Since there wasn't anything more to tax Congress decided to tax a tax. This was not a tax on income, this was a tax on the income tax, and again the single people had to bear the brunt of it.

Ten percent for married people, but up and up and up for single people, because they have to pay 10 percent on the penalty they are already paying. In thousands of cases this runs to 14 percent. I make no comment on this action. The facts speak for themselves.

Has there ever been such rank, discriminatory, unjust, unconstitutional legislation against millions of American citizens? Why? Because they are not married.

There has been one attempt to test the constitutionality of this system. It was the famous *Faraco* case. Mr. Faraco died just before or just after Christmas in 1953, and his widow's tax went up to 40 percent. She brought suit in the Fourth District Court of Richmond, Va., and the judge in this case came through with what I consider the most idiotic decision in the whole legal history of the United States.

He said that because the amount of the penalty tax, 40 percent incidentally, was so slight, it did not violate any constitutional principle. I am not here to pass upon the qualifications of any man for the Federal Supreme Court, but that judge has recently been nominated to serve on that Court.

In 1962, Senator Eugene McCarthy of Minnesota introduced a bill, S. 35, which would permit certain persons 35 years of age or over to qualify as head of household, and pay a lower tax, however, not as low as married persons in the same income tax brackets. There was already a rather nebulous classification, head of household, which Congress had added in 1951, to partly still the cries of outrage from indignant taxpayers, but the requirements were so strict that very few people could qualify. For all the relief it afforded, it might as well not have been there.

Senator McCarthy sought to amplify this classification to include many more overburdened single taxpayers. He got exactly nowhere. His was a lone voice crying in the wilderness. In spite of the lack of understanding and cooperation, even ridicule, the Senator persisted and has reintroduced this bill in each succeeding Congress—88th, 89th, 90th.

Convinced of the injustice of the penalty tax and also persuaded that it was unconstitutional, Senator McCarthy felt that it was the best bill that could be considered at that time, since there was such opposition to the whole idea of fairness and justice for single people. Later other Senators joined him in sponsoring the bill and several

Congressmen have introduced similar bills in the House of Representatives.

As a matter of fact, the administration has come now with their testimony recommending such a bill, and they bring up the question of age 35, which I shall not go into unless Senator McCarthy would give me permission to say why he chose age 35.

Senator McCarthy. I have raised that level a bit since.

Miss Kellems. Well, then, it doesn't apply.

Senator McCarthy. That is right.

Miss Kellems. May I say what you told me?

Senator McCarthy. You may, yes.

Miss Kellems. Senator McCarthy told me that he selected age 35 because a woman was supposed to be most beautiful at age 35.

Senator McCarthy. Melina Mecouri said that. I did not say it. I was just quoting her.

Senator Curtis. I can't let the record stand there.

Senator McCarthy. I understand she has raised the level 5 years since then.

Miss Kellems. I wish it was up to 73, but it isn't.

Senator Curtis. I must dissent from the acting chairman's statement. All the women I know get more beautiful every year.

Miss Kellems. Oh, Senator Curtis, I do hope you will vote for my bill.

Senator McCarthy. I think he is committed now.

Miss Kellems. I should say that I am sorry Senator Long is not here, because when Senator McCarthy introduced this bill in 1962, Senator Long asked him, "Are you trying to give a consolation prize to all these girls because they can't get proposals from a good man?"

And I would have like to ask Senator Long today, doesn't he think it is only right that if a woman can't get a proposal from a good man, that she should be given a consolation prize.

Senator Curtis. Maybe she has one already.

Miss Kellems. Well, I asked the Secretary of the Treasury how many eligible men of 73 or thereabouts he knew, but he did not reply to my question.

Finally, Senator McCarthy stood on the floor of the Senate on August 7 this year, and introduced a bill, S. 2794, to abolish the whole unsavory, unconstitutional mess. He was heartily commended by Senator Ribicoff, of Connecticut, who pledged his support of the bill. Senator Ribicoff said, "The Senator from Minnesota has been in the forefront of this fight for many, many years. He has been a lone voice, receiving very little support from anyone else in the executive branch or in the legislative branch. I will certainly be pleased, as a member of the Committee on Finance, to support the Senator's efforts to bring justice in this important field."

It is this bill, gentlemen, which brings me before your committee today.

On April 15, I signed a blank income tax form 1040 and sent it to the Director of Internal Revenue, Andover, Mass. I then wrote the Secretary of the Treasury that I would not pay any more taxes until the Federal Government refunded to me the sum of $73,409.03, taxes which have been illegally collected from me for the past 20 years, plus interest.

From that time, letters have poured in from all over the United States. As their numbers increase, my blood pressure rises. They come from all over the country, from all kinds of people, young people working their way through college, elderly widows trying to make ends meet on meager incomes, school teachers, nurses, telephone operators, stenographers, secretaries, factory workers, and thousands of retired people—a cross-section of America. All tell one bitter, heartbreaking story, a crushing penalty tax by an all-powerful, greedy, ruthless government for one reason only, these millions of people are not married.

What began as a simple test of the constitutionality of this tax, has now become a flaming, emotion-packed crusade.

We are creating paupers out of decent, self-respecting, self-supporting American citizens. Read these letters and see if you can stay calm; widows with small children, women whose husbands have been killed in Vietnam and who must pay a penalty for the sacrifice they have made, other widows using the capital of the small estate left by a husband to pay current taxes; one woman living on crackers and tea.

And this woman inclosed a dollar bill.

Thousands terrified at what the future holds; these are proud people who cannot bear to ask for public assistance, and always the cost of living spiraling ever up and up while their standard of living goes down. Is this what this committee wants? Is this what the Congress of the United States wants?

I have no quarrel with the split income tax provision, and certainly there isn't any intention to take this tax privilege away from married people. More power to them and to anyone else who can legally save on their taxes. All we single people ask is the same tax break. We want simple justice for single people. And millions of married people agree with me.

Senator McCarthy. Thank you very much.

Senator Curtis. I have one question. Suppose on one side of the street there is a business operated by an individual, and he makes a net profit of $10,000 a year. Across the street there is another business operated by a partnership, and the partnership is composed of two people, and they make a net profit of $10,000 a year. We will assume that they are equal partners, so that if they divide all the profits each one would get $5,000.

Are you suggesting a principle that the man who owns the business himself and makes $10,000 be taxed on no greater amount than each of these two partners who got the $5,000?

Miss Kellems. May I ask you, Senator Curtis, are these two people married who operate the business?

Senator Curtis. It doesn't make any difference.

Miss Kellems. If they are single, they make $5,000, is that right, $5,000 each?

Senator Curtis. The partnership makes $10,000.

Miss Kellems. But the point here at issue is whether the people are married or single. If the single person makes $10,000 a year, then we are asking that he be taxed at that rate.

Senator Curtis. I understand what you have said, but I have asked you a hypothetical case.

Miss KELLEMS. I can't answer it.

Senator CURTIS. You have got one businessman operating alone who makes $10,000. A similar business is operated by two partners. They make $10,000, five for each one of them.

Now, do you believe that the man who makes $10,000 for himself alone should not be taxed on any greater amount than the amount taxed to each one of these partners in a similar business?

Miss KELLEMS. My position is that if they are all single——

Senator CURTIS. No, no; that has nothing to do with it.

Miss KELLEMS. You see, I believe in equal taxation for everybody, which is a percentage. I think we would be far better off if we junked everything that we have got in this book and make a simple tax of a certain percentage for everybody.

Senator CURTIS. Well, even if we did that, would you apply that tax to $10,000 for the one man and to $5,000 for each of the other two?

Miss KELLEMS. Certainly, because this is what they are earning. This is an income we are taxing.

Senator CURTIS. When I got married I entered a partnership.

Miss KELLEMS. Yes, did you live in a community-property State?

Senator CURTIS. No. This was purely voluntary, believe me.

There is a notion afloat in the world that some way with the magic term of reform we can lower everybody's taxes, and have plenty of money for everything. I haven't been able to figure it out.

Miss KELLEMS. I feel, Senator Curtis, that our approach is wrong. In my opinion, operating the Government of the United States, in principle, is identical with the housewife operating a home, and what she does is to first determine her income.

Senator CURTIS. Hers or her husband's?

Miss KELLEMS. Well, whatever the income is that comes in to support that home. Then she decides what she can afford to spend. Now, I feel that if the Federal Government would first determine its income, and then see how many of these plain and fancy schemes they can afford to have, we might have better government and we certainly would have fairer taxation.

Senator CURTIS. I agree with that 100 percent.

Miss KELLEMS. Good.

Senator McCARTHY. Senator Ribicoff?

Senator RIBICOFF. Miss Kellems, will you describe to us briefly your education and training in the field of economics and taxation?

Miss KELLEMS. Well, I am in the process of getting a Ph. D. from the Edinborough University. My education goes back 50 years. I have a master's degree from the University of Oregon and a year's resident work at Columbia University under Professor Seligman, and this goes back 50 years, but even today I think any self-respecting library anywhere in the world will have copies of Seligman's essays on taxation.

It is still the standard work. I started to get this degree at Edinborough, and I have finished everything except the thesis, and that would be done now, except that in pursuit of this research I stumbled onto the fact that there is no law that says single people have to pay at a higher rate, and in pursuing this and finding out about it, the degree has had to sort of wait.

If Congress would just please pass this law and let me get back to my studies, everybody would be better off.

Senator CURTIS. It looks like we are going to have a long recess.

Miss KELLEMS. I am very hopeful that Congress will take action and pass this bill.

Senator RIBICOFF. That may depend. What do you estimate the cost of Senator McCarthy's bill would be?

Miss KELLEMS. I would like to put it another way, Senator Ribicoff. How much are you going to take away from the single people unconstitutionally? Now, I think Mr. Adams, when we first discussed this, had a figure of $1.6 billion, which was the Joint Committee on Taxation's figure. I think Senator McCarthy, in his speech on the floor of the Senate, estimated that for this year it would be $1.9 billion. Isn't that correct, Senator McCarthy?

Senator MCCARTHY. That is about right.

Miss KELLEMS. You estimated $1.9 billion. Now, this seems like a very large sum of money, but there are just two or three small things that could be done that could easily replace these funds, but I don't know if you are interested in my opinion as to what the Government should do to offset this so-called loss.

The loss is not to the Government if they go through and continue this taxation. The loss is to the single people, and I might say that we are coming to a confrontation, because the Treasury has issued a summons to me and to my accountant for all of my documents and papers in great detail for 1966, 1967, and 1968, with the idea, I suppose, that they will do what they did before.

They will levy a very large tax on me to try to shut me up, but I don't shut up easily, as you know, Senator Ribicoff.

Senator RIBICOFF. I am delighted to see you again and see you looking so well. I am pleased that you have recovered from your slight indisposition.

Miss KELLEMS. That is all right. I always bound right back.

Senator MCCARTHY. Senator Fannin.

Senator FANNIN. Thank you, Mr. Chairman.

Miss Kellems, I am sorry that you were not more successful many years ago with some of your advocacy of a balanced budget, whether a family budget or a Government budget, but the sad situation is that we do not have a balanced budget.

We are not in a position where we can do what we would like to do, and so we have to take matters in priorities. I think you will agree with me on that, will you not? Priority is what comes first.

I would just like to ask this question. And, incidentally, I agree with the part on the head of the household that you have made in your recommendation, but in weighing the priorities, do you feel that a $600 allowance for a child is sufficient, and how would you compare that to the burden that is placed on the single person on ability to pay?

Miss KELLEMS. Of course, I don't believe in ability to pay. I think that everybody, everybody, should pay a tax, because what is a tax? It is Government. You are buying Government. And every person should pay, even a small person should pay a little so that they are contributing to their Government.

Now, I am an old lady and not married and not even an unmarried mother. I feel that $600 is not adequate for a child. One thing I think that should be said is that I have thousands of letters from single people saying, "Why should we pay taxes to educate the children of married people", so this is something.

I personally, Senator Fannin, take a very pessimistic view of the whole thing. We are now coming to the full realization of what the so-called Keynesian philosophy has done. We started this, as you know, many years ago. Lord Keynes was the great economist who said you can inflate a currency about 3 percent a year.

Well, it is like taking a drug. It is true you can start with a tiny little bit, but presently in the morning when you wake up, in order to even feel normal you must take that amount of that drug.

Then it goes and you keep increasing and increasing, so that today the Keynesian theory to me stands for exactly what it is. We now have runaway inflation, and I feel that if you would reduce taxes, that is the quickest way to stop inflation in this country, because every tax that is levied is added to the price of something.

Senator FANNIN. Unless we add it onto our debt.

Miss KELLEMS. All right, but where do we go with this debt? Lord Keynes never said where we are going with this debt, but let me give you an example I often use.

Take a chair, a wooden chair. From the time that chair is a tree in the forest and it is cut down and put through one process after another until it is finally a chair, every person who touches it pays an income tax, and that percentage of that income tax is added to the price of that chair. So if you would do away with the income tax, if you would do away with this tremendous tax—and I am very realistic. We are never going to repeal the income tax. Let's face it.

The country would go into chaos if you did. You can't do that. But you can stop all of this ridiculous gobbledegook.

Look, we have gone so far in this country. Here is an Encyclopedia of U.S. Government Benefits. Now, think of it. Take a look at that book. You can even get your kitchen done over. There are all kinds of things. What business is this of Government?

Senator FANNIN. I will agree. I am disagreeing with you at all, but I am just trying to be realistic as to what we do first. In other words, we have a bill here before us, and I think we should start to think about priorities.

Miss KELLEMS. Well, don't we also consider constitutionality? Does the Congress wish to act illegally, because this is an unconstitutional law.

When this was debated in Congress in 1948, Senator Fulbright said that it discriminated against the taxpayer because of geographical location, and he said, "Show me any other tax law that discriminates against a taxpayer because of the place where he lives."

I would like to ask Senator Fulbright to show me any other law that discriminates against a taxpayer because that taxpayer is single. If you are going to discriminate and put a penalty on us because we are single, and believe me millions of girls are single involuntarily, there aren't men enough to go around; if you are going to do this, then why don't you tax us more at a higher rate on our property taxes?

Senator FANNIN. I am very concerned about property taxes.

Miss KELLEMS. Yes, I am, too.

Senator FANNIN. That is perhaps one of the most inequitable taxes of all.

Miss KELLEMS. There is no doubt about it.

Senator FANNIN. Thank you very much. I just don't know exactly what we can do at this time that would bring about what your goal is presently and has been for many years, but we do need to have priorities, and that is why I was asking these questions. How can we determine just where we should start?

Miss KELLEMS. But, Senator Fannin, millions of these people are being put into bankruptcy because of this tax. I would like the committee to read these letters. You can't read them and not shed tears. This is a terrible thing. We are creating paupers out of these people.

Senator FANNIN. I am not in disagreement with you in that respect, but I also know that there are many people with families, with children, that cannot send their children to school and cannot meet their obligations, and so we have a great problem in all of the categories that we are talking about.

I appreciate the information that you have given us.

Miss KELLEMS. Well, I agree, but I feel that if the Congress does not take action, this question will undoubtedly go to the Court, because I am going to sue the Government for all this money that they owe me, and they are acting lawlessly and illegally now, trying to take my documents to collect a tax that is illegal in the first place.

This tax has never been submitted to the Supreme Court, and I am quite sure as soon as the timing lapses, you have to get permission from the Government to sue them, and as soon as I get permission, I am going to sue the Government for that money.

In the meantime, they are going to probably sue me to get my records. I think it is going to be quite a confrontation.

Senator FANNIN. We could all agree on that.

Miss KELLEMS. Yes.

Senator MCCARTHY. Miss Kellems, I understand your constitutional position is that if we allow deductions for wives and also for children, in some particular amounts, it might be constitutional, but to allow the split income simply because people are married, at a different rate from those who are single, that this is truly unconstitutional.

Miss KELLEMS. I feel that, Senator, because if you establish this principle, how far are you going to go? If you can tax a person because they are single, all right, then you can tax a person because that person is an orphan, or because of their church affiliation or their political parties. You might tax a person eventually, you might have a Government who might tax somebody because they just plain didn't like them.

Senator MCCARTHY. Short people against tall people?

Miss KELLEMS. Yes. I am afraid I would come out as compared with you at the little end of the stick, if they started taxing people because they are short. But this is the principle.

Senator MCCARTHY. And you feel that Judge Haynsworth in the decision indicates he has very bad judgment?

Miss KELLEMS. Yes, I think it is the most idiotic decision——

Senator MCCARTHY. That not just the decision is bad but that the opinion is also bad? That is even more serious in a Supreme Court Justice. He might have a bad decision with a good opinion, or a bad opinion with a good decision, but in this case it is bad on both counts.

Miss KELLEMS. I am not qualified to pass on Judge Haynsworth or his qualifications for the Supreme Court.

Senator MCCARTHY. But in this case, however,—

Miss KELLEMS. But in this case I think this is the most dreadful thing. Would you like me to just read briefly?

Senator MCCARTHY. I think you should.

Miss KELLEMS. What he said here?

Senator FANNIN. Is it in the testimony?

Senator MCCARTHY. She skipped it, but I think we ought to let her read it.

Miss KELLEMS. It is most interesting. The court of appeals stated on page 389:

> Taxpayer seeks to recover the difference in the tax paid upon her 1954 income and the amount of tax which would have been due if a husband and wife reported the same income and deductions upon a joint return. Permitting married taxpayers to use the split income device of No. 2 of the 1954 code, 26 U.S.C.A. No. 2, while withholding the privilege from single persons she says is such an arbitrary and unreasonable discrimination that it cannot be allowed under the Consitution. Classification of taxpayers according to marital status is not unreasonable, however, and there was much reason behind the purpose to equalize the tax burden as it falls upon married couples in common law States in comparison with those in community property States. The fact that the change gave a proportionately greater tax reduction to married couples with large incomes is wholly irrelevant; if the rapid acceleration of the progressive tax rates run afoul of no constitutional guaranty, a slight withdrawal may not be said to have done so. We find no merit in the taxpayer's contentions.

Now, in simple English, with all that out, Judge Haynsworth said that an increase of 40 percent in Mrs. Faraco's tax, because her husband died, was so slight, that is the word he used, a "slight withdrawal," did not violate the Constitution.

Now, since when does the amount determine the constitutionality of a law? You could have $1 discrimination and it could violate the Constitution. As I say, I have nothing personal against Judge Haynsworth. I don't know anything about his record at all except that this one case was enough for me.

Senator CURTIS. Miss Kellems, you are reading something in that that isn't there.

Miss KELLEMS. What is it, then?

Senator CURTIS. He said, "If the rapid acceleration of progressive tax rates", something that you are very much opposed to——

Miss KELLEMS. I beg your pardon?

Senator CURTIS. That is something you are very much opposed to.

Miss KELLEMS. I certainly am. It is pure Marxian doctrine.

Senator CURTIS. Yes. He says—

> If the rapid acceleration of the progressive tax rates ran afoul of no constitutional guarantee, a slight withdrawal may not be said to have done so.

He is not saying that the amount of the tax in this case, the differential, is slight. He is comparing it with the accelerated progressive tax rates that we have that he says have not been held unconstitutional.

Miss KELLEMS. What does "slight withdrawal" mean?

Senator MCCARTHY. I think this runs against the judge, really. This was not the issue, the rapid acceleration of tax rates——

Senator CURTIS. No, I don't think so. I think he is comparing what has happened here with the accelerated tax rates. He said so.

Senator FANNIN. I don't know that Judge Haynsworth is the only one. It may have been ruled on in many cases. I can't say that has set a precedent.

Miss KELLEMS. But this is the only case that has ever bit the Court, and I cite it because the Secretary of the Treasury's chief counsel wrote this to me. He sent this to me, and I looked up the case.

Senator FANNIN. I think you should go further than that and determine. You say it is the only case. I don't know how much research has been done in that regard, but I think it shouldn't be taken for granted that this was done, but we should certainly make that determination.

Miss KELLEMS. What determination? I am not clear.

Senator FANNIN. As to whether or not he is all alone in his ruling?

Miss KELLEMS. I haven't been able to find any other, and I have had several lawyers looking at this, and as I say, of course, I thoroughly disagree with the progressive rate. It was Marx and Engel who cooked that up, and it was Vice President Garner, serving in the House of Representatives in 1913, who insisted upon it, because the 16th amendment makes no provision for a progressive rate, and it runs contrary——

Senator FANNIN. All I am saying is that we can't blame Judge Haynsworth.

Miss KELLEMS. I am not blaming him. I am merely putting this in the record. This is what he said. I may interpret it wrong. Anybody can interpret that as they please, but to me, and I have had some lawyers look at that, they say that means that a slight withdrawal, 40 percent I consider more than slight, may not be said to run afoul of constitutional guarantees.

Now, what does that mean to you, Senator Fannin?

Senator FANNIN. Well, of course, I would have to see the amount, see the determination, and I could not just without having more information make a statement on the subject.

Miss KELLEMS. I have only what the Treasury sent me.

Senator FANNIN. I don't even have that.

Miss KELLEMS. It is in my testimony.

Senator McCARTHY. I have just two points.

One, I think the only point in your testimony I object to is you seem to imply that members of the committee are supposed to understand the Internal Revenue Code.

Miss KELLEMS. Do you understand it?

Senator McCARTHY. That is an unreasonable demand. We don't even ask the staff to understand it.

The other is a clarification of what you said about Joseph selling the Egyptians into slavery with their own money. Would you explain that scripture reference?

Miss KELLEMS. It is a very nice story from Joseph's viewpoint. Most everybody thinks of Joseph, who was his father's favorite son and wore a coat of many colors and was sold into Egypt by his brothers into slavery, which all is very true, but the truth of the matter is that the Pharaoh had a dream, and the dream was of seven fat cows that came up out of the river and started eating the grass on the riverbank, and then seven lean cows came up. They didn't eat the grass. They ate up the fat cows, and the Pharaoh was very upset.

He went to sleep and he dreamed again, and he dreamed that there were seven ears of corn, fullbodied and well and healthy, and then there were seven very ill-favored ears of corn that came up and ate the seven good ones.

Nobody could interpret the dream, and a cupbearer who had been in prison with Joseph remembered that Joseph had interpreted a dream for him, so he asked the Pharaoh to bring Joseph out of the prison to interpret the dream, which the Pharaoh did, and Joseph said:

> It is very simple. There will be seven years of plenty followed by seven years of drought, and we should amass all that we can to care for the bad years.

Well, the Pharaoh was very pleased and he made Joseph second in command. Joseph had everything.

Senator McCarthy. Commissioner of Internal Revenue?

Miss Kellems. Yes, Commissioner, he could have been.

At any rate, while the 7 years of plenty were going on, and they had these bountiful crops, Joseph taxed the people 20 percent, and it is most interesting how throughout history this percentage of 20 percent crops up time and time again. But at any rate, Joseph taxed the Egyptians 20 percent of their income. This was an income tax, and he built tremendous graineries and he had places for the stock and the cattle and everything, and he gathered all of this tremendous wealth into the Government.

And then the 7 years of famine came, and the Egyptians came to Joseph and said, "Look, we are starving. Give us some food."

So he said, "How much money have you got?"

So they took all their money and they gave it to Joseph and he took out of the stocks and gave them food. This was theirs in the first place, remember. It came from them.

Then they ate that and presently they were hungry again and they came back and they said, "Look, we can't do anything. What can we do? We are starving."

He said, "What about your flocks and your herds? Bring them to me."

So they brought all of their cattle and their herds and they gave them to Joseph, and he gave them food.

Then that was gone, and they came back and said, "Now, what can we do? We are starving."

Joseph said, "What about your land? You deed your land to the Pharaoh and I will feed you."

That is what they did. In other words, the Pharaoh owned everything, and after the drought Joseph gave them seeds and they planted, but they were working for the Pharaoh, because he owned everything, and that is precisely what is happening in this country.

Senator McCarthy. Seven years?

Miss Kellems. Seven years. Well, I don't believe we can last 7 years, Senator McCarthy.

Senator McCarthy. Thank you very much.

Miss Kellems. You are very welcome.

(Miss Vivien Kellem's prepared statement follows:)

Statement of Miss Vivien Kellems, East Haddam, Conn.

SUMMARY

1—Brief History of the Community Property Law, passed in 1948, which resulted in the penalty tax on single people.
2—Analysis of this law.
3—Attempt to test the Constitutionality of the penalty tax.
4—Bill S2794, Introduced by Senator Eugune McCarthy, August 7, 1969.
5—Action taken by Miss Kellems to test the constitutionality of the penalty tax.

The first income tax law passed under the Sixteenth Amendment in 1913, consisted of 40 pages. The latest, published July 22, 1968, is 1593 pages. Titles, subtitles, tables, texts, cross-references, special rules, miscellaneous information, all in very fine print, is one vast labyrinth of gobbledy-gook. Can the most brilliant lawyer, the most adroit and versatile accountant, can the Secretary of the Treasury, can anyone of you gentlemen on the Finance Committee, possibly grasp and understand this fantastic monstrosity we call our Income Tax Law? And this does not include volumes of court decisions, regulations, special rulings, and other paraphernalia.

Congress now proposes to "reform" this hydra-headed monster: close a loophole here, put a path on there, levy more on one hapless taxpayer, give a crumb of benefit to another. When finished, the whole mess is going to be more incomprehensible and hopeless than it is now.

Naturally the whole thing is shot through with favoritism, injustices and inequities. The most blatant and unconstitutional of them all is the penalty tax against single people.

There is no law that says single people must pay higher income taxes just because they are single. Congress never has, nor does it dare to pass such a law; even this Supreme Court would have to declare it unconstitutional. Then how is it possible that for the past 21 years, the Federal Government has sucked into its cavernous maw billions of dollars from American citizens on the pretext that it is legal to penalize people for not being married?

It was done in 1948 with a sleight-of-hand trick called the Community Property Law which wasn't a Community Property Law at all. That was the excuse given for the wholesale robbery of millions of helpless people.

It all began when the Income Tax Amendment to the Constitution was adopted in 1913, and came about because our laws are derived from two different systems, the Spanish Law and the English Common Law. At the end of the Mexican War, Mexico ceded to the United States that territory now comprising New Mexico, Arizona, California, Idaho and Nevada. As each of these states was admitted to the Union, it embraced most of the English Common Law, but retained those Spanish Laws protecting the rights of the wife to one-half of the property acquired after the marriage, also one-half of the income earned by the husband. These laws were inherited from Mexico which in turn, had adopted them from Spain.

Texas came into the Union by treaty, an independent nation, but Texas had already put the community property laws in her Constitution. Louisiana was acquired by purchase from France, but the French community property law was practically the same as the Spanish, so one more community property state came into the Union.

The rest of the states derived their laws from the English Common Law and gave no such rights to wives. As Senator Connally said, women in many of these states were little better than serfs. In some states it was legal for a man to beat his wife, provided the switch was no thicker than his thumb.

When the first income tax law was passed under the Sixteenth Amendment, the Internal Revenue Service recognized these community property laws and permitted married people in these seven states to split their incomes and pay at a lower rate. Since these first income taxes were very low and exemptions relatively high, the rest of the country paid no attention to this special benefit enjoyed by their sister states. However, after the first world war when income taxes reached astronomical heights, the common law states came to with a bang. How come? Why weren't they entitled to the same tax break?

The first bill to equalize these rates was introduced in Congress in 1921, but went down to ignominious defeat. The community property states refused point blank to extend this lucrative loophole to the rest of the country. They had a good thing going and didn't propose to give it up. Again and again the common law states tried to pass this bill, but each time they lost. As Senator Fulbright said, these bills were "filibustered to death". Due to the lower taxes paid by married people in the community property states they were sitting pretty; the common law states were paying a disproportionate share of the cost of the Federal Government.

By 1947 the battle lines were drawn and feelings ran high!

The very first bill introduced in the 80th Congress was House Resolution No. 1—to reduce income taxes. The House passed this bill and sent it to the Senate where Senator McClellan immediately proposed an amendement to pass on the blessings of split income taxes to the rest of the country. By this time five more states, Michigan, Nebraska, Oklahoma, Oregon and Washington had passed community property laws, making a total of twelve such states. Senator McClellan's amendment proposed to bring the other thirty-six states under this protective tax umbrella.

It was a lighted match and fireworks exploded on the Floor of the Senate. Senator McClellan charged that the Community Property states were getting away with murder. He claimed the common law states were paying $500,000,000 a year more than the community property states, an advantage to these twelve states of $175,000,000. He was grieved that Arkansas, his home state, paid $5,000,000 more in federal taxes in 1946 than a community property state of comparable population would have paid. To the distinguished Senator this was an unbearable penalty inflicted upon his state and "the rankest and most unjust discrimination that exists anywhere in our tax laws against three-quarters of the states". "Such a monstrosity in our tax structure" was not to be borne and he demanded "righteous and equitable treatment for simple justice to all American citizens alike." But to Senator McClellan and 99% of that august body, such "righteous and simple" justice did not apply to single people.

Throughout the debate the only words used in referring to the taxpayers were the "citizens" or "people of my state" or of the United States. The words "single people" appear only three times in that whole, lengthy debate that stretched out over months. Senator Millikin rather timidly ventured the opinion that there were other people to be considered. He suggested that there might be "important effects on the distribution of taxes among the different income groups between married and single persons". And at another time, "I am emphasizing that we are dealing with a group problem. Under the Senator's amendment a single person living alone would not benefit. Widows with children would not benefit. Children with dependent parents would not benefit."

But the Senator might just as well have saved his breath. Not one member of that "most exclusive club in the world" even heard the word *single.* Even *widow with children* failed to register. Senator McClellan tartly replied, "the bill does perpetuate a group benefit which now accrues, and I am trying to quit perpetuating this group benefit to the community property states." And the rest of the Senators went right on prattling about the "citizens of my state," or the "citizens of the United States," or the "people" of the state or nation. To them there were no single people; *everyone* was married.

Incredible! Suffering poignantly from "blatant injustice" they were utterly oblivious that they were shunting off onto the frail shoulders of those least able to pay, the whole weight of the burden which they were determined to dump from their own. There was no pretense; it was a straight tax gimmick. It unabashedly gave a tax advantage to one class of taxpayers. One member assured Senator McClellan that the Ways and Means Committee would "consider this matter with the greatest sympathy". To which the Senator from Arkansas replied, "I want a reduction in taxes, not sympathy." He then informed Senator Knowland, "On our present salary ($12,000) I pay $646.00 more Federal tax than does the Senator from California. I need that money for my family as much as does the Senator need that amount of money for his family. All I am asking is that justice be done." The saving on the present Congressional salary is over $4500.00.

It was then suggested that Arkansas could pass its own community property law, but this was not easy. The five states that had passed such laws did so in self-defense with the greatest difficulty. Another state, Pennsylvania, had passed such a law only to have the Supreme Court of Pennsylvania declare it unconstitutional. Community property laws created all kinds of problems affecting estates, domestic relations and commercial credit; they could upset court decisions and cause individual and general chaos. Senator McClellan didn't think much of that idea; the only solution to his problem was a Federal Law; he would settle for nothing less.

At this point Senator Connally invited the Senator from Arkansas to move to Texas and this brought up another sore point. While the Senator couldn't very well move to Texas, that was exactly what a number of his constituents were doing. The town of Texarkana was divided right down the middle by the state line between Texas and Arkansas and many wealthy citizens of Arkansas, whose businesses were in that state, found it profitable to move their homes across the state line to Texas where they happily split their incomes and paid Uncle Sam at the lower rate. Other states lamented loudly that the Community property states were siphoning off the wealth and business of the non-community property states. They did, indeed, have a good thing going!

Senator Fulbright termed it "geographical discrimination" and he challenged any Senator to "cite any other case where we make a distinction and a difference in the tax burden because of citizenship in a particular state or states."

I ask Senator Fulbright, show me any other tax law which makes a distinction and a difference in the tax burden because of the marital condition of the taxpayer?

The bill did not pass in 1947. However, it was one of the first bills passed in 1948. On April 1, 1948 President Truman vetoed it, calling it "inequitable". The very next day Congress passed it over his veto.

It should be made quite clear that this was *not* a community property law. Not one property law, or any other law, was changed one iota. Not one piece of property, or penny of income changed hands under this law. No wife anywhere received one thing except as she benefited by the tax savings. Everything remained precisely as it was and the husband still owned his income. It was a straight tax gimmick, class legislation and discrimination of the most flagrant sort. There was absolutely no pretense. It was a rich, married taxpayer's bill, the higher the income the greater the *percentage* of saving. Poor married couples, those receiving $5000 or lower, didn't save a dime. The single taxpayers were left holding the bag. They had to pay at the confiscatory rates of World War II without a penny of relief. Never has a law been passed saying they must pay at these exorbitant rates, but under this so-called community property law, the Internal Revenue Service has arrogated to itself the power to illegally collect billions and billions of dollars from these helpless people.

But more than this, the law gave the rich, married people in the community property states something they had not had before. They could now split *all* income, including that derived from premarital estates. This they could not do before. But under this law rich, married people in all 48 states could split this income, and thereby save themselves billions of dollars. Add to this the estate tax which permits them to pass on one-half their estate with no tax, while the other half is taxed at the lowest rates, and the picture is complete. They had it made! To finish off the single taxpayer, when he dies 100% of his estate is taxed.

But before his sad demise, one more indignity—the Surtax! Since there wasn't one more thing to tax. Congress taxed a tax. This was not a tax on income, this was a tax on the income *tax* and again the single person had to bear the brunt of it. 10% for married people, but up and up and up for single people because they have to pay 10% on the penalty they are already paying. In thousands of cases it runs over 14%. I make no comment on this action; the facts speak for themselves.

Has there ever been such rank, discriminatory, unjust, unconstitutional legislation against millions of American citizens? Why? Because they are not married.

There has been one attempt to test the constitutionality of this system. The day after Christmas, 1953, one Mr. Faraco died. The very next year, the income tax of his widow was raised 40% because she was now a single person. Mrs. Faraco resented this unjust penalty for having lost her husband, and brought suit to recover this money in the Tax Court of the United States. The Tax Court refused to consider the constitutional issue, and the case, *Antoinette M. Faraco*, 29 T C 674 (1958), was appealed to the Court of Appeals for the Fourth Circuit and that court held that the law was constitutional (Faraco v. Comm., 261 F. 2d 387 (4th Cir., 1958)).

The Court of Appeals stated, page 389:

"Taxpayer seeks to recover the difference in the tax paid upon her 1954 income and the amount of tax which would have been due if a husband and wife reported the same income and deductions upon a joint return. Permitting married taxpayers to use the split income device of #2 of the 1954 Code, 26 USCA #2, while withholding the privilege from single persons, she says is such an arbitrary and unreasonable discrimination that it cannot be allowed under the Constitution. Classification of taxpayers according to marital status is not unreasonable, however, and there was much reason behind the purpose to equalize the tax burden as it falls upon married couples in common law states in comparison with those in community property states. The fact that the change gave a proportionately greater tax reduction to married couples with large incomes is wholly irrelevant; if the rapid acceleration of the progressive tax rates ran afoul of no constitutional guaranty, a slight withdrawal may not be said to have done so. We find no merit in the taxpayer's contentions."

In plain English, this decision says that because the increased tax of 40% was so "slight" it did not violate the Constitution, and without doubt, is the most idiotic decision in the whole legal history of the United States. Since when does the *amount of damage* determine the constitutionality of a law?

That decision was rendered by Judge Clement F. Haynsworth, who has recently been nominated for the Supreme Court.

The Supreme Court refused to rule on this question by denying certiorari (359 U S 925 (1959)) and until it does rule, the constitutionality of the penalty tax on single people simply because they are single, has not been established.

In 1962, Senator Eugene McCarthy, of Minnesota, introduced a bill (S35) which would permit certain persons 35 years of age, or over, to qualify as Head of Household, and pay a lower tax, however, not as low as married persons in the same income tax brackets. There was already a rather nebulus classification, Head of Household, which Congress had added in 1951, to partly still the cries of outrage from indignant taxpayers, but the requirements were so strict that very few people could qualify. For all the relief it afforded, it might as well not been there.

Senator McCarthy sought to amplify this classification to include many more over-burdened single taxpayers. He got exactly nowhere. He was a lone voice crying in the wilderness. In spite of the lack of understanding and co-operation, even ridicule, the Senator persisted and has reintroduced this bill in each succeeding Congress (88th, 89th, 90th). Convinced of the injustice of the penalty tax and also persuaded that it was unconstitutional, Senator McCarthy felt that it was the best bill that could be considered at that time, since there was such opposition to the whole idea of fairness and justice for single people. Later other Senators joined him in sponsoring the bill and several Congressmen have introduced similar bills in the House of Representatives.

And the Ways and Means Committee recently actually included such a measure in its proposed tax reform bill. This action reflects the change in the political "climate" regarding this tax.

Finally, Senator McCarthy stood on the Floor of the Senate on August 7th, this year, and introduced a bill (S 2794) to abolish the whole unsavory, unconstitutional mess. He was heartily commended by Senator Ribicoff, of Connecticut, who pledged his support of the bill. Senator Ribicoff said, "The Senator from Minnesota has been in the forefront of this fight for many, many years. He has been a lone voice, receiving very little support from anyone else in the executive branch or in the legislative branch. I will certainly be pleased, as a member of the Committee on Finance, to support the Senator's efforts to bring justice in this important field."

It is this bill, Gentlemen, which brings me before your Committee today.

On April 15th, I signed a blank income tax form (1040) and sent it to the Director of Internal Revenue, Andover, Massachusetts. I then wrote the Secretary of the Treasury that I would not pay any more taxes until the Federal Government refunded to me the sum of $73.409.03, taxes which have been illegally collected from me for the past twenty years, plus interest.

From that time, letters have poured in from all over the United States. As their numbers increase, my blood pressure rises! They come from all over the country, from all kinds of people, young people working their way through college, elderly widows trying to make ends meet on meager incomes, school teachers, nurses, telephone operators, stenographers, secretaries, factory workers, and thousands of retired people—a cross section of America. All tell one bitter, heart-breaking story, a crushing penalty tax by an all-powerful, greedy, ruthless government for one reason only, these millions of people are not married.

What began as a simple test of the constitutionality of this tax, has now become a flaming, emotion-packed crusade.

We are creating paupers out of decent, self-respecting, self-supporting American citizens. Read these letters and see if you can stay calm; widows with small children, women whose husbands have been killed in Vietnam and who must pay a penalty for the sacrifice they have made, other widows using the capital of the small estate left by a husband to pay current taxes, one woman living on crackers and tea. Thousands terrified at what the future holds; these are proud people who cannot bear to ask for public assistance, and always the cost of living spiraling ever up and up while their standard of living goes down. Is this what this Committee wants? Is this what the Congress of the United States wants?

I have no quarrel with the split income tax provision, and certainly there isn't any intention to take this tax privilege away from married people. More power to them and to anyone else who can legally save on their taxes! All we single people ask is the same tax break. We want simple justice for single people. And millions of married people agree with me.

Senator McCarthy. We will recess until 9:30 tomorrow.

(Whereupon, at 3:05 p.m., the committee adjourned, to reconvene at 9:30 a.m., Friday, October 3, 1969.)

APPENDIX A

WRITTEN TESTIMONY RECEIVED BY THE COMMITTEE EXPRESSING AN INTEREST IN THE SUBJECT OF REAL ESTATE DEPRECIATION

Written testimony received by the Committee expressing an interest in the subject of real estate depreciation

Statement of Owens-Illinois, Inc., submitted by Floyd M. Canter, Executive Vice President Commercial and Technical Administration

Section 521 is aimed at thinly capitalized real estate companies and ventures by limiting depreciation on new construction to the 150 percent declining balance method. However, in attempting to correct some abuses, the Bill penalizes all building depreciation including that of manufacturing facilities constructed by the user.

The rapid technological progress being made by American industry tends toward obsoleting manufacturing buildings almost before they are built, particularly in the case of special purpose buildings. Because of technological progress, more and more buildings are being designed to the particular needs of a manufacturer. The double declining balance and sum of the years-digits methods of depreciation give some recognition to the potential obsolescence and deterioration as an "ideal manufacturing facility." The restriction to 150 percent declining balance on new construction and straight line depreciation on used buildings will tend to restrict industrial construction, placing American business at a further disadvantage as compared to foreign business where, in some countries, write-offs of as much as 50 percent of a plant are allowed in the first year and where numerous special incentives for modernization of facilities are provided.

At the time that repeal of the investment credit was announced, the Treasury Department indicated that it was at least thinking of liberalizing depreciation methods with triple declining balance being given as one of the methods under review. Section 521 works in the opposite direction.

The Treasury Department currently has at its disposal several tools which could be used to restrict blatent abuses. The first of these is the life assigned to the building; the second is disallowance of interest costs on thinly capitalized companies. If strengthening of these tools is needed, we would concur; but we do not believe that all building construction should be penalized for the abuses of a few. Rather, we should request additional incentives to encourage American business to remain or become competitive with foreign operations who benefit from the above mentioned incentives.

We also strongly urge that the present tax rules regarding recapture of accelerated depreciation be retained rather than imposing complete recapture as proposed by Section 521. This retains the penalty in speculative investment in real estates without unduly penalizing those who after using a building for a number of years must dispose of it because of changing economic conditions. The present recapture provisions guard against abuse of the accelerated methods of depreciation without unduly taxing appreciation in dollar values caused by the continued inflationary trends in our economy. Where a building is used in bona fide business operations for substantially more than a decade, the complete recapture proposed by Section 521 would tax inflationary increases in value, which have nothing to do with misuse of accelerated depreciation, at ordinary income rates. Proposed Section 521 would, therefore, completely circumvent the capital gain provision with respect to the very kind of value appreciation to which the capital gain provisions historically have applied. Such a drastic change in fundamental tax policy, we believe, should not be so casually made.

Statement by Alex D. Hegel, President, Sierra National Corporation

CUTBACK IN DEPRECIATION ALLOWANCE COULD RESULT IN SERIOUS DAMAGE TO U.S. ECONOMY

The so-called "tax reform" bill now pending in the U.S. Senate will definitely jeopardize our nation's entire economy if enacted in its present format.

This sober fact of life seemingly has been overlooked in most discussions revolving around the controversial tax law measure.

Take, for example, the housing industry (single family residences, apartment houses and mobile homes) which constitutes the largest segment of our gross national product.

Proposed provisions in the "tax reform" bill modifying depreciation allowances and reducing income deductibles cannot but have a negative effect upon investment sources—once the latter become fully aware of the bill's restrictions.

Ironically, Cabinet member George Romney has repeatedly stressed the need for building more than two million (2,000,000) housing units next year. Even with existing depreciation allowances this goal would be exceedingly difficult—if not impossible—to meet.

And, if the depreciation cutbacks written into the bill already passed by the U.S. House of Representatives and now being discussed by the Senate Finance Committee remain unchanged, there is serious question whether even fifty (50) percent of the required two million housing units would be built during 1970.

Simply stated, investment capital—so absolutely necessary to underwrite these critically needed units—will not have enough incentive to invest and build!

Along with tax reform, one of the more widely debated issues of the day concerns employment for underprivileged minority groups. A flourishing construction industry can provide more employment opportunities for these groups than any other segment of our economy, economists point out.

Their position is well-taken because a thriving residential construction industry automatically generates increased production, and more jobs) for steel, lumber, copper and carpet mills; concrete and gypsum plants; paint, glass and roofing material manufacturers—and numerous related industries.

The largest segment of present employment for underprivileged minorities already lies within these industries, it is generally agreed. Therefore, it should be evident that if investment capital's incentive to finance residential construction is dampened, such construction will inevitably decline—and, with it, corresponding job opportunities for the presently unemployed.

It becomes increasingly clear, then, that the several restrictive depreciation allowances contained in the pending "tax reform" bill will seriously injure the health of our nation's overall economy—should they be enacted into law.

Statement of Leon London, Attorney, New York, N.Y.

My name is Leon London. I reside at 340 East 51st Street, New York City, N.Y. I have practiced law for 43 years, principally in real estate law. I have also built high rise apartment houses and I have rehabilitated slum buildings.

I have two suggestions to make, one in the direction of inducing investors to rehabilitate slum housing. The tax law should be amended to grant a deferment of capital gains taxes to persons who sell real property and within two years reinvest their profits in the purchase and rehabilitation of slum housing.

The hazards of investment in slum areas are well recognized. The rapid depreciation contained in H.R. 13270 may not be adequate to give that program enough of an impetus to enable us to overcome the deterioration in housing in those areas. A provision deferring taxes, the same as in the case of a condemnation for public use, an involuntary conversion, will provide a further incentive to devote those profits to a satisfying of the great need for rehabilitation of the housing supply in slum areas.

My second sugggestion is that the code be amended to enable a property owner using "straight-line" depreciation to increase his depreciation to the extent necessary to meet his mortgage and amortization payments.

The problem arises in the case of a long term mortgage, with fixed payments to cover both interest and amortization. The time arrives when the amortization exceeds the straight line depreciation deduction.

This occurrence induces the owner to sell his property rather than pay taxes on part of his amortization.

The fact is that property in the hands of the builder is likely to receive better treatment, sofar as making needed repairs is concerned, than the property will receive at the hands of a speculator. The result will be to prevent or postpone deterioration of our housing supply.

It will be less costly to prevent deterioration of existing housing than to build new housing to replace it or to make a major rehabilitation of it.

A principal question before this Committee on H.R. 13270 is neither fiscal nor financial: it is moral: Shall we change the rules of the game while the ball is still in play? "Not the morals of the market place but the punctillio of an honor the most sensitive", to quote the words of the late Supreme Court Justice Cardozo, describing the code applying to a trustee, is the standard for government conduct. Public policy is established by Congress as the rule and guide for the conduct of our people. Lower standards of government conduct teach our children moral lessons which cannot afterwards be eradicated.

The question goes beyond the 5 or 6 billion dollars in additional revenue which the government can take in, or a change of a like amount in the tax which particular taxpayer segments of our society will save as against some other segment. The question is when the change shall take place as to each investor.

As a nation, we are not about to go out of business. In the ordinary course of our national affairs, new bond issues will be written; new buildings will be built; new investments will be made. But if the change in the rules is made while a citizen owns a particular investment, which he made in reliance upon the good faith of government, the change can bring about a loss of confidence which can be as harmful in its effects as a depression.

Many, if not most, of the changes which the House bill proposes are good. But they should be given effect prospectively not retroactively. The widow and orphan who own a particular security should know that while they own it, it will continue to receive the same tax treatment as it did previously. When they make a new investment they will be doing so with their eyes wide open. The doctrine of caveat emptor will then apply; but it will only apply prospectively—on the investments they make today and tomorrow—not on those which they made yesterday. I repeat that it is a question of confidence. It is a question of the confidence which the investor, whether he be a businessman or a widow investing her "mite" can have in the attitude of government.

We have learned through experience that, at the bottom of the depression in the 1930's, bricks and mortar, the railroads and the machines did not change from one day to another; that they were the same the day before the stock market crash as they were the day after. What did change was the climate of confidence. And when the confidence climate changed, it took years to restore it.

The administration is seeking to curb inflation; it is not seeking to bring about a major depression. It has taken years to bring the small investor into the stock market—to make him a partner in American business. And making him a partner in American business is the soundest move the government can make. It brings stability because it makes him a partner in the country's success. This fact is brought sharply home to us when we compare the economy of our country with the economy of countries behind the iron curtain.

Moreover, the moral principle involved is of particular importance today when our young people are looking for guidelines: when crime is rampant in the streets, when the use of drugs is on the increase. If H.R. 13270 should pass in its present form, the young will say: "See, Congress has no moral values; why do they expect us to have them?"

The United States is not an oriental bazaar in which "buyer beware" must be the rule. Nor is it a banana republic in which the administration and the constitution change at the whim of a few men with guns. As the world's leading nation, we must live by the same moral code domestically as we do in our foreign affairs.

It is true that an investor has no vested interest in a particular rate of tax, or in a particular mode of depreciation. The fact is, however, that past government edicts, for example the provision that loans to foreign governments shall not be made to those governments which refuse to pay interest or principal on previous loans, and the one that foreign aid will be denied to governments which take property of American citizens without just compensation shall no longer be given. The same rules of high moral principle should apply to our own citizens.

In the past, when it was decided to change the rules of the game with respect to interest on U.S. Bonds, the rules were made prospective only, *i.e.*, applicable only to future issues of bonds. This principle should be followed now.

I would, therefore, urge Congress to go in the opposite direction for the House bill, sofar as dealing with present investments is concerned. I would go further: I would permit the original owner of a building or a machine to change its depreciation method to a higher one, or a different one. It is only with respect to new acquisitions of buildings, machines and oil wells and other new investments that the change in the rules of the game should apply.

All sorts of complex arrangements have been made between investors in reliance on these provisions of law. Changing the rules now will shake the confidence of the business world and may well ruin numerous investors. Our national honor and our tax needs can both be satisfied by amending H.R. 13270 to provide that the changes proposed by H.R. 13270 shall be operative only with respect to investments made after the date when the Ways and Means Committee first publicized the proposed new "rules of the game".

If you want to entice the private sector back into constructing housing, particularly in New York—after the bath which many of them are taking as a result of the imposition of "rent controls" on housing built after 1947—in the face of constantly rising construction costs, you can do it by providing tax incentives.

It is no answer to this problem to say that we will give the incentives to the fellow who builds tomorrow. If you take away the incentives from those who built yesterday, the private sector will say that tomorrow you will take away the incentive from me and he will not build.

My views are based upon my experience with a large number of real estate owners.

LEON LONDON.

STATEMENT OF THE BOISE CASCADE URBAN DEVELOPMENT, SUBMITTED BY STEPHEN D. MOSES, GENERAL MANAGER

MEMORANDUM ON 1969 TAX LEGISLATION

The Tax Reform Bill (H.R. 13270) passed by the House on August 7, 1969, goes beyond the apparent intention of the Administration and a concerned Congress to reform existing tax laws in order to prevent abuse by which certain wealthy individuals (according to studies, approximately 155) have escaped all income tax by utilizing alleged "loopholes" to shelter income. The proposed legislation appears to have been drafted without adequate consideration of its technical aspects. It passed the House with virtually no debate or serious consideration of the overall effect such formidable legislation will have on society, particularly (and in some instances, singularly) with respect to the real estate industry, that critical sector of the economy which assumes substantial risk to provide the facilities in which we live and work.

Tax reform, such as a minimum income tax for wealthy individuals is needed and would be welcomed but should be accomplished by laws which are designed to that end and which do not place one segment of the nation's economy in a seriously non-competitive position by generating inequities and uncertainties as to the tax status of an investment. The country faces a critical need for more facilities. They will not be constructed if the equity investors in real estate are not provided equitable opportunities for a fair return on invested capital. These investors have complete freedom of investment choice. To attract the capital it needs, real estate must be clearly competitive with other investment forms. The full impact of the proposed legislation on a patricular individual does not seem to be susceptible to precise calculations because of the overly complex rules which will affect each individual, but it is clear that real estate will no longer be sufficiently competitive to attract equity investments.

A dynamic growing construction industry is necessary to provide essential jobs for our growing work force. The need of the country for new housing and related commercial facilities has never been greater. The labor force must be supplied with new blood. If construction is impeded, where will these new workers be trained?

Specific provisions of the legislation are discussed hereinafter. The net effect of these provisions, if enacted, would be to reduce specific tax benefits and generate uncertainty with regard to investment decisions, resulting in a substantial reduction in real estate activity and an increase in future rental charges.

ACCELERATED DEPRECIATION

The Bill would reduce substantially the benefits of accelerated depreciation on real estate. New construction (other than rental housing) would not be eligible for double declining balance or sum-of-the-years'-digits method unless construction began before July 24, 1969, or a written contract for any part of the construction or for permanent financing was entered into before that date. Nonresidential new construction will now be limited to the 150 per cent method, the rate allowed under existing law for used property.

New residential construction may use accelerated depreciation only if in the taxable year at least 80 per cent of gross income from the building is from rentals of residential units.

Used buildings of whatever type which are acquired after July 24, 1969, must use straight line depreciation. The 150 per cent method of depreciation under existing law should be continued to prevent a significantly adverse effect on the resale market and on plans for new construction. The present useful life guidelines for real estate are unrealistically long and the present 150 per cent method takes cognizance of this inequity. In placing his capital, an investor must consider the ease with which he can liquidate a potential investment. Any proposal which makes it less desirable to acquire used property obviously will make it more difficult for the first owner to sell, and the initial investor will be less willing to make a real property investment.

Existing accelerated methods of depreciation should be continued for new commercial and industrial construction in order to provide incentive for continued expansion in line with our growing population. Even if an accelerated depreciation method is used, the excess over the straight line method is subject to recapture when the property is sold.

RECAPTURE OF DEPRECIATION

We do not quarrel with the concept of recapture of "excess" depreciation. However, under the proposed legislation any gain realized on depreciable real estate sold after July 24, 1969, would be recognized as ordinary income to the extent of depreciation taken after that date in excess of straight line. These rules do not only affect future acquisitions, but apply to transactions entered under the exising rules. Such legislation seems unfair and, in addition, confuses the investment community and generates too much uncertainty.

The expressed intent of these provisions is to curtail the rapid turnover of real estate investments. That purpose could be accomplished by a proposal applicable to facilities acquired after July 24, 1969, that would (1) recapture all gain as ordinary income to the extent of any depreciation claimed where the holding period is 3 years or less and (2) beginning with the first month of the fourth year reduce the percentage of gain taxed as ordinary income by 1 per cent a month. Such a provision would accomplish the intent to curtail abuse without hindering the country's need for new construction. Present law provides for a somewhat shorter recapture formula.

LIMITATIONS ON INVESTMENT INTEREST DEDUCTIONS

The Treasury on September 4, 1969, recommended to the Senate Finance Committee that this particular section of the House Bill be deleted from the legislation to be considered by the Senate. It was the feeling of the Treasury that as written, the provision failed o correct many of the problems which it was intended to deal with. It was their further feeling that it discriminates against those with earned income, and in the last analysis, may not have been necessary under any conditions due to the Allocation of Deductions provision.

We heartily agree with the recommendation of the Treasury for several reasons. Under the section as proposed, the amount of interest that would be permitted to be deducted would be restricted to essentially $25,000 for each taxpayer. The provision would apply to a partnership and to each of the individual partners. The partnership vehicle is a common one in the real estate field. From a reading of the proposed legislation and the existing Revenue Code, it is unclear whether Section 221 might apply to mortgage interest during period of construction. It probably does apply to housing which is leased to a local public housing authority under the authorization of Section 23 of the Housing Act of 1937. Under a strict reading, the Rent Supplement program of the Housing Act of 1965 is also covered since the government Rent Supplement Contract could be considered as a guarantee of income.

HOBBY LOSS MAY APPLY TO REAL ESTATE

The hobby loss provisions have been revised to apply to corporations as well as individuals, and deductions will be allowed only to the extent of gross income from *any* activity unless it is carried on with a *reasonable* expectation of realizing a profit. If there are excess deductions of $25,000 or more for any 3 of 5 consecutive taxable years, there will be a rebuttable *presumption* that there is no reasonable exception of a profit. To the mind of a sophisticated investor, this will appear to be an open invitation to tax litigation and he will avoid the possibility.

The title of this provision belies its obviousily far-reachng consequences which will hinder many bona fide business activities. For purposes of this section "activity" is defined to include a trade or business as well as an investment. The language could apply to an apartment or commercial building sustaining losses but held by the taxpayer for sale when market conditions improved or pending a decision for demolition and replacement. It would also be applicable in the early years of a properties "rent up" period as income builds up to a sustaining level.

LIMITED TAX PREFERENCES

Under this provision, if Tax Preference items exceed $10,000 and are also in excess of an individual's adjusted gross income, one-half of the excess would be taxed as ordinary income.

The items of Tax Preference included in the Bill are (1) tax exempt interest, (2) the 50 per cent deduction for long-term capital gains, (3) appreciation in the value of property donated to charity and deducted as a contribution but not included in gross income, (4) the excess of accelerated depreciation over straight line depreciation on real property and (5) farm losses to the extent they exceed losses under normal accounting rules.

Any disallowed items may be carried over and used as a deduction in the succeeding 5 years. If they are not exhausted, any remaining balance of excess real estate and farm losses would be added to the basis of capital assets only for the purpose of determining gain or loss on sale.

The LTP provisions represent an attempt to provide minimum tax on individuals. However, the House Bill and Administration recommendations skirt many so-called abuse areas and hit the real estate industry broadside. The House excluded the oil industry (percentage depletion and write-off intangible drilling costs) and the Administration wants to exempt tax exempt interest and the appreciated value of assets donated to charity. These proposals are difficult to comprehend since the tax returns of the 155 wealthy taxpayers who paid no taxes (the alleged purpose of the provisions) revealed that the greatest "loopholes" used by these taxpayers were the two which the Administration wants exempted.

As a further blow to the ability of real estate to compete for investment capital the Treasury on September 4 asked that the LTP items also include (1) interest and taxes paid by a developer during construction and (2) rapid depreciation which will be allowed taxpayers who rehabilitate housing for low and moderate income families.

Reform is needed but will not be achieved through this provision as it now exists. Today it will only serve to impede real estate development.

CONCLUSIONS

When the total effect of this legislation on real estate (depreciation methods, interest on investment property, depreciation recapture, limited tax preference and Treasury's September 4, 1969, recommendations) is considered, it is hard to relate this manifestation of Congressional intent with the announced goals of the Housing Act of 1968. Housing, while treated somewhat better than nonresidential construction, will suffer. The first owner and his investors will be in a non-liquid position due to total recapture of depreciation and the inability of their prospective buyer to use anything but straight line depreciation. The handling of construction deductions and estimating the investor's limited tax preference status is impossible to accomplish. It is safe to say that real estate will be non-competitive for the investment dollar and housing production will decline.

It should also be remembered that the cities of this Nation have invested great sums of money in their urban renewal programs. Not all of these have involved federal participation. Many of these contemplate commercial redevelopment. This development involves the reclaiming of what is by definition slum property with all the bad things that term implies. The risks of such development are even greater than in the normal situation. To deprive private industry of one avenue of profit makes the risks unreasonable and the task virtually impossible. The outlook for this type of development is even more discouraging.

Statement of Sidney I. Roberts of Roberts & Holland

PURPOSE OF STATEMENT

The purpose of this statement is to bring to the attention of the Senate Finance Committee what appears to be an omission in section 521 of H.R. 13270 as passed by the House of Representatives, and to propose an amendment that would cure that omission.

Section 521 would add a new subsection (j) to section 167 of the Code, limiting depreciation deductions in the case of real property. Paragraph (4) of section 167(j) would limit the allowance for depreciation "in the case of section 1250 property *acquired* after July 24, 1969." [Emphasis added.]

The word "acquired" might easily be read to include acquisitions, after July 24, 1969, by way of tax-free transfers under sections 332, 351, 368 and 721 of the Code, although this does not appear to have been intended.

PROPOSED AMENDMENT

In order to make it clear that such acquisitions are not to be considered under section 167(j)(4), a sentence should be added at the end of paragraph (4), substantially identical to the last sentence of section 167(j)(3), as follows:

"Under regulations prescribed by the Secretary or his delegate, rules similar to the rules provided in paragraphs (5), (9), (10), and (13) of section 48(h) shall be applied for purposes of this paragraph."

Since the same sentence would thus be duplicated in paragraphs (3) and (4), the Committee might consider it better form to delete the sentence from paragraph (3) and to create a new paragraph (5) as follows:

"Under regulations prescribed by the Secretary or his delegate, rules similar to the rules provided in paragraphs (5), (9), (10), and (13) of section 48(h) shall be applied for purposes of paragraphs (3) and (4)."

DISCUSSION

As indicated above, it does not appear that the House intended that section 167(j)(4) should apply to acquisitions in which the transferor's basis is carried over to the transferee.

Section 521(f) of H.R. 13270, amending section 381(c)(6) of the Code, provides an exception from section 167(j) for acquisitions after July 24, 1969 in transactions covered by section 381(a)—namely, liquidations under section 332 and certain reorganizations under section 368. This is accomplished by treating the transferee in those transactions as the transferor would have been treated had he retained the property. Section 381(c)(6), however, would not apply to transactions involving partnerships and other noncorporate transferees.

A similar problem arises in paragraph (3) of proposed new section 167(j), dealing with depreciation on newly constructed property, but there the House specifically provided an exception for all of the foregoing acquisitions. It directed (in the last sentence of paragraph (3)) that "rules similar to the rules provided in paragraphs (5), (9), (10), and (13) of section 48(h) shall be applied. . . ." Section 48(h) of the Code, dealing with suspension of the investment credit, provides (in subsection (h)(9)) for treating certain transferees as the transferors would have been treated. The provision covers transactions "as a result of which the basis of the property in the hands of the transferee is determined by reference to its basis in the hands of the transferor by reason of the application of section 332, 351, 361, 371(a), 374(a), 721, or 731."

These provisions in new section 167(j)(3) and amended section 381(c)(6) evince an intention on the part of the House to provide a carryover of status for property acquired after July 24, 1969 in certain types of transactions. No cogent reason exists for not affording that carryover of status to noncorporate acquisitions under new section 167(j)(4).

If the legislative intention was not clearly defined during passage of the Bill by the House, then it is submitted that such carryover of status should be provided and that precedent exists in several areas under the Code.

The purpose of section 167(j)(4) as stated in the Report of the Committee on Ways and Means (H. Rept. No. 91–413 (Part 1) page 167) is to "eliminate the repeated sale and resale of property for the purpose of tax minimization." This tax minimization may be accomplished under present law by the purchase of property in a transaction in which the transferee obtains a step-up in basis, which then becomes subject to depreciation deductions in the hands of the transferee. However, an acquisition which results in a carryover of basis to the transferee does not lend itself to this abuse. Such acquisitions could be provided for by applying the rules of section 48(h)(9), perhaps being further limited to section 48(h)(9)(A)(ii). The rules of section 48(h)(10) and (13) involve situations which similarly do not appear to fall within the abuse sought to be curtailed. (The rules of section 48(h)(5) do not actually apply, but have been included above to be consistent with the language of proposed new section 167(j)(3) in H.R. 13270). Therefore, the proposed amendment would be consistent with the House's stated purpose of preventing unwarranted tax minimization.

In addition to section 48(h)(9) referred to above, which deals with the investment credit, a similar rule was adopted in section 167(i)(1) of the Code when that section was amended in 1967 to reinstate certain depreciation methods that had been temporarily suspended along with the investment credit. Section 167(i) is entitled "Limitation in Case of Property Constructed or Acquired During the Suspension Period."

Similarly, when section 1245 was enacted in 1962 and again when section 1250 was enacted in 1964, exceptions were provided "if the basis of property in the hands of a transferee is determined by reference to its basis in the hands of the transferor by reason of the application of section 332, 351, 361, 371(a), 374(a), 721, or 731. . . ." I.C.R. §§ 1245(b)(3), 1250(d)(3).

SUMMARY

The suggested amendment is intended to provide for a carryover of status from the transferor to the transferee in certain acquisitions under proposed new section 167(j)(4). The omission of such a provision appears to have been unintentional in light of proposed new section 167(j)(3) and amended 381(c)(6), both of which would provide for such a carryover of status in similar acquisitions. The proposed amendment would be consistent with existing precedents and with the stated purpose of the House Committee on Ways and Means to prevent unwarranted tax minimization.

WEGMAN ASSOCIATES,
Tampa, Fla., August 22, 1969.

HON. RUSSELL B. LONG,
U.S. Senate,
Washington, D.C.

DEAR SENATOR LONG: We have just been acquainted with the provisions relating to Real Estate as contained in the Tax Reform Bill passed by the House Ways and Means Committee.

We feel that it is imperative that your attention be called to certain features of this bill which we feel will have a disastrous effect on the construction of rental apartment complexes.

Most features of this bill are reasonable, and with which the industry can survive. The two features of the bill which we consider to be disastrous for the public, and which in our opinion within twenty-four months, will produce the beginning of a social housing problem of disastrous proportions, are as follows:

1. The elimination of the 150% declining balance method of depreciation for existing apartments.

2. The classification of the accelerated portion of the depreciation as regular income on resale of the property.

In order to understand the effect of these provisions on the housing market, it is necessary to understand the events which take place to cause a developer to construct new apartments.

New rental apartments are developed by two different basic developers. One of these is the developer who builds the apartments to retain for an investment. Developers in this category are not being hampered greatly by this bill. The other source of new rental apartment construction, *who accounts for more than one-half of all starts*, is the developer who builds the project, and shortly thereafter sells it to go on to the next one, taking his profit and proceding from one complex to another. This latter developer, in our opinion, will be stopped in his tracks by this law if the 150% declining balance method of depreciation is removed from existing apartments. He will be locked in to his last completed project, as he will be unable to sell it to the investment market. This conservative investment market will not develop apartments, but only purchase existing apartments which have already been constructed, and occupied, and they won't buy unless they have reasonable tax shelter. This latter developer, in our opinion, is the one who will be the hardest hit by this bill, and is the one which *produces more new rental units than any other factor* in the construction market.

The developer who builds for investment, could live with a 150% declining balance method of depreciation and in our opinion, if the 200% declining balance method for new apartments were reduced to 150% declining balance, it would result in a Tax Reform which would be beneficial to the Government in increased revenues, and would not have a significant effect upon the development of new apartments.

We fear that if the 150% declining balance method is eliminated from the existing apartments, there will be a major social crisis on housing for families in the lower middle-income bracket, consisting of young marrieds from 20 to 35 years of age, within two years. This crisis will be something which can not be corrected in a short period of time by changing the laws again. Hindsight is not going to help the matter and it is going to be a disaster of major proportions.

Let use elucidate concerning our conclusions in this respect. There is no longer a home in the price class which can be afforded by the people in the group mentioned above. Consequently, families in this age bracket are moving into rental apartment units at a massive rate. As these new families are being formed, if the rental units are not made available, they will have no place to go. The Government subsidized low income housing will be soaked up by those in lower income brackets, and you will have a disaster for the prime movers of our economy, the prime producers of our goods, the prime sources of income tax revenue in this country, mainly the lower middle-income group. They will have no place to live.

It is only by ingenious methods, that apartments have been created for this class of citizen to rent, at a rate which he can afford. Since he can no longer afford the home until he becomes more affluent, his only resource now is the rental apartment.

We certainly hope that the Senate will do a little more investigation, and use a little more judgment than the House has shown. Tax Reform is good, and is needed, but it is not needed to be done in an irresponsible manner.

Thank you for allowing us to express our views, and we sincerely solicit your earnest consideration of these serious matters in handling this Tax Reform Bill.

Yours very truly,

W. J. WEGMAN, *Realtor*.

STATEMENT OF CHARLES DAVENPORT, DAVIS, CALIF.—AMORTIZATION OF REHABILITATION EXPENDITURES

SUMMARY

I appear in my own capacity representing no other person.

The rehabilitation of dilapidated housing structures presents a number of problems which usually renders rehabilitation an uncertain course. Rehabilitation has not been given a high priority under programs enacted by Congress.

The provisions of H.R. 13270 which permit certain rehabilitation expenditures to be amortized over 60 months have no rational relation to the solving of the rehabilitation problems—except to the extent that the allowance would constitute a subsidy and hence distribute Federal funds (through the deferral of taxes on currently earned income) to some rehabilitators. The amount distributed to any taxpayer depends on his tax rate and other income sources and pays greater rewards to high bracket taxpayers. This is contrary to our progressive tax system.

There is also no evidence that the tax benefit would not be wasted or that the funds distributed through this provision could not be more effectively applied in other programs. Also there is no evidence that the expenditure of such funds will in fact increase the housing stock.

The provision is unproven and questionable housing policy. It is unsound tax policy. It funds at the back door activities which have not gained sufficient Congressional approval for direct funding. The provision thus fails to meet the test that is generally applied to tax incentives: Is this the best way to do it? It should thus be eliminated from H.R. 13270.

STATEMENT

My name is Charles Davenport. I teach Federal income tax law at the School of Law, University of California, Davis, California. In presenting this statement I represent no interest other than my own, and I appear solely as a citizen having a special knowledge of the income tax law. From 1960 until the spring of 1967, I practiced law with a large firm in San Francisco, California, which represented many real estate investors and owners. From the spring of 1967 until just last month, I was with the Office of Tax Legislative Counsel in the Treasury Department. During my time there I had the opportunity to consider many of the tax aspects of real estate investment. I participated in the preparation of the study on real estate taxation which appears in "Tax Reform Studies and Proposals," published by this Committee and the House Committee on Ways and Means on February 5, 1969.

In addition to my interest in Federal income taxation, I am convinced that the most pressing and urgent problem now facing this nation is the housing of its people. One need only to walk through the squalor of the slums to recognize that there is a substantial number of people in this coutry who are living in substandard housing and in overcrowded conditions. The rural scene is often no better. These intolerable living conditions, when combined with the many other problems we face, tends only to aggravate them. The race problem, the pollution problem, the noise problem, the poverty problem, and many others are only made worse by the inability of substantial numbers of people to find adequate shelter. The lack of adequate shelter is intimately wound up with all of these other problems, and I submit that we will not do very well in solving them unless we find some way to provide decent shelter for our people. The reverse is also true. If we find some way to provide proper housing for our people, some of these other problems will be lessened or perhaps eliminated.

The facts and figures on the housing problem are not encouraging. While there are approximately 70 million housing units in this country, over 7 million are classified as substandard units which house some 20 million people. Of this 7 million substandard units, some 4 million lack indoor plumbing and over 3 million are considered dilapidated. We are building somewhere near 1.6 million units a year, but over the next ten years there will be a need for 26 million units, 10 million more than will be constructed at the present rate.

The picture is bleak, and the Federal funds allocated to housing have not met the need. However, the very scarcity of Federal funds to accomplish this task also argues that none of them be invested in ventures where the pay off for each dollar of Federal expenditures will be low. This is particularly true where the program has other serious drawbacks. Thus, even though the housing of our people is the most crucial and pressing problem of our time, and even though rennovation of some existing units may be appropriate, I urge this Committee not to waste any of our precious public resources upon those provisions contained in § 521(a) of H.R. 13270 which would add § 167(k) to the Internal Revenue Code to permit an amortization allowance for rehabilitation expenditures.

THE PROBLEM OF REHABILITATION

A number of problems block a very active rehabilitation industry. These are dealt with in part 4 of "A Decent Home" published by the President's Committee on Urban Housing. While they are discussed at length there, it may be well at least to summarize them at this point. They are:

(a) *Uncertainty.*—There are a number of uncertainties in rehabilitation which do not exist in new housing. One cannot be sure of the condition of the basic structural components or that the estimated cost of rehabilitation will be fairly accurate. A rule of thumb suggested by an elderly gentleman who had done considerable rehabilitation work during his life was to make as reasonable and close an estimate as possible and then to double it. These uncertainties also require a specialized construction talent with the result that most of the so-called rehabilitators are relatively small, individualized business operations. These talents are in short supply.

(b) *The Neighborhood Problem.*—Many candidates for rehabilitation are in a so-called slum area. If each of the buildings in the area were rehabilitated, the collective increase in their value might well exceed the aggregate amount spent on their rehabilitation. However, the expenditure on any one structure in the area increases its value very little because it remains in a slum. It might be possible to assemble large areas for rehabilitation, but our housing programs have not done so.

(c) *Financing.*—Both of the prior problems lead to difficulties with financing. Since cost estimates are not certain, lending institutions are reluctant to make commitments on them. In addition, many lending institutions have policies of not lending on properties in depressed areas. Recently, FHA has made some special efforts to extend its guarantees of loans to the sort of thing which would have been held to have been too risky by prior standards. Financing of the rehabilitation cost may also be complicated by the existence of financing on the purchase price of the basic structure and the land. In some, but not all, cases the two financings can be combined into a single transaction. Finally, a lending institution may well require a higher portion of equity of the overall cost of the basic structure and rehabilitation than is required for new construction because even after rehabilitation, the structure may well be an old building in a slum neighborhood.

(d) *Tenant Resistance.*—Since rehabilitation necessarily means an additional investment of capital, it seems likely that the rent levels in the building will have to rise. Thus, existing tenants are likely to oppose the rehabilitation because they probably are living at the limits of their income for housing in any event. Thus, to them, rehabilitation means only higher rents or being homeless. In many cases, the higher rent level will convert what might be classed as low income units to the luxury category.

(e) *Property Taxes.*—In the usual case property taxes will be substantially increased by rehabilitation. While the same is true for new construction, the problem for rehabilitation is somewhat aggravated because it generally also results in a large upward reassessment of the basic property value as well as the addition made through the rehabilitation.

(f) *Income Tax.*—The charge is sometimes made that the Internal Revenue Service in administering the depreciation allowance will lengthen the life of a rehabilitated structure so as to make the life somewhat unrealistic. In my own experience, this has not been much of a problem.

These may not be the only problems connected with rehabilitation, but I think that most people would agree that the foregoing touches the major problems. With these problems in mind it is interesting to note that neither the Congressional committees which deal with the housing problems nor the Department of Housing and Urban Development has shown much interest in establishing a rehabilitation program which could complete in terms of public subsidy with programs for new housing. While most of the Federal programs providing some sort of mortgage assistance are nominally available for rehabilitation, the major source of publicly assisted rehabilitation funds has been a special rehabilitation program under § 312 of the Housing Act of 1964. It authorized HUD to assist in the granting of loans at an interest rate of 3%, limited to the cost of the rehabilitation, but not in excess of $10,000 per dwelling unit, with a maximum maturity of 20 years or three-quarters of the life after rehabilitation, whichever is less. Use of this type of rehabilitation loan is also limited to Federally assisted urban renewal and concentrated code enforcement projects, certified areas, and properties which require rehabilitation to qualify under the riot reinsurance program. With these limitations on property location, and the income of applicants (so as to qualify under § 221(d)(3) of the National Housing Act), and the loan limitations, the § 312 program likely will not contribute significantly to the rehabilitation of existing housing.

All of this suggests to me that rehabilitation, while clearly desirable in many cases, may not be a high priority matter when viewed by those Congressional committees and administrative agencies most intimately involved with the housing problem.

AMORTIZATION PROVISIONS OF H.R. 13270

With this background we can now turn to the provisions of H.R. 13270 which would add § 167(k) to the Internal Revenue Code. That section would permit a taxpayer to amortize over a 60 month period expenditures made in connection with the rehabilitation of an existing building for low cost rental housing. Such expenditures would have to exceed $3,000 over two consecutive tax years, and any amount in excess of $15,000 per rental unit would not be subject to the special amortization provision. They would also have to be for the acquisition of property having a useful life in excess of five years and could not include the acquisition cost of the building or the land. Sale of the property, however, results in the recapture as ordinary income of all amortization taken to the extent it exceeds straight line depreciation.

It should be noted that this provision does nothing more than permit an amortization of expenses which would otherwise have to be capitalized and written off over a much longer period of time. The benefit conferred is that of permitting taxes on other income to be deferred through the overstatement of deductions during the amortization period. These deferred taxes are then repaid in the following years when income is overstated because there is no depreciation allowance. The deferred taxes are the equivalent of an interest free loan which is repaid in installments in subsequent years.

It is possible to quantify this benefit if certain assumptions are made. The table which follows assumes an amortization of rehabilitation expenditures over a five year period on two assumptions. The first is that the normal life of the expenditures would be ten years, and the second is that the normal life would be twenty years. It also assumes that the taxpayer who undertakes this rehabilitation expenditure could earn alternatively 8%, and then 10%, on his capital if it were invested in another endeavor. The benefit of this amortization may then be stated as the equivalent of an investment credit of some percentage of the rehabilitation cost. Alternatively, it is stated as the equivalent reduction in interest rate on a 100% mortgage at an 8% interest rate for the life of the rehabilitation expenditures assuming deductibility of interest.

VALUE OF AMORTIZATION AS PERCENT OF CAPITAL COST-INVESTMENT CREDIT EQUIVALENTS

Bracket of taxpayer, discount rate, and normal life	Amortization over 5 years	Reduction in interest of 8-percent mortgage for entire rehabilitation cost: 1 point	5 points
70-percent taxpayers:			
8-percent discount rate:			
20 years	17.1	2.4	15.4
10 years	6.8	1.4	8.1
10-percent discount rate:			
20 years	19.1	2.4	15.4
10 years	7.8	1.4	8.1
50-percent taxpayer:			
8-percent discount rate:			
20 years	12.2	4.0	25.8
10 years	4.8	2.3	13.3
10-percent discount rate:			
20 years	13.6	4.0	25.8
10 years	5.6	2.3	1.33
20-percent taxpayer:			
8-percent discount rate:			
20 years	4.8	6.3	41.2
10 years	1.9	3.7	21.7
10-percent discount rate:			
20 years	5.5	6.3	41.2
10 years	2.2	3.7	41.2

From this table one can observe:

(*a*) The value of the amortization incentive depends on the taxpayer's tax rate bracket. A five year write-off of rehabilitation expenditures that would otherwise have had a twenty year life is about a 19% investment credit for a 70% taxpayer and a 5% investment credit for a small property owner in the 20% bracket. This is the equivalent of reducing the interest rate for the 70% taxpayer by approximately 5 points, or down to 3%, and for the 20% taxpayer by 1 point, or down to 7%.

(*b*) A five year amortization period provides more incentive for rehabilitation expenditures which would have had a longer useful life under normal depreciation. In general, it may be that the longer useful life is associated with a good or extensive rehabilitation job or with a very good building shell. A short useful life would normally be associated with a very old shell or a minimum rehabilitation job or on a site which is likely to go commercial fairly soon.

(*c*) Since the amortization is keyed to rehabilitation expenditures, it has greater value to the rehabilitation where such expenditures are the greater portion of the total cost than it does where the basic structure and land costs are greater.

One concludes then the provision would offer the greatest subsidy to a high bracket taxpayer making a long lived rehabilitation that represents a very high proportion of the cost. The housing policy behind a provision which structures a subsidy so as to be most attractive to this kind of a taxpayer for this kind of rehabilitation is not apparent because there is no obvious relation between the encouraging of such rehabilitation and the housing shortage. Whether it encourages the right kind of rehabilitation, we do not know. On the other hand, it is indefensible as a matter of tax policy because it is contrary to the progressive tax system. Thus, we know the provision is bad tax policy. We really have no idea whether it is good housing policy.

IMPACT ON REHABILITATION

The effect of all this would have on the rehabilitation process is at best risky to predict. A generalization or two might be in order, however.

(a) The largest part of real estate investment is by individuals or syndicates, which pass the depreciation deduction through to their members to be used against the individual tax. A subsidy based on fast write-off works like any deduction incentive. It provides an incentive that increases with the effective tax rate of the taxpayer. Economically, such an incentive would work by attracting new resources to the favored industry until the increase in the capital supply reduced the before tax rate of return enough to restore the prior equilibrium between supply and demand. If this equilibrium were reached for, say, a taxpayer having a marginal tax rate of 50%, all investors with higher marginal tax rates would have a windfall in that the tax benefit is greater than the price change. Investors with lower tax rates would find rehabilitation less attractive than before. Two consequences seem to flow from this conclusion. First, the tax benefit is wasted in the windfall to high bracket taxpayers. Second, the high bracket investor is attracted to rehabilitation while the low bracket taxpayer or tax exempt institution is driven out. Certainly, the first of these results is not justifiable, and the second does not seem to serve any purpose. Indeed, it may be considered harmful because it could exclude non-profit organizations whose orientation is appropriate for undertaking some of the problems connected with low cost rental housing.

(b) Because the tax subsidy is available to all comers, we cannot be sure that is induces any rehabilitation that would not otherwise have been undertaken. To the extent the subsidy goes to those who would have made the rehabilitation without the subsidy, the funds lost through the amortization are wasted.

(c) Rehabilitation outlays increase the housing inventory less than does new construction (unless either (1) the rehabilitation prevents demolition or (2) the new construction is accomplished through demolition). Increased rehabilitation may also divert construction workers from new construction to a less productive (in terms of units created) form of work.

(d) Very likely funds diverted to rehabilitation will largely be funds which would have been invested in real estate anyway. Thus, if the investment funds diverted to rehabilitation do not yield more units than new construction would, the subsidy provided by the amortization is wasted and does not produce any benefit.

(e) The budget cost of the amortization allowance is estimated to commence $15 million per year and rise to $330 million. If these same funds were used to reduce the interest cost of funds borrowed for low cost housing, the interest rate could be reduced 1% on $33 billon of mortage debt. Assuming that the debt/equity ratios of such properties were 9 to 1, the total cost of such properties would exceed $36 billion, which at $20,000 per unit is 1.8 million housing units. Thus, the amortization subsidy could reduce the interest cost of 1.8 million units by 1%, on .9 million units by 2%, or on .6 million units by 3%. If this revenue loss were so used under programs now on the books, we would be sure the subsidy would flow through to the tenant. We have no assurance that the amortization provision will lower rents or otherwise benefit tenants.

CONCLUSION

Enactment of the amortization of rehabilitation expenditure is undesirable. The provision is (a) unwise tax policy and (b) uncertain housing policy.

(a) The provision is not appropriate policy for a bill which is styled a tax reform act because it has a highly preferential effect for high income taxpayers. It adds another loophole to a Code already shot full of loopholes and perverts the progressive tax system to a regressive one.

One is both amused and befuddled by a bill which gives an incentive for certain activities but takes the subsidy away through recapture on sale. The sale is argued to be an appropriate time to take something which the taxpayer should never have had. While recapture does not do this (because it still confers on the taxpayer the benefit of having deferred his taxes until sale), it can have no other justification. Better policy is to deny the benefit initially.

Similarly, the Administration's recommendation that amortization be included in the Limit on Tax Preferences indicates the true nature of this allowance. Inclusion in LTP concedes the deduction is improper and offers unwarranted benefits to high bracket taxpayers.

(b) The provision is very questionable housing policy. We are not sure that it would generate the kind of rehabilitation we need or desire. It would exclude certain segments of the housing industry (the low bracket or tax exempt taxpayer) from the rehabilitation process. There is much doubt that the funds spent through the amortization allowance will increase the housing inventory as much as a more direct subsidy. There is no suggestion that the subsidy will lower rents. This, of course, contrasts with our other subsidized housing programs. A large part of the subsidy will be wasted and may not encourage rehabilitation which would not have occurred without the subsidy. The subsidy may be spent on activities which would have taken place anyway. Finally, the Congressional committees which have designed elaborate subsidy programs for new construction have been unwilling to design programs as elaborate for rehabilitation. It seems likely that this reluctance arises out of the desire to apportion scarce Federal funds to an area in which the most pay-off can be achieved. Since the committees charged with this responsibility have chosen to allocate little to rehabilitation, it seems inappropriate for amendments to the Internal Revenue Code to fund at the back door a program which has not been admitted at the front door, particularly when there has been a general consensus that the back door route will not be used unless it is proven more efficient. On that ground alone this provision must fail.

In short, beyond the emotional nostalgia of preserving some fine old structures built in yesteryear (recently constructed but dilapidated housing seems not to have any such appeal), there is no justification for the amortization allowance. It creates another tax haven for the high income taxpayer while having a vague and unknown impact on the housing problem. Thus, it creates a loophole questioning the integrity of our progressive tax system, while flailing wildly around the housing shortage. This provision would only proliferate tax shelters while embarking on a questionable, expensive, and perhaps wholly ineffective housing policy. Scarce Federal funds can be better used through programs and appropriations more finely and rationally structured to overcome the problems of our housing shortage.

Statement of Robert L. Lanham, Vice President and Controller, American Natural Gas Service Company

The following comments with respect to the Tax Reform Act of 1969 are submitted on behalf of American Natural Gas Company ("American Natural") and its several subsidiaries. American Natural's subsidiaries are primarily engaged in the transportation and distribution of natural gas, directly or indirectly, to approximately two million customers. In addition, through one of its subsidiaries, American Natural is engaged in the rental of low and moderate income housing.

Several provisions of H.R. 13270 would have a direct impact upon the American Natural system. However, I would like to limit my detailed comments to two sections of the Bill; Section 521 of the Bill, dealing with depreciation of real estate, and Section 704 of the Bill, dealing with rapid amortization of pollution control facilities.

DEPRECIATION OF REAL ESTATE

In 1968, one of American Natural's subsidiaries began constructing low and moderate income housing. This construction was undertaken in a separate subsidiary which qualifies as a limited dividend corporation under the National Housing Act. As such, the dividends payable by the housing subsidiary are limited to 6% per annum on equity investment. Maximum rentals for housing constructed by such a corporation are fixed by the Federal Housing Administration, which must also pass on the feasibility of the project.

The first project, which involves 130 units in Detroit, Michigan, is scheduled for completion in the fall of this year. Two additional projects are now moving forward; a 134 unit townhouse-type project in a predominately Negro suburb of Detroit, and a 168 unit project for elderly and handicapped persons. Several other projects are in the planning stages.

Because of the restraints imposed by the non-tax laws on rental income and dividends, the economic feasibility of these housing projects is dependent on the continuation of those provisions of the Code which permit (1) accelerated depreciation, (2) capital gain treatment with respect to gain realized when the properties are sold after a substantial period of time, and (3) the use of 150% declining balance depreciation by the purchaser of used rental housing.

The Ways and Means Committee recognized the special need for tax incentives for the construction of housing, particularly low income housing. For example, the House Bill would continue to allow accelerated depreciation in the case of most residential housing units and would permit rapid amortization of certain expenditures incurred to rehabilitate buildings used for low income housing. However, the distinction between residential buildings and other types of structures was not applied to the proposals relating to the recapture of accelerated depreciation or the provisions which would prevent a purchaser of a used building from using the 150% declining balance.

The proposals contained in H.R. 13270, as applied to rental housing units, would decrease the amount which an owner would be able to realize upon the disposition of his property. Limiting the purchaser to straight line depreciation, the amount which a potential purchaser would be willing to pay for a used building would be decreased. By changing the recapture provisions on rental property held for more than ten years, the after-tax proceeds from the sale would be decreased, thus further reducing the financial benefits from investing in residential housing.

While it may be that the tax incentive provided under existing law with respect to commercial real estate are inappropriate, the elimination of these incentives from residential rental properties in general, and low and moderate income housing in particular, would certainly discourage taxpayers from making low-return, high-risk investments in low income housing. The decrease in the supply of such housing which would surely follow the enactment of these provisions would be a high price to pay for the small revenue gain which would result. In fact, the revenue gain will probably be substantially less than the additional funds which the Federal government will be called upon to expend to increase the supply of residential buildings which private parties are willing to construct under the existing law.

In order to keep the tax law consistent with the announced National policy of encouraging the construction and operation of low and moderate income housing, the gain which a limited dividend corporation realizes from the sale of low and moderate income dwelling units should be excluded from the proposed recapture of accelerated depreciation. Similarly, the use of 150% declining balance depreciation on used property should continue to be permitted with respect to qualified purchasers of low and moderate income dwelling units from limited dividend corporations when such purchases occur after the seller has owned the assets for a substantial period of time. In light of the nature of the assets involved and the type of taxpayer to which such relief would be limited, these changes would create no possibility for abuse.

AMORTIZATION OF POLLUTION CONTROL FACILITIES

Section 704 of the Bill proposes a new Code section which would permit the cost of certified air and water pollution control facilities to be amortized over a period of 60 months. The definition of a "certified pollution control facility" would limit the property eligible for amortization to assets which control pollution "by removing, altering, disposing, or storing pollutants, contaminants, wastes or heat . . ."

Although probably not intended by the drafters, it would appear that the language of the Bill could be interpreted in a manner which would exclude from the category of assets which qualify for rapid amortization those assets which prevent pollution by eliminating or reducing the creation of pollutants.

The Clean Air Act makes it clear that the Federal government is committed not only to the control, but also to the prevention, of air pollution. Accordingly, taxpayers should be encouraged to install facilities, such as natural gas burning equipment, that prevent pollution by eliminating or reducing the creation of pollutants.

In order to provide the same incentives to *eliminate* pollutants as the House Bill presently grants to assets that *control* pollutants, it is suggested that the definition of a "certified pollution control facility" be amended to include facilities that eliminate or reduce the creation of pollutants. Inasmuch as the provisions of Section 704 of the Bill require Federal or State certification of facilities as a prerequisite for rapid amortization, the proposed change would create no possibility for abuse.

OTHER PROVISIONS OF THE BILL

American Natural believes that certain changes should also be made to other sections of H.R. 13270, particularly Section 451 of the Bill, dealing with depreciation of utility property, and Section 501 of the Bill, relating to natural resources. American Natural fully supports the position on these issues set forth in the statement and testimony presented before this Committee on October 1, 1969 by Mr. Walter E. Rogers, President, Independent Natural Gas Association of America.

STATEMENT OF NATHANIEL S. KEITH, PRESIDENT OF THE NATIONAL HOUSING CONFERENCE

I welcome this opportunity to present the comments of the National Housing Conference on some of the proposals contained in "The Tax Reform Act of 1969." The National Housing Conference has long supported and helped to achieve many of the housing programs we have today. A common theme of all these programs has been to maximize private participation while also achieving rents within the means of those unable to afford unsubsidized housing. We believe, however, that many of these proposed changes in the House-passed Tax Bill will have serious and deleterious effects on the ability to adequately meet our critical housing shortages.

In this regard, the National Housing Conference recognizes the overriding public need for maintaining a financially sound and healthy construction industry. Without such a resource, our Nation will be able to meet the unprecedented target need of providing 26 million dwelling units during the next ten years, the goal set by the Housing and Urban Development Act of 1968. This housing is urgently needed not only to provide decent shelter and homes for people in the United States, but also to help solve the pressing social problems inherent in our ghettos and blighted neighborhoods. Unless a solution is found to the housing needs of families of low and moderate incomes, the social and economic problems of our cities are likely to prove insurmountable. The proposed tax legislation will effectively preclude the achievement of national housing goals. In an effort to realize a more "equal distribution" of the tax burden, the proposed modifications in the tax law have made private investment in real estate, particularly residential housing, even more unattractive than it is now. Unless relief is given from provisions of the House Bill, it is difficult to imagine how the national housing goals will ever be achieved.

The National Housing Conference suggests the following changes in the proposed tax reform legislation in order to assist in achieving the national housing goals:

1. The options of an investor deducting interest paid and real estate taxes paid as a current business expense during the period that the project is being built should not be limited or circumscribed. Unless such deductions are permitted as current tax deductions available to investors, the investment in real estate becomes much less attractive. This is particularly true in the case of housing to serve the needs of low and moderate income families with financing under some government-insured or assisted program. The limited return available to investors in such cases (most such programs limit the return to 6 percent) is such that it would be highly doubtful that an investment of this kind would be attractive if the investor were not permitted to deduct interest and real estate taxes during construction. This same consideration is also applicable to other presently permissible deductible items during the construction period.

2. Under the House Bill, accelerated depreciation on residential rental property is only available to the first user. This would seriously impair the resale market for rental properties and correspondingly reduce the attractiveness of initial equity investments in such properties. The NHC urges that the provisions of existing tax law as to depreciation advantages for subsequent purchasers of residential rental properties be continued. This proposed requirement in the House Bill also involves difficult applications in specific cases and introduces uncertainties which could discourage investors from investing in multifamily housing projects. If accelerated depreciation is available to the Mortgagor at the time the first family moves in, this could take place at a time long before the project is "officially" completed. Customarily, on sizeable projects partial occupancy will occur as individual buildings are completed. Yet, changes in the requirements may necessitate further investment by additional investors. In some cases, some of the original investors may die or retire and new investors substituted. In such instances, the question could be raised as to whether the mortgagor is no longer a first user entitled to depreciation.

NHC recommends that the determination of first user should occur as of the date of completion of the project. This would present no problem in the case of projects to serve the needs of low and moderate income families because under Federally-assisted financing, the government agency makes a formal determination as of the date of completion of the project. Changes in the composition of the mortgagor entity prior to that date should not preclude the availability of accelerated depreciation; indeed, changes in the composition of the entity (e.g., the death of a partner or the transfer of a limited partnership interest) after the project is completed should not be deemed a change in the first user so as to preclude the availability of accelerated depreciation.

It is doubtful that any legislative language is necessary to accomplish this result; a statement of policy in the report of the Bill will probably be sufficient to assure that there will be no arbitrary denial of the accelerated depreciation by some rigid, inflexible application of a first user principle.

3. NHC supports the provisions of the Bill which allow accelerated depreciation (double declining balance) in the case of housing developments. Denial of accelerated depreciation would require substantial increase in rents and yet yield to the investor to make an investment in housing projects financially attractive. In the case of projects to serve low and moderate income families, the alternative of increased rent would simply defeat the basic purpose of the project or require a commensurate increase in the Federal subsidy to make the investment attractive and competitive.

The best and easiest approach is simply to permit a rapid depreciation which would afford tax deductions which, in combination with cash yield, would make the project attractive to investors. This is essential to assure adequate investment in residential construction.

4. The tax advantage of accelerated depreciation would largely be lost if the proposed recapture provisions become law. Generally, since 1964, the gain on a

sale of a building is taxed as ordinary income to the extent of depreciation taken on that building after December 31, 1963. However, after the building has been held 12 months, only the excess over straight line depreciation is "recaptured." After 20 months, that amount can be reduced at the rate of 1 percent per month, until 120 months, after which nothing is recaptured. In other words, currently under section 1250, the recapture upon sale of the project is reduced on a formula scale over a period of 10 years.

Under the House Bill, the taxability of the difference between the straight line accelerated depreciation is not reduced but is recaptured regardless of when the project is sold. The effect of this provision is to negate the benefit of the deduction originally received by the taxpayer. Therefore, while the taxpayer will derive tax benefits through accelerated depreciation of the project, these will be taken away when he later sells the project. This means that the investment becomes much less attractive, since every investor will take into account the consequences of the sale of the project at some later date. It is unreasonable to assume that a requirement making the future sale of an investment unattractive will not have a debilitating effect on such investment. Even if the investor had no intention of selling the project, he must assume what the tax consequences would be in case of foreclosures where the project is in trouble. Under the proposed legislation, the foreclosure could precipitate a substantial tax to the taxpayer.

NHC recognizes, however, that the intent of the House bill was undoubtedly to avoid abuses from quick turnover projects. Hence, the NHC supports a recapture provision under Section 1250 which precludes capital gain treatment on transfers during the first 5 years and then applies a formula of 1 percent per month reduction thereafter. This would put off full capital gain treatment for over 13 years.

5. NHC believes that in the case of low and moderate income housing, the recapture provisions should not be made applicable where such housing is sold to a cooperative approved by the Secretary. There is a strong public policy embodied in the Housing and Urban Development Act of 1968 of encouraging and promoting the achievement of homeownership by families of low and moderate incomes. Cooperative ownership gives families a greater sense of responsibility and produces better communities than rental housing. NHC recommends that the recapture provision should not apply where a project owned by a limited distribution mortgagor with appropriate government-assisted financing is sold to a nonprofit cooperative consisting of low and moderate income families which will own and operate the development.

6. NHC is also concerned about the proposed tax treatment of state and local bond interest. NHC is distressed with the near collapse of the municipal bond market as a result of the House-passed provisions of H.R. 13270 which affect municipal bond interest. Since H.R. 13270 was passed, interest rates on all municipal bonds have increased an average of nearly one percentage point. Active investors in these bonds, now reacting to the uncertainty caused by the provisions on H.R. 13270, are refraining from further purchaee.

For those who have worked long and hard to help create a sound financial base for public housing, we are particularly concerned by the events of two weeks ago partially brought on by the House bill. On September 24, the Housing Assistance Administration placed nearly $192 million worth of public housing bonds on the market. These bonds are general obligations of local housing agencies and are guaranteed with the full faith and credit of the United States, a factor which gives them a triple "A" rating in the market. Because of a legal 6 percent interest ceiling, $142.4 million of these bonds failed to find bidders. Of the $49 million that did sell, a historically high interest rate of 5.9948 percent annually will be paid.

This is an intolerable situation which substantially increases the cost of public housing and threatens the future of our public housing programs. NHC joins with the National League of Cities and the United States Conference of Mayors in asking this Committee to delete any reference to interest from state and local government bonds wherever it appears in Sections 301, 302, 601 and 602 of the bill.

NATIONAL HOUSING CONFERENCE

PROPOSED LANGUAGE FOR COMMITTEE REPORT

1. Because of the tax bill may limit accelerated depreciation on residential housing to the first user, the National Housing Conference (NHC) urges that the Committee Report contain the following clarifying language carefully defining "original use" treatment (p. 301, 1, 16 and 302, 1. 22).

"Determination of 'original use' for purposes of determining eligibility under Section 167(j)(2) and (3)

"Customarily, on large projects, partial occupancy will occur as individual buildings are completed. Yet, other buildings will still be under construction and there will be other changes in the construction requirements which may necessitate further investment by additional investors. In some cases, some of the original investors may die or retire, with new investors being substituted. In such instances, the question could be raised as to whether the mortgagor is no longer an original user entitled to accelerated depreciation.

"The determination of original use should occur as of the date of completion of the project. In low and moderate income housing built under federally-assisted financing, the formal determination of the date of completion of the project is already made by the governmental agency administering the program. Changes in the composition of the mortgagor entity prior to that date should not preclude the availability of accelerated depreciation. Likewise, certain changes in the composition of the entity (e.g., the death of a partner or the transfer of a limited partnership interest) after the project is completed should not be deemed a change in the original use so as to preclude the availability of accelerated depreciation."

2. NHC urges the following language in the Report to make it clear that the "hobby loss" provisions do not apply to limited profit investments in publicly-assisted housing proects:

"Hobby Losses

"The proposed Section 213 of the House bill would amend Section 270 to create a rebuttable presumption that an activity was not being carried on with a reasonable expectation of profit if total deductions allowable with respect to that activity exceeded gross income from that activity by $25,000 in three of five consecutive years.

"This new provision is not intended to apply to investments in residential rental housing. Thus, in the case of investments in housing developed with Federal aids and subsidies, the income and profits are strictly limited by law to assure that the housing will reach the lower and moderate income group intended to be served. The amendment to Section 270 is not intended to apply to such properties."

3. NHC urges the following language in the Report to make it clear that the tax preference provisions are not applicable to interest, taxes and ground rents on residential rental housing:

"The Committee agrees with the Treasury Department's position that interest, taxes and ground rent should not be treated as a tax preference if the construction consisted of residential rental housing as defined in the proposed Section 167(j)(2) which is added by Section 521 of the House bill."

AMENDMENT RELATING TO APPROVED DISPOSITIONS OF PUBLICLY-ASSISTED HOUSING PROJECTS

Subchapter O of chapter 1 of the Internal Revenue Code of 1954 (relating to gain or loss on disposition of property) is amended by adding at the end thereof the following new part:

"PART X—DISPOSITIONS OF QUALIFIED HOUSING PROJECTS

"SEC. 1131. APPROVED DISPOSITIONS OF QUALIFIED HOUSING PROJECTS—

"(a) GENERAL RULE.—In the case of an approved disposition (as defined in subsection (c)) of a qualified housing project (as defined in subsection (b)),

"(1) any gain or loss recognized on such disposition shall be treated as gain or loss on the sale or exchange of property described in section 1231(b), and

"(2) gain shall be recognized only to the extent that the amount realized on such disposition exceeds the cost as determined under section 1012.

"(b) QUALIFIED HOUSING PROJECT.—For purposes of this section, the term 'qualified housing project' means buildings and other structures determined, in accordance with regulations prescribed by the Secretary of Housing and Urban Development, to have been constructed or rehabilitated pursuant to the provisions of the National Housing Act, as amended, or any other federal, state or local law of comparable purpose, primarily to provide publicly-assisted housing and related facilities for individuals or families of low and moderate income, and the land underlying or appurtenant to such buildings and other structures. The term 'publicly-assisted housing' as used in this subsection means multifamily housing receiving or eligible to receive the benefits of government assistance through below-market interest rate financing, interest reduction payments or rent supplements.

"(c) APPROVED DISPOSITION.—For purposes of this section, the term 'approved disposition' means any sale or transfer of a qualified housing project to a housing cooperative or otherwise to enable ownership for the benefit of individuals or families of low or moderate income in accordance with regulations prescribed by the Secretary of Housing and Urban Development and pursuant to the National Housing Act, as amended, or any other provision of federal, state or local law of comparable purpose.

EXPLANATION

NHC believes that in the case of low and moderate income housing, the recapture provisions should not be applicable where such housing is sold to a cooperative, or otherwise to enable ownership, as approved by the Secretary. There is a strong public policy embodied in the Housing and Urban Development Act of 1968 of encouraging and promoting the achievement of cooperative and other homeownership by families of low and moderate incomes. Such ownership gives families a greater sense of responsibility and produces better communities than rental housing.

NHC recommends the foregoing amendment in order that the recapture provision would not apply upon the sale of a project by a limited-dividend entity to enable ownership of the housing for the benefit of low and moderate income families, with appropriate government assistance. Typically, the sale would be to a nonprofit cooperative consisting of the lower income families residing in the project.

Re Proposed Amendment for Accelerated Depreciation for Publicly-Assisted Housing Projects

Section 167(j)(2) as added by Section 521(a) of the House bill is hereby amended by deleting all of the first sentence after the word "is" and inserting in lieu thereof the following (p. 301, l. 14):

"multifamily housing owned by a limited dividend entity which provides publicly-assisted housing and related facilities for individuals or families of low and moderate income which qualify under regulations prescribed by the Secretary of Housing and Urban Development to receive the benefits of government assistance through below-market interest rate financing, interest reduction payments, or rent supplements; and the original use of which commences with the taxpayer."

The NHC recommends this amendment if this Committee should decide that all "residential rental housing" should not be allowed to take accelerated depreciation. NHC supports the allowance of accelerated depreciation for publicly assisted housing whose owners are limited in the return they may receive and which is devoted to housing families of low and moderate income. Since the owners of such housing are limited to a 6% return on their investment, the accelerated depreciation is needed to attract and keep investors who develop and own such housing for low and moderate income families.

Re Proposed Alternative Amendments to Permit Exemptions from Section 1250 for Residential Rental Housing

1. Section 1250(a) as amended by Section 521(b) of the House bill (see p. 305) is amended by inserting the following between the words "property" and "is" on line 16 in the first sentence:

"(other than residential rental housing)"

OR

2. Alternatively, the NHC would urge that Section 1250(a)(1) be amended by adding the following between the words "property" and "is" in the first sentence:

"(other than multifamily housing owned by a limited dividend entity which provides publicly-assisted housing and related facilities for individuals or families of low and moderate income which qualify under regulations prescribed by the Secretary of Housing and Urban Development to receive the benefits of government assistance through below-market interest rate financing, interest reduction payments or rent supplements)".

The NHC recommends the exemption from the recapture provisions of Section 1250 of all residential rental property; or, in the alternative and at the least, the exemption of publicly-assisted projects serving the housing needs of low and moderate income families and individuals. An exemption of this kind is essential to obtain investor participation in the construction and ownership of such housing.

Re Proposed Alternative Amendments to Exempt from Limitation on Tax Preferences, the Deductions Related to Residential Rental Housing

1. Section 84(c)(1)(B), a new section of the Internal Revenue Code added by Section 301(a) of the House Bill (see page 166) is amended by inserting after the word "property" in the first sentence (line 13) the following:

"except for residential rental housing"

2. NHC alternatively recommends that, in the event the Committee does not want to exempt all residential rental housing, Section 84(c)(1)(B) be amended by inserting after the word "property" in the first sentence (line 13) a comma, and the following:

"other than multifamily housing owned by a limited dividend entity which provides publicly-assisted housing and related facilities for individuals or families of low and moderate income which qualify under regulations prescribed by the Secretary of Housing and Urban Development to receive the benefits of government assistance through below-market interest rate financing, interest reduction payments or rent supplements,".

NHC does not oppose the enactment of the general limitation of tax preferences and allocation of deductions. However, NHC supports an exemption therefrom as to residential rental housing, or in the alternative, as to limited dividend multifamily projects for low and moderate income families. Such an exemption will permit such worthy projects to attract the needed capital in a highly competitive market.

OCTOBER 17, 1969.

Hon. RUSSELL B. LONG,
Chairman, Senate Finance Committee,
Senate Office Building,
Washington, D.C.

DEAR MR. CHAIRMAN: We are attaching hereto a statement setting forth our views on how the Federal Tax Reform Act of 1969, as passed by the House of Representatives, will affect urban housing and commercial property development in our cities. This letter will summarize in capsule form the principal suggestions made in that document.

First of all, we believe that it is not in the nation's interest to leave intact large loopholes in the progressive tax rate scale. The objective of achieving equal treatment under the tax laws is of critical importance to both the viability and creditability of the Internal Revenue Code. However, we are concerned that any proposed tax reform measures do not lower existing incentives for construction to a point which would seriously threaten the achievement of the housing objectives set forth in the Housing and Urban Development Act of 1968. This concern stems from two basic facts: first, private investment in housing is being seriously curtailed by rising costs and soaring interest rates; and second, the housing industry has historically been a relatively weak competitor for investment capital: as pointed out by the U.S. Conference of Mayors, the devastating reality is that "from 1961 to 1968, our gross national product grew at an annual rate of 5.2 percent, durable equipment by 9.9 percent, and investment in new plants by 7.5 percent, while growth in urban housing investment was only 0.5 percent."

After a thorough review of the bill enacted by the House we have concluded that this legislation goes so far in meeting the first objective of tax reform that it is clearly destructive to the second objective of achieving the housing goals set forth in the 1968 Act. As indicated in the brief attached hereto, the cumulative effect of the House-approved changes would reduce the yield on real estate investment by:

28% to 49% in the case of an investment in low- and moderate-income housing

21% to 37% in the case of an investment in new conventional residential housing, and

42% to 67% in the case of an investment in an office building or other commercial property.

If the office building boom is cut off, either because of a change in the existing tax rules, or further increases in the cost of money, or both, it will mean not only the elimination of the potential for more blue collar jobs in the cities, but, indeed, the elimination of already existing construction jobs.

When they were introduced, the existing pattern of tax depreciation rules affecting improved real property (including not merely the rules as to method of depreciation, but also the rules as to useful life, depreciable basis, and calculation of gain upon sale) might have been regarded as inconsistent, and not finely tuned to economic factors. However, since World War II, these rules have been an important factor in providing a flow of equity capital for construction of apartment houses and office buildings in cities across the nation.

This is not to say that the existing rules are immutable and should never be changed. Nevertheless, the foregoing factors further support an admonition made by former Treasury Secretary Fowler in submitting the last Administration's tax reform recommendations. Secretary Fowler warned that tax rules which have an important effect on the operations of an entire industry should not be changed without a careful study of the potential results of these changes on the industry and the economy.

This is particularly the case in regard to the development of residential housing and commercial buildings because here the impact is not merely on a particular industry. The effect is upon the economic well-being of our urban areas and citizens, especially those with low incomes. To serve them, a growing stream of new construction is required.

As set forth in our statement, in the past year, two Presidential commissions have made comprehensive studies of the development of urban housing. It is noteworthy that both of these commissions recommended increases rather than decreases in tax incentives for the construction of new urban housing.

Some have come before your Committee to take the essentially negative position of urging that all existing rules be retained. We do not agree. Rather, we respectfully suggest a series of changes in the House bill which we believe more fairly balance the dual objectives of tax reform and encouragement of urban investment. These changes may be summarized as follows:

1. *Low and Moderate Income Housing.*—We suggest retention of the existing tax rules with regard to low- and moderate-income housing, to wit:

A. The provision of the House bill permitting the continued use of the accelerated depreciation methods (that is, the 200% declining balance and sum of the years digits methods) with regard to new residential housing (low or moderate or otherwise) should be retained.

B. The House bill subjects the excess of accelerated depreciation over straight-line depreciation to the LTP and AOD sections. An exception to these sections should be provided for low- and moderate-income housing.

C. Under the House bill, upon a sale of real property, the full excess of accelerated depreciation over straight-line depreciation is subject to "recapture" as ordinary income to the extent of any gain. An exception to this should be provided in a case of the sale of low- or moderate-income housing.

D. The Committee should reject the Treasury's recommendation that interest and other carrying charge deductions during construction be subject to the LTP and AOD sections. In our opinion, the Treasury's recommendation is uniquely discriminatory; it is the sole case in which a business expenditure is arbitrarily subjected to these limitations.

(Without the modifications suggested in B, C, and D, the laudable objective of the House bill contained in A would be seriously undermined.)

E. For purposes of these rules, low- or moderate-income housing may be very narrowly defined as housing which is financed by a HUD insured loan or under a state or local program of financial assistance for low- and moderate-income housing.

2. *Rehabilitation.*—We concur in and applaud the House recommendations authorizing a 5-year rapid amortization period as an incentive for the substantial rehabilitation of low-income housing. In addition, we urge that in order to encourage the upgrading of the nation's enormous existing inventory of older housing, a similar but less generous incentive be granted for rehabilitation expen-

ditures for other housing at least 20 years old. We recommend, therefore, that substantial improvement expenditures shall be subject to a 10-year amortization period. The new useful life should be the difference between a 40-year life (the life used for new housing) and the age of building in question, but in no event less than 10 years.

3. *Conventional Multi-family Housing.*—We recommend the following set of rules with regard to conventional residential housing:

A. The provision of the House bill permitting accelerated depreciation of new residential housing should be retained.

B. The provision of the House bill subjecting the excess of accelerated over straight-line depreciation to the LTP and AOD should be retained except that:

1. Only 25 percent of the excess shall be treated as a "preference"

2. The LTP and AOD should not apply to the accelerated depreciation deductions of a taxpayer who realizes over 60% of his gross income from the development and/or ownership of real properties. (It is our understanding that this provision is similar to the rule proposed by the Administration for oil investment.)

C. The Committee should reject the Treasury's recommendation that interest and other carrying charge deductions during construction be subject to the LTP and AOD sections.

D. The Committee should reject the provision of the House bill limiting a subsequent user of residential property to straight-line depreciation. He should be permitted to use the 150% declining balance method as under existing law.

E. In regard to the recapture of depreciation on sale, we propose that:

1. Upon a sale within the first 3 years (as opposed to the first year as under present Section 1250) all depreciation, and not merely the excess over straight-line depreciation, should be subject to recapture.

2. Upon a sale after 3 years, a percentage of the excess over straight-line depreciation should be subject to recapture as under the House bill. The percentage should decline by 1% per month so that after 11 years 4 months (as contrasted with 10 years under existing law) the entire gain will be taxable as long-term capital gain.

4. *Office Buildings and Other Commercial Property.*—The following changes are suggested in the tax treatments of office buildings and other commercial property:

A. As under existing law, the first user should be permitted to use the accelerated methods of depreciation and a subsequent user should be permitted to utilize the 150% declining balance method.

B. The provision of the House bill subjecting the excess of accelerated over straight-line depreciation to the LTP and AOD should be retained except that:

1. Only 25% of the excess should be treated as a "preference"

2. The LTP and AOD should not apply to the accelerated depreciation deductions of a taxpayer who realizes over 60% of his gross income from the development and/or ownership of real properties.

C. The Committee should reject the Treasury's recommendation that interest and other carrying charge deductions during construction be subject to the LTP and AOD sections.

D. In order to prevent an abuse of rapid depreciation by means of a quick turnover of properties, there should be stricter provisions for recapture of depreciation upon a sale than those recommended by the House. Specifically, we recommend that:

1. Upon a sale within the first three years (as opposed to the first year as under the present Section 1250 and the House bill) all depreciation—and not merely the excess over straight-line depreciation—should be subjected to recapture, and

2. Upon a sale after three years, a percentage of the total prior depreciation (and not merely the excess of straight-line depreciation as under the House bill) will be subject to recapture. This percentage will decline by 1% per month so that after 11 years and 4 months (as contrasted with 10 years under existing law), the entire gain will be taxable as long-term capital gain.

We believe that these recommendations are most comprehensive and deserve your attention and evaluation. We will be glad to answer any questions you have, or to work with the staff of the Senate Finance Committee is clarifying any of these proposals.

In conclusion it is our belief that if changes are made in the Tax Reform Act of 1969 along the lines recommended herein, a measurable and desirable degree of tax reform can be brought about without serious restraints on the important objective of encouraging private investment in housing and commercial construction which is so important to the economic and social well-being of American cities.

Respectfully submitted,

STATEMENT REGARDING HOUSING AND COMMERCIAL DEVELOPMENT PROVISIONS OF TAX REFORM BILL OF 1969 [1]

This statement represents our views on how the Federal Tax Reform Act of 1969 will affect urban housing and commercial property development in our core cities.

Our nation faces an urban crisis and one of the most conspicuous components in this crisis is the lack of safe, decent housing for many of our urban residents.

We know that over 6 million families now live in unsafe and unsanitary conditions.

We know that our housing stock continues to deteriorate at a fast rate.

We know that neither the government nor the building industry has done enough to: (1) replace the inadequate housing, and (2) slow down the rate of deterioration.

Last year, in enacting the Housing and Urban Development Act of 1968, Congress reaffirmed the goal of a "decent home and suitable living environment for every American family." Furthermore, this goal is to be . . . "substantially achieved within the next decade by the construction or rehabilitation of 26 million housing units, 6 million of these for low- and moderate income families."

In this Act, Congress strengthened existing programs and established a series of new ones to give communities and private businesses the tools they need to rehabilitate or build 26 million units. We now have a variety of government tools to encourage housing construction such as rent subsidies, interest subsidies, loan guarantees, mortgage insurance, direct loans, and below-market mortgage loans. Yet these tools are useless if private enterprise is unwilling to invest in and build housing and generally support the building industry. Private-sector participation depends on the potential returns offered by this kind of investment relative to other investment possibilities. In other words, if the rates of return in housing construction and ownership are favorable, the private sector will be more inclined to use the government tools established by last year's legislation. However, if the returns from other investments look more promising, then the goal of 26 million units in the next 10 years is not attainable and the rate of deterioration within the existing stock will increase; urban blight will continue and the urban crisis will intensify.

Inflation and tight money have seriously damaged the mortgage market and resulted in a construction slowdown. Thus, investors are placing available funds in other short-term, safer, high-yield investment areas and bypassing the longer term construction area. On September 23, 1969, George Romney, Secretary of Housing and Urban Development, disclosed that housing starts have declined by 33 percent since the beginning of the year and deemed the outlook "critical."

Dr. Leon Keyserling testifed before both this committee and the House Ways and Means Committee that, between 1960 and 1969, the construction industry has grown at a far slower rate than other forms of business investment (House Ways and Means Committee, *Hearings on Tax Reform—1969*, p. 2719).

---

[1] This statement was prepared by: Gerald P. Hillman, McKinsey & Company, Inc., Robert P. O'Block, Harvard Business School, Stephen S. Zeigler, Esq., of Young, Kaplan & Edelstein.

We feel that, as the Committee examine the 1969 Tax Reform Act, you should consider all proposed changes that would affect rates of return and capital committed to the construction industry in light of the industry's already weak competitive position.

If this Committee recommends changing the tax law, and Congress approves, thereby reducing the potential yield from investing in construction, this industry will become even less attractive to private investors than before. Thus, new housing and commercial construction would be even further curtailed; and this will have an adverse effect on our entire economy. However, perhaps its most important effect would be to increase the shortage of housing and therefore increase group tensions in our major cities. The severe shortage of multifamily housing in our major cities may be illustrated with reference to the present situation in New York City.

I. HOUSING CRISIS IN NEW YORK CITY

At present, New York City is experiencing a severe shortage in housing for all income groups, and this shortage has developed in spite of one of the largest government programs for public and publicly assisted housing in the country.

The problem is that the private sector has been reluctant to build in the City for a variety of reasons, one of the most important being that alternative investments are more attractive. The following table shows the recent decline in new construction starts.

TABLE 1.—PLANS FILED AND UNITS COMPLETED FOR NEW RESIDENTIAL CONSTRUCTION,[1] NEW YORK CITY, 1959 TO 1968

Number of housing units Year	Plans filed	Completions
1959	62,700	37,200
1960	43,100	35,200
1961	150,000	35,100
1962	6,600	47,300
1963	4,200	60,000
1964	13,700	51,900
1965	20,500	49,500
1966	26,100	32,000
1967	12,200	23,000
1968 (9 months)	15,000	15,000

[1] The large increase in construction in the middle 1960's was in part the result of changes in the zoning law (note "Plans Filed" in 1961). Yet, the present rate of construction is only ½ that achieved in the late 1950's.

Rental housing has been particularly hard hit from 1965 to 1968, and the number of rental units on the market decreased by 23,000. This in turn has led to increases in rent and has produced an incredibly tight housing market, with a vacancy rate of only 1.23 percent. For tenants who live in non-rent-controlled apartments, rent increases last year averaged 26.5 percent, or $45.40 per month. Because of these exhorbitant increases, the City was forced to limit increases in noncontrolled apartments. The housing crisis is not limited to low-income groups; in fact, most noncontrolled apartments are rented to middle- and upper-income people. Thus, every New York City family feels the effect of this housing shortage.

Moreover, the rental housing is old and in generally poor condition:

> Nearly a million units now occupied were constructed before 1929, and most of these are concentrated in the slums and deteriorating neighborhoods of Brooklyn and Manhattan.
>
> About 25 percent of all units now occupied are in either deteriorated or dilapidated condition.

The condition of vacant units is even worse: Only 56.7 percent of these are sound, and 30 percent are considered to be deteriorating.

One housing expert concluded that New York City must build 45,000 units and rehabilitate 16,000 units annually over a 20-year period to replace the estimated 385,000 substandard units, to upgrade the 6,000 units which each year fall into the substandard category, and to provide for an increase of 600,000 households.[1]

To restate the obvious: New York City needs a massive housing construction and rehabilitation program. To fulfill this need, the resources of the private marketplace must be marshaled. Implicit is the notion that investments by the private market in this area must be competitive with other investment opportunities. Should changes in the Internal Revenue Code be made which limit the rate of return to these investors, we must then rely only on publicly funded programs, which means either a limited housing construction program and further deterioration, or a tremendous increase in the public sector's involvement in housing and a concomitant increase in appropriations necessary to achieve this construction.

II. THE NATURE AND EFFECT OF THE PROPOSED CHANGES

The existing depreciation rules (together with the leverage provided by a high mortgage and the normal bunching of interest deductions in the early years) generally produce the following pattern of taxability for a person building and operating residential or commercial structures:

> Generally, during the first few years of building operation, the cash flow is tax free. In addition, the owner realizes a tax loss equal to the excess of the accelerated depreciation and interest deductions over the net operating income of the property.
>
> Thereafter, for a period of several years, no tax losses are realized. However, a substantial portion of the cash flow from the property is realized by the owner, tax free.
>
> During the latter years of building operation, the pattern reverses and the owner is taxable each year on an amount of income from the property, which is greater than the cash flow he may actually draw down. (See U.S. Treasury Department, *Statement Regarding Real Estate Tax Shelters*, hearings on the President's 1963 Tax Message, p. 420.)

Inasmuch as a dollar received after 1 year is worth more than a dollar received after, say, 10 years, this pattern of initial tax losses, and later taxable income, tends to increase the potential yield of an investment in real property. (Slitor, *The Federal Income Tax in Relation to Housing*, report to President's Commission on Urban Problems, pp. 46–47.)

As set forth below, the House bill would seriously and adversely affect this pattern of tax incentives for the development of housing. The important provisions in this regard are as follows:

> At present, the first user of residential housing may utilize the "accelerated methods" of depreciation, that is, the 200 percent declining balance ("DB") and the sum of the years digits ("SYD") methods of depreciation. The House bill permits the continued use of this method for residential housing (Proposal 167, (j) (2)). However, the taxpayer's deductions for the excess of the accelerated depreciation taken over straight-line ("SL") depreciation are subject to disallowance under the limit on tax preference ("LTP") and the allocation of deductions ("AOD") sections (Prop. 84,277).[2]

Under existing law, the first user of an office building (or other commercial property) may utilize the accelerated methods of depreciation. Under the House Bill, the first user may use only the 150 percent declining-balance method, which

---

[1] Dr. Frank Kristof, formerly Assistant Administrator for Programs and Policy for the Housing and Development Administration, *The Future of Rehabilitation in Our Aging Cities* (Conference of The New England Region on Problems of a Mature Economy, November 18, 1967).

[2] Under the LTP, a taxpayer's deductions (or income exclusions) for certain items (designated as "preferences") are disallowed to the extent that they exceed 50 percent of the sum of: (1) the individual's adjusted gross income, plus (2) the amount of the preferences. Among the "preferences" designated in the House Bill is the excess of accelerated over straight-line depreciation.

The designation of one of the taxpayer's deductions as a "preference" may also result in disallowance of a portion of the taxpayer's personal deductions. Under the AOD section, a taxpayer's personal deductions must be allocated between the portions of his adjusted gross income (before preferences) which are, and are not, sheltered by preferences. This calculation is made after the LTP has been applied to disallow part of the preferences. The portion of the personal deductions allocated to income sheltered by preferences is disallowed.

From the point of view of a potential investor in real estate, the AOD section is merely disallowing an additional portion of his accelerated depreciation, deducted over and above that which is disallowed under the LTP section. That is, his personal deductions would be allowed, if he did not make the investment which produced the preference.

is less rapid than the accelerated methods (i.e., the 200 percent DB and SYD methods), but more rapid than the SL method (Prop. 167(j)(1)).

At present, a subsequent user of residential or commercial real property may utilize the 150 percent DB method of depreciation, not the accelerated methods.

Under existing law, the first user of an office building (or other commercial property) may utilize the accelerated methods of depreciation. Under the House Bill, the first user may use only the 150 percent declining-balance method, which is less rapid than the accelerated methods (i.e., the 200 percent DB and SYD methods), but more rapid than the SL method (Prop. 167(j)(1)).

At present, a subsequent user of residential or commercial real property may utilize the 150 percent DB method of depreciation, not the accelerated methods. Under the House Bill, a subsequent user may use only SL depreciation (Prop. 167(j)(4)).

At present, under Section 1250 of the Internal Revenue Code, upon a sale of real property (residential or commercial), only a limited portion of prior depreciation taken by the taxpayer may be subject to "recapture" (i.e., treatment as ordinary income to the extent of any gain realized). Specifically, if the taxpayer has held the property for over 12 months, only the excess of the accelerated depreciation taken over SL depreciation is subject to recapture. The percentage of this excess subject to recapture declines by 1 percent for each month that the taxpayer has held the property for over 20 months. Thus, after 10 years, no part of the gain realized on a sale is subject to ordinary income treatment.

Under the House bill, the entire excess of the accelerated depreciation taken over SL depreciation is subject to recapture upon a sale, no matter when the sale is made, that is, the sliding scale has been eliminated. The Treasury has now proposed an exemption to the stricter recapture rule upon a sale of low- and moderate-income housing financed by a loan insured by HUD.

For conventional residential housing, in the hands of the first user, the Treasury subsequently proposed full recapture of excess depreciation for the first 10 years, lowered by 1 percent per month to year 19 of the taxpayer's holding period, when all gain realized on a sale is taxed as long-term capital gain (*Technical Explanation of Treasury*, p. 43).

Under present law, a taxpayer may deduct currently (rather than capitalize) interest and real estate taxes paid during the construction period.

Under the House bill, such carrying charge deductions are not subject to the LTP or AOD.[3]

The Treasury has proposed to the Committee, however, a more rigid treatment, namely, subjecting the taxpayer's carrying charge deductions to the LTP in regard to commercial but not residential property (*Statement of Treasury Secretary David M. Kennedy*, September 4, 1969, p. 37; *Technical Memorandum of the Treasury*, p. 19).

The House bill did include one provision allowing greater liberality in depreciation of real property. It permits a taxpayer making significant rehabilitation expenditures in regard to low-income housing to amortize such expenditures over a period of 5 years. The maximum expenditure thus amortizable is $15,000 per unit. In order to be eligible for this rapid amortization, the taxpayer must expend over $3,000 per unit in a period of 2 consecutive pears (Prop. 167 (r)).

The Treasury suggested to your Committee that there be subjected to the LTP the excess of amortization taken under this provision over the depreciation allowable under the otherwise applicable life (Statement of Secretary Kennedy, *supra*).

We have recently made calculations to determine the effect that the proposed changes in the House bill would have on the yield of the builder/owner of a residential or commercial building.[4] These calculations are set forth in full in Exhibits 1 to 11 attached hereto. They may be summarized as follows:

---

[3] Under the House bill, if the property will be subject to a net lease upon completion, the interest deductions may be subject to partial disallowance under the AOD section or the investment interest section. Based on discussions between New York City representatives and the staff of the Joint Committee on Internal Revenue Taxation, it appears this result may never have been intended and will be corrected at a technical level.

[4] Throughout this analysis, yield is defined as the discount rate which equals the present value of cash inflows to the present value of cash outflows. This discount rate in economic terms is commonly called the internal rate of return. Cash flows included are the initial equity investment, interest and real estate taxes during construction, before-tax cash flow, the cash value of taxable income and the after-tax capital gain.

The cumulative effect of the changes in the House bill, with the proposed Treasury changes therein (the "House changes"), is *to reduce the yield of an investment in real property by the following percentages, assuming returns under existing laws equal 100 percent:*[5]

—27.6 to 48.6 percent in the case of an investment in low- and moderate-income housing[6]

—20.9 to 37.4 percent in the case of an investment in new conventional residential housing[6]

—42.2 to 66.5 percent in the case of an investment in an office building.[6]

The effect of the provision for a greater recapture of depreciation upon sale, considered by itself, is to reduce the yield of an investment in real property by a minimum of the following percentages:

—4.9 percent in the case of an investment in low- and moderate-income housing

—2.0 percent in the case of an investment in conventional residential housing

—2.1 percent in the case of an investment in an office building.

The foregoing figures are a very low estimate of the impact of a reduction in sales price on yield, since they assume that the developer is looking forward to a depreciation in property value of 1 percent per annum. If, as is generally the case, the developer is looking forward to an appreciation in value, the stricter recapture of depreciation will have a much greater impact on the developer's expected yield, that is, a percentage yield reduction in the range of 10.0 to 13.1 percent for conventional housing and 7.2 to 10.5 percent for commercial construction.[7]

The effect of the proposed restriction of a subsequent user to straight-line depreciation, considered by itself, is to reduce the subsequent user's yield by approximately 22 percent.[8] This, in turn, reduces the selling price that the first user may expect and reduces the first user's yield by a minimum of the following percentages:

—4.6 percent in the case of an investment in low- and moderate-income housing

—4.4 percent in the case of an investment in a conventional apartment house

—5.7 percent in the case of an investment in an office building.

The figures are a very low estimate of the impact of a reduction in the first user's sales price on yield. They assume that the developer is looking forward to a depreciation in property value of 1 percent per annum. If, as is generally the case, the developer is looking forward to an appreciation in value, the limit of the second user to straight-line depreciation, which reduces the first user's sales price, will have a much greater impact on the developer's expected yield, that is, a percentage yield reduction in the range of 42.9 to 44.8 percent for conventional housing and 40.7 to 42.9 percent for commercial construction.[9]

The effect of limiting the first user of an office building to 150 percent DB depreciation, as opposed to 200 percent DB depreciation, is to reduce such user's yield by approximately 18 percent.

The effect of applying the LTP and AOD sections to construction carrying charges is to reduce the yield of an investment in real property by the following percentage:[9]

—20.0 to 34.7 percent in the case of an investment in low- and moderate-income housing[10]

—17.9 to 30.7 percent in the case of an investment in conventional residential housing[10]

—16.7 to 30.6 percent in the case of an investment in office buildings.[10]

---

[5] Ranges calculated assuming 50 to 100 percent disallowance of accelerated depreciation and/or carrying charges under LTP and AOD.

[6] Percentage reductions calculated assuming returns under existing tax laws equal 100 percent.

[7] Range calculated assuming a 1 percent and 2 percent per year increase in property value.

[8] Percentage reduction for low- and moderate-income housing equals 20.5 percent; reduction for office buildings equals 22.6 percent.

[9] Ranges calculated assuming 50 to 100 percent disallowance under LTP and AOD.

[10] Percent reductions calculated assuming returns under existing tax laws equal 100 percent.

The effect of applying the LTP and AOD sections to accelerated depreciation, considered by itself, is to reduce the yield of an investment in real property by the following percentages:[11]

—27.6 to 48.6 percent in the case of an investment in low- and moderate-income housing

—20.9 to 37.4 percent in the case of an investment in conventional residential housing

—18.0 to 23.7 percent in the case of an investment in office buildings.

Clearly then, the House bill (especially the proposed Treasury revision therein) would drastically change the economics of investment in residential housing and commercial development—change it in such a way as to significantly reduce the incentive to build such structures.[11]

III. SUMMARY OF OUR POSITION

When it was introduced, the existing pattern of tax depreciation rules affecting improved real property (including not merely the rules as to method of depreciation, but also the rules as to useful life, depreciable basis, and calculation of gain upon sale) might be regarded as inconsistent, and not finely tuned to economic factors. However, since World War II, these rules have been an important factor in providing a flow of equity capital for construction of apartment houses and office buildings in cities across the nation. (Slitor, supra, p. 45; *1969 House Hearings*, pp. 2656–57 (testimony of representative of National Association of Real Estate Boards), p. 2753 (testimony of representative of National Apartment Association), pp. 2776–77 (testimony of representative of Mortgage Bankers Association of America).) Thus, for example, in hearings on the Revenue Act of 1964, the Treasury submitted exhibits showing that the existing tax advantages were a major factor in inducing the public to invest in public real estate development companies. (See *Statement on Real Estate Tax Shelters*, hearings on the President's 1963 Tax Message, p. 420.) The following chart included in the 1969 Hearings tells the story better than many statements.

This is not to say that the existing rules are immutable and should never be changed. Nevertheless, the foregoing factors further support an admonition made by former Treasury Secretary Fowler in submitting the last Administration's tax reform recommendations. Secretary Fowler warned that tax rules which have an important effect on the operations of an entire industry should not be changed without a careful study of the potential results of these changes on the industry and the economy.

This is particularly the case in regard to the development of residential housing and commercial buildings, because here the impact is not merely on a particular industry. The effect is upon the economic well-being of our urban areas and citizens, especially those with low-incomes. To serve them, a growing stream of new construction is required. As the *Report on the President's Commission on Civil Disorders* states:

> "Today, after more than three decades of fragmented and grossly underfunded Federal housing programs, decent housing remains a chronic problem for the disadvantaged urban household. (Fifty-six percent of the country's nonwhite families live in central cities today, and of these, nearly two-thirds live in neighborhoods marked by substandard housing and general urban blight.) For these citizens, condemned by segregation and poverty to live in the decaying slums of our central cities, the goal of a decent home and suitable environment is as far distant as ever.
>
> "Statistics available for the period since 1960 indicate that the trend is continuing. (There has been virtually no decline in the number of occupied dilapidated units in metropolitan areas . . .)
>
> "Inadequate housing is not limited to Negroes. Even in the central cities the problem affects two and a half times as many white as nonwhite households. Nationally, over 4 million of the nearly 6 million occupied substandard units in 1966 were occupied by whites. . . .
>
> "Nevertheless, in the Negro ghetto, grossly inadequate housing continues to be a critical problem." (*New York Times*, ed. pp. 467–68.)

As set forth below, in the past year two Presidential commissions have made comprehensive studies of the development of urban housing. It is noteworthy

[11] Changes in yield are summarized in Exhibits 4 to 6.

that both of these commissions recommended increases rather than decreases in tax incentives for the construction of new urban housing.

We recognize that the achievement of these housing goals must be balanced with the objective of achieving a fair tax structure. However, it is our position that the House bill goes too far in meeting the tax reform objectives at the expense of the housing objectives.

With a view toward attaining a better balance between housing and tax reform goals, we have made a series of detailed recommendations relating to each of four major categories of real property, namely:

Low- and moderate-income housing
Rehabilitation of existing housing
Conventional residential housing
Office buildings and other commercial structures.

Our recommendations are summarized in the cover letter attached hereto. They are specified in the following discussions of the aspects of housing and commercial development affected.

IV. LOW- AND MODERATE-INCOME HOUSING

A. New Construction

The case for retention of at least the existing tax incentives is most clear in regard to low- and moderate-income housing.

Thus the memorandum on real estate tax changes submitted by the Treasury under the Johnson Administration (the "Treasury Memorandum") did not recommend any change in the existing depreciation rules regarding low- and moderate-income housing. In this regard, it quoted the following recommendations in the *Report of the National Commission on Urban Problems* (the "Douglas Commission"):

> "The Commission recommends prompt revision of the Federal income tax laws to provide increased incentives for investment in low and moderate income housing, relative to other real estate investment, where such housing is governmentally subsidized and involved in a legal limit upon the allowable return on investors' equity capital. Specifically, we propose that the Internal Revenue Code be amended to provide especially favorable treatment (whether preferential depreciation allowance or through investment credits) for investments made under the governmentally-aided limited-profit programs for the construction of low and moderate income housing."

Indeed, after the Treasury Memorandum was prepared, the *President's Commission on Urban Housing* (the "Kaiser Commission") issued a further report regarding the development of low- and moderate-income housing. This Report recommended not a cutback of existing tax incentives, but rather the addition of further tax incentives, that is:

> A tax credit for investment in low- and moderate-income housing comparable to the existing investment credit.[12]
>
> A partial forgiveness of capital gains tax upon certain sales of low- and moderate-income housing.

Thus, two Presidential Commissions, each working for over a year, submitted comprehensive reports recommending increases, not decreases, in the existing tax incentives for the development and operation of low- and moderate-income housing. Each report was made on the basis of studies done by leading consultants, public hearings, intensive statistical studies, and the experience of the distinguished Committee members.

The distinguished group of businessmen who constituted the Advisory Panel on Private Enterprise to the Commission on Civil Disorders recommended:

> "It is contended that tax incentives tend to obscure the search for more effective techniques to common social goals. This may be an effective argument in regard to other uses of tax incentives, but it is inapplicable to the use we recommend. We arrived at the tax approach only after carefully appraising the various other available means of governmental assistance.

---

[12] As one leading economist stated: "It is, perhaps, permissible to cast a puzzled glance at national policies which purport to encourage housing as such and at the same time appear to regard private investment in housing as "unproductive" (compared with, say, investment in industrial plant) and hence unworthy of investment tax incentives." Netzer, *Housing Taxation and Housing Policy*, p. 136 (1967).

several of which have been tried. After weighing these alternatives, we have come to the firm conclusion that the tax technique is indeed the most effective for the particular social goal. We have sought a means of motivating the widest possible spectrum of American business in alleviating joblessness in our urban and rural poverty areas, and we find that no other technique is as likely to move the American business community into action for this purpose as the tax incentive device."

The fact is any substantial reduction of the existing tax incentives for the development and operation of low- and moderate-income housing would result in driving private investment out of this field. The reason why this is so is quite simple. The rents on privately owned low- and moderate-income housing qualifying for assistance under Federal or state programs are generally restricted to an amount sufficient to yield the owner a 6 percent cash flow on his net equity. In an economy in which an investor can realize an 8 or 9 percent yield on a high-grade corporate bond (or yields of 10 to 11 percent on a mortgage, that is, a debt investment in real estate), a yield of 6 percent would hardly induce private parties to undertake the work and risk involved in the development of low- and moderate-income housing.

The difficulties which tend to discourage builders from undertaking a low-income project include:

1. Assembling land in the face of possible resistance from militant community groups
2. Inducing investors to contribute "seed money" for attorneys' and architects' fees and land deposits before final government authorization for the project has been obtained
3. Estimating construction costs and the construction period—especially if, as is often necessary, some inexperienced new subcontractors are used
4. Meeting government cost limitations
5. Obtaining government approval for rent increases when such increases become necessary due to increased expenses
6. Dealing with rent interruptions and possible rent strikes—both of which may be totally unrelated to the operations of the particular project
7. Delegating certain management responsibilities to a tenant's group which, at least at the outset, will probably be inexperienced in real estate management.

The 1968 Housing and Urban Development Act provides a new interest subsidy program to reduce the rental charges of housing erected by private enterprise under Federal, state, and local loan programs. In addition, this same legislation established a new mechanism—a National Housing Partnership (the "NHP")—which will use existing tax incentives to attract new capital to the housing market. The NHP will be a private partnership in which the equity interests will be held by the nation's leading industrial concerns. The NHP will, in turn, purchase up to 25 percent equity interests in low- and moderate-income housing projects sponsored by local partnerships. It was the hope of Congress that existing tax incentives, together with certain provisions of the new Act, would be sufficient to raise the yield of investments in low- and moderate-income housing to those realized by leading industrial corporations. Thus, the *Senate Report* stated:

"The partnership arrangement also makes it possible to assure an adequate return to investors. Under existing Internal Revenue Service regulations and rulings, partnership losses for tax purposes flow to the individual partners. In the case of new housing units financed on a 10 percent equity-90 percent debt basis, the annual accelerated depreciation of the building costs results in substantial book losses during the initial 10 years after the project is built. Assuming the member of the partnership is in a relatively high income bracket, his share of the depreciation losses plus cash income from project operations would provide an after-tax return on his investment which would compare favorably with the return which most industrial firms realize on their equity capital." (*S. Rep. No. 1123*, 90th Cong. 2d Sess. p. 85 (1968).)

The NHP organization arose as a result of a proposal by the Kaiser Commission. In hearings before the House Ways and Means Committee on this tax reform bill, Mr. Kaiser stated:

"Private participation in the development of housing for low- and moderate-income families depends upon the continued availability of assistance through both the Federal housing programs and existing Federal income tax treatment of real estate. Changes in existing rules regarding accelerated methods of depreciation could make equity investment in low- and moderate-income housing less attractive and reduce private participation in housing.

"Increased private involvement in producing decent housing for the poor in the volume required could not be expected if either of the existing incentives is eliminated without providing suitable substitutes.

"Even if substitutes for the tax incentives were designed, housing production may slow down until the new programs are proven and become familiar to the industry.

"The existing combination of Federal assistance and favorable tax treatment have not succeeded in producing sufficient amounts of housing for low- and moderate-income families. Instead of eliminating existing incentives, additional devices for stimulating the production of low- and moderate-income housing should be provided." (*1969 Hearings*, p. 2797.)

Thus the case for not cutting back the existing benefits in regard to privately financed low- and moderate-income housing is quite basic—without them, the rate of private construction of low- and moderate-income housing will be severely curtailed.

There are some who state, regardless of what existing tax rules are for low- and moderate-income housing, that little private construction will be undertaken. We respectfully dissent from this position.

In 1968, the New York State legislature amended the Mitchell-Lama Law[13] to allow a partnership to be the sponsor of a project financed thereunder. The purpose of this amendment was to spur investor and builder interest in the development of low- and middle-income housing by making available the pass-through of tax losses which the partnership form accords. The effect of this amendment dramatically indicates the impact of tax incentives on the development of low- and moderate-income housing.

In May 1969, New York City held a public forum on private investment in low- and moderate-income housing, which was well attended. Leading attorneys and representatives of the investment banking and building communities reported on the effect of the Mitchell-Lama amendment.

Thereafter, in June 1969, New York City made its first loan to a partnership and since that time, three other projects have gone to loan closings and construction in the partnership format, representing a total of over 1,000 new units. The application for these projects, filed years before, had been dormant until the use of the partnership form was authorized. It is noteworthy that the sponsors of each project applied for interest-reduction payments under Section 236 of the National Housing Act (added by the 1968 Housing Act), so that apartments could be rented to the very lowest income families. At the present time, applications covering thousands of additional units employing the partnership format are in the administrative pipeline.

All of these endeavors may be curtailed by the House Bill, since, as set forth above, the cumulative effect is to reduce the yield of an investment in low-come housing by a striking 27.6 to 48.6 percent. Moreover, as indicated by the material in Exhibits 1 to 11 attached hereto, the impact in yields of any one of these changes, considered separately, is significant.

In view of the high risk and work factors involved in developing low-income housing, two Presidential commissions recommended increased tax incentives for low- and moderate-income housing to attract private investment, not tax disincentives. Hence, we take the position that at the very least, no change should be made in the existing tax rules affecting low- and moderate-income housing.

The Treasury's offer to surrender the increased recapture on the sale of a limited category of low- and moderate-income projects is of no consequence because, of all the changes proposed, increased recapture has the least effect—only a 4.9 percent reduction in yield.[14] Even with this change excluded, the cumulative effect of the House changes is to reduce the yield of an investment in low- and moderate-income housing by 22.7 to 43.7 percent.

Indeed the Treasury's proposal apparently covers only projects financed by loans insured by HUD under Section 221 (d) or Section 236 of the National Housing Act. It does not even cover low- and moderate-income projects financed by State or local low-interest-rate loans.

---

[13] The New York State Private Housing Finance Law, Article II (commonly called the "Mitchell-Lama Law") authorizes the City and the State Housing Finance Agency to make long-term, low-interest-rate loans to private sponsors of low- and middle-income housing projects and to grant local real estate abatement to such projects.

[14] Calculation based on a sales price reduction of 1 percent per annum.

A separate point should be made of our recommendation that accelerated depreciation of low- and moderate-income housing be exempted from the LTP and AOD.[15] We do not denigrate the importance of the LTP and the AOD as the "goal-line" defenses against a taxpayer, eliminating an undue portion of his taxable income by various preferences. Nor do we dispute that as to a potential investor without any other preferences and without major personal deductions, these two rules have little, if any, effect. However, these observations are of only theoretical significance since the typical investor in a low- or moderate-income housing project is a wealthy individual who has other substantial preferences. To such an individual, the application of the LTP and AOD means, in essence, a potential disallowance of from 50 to 100 percent of his deductions for accelerated depreciation deductions; and as set forth above, the combined effect of such disallowances (considered apart from the other House changes) is to reduce his yield from investment in the project by about 27.6 to 48.6 percent. Needless to say, if such an individual has other activities (e.g., oil and security investments), producing tax preferences in excess of the 50 percent limit, the activity that he will first seek to eliminate (or not undertake at all) is an investment in low- or moderate-income housing—simply because such an investment does not yield a substantial income apart from the tax savings.

Of equal importance to the economic impact of the LTP and AOD is their psychological effect. We are informed that since passage of the House bill, developers of low- and moderate-income housing projects have faced even greater difficulties than before in securing equity investments. Prospective investors, counseled by their accountants and lawyers, have been "turned off" by the complexity of the LTP and AOD and the difficulty of predicting the economic impact for the investment time horizon. Of course, such factors do not constitute a valid argument against some application of LTP and AOD to depreciation (e.g., of an office building), where economic factors rather than tax savings should predominate in determining whether the investment is made. However, these factors militate against applying the LTP and AOD to an investment in low- and moderate-income housing where under government regulations the cash flow from rentals is not competitive and hence the tax incentives are critical.

Finally, it is an undeniable fact that granting preferential treatment to low- and moderate-income housing in the form of exclusion from the LTP and AOD will greatly increase the number of investors interested in such projects.

In summary, *we suggest retention of all the existing tax rules with regard to low- and moderate-income housing,* to wit:

1. The provision of the House bill permitting the continued use of the accelerated depreciation methods (that is, the 200 percent declining balance and sum of the years digits methods) with regard to new residential housing (low- or moderate-income or otherwise) should be retained.
2. The House bill subjects the excess of accelerated depreciation over straight-line depreciation to the LTP and AOD sections. An exception to these sections should be provided for low- and moderate-income housing.
3. Under the House bill, upon a sale of real property, the full excess of accelerated depreciation over straight-line depreciation is subject to "recapture" as ordinary income to the extent of any gain. An exception to this (or any stricter recapture role) should be provided in a case of the sale of low- or moderate-income housing.[16]

In the 1968 Housing Act, Congress authorized HUD to insure a 100 percent mortgage loan to a cooperative or nonprofit organization to purchase a project from its initial limited-dividend sponsor. This provision was an important bridge between the private developer, who eventually wishes to secure a return of the capital invested in the project, and the community, which wishes to secure management rights in the project.

A postponement of gain provision, such as that discussed above, would provide a further incentive toward reaching the goal of private development with eventual community ownership. The provision should be narrowly limited to the situation in which the taxpayer reinvests the proceeds of the sale in yet

---

[15] For reasons set forth below, we take the position that construction interest and other carrying charges should in no case be subject to the LTP and AOD.

[16] Indeed, the Committee might consider granting full nonrecognition of gain treatment upon a sale of a low- or moderate-income project when:

(a) The sale is made to a cooperative or local nonprofit organization.

(b) The taxpayer reinvests an amount equal to the net proceeds of the sale in another low- or moderate-incme project.

another low- or moderate-income project. It will be noted that the *President's Commission on Urban Housing* recommended exemption of gain on a sale to a cooperative or nonprofit buyer without any reinvestment requirement.

4. For purposes of these rules, low- or moderate-income housing may be very narrowly defined as housing which is financed by a HUD-insured loan or under a state or local program of assistance for low- and moderate-income housing.

No loss of revenue for the Treasury will be generated by the above proposal for low- and moderate-income residential housing (see Exhibit 7).

B. AMORTIZATION OF REHABILITATION EXPENDITURES

The House bill contains a new provision to promote the rehabilitation of low-income housing. The bill authorizes a 5-year amortization period in regard to expenditures for the rehabilitation of low-income housing, if the taxpayer makes such expenditures in excess of $3,000 per unit over a period of 2 consecutive years (including the taxable year). The maximum amount subject to the rapid amortization is $15,000 per unit.

We heartily applaud this proposal as one of the most imaginative attempts in years to spur low-income housing development.

Our awareness of the great potential of rehabilitation is indicated by the fact that New York City is currently financing a prototype rehabilitation project in Brooklyn which, upon completion, will consist of 450 units. The rehabilitation being done is of a "gut" character with nothing but the structural shells of the old buildings being retained. Thus, upon completion, the units will be virtually new. They will, however, rent at a figure of approximately two-thirds of the rentals of new low-income housing currently being developed. This project is sponsored by a limited partnership in which leading businessmen and corporations are the investors and a young, imaginative builder is the active manager. With the assistance of the new amortization provision, hundreds of such projects can be undertaken.

Completely apart, however, from this type of "development" rehabilitation, there is a need to remove the tax detriments to the current rehabilitation of all types of older housing, low-, moderate-, and high-income. In many of our urban areas at the present time, the deterioration of the existing housing inventory is taking place at such a rapid rate that even the most ambitious development program could never hope to catch up. A leading expert has suggested that in the next few years, 47,000 buildings in New York City will be abandoned (Dr. Frank S. Kristof, Statement at Meeting of American Statistical Association August 20, 1968).

We do not believe that a new tax incentive is necessary to encourage this type of rehabilitation, because outside of the low-income areas, rehabilitation should and will produce its own economic return. However, we feel that it is necessary to remove at least the present tax deterrents to the rehabilitation of older housing.

At present, the very fact of a substantial rehabilitation expenditure is sometimes used by an IRS agent as evidence that the useful life of the property is longer than that claimed by the taxpayer in his return. "If not, why did he make the expenditure?" Needless to say, the *possibility* of this result has a deterrent effect on the owner's considering the expenditure.

The uncertainty is greater because, unlike the case in regard to new housing, the Treasury guidelines do not specify any particular life for used housing acquired by the taxpayer. The "guideline life" for new residential housing is 40 years. However, if a taxpayer purchases a building, say, 25 years old, the regulations do not explicitly authorize him to use a 15-year life.

We believe that the making of rehabilitation expenditures would be facilitated if their tax consequences were more predictable. Specifically, we recommend that when a taxpayer makes rehabilitation expenditures meeting the requirements hereinafter set forth, he should be permitted upon completion of the work, to establish a new useful life for his entire adjusted basis in the building in question. The new useful life should be the difference between the 40 year life for new housing and the age of the building in question, but in no event less than 10 years. This provision would be optional and the taxpayer would be free to claim faster depreciation deductions if he could substantiate them under existing rules.

The foregoing provision would apply only when:

1. The building is at least 20 years old at the time of the rehabilitation in question, and
2. The rehabilitation expenditures over a period of 2 consecutive years (including the taxable year) exceed the greater of:
   (a) $3,000 per unit
   (b) Five percent of the taxable adjusted basis for the units (excluding land cost) at the beginning of the period.

This change in the depreciable life of the building in question should accompany the authorization of a 10-year amortization period in regard to the expenditures for rehabilitation. These provisions could encourage desperately needed investment in existing housing stock, now in declining condition.

V. CONVENTIONAL MULTIFAMILY HOUSING

The case for the retention of the existing depreciation rules in regard to conventional, non-publicly-assisted multifamily housing is becoming unfortunately quite similar to the case in regard to subsidized low- and moderate-income housing.

In recent years, the costs of construction and operation of multifamily housing in center cities have increased geometrically. At the same time, as money has become increasingly tight, interest rates have also increased rapidly. The trend continues as the costs of land, labor, and money continue to rise. Land costs lead the increase at 6 percent per year, followed closely by 5 percent per year construction cost increases. (See Figures 2 to 5.)

This pattern of costs has gradually produced a situation in which new construction in our urban areas is limited to subsidized low-income units and high-income luxury apartments. The economics involved are producing a financial environment in which there is no place for the middle class in the cities.

The ramifications of this situation are startling. It will lead to further migration of the middle class to the suburbs and continued dwindling of the urban tax base. As these people are replaced by low-income families, an increased demand for services is forced upon the central city. Thus, the financial condition of cities worsens from two directions: the loss of a tax-paying middle-class base and the increased demand for more municipal services, necessitating an increased rate of city expenditure. In short, the urban housing crisis is critically linked to the financial crisis that cities are experiencing.

Without the continual construction of housing units for the middle class, we must be content to accept cities which are populated islands of affluence and poverty, witnessing both economic wealth and economic deprivation.

Thus, the housing crisis in our cities is not limited to the poor, but encompasses the middle class and the rich. We just do not have enough standard units to go around. We need a program of construction which will increase the supply of housing and simultaneously hold down rental charges.

The grim facts are that without wealthy or subsidized tenants, rentals cannot cover the estimated debt service on construction and operating costs, let alone provide the owner with an adequate yield on his investment. Thus, for example, the minimum aggregate development cost (including land, carrying charges, and construction) of a nonsubsidized 2-bedroom unit in New York City, at the present time, may be in excess of $36,000. Assuming a 90 percent mortgage payable over 30 years, the estimated monthly rental necessary simply to cover expenses is $410, computed as follows:

Debt service	$238
Operating expenses	60
Real estate taxes [17]	84
Vacancy factor (7 percent)	28
Estimated monthly rental necessary to merely cover expenses	410

[17] This tax is estimated at about 20 percent of gross rental income, a typical figure according to recent studies.

In view of these factors, construction of middle-income housing in the cities has declined rapidly.

Recent experiences in New York may be more severe than in other cities, but it is surely the direction in which other cities are heading. As set forth above, recent rent increases were so high that the City was forced to adopt a system of rent guidelines, limiting rent increases to approximately 10 percent every two years.

The relevance of the aforesaid economic pattern to the tax changes presently being considered by the Committee is obvious. If builder-investor yields are already being squeezed out of existence by the converging lines of cost increases and governmental rent controls, the reduction of existing tax incentives will bring construction to a total halt.

Thus, the Treasury's proposals will result in an economic imbalance for conventional multifamily housing similar to that which we find in low- and moderate-income housing. The rentals which society is able and willing to pay are too limited to yield an adequate rate of return for the owner. The difference between the rate of return included in rents and that necessary to induce new construction must, of necessity, come from tax incentives or *direct* government subsidies.

Obviously, such a system leaves a great deal to be desired. At least in regard to housing for the middle class, the housing industry should "be able to stand on its own." However, the fact of the matter is that in view of current construction, operating, and financing costs, the industry is unable to do so unless it charges rentals which would completely push the middle class out of the cities—a result which would seriously intensify the nation's racial crisis.

As set forth above, the changes proposed by the House bill would, both cumulatively and separately, have a drastic effect on the yield of an investment in a conventional apartment house—anywhere from a 44 to 70 percent reduction of yield on a cumulative basis. Thus, the question must be asked: In view of the facts described above regarding the desperate need for more construction of conventional apartment houses and the critical industry conditions at the present time, what, if any, justification is there for making these changes?

The report of the House Ways and Means Committee sets forth two objectives for its changes, both of which can be met without these serious effects on new housing developments.

Objective 1—The Committee asserts that the existing liberal tax depreciation rules could be abused by a quick turnover of properties ((*H.R. Rep. 91–412*) (Part I), 91st Congress, 1st Session, p. 166 (1968)). This is the apparent rationale for its denial of 150 percent DB depreciation to a subsequent user and its proposal for stricter recapture upon any sale.

Both of these provisions reduce significantly the yield of an apartment house. As set forth in Exhibits 1 to 11, the denial of 150 percent DB depreciation to a subsequent user reduces that user's yield by 20.5 to 22.6 percent.[15] Accordingly, it reduces the price he is willing to pay to the developer (first owner) of the property and the developer's projected yield is accordingly reduced by a minimum of 5 to 6 percent.

For conventional residential housing, the House provision for increased recapture of depreciation reduces the developer's yield by about 5.4 to 26.2 percent in the case of a sale after about 5 years and by 2 to 9.4 percent in the case of a sale after about 12 years.

It would seem that the repeated turnover abuses could be corrected by requiring a far stricter recapture of depreciation upon an early sale. Thus, we recommended that upon a sale of a conventional apartment house within 3 years after acquisition, the entire depreciation (and not merely the excess over straight line as under the House bill) should be subject to recapture as ordinary income. Thereafter, the depreciation in excess of the straight-line rate should be subject to recapture on a sliding scale as under existing law. This complete recapture within the first 3 years would clearly prevent the turnover abuses. For example, upon sale at the end of 3 years with full recapture, the investor's yield would be

[15] Range of percentage yield reduction computed for low and moderate, conventional and commercial construction.

reduced by 26.8 percent. In addition, the Treasury would collect an additional $25,832 per $1MM of investment through the capital gains tax.

This type of interrorem recapture upon quick sales would permit Congress to correct the turnover abuse, while still: (a) leaving 150 percent DB depreciation in effect for a subsequent user, and (b) having a recapture provision which does not so severely affect an investor who holds the property for a long period of time. The yield reductions for a 12-year holding period under our proposal would be from 8.0 to 11.2 percent.

Objective 2.—The second basic objective of the House Committee was to prevent individuals from sheltering their entire incomes by real estate depreciation. This was the basis for the treatment of the excess of accelerated over straight-line depreciation as a preference under the LTP and AOD (House Report, *supra*, pp. 9, 77–78).

This proposed change has a serious effect on the yield of an investment in a conventional apartment house. Assuming a 50 percent disallowance of accelerated depreciation under the LTP and AOD, the reduction in yield is 20.9 percent. Assuming a 100 percent disallowance, the reduction in yield is 30.7 percent.

Clearly, such drastic reductions in yield would reduce still further the already declining rate of construction of apartment buildings.

While it appears, on the basis of statistics submitted to the Ways and Means Committee, that there is a need for limiting the extent to which an individual can eliminate otherwise taxable income by faster bookkeeping charges for accelerated depreciation, nevertheless this need must be balanced against the country's needs for the construction of residential housing.

In an effort to resolve this conflict of objectives, we propose that only 25 percent of the excess of accelerated over straight-line depreciation should be subject to the LTP and AOD. This proposal would serve the function of preventing individuals from reducing their tax to zero by means of accelerated depreciation. However, in contrast to the House proposal, it would reduce the yield of an investment in residential real property by only 10.5 percent, a cutback which, though harmful, should not be fatal.

This very moderate proposal should be considered in the light of the following point made to your committee by an industry representative.

> "The limit on tax preferences (LTP) was originally devised to prevent high-income persons from escaping taxation. As it has now been watered down, hobby farming may escape it by the use of accrual method of accounting; oil is exempted from it; the bulk of the income from municipal bonds is exempted; and the Treasury has recommended elimination not only of any reference to state and municipal bonds but also the appreciated value of assets donated to charity, Thus, the prime target of the limited tax preference plan now turns out to be real estate, the one area in our economy which can stand the least the cutback which would inevitably result from the provisions in the House-approved bill." (*Senate Hearings*, p. 2128.)

This point is underscored by a recommendation which the Treasury has now made to your Committee. The Treasury proposes that percentage depletion and intangible drilling expenses be included in the LTP and AOD, but that an exception be provided for an individual who derives over 60 percent of his gross income from the business. The apparent rationale for this exception is that the LTP and AOD should be used to strike only at deductions and exceptions an individual secures by investment to shelter his main business income. It should not be used to change the tax characteristics of an individual's normal business transactions. It seems very basic and important that a parallel exception should be granted to the treatment of accelerated depreciation as "a preference." The exception should apply to an individual who derives over 60 percent of his gross income from the development and ownership of real properties.

In summary, then, we recommend the following set of rules with regard to conventional residential housing (i.e., residential housing other than low- or moderate-income housing):

> The provision of the House bill permitting accelerated depreciation of new residential housing should be retained.

The provision of the House bill subjecting the excess of accelerated over straight-line depreciation to the LTP and AOD should be retained, except that:

—Only 25 percent of the excess should be treated as a "preference"

—The LTP and AOD should not apply to the accelerated depreciation deductions of a taxpayer who realizes over 60 percent of his gross income from the development and/or ownership of real properties.

The Committee should reject the Treasury's recommendation that interest and other carrying-charge deductions during construction be subject to the LTP and AOD sections.

The Committee should reject the provision of the House bill limiting a subsequent user of residential property to straight-line depreciation. He should be permitted to use the 150 percent declining balance method as under existing law.

In regard to the recapture of depreciation on sale, we propose that:

—Upon a sale within the first 3 years (as opposed to the first year as under present Section 1250) all depreciation, and not merely the excess over the straight-line depreciation, should be subject to recapture.

—Upon a sale after 3 years, only a percentage of the excess over straight-line depreciation should be subject to recapture as under the House bill. The percentage should decline by 1 percent per month, so that after 11 years and 4 months (as contrasted with 10 years under existing law) the entire gain will be taxable as long-term capital gain.

It will be noted that even with only these limited changes, there will be a decrease in the yield of an investment in conventional residential housing of 9.7 percent, assuming a sale after 5 years, and by 10.5 percent, assuming a sale after 12 years. This is clearly not an insubstantial price being paid for tax reform. Exhibits 8 and 9 compare the revenue position in regard to conventional residential housing under the House bill and our proposals.

VI. OFFICE BUILDINGS AND OTHER COMMERCIAL PROPERTY

We are also gravely concerned about the impact of the House bill upon the development in our urban areas of commercial real properties; that is, factories, warehouses, office buildings, shopping centers, and other structures. The reasons why we are concerned may be illustrated by reference to office buildings, which represent one of the primary forms of commercial construction in our urban areas.

As set forth in Exhibit 11, the effect of our proposal on conventional residential housing is to give the Treasury a full 40 percent of the revenue it might expect from the House changes.

Reams of economic literature and governmental studies have been produced in recent years about the emigration of manufacturing and wholesaling industries out from the cities to the suburbs and rural areas, and of the economic suffering produced by the departure of the blue collar jobs (see, e.g., Council of Economic Advisors, *Economic Report of the President*, pp. 134–35 (1968)). Needless to say, the impact of this departure of industry has been most serious for the Negroes and Puerto Ricans coming into the cities, since the normal route of advancement for minority groups has been from unskilled jobs to professional or white collar work. The President's Commission on Civil Disorders regarded the movement of blue-collar industry out of the cities as one of the most important reasons why the Negro and Puerto Rican groups have not moved forward in income and job standing as rapidly as previous minority groups. (*Report*, pp. 278–79.)

Office building construction is one of the few growth industries left in the center cities which utilizes skilled labor. Thus, in recent years there has been a really prodigious boom in office building construction in center cities. (See *Fortune*, October 1969, p. 184).

The tax benefits offered by the present depreciation rules have been a major factor in this office building construction boom. It is true that the actual construction work is often done by large publicly held corporations which might do the work solely for construction fees, even if the existing tax benefits of ownership were eliminated. However, these large corporations generally do not "enter the picture" until the risky and time-consuming jobs of land assembly, planning, and financing have been done by an independent entrepreneurial group. The independent group which generally emerges as an owner or co-owner of the property is generally motivated, in large part, by the significant tax benefits of the ownership interest; i.e., current deductions of carrying charges during construction and rapid depreciation deductions thereafter.

If the office building boom is cut off, either because of a change in the existing tax rules, or further increases in the most of money, or both, it will mean not only the elimination of the potential for more blue collar jobs in the cities, but, indeed the elimination of already existing construction jobs. Under prevalent union seniority rules, the first jobs to be eliminated would be those in which minority group members have been placed in recent years as a result of efforts by government, industry, and the unions themselves. Surely this tragedy should not be permitted to occur.

As indicated in Exhibits 1 to 11, in recent years investments in office buildings have been profitable as an economic matter and should be able to stand on their own without special tax incentives. Here, if anywhere, it is appropriate to apply the LTP and AOD to prevent the use of accelerated depreciation deductions to shelter an individual's entire income against tax. However, as the Treasury proposed in the use of oil depletion and drilling expenses, an exception should be granted for an individual who realizes over 60 percent of his gross income from the development and ownership of real properties.

However, we firmly believe that in other respects the House bill goes too far, and in the wrong direction, in regard to achieving tax reform for commercial construction.

In the first place, as set forth in Exhibit 6 attached hereto, the application of the LTP and AOD to construction carrying charges has an extremely serious effect on yield even in regard to otherwise profitable office buildings. It reduces the available yield by anywhere from 16.7 to 30.6 percent. Thus, to apply the LTP and AOD to construction carrying charges incurred in the development of office buildings and other commercial construction could very well have adverse effects on the economy of our urban areas, as set forth above.

Moreover, for the following reasons, the rationales for the LTP and AOD simply do not apply to construction interest and other carrying charges.

1. Carrying charges, unlike accelerated depreciation and the capital-gain deduction (i.e., the other primary LTP items), are not mere bookkeeping entries. Carrying-charge deductions represent out-of-pocket expenditures.

2. The rationale for the application of the LTP and AOD to a deduction is supposedly that the deduction bears an artificial relationship to the activity which generates it, i.e., that the taxpayer is engaging in the activity so as to generate deductions to shelter his other income (*House Report*, pp. 10–18). Hence, it is disallowed when it exceeds a certain percentage of the taxpayer's other income. Construction interest can hardly be disallowed under this rationale because, by definition, it is incurred when there is no other income from the activity to offset against it. This lack of offsetting income from the same activity is not a tax device. It merely results from the fact that when a taxpayer is constructing a building, he is not realizing any income from it.

Finally, there is a further reason why it is inappropriate to apply the LTP and AOD to construction interest in regard to office buildings and other commercial property. The group which assembles the land and arranges the financing and construction very often does not retain an ownership interest after construction has been completed. Thus, to subject construction interest to the LTP and AOD is to change the entire economic picture for the very group which makes the construction possible.

Apart from the LTP and AOD, we believe that the reforms proposed by the House in regard to depreciation of commercial properties are misdirected rather than too severe. In order to prevent the abuses of rapid depreciation deductions, the House limited the first user of commercial buildings to 150 percent DB depreciation (as opposed to the accelerated method available under existing law) and limited a subsequent user to SL depreciation (as opposed to 150 percent DB method under existing law).

The problems of depreciation policy now presented in regard to commercial real property are similar to those considered by the Treasury and Congress in 1962 in regard to commercial personal property, i.e., machinery and equipment. It was then concluded that business investment could be encouraged to the maximum extent, while at the same time preventing tax-reduction abuses, by:

Allowing initial liberal depreciation deductions with their positive effect on yield[19] while at the same time

Imposing very strict recapture of depreciation upon a sale.[20]

We respectfully submit that the same considerations apply to office and other commercial buildings.

Thus, we recommend that the Committee adopt, in regard to office buildings, the following changes:

As under existing law, the first user should be permitted to use the accelerated methods of depreciation and a subsequent user should be permitted to utilize the 150 percent declining balance method.

In order to prevent an abuse of rapid depreciation by means of a quick turnover of properties, there should be stricter provisions for recapture of depreciation upon a sale than those recommended by the House. Specifically, we recommend that:

—Upon a sale within the first 3 years (as opposed to the first year as under the present Section 1250 and the House bill), all depreciation, and not merely the excess over straight-line depreciation, should be subject to recapture; and

—Upon a sale after 3 years, a percentage of the total prior depreciation (and not merely the excess of straight-line depreciation as under the House bill) will be subject to recapture. This percentage will decline by 1 percent per month so that after 11 years and 4 months (as contrasted with 10 years under existing law), the entire gain will be taxable as long-term capital gain.

We recommend that 25 percent of the excess of accelerated over straight-line depreciation should be treated as a preference, with an exception for an individual who realizes over 60 percent of his gross income from the development and ownership of real properties. However, we recommend that the Committee reject the Treasury's suggestion that construction carrying charges be subject to LTP.

It will be noted that even with only these limited changes, there will be a decrease in the yield on investment of 8 percent, assuming a sale after 5 years, and of 11.2 percent, assuming a sale after 12 years. Exhibits 10 and 11 compare the Treasury's revenue position in regard to commercial properties under the House bill and our proposals.

We do not submit that the rules that we propose are the embodiment of wisdom. We must all be realistic enough to realize that there are two diametrically opposed objectives in competition here—the objective of securing the construction of more new housing and commercial structures in our urban areas and the objective of preventing undue tax avoidance. We believe that the House bill goes too far in meeting the second objective and will have disastrous results upon the construction of housing in our urban areas. We believe that the rules we suggest might represent a better balance between the objectives.

---

[19] This was done in the depreciation guidelines promulgated by the Treasury which allowed shorter useful lives for depreciation purposes (*Rev. Proc. 62–21,* 1962–2 C.B. 418).

[20] This was done by the enactment of Section 1245.

CAPITAL CONCEPTS CORP.,
Los Angeles, Calif., September 15, 1969.

SENATE FINANCE COMMITTEE,
New Senate Office Building,
Washington, D.C.

GENTLEMEN: It is my considered opinion that it would be a mistake to eliminate accelerated depreciation as proposed in the Tax Reform Bill as reported out of the House of Representatives.

As you are well aware, the present real estate market is in a state of extreme depression. It is very difficult to purchase investment quality real estate and even more difficult to sell investment real estate at a price sufficient to yield a reasonable return on the initial investment. The price of real estate is a function of the economic return that it generates. A substantial portion of the return generated by real estate through the present time has been the tax benefits created by the interest and depreciation deduction allowed to the owner of the real estate.

Our firm specializes in purchasing, for our clients, investment quality real estate. By the end of 1969 our real estate holdings will exceed fifty million dollars. In many cases we will purchase apartment houses where the cash return is quite low but where the tax benefits to the investor are substantial and the potential for appreciation, we feel, is great.

If there were no substantial tax benefits to be gained by owning real estate we would have three courses of action open to us.

1. Pay considerably less money for the real estate, which would result in a higher cash yield to the investor.
2. Pay the same price for the real estate but raise the rents substantially after the purchase.
3. Find another suitable investment vehicle other than real estate.

It is my opinion that the effect of the reduced tax savings will be a substantial across the board increase in rents to raise the return to real estate investors so that the need for residential units can be met. The argument is made that accelerated deprication is continued to be allowed to original owners of apartment houses. That in itself is not satisfactory because firms such as ours only buy existing structures. The initial builders must be able to anticipate a profit on sale or they will not build the building even though the builder may receive the tax benefits.

There are two reasons for this.

1. As you know the tax benefits to the original builder, under the new law, will be illusory because of the recapture provisions.
2. There will be no market to re-sell the property because the second buyers will not receive any tax benefits.

It is my opinion that the economy is a self adjusting device that adjusts for tax benefits. In other words, an investor expects a 15% yield on his invested dollars. He is willing to take part of this yield in tax benefits if they are available. If they are not available then he must have a greater cash yield to offset the lost tax benefits. The net result of this is that if you remove the tax benefits from real estate the yield on real estate will have to rise which will cause increased rents and greater inflation.

Very truly yours,

LAWRENCE M. SCHULNER, *President.*

ARTHUR ANDERSEN & CO.,
Chicago, Ill., September 19, 1969.

Re statement regarding H.R. 13270 Tax Reform Act of 1969—Real Estate Depreciation.

Mr. TOM VAIL,
Chief Counsel, Committee on Finance,
New Senate Office Building, Washington, D.C.

SUMMARY OF COMMENTS AND RECOMMENDATIONS

DEAR MR. VAIL: Recapture of depreciation at ordinary income tax rates should not apply to depreciation on real property on which construction was begun before July 24, 1969, or where a binding contract to construct or acquire had been entered into before July 24, 1969. Drastic changes in the tax consequences of gain on real property which is already subject to inflexible financial arrangements can create real economic loss upon their disposition.

BASIS FOR COMMENTS

Purchasers of real property generally make their investment decisions based on a required rate of return and cash flow, including net after-tax proceeds on the property's disposition at a later date. To date, all such decisions have been made based on long-term capital gain treatment for any gain on disposition, and justifiably so, since all prior tax law has provided for such treatment. Long-term financing with a fixed interest rate has been arranged; correspondingly, long-term leases have been contracted which cannot be revoked. In many cases, purchase options have been granted for dates far in the future, at a price which was determined as resonable *based on capital gain treatment of the gain on disposition.* To change the anticipated tax treatment when all other arrangements have been closed and must remain inflexible will create numerous situations where a previously planned and proven rate of return on an investment will be reduced, at a minimum, to a much lower rate. In many instances, there will be a definite economic loss. In nearly all cases, the resultant rate of return would have been unacceptable if known at the outset.

We realize that Section 1245 was similarly enacted in 1962; however, most tangible property within the scope of 1245 is not purchased primarily as a financial investment, but as a necessary tool in the overall business. Contemplated appreciation and the resultant tax on it are not prime considerations in most purchases of machinery and equipment; hence the enactment of Section 1245 did not create similar problems in 1962. Introduction of Section 1250 in 1964 was not necessarily disastrous, either, since it provided for continued capital gain treatment on long-term holdings. The proposed amendments to Section 1250 and its concomitant financial effects are without parallel in previous tax legislation, and come at a time when inflation has become a major factor in creating taxable gain where economic gain does not exist. Ultimate gain on disposition will, at least in part, not so much be attributable to excess depreciation as it will be to a rising price level and thus result in taxing fictitious rather than real income.

The provisions for amendment of Section 1250 should be revised to provide for recapture of depreciation on future construction or commitments only, to allow investors and businessmen to plan for the tax effect, assuming any extension of Section 1250 is to be enacted.

CONCLUSION

This statement is submitted as part of a series of letters, each dealing with a particular area of the proposed legislation. It is intended that the comments and recommendations contained herein be made part of the record of testimony relative to the legislative changes contemplated for real estate depreciation. We shall be pleased to discuss these matters further with you or the Committee, either in person or by telephone. Please call us collect at 312-346-6262 if necessary.

Very truly yours,

ARTHUR ANDERSEN & CO.,
By JOHN MENDENHALL,
Director of Taxes.

AMERICAN LAND TITLE ASSOCIATION,
Bryn Mawr, Pa., October 1, 1969.

Re Tax Reform Act of 1969.

Senator RUSSELL B. LONG, *Chairman,*
Senate Committee on Finance, New Senate Office Building, Washington, D.C.

DEAR SENATOR LONG: The American Land Title Association, representing a substantial majority of the more than 2,000 land title evidencing and insuring companies in business throughout the nation, respectfully presents the Senate Finance Committee with its views on certain parts of the Tax Reform Act of 1969.

Evidencing and insuring land titles has afforded members of this Association with an understanding of the real estate business, and we offer our conclusions in the belief that they can be of assistance to the Committee in its consideration of the previously-mentioned Act.

It is the view of this Association that certain parts of the Act threaten to be dangerously inflationary and may well aggravate the already grievous national shortage of housing. Other parts of the Act may produce adverse effects on individual citizens—and on the nation's economy—through alterations in capital gains taxation.

Provisions of the Act that would limit the maximum rate of depreciation on existing property to straight-line depreciation, and that would recapture as ordinary income all depreciation taken in excess of the straight-line method, are, in our view, highly questionable. This effort to restructure the taxes paid by real estate interests could readily bring severe consequences to Americans with low and moderate incomes.

Our main concerns are embodied in the following points:

The Act as proposed would curtail building construction, which would lessen available rental space and force accelerated increases in rental rates, adding to the problems of this nation's already seriously-inflated economy.

The Act as proposed would reduce the economic incentive to construct housing for low and moderate income families; as a result, significant reductions can be anticipated in housing construction under provisions of the Housing Act of 1968, along with further inhibition of attainment of Housing Act goals.

The Act as proposed would tend to realign the financial structure of real estate interests, shifting more of the burden for producing profit to the raising of rentals—including residential rentals.

The Act as proposed would tend to influence real estate interests to invest a smaller share of capital in building single family homes.

In addition, as previously mentioned, we are deeply concerned about the possible impact on investors, employees, and the economy of the nation in general, that may result from changes in capital gains taxation.

In our opinion, provisions of the Tax Reform Act relating to the treatment of and tax rates on capital gains will have a seriously adverse effect on many facets of the national economy. The consequences of increasing the tax rate on capital gains and extending the holding period required to obtain capital gains treatment may critically impair the flow of needed investment capital.

The effect of proposed changes in the treatment of employee contributions to pension plans threatens the economic well-being of employees who have spent a lifetime providing some measure of security for their retirement. It would be most regrettable to see this security diminish as a result of arbitary and inequitable changes in tax legislation.

The net result of the proposed changes cannot help but result in added financial burdens on investors, employers, and employees alike. Ultimately, such burden will reflect itself in higher costs to those individual taxpayers whom the proposed Tax Reform Act purports to benefit.

Following are specific points that are of grave concern to the members of this Association:

The Act as proposed would significantly decrease the performance potential of publicly-held member companies of this Association, as a result of increased taxation on investments in securities—particularly bonds—which are required to meet various state regulations, as well as to fund required reserve. The ultimate effect would be to reduce the flow of new investment in the insurance industry because of unattractive earnings or to cause inflationary pressure on the overall cost of insurance.

The Act as proposed would considerably increase the pension cost for all employers if they are to offset the adverse effects on retirement income resulting from a proposed change in treatment of employee contributions. These additional costs would either adversely affect already shrinking profit margins, or result in inflationary price increases.

The Act as proposed, by increasing the required holding period of investments, would remove a considerable incentive for the small investor who, in many cases, could not afford to have his limited capital tied up for the period required to take advantage of capital gains treatment. Thus, instead of benefiting small individual tax payers for whom the tax reform is intended to provide relief, the proposed change would place an additional tax burden on their income, while at the same time restricting an important source of needed investment capital.

The Act as proposed would discriminate specifically against retiring employees by proposing to tax lump-sum distributions of employee contributions to pension plans as ordinary income. Considering our present system of steeply progressive tax rates, the retiring employee would face the prospect of paying a considerably higher tax on what was intended to be his retirement income—a tax higher than he would have paid had he not tried to provide for his retirement. This type of reform appears to be contrary to public policy and stated government objectives. It defeats the purpose of the plans as originally encouraged by the government and places an additional burden on the social security system, if economic welfare of the retiree is to be maintained above the mere subsistence level.

It is our conclusion that the proposed changes in the Tax Reform Act relating to capital gains taxation will result in regression rather than reform and will thus defeat the original intent of the Congress. We believe that the specific proposals relating to capital gains, if enacted, will contribute to further inflation by removing significant vestiges of incentive for long-term investment on the part of those Americans who should be most encouraged to invest in the future of this nation. Furthermore, the proposed legislation would bring severe additional economic hardship for those who can least afford to bear such a burden. The Tax Reform Act is obviously not intended to produce such adverse results.

In summation, we believe that the Act's "recapture" provision, denial of accelerated depreciation, and provisions related to capital gains taxation—no matter how well-intentioned—would culminate in contributing to greater inflation and placing additional economic hardship on Americans who can least afford it. We respectfully urge that these portions of the Act not be permitted to become law.

Sincerely,

GORDON M. BURLINGAME,
President, American Land Title Association.

STATEMENT BY EDWIN M. HOOD, PRESIDENT, SHIPBUILDERS COUNCIL OF AMERICA, WASHINGTON, D.C.

I. PROPOSED AMENDMENTS TO THE TAX REFORM BILL OF 1969

The Shipbuilders Council of America, composed of major shipbuilding companies and allied suppliers in all sections of the United States, proposes amendments to HR-13270 (the Tax Reform Act of 1969) to accomplish the following:

(1) A 15 percent write-off between contract and delivery dates of new vessels.

(2) A ten-year ship life for tax purposes.

(3) A special additional depreciation allowance of 30 percent for the first five years after delivery of a new ship.

(4) Tax exemption of the proceeds of ship sales reinvested in new ships.

(5) A tax deduction for lenders of a percentage of interest, leasing and charter income from new ships.

For an evaluation of the merit of these techniques, there is attached as Appendix A a paper entitled "Investment Incentives for the Maritime Industry" prepared by Dr. Jacob J. Kaplan of Washington, D.C., an independent consultant on international finance and economics.

II. WHY THE PROPOSED AMENDMENTS ARE NECESSARY

All of the reasons compelling adoption of the above proposed amendments to HR-13270 are variations of one central theme—the present United States Merchant Marine desperately needs incentives for investment in new United States flag vessels. Because of inadequate financing, levels of ship construction in the past decade have failed to offset the impediments of age and inefficiency which have plagued the nation's shipping fleet.

The United States Merchant Marine is largely comprised of vessels that are obsolete—85 percent of the combined government-owned and privately-owned fleet today registered under the American-flag is 20 years of age and older. What newer investment there has been, over the past decade, relates primarily to vessels built through governmental subsidies, representing substantial cost to the government but applying to less than one-third the present fleet.

These statistics simply confirm that if maintenance of the United States Merchant Marine is of national importance—and there is virtually no debate on this point—private investment has not been sufficiently attracted. Some alternative approach—to stimulate private investment—is obviously in order, and the proposed amendments are designed to provide that stimulus.

The obsolescence and decline of the American Merchant Marine is further illustrated by the fact that only 6.5 percent of United States oceanborne foreign trade was carried on U.S. flag vessels in 1967. When this figure is compared with the goal of The Merchant Marine Act of 1936 that the United States fleet carry 30% of the nation's foreign trade and with the 1950 performance in which 39 percent of the nation's foreign trade tonnage was transported on United States bottoms, the need for providing incentives for private investment in domestic built vessels becomes dramatically apparent.

From its position as the world's greatest shipbuilding nation at the end of World War II, the United States has slipped to 12th place in terms of annual commercial tonnage constructed. The American-flag merchant fleet, which at the end of World War II was the largest in the world, now ranks fifth and will plummet further in global standing in the years ahead unless corrective incentives are instituted promptly.

Since 1946, American owners or their affiliated corporations have purchased approximately 1,650 new foreign built merchant vessels of nearly 35,700,000 dwt. to be sailed under "flags of convenience" or other foreign registry. During the same period, only 484 commercial vessels of approximately 7,800,000 dwt. have been built in United States shipyards to be sailed under the United States flag.

In these times of sharply increasing international trade and tensions, the United States has become dangerously dependent upon foreign-flag vessels built in foreign yards and manned with foreign crews for import and export, as well as for defense purposes. An additional consequence of this situation is the adverse effect upon the nation's balance of payments deficit. The combination of United States companies' purchases of foreign built vessels (estimated to have totalled between $5 billion and $8 billion since 1946), wage payments to foreign crews plus United States manufacturers' and retailers' shipping payments to foreign shippers add up to a very heavy drain on the United States balance of payments.

The decrease in the United States Merchant Marine is of extreme national importance. President Nixon has stated the need for "the restoration of the United States as a first-rate maritime power." In view of the essentiality of a sound U.S. shipping fleet, and in view of the drastic need for its improvement, the construction of ships in U.S. shipyards for commercial operation under the United States-flag must be stimulated. This is not the time to remove incentives for private investment in new U.S. vessels, yet HR-13270 in its present form would eliminate the investment tax credit with respect to oceangoing vessels.

III. GENERAL EXPLANATION OF PROPOSALS

The Shipbuilders Council of America submits that, given adequate economic incentives, United States private enterprise can significantly contribute to an improvement in the Merchant Marine situation so as to enable decreasing direct outlays on the part of the Federal Government. The Council believes that tax incentives can help provide a favorable shipbuilding climate at less cost than direct subsidies with their dependence on annual appropriations and limitations to only a part of the American fleet.

Although the investment tax credit has not been sufficient alone to solve the maritime problem, some enterprising United States shipbuilders and operators have used the investment tax credit for construction of vessels that might otherwise have been built overseas. Its loss would further hinder a nation seeking to re-establish itself as a first-rate maritime power within the framework of the free enterprise system.

The Shipbuilders Council of America submits that national interest and national security are vitally affected by the status of the United States Merchant Marine, and hence requires urgent attention, sufficient stimulli and adequate incentives.

IV. TECHNICAL EXPLANATION OF PROPOSALS

As demonstrated in Dr. Kaplan's report, the Shipbuilders Council of America recommends incorporation into HR-13270 of the following alternative tax incentives for investment in a sound United States Merchant Marine:

1. The purchaser of an oceangoing vessel constructed or reconstructed in a United States shipyard shall be entitled to commence depreciating the vessel upon entering a binding shipbuilding contract. The depreciation allowable during the construction period (commencing with execution of the shipbuilding contract and ending with delivery of the vessel) shall be limited to 15 percent of the vessel's contract price. The completed vessel's cost basis for regular depreciation deduction should be available only with respect to vessels which are not the subject of a construction differential subsidy, thus providing an economic incentive for a ship operator to forego obtaining direct governmental subsidy.

2. The owner of an oceangoing vessel which is constructed or reconstructed in a United States shipyard and which is not the subject of a construction differential subsidy shall be permitted to amortize the cost of the vessel over a ten-year period. This provision would be compatible with Section 705 of HR-13270, permitting accelerated amortization of railroad cars, on the basis that the national interest will be served by similar treatment for oceangoing vessels. The exclusion of vessels subject to a construction differential subsidy is, of course, for the purpose of encouraging operators to forego direct governmental subsidy.

3. The owner of an oceangoing vessel constructed or reconstructed in a United States shipyard shall be entitled to an additional depreciation allowance of up to 30 percent of the vessel's cost during the first five years of its operation. Such depreciation shall be in addition to the depreciation otherwise allowable, in the same manner as additional first year depreciation is presently allowed for small business under Section 179 of the Internal Revenue Code. The taxpayer-owner shall be entitled to elect in each of the first five years to take any amount of such additional depreciation, but the amount claimed in any one year shall not exceed 10 percent of the vessel's cost. The additional first year depreciation shall be limited to vessels which are not the subject of a construction differential subsidy, as previously described.

4. Any gain on the sale of an oceangonig vessel shall not be recognized for tax purposes if, within a period beginning one year before the sale and ending one year after the sale, the taxpayer enters a contract to acquire a newly constructed or reconstructed oceangoing vessel. The nonrecognition of gain shall apply much in the manner that Section 1034 of the Internal Revenue Code presently provides for nonrecognition of gain on the sale or exchange of a residence, thus requiring the new vessel's purchase price exceed the old vessel's sales price for complete nonrecognition. The nonrecognition shall, of course, apply to defer recognition of depreciation recapture (under Section 1245 of the Internal Revenue Code) as well as capital gain. As with respect to sale or exchange of a residence under Section 1034, the cost basis of the newly acquired vessel shall be reduced by the amount of gain deferred. Similarly, the amount of depreciation recapture deferred upon sale of the old vessel shall be carried over until sale of the new vessel (or a succeeding vessel) results in a recognized gain. As in the previously suggested provisions, this nonrecognition of gain shall apply if the newly constructed vessel is not the subject of a construction differential subsidy.

5. Financial institutions shall be entitled to except from their interest income an amount equal to 10 percent of the interest received under construction and mortgage loans with respect to oceangoing vessels constructed or reconstructed in a United States shipyard. Similarly, recognizing that financing institutions and others will in some cases actually take ownership of vessels and charter them to operators in order to finance the operators' use of the vessels, such institutions and others shall be entitled to exempt from gross income an equivalent portion of the charter hire as it is received. The exemption of both interest and charter income shall, as previously described, apply only with respect to vessels which are not the subject of a construction differential subsidy. This provision would conform to the deduction for interest upon residential real property loans, student loans and other loans in the national interest, as recommended by Assistant Secretary of the Treasury Cohen before the Senate Finance Committee on September 4, 1969.

Appendix A—Investment Incentives for the Maritime Industry

(Prepared for Shipbuilders Council of America, Washington, D.C., September 1969 by Jacob J. Kaplan, consultant, Washington, D.C.)

SUMMARY

The obsolescence of the U.S. merchant marine has proceeded to the point where major decisions can no longer be deferred by the U.S. government. For at least a decade, other pressing concerns have been given priority while policy makers took some comfort from the continued existence of a large fleet of ships built during World War II. With the passage of a quarter of a century since they were built, such vessels cannot be counted upon any longer for reliable carriage of goods in international trade. They have, of course, long passed the point of competitiveness. Other countries have taken advantage of advances in marine technology and ship size to increase and modernize their fleets with newer and much more efficient vessels.

U.S. flag ships carried 6.5 percent of U.S. oceanborne foreign trade in 1967, a steady and persistent decline from the 39 percent level of 1950. The number of new merchant vessels completed in U.S. yards averaged 15 per year over the last five calendar years. Even these low levels of U.S. shipbuilding and U.S. participation in the carriage of its overseas trade required substantial U.S. government budgetary expenditures. Such charges on the federal budget stem from higher wages and other costs prevailing in the United States. However, they also result from the operation of economically obsolete vessels and the low volume of merchant ship construction in U.S. yards.

The present inadequacy of the U.S. merchant marine—and the prospect of continued deterioration—involves increased national security risks and reduced options for the U.S. government in dealing with emergency situations that may arise. In recent years, the Soviet Union has placed a very high priority on the expansion and modernization of its merchant fleet.

A significant contribution to correction of the U.S. balance of payments problem would be made if the U.S. merchant marine was expanded and if owners turned to U.S. shipyards rather than buying vessels abroad for operation under U.S. and foreign flags. The purchase of ships by U.S. nationals from foreign yards involves large and increasing sums of foreign exchange. Without appropriate incentives for investment in U.S. built ships, the U.S. balance of payments will suffer significant further damage.

Investment incentive techniques have been very effective in other industrialized countries that boast of much younger and more competitive merchant marines. The following techniques should be considered for application in the U.S.:

(1) A 15 percent write-off between the contract and delivery dates of new vessels.

(2) A ten-year ship life for tax purposes.

(3) A special additional depreciation allowance of 30 percent for the first five years after delivery of a new ship.

(4) Tax exemption of the proceeds of ship sales reinvested in new ships.

(5) A tax deduction for lenders of a percentage of interest, leasing and charter income from new ships.

BLOCK OBSOLESCENCE OF THE U.S. MERCHANT MARINE CAN NO LONGER BE IGNORED

The Merchant Marine Act of 1936 confirmed the statutory life of vessels at 20 years, a reasonable estimate of the economic life of oceangoing ships under then prevailing conditions. Amendments to the Act in 1960 extended that life to 25 years for vessels other than tankers and other liquid bulk carriers. The amendments reflected physical longevity rather than the rate of economic obsolescence. Internal Revenue Service guidelines on depreciation for tax purposes suggest 18 years for ships.

Actually, the rate of technological advance in shipping has been much accelerated during the 1960's. Larger and faster ships with more sophisticated equipment offer important economies so that the more competitive fleets have been rapidly replacing older tonnage. With wage rates rising rapidly in all industrialized countries, the incentive to take advantage of further advances in ship technology remains high. For such countries, the economic life of vessels that must operate under international competitive conditions is unlikely to exceed ten years and may well be much less.

The U.S. Fleet is strinkingly overage

On September 30, 1946, the U.S. merchant marine consisted of 4,852 vessels,[1] most of them built during World War II for government account. Only 2,332 of these ships were then active in foreign and domestic trade. The very size of the inactive fleet minimized the national security requirements for building additional ships in the post-war years, whatever the economies offered by newer vessels.

By the end of 1966, however, the U.S. merchant marine had fallen to 2,278 vessels. Of this total, 1,313 were government-owned, with an average age of 23 years.[2]

By mid-1959, the last of the inactiveships that were desirable for reconversion had been sold to private operators. On July 1, 1969, only 1,050 ships[3] remained under government ownership, a third of them classified by the Maritime Administration as "scrap." Only 72 out of 172 ships activated to meet Vietnam requirements remained in full operating status. In another five years, the reserve fleet will have few, if any, World War II vintage vessels that can be depended upon.

As for the privately-owned U.S. flag fleet, it numbered 965 ships at the end of 1966, with an average age of 19 years. Despite sales from the government-owned fleet and some new construction, the privately-owned fleet numbered 963 ships on July 1, 1969.

The dry bulk carrier segment of the fleet is in particularly bad shape. Not only had the number of such ships declined to 53 by mid-1968,[5] but their average age at that time was 24 years. Time has run out, even on the statutory life decreed for subsidized ships by the 1960 amendments.

The privately-owned freighter and tanker fleets are not much younger. Two-and-a-half years ago, their average age was 19 years and 17 years respectively.

The older ships are inefficient and cannot compete with newer vessels

They are generally smaller and slower than ships built in recent years. They suffer more breakdowns and need more repairs. Insurers are seeking higher premiums for aged vessels. Rising living standards and wages put a premium on the efficient use of labor. Ships now being ordered on the world market carry several times the cargo of vessels built in the 1940's, frequently at manning levels below that of older ships. Four tankers are now being built for the U.S. flag fleet with a deadweight tonnage of 35,000 and a manning level of 23 that seems to be acceptable to the unions. The much smaller tankers built ten or 20 years ago have crews twice as large. Orders for 120,000-ton tankers have recently been placed in U.S. yards. While no manning level has been announced for these ships, it could well approximate that for the 35,000-ton vessels.

U.S. wage levels present a formidable obstacle to the operation of ships with U.S. crews in competition with those manned by nationals of lower wage countries. Nevertheless, the container ship experience demonstrates that U.S. operators who are able to move to the forefront in applying modern ship technology may be able to face such competition successfully and profitably, at least for part of the traffic.

The situation of the dry bulk cargo operators demonstrates the results of trying to operate highly obsolete vessels under the U.S. flag. Their ships are able to compete only for U.S. government sponsored cargoes that must be carried on U.S. flag ships. Last year charter rates for such vessels to carry grain from the U.S. Gulf to India ran as much as $29 per ton. For the same cargo and voyage, rates of $12 a ton were fixed for internationally competitive cargoes. A recent study estimated that a new 40,000 ton vessel built in U.S. yards without subsidy and using U.S. crews could carry such cargo profitably at $16 per ton.[6]

Competitor Fleets are Much Younger on the Average

The U.S. merchant fleet is about twice as old, on the average, as the fleets of other industrialized countries. The data in Table No. 1 reflect the situation as of the end of 1966, the latest date for which complete data are readily available. In the interim, the other countries listed have received delivery on a large number of new vessels, so that the disparity between the average age of their fleets and ours has increased. The order books suggest that the disparity will continue to increase over the next few years, no matter how promptly the U.S. begins the renovation of its merchant marine.

TABLE NO. I.—MERCHANT FLEETS OF INDUSTRIALIZED COUNTRIES, NUMBER AND AGE, END OF 1966

Country	Total		Freighters		Bulk carriers		Tankers	
	Number	Average age (years)	Number	age (years)	Number	age (years)	Number	age (years)
U.S., privately owned	965	19	606	19	57	22	275	17
Denmark	342	10	246	10	19	8	57	6
Germany, Federal Republic	860	11	725	11	69	9	51	10
Japan	1,406	9	881	10	234	6	265	7
Netherlands	469	11	311	11	34	7	88	10
Norway	1,356	10	616	12	256	6	455	8
Sweden	433	11	265	13	85	9	74	7
United Kingdom	1,985	12	1,154	12	297	10	423	10

Source: Maritime Administration, A Statistical Analysis of the World's Merchant Fleets, December 1966, p. 1.

The differences in average age reflect disparities in average size, speed and other efficiency factors. The United States fleet will not begin to move toward greater competitiveness with the merchant marine of these countries until it too initiates a substantial program for the replacement of overage tonnage.

The Youthfulness of Foreign Fleets Reflects the Effectiveness of Regulations that Encourage Fast Depreciation and Reinvestment of the Proceeds of Ship Sales

The countries with much more youthful merchant marines than the U.S. all encourage much faster depreciation of new ships.[7] Earnings before depreciation on a new ship tend to be high because its new features attract cargoes. Moreover, maintenance and repair costs are at a minimum, as is time lost for repair and maintenance. Higher depreciation allowances in these early years permit a higher cash flow to the operators at the expense of taxable earnings. If the operator can sell his ship after accelerated depreciation allowances have been used up, and either defer tax payments on his net profit over book value or pay such taxes at reduced rates, he has a substantial incentive to buy a new ship. These incentives exist in every country listed in Table No. I, except the United States.

Thus since April 1965, the owner of a U. K. ship may claim depreciation at any rate he chooses for each year. In effect, he can take the entire depreciation for one ship in one year if feasible and his profits permit. The U. K. does not tax capital gains.

Sweden permits depreciation of 30 percent of book value per year or a complete write-off in five years. Thirty percent of the contracted price may be depreciated prior to delivery of the vessel. Taxable earnings from the sale of vessels may be transferred to a special fund which, if used to acquire new vessels, is not taxable.

Germany permits depreciation of a dry cargo ship over 15 years and a tanker over 12 years, using either a straight line or a declining percentage that may not exceed twice the applicable straight line percentage. However, between 1965 and 1970, a special depreciation of up to 30 percent may be taken during the first five consecutive years. Book profits from the sale of a ship may be transferred without tax to a replacement ship.

Norway permits accelerated depreciation up to 25 percent of cost, beginning as soon as the first installment has been paid under a new building contract. If used

[7] See Maritime Administration, *Maritime Subsidies*, 1969. Details on depreciation allowances and tax treatment of ship operators are provided for most maritime countries.

on a ship for which ordinary depreciation is seven percent, the vessel will be written-off within 11 years. Capital gains may be put in a special fund and used to finance new investments.

By contrast to such treatment, U.S. operators are expected to depreciate an unsubsidized vessel over an 18 year period. Subsidized vessels are depreciated over 20 or 25 years. The declining balance and sum-of-the-year digits methods of accelerated depreciation may be adopted. Income tax at regular rates, rather than at capital gain rates, must be paid on the proceeds of the sale of a ship. The subsidized operator only gains tax advantages from the possibility of depositing earnings in a capital reserve fund for the purchase of new ships. On the other hand, such a fund establishes no special incentive for early investment in new ships. Unlike the operators of foreign flag ships, the U.S. operator has substantial underpreciated value for tax purposes on his ten-year old ship and less incentive to contemplate replacement.

U.S. Flag Ships Now Carry Only a Token Percentage of U.S. Foreign Trade

In 1967, U.S. flag ships carried fewer than 29 million tons of U.S. imports and exports, less than half as much as in 1950. This absolute decline reflects a much more dramatic drop in the percentage of total U.S. waterborne trade carried in U.S. bottoms. Though U.S. waterborne imports and exports tripled in tonnage over this period, the decline in the share of the U.S. flag fleet has been continuous and persistent since 1950. That share equalled 39 percent in 1950, 23.5 percent in 1955, 12.3 in 1960, 8.1 in 1965, and only 6.5 in 1967.

TABLE II.—U.S. WATERBORNE IMPORTS AND EXPORTS, 1950–67

Year	Tonnage (millions of short tons)			U.S.-flag ships (in percent)		
	Total	Dry cargo	Tanker cargo	Total	Dry cargo	Tanker cargo
1950	159	100	59	39.3	31.2	53.0
1955	254	169	85	23.5	23.2	23.5
1960	323	202	120	12.3	15.2	7.5
1965	427	274	153	8.1	9.3	5.9
1967	444	294	150	6.5	8.1	3.4

The Level of Output of the U.S. Merchant Shipbuilding Industry Has Been Much Too Low To Permit Production at Minimum Cost

Over the past five years, 1963–1968, an average of only 15 merchant ships a year were completed in all U.S. shipyards. The level of output has been dependent primarily on the availability of government construction subsidies.

A variety of expert opinion has emphasized the economies inherent in producing a standardized ship in series. For example, the Booz Allen study previously mentioned estimated the cost of its 40,000 ton dry bulk ship at $16 million for the first ship, but $12.1 per ship if an order of 15 ships were placed with a single U.S. yard. Because U.S. labor skills and wage rates are both high, the economies of serial production are undoubtedly much greater than in foreign yards. Given a substantially higher volume of orders and some reasonable assurance that the higher level would be maintained for a period of years, the U.S. shipbuilding industry is likely to become more specialized and adapted to serial production.

The industry has no significant recent experience with the economies of serial production, so that estimates of possible cost reduction per ship may well be conservative. The full economies can only be known after several U.S. yards experience orders for a standardized vessel in series of fifteen each, repeated for the same or another standardized ship well before production of the first series is completed. With such a pattern of orders on their books, U.S. yards would be able to equip themselves appropriately, order more efficiently from suppliers and organize their production so as to take full advantage of modern shipbuilding technology and the skills of U.S. labor and management.

Since the investment tax credit was enacted in 1962, U.S. shipyards have engaged in a substantial investment program designed to expand and modernize their capacity. According to the Census Bureau,[8] new capital expenditures by the industry have risen steadily—from $23 million in 1962 to $24.5 million in 1963, $32.8 million in 1964, $44.2 million in 1965, $52.8 million in 1966 and $66 million in 1967. Reports to the Shipbuilders Council indicate that the figure of 1968 approximated $100 million. If substantial replacement of obsolete ships in the U.S. fleet is to be achieved, this investment program in U.S. shipyards must be continued.

This ambitious and costly program was stimulated by the availability of investment tax credits to ship operators and by an expectation that the government of the United States would soon take substantial measures to overcome the block obsolescence of the U.S. merchant fleet.

In the last two years, orders for new U.S. built ships have increased, primarily for new tanker tonnage. Without tax incentives or other government support, even this modest step toward renovation of the U.S. merchant marine may be set back.

The Maintenance of Inefficient Ships in the U.S. Fleet Involves Substantial Costs to the Federal Budget

Ship operating subsidies for liners engaged in serving Essential Trade Routes at international cargo rates have been running at about $200 million per year. Otherwise, overage vessels have been able to continue in service only in protected markets—domestic shipping and government-sponsored cargoes in foreign trade. Rates have been substantially higher than would be required on efficient new ships. The use of such ships increased the costs and expenditures of the Departments of Defense and Agriculture as well as the Agency for International Development. A modern dry bulk cargo fleet might save 75 percent of the transportation costs now borne by the Department of Agriculture's Food for Peace program. These costs have amounted to as much as $80 million a year.

THE NATIONAL INTEREST IN THE MERCHANT MARINE

It is unprecedented for a major power to become as dependent on foreign flag fleets for the transport of its international commerce as has the United States. It is possible to take comfort from the fact that adequate shipping has been available even during periods of international crisis. However, with the prospective disappearance of the reserve fleet, U.S. flexibility and credibility during future crisis situations may be seriously restricted.

The Soviet Union has come to place a much higher priority on the development of its own merchant marine. It has grown from 1.8 million deadweight tons in 1950 to 3.6 million in 1958 and about 12 million tons at present. In November of 1968, it was reported to have 458 ships on order, aggregating more than four million deadweight tons. At the same time, only 62 ships were on order for the U.S. fleet, totalling 1.8 million deadweight tons.

However one views the security implications of U.S. dependence on foreign flag shipping, the foreign exchange costs are high. The U.S. balance of payments deficit has averaged about $2 billion per year throughout the 1960's and gives little evidence of improvement. The U.S. surplus on merchandise trade virtually disappeared in 1968. The Department of Commerce [9] is pessimistic about the prospect for reestablishing the large trade surpluses which existed even in the mid-1960's.

In such circumstances a significant national interest must prevail in saving foreign exchange or finding new avenues for earning foreign exchange without causing serious disruption in the free flow of international commerce. A recent study concluded that the U. S. balance of payments "would have suffered a loss of approximately $2.2 billion for the three year period 1964–1966 if the shipping services performed by the U. S. flag fleet . . . had been performed instead by foreign owned and operated vessels."[10] Since the U. S. fleet carried less than ten percent of U. S. foreign trade in that period, a modest improvement in its share of U. S. foreign commerce would have made a significant contribution toward ameliorating the U. S. balance of payments deficit.

Perhaps even more serious is the cost of ships purchased from foreign yards by U. S. nationals. Since 1946, 1650 new ships were purchased for registry under

[8] Published in reports of the *Annual Survey of Manufacturers.*

foreign flags. The U. S. balance of payments accounts keep no separate record of expenditures for such purchases, but they must have totalled $5 billion and may well have reached $8 billion. There is no sign of any diminution in these purchases.

Recently a single U. S. operator ordered eight ships from European yards at a reported cost in excess of $250 million. These vessels are to be financed abroad, so that purchase and interest costs together are likely to aggregate at least $350 million, a foreign exchange cost to the U. S. which could have been avoided if the ships were obtainable from U. S. yards at comparable cost to the operator.

The President has reasserted a goal of carrying 30 percent of U. S. foreign trade on U. S. flag ships. Though the past year has been one of substantial debate and dissent about a wide variety of national goals and priorities, this one has been remarkably free of criticism. In any reasonable assessment of national needs, the maintenance of a substantial merchant marine must claim serious attention. The merchant marine today requires prompt and effective measures to cope with its advanced obsolescence.

Using Investment Incentives To Modernize the U.S. Merchant Marine

In a free enterprise system, investment incentives through the tax system can be a potent force for achieving national purposes. If the objective be to expand and modernize the privately operated U.S. fleet with ships built in private U.S. shipyards, it is likely to be realized sooner and more efficiently through such incentives.

The investment tax credit was a most potent instrument for raising business investment and accelerating plant expansion and modernization in the U.S. economy as a whole. Indeed the proposal to eliminate it stems from the belief that such investment proceeded so rapidly that its pace can now be moderated. Resources need to be directed more toward other national priorities such as urban problems and poverty. If the maritime industry also deserves priority attention, it should seek investment incentives through the tax system to encourage rapid modernization of the merchant marine.

Investment Incentives Are an Efficient Way To Promote Expansion and Modernization of the Merchant Marine

The problems of the U.S. merchant marine are attributable, in some degree, to the direct subsidy techniques through which it has received government support. The administrators of public funds are accountable for their expenditure. They must therefore supervise the use of public funds in great detail and review decisions with great caution. A competitive private enterprise, however, requires flexibility and decisiveness. Success usually comes to those who are prepared to innovate and take risks on the basis of experienced judgment. The administration of maritime subsidies brings these legitimate concerns of officials and business men into constant conflict. The efficiency of the U.S. maritime industry has undoubtedly been victimized by such conflicts. Moreover, the system depends on annual decisions by the Executive Branch and the Congress concerning how much money is to be available. Uncertainty, instability, indecisiveness and overcautious supervision are thus loaded on the industry by the subsidy system.

Investment incentives through tax legislation have important advantages over the present methods used by the government to support the merchant marine. Shipbuilders and operators can count on their availability, unless another legislative process modifies them. The incentives for shipbuilders to reduce construction costs and for operators to maximize revenues and to minimize operating costs will be greater. The benefits of efficiency will accrue to the builders and operators and will show up in their earnings reports. The government will share in these benefits through income tax collections.

A Variety of Techniques Should be Employed to Provide Effective Investment Incentives to the Maritime Industry

Permitting operators to depreciate new ships rapidly for tax purposes is probably the most efficient technique, particularly if the proceeds from the sale of a heavily depreciated vessel can be fully reinvested in new ships free of tax payments.

A two year period normally elapses between the signing of a contract for a new ship and the delivery of the completed vessel. Down payments must be made and a construction loan obtained and serviced long before the operator realizes income from operating the vessel. At current interest levels, such costs are a significant burden, particularly for small operators. If the operator were permitted to charge depreciation on the vessel under construction against the earnings of ships already in operation, he can realize part of the down payment he must make on the new ship.

While U.S. tax law permits the use of any reasonable depreciation method consistently applied, Internal Revenue Service guidelines certainly inhibit departures from the 18 years suggested therein. Even if the accelerated depreciation techniques generally available to U.S. taxpayers are adopted by the ship operators, the result is aan unrealistically low rate of write-off of ship costs. Relatively high earnings during the first years after a new ship is delivered produce large tax liabilities and a modest cash flow to the operator. In later years, the relatively large undepreciated balance encourages continued operation of older vessels, despite lower earning power and higher operating costs.

A powerful incentive for modernization would be established—and the financing problems of small operators would be eased considerably—if owners were permitted to write-off the full cost of a new ship within ten years, using accelerated depreciation methods as earnings permit. To facilitate financing downpayments, they should be permitted to write-off at least 15 percent of the cost of a new ship between the contract and delivery dates.

To initiate rapidly, a substantial modernization program for the U.S. merchant marine, a special depreciation allowance might be offered on new ships for which contracts are placed before 1975. Owners would be permitted to depreciate 30 percent of the contractual cost within the first five years after delivery of the vessel, in addition to regular depreciation charges for those years. Such an allowance would offer owners a significant inducement to contract for replacement tonnage within the next five years. Owners taking advantage of such a provision would be able to increase their depreciation charges in any of the first five operating years of a new vessel in which earnings prove to be high, thus augmenting their cash flow at the expense of their tax liability.

While U.S. flag ships should not be expected to have an economic life in excess of ten years, the ships would continue to be attractive to the fleets of lower wage countries. A substantial international market should continue to exist for such vessels and U.S. owners should expect to sell new ships within a ten-year period for sums considerably in excess of scrap value. If the proceeds of such sales were exempt from taxation provided that they are reinvested in new ships within a few years, operators would be encouraged both to take advantage of the new depreciation allowances and to replace ships as annual depreciation charges diminish.

Such incentives should attract specialized financial institutions to invest in new ships under leasing or long-term charter arrangements, as well as ship operators. New sources of private capital for the maritime industries might then be developed.

Lenders would also be attracted by a special tax deduction on gross interest income from construction and mortgage loans on new ships, as well as on lease or charter income from new ships. Such a deduction should reduce the high interest rates currently required on ship mortgages, as well as draw private capital to financing the fleet modernization program. A similar reduction has been recommended by the Treasury as an incentive for investment in residential real property loans, student loans and "certain other loans which are made pursuant to national policy objectives." [11]

Investment incentives such as the foregoing have played a major role in the modernization of foreign flag fleets. They should also be effective under U.S. conditions. If the incentives are restricted to new ships ordered from U.S. yards, the annual cost to the Treasury in the form of taxes foregone would be nominal for the next few years. As the numbers of ships involved increase, losses of tax receipts would be offset in substantial measure by reductions in budget expenditures for government sponsored cargoes. Moreover, despite such depreciation allowances, a profitable merchant marine and shipbuilding industry will be a better source of tax revenues than the present obsolete fleet and shipyards building a few ships a year. As for the balance of payments of the United States, it would benefit by a multiple of any reduction in tax collections.

APPENDIX B

WRITTEN TESTIMONY RECEIVED BY THE COMMITTEE EXPRESSING AN INTEREST IN THE SUBJECT OF PUBLIC UTILITY DEPRECIATION

Written testimony received by the committee expressing an interest in the subject of public utility depreciation

CIVIL AERONAUTICS BOARD,
Washington, D.C., September 26, 1969.

Hon. RUSSELL B. LONG,
Chairman, Committee on Finance,
U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: The Board appreciates this opportunity to comment on H.R. 13270, the "Tax Reform Act of 1969." The Board's central concern is with Subtitle F of the bill. Although that Subtitle contains new rules concerning rapid depreciation for most regulated industries, the legislative language excludes air carriers from the list of affected industries. The Board supports this proposal to exclude air carriers from the scope of Subtitle F.

For most regulated industries, Subtitle F amends IRC section 167 and lays down special rules for depreciation for both "existing" and new public utility property. For new property, the bill in effect precludes regulatory commissions from setting rates under the flow-through method for companies which now use straight-line depreciation for tax purposes, or which use rapid depreciation for tax purposes and normalize for regulatory purposes. The bill achieves this result by denying those companies the right to use rapid depreciation for tax purposes *unless* they also use the normalization method for regulatory purposes. Hence, the only utilities which will be allowed to use rapid depreciation for tax purposes and flow through for regulatory purposes on new property will be utilities which have used flow through for regulatory purposes.

For "existing" property, the bill in effect freezes the status quo. First, utilities which now use straight-line depreciation on existing property for tax purposes cannot shift to rapid depreciation for tax purposes with respect to that property. Second, companies which use rapid depreciation on existing property for tax purposes and flow through the benefits to the consumers may continue to use rapid depreciation for tax purposes and flow through for regulatory purposes. Finally, companies which use rapid depreciation for tax purposes but normalize for regulatory purposes may continue to use rapid depreciation for tax purposes only if they also continue to use normalization for regulatory purposes.

Because H.R. 13270 now excludes air carriers from these new rules, it will not affect the Civil Aeronautics Board's regulatory powers. As you know, the Board differs from most other ratemaking agencies in that its functions include both commercial ratemaking and also subsidy determinations. In commecrial ratemaking, the only Board ruling on rapid depreciation is the *General Passenger Fare Investigation*, 32 C.A.B. 291, 326–327 (1960). On the basis of the record in that proceeding, the Board concluded that the Federal income tax expense which should be recognized for ratemaking purposes is the normal tax that is paid under straight-line depreciation, rather than the actual tax paid under the liberalized provisions of the Internal Revenue Code. The Board favored the normalization method because it believed that "* * * Congress intended that utilities should retain the benefits of section 167" (*Id.* at 327). Although the Board's 1960 reading of legislative intent accorded with the then-prevailing legal interpretations of the rapid depreciation statute, more recent Federal judicial decisions have held that normalization is not necessary to effectuate the Congressional objective expressed in section 167. The Board therefore regards itself as free under present law to reexamine how it should treat rapid depreciation for ratemaking purposes. If H.R. 13270 is expanded to cover air carriers, however, the Board will in effect be prevented from deciding whether liberalized depreciation results in a tax saving and, if so, from treating it accordingly for ratemaking purposes.

As to subsidy determinations, the Board and the courts have interpreted section 406(b) of the Act, which requires that subsidy payments be limited to current "need," as allowing tax benefits from rapid depreciation to be used to reduce the carriers' subsidy. (See *Reopened Pan American Mail-Rate Case*, 35 C.A.B. 540, 555 (1962) *Trans World Airlines* v. *C.A.B.* 385 F. 2d 648 (D.C. Cir. 1967).) If H.R 13270 is expanded to cover air carriers, the Board assumes that the bill's language should be construed as allowing the Board to use the tax benefits to reduce subsidy, as the Board has done in the past. But since the Board's present class rates for subsidized carriers employ the normalization method (rather than the flow-through method), the subsidized carriers might argue that a version of H.R. 13270 which covers air carriers would entitle subsidized carriers to compute their subsidy on a normalization basis. If the Board is required to use normalization in fixing subsidy rates, it estimates that the potential 1970–1974 subsidy could be $30 million in excess of the subsidy established using flow-through principles.

It is for these reasons that, as I stated earlier, the Board supports exclusion of air carriers from the scope of Subtitle F of H.R. 13270. These comments are being submitted in lieu of an oral presentation of the Board's views.

The Board has been advised by the Bureau of the Budget that there is no objection to the submission of this report from the standpoint of the Administration's program.

Sincerely,

JOHN H. CROOKER, Jr., *Chairman*.

STATE OF WISCONSIN,
PUBLIC SERVICE COMMISSION,
Madison, Wis., September 23, 1969.

Re Tax Reform Bill of 1969 House Report 13270.

Subtitle F—Depreciation Allowed Regulated Industries; Earnings and Profits Adjustment for Depreciation.

Section 451. Public Utility Property.

COMMITTEE ON FINANCE,
U.S. Senate, New Senate Office Building,
Washington, D.C.

GENTLEMEN: This written statement, presented in lieu of a personal appearance before the Committee, is for the purpose of suggesting a change in subsection 451(a)(5)(B)(ii) in H.R. 13270 to permit continuance of the Wisconsin method of normalizing the effects of liberalized depreciation on the accounting records of regulated public utilities in Wisconsin. The nature of and reasons for such modification are stated below.

Public utilities computing the amount of depreciation deduction for income tax purposes under section 167 of the Internal Revenue Code by the declining balance, sum of years digits or other methods different from the straight-line method, generally record on their books of record, as do most other taxpayers, depreciation expense computed by use of the straight-line method. Under these circumstances, recording of actual income tax liability results in an increase in the level of net income and, with other factors being equal, permits a reduction in the utility's rates for rendering service, thus resulting in an additional reduction in income tax payments by the utility.

Amendments to section 167, as reflected in section 451 of the Tax Reform Bill of 1969, (a) with respect to existing public utility property generally freezes the present situation and (b) for property completed after December 31, 1969, requires a normalization method by adjustments to a reserve for deferred taxes to reflect the reductions in income tax liability resulting from the use of methods of depreciation other than straight-line.

Increases in income from flow through treatment of liberalized depreciation benefits and associated reductions in rates for utility service further reducing income tax payments results directly from utility taxpayers recording lesser depreciation charges on their books than they take as deductions for tax purposes. The Public Service Commission of Wisconsin has recognized this as a depreciation problem since the enactment of liberalized depreciation provisions in section 167 in 1954. We have required public utilities using other than straight-line methods for Federal income tax purposes, to record as additional depreciation expense, the reduction in income taxes resulting from the use of such depreciation methods for tax purposes.

This procedure accomplishes the objective of the amendments in section 451 of H.R. 13270 with respect to protection of Federal income tax revenues and recognizes that a remedy of the problem is that of properly recording depreciation expense. The Wisconsin method therefore should, in our opinion, be recognized as an alternative in the normalization method of accounting set forth in section 451 (a)(5)(B)(ii) by a simple adjustment deleting the phrase "for deferred taxes" to read as follows:

"(ii) makes adjustment to a reserve to reflect the deferral of taxes resulting from the use of such different methods of depreciation."

The Wisconsin Commission requests favorable consideration of this change so that the Wisconsin method of reflecting normalization widely accepted by Wisconsin public utilities and acclaimed by many others may be continued in Wisconsin.

Respectfully submitted.

PUBLIC SERVICE COMMISSION OF WISCONSIN,
WILLIAM E. TORKELSON, *Chief Counsel.*

[Telegram]

WASHINGTON, D.C., *September 30, 1969.*

Senator CLIFFORD P. HANSEN,
New Senate Office Building,
Washington, D.C.:

The Transportation Association of America urges that section 451 of the tax reform bill, H.R. 13270, be amended to exclude oil pipe lines from the classification of public utilities. More specifically we ask that the oil pipe lines be exempted from straight-line depreciation requirements for public utilities as contained in Section 451 of the bill. They should be exempt as provided for airlines, highway, rail, and water carriers. Oil pipe lines are not a public utility. They are regulated by the Interstate Commerce Commission which also recommends such exemption. Oil pipe lines are a vital segment of the common carrier industry. Anyone can enter the common carrier pipe line business to compete with other pipe lines and other types of interstate transportation. They do not have a monoply. Shippers, investors, other modes of transportation, and government agencies, recognize oil pipe lines as an important segment of the transportation industry which transported 397 billion ton miles of petroleum products in 1968. Please include this telegram as part of record of hearings on H.R. 13270.

HAROLD F. HAMMOND,
President, Transportation Association of America.

STATEMENT OF DR. HOMER A. BLACK ON BEHALF OF THE UNITED STATES INDEPENDENT TELEPHONE ASSOCIATION

SUMMARY

Purpose of statement

The purpose of Section 451 of H.R. 13270 is to assure that the original Congressional intent of the accelerated depreciation provision in Section 167 of the Internal Revenue Code is carried out. According to Committee reports, the faster tax write-off is intended to aid growing businesses in financing expansion and modernization by increasing available working capital.

Enactment of ths proposed legislation, Section 451, is vitally important to the 2,000 Independent telephone companies because accelerated tax depreciation can provide them about 10 percent of the funds they need annually—$140 million of the $1.4 billion total—to finance investment in new plant and equipment.

The Congressional intent of Section 167 of the Internal Revenue Code has been realized for non-regulated businesses, which have obtained substantial amounts of new capital by using accelerated depreciation for tax purposes. Regulated utilities are increasingly being denied by flow-through accounting or imputed flow through the use of funds which they obtain from accelerated tax depreciation.

One result of this trend to flow-through is to deny regulated companies money needed in financing the new plant and equipment necesasry to meet the accelerating demand for telephone services. Other results are the inequitable distribution of the benefits of accelerted tax depreciation between current and future customers, and the potential loss to the Federal Treasury of $1.5 billion annually in tax revenues.

Consideration by House Ways and Means Committee

The House Ways and Means Committee studied comprehensively the consequences of present practices under the accelerated tax depreciation provisions of the Internal Revenue Code. As a result, the Committee drafted Section 451 of the Bill now being considered so as to assure that the tax depreciation provisions will more effectively accomplish their intended working capital purposes.

Advantages of Section 451

Enactment of Section 451 is desirable because:

(1) It eliminates the $1.5 billion potential loss of Federal revenues expected if the current trend to flow through is continued.

(2) It requires no change in tax depreciation practices that will disrupt the existing rate structures of regulated utilities.

(3) It does not impair the authority of regulatory agencies to regulate the rates of accounting practices of utilities.

(4) It enables utility companies, with the consent of their regulatory authorities, to use funds from accelerated tax depreciation to finance new plant and equipment, just as non-regulated companies are now doing.

(5) It assures a more equitable distribution of the benefits of accelerated tax depreciation between present and future utility customers.

(6) It limits the extent to which regulated companies become dependent on continuation of accelerated tax depreciation measures, and protects the usefulness of these measures in promoting necessary economic development.

STATEMENT

Mr. Chairman, members of the Committee:

This statement is submitted at the request of the United States Independent Telephone Association to express support and emphasize the importance of Section 451 of H.R. 13270 to the Independent (non-Bell) segment of the telephone industry.

I am Professor and Chairman of Accounting at Florida State University. I hold a Ph. D. degree in Business Administration from the University of Michigan and am a Certified Public Accountant. I am the author of *Accounting Research Study No. 9*, "Interperiod Allocation of Corporate Income Taxes," published in 1966 by the American Institute of Certified Public Accountants. This study was the basis on which the Accounting Principles Board issued its opinion requiring normalization.

On March 26, 1969, I testified before the House Ways and Means Committee in support of proposed legislation designed to insure that the Congressional intent in providing for accelerated tax depreciation was carried out.

There are approximately 2,000 Independent telephone companies which serve more than one-half the geographical area of the nation, primarily in the smaller communities—the suburban and rural areas. The Independent telephone companies had 18 million telephones in service in 1968, representing a plant investment of almost $10 billion. For the past 10 years customer demand for the services of the Independents has grown at an average rate of 10.7 percent a year. This is almost double the rate of increase of the Gross National Product.

Last year the Independents were investing new capital at an annual rate of $1.4 billion to improve their services and to expand their plants and facilities. By 1970 the industry will have 20.8 million telephones in service, representing a total plant investment of $12.5 billion and consumer demand of $2.8 billion per year.

Depreciation is the largest single expense item of the Independent telephone industry. It amounts to approximately $425 million per year, which is 24 percent of the industry's total operating expenses and taxes. It is estimated that about 10 percent of the funds annually needed by the Independent telephone companies for plant investment might be derived from industry-wide use of accelerated tax depreciation. Because of the amounts involved, the enactment of the provisions of Section 451 of H.R. 13270 is most important.

THE PROBLEM

The following circumstances underlie the urgent need for Section 451 in the legislation adopted by the House:

SECTION 167 WAS ENACTED TO PROVIDE WORKING CAPITAL

When Congress passed Section 167 of the Internal Revenue Code in 1954, the Committee reports stated that "the faster tax write-off would increase available working capital and materially aid growing businesses in the financing of their expansion." (H. Report 1337 and S. Report 1622). The House report recognized that "the changes made by your committee's bill affect the timing and not the ultimate amount of depreciation deductions with respect to a property."

THE INTENT OF CONGRESS HAS BEEN ACHIEVED FOR NON-REGULATED BUSINESSES

Non-regulated businesses have increased their cash flow and thereby obtained the use of capital through adoption of accelerated tax depreciation in either of two ways:

(1) They have used accelerated depreciation for both book and tax purposes, or

(2) They have used accelerated depreciation for tax purposes, and straight-line depreciation for book purposes, and have normalized.

Normalization is an accounting procedure required by the accounting profession and the Securities and Exchange Commission for non-regulated industry. Under this procedure the amount of the taxes deferred by using accelerated tax depreciation is placed in a reserve for future payment. Thus, it is clearly recognized that accelerated tax depreciation results in a deferral of tax payment, not in a cost saving.

REGULATED BUSINESSES HAVE BEEN SUBJECTED TO DIFFERENT TREATMENT

Under rules established by regulatory agencies, utilities are generally required to use straight-line depreciation for book purposes. Although utilities using accelerated depreciation for tax purposes were initially permitted to normalize the deferred taxes, many are now being required to "flow through". Under "flow through" the funds provided by lower current tax payments resulting from the use of accelerated tax depreciation are erroneously treated as additions to net earnings after taxes, rather than correctly as a temporary source of working capital.

RECENT DEVELOPMENTS STRESS THE NEED FOR REMEDIAL LEGISLATION

(a) Action of regulatory bodies

In recent years, both Federal and state regulatory agencies have increasingly been adopting flow-through treatment. Some agencies that initially authorized normalization have reversed their policy and are requiring flow through. Thus, contrary to the intent of Congress, utilities are increasingly being denied the right to use working capital obtained through the use of accelerated tax depreciation benefitting consumers over a period of years.

Federal tax revenues that were intended by Congress for business investment are being diverted instead to subsidize only present utility consumers. Furthermore, in recent months some agencies have required utility companies to compute their earnings as if they had used accelerated tax depreciation, and to flow through to consumers the imputed tax benefits even though the companies had actually been using straight-line depreciation for tax purposes.

The increasing requirement of flow-through, and imputed flow-through, is of particular concern to the Independent telephone companies because it places them at a competitive disadvantage. They must compete with non-regulated industry to raise large amounts of capital, under current high interest rates, in order to provide the larger quantity and higher quality of services demanded by their customers.

(b) Loss of federal tax revenues

The Treasury Department advised the Ways and Means Committee that "If utility commissions generally proceed to treat companies as though they had adopted accelerated depreciation and require this amount to be flowed through, the total impact on (Federal) revenues, over the next few years, could build up to an annual loss of $1.5 billion."

COMPREHENSIVE CONSIDERATION BY THE WAYS AND MEANS COMMITTEE

The Ways and Means Committee devoted most of two days to hearing testimoney from and questioning 15 witnesses on the problems created by methods presently required in accounting for accelerated tax depreciation. These witnesses included representatives from four Federal regulatory agencies; a state public service commission; a national public accounting firm; and electric, gas and telephone companies; as well as economists and an investment banker. In addition, statements were filed by 14 others representing utilities, consumers, and regulators.

The testimony developed in detail the points of view of regulatory agencies, regulated utilities and others who are vitally concerned about the uneconomic and inequitable results of present practices under the existing provisions of Section 167 of the Internal Revenue Code.

SUMMARY OF SECTION 451, SUBTITLE F OF H.R. 13270

In drafting Section 451, the Ways and Means Committee reaffirmed that the use of accelerated tax depreciation results in a "deferral" of Federal income tax payments and not a "saving" of taxes. As drafted, the Section assures that accelerated tax depreciation provisions of the Internal Revenue Code will more effectively accomplish their intended purpose and prevent the unintended drain on Federal revenues.

The Section applies to property used in the furnishing of electrical energy; water; sewage disposal services; gas through a local distributing system; telephone services (excluding ComSAT); and transportation of gas, oil, or petroleum products by pipelines, if rates for these services are regulated by a utilities commission.

As to all such property constructed or acquired up to January 1, 1970, the following rules apply:

(1) If straight-line depreciation is presently used for tax purposes, then no other method is permitted;

(2) If accelerated depreciation is used for tax purposes, with "normalization," the utility must continue to do so unless it changes to straight-line; and

(3) If accelerated tax depreciation is used with flow-through no change is made.

As to new property (after December 31, 1969), the provisions are:

(1) If the taxpayer presently uses accelerated tax depreciation and flow-through, no change is made.

(2) In all other cases accelerated tax depreciation may be used only if the utility taxpayer normalizes the deferred income taxes.

The Section will permit any necessary changes in the methods used by taxpaying utilities, and authorized by regulatory commissions, in implementing the public policy to be made in an orderly way, without hardship to the utility consumer, the utility enterprise, or the Federal Treasury.

REASONS FOR ADOPTING SECTION 451

(1) *Section 451 will eliminate the potential $1.5 billion annual loss of Treasury tax revenue* that is expected to result from continuation of the current regulatory trend to require utilities to use accelerated tax depreciation with flow through. Section 451 will prevent adverse tax revenue effects with respect to existing property by prohibiting:

(a) A company which now uses straight-line tax depreciation from switching to accelerated tax depreciation.

(b) A company which now uses accelerated tax depreciation, and normalizes, from switching to flow through.

Adverse tax revenue effects will also be prevented by allowing only those taxpayers who are now using flow through to do so on property added after 1969. Even those companies may normalize if they receive regulatory approval.

(2) Section 451 requires no change in the existing use of tax depreciation methods by utilities that will disrupt the rate structures prescribed by regulatory agencies.

Section 451 does not infringe upon the present authority of regulatory agencies to regulate the rates or accounting practices of utilities under their jurisdiction. The authority of regulatory agencies to exclude a normalization reserve from the rate base in the same manner that depreciation reserves are excluded remains unaffected. By such exclusion the consumer receives the benefits of the use of the money. Thus, Section 451 amends the tax law merely to insure that the original intent of Congress is achieved.

(3) *Section 451 enables the original purpose of Congress—to provide working capital for all industries—to be accomplished for regulated firms as it is now being accomplished by non-regulated firms.* When the regulatory agency permits normalization accounting, a regulated company may us accelerated depreciation for tax purposes and thereby obtain the use of working capital as intended by Section 167 of the Internal Revenue Code.

(4) *Section 451 assures a more equitable distribution of the benefits of accelerated tax depreciation between present and future customers* of those utilities which normalize.

All customers benefit when a company normalizes because the company's cost of capital is reduced.

(5) *Section 451 protects the usefulness of an important measure of Federal tax and fiscal policy—accelerated tax depreciation*—in promoting necessary economic development. By limiting the use of flow-through for the future, this Section reduces the extent to which utility companies become dependent on continuation of these measures. If utility companies generally adopt the use of flow through, Congress would find it difficult to reduce or repeal tax provisions for accelerated depreciation regardless of the national policy requirement for such a change.

CONCLUSION

I wholeheartedly endorse the enactment of Section 451 as a means of accomplishing the original intent of Congress, reflected by Section 167 of the Internal Revenue Code, in an effective, equitable, and orderly manner. This Section substantially avoids the increasing drain on Federal revenues from existing practices, avoids infringing on the prerogatives of the regulatory agencies, and benefits utility customers and utility companies.

STATEMENT OF THE ASSOCIATION OF OIL PIPE LINES, SUBMITTED BY J. D. DURAND, GENERAL COUNSEL

SUMMARY

Section 451 of H.R. 13270 would have the effect of classifying oil pipelines, alone of all forms of transportation regulated by the Interstate Commerce Commission, as public utilities with guaranteed rates of return and "freezing" them in the methods of depreciation they are now using. With respect to the new pipeline companies which each year enter the ranks of the industry, section 451 would compel them to use straight line depreciation only. The Association of Oil Pipe Lines (AOPL), which is composed of substantially all of the oil pipelines regulated by the Interstate Commerce Commission, believes that such a classification is incorrect and improper for three principal reasons. First, the oil pipelines are not monopolistic utilities with guaranteed rates of return. They are in law and in fact true common carriers subject to strong competition from the water carriers (barge lines), the motor carriers and the railroads, the remaining forms of transportation regulated by the ICC. Second, all of the forms of transportation which compete with the oil pipelines have been excluded from section 451, and to leave oil pipelines subject to that section, contrary to the recommendations of the ICC, would result in a serious tax discrimination against them and in favor of their competitors. Third, the oil pipelines do not create for the Treasury Department a revenue loss problem from "flow through."

For these reasons, which have been set forth in detail in the following statement, AOPL urges the Committee on Finance to amend section 451 to exclude oil pipelines therefrom. This can be done by deleting from section 451, at lines 8 and 9, on page 268 of the bill, the words ", oil (including shale oil), or petroleum products."

STATEMENT

1. *Oil pipelines are in law and in fact true common carriers and there is "freedom of entry" into the oil pipeline transportation field.*

The oil pipeline companies are in law and in fact true common carriers. Insofar as the legal situation is concerned, they are, like the railroads, subject to Part I of the Interstate Commerce Act and thus come under the economic regulatory jurisdiction of the ICC although no certificate of public convenience and necessity or operating permit from the Commission is needed to enter the common carrier oil pipeline business. Pipelines are required to file tariffs covering their transportation of petroleum and petroleum products and strictly abide by those tariffs in all instances; their rates and charges to shippers must be just and reasonable; the transportation of petroleum and petroleum products must be performed under just and reasonable regulations and practices and no pipeline may grant unreasonable preference to any shipper or unduly discriminate among shippers in any way in connection with its services; transportation must be furnished to all shippers upon reasonable request therefor and reasonable through rates and services with other pipelines must be established; pipelines may not pool traffic, services or earnings except with the approval of the Commission, and all pipelines must keep their accounts and records in conformity with the Uniform System of Accounts for Pipelines prescribed by the ICC.

Oil pipelines serve simply as common carriers for all petroleum shippers who offer crude oil or petroleum products to them for transportation in accordance with the tariffs which the pipelines have on file with the ICC. *The oil pipelines do not buy or sell petroleum or petroleum products and they do not own the petroleum or petroleum products which they transport.* In this important respect they differ completely from the gas transmission lines. They also differ importantly from the electric, water and telephone companies since they do not sell products or services to the general public but only provide a mode of transportation to producers and refiners of petroleum.

Since, as stated above, a certificate of public convenience and necessity or operating permit is *not* required to enter the common carrier oil pipeline business, there is freedom of entry into this mode of transportation. Studies made by AOPL indicate that fourteen new oil pipeline companies have begun operations during the five and one-half year period since January 1, 1964. *Clearly therefore, transportation of oil by pipeline is not a monopolistic industry.*

2. *The common carrier oil pipelines are in direct competition with the inland water carriers (barge lines), the motor carriers and the railroads and should be treated in the same way as these competitors are treated with regard to permitted methods of tax depreciation.*

This Association annually compiles data showing the relative tonnage of petroleum and petroleum products carried in domestic transportation by the pipelines, the water carriers (barge lines), the motor carriers and the railroads. For 1967, the latest year for which data are available, and which is a typical year, the oil pipelines carried 45.64% of the total tons of crude petroleum and petroleum products carried in domestic transportation by the four modes specified. The motor carriers were second with 29.13%, the water carriers third with 23.50% and the railroads fourth with 1.73%. It can be truly said that competition from motor carriers and water carriers is significant since together these two modes carry more tonnage than the oil pipelines. While the pipelines are the principal mode of transportation of crude petroleum, the water carriers carry 18.79% of this commodity and the motor carriers carry 7.37%. With regard to petroleum products carried in domestic transportation, the oil pipelines carry 29.25% of the total tonnage, far short of the 41.87% carried by the motor carriers and only slightly more than the 26.26% transported by the water carriers.

These figures point up the correctness of the reference to "the existence of strong competitive forces" among the ICC regulated carriers referred to at the bottom of page 2 of the letter of April 15, 1969, to the Ways and Means Committee from the Chairman of the ICC (copy attached). It would be obviously unfair to permit, as section 451 contemplates, the water carriers, the motor carriers and the railroads to continue to have the right to select the method of depreciation most advantageous to them and to prevent the oil pipelines from exercising this choice.

3. *Subjecting oil pipelines to the provisions of proposed section 451 would be contrary to the recommendations of the ICC.*

The April 15, 1969, letter to the Ways and Means Committee from the Chairman of the Interstate Commerce Commission, to which reference was made above, urges that *all* modes of transportation regulated by the ICC be treated alike insofar as methods of tax depreciation are concerned. The letter refers to the strong competition which exists among the modes of transportation regulated by the ICC and the fact that (bottom of page 3 and page 4) "The interplay of competitive forces keeps the rate structure in a constant state of change" and that "in many cases where the Commission has permitted increases in the rates of a particular mode to take effect, competition from other regulated modes or unregulated transportation has subsequently forced reduction in these rates to prevent undue diversion of traffic to a competing mode of carrier."

The obvious conclusion from this letter is that all modes of transportation regulated by the ICC—the railroads, the motor carriers, the water carriers and the oil pipelines—should be treated alike with regard to such an important tax consideration as methods of depreciation.

This even-handed treatment for all modes of transportation regulated by the ICC is in accord with the National Transportation Policy set forth in the Interstate Commerce Act, which, in part, provides:

"It is hereby declared to be the national transportation policy of the Congress to provide for fair and impartial regulation of all modes of transportation subject to the provisions of this Act, so administered as to recognize and preserve the inherent advantages of each; * * *"

In connection with the review by the Committee on Finance of the scope of section 451, AOPL strongly recommends that the Committee consult with the ICC and determine its views with regard to the desirabiliy of including oil pipelines under that section.

4. *Unlike the rate procedures of the Federal Power Commission and the Federal Communications Commission, the ICC rate procedures do not and cannot result in prescribing levels of earnings for the carriers which it regulates and thus the oil pipelines do not have a guaranteed rate of return.*

To classify the oil pipeline transportation industry in the same category for treatment of accelerated depreciation as the gas, telephone, water and electric utility industries appears to involve a moral (and perhaps a legal) wrong, plus an economic monstrosity.

The Interstate Commerce Commission's processes in handling oil pipeline tariff rates are not in any way similar to the processes whereby the FPC, the FCC and state regulatory agencies establish and set rates for gas, electric, water and telephone utilities. Under normal rate procedures, these latter agencies make a determination of the rate level necessary to fix corporate net income at a permitted rate of return on an agreed rate base.

The ICC does not and cannot prescribe earnings for oil pipelines, barge lines. railroads and motor carriers as do the agencies that regulate true utilities since the ICC regulated carriers do not have monopolistic characteristics. The interplay of competitive forces assures that the rate structure will be in a constant state of change.

Distinguishing between oil pipelines and their transportation competitors by putting oil pipelines in a true utility category, in which they do not belong, was probably due to a msunderstanding by the Ways and Means Committee of the nature of oil pipeline transportation, and the Committee on Finance is urged to review carefully the attached letter from the ICC, particularly the following portion (commencing on page 4):

"In this regard, we should point out that in many cases where the Commission has permitted increases in the rates of a particular mode to take effect, competition from other regulated modes or unregulated transportation has subsequently forced reductions in these rates to prevent undue diversion of traffic to a competing mode or carrier."

This observation is particularly pertinent to oil pipelines since one of our principal competitors, the water carriers, enjoy freedom from rate regulation by the ICC in their transportation of petroleum and petroleum products.

5. *The oil pipelines do not create for the Treasury Department a revenue loss problem from flow through.*

Since oil pipeline rate are regulated more by competition than by regulatory agency determination, the rate level is not affected by flow through. There have been a few rate cases before the ICC affecting oil pipelines. Most of these cases involved only point to point rates and none involved flow through.

The problems that Treasury faces in loss of revenue through flow through of accelerated depreciation centers around the growing practice of regulatory agencies of forcing flow through to *residential* customers using gas, electricity, water and telephone services. It should be recognized that the customers of the oil pipelines are the corporate producers and refiners who buy and ship crude oil to refinery centers and in turn ship refined products to jobbers. If any flow through should occur from oil pipeline accelerated depreciation, it would go directly to other corporate taxpayers and, by reducing their operating costs, it would increase their Federal income taxes.

CONCLUSION

In view of the foregoing, AOPL urges the Committee on Finance to amend section 451 to exclude oil pipelines from the classification of public utilities subject to that section. From the viewpoint of even-handed justice and to prevent the tax discrimination which would result against oil pipelines as compared with their competitors, the oil pipelines should be treated similarly to the motor carriers, the water carriers and the railroads with respect to this important tax provision.

J. D. DURAND,
General Counsel, Association of Oil Pipe Lines

INTERSTATE COMMERCE COMMISSION,
Washington, D.C., April 15, 1969.

Hon. WILBUR D. MILLS,
Chairman, Committee on Ways and Means,
House of Representatives,
Washington, D.C.

DEAR CHAIRMAN MILLS: In the course of my testimony before the Committee on March 25, 1969, you and other members of the Committee requested that I provide certain additional information for the record regarding several aspects of the tax expenses incurred by carriers subject to the Commission's jurisdiction and our treatment of such expenses. The information requested is set forth below.

On pages 4210–12 of the hearing transcript, Congressman Burke requested information concerning (1) what taxes, if any, were owned to the Federal Government by the New Haven Railroad and by whom were they assumed; and (2) whether the Commission in its recent approval of Penn Central's request to increase fares reached its decision on the basis of the operation of the New Haven Railroad prior to takeover or if it was based on the anticipated revenue this year in view of the abandonment of 91 trains and other things before the Commission.

As to the first question, the New Haven Railroad had the following current tax liabilities due the United States Government at the time its operations were taken over by the Penn Central: $83,266 representing Federal income taxes of leased lines and $1,021,435 payroll taxes. Under the agreement Penn Central acquired certain current assets and assumed certain current liabilities, including $45,661 of the Federal income taxes and the $1,021,435 payroll taxes. The New Haven Railroad is to pay Penn Central in cash the excess of the liabilities over assets. We have been advised that the taxes in question were paid by Penn Central in January 1969. The remaining $37,604 of income taxes is still a liability of the New Haven.

We are unable to provide any information on the second question since the passenger fare increase proposed and put into effect by Penn Central was not applicable to passenger service performed over lines of the New Haven.

On page 4248 of the hearing transcript, you requested the views of the Commission with respect to effect on industries subject to our jurisdiction if Congress were to repeal the present provisions of the tax laws dealing with accelerated depreciation or were to otherwise deprive such industries "of anything other than straight line [depreciation]?"

As indicated in my testimony before the Committee, the regulatory problems with respect to maximum rates and earnings of regulated surface transportation carriers are not as significant for the Commission as they are for other agencies engaged in regulating other public utilities. This is largely due to the existence of strong competitive forces, both within the regulated portion of the industry and without, in the form of unregulated for-hire and private carriage. These strong competitive pressures generally serve to keep rates from exceeding a reasonable maximum level, thus minimizing the necessity for the Commission to prescribe a maximum rate level or otherwise intervene in the ratemaking process to the same extent required in the case of the regulation of industries with monopolistic characteristics. Because of these competitive forces, we do not believe that the denial of accelerated depreciation to regulated industries, as suggested by the Federal Power Commission (Testimony of Chairman White, Tr. p. 4131), would be in the best interests of the carriers subject to our jurisdiction or to the growth and development of an economically sound transportation system. In essence, it is our understanding that the position of the Federal Power Commission is premised on the concept that if additional stimulation is required for the attraction of capital in regulated industry, it is the responsibility of the appropriate regulatory agency to approve or to prescribe a level of rates sufficient to attract such capital rather than having such capital attracted through incentives in the tax laws. Put differently, the burden of attracting new capital into the regulated industry should fall upon the ratepayer rather than the taxpaying public as a whole. (Tesimony of Chairman White, Tr. p. 4123).

While the principle described above can be logically applied to industries having the monopolistic characteristics of those subject to regulation by the Federal Power Commission, this principle could not be applied with any precision in the regulated surface transportation industry where the interplay of competitive forces keeps the rate structure in a constant state of change. In this regard, we should point out that in many cases where the Commission has permitted increases in the rates of a particular mode to take effect, competition from other regulated modes or unregulated transportation has subsequently forced reductions in these rates to prevent undue diversion of traffic to a competing mode or carrier. As long as the transportation ratepayer has this wide choice of options among carriers, the suggestion of the Federal Power Commission could not be meaningfully applied to regulated surface transportation carriers. Given these circumstances, depriving regulated transportation carriers of the use of any method of depreciation, other than the "straight-line method" would result in undesirable effects on the carriers. It would decrease net income of carriers by the amount of additional taxes they would have to pay; assuming operations are profitable. This would reduce the amount of cash available for investment in new property, particularly needed freight cars, maintenance of plant and dividends, among other things. To replenish the cash used to pay additional taxes, it would seem that carriers would have no alternative but to seek relief through requests for increased rates, which, for the reasons mentioned above, might not accomplish the intended effect. Additionally, the immediate resultant decrease in net earnings and cash flow could affect the carriers' credit position and their ability to provide adequate service to the shipping public.

As long as Congress sees fit to provide liberal depreciation methods for tax purposes and the investment tax credit for industry in general, we feel the surface transportation industry should not be deprived of such benefits.

I hope you and the other members of the Committee will find this information helpful.

Sincerely,

(S) Virginia Mae Brown
VIRGINIA MAE BROWN,
Chairman.

STATEMENT BY ERNEST L. GROVE, JR., VICE PRESIDENT AND CHIEF FINANCIAL AND ACCOUNTING OFFICER, NORTHEAST UTILITIES

(Northeast Utilities is a utility holding company system operating in Connecticut and western Massachusetts. Its principal operating subsidiaries are The Connecticut Light and Power Company, The Hartford Electric Light Company, Western Massachusetts Electric Company, and The Holyoke Water Power Company.)

Northeast Utilities believes that Section 451 of the Tax Reform Bill is inappropriate tax legislation. First, we feel it is wrong to make regulatory accounting procedures determinative of income tax deductions. This Bill would deny the benefits of accelerated depreciation to those public utilities regulated by commissions which adopt the "flow through" method of accounting. Under this Bill, a utility company's deduction for depreciation, which is the largest single deduction most utilities have, would be controlled by accounting policies adopted by the regulatory commission. We believe that to permit policies and procedures of regulatory commissions to determine tax effects is a questionable precedent for the Congress to adopt.

Second, the requirements in Section 451(a)(2) and (3) of the House Bill for the actual use of flow through in establishing cost of service on and prior to July 22, 1969, in order to utilize flow through are too rigid and inflexible. They fail to recognize those situations where a regulated utility which was using accelerated depreciation had taken positive and concrete steps to change from normalization to flow through prior to such date but where such change had not yet been authorized or implemented.

As an example of the difficulties and anomalies that this section of the Bill in its present form will create, may I cite the situation in Massachusetts with respect to our subsidiary, the Western Massachusetts Electric Company. This Company has been utilizing an accelerated depreciation method on its tax returns. However, for rate-making purposes, it has been obliged by the Massachusetts Regulatory Commission to "normalize," that is, to charge the tax reduction as a current tax expense and reflect it in its rates to its customers. Since February 14, 1969, when hearings were ordered, the Massachusetts Department of Public Utilities has had under formal consideration and advisement a change in the accounting method required of regulated public utilities from "normalization" to the "flow through" method. At a hearing before the Department on March 20 of this year, Western Massachusetts Electric Company pledged to reduce its rates to its customers by an annual amount of at least $1,700,000 if the Department would permit the use of the flow-through method. Before the Department had had opportunity to act, the House passed the present Bill. Now Section 451 will prevent this rate reduction which the Company is desirous of making since a "flow through" accounting order in Massachusetts would automatically result in the denial under this Bill of the use of accelerated depreciation to the Western Massachusetts Electric Company.

We respectfully suggest that Section 451 be modified to provide for situations where the regulated public utility has, on or before July 22, 1969, taken steps to obtain authorization to adopt flow-through accounting. This would be only equitable since the proposed tax legislation was not the inducement for proposing the accounting change.

With respect to Section 452 of the Tax Reform Bill, we would urge that if the Congress feels corrective action is required in this area, then the situation should be approached with a phase-out method, as President Nixon originally proposed, rather than with an absolute cut-off for tax years beginning after June 30, 1972, as Section 452 is presently written. The effect of the absolute cut-off date would mean that Northeast Utilities, for example, might have a return of capital dividend of, say, 60 percent in 1972 which would abruptly become fully taxable in 1973. We believe this would have a serious detrimental effect on the market price of our common shares. Also, it should be pointed out, a phase-out method would increase Treasury revenues in the interim years.

WISCONSIN GAS CO.,
Milwaukee, Wis., September 24, 1969.

CHIEF COUNSEL, U.S. SENATE FINANCE COMMITTEE,
Washington, D.C.

DEAR SIR: Your telegram dated September 9, 1969 scheduled my appearance on Monday, September 29, at 10:00 A.M. to present an oral statement relating to the Tax Reform Bill of 1969. My appearance was as Chairman of the Wisconsin Utilities Association Task Force on the Bill.

As outlined in my telegram, my request for time to be heard was with particular reference to Section 451(a)(5)(B)(ii) of H.R. 13270.

Section 451(a)(2) permits a method of depreciation other than the straight-line method in computing taxable income only if the taxpayer used the "normalization method" of accounting as of July 22, 1969 and continues such use.

Section 451(a)(5)(B)(ii) provides that a taxpayer is considered as using the normalization method of accounting only if he—

"(ii) makes adjustments to a reserve for deferred taxes to reflect the deferral of taxes resulting from the use of such different methods of depreciation."

The Public Service Commission of Wisconsin has, in effect, provided for such normalization method of accounting, but adjustments are made to reserve for depreciation rather than a reserve for deferred taxes. Accordingly, the intent of the proposed legislation is met and the inadvertent failure to recognize the Wisconsin method would be corrected if the paragraph were amended as follows:

"(ii) makes adjustments to a reserve for deferred taxes to reflect the deferral of taxes resulting from the use of such different methods of depreciation."

This matter has been discussed with the staff of the Joint Committee on Internal Revenue Taxation and it is my understanding that there is no disagreement as to the suggested technical revision which would (1) accommodate the normalization accounting method of the Public Service Commission of Wisconsin, (2) satisfy the intent of the proposed legislation, (3) correct a technical deficiency in H.R. 13270 and (4) serve the public interest.

On this basis, I ask that this statement be made a part of the printed record of the Committee's proceeding as if read and, in deference to the demands on the Committee's time, my request for time to appear is withdrawn.

Thank you for the Committee's consideration and understanding of this matter.

Very truly yours,

ROBERT M. HOFFER.

AMERICAN TELEPHONE AND TELEGRAPH CO.,
New York, N.Y., September 24, 1969.

Hon. RUSSELL B. LONG,
Chairman, Committee on Finance,
U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: This statement is respectfully submitted on behalf of the Bell Telephone System in favor of the public utility tax depreciation provisions as set forth in Section 451 of H.R. 13270.

The report of the Committee on Ways and Means accompanying H.R. 13270 discusses the background and need for legislation along the line of proposed Section 451, and I will limit my comments to a summary of the highlights of this background as it affects A.T. & T. and its operating telephone companies.

Briefly stated, we are convinced that the proposal is in the best interests of our customers and the Federal Treasury. We believe this bill, which directly involves a matter of tax policy, has been well designed to accomplish its purposes and does not infringe on regulatory authority.

We are vitally interested in these provisions because, as a capital-intensive industry, the Bell System companies must invest—and recover through depreciation—large amounts for the replacement, modernization and expansion of communications plant to meet public demand for service. The Bell System construction program this year calls for expenditures of about $5.7 billion, with every indication that the need in 1970 will be greater.

PROPOSED REFORM PROVIDES WORKING CAPITAL IN ACCORD WITH CONGRESSIONAL INTENT

Section 451 of H.R. 13270 is a reform measure which will assure that the original purpose of Congress, when it authorized accelerated tax depreciation in 1954, will be carried out substantially for the regulated sector of the economy as it is being fulfilled in the unregulated sector.

The declared purpose of Congress in 1954, when it initially authorized accelerated tax depreciation under Section 167 of the Internal Revenue Code, was to make working capital available to all American industry—regulated as well as unregulated—to encourage modernization and expansion of industrial capacity. This purpose was clearly stated in the Congressional reports, including that of the Senate Finance Committee, accompanying the original enactment of Section 167.[1]

In the case of non-regulated industries the accelerated tax depreciation provisions of Section 167 operate as Congress intended and produce working capital

---

[1] S. Rep. No. 1622, p. 26. See also H. Rep. No. 1337, p. 24 (83d Cong., 2nd Sess.).

for these industries in one of two ways. First a non-regulated company may use accelerated depreciation not only for tax purposes but also for book purposes and to reflect the effect in its earnings. When this is done, tax payments are lower, cash flow is increased and outside capital requirements are thereby reduced. Another way a non-regulated company can obtain working capital is to use straight-line depreciation for book purposes, accelerated depreciation for tax purposes and reflect the reduction in current tax payments in a reserve to allocate tax costs properly over the life of the property. This procedure is known as "normalization" and is required by the accounting profession and the Securities and Exchange Commission for all non-regulated industries when faster depreciation is used for tax purposes than for book purposes.

For a singificant number of regulated public utilities, however, the accelerated tax depreciation provisions of Section 167 have not been accomplishing their purpose. Since regulatory commissions generally require utilities to use straight-line depreciation for book purposes, only the second method mentioned above is available to public utilities that wish to obtain working capital in this manner. However, many regulatory agencies will not permit the "normalization" procedure which, as indicated above, is required by the accounting profession and the S.E.C. in the case of non-regulated industry. Rather, they require the utilities under their jurisdiction to use an exception to this procedure, known as "flow-through". Under "flow-through" the cash flow generated by accelerated tax depreciation can be used to subsidize rates charged to current utility customers rather than to create a reserve of working capital. When this occurs, the cash flow generated by the use of accelerated tax depreciation does not generate a source of capital that Congress intended to provide under Section 167.

Any short-term benefit to current utility customers from "flow-through" is at the expense of future utility consumers and impairs the financial position of utilities by burdening them with large amounts of unprovided-for costs. For these reasons, Bell System companies—even though they have had pressing and increasing needs for large amounts of capital to provide the communications needs of the country and have wanted to obtain capital by using accelerated tax depreciation—have to date used for tax purposes the same straight-line depreciation method prescribed by the F.C.C. for book and rate-making purposes.

In a time of rapidly expanding national need for utility services, accompanied by unprecedented demands for utility investment capital, Section 451 of H.R. 13270 will afford all present straight-line and present normalizing utilities the same opportunity as nonregulated industry to obtain working capital from the use of accelerated tax depreciation, thus enabling those utilities to compete on the same terms as non-regulated industry in the capital markets.

UTILITY CONSUMERS BENEFIT

Section 451 of H.R. 13270 also serves to assure in the case of present straight-line utilities—thus, including Bell System companies—and also in the case of present normalizing companies, that the full benefits of accelerated tax depreciation will go to customers both present and future.

There is a widespread belief that utility consumers are better off under flow-through than under normalization. The fact is, however, that the difference between flow-through and normalization, so far as utility rate payers are concerned, is simply which particular utility customers get the benefit and when. Flow-through treats the entire reduction in current tax payments as available to reduce rates to today's customers. But it has been demonstrated that utility revenue requirements—and thus rates charged utility customers—become greater after a period of time under flow-through than they would be under normalization. Flow-through, in sum, gives a windfall benefit to today's customers to the detriment of tomorrow's customers.

With normalization, on the other hand, there is a savings in capital costs to utility consumers because they do not have to pay interest or other charges for these capital funds used in providing utility service. Moreover, reduced demands on the money markets may tend to lower the costs of the remaining external financing requirements. Under Section 451, regulatory agencies would have full authority to see that the normalization reserve is used as cost-free capital, and that the full benefit of this cost-free capital is given to utility customers. If the Bell System companies could normalize, they have made it clear they would use the reserve for the benefit of customers, passing savings in capital cost on to customers over the entire period the working capital is used in their behalf. No Bell System customer would be called on to pay higher charges because the cash flow from accelerated depreciation had been used to subsidize rates of earlier customers; all Bell System rate payers would receive an increasing benefit as the cost of capital is reduced.

FEDERAL TAX REVENUES ARE PROTECTED AGAINST UNINTENDED LOSS

Section 451 of H.R. 13270, in addition, will tend to increase Federal tax revenue levels. The Report of the Ways and Means Committee estimates these increased tax revenue levels annually at $60 million in 1970, $260 million in 1974, and $310 million in 1979.

These increased tax revenue amounts derive directly from the effect of "flow-through" on utility Federal income tax payments. The result of "flow-through" in general, as pointed out by the House Report, is to double the Government's revenue reduction in the early life of plant when measured against that which is contemplated to result directly from granting accelerated tax depreciation allowances to industry. Normalization, largely, avoids this doubling effect.

As mentioned above, Bell System companies to date have used the straight-line depreciation method for Federal income tax purposes. However, regulatory and other pressures have reached the point where the Bell System no longer has any practical choice but to adopt accelerated tax depreciation. Moreover, some regulators are imputing accelerated tax depreciation with "flow-through" on companies even though the companies are in fact using straight-line tax depreciation. If legislation applying to present straight-line companies along the line of Section 451 of H.R. 13270 were not to be enacted, and Bell System companies were forced—as they inevitably would be by regulatory pressures—to adopt accelerated tax depreciation with "flow-through", the reduction in their tax payments for 1970 would be about $110 million (assuming accelerated tax depreciation is taken only on plant placed in service after December 31, 1969), or some $55 million greater than the estimated reduction in their tax payments under normalization for 1970. If legislation along the lines of Section 451 of H.R. 13270 covering present straight-line utilities were enacted into law, the Bell System companies would expect to take accelerated tax depreciation on plant added in 1970 and subsequent years with "normalization".

In our view the provisions of Section 451 of H.R. 13270 are in the public interest, and I urge that they receive the Committee's favorable consideration.

Respectfully yours,

A. L. STOTT,
Vice President and Comptroller.

STATEMENT OF FLORIDA GAS TRANSMISSION COMPANY, SUBMITTED BY E. P. SHANAHAN, VICE PRESIDENT AND TREASURER

SUMMARY

H.R. 13270, Section 451, bases the ability of a public utility to use accelerated depreciation in the future upon the filing of its Federal income tax return on or before July 22, 1969. The filing of the tax return is an inappropriate event to determine this question. The significant events to which the future use of accelerated depreciation should be related are either (i) the recording of income tax expense on the regulated books of account or (ii) the filing of rates with the appropriate administrative agency, as of the relevant date selected for such determination.

In the case of Florida Gas Transmission Company, the Internal Revenue Service granted the Company an extension of time to September 15, 1969 for filing its tax return for 1968, the first tax return of the Company which uses accelerated depreciation. Accordingly, this return was not filed until August 25, 1969. However, in August 1968, the Company had filed rates with the Federal Power Commission in reliance upon the use and flowthrough of accelerated depreciation on all property acquired subsequent to 1967. These rates, which have been in effect since February 16, 1969, were based upon a cost of service which included Federal income tax expense at a level approximately $1.6 million a year below what it will be unless the Company is permitted to use accelerated depreciation for tax purposes in 1969 and future years.

Several alternative amendments to H.R. 13270 are suggested at the end of the Written Statement.

STATEMENT

In its bill to reform the income tax laws, the House of Representatives has proposed certain amendments to Section 167 of the Internal Revenue Code which would restrict the right of a public utility to use accelerated depreciation. Section 451 of House Bill 13270 would require the use of straight-line depreciation on public utility property unless a different method had been on such property for the latest taxable year for which a return was filed on or before July 22, 1969.

In the case of Florida Gas Transmission Company, the proposed requirement of the House Bill that the applicable return be filed on or before July 22, 1969 would have what undoubtedly is an inadvertent result. On June 26, 1969, the Internal Revenue Service granted the Company an extension of time until September 15, 1969 to file its income tax return for calendar year 1968. Thus the Company's 1968 tax return, which will be the first to use accelerated depreciation, was not filed until August 25, 1969. Nevertheless, in August 1968, the Company irrevocably committed itself to the use of accelerated depreciation, with respect to property acquired subsequent to December 31, 1967, by filing rates with the Federal Power Commission in reliance upon the use and flowthrough of accelerated depreciation. These rates have been in effect since February 16, 1969, and will not realize a fair return for the Company without the use and flowthrough of accelerated depreciation on property acquired in 1968 and 1969 (amounting to approximately $90,000,000 of a total plant of approximately $350,000,000). Nevertheless, because for the year 1967 (the latest taxable year for which a tax return was filed on or before July 22, 1969) the Company used solely a straight-line method of depreciation, the Company would be required by the House Bill to remain on straight-line depreciation for all years subsequent to 1968. For the year 1968, however, the Company would be entitled to take accelerated depreciation since the Bill does not apply with respect to taxable years ending before July 23, 1969.

We submit that the crucial determination with respect to its method of depreciation for tax purposes is made by a public utility when it files rates based upon the use and flowthrough of accelerated depreciation and so calculates the income tax expense recorded in its regulated books of account. Once rates have become effective in reliance upon the use and flowthrough of accelerated depreciation for tax purposes, the utility, in effect, has irrevocably committed itself to this method of depreciation so long as those rates remain in effect. Accordingly, the tax reform bill should base the relevant date for determining the future use of accelerated depreciation upon the recordation of income tax expenses in the regulated books of account or the filing of rates with the appropriate administrative agency, instead of or in addition to the date its Federal income tax return was filed.

The following evidences the fact that Florida Gas Transmission Company had decided to take accelerated depreciation during 1968, a year prior to the June 22, 1969 cut-off date presently in the House Bill. On June 17, 1968, the prepared direct testimony of Mr. W. J. Bowen, President and Chief Executive Officer of the Company, was filed with the Federal Power Commission and was formally introduced into evidence on July 18, 1968 at Volume No. 47, page 5923, in rate proceedings RP68–1 and RP66–4. Mr. Bowen stated that:

"If we are to achieve the rate objectives I have outlined, that is, to produce rates as low as or lower than the 17.9, 21.9 and 57.0 cents per MMBTU rates which we are collecting prior to the in-service date of the CP65–393 facilities exclusive of the surtax and to do so without seriously impairing the Company's financial integrity and competitive position, there is but one course open to us. We must accept the risks inherent in reducing our current revenues by deferring to a later period a part of our tax costs with the concomitant lowering of our financial debt coverages. We must elect to take liberalized depreciation on the CP65–393 facilities and on future plant additions. Therefore, I have asked our people to prepare the testimony and exhibits for the new rate filing on this basis and to request the necessary authorization to reflect 'flow through' accounting on those facilities."

On August 1, 1968, the Company made the new rate filing based upon the use of accelerated depreciation with respect to all property acquired subsequent to 1967. The relevant exhibits filed with the Federal Power Commission demonstrating this election are attached hereto as Schedule A. Since August 1, 1968, the Company uniformly has used accelerated depreciation with respect to property acquired subsequent to December 31, 1967 in calculating the income tax expense recorded in its regulated books of account. Since the rates filed on August 1, 1968 were based upon a cost of service which resulted from utilizing accelerated depreciation, thus flowing through the tax reductions to the customers in the form of lower rates, the rates would not provide the Company a fair return if depreciation based upon a straight-line method is required in determining taxable income for 1969 and subsequent years.

The rates filed on August 1, 1968 were allowed by the Federal Power Commission to become effective on February 16, 1969 and have remained in effect until the present time. A rate increase to reflect the unavailability of accelerated depreciation could be delayed by the administrative process for up to nine months after the decision to file the increased rates. From February 16, 1969 until new rates are permitted to become effective, the Company would have suffered a non-recoverable loss of approximately $1,600,000 annually because of its reliance upon the use and flowthrough of accelerated depreciation as described above.

As further evidence that the Company had elected to take accelerated depreciation during 1968, we attach hereto the following:[1]

1. Annual Report to stockholders of Florida Gas Company for the year 1968. Note (3) to the Notes to Financial Statements at page 21 states that:

"Concurrent with the completion in 1968 of its 192,000 MCF per day expansion, Florida Gas Transmission Company elected to claim liberalized depreciation for Federal income tax purposes on new facilities and to flow through the tax reductions to ratepayers, following an accounting method approved by the Federal Power Commission. Since there was a concurrent rate reduction, this change in accounting had no appreciable effect on net income for 1968."

In its report on page 22 of the Annual Report, Arthur Andersen & Co. states that the accounting principles:

". . . other than for the flow-through of the tax reductions from using liberalized depreciation as described in Note 3, were applied on a consistent basis during the two years [1967 and 1968]."

2. Prospectus, dated April 10, 1969, with respect to the sale of Florida Gas Company's 5¾% Convertible Subordinated Debentures due April 1, 1989 wherein Florida Gas Company and Arthur Andersen & Co. make similar representations on pages 8, 14, 29, and 35 to those made in the Annual Report of Florida Gas Company.

3. Form 10-K, dated April 30, 1969, filed with the Securities and Exchange Commission, containing statements identical to those in the Annual Report of Florida Gas Company.

In addition, on December 13, 1968, the Company filed its Amended Declaration of Estimated Income Tax for 1968 on the basis of depreciating its properties acquired subsequent to December 31, 1967 at accelerated rates for tax purposes. Also, registration statements filed with the Securities and Exchange Commission in May 1969, with respect to the Florida Gas Company Employees Savings Plan and the Florida Gas Company Qualified Stock Option Plan, contain statements with respect to accelerated depreciation similar to those contained in the Annual Report of Florida Gas Company.

For the above reasons, Florida Gas Transmission Company requests that subsection 167(k)(1)(A) of the Internal Revenue Code, as proposed to be amended by Section 451(a) of House Bill 13270, be amended in one of the following manners:

1. Delete subsection (1)(A) and substitute the following:

"(A) with respect to such property (or with respect to property of the same kind as such property) the taxpayer used a method other than the straight-line method in the calculation of income tax expense recorded in his regulated books of account for his latest monthly accounting period ending on or before July 22, 1969."

2. Delete subsection (1)(a) and substitute the following:

"(A) with respect to such property (or with respect to property of the same kind as such property) the taxpayer (*i*) for his latest taxable year for which a return was filed on or before Juyl 22, 1969, used a method other than the straight-line method, *or (ii) was, on July 22, 1969, collecting rates pursuant to rate schedules filed with a state or federal agency established by using a cost of*

[1] The attachments referred to are made a part of the official files of the Committee.

service which included tax expense computed by using a method other than the straight-line method and used a method other than the straight-line method in his Federal income tax return for his latest taxable year ending on or before July 22, 1969." (Changes underlined.)

3. Delete subsection (1) (A) and substitute the following:

"(A) with respect to such property (or with respect to property of the same kind as such property) the taxpayer (*i*) for his latest taxable year for which a return was filed on or before July 22, 1969, used a method other than the straight-line method, *or* (*ii*) *had filed, on or before July 22, 1969, rate schedules with a state or federal agency wherein rates were established by using a cost of service which included tax expense computed by using a method other than the straight-line method and used a method other than the straight-line method in his Federal income tax return for his latest taxable year ending on or before July 22, 1969.*" (Changes underlined.)

4. Delete the date "July 22, 1969" and substitute the date "September 15, 1969" therefor.

5. Delete the words "for which a return was filed" and insert in lieu thereof the word "ending" so that subsection (1) (A) would read as follows:

"(A) with respect to such property (or with respect to property of the same kind as such property) the taxpayer for his latest taxable year ending on or before July 22, 1969, used a method other than the straight-line method, and".

6. Delete the word "filed" and insert in lieu thereof the words "intially due" so that subsection (1) (A) would read as follows:

"(A) with respect to such property (or with respect to property of the same kind as such property) the taxpayer for his latest taxable year for which a return was intially due on or before July 22, 1969, used a method other than the straight-line method, and".

7. After the words "for which a return was filed on or before July 22, 1969" add "or on or before a subsequent date if a valid extension to file at such later date had been granted on or before July 22, 1969", so that subsection (1) (A) would read as follows:

"(A) with respect to such property (or with respect to property of the same kind as such property) the taxpayer for his latest taxable year for which a return was filed on or before July 22, 1969, or on or before a subsequent date if a valid extension to file at such later date had been granted on or before July 22, 1969, used a method other than the straight-line method, and".

APPENDIX C

WRITTEN TESTIMONY RECEIVED BY THE COMMITTEE EXPRESSING AN INTEREST IN THE SUBJECT OF INTEREST DEDUCTIONS

33-865—69—pt. 5——68

Written testimony received by the committee expressing an interest in the subject of interest deductions

ARTHUR ANDERSEN & Co.,
Chicago, Ill., September 19, 1969.

Re statement regarding H.R. 13270, Tax Reform Act of 1969—limitation on deduction of interest.

Mr. TOM VAIL,
Chif Counsel, Committee on Finance,
New Senate Office Building, Washington, D.C.

SUMMARY OF COMMENTS AND RECOMMENDATIONS

DEAR MR. VAIL: The provision (Section 221), relating to limitations on the deduction of certain interest, should be deleted, in accordance with the recent recommendations made by the Treasury.

BASIS FOR COMMENTS

Our conclusions are based on the following:

(1) Portions of certain taxpayers' interest will already be subject to disallowance under Section 301 dealing with the general allocation of deductions. Providing for further disallowance under this Section creates a penalty provision.

(2) The Bill only relates to "investment interest," which is only defined as that interest paid on debt incurred or continued to purchase or carry property held for investment. On close analysis, this definition provides for a subjective test which will be virtually impossible to administer.

(3) Disallowance of interest on present debt would have a retroactive effect because it would unfavorably alter the economic rate of return on investments previously made, which were entered into on the basis of fixed commitments and the present tax law.

(4) In addition to the limitation at the individual level, a separate $25,000 limitation imposed on each partnership and Subchapter S corporation is not justified. Such a proposal would not take into consideration the size of the partnership or corporation, its investment, or the number of partners or shareholders. There is no economic basis for imposing such a harsh rule on investment property held by a partnership or Subchapter S corporation and many such entities would be forced to liquidate.

CONCLUSION

This statement is submitted as part of a series of letters, each dealing with a particular area of the proposed legislation. It is intended that the comments and recommendations contained herein be made part of the record of testimony relative to the legislative changes contemplated for limitation on deduction of interest. We shall be pleased to discuss these matters further with you or the Committee, either in person or by telephone. Please call us collect at 312-346-6262 if necessary.

Very truly yours,

ARTHUR ANDERSEN & Co.,
By JOHN MENDENHALL,
Director of Taxes.

CHRYSLER REALTY CORP.,
September 29, 1969.

Re H.R. 13270—The Tax Reform Act of 1969
Subject Section 221—limitation on deduction of interest

COMMITTEE ON FINANCE,
U.S. Senate, New Senate Office Building,
Washington, D.C.

GENTLEMEN: Chrysler Realty Corporation hereby presents its views on Section 221 of H.R. 13270 dealing with the limitation on the deduction of funds borrowed to acquire or carry investment funds.

Under Section 221 of the bill, a limitation would be imposed (in the case of *non-corporate* taxpayers) on the deduction of interest on indebtedness incurred or continued to purchase or carry property held for investment. Investment interest in excess of the aggregate of (i) $25,000, (ii) net investment income and (iii) net long-term capital gains would be disallowed as a deduction.

Although the language of Section 221, as well as the House Report and the Supplemental Report thereto, clearly indicates that this limitation on certain interest deductions is aimed exclusively at *individuals*, one of its subparagraphs (Section 221(a)(4)(A)) would create an *unintended tax problem* for corporate taxpayers. This provision states that, in the case of partnerships, the limitation on the deduction of interest would apply at *both* the partnership and partner level. Hence, the partnership deduction would be limited to $25,000, and the partners, corporate as well as individual, would be limited to their proportionate share of the reduced interest deduction of the partnership.

Chrysler Realty Corporation sometimes enters into real estate ventures with one or more individuals, on a partnership basis. These ventures are part of Realty's regular business operations and it should not be faced with a potential interest disallowance from conducting an operation or transaction through a partnership which penalty would not be incurred had such operation or transaction been handled solely by Realty.

The unreasonable result could easily be remedied by applying the interest limitations at the individual partner level only. It should be noted that a similar approach is employed with respect to another partnership deduction, the charitable deduction. The latter deduction flows through intact from the partnership to the individual partners, in accordance with their respective distributive share, and the percentage limitation on such charitable deductions is then applied at the individual taxpayer's level.

Very truly yours,

E. A. SIGLER,
Vice President.

STATEMENT SUBMITTED BY GEORGE B. KILBORNE, BIRMINGHAM, MICH.

I would like to express my concern with Section 221 of H.R. 13270, the Tax Reform Act of 1969, which would limit the deduction of interest incurred on funds borrowed to acquire or carry investments. My concern is both general and specific in nature. My general concern is that this section proposes to limit out-of-pocket interest payments because they are made by an investor rather than in the course of a "trade or business" (as implicitly construed to exclude investors); this, in my view, is a questionable distinction. More specifically, I am concerned that this limitation on the deduction of interest would serve as a disincentive to investment motivated transactions, thereby raising serious questions as to the continuing availability and vitality of venture capital in our economy.

I would urge that in view of the negative results this provision would produce in the entrepreneurial and investment sectors of the economy, serious consideration be given to deletion of this provision. Alternatively, I would urge the Committee to adopt a venture capital exception so that interest paid with respect to investment motivated transactions represented by substantial equity participations would not be subject to the limitation on the deductibility of interest. It is also submitted that equitable application of this limitation suggests consideration be given to certain technical changes in order to provide flow through treatment in the case of partnerships and prospective application of the section.

Section 221.—Section 163(a) of the Internal Revenue Code provides that "There shall be allowed as a deduction all interest paid or accrued within the taxable year on indebtedness." Section 221 of H.R. 13270 would amend Section 163 to deny "investment interest" deductions for taxable years beginning after December 31, 1969 to individuals and other noncorporate taxpayers to the extent such interest exceeds the sum of: (1) $25,000; (2) "net investment income"; and (3) the excess of net long-term capital gain over net short-term capital loss for the taxable year. "Investment interest" is defined as that interest paid or accrued on indebtedness incurred or continued to purchase or carry property held for investment. "Investment income" is defined as the gross amount of interest, dividends, rents, royalties, and net short-term capital gains derived from property held for investment and not derived from the conduct of a trade or business. The term "investment expenses" includes all deductions allowable under Sections 164(a)(1) or (2), 166, 167, 171, 212, or 611 directly connected with the production of investment income. The term "net investment income" means the excess of investment income over investment expenses.

Statutory Objectives.—In support of the interest limitation, the Report of the Committee on Ways and Means states, "Your committee does not believe it is appropriate to allow an individual taxpayer to currently deduct interest expense on funds borrowed for investment purposes where the interest expense is substantially in excess of the taxpayer's investment income."

The basic assumptions which in the Committee's view appear to underlie this statement (and the interest limitation generally) are:

(1) A taxpayer who is motivated by investment rather than tax considerations is generally interested in investments which produce a profit after taking interest expense into account;

(2) since interest is a controllable expenditure, it usually isn't necessary for a taxpayer to borrow substantial amounts for investment purposes, and, therefore, interest is a controllable expenditure; and

(3) taxpayers who incur interest expense substantially in excess of investment income are primarily interested in mismatching income and expenses so as to insulate their other income.

Assumptions Questioned.—Each of the assumptions stated above are subject to question:

(1) *Interest in Excess of Current Investment Income Equals Tax Motivation.*—There are few, if any, situations which permit an investor an opportunity to borrow funds and invest them at a current return equal to or greater than the interest cost on his borrowings. Furthermore, the fact that an individual is willing to make an investment and to seek eventual dividends and capital appreciation in the future, while incurring current interest expense, does not imply that such investment was solely motivated by tax considerations rather than bonafide efforts to achieve a profit from his investment.

(2) *Interest as a Controllable Expenditure.*—The Committee's assumption that it usually is not necessary for a taxpayer to borrow substantial amounts for investment purposes excludes a large segment of potential investors who are considered necessary to the functioning of the free enterprise system. This group consists of developers of large real estate projects, potential purchasers of new issues, investors in small businesses and new industries, and investors seeking to motivate better management.

(3) *Mismatching of Income and Interest Expense.*—While recognizing that there may be some mismatching of investment income and expense in order to insulate other income, I disagree that such mismatching is the primary motivation for all investments which may result in interest exceeding income for a given year. The very heart of the investment sector is the element of greater future return and appreciation on current investment. As a result, current investment income in the early years of investment seldom equals or exceeds investment interest.

Venture Capital.—The venture capitalist specifically belies the basic assumptions stated by the Ways and Means Committee in support of the interest limitation. The venture capitalist incurs interest on borrowing used for investments which are "investment" rather than "interest deduction" motivated. He is personified by the individual who has been successful in other areas and now wishes to apply his entrepreneural expertise in the risk capital area by acquiring substantial equity interests and participating in the management thereof. By definition such investments are not without risk and may involve two, three, four or five losses prior to hitting a winner.

A venture capitalist is not interested in the marginal profit involved in borrowing to invest in assets with a high current yield and low potential appreciation. Nor would he liquidate existing low-risk investments to generate funds for higher risk investment when such action would result in capital gains tax and a limitation on his deduction of investment interest. The mismatching of income and expense is even more pronounced with regard to the venture capitalist who acknowledges the time lag involved in turning risk investments into profit situations but is prepared to accept this medium term lag in anticipation of greater long term appreciation and investment income. To say that such mismatching of income and expense and the resultant presumed tax benefits is the primary motivation misjudges the role of the venture capitalist: this is especially true since the carrying costs of interest are real negative cash outlays detrimental to the taxpayer.

Disadvantages of the Interest Limitation.—In my view, the limitation on the deduction of interest imposed by the House Bill is a disincentive to venture capital, discriminates against earned income, favors incorporation, and ignores economic realities:

(1) *Disincentive to Venture Capital.*—The House Bill fails to recognize the legitimate and essential role of venture capital in our free enterprise system by serving as a clear disincentive to risk investments by those venture capitalists operating as individuals or through partnerships who are best equipped to provide the seed money that is so essential to our continuing prosperity. Even today, there is a substantial equity capital gap between the demand for equity capital in our economy and the available supply. This gap is widening. The limitation on the deduction for interest would serve as a further deterrent, possibly widening the equity capital gap to such an extent that Federal financing assistance would become necessary. This is contrary to the stated Federal policy which continually seeks to have the private sector provide venture capital.

(2) *Discriminates Against Earned Income.*—I agree with Assistant Secretary Cohen's statement of September 4 that the interest limitation "discriminates against the taxpayer who has only earned income out of which to pay his interest expense." That is, the taxpayer with investment income is permitted a deduction for investment interest, but the taxpayer with earned income is denied the deduction. In the same context, it favors the taxpayer with inherited or established wealth and discriminates against the "self-made" taxpayer with substantial earned income. Let me also suggest that the $25,000 exclusion or allowance, which permits an investment interest deduction to this extent and apparently reflects partial recognition of the need for equity capital, would deny interest deductions to larger risk capital investors except to the extent of invesment income. Such denial could result in creating large stagnant pools of capital, capital which should not remain in place but rather should be put out to productive work.

(3) *Favors Incorporation.*—By placing a limitation on the interest deduction of individuals and partnerships, the House Bill provides preferential treatment to corporations which borrow to acquire investment assets (the proposed amendments relating to the issuance of certain debt to the shareholders of acquired corporations notwithstanding). In other words, corporations could continue to borrow to finance acquisitions of investment assets totally unrelated to the business in which they are presently engaged and offset the borrowing costs against income derived from their other activities. This favors incorporation and distorts the traditional freedom of choice as to form of business organization.

(4) *Ignores Economic Realities.*—Although there may be abuses with respect to the deductibility of interest under existing law, it must be stressed that most investments made by individuals and partnerships are not tax motivated. The magnitude of the interest deduction, its relationship to the degree of investment income, and its label as a "controllable" expenditure—none of these factors either individually or in the aggregate automatically lead to a conclusion that tax abuse must be present. Venture capital involves risk investment which may appreciate or depreciate; interest paid is an out-of-pocket expense incurred whether or not the investment bears fruit or withers. Not all investments in low yield stocks are tax motivated. The use of borrowings to make investments is an accepted financing pattern and not just a tax gimmick. The time lag in many investments between start-up, break-even point, and dividend payment date is frequently long-term.

Recommendation.—Accordingly, it is urged that the Treasury Department's recommendation to delete the interest limitation be accepted by the Senate Finance Committee.

Venture Capital Exception.—If, however, the Committee considers the enactment of some limitation necessary to curb tax motivated investments, an exception should be adopted for investment motivated transactions representing direct rather than portfolio investments. Precedent for such a distinction is found in the "direct investment" exception to the interest equalization tax, where the equity investment is so substantial that it is considered as represening a management interest in the future profitability of the corporation. Such an exception, applying to investments involving a specified voting interest whether held individually or in investment partnership with others, would implicitly recognize the "trade or business" role of venture capitalists and provide a continuing and needed outlet and vitality for risk capital.

I would suggest that investments of venture capitalists are distinguishable from pure portfolio investments. The latter investments are most frequently made in established enterprises through registered national securities exchanges; they usually involve a nominal investment without management participation, and can be freely traded in an established market. On the other hand, venture capital involves a substantial equity participation and commitment, often in a small new business, with the management expertise of the investors being a key reason for the investment and for its later success. Such investments frequently have no established market; certainly where investors join in a venture capital partnership to make the investment, the transferability and marketability of the partners' interests (both general and limited partners) are severely restricted. Such investors do not generally participate in such investment partnerships because of the availability of a tax deduction or because of capital gain benefits; their investments are "investment", not tax, motivated. The general partners take meaningful equity participations and are directly and without limitation subject to the full risks of the partnership.

I would, therefore, urge the Committee to consider a venture capital exception where a substantial equity investment, say at least 5 to 10 percent of the underlying investment, is made either by an individual directly or in conjunction with others through a partnership. In the case of a partnership, the Committee may wish to consider additional limitations, based on the partner's percentage capital and profits interest in the partnership. A sliding scale as to amount of investment and percentage of ownership could be introduced if the Committee considers it desirable.

Technical Changes.—It is submitted that other changes, denominated as "technical" but which would remedy substantially adverse and apparently unintended effects of the limitation in its present form, should be seriously considered.

(1) *Partnerships.*—If the intent of the interest limitation is to permit the investment interest incurred to offset investment income, it is essential that a partner's pro-rata share of both net investment income and investment interest be fully attributed to him. In other words, if an individual has invested through two partnerships, one of which has net investment income substantially in excess of investment interest expenses and the other partnership has investment interest expenses substantially in excess of net investment income, the full amount of the partner's share of both net investment income and investment interest expense should be flowed through in the case of each partnership in order to achieve an equitable result and conform with the apparent intent of the proposed Bill.

This result is not achieved under the House Bill which requires that the limitation be applied both at the partnership level and at the partner level. The inequitable results of this bi-level approach (which appears to apply an entity theory to the partnership for some purposes and a flow-through approach for other purposes) are obvious and should be corrected.

(2) *Carryover.*—If the carryover of excess interest disallowed is to achieve its apparent purpose, that is to defer deduction for investment interest expenditures until there is adequate offsetting investment income, the term of the carryover should be substantial. This is based on the very nature of risk investments, and the time lag involved before new risk enterprises start paying dividends. It is presumed that the statute contemplates an unlimited carryover as to time but it would be reassuring to have this clarified.

(3) *Effective Date.*—The limitation on interest deduction contained in the House Bill would be effective for taxable years beginning after December 31.

1969. It would limit the deduction for investment interest expense regardless of when indebtedness was incurred. It is submitted that past investments have been based on existing law which permits an unlimited deduction for interest and that any limitation on investment interest should apply prospectively only to interest paid on indebtedness incurred after its enactment. Retention of the present effective date would unduly discriminate against those taxpayers, particularly venture capitalists, who made their outstanding investments within the context of long-standing, existing law.

Summary.—In summary, it is respectfully submitted that the Committee should delete the limitation on the deductibility of interest. Alternatively, it is recommended that an exception be enacted to preserve the viability of venture capital in our free enterprise system. Finally, it is submitted that flow-through treatment for partnerships and prospective application of the limitation are necessary to achieve an equitable result.

KINDEL & ANDERSON,
Santa Ana, Calif., September 26, 1969.

Re comments on sections 221 and 412 of H.R. 13720.

COMMITTEE ON FINANCE,
U.S. Senate,
Washington, D.C.

GENTLEMEN: On behalf of many of our interested clients, the law firm of Kindel & Anderson respectfully submits comments which we believe are of importance to your Committee on Sections 221 and 412 of H.R. 13720, the Tax Reform Bill of 1969.

While there are many portions of H.R. 13720 which are of concern to us and should be of concern to the general public, we believe that the Committee will receive adequate exposure to these problem areas from other interested individuals, groups, and businesses. We will, therefore, confine our observations to section 221, dealing with limitations on the deductibility of interest, and that portion of section 412 which would impose new rules on the election of the installment sale method of reporting the gain on the sale of personal or real property. These sections of the Bill otherwise may be overlooked since they will primarily affect individual taxpayers who, as a group, may not receive effective representation before your Committee.

I. Section 221

Section 221 would amend section 163 of the Internal Revenue Code by limiting the now unrestricted right of a taxpayer to deduct interest paid or accrued during the taxable year. The purpose of section 221, according to the House Ways and Means Committee Report, is to restrict the discretionary payment of interest by limiting the deduction available for "funds borrowed for investment purposes where the interest expense is substantially in excess of the taxpayer's investment income." H.R. Rep. No. 91–413, at 72.

Without arguing the policy underlying the stated purpose, we submit that the section will not accomplish its avowed purpose. It will not markedly limit the tax shelter availability of an interest expense for wealthy taxpayers, but rather will represent a drastic and unexpected burden on middle income taxpayers, and by reason of its complexity and confusing draftsmanship, it will present a host of interpretive problems for the Internal Revenue Service and the courts.

A. RETROACTIVE EFFECT

The limitations of section 221 would apply to all individuals, partnerships, and Subchapter "S" corporations by limiting the amount of "investment interest" which could be deducted in any one year. It would become effective for taxable years beginning after December 31, 1969, as to all indebtedness interest "incurred or continued to purchase or carry property held for investment." This means that the section would apply not only to indebtedness incurred after December 31, 1969, but also to indebtedness which was created prior to that date and as to which the taxpayer had become legally obligated to pay interest.

Even though Congress possesses the power to enact retroactive tax statutes, it has shown reluctance to do so in the past. For example, in 1917 the Senate Finance Committee rejected a House proposal to levy an additional tax on 1916 income for the purpose of financing the hevay costs of World War I. The Committee gave as its reasons:

"This [retroactive] tax seemed to the committee to be in principle both morally and economically unsound and to deserve exclusion as retroactive legislation. . . . Moreover, it is to be remembered that if we admit the principle of retroactive taxation running back six months we also assert the right to carry it back for one or ten years, or for any length of time. To do so this would hold out a threat of uncertainty in tax conditions, and almost the greatest foe of business productivity and prosperity is uncertainty. For these reasons the committee had no doubt as to the wisdom of striking from the bill the retroactive tax on incomes. . . ." Senate Report No. 103, 65th Congress, 1917.

Another example of Congressional reluctance to give retroactive effect to changes in the Internal Revenue Code came up in connection with the 1950 revisions of the formula for taxing life insurance companies. The Senate Finance Committee felt it inadvisable to apply the changes retroactively to the years 1947 and 1948 since to require the payment of a tax for those years could impose a hardships upon policyholders. Senate Report No. 2375, 81st Congress, 39 (1950). The Senate Report stated:

"The imposition of a tax on 1947 and 1948 incomes at this late date would be inconsistent with the fundamental public policy which requires that a taxpayer's obligation to his Government be made definite and certain at the time the tax is due." *Id.* at 39–40.

We feel that the application of the limitation on interest deductions to existing contracts would unfairly penalize taxpayers who, when incurring the indebtedness in prior years could not possibly foresee the disallowance of these legitimate business expenses. To change the rules as they apply to existing contracts, substantially diminishes the after-tax income of these taxpayers simply because they chose to borrow money for investment. If the purpose of this section is to curb voluntary assumptions of indebtedness for investment property, then at the very least, it should apply to future transactions contracted for after the effective date.

B. RENTAL INCOME

The language of section 221 is ambiguous and often conflicting. For instance, "investment income" is defined to include rents and interest (among other things) which are not "derived from the conduct of a trade or business." The words "trade or business" are words of art stemming from the capital asset definition of section 1221 of the Code. We know, from the administrative and judicial interpretations of section 1221, that a taxpayer may have more than one trade or business . A practicing doctor may invest in apartment buildings and this activity may become a separate trade or business. He may also, for example, purchase and sell loans secured by junior encumbrances at discounts which also may become a separate trade or business. The rent or interest from these types of activities would not come within the section 221 definition of investment income.

On the other hand, allowable investment interest which is limited to $25,000 plus the amount of investment income and net long-term capital gains, is that interest which is paid or accrued on property "held for investment". It is well known under present tax laws that a taxpayer may hold property for investment in his trade or business. A real estate developer may acquire rental property for investment while buying and selling real estate in his trade or business. In this situation, section 221 would have the effect of limiting the amount of investment income available for offset against investment interest from the same asset since the asset is held for investment, but as a part of the taxpayer's trade or business.

Further, the section would define all rental income to be income from a trade or business and, therefore, not "investment income", unless the rental income results from a "net lease". A net lease is defined as one where the Code section 162 ordinary business deductions are less than fifteen per cent of the "rental income" and there is a guarantee of a fixed return or against loss of income.

Applying these provisions to a typical example illustrates the ambiguities of the section. Assume X owns land and an office building which he leases to Y for a negotiated amount of rent. Y is required by the terms of the lease to pay the taxes and utilities and to maintain the building. X remains liable on a mortgage which was incurred to acquire the property and as the owner, is entitled to the depreciation on the property. By the terms of the lease, Y is contractually obligated to pay X a fixed monthly rent based upon their estimate of a fair return on the property. This would fit the classical pattern of a net lease. To apply section 221 to this transaction, the first test is whether "the sum of the deductions with respect to the rent-producing property which are allowable under section 162 (relating to trade or business expenses) equals or exceeds fifteen per cent of the rental income produced by such property. . . ." Is this fifteen per cent test to be applied as to the rental income received by X, or is it the total rental income from the entire property? Also, whose section 162 deductions are we talking about? Are these the deductions of the owner or are they the deductions relating to the properly as a whole? If they are the deductions relating to the property as a whole, the net lease concept does not seem to be achieved. X does not control the amount of the section 162 deductions. Similarly, if the fifteen per cent test is to be measured against the rental income to Y, why should X's interest expense be limited?

The second test is whether "the taxpayer is neither guaranteed a specific return nor is guaranteed in whole or in part against loss of income." These tests are in the conjunctive: that is, both have to be met. For some reason, the House Ways and Means Report treats these as alternative requirements. In any event, if Y agrees to pay X a fixed monthly rental, is this a "guarantee"? If it is not such a "guarantee", who must the guarantor be? If instead of a lease from X to Y, X had decided to enter into individual tenant leases, each one of the tenants, we would assume, would agree to pay their rent to Y, and isn't this a form of "guarantee" of rent? If X can keep his section 162 deductions to less than fifteen per cent of the rental income from these individual tenants who each are supposedly guaranteeing the income, X would seem to come under the net lease provisions.

There is a substantial question whether the definition of rental income in this subsection is intended to be exclusive. Should not a taxpayer have the right to invest in a rental property which is not a trade or business as to him but which would not qualify under the restrictive definitions of a net lease? For example, a retired taxpayer who invests in a four unit medical building may find, if he handles the leases himself, that the expenses of the building exceed fifteen per cent of the rental income, therefore, disqualifying him from the net lease category. Yet this type of activity would seem clearly not to constitute a trade or business, and therefore, should entitled him to treat the income as investment income which could be used to offset the interest expense on the building.

C. APPLICATION AT PARTNERSHIP LEVEL

The application of the limitations on deductibility of interest at the partnership level is inconsistent with the entire theory of partnership taxation which is firmly established in the Internal Revenue Code and Regulations under the Code. The partnership is a reporting entity only and not a taxpaying entity. Income and expenses of the partnership pass through the partnership to the individual partners.

The partnership has proven to be a flexible and effective method of investing in real estate. A limited partnership offers the limited partner the advantage of limited liability while taxing him as if he held the property directly. This method of capital pooling is attractive to many middle income taxpayers because by grouping a number of such people together in a limited partnership, all are able to participate in lucrative real estate investments which in the past have been available only to very wealthy individuals.

It is easy to demonstrate how this section would discriminate against the small investor in favor of the wealthy individual. Assume a large building is purchased for a million dollars and after a downpayment of $200,000, there are annual interest payments of $50,000 a year. Ten middle income taxpayers who could have purchased the property in a partnership would now find that instead of a

$50,000 interest expense available to the partnership, the expense could be limited to as low as $25,000, thereby resulting in the allocation of $2,500 of interest expense to each individual partner instead of $5,000. On the other hand, if two individual wealthy taxpayers were to purchase the property as tenants-in-common, they would each have a minimum allowable interest deduction of $25,000.

If section 221 is enacted in its present form, use of the partnership for investing in real property will be replaced by some form of common tenancy with the attendant liability risks and lack of flexibility. Rather than force the partnership out of existence, the desired result can be achieved by applying the interest limitation solely at the individual level.

D. THE CORPORATE EXEMPTION

We can see no reason why the limitation on allowable interest is applicable at the individual level but not at the corporate level. It seems to us that if the section is enacted many taxpayers will merely incorporate and contribute the income-producing and expense assets to the corporation. The assets contributed will be arranged so that there will be no taxable income in the corporation or perhaps loss. When the property is to be sold, the corporation will be liquidated in a section 337 liquidation and there will be a single capital gains tax at that time.

The House Ways and Means Committee Report gives as an example the following type of objectionable activity: "A taxpayer may borrow substantial amounts to purchase stocks which have growth potential but which return small dividends currently. Despite the fact that the receipt of the income from the investment may be postponed (and may be capital gains), the taxpayer will receive a current deduction for the interest expense even though it is substantially in excess of the income from the investment." (*Id.* at 72) It appears to us that a taxpayer could achieve substantially the same result merely by incorporating his investment assets.

E. INTEREST EXPENSES

Another area of confusion is the exclusion from the definition of "investment expenses" of section 165(c) (2) and (3) losses. The other forms of deductions which would be allowable to an individual all relate to his investment activities. Why aren't these type of losses allowable? Excluding these losses certanily benefits the taxpayer, since these losses do not have to be used to offset gross investment income, thereby maximizing the amount available to offset against investment expense, but what is the rationale for excluding them?

F. PREPAID INTEREST

Unlike the House Ways and Means Committee, we do not feel that the ruling issued on November 26, 1968, adequately deals with the problems of prepaid interest and we feel that our view is shared by many other people. A long line of cases and administrative rulings had upheld the principle that interest paid in advance by a cash-basis taxpayer is deductible in the year paid. The taxpayer was in difficulty only where there was no true indebtedness or where there was no "purposive" motive in incurring the indebtedness, other than securing the deduction itself. (See discussions by Miller, *Prepaid Interest*, 19 *U.S.C. Tax Inst.* 381 (1967) and Koster, *Prepaid Interest Purchase Method Still Useful Despite IRS Attack*, 30 *Journal of Taxation* 16 (1969).)

Prior to the IRS ruling, we felt any change in the law would require legislative action. Instead, the IRS, by its administrative action, attempted to reverse the existing case law. We believe that such action only compounds confusion and invites further litigation. Apparently the Treasury shares our concern. The March 24, 1969, Wall Street Journal contains the following:

> "Also with a view toward enhancing "equity", or equal treatment of taxpayers with about the same amount of income from various sources, officials say they're weighing whether to ask Congress to guard against a practice involving "bunching" of unusually large interest deductions. The Internal Revenue Service last fall ruled—contrary to Tax Court decisions—that investors paying in one year all the interest they owe over five years, for instance, couldn't deduct the whole amount in one year. To make "ab-

solutely sure" that such interest deductions are spread out over the life of the loan may require legislation, an official adds. Otherwise, he says, some persons might have a big enough deduction in one year to avoid paying any tax on income as large as $200,000." (at p. 2)

We know that the status of the deduction for prepaid interest is still very confusing to many taxpayers. We know that the Internal Revenue Service intends to challenge certain types of prepaid interest cases, but we are not satisfied that the position of the Internal Revenue Service is correct. Prepaid interest is an area of legitimate congressional concern and should have been dealt with as a part of any change in section 163 of the Code.

G. CONCLUSION

In summary, we feel that if Congress intends to change section 163 by limiting the interest deduction, it should do so in a manner that will minimize the problems that section 221 of the Bill would create. Such a change should include consideration of the deduction of prepaid interest. We respectfully urge that the Committee remove section 221 from the Tax Reform Bill to allow more time to consider the very complex problems and to draft a provision that will accomplish those purposes which the Congress feels are legitimately in the national interest.

II. Section 412

Section 412 would amend the installment sale provisions of section 453 to accomplish two things. The amendment would first require taxation in those corporate acquisition situations where assets are acquired through the use of debentures which are essentially the equivalent of cash, even though the debentures would not require principal payments for a period of years. The second part of the amendment is what concerns us. It would restructure the installment provisions to require the payment of periodic installments of principal in relatively even amounts. The exact procedure would be prescribed by the Commissioner in Regulations; however, there is a "safe haven" allowed if certain conditions are met. The safe haven test is met if payments of "relatively even" or "declining amounts" are made at least once every two years of the installment period or alternatively, if at least five per cent of the principal is required to be paid by the end of the first quarter of the installment period, fifteen per cent by the end of the second quarter, and forty per cent by the end of the third quarter.

We agree that if the equivalent of cash is received from the sale of an asset, the tax should be paid. If cash or its equivalent is not received, then Congress, in its wisdom, has said no payment of tax has to be made. Naturally, if the payment of principal is deferred, interest or imputed interest will accrue or be collected by the taxpayer which will be taxable at ordinary income rates.

This system has worked well for many years. The changes proposed will, however, drastically restructure and limit the flexibility that is now offered to taxpayers.

For instance, in California it is common practice for a landowner, often a farmer, to sell his land to a developer in a transaction where the developer will pay between ten and thirty per cent of the principal as a downpayment. The developer will then ask the owner to accept his installment obligation over a period of years. The owner will usually agree to wait for the balance of the purchase price to ease the developer's financial burden during the progress of his construction activities. In the meantime, the developer will be making periodic payments of interest.

This very typical transaction would no longer qualify as an installment sale if section 412, as proposed, is enacted. Even if the entire balance of the purchase price were agreed to be paid on January 2 of the year after the sale, the safe-haven test of the section would not be met and the entire tax would be due in the year of sale. If the balance of the principal were deferred for two years and thirty per cent of the principal had been paid as a downpayment, the landowner could easily qualify under the new section by requiring that an additional ten per cent of the principal be paid on January 2 of the next year, thereby meeting the forty per cent test. The balance of the purchase price could be deferred for as long as wished. It is hard for us to see why requiring this additional ten per cent payment is either a necessary or desirable policy of the tax law.

We are unable to understand the need for this part of section 412. Until the abuses sought to be corrected are identified, it seems to us folly to disturb tax provisions which have been in existence for fifty years. If there are abuses under the law in these types of sales—and we know of no such abuses—there must be a better way to solve the problem. We submit that setcion 412, as proposed, should be amended to remove all but the proposed addition of section 453(e)(4).

Respectfully submitted.

KINDEL & ANDERSON.

LOS ANGELES, CALIF., *August 20, 1969.*

COMMITTEE ON FINANCE,
U.S. Senate, New Senate Office Building, Washington, D.C.

GENTLEMEN: The "Tax Reform Act of 1969," H.R. 13270, is a praiseworthy attempt to promote equity in our tax system.

May I draw your attention, however, to two aspects of *Sec. 221* ("Limitation on Interest Deduction") of the Bill which, as written, are punitive and will have *hardship consequences potentially disastrous* for some taxpayers? It is my belief that these consequences were not fully anticipated in the drafting of the Bill. I refer to:

I. The *de facto retroactivity* of Sec. 221 to *non-liquid* commitments made in good faith under current tax laws;

II. The *discrimination* of Special Rule A (Sec. 221) against individual taxpayers who are members of *partnerships*, as compared to individual proprietors.

Beyond this I cannot disagree with the objectives of the Limitation on Interest Deduction, nor with specifics of the amount of limitation and the method of application. However, as one of many thousands of investors of moderate means, lacking the wherewithal to abuse the tax system, I would much rather see the limitation reduced than to have characteristics I and II, above, enacted.

POTENTIAL EFFECTS

In the following, illustrative references are made to the attached table which, for purposes of realism, represent contractually committed interest payments on trust deeds for the next several years for my membership positions in four limited partnerships which hold, as their sole investment assets, undeveloped land. The typical partner holds an interest of about two percent.

De Facto Retroactivity

The thousands of investors who hold land ownership among their investments, having made those purchases before H.R. 13270 was revealed, judged the merits of these holdings on the basis of current tax law. Unlike the situation of margin interest in security transactions, these interest payments are contractual commitments on trust deeds (mortgages secured by the land) and are *not liquid*. Default results in reversion of ownership and total loss. The potential losses under retroactivity are least controllable under partnership ownership, since various partners will interpret their economic interests in differing ways. If Sec. 221 is enacted as written:

Some members of partnerships (more probably those in high tax brackets) may decide that loss of significant interest deductions (e.g., $660 deduction vs. $10,400 paid out in 1970 in Partnership A, for a 2.64 percent holding) and loss of capital gains status for gains eventually offset by disallowed interest carryovers, recommend abandonment of their positions. This a limited partner could do without further liability but, presumably, with loss.

The remaining partners must replace those in default or assume the additional payment burden. Clearly, in view of the retroactivity of Sec. 221 and of Special Rule A, replacement of defaulting partners would be difficult, probably impossible. Since those remaining would tend to be of lower tax brackets and lesser means, such burden assumption could prove impossible. The result would be *serial abandonment* (in an effect much like a *bank run*) with *complete loss* of invested capital for all.

An alternative would be a distress sale of the full partnership property. This would be into a market weakened by the buyers' knowledge of the distress, by haste, by other partnership properties similarly situated, and by the depressive effect on potential commercial property of depreciation provisions of other sections of the Bill. Recovery of invested capital, or any part thereof, would be unlikely.

At the very best, should no abandonment occur (abandonment, for example, is somewhat less likely in Partnership B than in A because of the financial character of the partners and greater proportionate deductibility of interest), the investment made under existing rules becomes less valuable than when purchased simply through the loss of current deduction and of capital gains treatment on part of what is clearly a capital asset.

The many citizens who have elected to forego current consumption to accumulate and invest savings deserve better treatment at the hands of their government than this retroactive character wuold provide them. The IRS, for example, took care in 1968, in promulgating Revenue Ruling 68–643 on the subject of prepaid interest, to exempt future prepaid interest payments required by financial commitments undertaken before the date of the ruling. Incidentally, in this regard, large prepayments of interest, once considered to be a tax abuse in land purchases, are now controlled by R.R. 68–643. Ways and Means noted (House Report No. 91–413 (Part I, page 73) that no further action on prepaid interest is required.

Should total abandonment ensue, major losses by investors of moderate means would be sustained. (In my own case, if all four partnerships were involved, the losses would exceed $60,000, over half of my life's savings, even without possible additional losses in attempts to prevent collapse because of default of partners.) Some might argue that these transactions are on "shakey financial foundations;" if so, should tax law be used retroactively to topple them? In this regard, the average down payment exceeded 27 percent of the total principal amount, and the partnerships were formed under securities permits issued by the California Commissioner of Corporations, which is not a pro forma arrangement. I am sure my fellow partners did not consider investment in land in developing areas of California as unusually risky; but then that was before retroactivity of Sec. 221 and, in particular, of Special Rule A won House approval.

Discrimination Against Partners

The vast majority of investors in limited partnerships (of which I am aware) are of relatively modest means, as land investors go, and hold small fractions of the partnerships. (For example, in Partnership A, the minimum holding is 0.528 percent, the maximum 5.28 percent, representing down payments of $5,000 and $50,000, respectively. The average position is 1.7 percent. At the other extreme, in Partnership C, 38 of the 43 partners hold two percent each and the maximum holding is four percent. These represent down pyaments of $4,400 and $8,800, respectively.) Under current law, *These limited partners have no tax advantages* over single proprietors. If Special Rule A of Sec. 21 is enacted as written:

Most of these investors would be allowed to deduct only a trivial fraction of their interest payments (see examples of table) while single proprietors, who in thousands of cases have holdings no larger than my interests in Partnerships A and D, and in thousands more less than a tenth as large, would be able to deduct all interest payments up to the amounts of their personal limitations.

These partnership investors would see a much greater proportion of their gains (if any) offset by disallowed interest carryover than would single proprietors, rendering a vastly larger share of capital gains, on what is clearly a capital asset, subject to taxation (pre-taxation, at that) at regular income levels.

Because the partnership terminates once all property has been sold, if interest carryovers were to exceed net gains (if any), the remaining deduction would be lost to the partners irrevocably.

Under current law, all tax consequences (all gains, losses, property taxes and expenses) *flow through* to the partners in proportion to their ownership, with unchanged tax character, in the year of their occurrence. (The partnerships and partners usually are on the calender year, cash basis.) No tax benefits are derived from the partnership form that are not enjoyed by individual proprietors. Land investment partnerships are comprised of persons who lack the means and/or the knowledge and opportunity to select and purchase more promising land investments as single proprietors.

What possible objective of either *equity* or *reform* can be achieved by *depriving* partners of their right to current interest deductions of paid amounts *not exceeding* their personal limitation (defined by Sec. 221), as Special Rule A would do? (At the time of purchasing my position in Partnership D I rejected, as having marginally less investment merit, a single proprietorship land purchase requiring of me approximately the same down payment and carrying charges, including interest payments. Facing possible enactment of Special Rule A, retroactively applied, it seems I made a mistake, because interest payments in the single proprietorship would be fully deductible. Do taxpayers need crystal balls for anticipating retroactive changes in tax laws?)

To make tax treatment of individuals dependent upon the form in which they own property does not appeal to reason. Further, it is not the investor of moderate means who has been harvesting the tax laws. Even had he been, the $25,000 (plus offsets) limit on interest deduction, the limit on tax preferences, and the allocation of deductions would restrain his advantages sufficiently. Massive overkill is not required. Since the entire annual revenue gain from Sec. 221 is expected to be $20 million, the trivial part of that to be derived from Special Rule A scarcely can justify this distortion of taxpayer rights on revenue grounds.

SUGGESTIONS

May I strongly urge the Committee to consider the advisability of:

Elimination of the *de facto retroactivity* of Special Rule A, at least with regard to *non-liquid properties*, the financial commitments for which were made before August 6, 1969, because its enactment will induce *great financial hardship, perhaps disaster*, for many investors of moderate means, will not promote equity or reform, and will lead to trivial revenue gain.

Elimination of the future application of Special Rule A to *prevent partners from having the same rights as other individual taxpayers*, because it effectively will close a mode of investment to persons of moderate means, will not promote equity or reform, and will lead to trivial revenue gain.

Elimination of the *de facto retroactivity* of the remainder of Sec. 221 to *non-liquid properties*, because it will seriously affect financial commitments made in good faith under existing tax law, will not promote equity or reform, and will lead to trivial revenue gain.

Because of the costs and time involved I will not be able to testify. However, I respectfully request that this letter be made a part of the record of the Committee's deliberations on the Tax Reform Act of 1969. Thank you for your consideration.

Very truly yours,

PETER M. BELCHER.

CURRENT-YEAR INTEREST DEDUCTION PERMITTED UNDERSIGNED TAXPAYER IN 4 PARTNERSHIPS UNDER CURRENT LAW AND UNDER SPECIAL RULE A (SEC. 221) (TO NEAREST DOLLAR)

	1970	1971	1972	1973	1974	1975	1976	1977	1978

Total interest payment	10,824	9,048	11,091	11,403	12,037	6,123	5,941	5,758	5,562
Total deduction[2]	1,082	1,715	1,715	2,215	2,215	1,566	1,555	1,555	1,555

[1] Dates of deposit of full downpayments in trust accounts.
[2] Deduction under de facto retroactive application of special rule A of sec. 221 (H.R. 13270). Under current law, total deduction equals total interest payment.

Note: In no year do total interest payments reach 50 percent of the $25,000 permitted individuals under sec. 221. In no year do interest deductions permitted undersigned under special rule A (sec. 221) reach 10 percent of the $25,000 permitted individuals.

AUTONETICS,
NORTH AMERICAN ROCKWELL,
Anaheim, Calif., September 23, 1969.

Senator RUSSELL B. LONG,
Chairman, Senate Finance Committee,
Senate Office Building, Washington, D.C.

DEAR SENATOR LONG: A number of provisions of the House passed "Tax Reform Act of 1969" are deeply disturbing to me. The one which disturbs me the most is the proposed application to Limited Partnerships of the limitation on investment interest. A worse aspect of this is that it would be applied retroactively to investments that already exist. I am one of a number of Limited Partners in an Orange County California Land Development Syndicate and the consequences of the proposed legislation to me and to the other Limited Partners would be most serious.

I urge that you do everything in your power to modify or eliminate this inequitable section of the proposed tax reform legislation. Although the Tax Reform Bill passed by the House of Representatives eliminate many tax abuses, there are several areas where unintended hardships were created. The interest provisions as contained in Section 221 stand out as creating the greatest possible inequities which could be solved by two simple amendments to the proposed changes:

1. By stating that in the case of a partnership, the provisions of the subsection shall apply only with respect to each partner (as opposed to also operating with respect to the partnership itself), and

2. By providing that "investment interest" shall not include interest paid or accrued on indebtedness incurred or continued to purchase or carry property which is acquired prior to some given date, which probably should be December 31, 1969.

Sincerely,

W. F. SAUERS.

APPENDIX D

WRITTEN TESTIMONY RECEIVED BY THE COMMITTEE EXPRESSING AN INTEREST IN THE SUBJECT OF NATURAL RESOURCES (HARD MINERALS)

Written testimony received by the committee expressing an interest in the subject of natural resources (Hard Minerals)

U.S. SENATE,
COMMITTEE ON APPROPRIATIONS,
Washington, D.C., September 29, 1969.

Hon. RUSSELL B. LONG,
Chairman, Senate Finance Committee,
Washington, D.C.

DEAR RUSSELL: I am forwarding herewith a letter I received from Mr. Homer Hooks dated September 24, 1969, regarding the proposed depletion allowance for certain minerals as contained in H.R. 13270, together with copies of his testimony that has been submitted to the Committee for consideration.

You may recall when H.R. 4069, to terminate certain tax provisions before the end of World War II, was being considered by the Senate on July 24, 1947, I introduced an amendment which was agreed to, to include phosphate rock in the 15% depletion allowance for various nonmetallic minerals. Having authored this amendment I would be extremely reluctant to see any action taken to reduce the allowance from 15% to 11%. However, since phosphate was only one of a large number of nonmetallic minerals included in the 1947 Act, (P.L. 80-384), it is realized that if the Committee, in its wisdom, reduces the depletion allowances, such reductions should be proportionate unless there are extenuating circumstances. It is here that I feel the testimony of Mr. Hooks defends very ably the need for retaining the present depletion rates on those minerals, including phosphate, related to the manufacture of fertilizer for the production of food for the United States and world population. In addition to phosphate it is recommended that other minerals such as sulfur, potash limestone and dolomite deserve special consideration for possible retention of the present depletion rates.

I call this to the attention of the Committee as I believe the suggestion of Mr. Hooks as contained in his testimony has considerable merit and I am hopeful that the Committee will carefully consider and act favorably on it.

With kindest personal regards, I remain

Yours faithfully,

SPESSARD L. HOLLAND.

STATEMENT OF THE FLORIDA PHOSPHATE COUNCIL, MAYWOOD W. CHESSON, PRESIDENT, SUBMITTED BY HOMER HOOKS

SUMMARY OF STATEMENT

1. In the original drafting of H.R. 13270, no consideration was apparently given to the impact of a decrease in percentage depletion on individual minerals. This kind of "across the board" treatment, without recognizing the characteristics and economic condition of each mineral, is patently unfair.

2. Phosphate and other minerals directly related to the manufacture of fertilizer for the production of food for U.S. and world populations (sulfur, potash, limestone and dolomite) deserve special consideration.

3. Phosphate reserves in the United States are smaller than those in competing countries, and the grade of deposits in the U.S. is generally lower than that of foreign reserves.

4. Foreign competition for worldwide phosphate markets is steadily increasing, in some cases aided and abetted by government-managed industries not necessarily susceptible to normal cost and supply-demand factors.

5. Proximity of foreign phosphate producers to foreign markets and resultant favorable freight rates puts U.S. producers in an even more severe competitive position.

6. Three successive bad-weather planting seasons in the United States and foreign competitive factors forced phosphate production declines in the U.S. in

1968 and has further driven the U.S. phosphate industry, especially in Florida, into a serious recession.

7. A decrease in the percentage depletion allowance would amount to an added cost for U.S. producers which would be a further detriment to our already precarious competitive position.

8. As the world faces a long-term population surge and an expected increase in demands for foods, fertilizers are playing an ever-growing role. A reduction in percentage depletion on the agricultural minerals named in number 2 above would seriously damage the current economic position of these minerals and inhibit their future development in the United States.

9. We therefore urge that H.R. 13270 be amended to restore the percentage depletion on phosphate, potash, limestone and dolomite to 15% and sulfur to 23%.

Mr. Chairman: As President of the Florida Phosphate Council, I am submitting to you for distirbution to your Committee the position of the Florida Phosphate Council on the provisions of H.R. 13270 that are of particular concern to the phosphate mining industry.

The Florida Phosphate Council, who members are listed below, is a non-profit trade association representing most of the firms mining and/or processing phosphate rock in the State of Florida.

Agrico Chemical Company;
American Cyanamid Company;
Borden, Inc.—Chemical Division/Smith-Douglass;
CF Chemicals, Inc.;
Central Farmers Fertilizer Company/Central Phosphates, Inc.;
Farmland Industries, Inc.;
W. R. Grace & Co., Agricultural Chemicals Group;
International Minerals & Chemical Corporation;
Mobil Chemical Company;
Occidental Chemical Company;
Royster Company;
Swift Agricultural Chemicals Corp.; and
USS Agri-Chemicals.

The Council is grateful for this opportunity to express its views on tax reform, a subject of increasing concern on the part of American business due to the heavy tax burden and the impact on the economy. We believe the entire nation shares this concern. It is our hope that these hearings will aid in developing a program of tax reform consistent with the economic needs of our nation, with the least detrimental effect on taxpayers and on economic growth.

The Florida Phosphate Council believes that attainment and maintenance of a sound domestic mining industry requires recognition in the tax laws that certain minerals used in the manufacture of fertilizers, such as phosphate, hold a unique position in the nation's and the world's welfare and economy and deserve a degree of consideration that, unfortunately, was apparently not given in the "across the board" reductions in percentage depletion as proposed in this bill. Other minerals in this agriculture category include potash, sulfur, limestone, and dolomite.

We submit that tax reform should take into account the characteristics of each extractive industry and cannot be adequately or equitably accomplished without close study of each mineral industry. They are not all alike, and sweeping, class treatment of them is patently unfair.

We can find no evidence that the singular merits of each segment of the mining industry were recognized or considered prior to the introduction of H.R. 13270. Instead, a general form of legislation has been proposed that is all-encompassing, placing all types of natural resources into large groups, ignoring the differences and uniqueness of each.

Therefore, we feel it is incumbent on this Congress to fully examine and determine all the facts relating to each different type of mining. Only then can a fair and equitable finding be made and proper reform accomplished.

I will now direct my remarks specially to the phosphate industry and our strong and justifiable opposition to the proposed reduction in the depletion rate from 15% to 11%—a 26.6% differential.

Phosphate rock is unique in that it is the basic source of the element phosphorus, which is essential in the makeup of every living cell, tissue and organism. Humans must have phosphorus for survival—they obtain it from the food consumed in their daily diets. There is no substitute—natural or synthetic.

Phosphate is indispensable in the manufacture of fertilizers and plant foods used to feed the hungry people of the world—both here and abroad, notably in the underdeveloped nations.

There are four major phosphate producing regions in the United States. Florida is the largest producer, followed by a quadrangle of states in the West: Idaho, Montana, Utah and Wyoming. North Carolina is a new producer, but growing in importance. Tennessee is the fourth ranked phosphate mining area of this country.

Production in these areas accounts for approximately 46% of the total world output of phosphate. In 1968 U.S. production amounted to an estimated 40 million tons.

It must be considered, however, that despite this high percentage of world production, the economically recoverable reserves in the United States as a percentage of estimated world phosphate reserves is considerably lower—less than 30% of the world total. This factor becomes even more critical when one considers that much of the higher grade phosphate rock in this country—especially in Florida—is being exhausted. This means that in the future, exploration, extraction and processing of lower grade ores will substantially increase mining costs in the U S.

On the other hand, much of the phosphate in Morocco, the Spanish Sahara and other areas of the world is of higher grade than that found here and the reserves are much larger.

Also consider the fact that much of the United States competition for international phosphate markets is either government owned, dominated or supported. Such is the case in Soviet Russia—second largest producer in the world—and Morocco, third ranking producer and the world's largest exporter of phosphate rock. This means that prices from these competitive sources may not reflect cost structures nor a supply/demand circumstance.

The depletion allowance is one of the primary reasons United States phosphate producers have been able to maintain a fair share of world markets in the face of this adversity.

Still another factor in favor of foreign producers is the decided delivery cost advantage which invariably enters into the overall cost of a high volume, bulk commodity such as phosphate.

Since more than one third of this nation's total phosphate production is shipped to foreign countries, this factor is extremely important. In reality, the cost of shipping a ton of phosphate often is more than the price of the rock itself, which points up the critical competition involved in selling to customers in Western Europe and Great Britain. Morocco is closer to these markets than we are and can deliver cheaper.

For example: The ocean freight rate from Tampa, Florida, to Rotterdam on phosphate is $5.00 to $5.25 per long ton, but the rate from Casablanca. Morocco, to Rotterdam is about $3.25 per long ton. Morocco can ship to Italy in small vessels for about $3.00 per long ton, as compared to our rate of $5.00 to the same ports in Italy. The rate from Casablanca to Spain or Greece in small vessels is about $3.00 to $4.00 per ton, comparable to a rate from Tampa of $8.00 to $9.00 in the same size vesels.

These factors alone justify the continuation of the present 15% depletion allowance on phosphate. Any weakening of our world-wide marketing ability would lead straight to economic recession. It is not an understatement to affirm that any reduction in the phosphate industry's depletion allowance would place this industry in a most hazardous competitive position in the world markets.

There are, moreover, other unique features about the phosphate industry which deserve your attention and consideration before a decision on the depletion allowance on this mineral is reached.

At this very moment, the United States phosphate industry is in the throes of a most difficult period. In addition to the rigorous foreign competition already described, domestic production 1968 fell below previous years and indications are that 1969 will be even worse.

The reason for this unfortunate condition is one that neither government nor business can quickly remedy. Unprecedented weather conditions that have prevailed over the major farming and fertilizer consuming areas of the United States for the past three years have drastically curtailed sales and pushed inventories to new highs. For the first time in over 20 years, the 1969 planting season showed a drop in the demand for domestic plant nutrients.

As a result, prices have been slashed, revenues have diminished further, and dwindling financial return to fertilizer manufacturers is sinking even lower.

Adding to our problems is the fact that a tremendous expansion program was initiated a few years ago, largely on the basis of projected purchases for the AID program of our government. Gearing production to meet these anticipated needs, our firms made long-range commitments that were non-retractable when AID funds were drastically reduced.

This combination of developments has resulted in employment cutbacks in the Florida phosphate fields from a high in January 1967 of 10,400 workers to an estimated 9,000 today. Industry payrolls which reached a record high of $71.7 million in 1966 have sagged to $68 million in 1968, despite incremental wage increases. Total earnings this year are expected to drop still lower.

I can tell you gentlemen quite frankly that nobody is making money in the phosphate business today. The industry is sick.

I submit to this committee that the proposal for reducing the depletion allowance on phosphate could not have come at a more unfortunate time. And I cannot overstate the results which such action would bring about.

It comes at a time when those companies which deal primarily in fertilizer materials are struggling to survive.

H.R. 13270, as it passed the House, would reduce the phosphate depletion rate from 15% to 11%—or a reduction of 26.6%. This reduction would amount to approximately 13¢ for every ton of phosphate rock mined. Now, what would this added cost of 13¢ a ton do to us?

In the domestic market, the producer would be required to absorb this additional cost on top of a dwindling profit margin—or to increase prices. The latter is just not possible in today's market picture. The former might well put some of us out of business.

If the U.S. producer adds 13¢ to foreign sale prices—which already hang in balance on the basis of pennies a ton—it is safe to assume that a majority of this nation's phosphate rock exports would be lost to foreign competition.

Should this occur, this nation would immediately lose millions annually in balance of payments, phosphate miners in this country would have no place for their production, and the eventual result would be a depression on an already burdened phosphate mining industry.

To this point my remarks have dealt primarily with factors which are germane only to the phosphate mining industry and may not apply to other extractive industries.

There are other types of mining which do have many things in common, such as land reclamation requirements after mining is completed, air and water pollution control installations to protect the environment, and the very substantial tax load which we are already bearing. The extractive industries are active in all these areas.

With respect to taxes, in most of the communities where we operate in Florida, the phosphate industry is literally the backbone of the tax structure. Our companies paid more than $6.5 million in property taxes in 1968. In Polk County, Florida, center of operations, phosphate tax payments accounted for more than 20% of the total county ad valorem tax roll in 1968. The phosphate industry also is subject to the same type of sales and use taxes as other industries.

Finally, let me summarize briefly the justification for continuing the depletion allowance on phosphate at 15% and the other agriculture minerals at their present rates.

It has been recognized that minerals in the ground have no usefulness to the people until someone has the courage and persistence to expend substantial amounts of risk capital in searching for, finding, acquiring, developing and making them available to consumers.

Most of the advanced countries in the world today recognize that their minerals and natural resources form the basic foundation for economic strength and growth, and have provided necessary encouragement in one form or another for their production.

The practical effect of percentage depletion is greater production of minerals at a lower price, and an inducement for increased use of the nation's natural resourecs.

Without recognition in the tax laws of the capital value being depleted by production, taxes would be devouring the capital of mineral producers and depriving them of the funds needed to replace reserves in order to remain in business and continue to supply essential minerals.

The extraordinary risks involved in searching for and producing minerals, the long time lag between investment and production, and the possibility of a total loss of the investment in unsuccessful ventures, with no possibility of converting to another type of business, are among the factors that make percentage depletion necessary. With the demand for natural resources to meet the requirements of our advancing civilization, and the ever-increasing risks and cost in replacing depleted reserves, it is more essential than ever that we maintain the present tax treatment of natural resources in order to assure the nation's economic growth.

Percentage depletion aids in keeping the mining industry competitive with foreign mineral producers and provides funds for use in mineral research and recovery methods, resulting in mineral conesrvation; it provides funds for exploration of continuing mineral deposits and the development of mines; it provides the funds for the construction of plants designed to give a better and fuller use of the nation's natural resources.

With respect to the phosphate industry specifically, allow me to summarize:

—The phosphate industry is unique in its makeup. Little or no attention was given to the specifics of this industry or to the other agricultural minerals or to the total impact of a reduction in percentage depletion on these minerals before the introduction of H.R. 13270.

—Phosphate rock is an indispensable ingredient in the manufacture of fertilizer for which there is no substitute, natural or synthetic. It is truly a mineral of life, essential in the diets of all mankind.

—United States economically recoverable phosphate reserves are smaller than those of foreign producers, and the grade of domestic deposits is generally lower than that of foreign competition.

—A reduction in the depletion allowance for phosphate would severely damage United States producers from exporting to international markets.

—The phosphate industry in this country is in the midst of a depressed period, and a reduction of the depletion allowance would drive marginal producers to the brink of disaster.

—The basic premise of the depletion allowance as originally constituted makes it mandatory that this policy be continued in order to assure orderly development of natural resources, continued growth, and, hopefully, prosperity.

Taking all of the above into consideration, it would seem to me most appropriate that the agricultural minerals—such as phosphate, potash, sulfur, limestone, and dolomite—be continued at the same percentage depletion allowance as now exists, sulfur at 23% and 15% for the others, so that these vital ingredients in chemical fertilizers can continue to survive and play their part in providing the necessary plant foods, so that farm crops, both at home and abroad, might produce the bountiful foods to feed the ever-growing population of the world. With the specter of a doubled world population by the year 2000, this is certainly not the time to impede in any way the reasonable growth of these vital mineral industries, and so I ask this Committee to consider most seriously the restoration of these minerals I have named to their present percentage depletion rates, for humanitarian as well as economic reasons.

CONGRESS OF THE UNITED STATES,
HOUSE OF REPRESENTATIVES,
Washington, D.C., October 1, 1969.

Hon. RUSSELL B. LONG,
Chairman, Committee on Finance, U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: This is with reference to the percentage depletion allowance for certain metals which your Committee is presently considering as part of the Tax Reform bill recently passed by the House of Representatives (H.R. 13270).

Section 501 of H.R. 13270 generally reduces the percentage depletion allowance for oil and gas and most minerals. However, regarding gold, silver, copper and iron ore, section 501(b)(3) keeps the percentage depletion allowance at the same 15% rate which exists under the present law, but only for mines or deposits located within the United States. If the mines are outside the United States the allowance is reduced to 11%. This creates an unfair treatment for mines in Puerto Rico because the only definition of "United States" in the Code defines the term as "the States and the District of Columbia" (section 7701, Internal Revenue Code). In other words, under the language of H.R. 13270 as passed by the House, mining operations in Puerto Rico are considered as "foreign."

This is not only contrary to reality but contrary to the previous part of section 501 of the House bill which deals with depletion allowance for oil and gas. That other part of the bill (section 501(b)(1)) treats oil and gas wells located in Puerto Rico in the same manner as oil and gas wells located in any of the fifty States. It eliminates the percentage depletion allowance for foreign oil and gas wells but gives such wells, if located in Puerto Rico, the same 20% allowance they would have if they were located in any of the States. And yet, there are no known oil or gas deposits in Puerto Rico.

We are sure that the reason why Puerto Rico is being treated as "foreign" for purpose of mineral depletion while being treated as domestic for purpose of oil and gas depletion is that the Ways and Means Committee was not informed that there are copper deposits in Puerto Rico. The fact is that, at the present time those deposits are not being mined but negotiations are being carried on to allow certain American firms to mine them. The deposits are not of a high-grade mineral content and the additional 4% depletion allowance is highly important in determining whether the mining operations will be economically feasible.

Furthermore, the report of the Ways and Means Committee indicates that the reason for not cutting the depletion allowance for domestic mines is to encourage exploration and the discovery of new domestic reserves. At a time when the government of Chile has taken steps to nationalize 51% of the U.S. copper mines in that country and when the African Republic of Zambia is also reported ready to do the same, it becomes essential to keep the 15% rate for the mines located in Puerto Rico which will never run the risk of being nationalized and which will assure a supply of part of the copper needs of the country.

In conversations with your Committee's Chief Counsel, Mr. Vail, it was noted that our objective can be accomplished in either of two ways: first, by leaving present law as it is, and second, by amending section 501(b)(3) to read "15 percent—if the mines or deposits are located in the United States or the Commonwealth of Puerto Rico . . ." Both solutions are acceptable to Puerto Rico and we leave that decision to your Committee.

I trust that your Committee will give favorable consideration to this matter and I thank you indeed for your valuable cooperation.

Sincerely,

JORGE L. CÓRDOVA.

TEXAS GYPSUM,
Irving, Tex., September 24, 1969.

Hon. R. B. LONG,
U.S. Senate,
Washington, D.C.

DEAR SIR: We urgently request that at the Senate Finance Hearings, of which you are Chairman, you use your influence to retain the present 15% depletion allowance for gypsum.

The ultimate effect of a reduction of the depletion allowance on this segment of the building industry can only be an increase in building costs, and a further penalty to an industry which has been severely depressed for some time now because of increased labor and material costs, high interest rates, and the resultant low residential housing starts.

Unlike many other segments of the building industry, the prices for which we sell our product have steadily declined over a period of years until they are now at an all time low. As with any increase in taxation, a reduction in the percentage depletion allowance will be more severely felt by small, independent producers, such as ourselves, than by the larger multi-plant producers; so the long-term effect of such action is a tendency toward a reduction in competition.

As a Senator from the State of Louisiana, you are aware that there are several gypsum companies, with several hundred employees, operating in the State of Louisiana at the present time. Any reduction in depletion allowance of gypsum at this time can only result in higher cost of operation and less profits, and as a long-term effect will result in less venture capital and consequent failures to develop gypsum reserves in your state.

For these and other reasons, we urgently solicit your support for the retention of the present 15% depletion allowance on gypsum.

Very truly yours,

TED E. ARMSTRONG, Jr.,
Executive Vice President.

STATEMENT OF CHARLES E. BRADY, PRESIDENT, MATERIAL SALES CO., SALISBURY, N.C.

I am Charles E. Brady, President of Material Sales Company, Salisbury, North Carolina. Material Sales Company is sales representative for quartzite produced by Lessees of B. V. Hedrick Gravel and Sand Company and W. R. Bonsal Company of Lilesville, North Carolina; and for Becker Sand and Gravel Company of Cheraw, South Carolina.

Quartzite is the mined raw material from which the metal silicon and its many alloys are produced. The metal silicon is not found as such in nature. Quartzite is reduced in an electric furnace along with an oxidizing agent to produce the pure metal silicon. Some of the companies producing this metal are: Electrometallurgical Division of Union Carbide Corporation, Electrometallurgical Division of Air Reduction Corporation, Interlake Steel Corporation. Foote Mineral Corporation, Ohio Ferro-Alloys Corporation, Tennessee Metallurgical Company, and others.

The metal silicon is not unlike aluminum in appearance. It is very hard, has great tensile strength, is light, and highly heat resistant. Because of these qualities it is used in alloys of iron (Ferro-Silicons), alloys of steel and maganese, alloys of steel and chrome, and it is essential in the making of aluminum used in automobiles, trucks, airplanes, and in the hundreds of other aluminum products. Silicon is extremely important in times of peace, and its use and importance multiplies in times of national emergencies.

The purity of the quartzite (SiO_2 content) is essential in making the grade of silicon needed to make the high quality alloys needed in modern metallurgy. Consequently the prime source of this quartzite is from Marlboro County, North Carolina, and from Harnett and Anson Counties in North Carolina. The quartzite produced from these sources by the aforementioned companies, whom we represent, analyzes 99.5% SiO_2 and better.

In 1951 the congress recognized the importance of quartzite to the metallurgical industry granting it 15% depletion along with gold, silver, iron and copper ore, and oil shale. None of these are proposed to be reduced, but H.R. 13270 proposes to reduce quartzite to 11%. I urge that you recognize the need of allowing quartzite to remain in the 15% depletion category. The known reserves of quartzite in Anson and Harnett Counties in North Carolina, and Marlboro County in South Carolina, are estimated at the present rate of consumption to have a life of from only 15 to 20 years. Each of the production companies we represent keep a trained crew of men and geologists prospecting for and testing for additional quartzite deposits. Within the past three years they have purchased more than 1,500 acres of land at a cost in excess of $1,250,000.00 and have invested more than 2½ million dollars in new plants and facilities.

Even though the total production of metallurgical quartzite is small when the whole United States is considered, the approximately ½ million tons, mined and shipped from North Carolina and South Carolina, constitute an industry of importance to these states, and supplies a mined product of vast importance to almost every heavy industry in our country.

There is considerable evidence that the producers of quartzite need this allowance to help them finance the exploration costs, and the acquisition costs of additional high quality quartzite, and should the supply of this high quality quartzite become scarce, or require more expense in the acquiring, then the cost of quartzite to the electro-metallurgical industry would be greater, their profits consequently smaller, resulting in tax losses which we think would more than offset any revenue resulting from the cutting of quartzite's depletion allowance.

The new areas where quartzite is known to exist in quality and quantity sufficient to justify commercial production, and that are reasonably accessible physically and economically, are so scarce as to appear non-existent at this moment. I urge you to encourage this industry, small in size, but of key importance to our economy.

Thank you.

STATEMENT OF ILLINOIS ASSOCIATION OF AGGREGATE PRODUCERS

The proposed reduction in the depletion allowances on wasting assets in the mining industry, in our case, sand, gravel and stone, will produce results quite adverse to anything planned or imagined by this measure.

If this Bill is designed to increase governmental income, curb inflation,, eliminate "windfall profits" and similar claims, as reported by the press, the sponsors will find that the results of this piece of legislation will be to the converse of all the claims.

The aggregate industry is the fundamental industry of our economy. Without it, nothing is built. Without it, everything deteriorates—transportation, power, communications, etc. I can not think of any thing in our lives that is not related to, or dependent on, the basic ingredient of construction—aggregates.

This cornerstone industry of our economy is founded on the extraction of a wasting asset. The 1% reduction, from an allowance of 5% to 4%, is a 20% cut. The allowance for our industry, if anything, should be raised 100% or 200%. The highly definitive laws of science do not apply to the prospecting for a suitable piece of property for aggregate production. Mother Nature was very whimsical when she laid down deposits of sand, gravel and stone. Even though the most highly sophisticated methods available for prospecting for these minerals are employed, final judgment on a site, because of the high degree of variability, is based on a program of repetitive testing, drilling and excavation. Even then, success is not assured. Changing deposits, changing demands and specifications and changing markets make our industry one of high risks. If a man builds and tools up to manufacture a product and fails in that business, he has a residue in his capital expenditures and an opportunity to put his plant to another use. Our industry does not enjoy that opportunity.

Specifically, in the State of Illinois, and I'm sure most states are in a similar situation, we find ourselves just entering into a massive highway building and upgrading program. This project will surpass any highway project in the history of the State. It will give Illinois one of the finest high-speed, intrastate highway networks in the Nation. In order to provide this facility for the taxpayers at the lowest possible cost, numerous pits and quarries will have to opened throughout the State, particularly, in the more remote areas where there are no existing plants today. These new operations will supply quality materials at an acceptable cartage rate. Without these new operations, material will have to be hauled great distances in some cases. A cut in the meager allowance allotted to our industry will make it just that much more difficult to justify opening a new operation. What we need is a greater incentive to prospect and open new deposits, not a lesser one. A decrease in the already inadequate depletion allowance for our industry will simply mean an additional expense to be passed on to the customer. Another step in the march of creeping inflation. Another inadequacy in our regulatory system.

AMERICAN MONUMENT ASSOCIATION, INC.,
Olean, N.Y., September 29, 1969.

Senator RUSSELL B. LONG,
502 Union Federal Building,
Baton Rouge, La.

DEAR SENATOR: As a representative of all of the quarriers of granite and marble in the United States, I ask your consideration in the retention of the 15% depletion allowance now granted to our product.

It is my understanding that the tax reform bill now under study by your Committee has been proposed because there is a general feeling that those at the top of the income scale are getting too much advantage from it. The remedy proposed is to tighten the screws at the top and loosen them at the bottom. I feel that this industry is a definite part of the bottom.

The gross annual sales from the quarrying of granite and marble would fall short of forty million dollars and our largest quarrier would realize gross sales of approximately three million dollars. In terms of reference, generally used in our economy today, this places us at the lower end of the economic scale and even in terms of definition used by the Federal Government qualifies us as "small business".

Because our product is quarried and manufactured in mountainous sections of the country, these are usually economically disadvantaged areas also, and many small communities are entirely dependent upon our product for their industrial prosperity. As an example, Barre and Proctor, Vermont; Elberton and Tate, Georgia; Rion, South Carolina; Milbank, South Dakota; Snyder, Oklahoma; and Marble Falls, Texas, are entirely dependent upon our industry, while our quarrying operations make an important contribution to large communities in twenty-two states of the Union.

Because of the static nature of our market "cemetery monuments" and a highly competitive situation, the net profit for most of our companies after taxes is approximately three per cent.

I sincerely believe that any reduction in the present depletion allowance would cause the quarriers to increase their prices which would then be passed on through the manufacturers to the ultimate consumer, and would defeat the entire anti-inflationary objectives of the proposed legislation.

The one hundred and thirty two members of this association would sincerely appreciate your assistance in helping to maintain the present depletion law, as it pertains to granite and marble.

Sincerely,

F. E. FOSTER,
Executive Vice-President.

STATEMENT OF THE NATIONAL ASSOCIATION OF MARBLE PRODUCERS AND THE MARBLE INSTITUTE OF AMERICA, SUBSTITUTED BY DON A. HAGERICH, EXECUTIVE DIRECTOR, MARBLE INSTITUTE OF AMERICA

The National Association of Marble Producers is an association of American marble producers (quarriers) of approximately 95 percent of the natural quarried domestic marble and travertine production.

The Marble Institute of America is the American marble industry's national trade association of companies engaged in producing (including almost all the members of the National Association of Marble Producers), importing, wholesaling, manufacturing and contracting for approximately 85 percent of domestic marble sales.

Marble production in the United States is a declining industry at a time when production of most other non-precious minerals is growing at a pace comparable to that of the growth of the Gross National Product. This decline is due partly to unlimited importation of foreign fabricated marble and partly to the increased use of simulated marble and other manufactured competitive materials.

Unlike the gigantic oil and gas industry, the marble producing industry enjoys no protection from foreign competition. There is no quota for imported fabricated marble, such as the oil and gas industry has, and which enables that industry to keep prices artificially high. The tariff on imported fabricated marble was only 21 percent ad val and lowered further by the GATT agreement at 10 percent per year to 10.5 percent by December 30, 1973. This rate is so low that it plays no effective part in protecting the marble producing industry in the United States from foreign imports.

For example, Italian marble can be quarried, fabricated, and shipped to the United States for about 40 percent of the cost of U.S. produced marble of a comparable quality shipped to the same building site.

The total United States sales of marble in 1966 increased to 48 percent above 1956, while the sales of domestically fabricated marble decreased 2 percent. During the same period, the United States sales of imported fabricated marble increased by 534 percent. This staggering gain in sales of imported fabricated marble was made possible by the 40 percent cost differential and the lowering of tariffs.

The presently authorized depletion rate for marble is 15 percent. In 1968, this amounted to approximately $1,900,000. The Tax Reform Act of 1969, as passed by the House, would cut this rate to 11 percent, a reduction of more than 26 percent, about the same as that of the multi-billion-dollar quota-protected oil and gas industry.

The additional tax revenue from marble production represented by the proposed change would amount only to approximately $530,000, assuming continuation of production at the 1968 rate, a doubtful assumption. Contrasted with this drop-in-the-bucket benefit to the Treasury, the amount represents a crucial decrease in the after-tax revenue of the domestic marble producers. There is a desperate need on the part of the American marble industry to find new deposits of sound quality marble more easily quarried, to devise and perfect new means of more efficient quarrying of known deposits in order to cope to some extent with unchecked foreign competition. Such exploration, research and development is costly, but promise to keep alive an old, honored and specialized industry, which makes an aesthetic and quality contribution to building construction at a time when the need for such a contribution is evident to every eye.

The National Association of Marble Producers and the Marble Institute of America oppose the proposed reduction in the existing 15 percent depletion rate for marble. The action of the Ways and Means Committee was not based on study of the marble industry, or of the mining industry generally. The action appears rather to have been based on conclusions reached from examination of the special circumstances of the oil and gas industry, rich in itself and highly favored by tax laws even with reduction in the depletion allowance.

The effect of the Ways and Means Committee action would be to make the poor poorer. It is submitted that if the policy reflected by the Tax Reform Act of 1969, indeed is the tentative policy of the Congress, the proposed change should be the subject of a thorough-going study of its effect, rather than by a decision reached without consideration of the effect on the subject industry.

Statement of Ian MacGregor, Chairman and Chief Executive Officer, American Metal Climax, Inc.

MOLYBDENUM PERCENTAGE DEPLETION

American Metal Climax, Inc. is a diversified mining and metal processing firm. Our Climax mine at Climax, Colorado is one of the major producers of molybdenum and is the Free World's single most important source of that metal.

Molybdenum is a vitally important metal which is chiefly used by the steel industry as an alloying element. Over 80% of molybdenum produced is used in this alloying with iron and steel in making tool steels, stainless steels, and a wide range of constructional alloy steels, as well as special steels for corrosion resistance and elevated temperature service. Molybdenum also has smaller but growing use in such "space age" applications as rocket motors and electronics. Molybdenum was classified as a strategic mineral under the Korean excess profits tax and it has been stockpiled as a strategic and critical material by the U.S. Government.

At the present time molybdenum is entitled to only a 15% percentage depletion allowance, whereas all the other important ferro alloys used in making alloy steel are entitled to 23%. These other alloys are chromite, columbium, manganese, nickel, tungsten and vanadium. This appears to be an unreasonable discrimination against molybdenum. In fairness, molybdenum should be included in the 23% category. Equity would seem to require that it should be treated no differently than other ferro alloy materials and, therefore, it would be appropriate at this time to transfer molybdenum to Section 613(b)(2)(B) of the Internal Revenue Code.

The House-passed tax bill H.R. 13270 would reduce the 23% category to 17% and the 15% rate to 11%—except for copper, gold, silver, iron ore, and oil shale which will remain at 15% if domestically mined. If it should be decided that molybdenum should not be transferred to the 23% category (proposed to be reduced to 17%), at the very least molybdenum should be added to the exception group in the present 15% category. Otherwise, molybdenum will be the only important industrial metal reduced to as low a rate as 11%, a situation which would compound the present discrimination.

During the period 1963–1966 molybdenum was in critical short supply. Usage for the metal is growing at an extremely fast rate and unless major new mines are developed it is anticipated that it will again be in short supply in the not too distant future. An adequate rate of percentage depletion is an important factor in providing the incentive to risk the substantial sums required to explore for and develop these mines.

My company has been engaged for the past four years in developing a new source of molybdenum at its Henderson mine in Empire, Colorado. We estimate that the cost of bringing this new mine into production (in the mid-1970's) will exceed $200,000,000. Needless to say, the percentage depletion deduction for molybdenum is an important element in our decision to go ahead and will be of great significance in financing the project.

In conclusion, we believe Section 613(b)(2)(B) of the Internal Revenue Code should be amended by adding after the word "mercury" appearing therein the word "molybdenum".

IAN MACGREGOR.

NTAIONAL COAL POLICY CONFERENCE, INC.,
Washington, D.C., October 3, 1969.

Hon. RUSSELL B. LONG,
Chairman, Committee on Finance,
U.S. Senate,
Washington, D.C.

DEAR MR. CHAIRMAN: This is letter is to inform you that National Coal Policy Conference, Inc., desires to be on record as fully endorsing the testimony on the Tax Reform Act of 1969 presented by Mr. Brice O'Brien, General Counsel of the National Coal Association, *before your Committee on September 30.* We did not request an opportunity to testify because it seemed unnecessary to duplicate Mr. O'Brien's excellent presentation of the situation, but would appreciate this statement of support being included in the formal record of your hearings. For the record, it should be noted that the National Coal Policy Conference, Inc., represents American bituminous coal producers, the United Mine Workers of America, the principal coal-hauling railroads and barge lines, leading electrical utility systems utilizing coal for fuel and the principal manufacturers of coal-mining machinery and equipment.

Anyone familiar with the coal industry and cognizant of our tremendously increasing national power needs must recognize that it is imperative that proper incentives to attract investment capital for new mines and production facilities, as well as building and acquisition of transportation equipment, is absolutely necessary in the national interest.

The nation is in a dangerous position today because the East Coast has become precariously dependent upon imported residual fuel oil for much of its power generation, as well for industrial and commercial purposes. If an emergency situation should suddenly halt the influx of this oil, the coal industry would be in no position to make up any substantial part of the lost energy fuels because, for the past several years, the government has ardently promoted atomic energy along with a major public relations and propaganda campaign aimed at convincing both the public and the investment sector that nuclear plants were the whole answer to our fuel needs for the future. At the same time, Federal policy was continuing to permit increases in the importation of foreign heavy fuel oil and in 1966 completely eliminated quota restrictions on its import. As a result, there was no incentive to finance and construct mining facilities aimed at serving the East Coast market.

In addition. other government policies, while we do not quarrel with their objectives, are making it more expensive to produce coal and, thus, adding to the problems of financing new installations and market competition. We believe it would be most unwise to further erode incentives for growth of the coal industry and fully endorse Mr. O'Brien's suggestion that rather than reducing the 10% depletion in the existing law, coal should be at least given the 15% depletion rate now applicable to all other minerals. We further urge that the limit on taxable income from the property should be liberalized for the marginal or near marginal producers.

With electric power demand increasing at an even more rapid rate than the "doubling every ten years" which had been projected for it a year or two ago, and with the delays and unanswerable problems plaguing the large nuclear power generators, it is clear that a major increase in coal production for electric generation will be necessary for a number of years to come. We sincerely urge the Congress not to take steps affecting the taxation of coal producers which would further hamper our ability to meet these national energy demands.

Sincerely,

W. W. McCLANAHAN, Jr.,
Vice President.

CLOW CORP., *September 22, 1969.*

Hon. RUSSELL B. LONG,
Chairman, Senate Finance Committee,
U.S. Senate
Washington, D.C.

DEAR SENATOR LONG: As a manufacturer of clay pipe, I am writing you to urge your appropriate action to maintain the 7½% depletion allowance now proposed to be reduced to 5% in the Tax Reform Bill. This reduction in depletion allowance will obviously increase our cost of manufacturing and place us in an increasingly unfavorable competitive position with other sewer pipe manufacturers, and primarily that of concrete which enjoys a 15% depletion allowance on their basic ingredients—limestone and shale—which is to be reduced to 11½%.

Recent history of clay depletion allowances makes the present proposed reduction inequitable. Prior to 1960, the fire clay necessary in sewer pipe manufacture to produce a Federal Specification product enjoyed a 15% allowance which, without warning, in 1960 was reduced to 5% a reduction of 66.6%. In response to a plea for equity, Congress in 1966 agreed to a partial restitution by raising the allowance to its present status of 7½%.

While all other minerals are to be reduced on a proportionate basis from their original allowance, clay is to be subjected to the same proportionate reduction from a base already 50% lower than its original percentage allowance. Surely this is inequitable by any objective standard.

In such matters as eliminating the 7% investment tax credit, which is applied uniformly to all business and industry, I make no objection. I do, however, object strongly that the treatment accorded clay pipe manufacturers will not be equitable and fair if the provisions of the present bill are allowed to pass into law.

Please do whatever you can to insist on equitable treatment of all industries and not permit the perpetuation of an unfair penalty for our industry.

Sincerely yours,

R. G. RINEHART, *President.*

THE ROBINSON CLAY PRODUCT COMPANY,
AKRON, OHIO, *September 19, 1969.*

Hon. RUSSELL B. LONG,
Senate Finance Committee,
Senate Office Building,
Washington, D.C.

MY DEAR SENATOR LONG: As the Senate prepares to consider the complex and vital subject of Tax Reform, I thought it might be helpful to forward my view on one aspect of this matter.

As the President of The Robinson Clay Product Company, and Chairman of the Clay Pipe Industry Depletion Committee, I hope that there will be no reduction in the relatively minor 7½% depletion allowance. In making this request, I am not unmindful of the desire of many members of Congress to introduce changes in the tax code in the interest of equitable treatment. This same emotion caused me to refrain from any objection when the House recently voted to repeal the 7% investment tax credit, at considerable potential cost to my company. That action at least had the virtue of affecting all business like. A reduction of the clay depletion allowance would further weaken clay pipe manufacturers in our severe competition with the many other pipe materials.

A review of the brief statement attached hereto reveals how the clay pipe depletion allowance has already received a reduction through the years, while our biggest competitor, cement, enjoys a 15% rate on both the limestone and the clay or shale that is used at a kiln feed cut-off point. It is not right that we should suffer now under the cloak of fair play. Our industry is small. Any reduction of the clay depletion allowance would increase annual Treasury receipts very little, but would be a severe shock to my company and to all clay pipe manufacturers.

Clay pipe, as you know, is a quality material used in the great effort of our country to forestall the deadening effects of water pollution. It appears to be inconsistent to grant companies a fast tax write-off for constructing water pollution facilities and simultaneously to penalize their efforts by inducing the higher costs which will inevitably result from depletion allowance reductions.

Moreover, this is surely not in the interest of our country in its current struggle to contain 'nflation.

In view of the above comments, I respectfully urge you to take appropriate action to insure that the clay depletion allowance is not further reduced from its current rate of 7½%. Fire clay used in sewer pipe manufacture deserves, for equity, the same 15% depletion rate as the limestone and clay used in cement.

Sincerely yours,

CLARK SUTHERLAND, *President.*

SOME FACTS ABOUT PERCENTAGE DEPLETION FOR CLAY USED IN SEWER PIPE MANUFACTURE

Under earlier tax laws, refractory clay used in the manufacture of clay pipe was allowed the 15% rate. Justification for the 15% rate was fortified by Internal Revenue Ruling 56–59, which included these comments: "A clay will be considered a refractory and fire clay only if it is used or sold for use for a recognized refractory purpose." Under this new ruling, "fire clay, when blended with ordinary clay to produce vitrified clay sewer pipe, is considered to be used as refractory clay. In the view of the above, it follows that in determining percentage depletion application to clay, the end-use test must be employed. For example . . . clay use or sold for use as refractory clay is entitled to the 15% depletion." For some years, then, the Clay Sewer Pipe Industry explored for additional deposits in an atmosphere of some stability when, in 1960, almost without warning, clay used in sewer pipe manufacture was singled out for a decrease of its allowance to 5%, a reduction of 66.6%. (P.L. 86–564). In 1966, Congress agreed to a partial restitution, in response to a strong plea of equity, by raising the allowance to its current status of 7.5%. Under the provisions of H.R. 13270, this clay is once more to be reduced to 5%. Therefore, while all other minerals are to be reduced on a proportionate basis from their original allowances, clay is to be subjected to the same proportionate reduction from a base already 50% lower than its original allowance! Clearly, this is inequitable, by any standard.

The kind of clay used in the manufacture of vitrified clay sewer pipe demands refractoriness found only in certain fire clays. Thus, clay used in the manufacture of sewer pipe should be specifically included in the percentage depletion rate paragraph (501(b)(4)(B) in H.R. 13270) as a clay "used for purposes dependent on its refractory properties." Sewer pipe clays could surely rest their case for fairer treatment at this point, were it not for the fact that they have suffered added unfair treatment compared to their most active competitor—cement. Limestone and shale (clay) used as the basic ingredience of cement, have the 15% depletion rate. Unless some action is taken on behalf of clay used for the manufacture of sewer pipe, the "proportionate" reductions of H.R. 13270 will again strike the Clay Sewer Pipe Industry with disproportionate results.

Equity demands reinstatement of the Clay Sewer Pipe Industry's fire clay to a 15% depletion rate.

STATEMENT OF AMERICAN INDUSTRIAL CLAY CO. OF SANDERSVILLE, ENGELHARD MINERALS & CHEMICALS CORP., FREEPORT KAOLIN DIVISION OF FREEPORT SULPHUR CO., GEORGIA KAOLIN CO., J. M. HUBER CORP., AND THIELE KAOLIN CO.

This statement is filed by the following producers of china clay: American Industrial Clay Company of Sandersville, Engelhard Minerals & Chemicals Corporation, Freeport Kaolin Division of Freeport Sulphur Company, Georgia Kaolin Company, J. M. Huber Corporation, and Thiele Kaolin Company.

For the reasons set forth below, these companies are opposed to Section 501(a) of H.R. 13270, as passed by the House of Representatives, insofar as it reduces the 15 per cent rate of percentage depletion which has been applicable to china clay since 1947.

THE MINERAL

China clay (or "kaolin" as it is sometimes called) is one particular, comparatively scarce, variety of clay. Its unique properties make it a valuable raw material for many important industries. Its principal use is in paper, both as a coating and as a filler, but it also has a wide variety of other uses, including whiteware (porcelain, electric insulators, plumbing fixtures, etc.), certain refractories, medicines, and as a filler for rubber, paint, plastics, insecticides, and many other products. It is clearly distinguishable from the low grade, inexpensive clays which are found in many parts of the country, and, in fact, from all other clays, on the basis of the following characteristics: china clay has a clay mineral content of substantially pure kaolinite, it is white or nearly white or can be beneficiated to be white or nearly white, it will fire to a white or nearly white color, and it is amenable to beneficiation by known methods to make it suitable for use in whiteware, paper, rubber, paint, and similar uses.

SIZE OF THE INDUSTRY

The principal producing area for china clay in this country lies in a belt of rural counties in Georgia (principally Twiggs, Wilkinson, and Washington Counties) and South Carolina (Aiken County).

The china clay industry is small when compared to most other mining industries, but it is extremely important to the economy of the rural area of Georgia and South Carolina where it is located. China clay, in fact, accounts for about 47% of Georgia's mineral production value. The six principal producers submitting this statement, with a combined payroll cost of approximately $20,000,000, employ about 2,800 people, the great majority of whom live in this rural area. These six companies have invested more than $50,000,000 in paint and equipment during the past five years and more than $75,000,000 in the past 10 years.

DEVELOPMENT OF THE INDUSTRY

During the early part of this century, substantially all of the china clay used in this country was imported from England. The development of the domestic industry began in the 1920's; today, the Georgia and South Carolina area is the largest producing area in the world. The domestic industry now supplies practically all domestic needs and it also contributes to a favorable balance of trade by exporting substantial quantities. In order to achieve this growth, the producers were required to develop means to process the domestic clay to improve its color, which, in the ground, is not as white as the English clay and to provide the users of the clay with superior service. At the same time, they have worked with customers to develop new uses and to improve the technology of processing and utilizing the clay.

Accordingly, the present position of the industry is due in substantial part to the large sums spent by the industry on research and development, and the future success, and even survival, of the industry depend on continuing this work.

In addition, as the markets have grown and the specifications of customers have become stricter, the industry has had to spend large sums prospecting for additional deposits of suitable clay. Because of the ever shifting demands of customers, no company can be certain of the extent of its reserves; clay which is suitable for today's market may be unsuitable a year from now. Thus, the industry must constantly search for new deposits, at the same time that it seeks to develop new processing techniques to utilize known deposits.

THE IMPORTANCE OF PERCENTAGE DEPLETION

The amount of tax involved in the depletion deduction for china clay is negligible from the Government's standpoint, but it is extremely significant to this industry. Thus, in the past five years, the *total* annual tax saving, from percentage depletion, for the six major producers *combined* has averaged less than $3,500,000. The reduction to 11% adopted by the Ways and Means Committee would have reduced this amount, and increased revenues, by less than one million dollars a year. Obviously, such an increase in tax would have no noticeable effect on revenue collections or on curbing inflation. However, the increased tax resulting from this proposed reduction in the depletion rate would adversely affect the future of the small industry for the following reasons.

It must be realized, first of all, that any increase in tax will constitute an additional increased cost, which will be imposed upon the producers on top of increases in all other costs. Of course, all businesses are experiencing cost increases today, but such increases have been particularly severe for this industry. Thus, as the more accessible deposits of china clay have been exhausted, it has been necessary to remove more and more overburden to reach suitable clay, and to transport the clay farther and farther to the processing plants. The competition for suitable clay deposits has increased tremendously the cost of buying or leasing clay land. Over all, the expenditures by these companies for royalties and rents have more than doubled in ten years. In addition, recently enacted legislation requires the industry to incur substantial expenses for land reclamation, as well as for air and water pollution control.

Accordingly, the increase in taxes resulting from a decrease in depletion would be imposed on top of other escalating costs, and would further and materially reduce the profitability of the business at present price levels.

If the producers would try to offset that decrease in profits by increasing prices, they would face a loss of business, both here and abroad, to the English producers.

English China Clays, Limited, which controls vast reserves in the Cornwall district of England, is the largest producer of china clay in the world. The china clay production of this one company, which has total assets of $155,000,000 and sales of over 2,000,000 tons of china clay a year, is almost as large as that of the six major U.S. producers combined. It exports 75% of its production and has the know-how to supply all markets. The English producers have at least two cost advantages as compared to American producers: first, their labor rates are substantially lower than the rates in Georgia and South Carolina and, second, their deposits are adjacent to seaports so that they can load directly on to ships which provide low cost transportation to customers. In addition, the English producers enjoy a special advantage under British tax laws in that they receive rebates from the government of 40% of new capital investments in the china clay business.

During 1968, Canada and the United States imported 175,000 tons of china clay from England, having a value in excess of $4,000,000, whereas U.S. producers exported 389,000 tons valued at almost $13,000,000. All of these export sales are in direct competition with the English. The china clay industry has contributed to a favorable balance of trade, but any price increase resulting from a reduction in percentage depletion would allow a substantial penetration of the U.S. market by the English and would reduce substantially U.S. exports; obviously, there would be a substantial adverse effect on our balance of payments.

If the producers could not recoup the lost profits by increasing receipts, they would either have to reduce other expenses or be satisfied with a smaller return on their investment. Any program to reduce expenses, in order to compensate for the loss of depletion, would necessarily affect primarily non-production expenses such as exploration and research and development. A reduction of expenditures in either or both of these categories would, of course, slow or halt the search for suitable clays and prevent work on the development of new processing techniques and uses and thus affect adversely the future growth growth of the domestic industry.

If costs cannot be reduced, the producers' return on investment is lowered, and the additional tax cost is borne by the individual investors in the producing corporations who invested their money in this industry in reliance on the existing depletion allowance, which has remained unchanged for over 20 years.

Furthermore, the lower return means that less capital will be invested to expand present production and to utilize improved processing techniques. One of the major producers recently studied the possibility of constructing facilities to utilize reserves which it holds in the Sandersville area of Georgia. Its projections showed a return, after taxes, at current prices and with the present depletion deduction, of only 8.4% on an investment of over $10,000,000, obviously, such, such a return on investment is low today, especially in view of the high interest rates. Any reduction in this rate of return could well prevent further investment in this industry.

Although the proposed reduction in the depletion rate to 11% might not be sufficient in and of itself to dry up sources of capital, the resulting cost increase is substantial to these companies and this increase, together with other cost increases, would have a significant effect on earnings.

In addition, such a cut in the rate would, at the very least, cause the financial community to be wary of possible additional cuts, and the complete repeal of percentage depletion would reduce profits to such a point that it is doubtful that any funds would be available in today's money market, especially for the smaller producer. Thus, a study sponsored in 1966 by the Georgia Department of Industry and Trade and the U.S. Department of Commerce ("Mineral Resources of the Central Savannah River Area") reported that dry process operations (conducted by the smaller companies) are "only marginally profitable" and that in some cases "the profit margin lies within the depletion allowance." Accordingly, even a small cut in the depletion allowance might well result in eliminating or severely limiting future investment.

CONCLUSION

In summary, the domestic china clay industry, although small, contributes significantly to the economy of the Southeast and supplies a wide market with a unique product having many important uses in our present day civilization. The industry has been able, through research and outstanding service to its customers, to preempt markets (domestic and foreign) of foreign producers. Those foreign producers, however, still compete vigorously, and any increased tax caused by a reduction in depletion, especially when combined with other rapidly rising costs, would seriously impair the industry's ability to compete. The increased revenue, of less than $1,000,000, is of negligible significance to the Government, but is of critical importance to this industry.

Whatever may be the merits of cutting the rates for other minerals, where more tax is involved and where the effect on the industry may be less severe, Congress should retain the 15% rate for china clay, just as the Ways and Means Committee has done for oil shale and gold, silver, copper, and iron ores.

Hon. Russell B. Long,
Chairman, Committee on Finance, U.S. Senate, New Senate Office Building, Washington, D.C.

Sir: Pursuant to the procedure set forth by the Committee on Finance in its press release of August 12, 1969, regarding Tax Reform Hearings, I am availing myself of the privilege of submitting a written statement in lieu of a personal appearance.

The principal area of the Tax Reform Bill of 1969 (H.R. 13270) on which I want to comment covers certain provisions pertaining to natural resources and foreign tax credit allowances. I believe that these provisions constitute a serious threat to the ability of the United States to meet its future mineral requirements.

The provisions to which I refer are those which would reduce present percentage depletion allowances for most minerals, and those which would alter the present method of computing foreign tax credits allowable. Specifically, my references are to Sections 501(a), 431 and 432 of the bill. I will also comment with respect to certain testimony of the Secretary of the Treasury presented to the Senate Finance Committee on September 4, 1969.

SECTION 501(a)—PROPOSED REDUCTIONS IN PERCENTAGE DEPLETION RATES

Under Section 501(a) of the bill, it is proposed to reduce percentage depletion rates for all minerals with the exception of gold, silver, oil shale, copper and iron ore from domestic deposits. The proposed reductions range from 26.1% in the case of lead and zinc and certain other minerals from domestic deposits to 33⅓% for certain clays, shale and slate. The House Ways and Means Committee Report on the bill justifies these proposed reductions on the grounds that "there is a need to strike a better balance than now exists between the objective of encouraging the discovery of new reserves and the level and revenue cost of percentage depletion allowances."

Having been associated with the non-ferrous metals industry for over 40 years, I have seen many changes in the technology of exploration for and development of new mines as well as in the operation thereof. I have also seen the appetite of the United States and other industrial nations for non-ferrous metals grow insatiably as standards of living throughout the world have continued to improve. Years ago, he United States was largely self-sufficient in the major non-ferrous metals and the discovery of easily accessible high-grade domestic deposits assured an adequate supply for an indefinite period.

Today the situation is vastly changed. The growth in population and the astounding advances in American technology, neither of which show any signs of tapering off, have brought about a level of consumption of non-ferrous metals which cannot be met by U.S. domestic production alone. The higher grade deposits have been largely mined out and the grade of ores currently being mined is constantly declining. The search for new mineral deposits has been intensified but the cost of such exploration has increased unrelentingly. So too, costs of mining low-grade deposits have risen. To recover the metal content from these deposits, it is necessary to mechanize the operation with expensive equipment.

The capital investment required to locate a new mine and bring it into production is formidable. In many cases, because of inaccessibility of the ore bodies, it is necessary to build roads or even railway facilities, power plants, auxiliary shops, piers, barges, housing areas, stores, schools and recreation facilities in addition to the stripping of the overburden, other mine preparation and the building of the concentrator mill. Large trucks for hauling crude ore to the mill may cost as much as $200,000 apiece.

It is no exaggeration to say that from the time the existence of a large non-ferrous ore body is determined by today's sophisticated but costly exploration techniques until the time when the mine starts to operate, total capital investment may run as high as $350,000,000. The time factor from discovery of ore in commercial quantities until the commencement of production may be from five to ten years which means that substantial sums of investment capital is sterilized, producing no return during the development and construction period.

When one considers such awesome cost factors plus the high risks involved in exploring for new ore deposits in the field of non-ferrous metals, it is difficult to see how we can achieve the necessary balance between estimated demand and estimated production in the future. It is expected that the population of the United States will be about 320 million people by the year 2000. It is also expected that consumption of minerals and metals on a per capita basis will increase with the result that demand will expand more than 4 times by the year 2000 over what it is today. At the same time, the Bureau of Mines has estimated that domestic production of these essential raw materials will be only about twice today's production by the year 2000.

In view of the foregoing facts and predictions, the conclusion of the House Ways and Means Committee in its report on H.R. 13270 is unacceptable. In commenting on the proposed reductions in percentage depletion rates, the report says, "These new percentage depletion rates will still provide substantial encouragement for the exploration and discovery of new reserves of oil and gas and the minerals concerned. Moreover, these new rates will be more realistic in relation to the need for such encouragement." Such a conclusion is illusory and completely inconsistent with the hard realities of the future supply-demand situation in the non-ferrous mining industry. I therefore recommend that the proposed reductions in percentage depletion rates be rescinded because they are incompatible with the desirable national objective of maintaining adequate mineral reserves.

SECTION 431—FOREIGN TAX CREDIT—LOSSES-RECAPTURE

Section 431 of the bill proposed that when a U.S. taxpayer, using the "per country" limitation, sustains losses in a foreign country which are deducted from domestic income, the tax benefit from the foreign losses is to be recaptured when income is subsequently derived from the foreign country. The House Committee Report states that the provision is needed to abolish a double tax benefit which is available under present law. Specifically, it is alleged that the double tax benefit occurs because in the year of the losses, the U.S. tax on domestic income is reduced by the losses, and then when the business operations in the loss country become profitable, a credit is allowed for the taxes paid in that country against what otherwise would be the U.S. tax on the income from that country.

Actually, there is no double tax benefit. Let us take the case of a taxpayer who develops a new mine in Arizona at a cost of $10,000,000 over a two-year period. He writes off this $10,000,000 against other income in his U.S. tax returns, thus reducing his tax liability by $5,000,000 (assuming a 50% tax rate for simplicity of explanation). In the third year, the mine is in operation and has taxable income of $5,000,000 on which it pays U.S. tax of $2,500,000. Now, assume the same facts, except that the mine is located in a foreign country. The $10,000,000 of development expense is written off in the U.S. tax returns with a resultant decrease in tax liability of $5,000,000. In the third year, the U.S. tax, before foreign tax credit, is $2,500,000, but assuming the tax rate in the foreign country is 50%, the taxpayer must pay $2,500,000 of tax to the foreign country which he claims as a credit against the U.S. tax. In both cases, the taxpayer has sustained the same losses, the same income and the same net tax effect, the only difference being that the tax payable in the case of the foreign mine went to the foreign government rather than to the U.S. This is as it should be. To propose a form of recapture of an alleged double tax benefit in the case of the mine located outside the U.S. would really result in double taxation.

Earlier in this letter, I referred to the fact that the U.S. is no longer self sufficient with respect to its requirements for many non-ferrous metals. We are dependent upon imports to supplement our domestic production of copper, lead and zinc and many other metals. At the same time, we must compete with other industrial countries in the world for foreign sources of supply. Many of these other countries do not tax income which has its origin outside their national boundaries. Certainly, taxes are one of the most important competitive factors in determining which countries will control foreign mineral resources. These resources are generally located in the less-developed countries and in Canada and Australia, and these countries have enacted tax incentives to encourage the development of their mineral resources. The industrialized nations of Europe have endeavored to adjust their own tax laws so that their citizens may take the fullest advantage of the tax incentives offered by the countries where the mineral deposits are located.

The effect of the U.S. tax laws, in contrast, is to nullify the tax incentives granted by mineral producing countries. The tax laws of some of these countries which grant incentives (such as lower income tax rates during the early period when the investment outlays are being recovered, or even complete exemption from income taxes during the early period of operation) provide for the elimination of the incentives where they merely divert tax revenues to the country where the investment originates. In other instances, even though the countries do grant the incentives, these incentives are completely offset by U.S. income taxes.

Section 431 of the House Bill, H.R. 13270, should be deleted. Not only is it aimed at curing a "phantom" double tax benefit which does not exist, but its enactment would be a further handicap and deterrent to U.S. mining companies in their search for foreign ore deposits which are so essential to our U.S. economy.

SECTION 432—FOREIGN TAX CREDIT LIMITATION WITH RESPECT TO FOREIGN MINERAL INCOME

Section 432 of the House Bill is directed at a presumed abuse of the foreign tax credit. The presumption is that where foreign taxes paid on mineral income exceed U S. taxes on such income, the higher foreign tax probably includes a disguised royalty payment which should not be allowed as a foreign tax credit against the U.S. tax on income from other sources in the foreign country. The House proposal sets up three tests and if any one of the tests are met, it is deemed prima facie evidence that the foreign income tax rate includes an element of hidden royalty. Under the proposal, this theory would be applied not only to foreign mineral income earned directly by a U.S. taxpayer but would also be applicable to dividened income from foreign mining companies to the extent the dividends were attributable to mineral income.

If a foreign country designates an impost as an income tax, it is inappropriate for the U.S. arbitrarily to redesignate a portion of the impost as a royalty. One of the tests proposed for the determination of whether the foreign income tax rate includes an element of disguised royalty is where the foreign country has substantial mineral rights with respect to property from which the foreign mineral income is derived. In many countries, under the law, the ownership of the mineral rights vests in the government, which grants concessions to private mining companies for long periods of time. Under the House Bill, in all such cases, any income taxes imposed would automatically be deemed to include a hidden royalty to the foreign government.

Section 432 of the bill is narrowly conceived and is not consistent with a broad policy of trying to assure that the U.S. has available in the future an adequate supply of metals to meet its requirements. It attempts to add an additional U.S. tax cost in the case of foreign mining operations, and hence it would make U.S. mining companies less competitive in the struggle to obtain control of foreign mineral deposits. For these reasons, this section of the House Bill should be deleted.

Comments on the Testimony of the Treasury Department Before the Senate Finance Committee—September 4, 1969

Under the House Bill, percentage depletion would be eliminated with respect to foreign oil and gas production. Also under the House Bill, it is proposed that the percentage depletion rates for gold, silver, copper, lead and zinc produced from deposits not located in the U.S. should be reduced from 15% to 11%.

In his testimony before the Senate Finance Committee on September 4, 1969, the Assistant Secretary of the Treasury for Tax Policy, The Honorable Edwin S. Cohen, recommended that the proposal to eliminate percentage depletion on foreign oil and gas production be deleted. The reason advanced for this recommendation was very sound. Mr. Cohen said, in part, "* * * after a brief period it will probably result in foreign countries increasing their effective tax rates on income from oil and gas production to "sponge-up" any additional tax revenue otherwise accruing to the United States. Thus the denial of foreign depletion will increase the effective U.S. rate of tax on such income, which tax the foreign governments will then offset by increasing their rates. The end result will be that the U.S. taxpayer will pay additional tax to those countries, but no additional tax to the United States."

Mr. Cohen has shown that he fully grasps the futility of eliminating percentage depletion with respect to foreign oil and gas production. I would like to submit that his very convincing reasoning has equal application to the proposed reduction in percentage depletion rates for gold, silver, copper, lead and zinc produced from foreign deposits from 15% to 11%. This proposed reduction, as Mr. Cohen says about foreign oil and gas deposits, "is unlikely to increase U.S. revenues significantly, and will merely increase the burden of foreign taxes on U.S. businesses." Many foreign countries also allow deductions for percentage depletion. These countries can be expected to reduce their percentage depletion rates promptly to coincide with any reductions in such rates made by the U.S. Those countries which do not have the concept of percentage depletion will, as Mr. Cohen has said, increase their effective tax rates to "sponge-up" the additional tax that would otherwise be payable to the U.S.

With respect to Section 432 of the House Bill, I was gratified to see that Mr. Cohen testified that the Treasury Department did not feel that it was proper to characterize all foreign taxes on mineral income in excess of U.S taxes on such income as disguised royalties. However, the Treasury Department recommended an alternative to Section 432 which would deny the use of excess foreign tax credits which result from the allowance of percentage depletion by the U.S. against other foreign income. The Treasury Department in its testimony before the Senate Finance Committee said, "We believe this rule will effectively deal with the problem of percentage depletion on foreign mineral production." In truth, there is no "problem of percentage depletion on foreign mineral production."

The Treasury Department, by its recommended alternative to Section 432 of the House Bill admits that U.S. taxation of foreign mineral income generally results in no tax revenue to the U.S. by its proposal to deny the use of excess foreign tax credits which result from the allowance of percentage depletion by the U.S. against other foreign income, the Treasury seems to be saying, "Let's see if we can't get some U.S. tax revenue out of smelting, refining or fabricating operations which the U.S. taxpayer performs abroad." This approach is like "grasping at straws", for it would merely encourage foreign countries to raise their tax rates on other than mineral income to "sponge-up" any additional tax revenue accruing to the United States.

In the course of his testimony on Section 432 before the Senate Finance Committee, Mr. Cohen said at one point, "We plan to present recommendations to Congress on this subject as a part of comprehensive proposals relating to the U.S. taxation of foreign source income which we are presently developing." Pending the announcement of these comprehensive proposals, it is untimely for the Treasury Department to foster piecemeal legislation of any kind in the field of U.S. taxation of foreign source income. I suggest that in the course of its study of the subject, the Treasury Department should keep in mind that unilateral actions taken by the U.S. in this field are unwise. Other sovereign nations can be expected to take corresponding retaliatory actions in their tax laws to prevent revenue from being diverted to the U.S. Treasury. The net result of this sort of contest is likely to be higher taxes for the U.S. company operating abroad with little or no additional revenue for the U.S. Treasury.

CONCLUSION

I submit that any proposed changes in our tax laws as they affect natural resources should not be considered solely from a revenue-raising viewpoint. A sound natural minerals policy for the future must contemplate appropriate tax incentives. If it does not, within 30 years the United States will find that it does not have the mineral resources needed to keep pace with its living standards and technological growth.

Respectfully submitted,

E. McL. Tittmann.

Statement of the Cement Industry Tax Committee of 1969, by Robert W. Fort, Chairman, Medusa Portland Cement Co., Cleveland, Ohio

Dear Mr. Chairman: I am writing on behalf of the Cement Industry Tax Committee of 1969, consisting of a majority of the producing capacity of the cement industry in the United States. The names of the companies supporting this statement are listed at its conclusion. The purpose of this letter is to present the position of the cement industry on matters of vital importance to it.

We join with and support the statement of the American Mining Congress presented to this Committee on September 30, 1969, with respect to the provisions of H.R. 13270 affecting the mining industry in general and the cement industry in particular.

However, the cement industry has a specific problem which is not dealth with in H.R. 13270 but which we believe merits the attention of the tax writing committees of Congress. We believe that legislation is necessary to correct an unwarranted reversal by government representatives of their previous interpretation of the law relating to the application of percentage depletion to the cement industry.

BACKGROUND

In 1951 Congress expanded the list of minerals eligible for percentage depletion. Included were calcium carbonates and other minerals utilized in the production of cement. The statute provided that the base for computing the percentage depletion allowance was "gross income from mining," which was defined to include ". . . not merely the extraction of ores or minerals from the ground," but also ". . . the ordinary treatment processes normally applied by the mine owners or operators in order to obtain the commercially marketable mineral product or products . . ."[1] One of the problems in the application of this statute involved the determination of what constituted "ordinary treatment processes" in the case of the so-called integrated producers who conducted both mining and

[1] Sec. 114(b) (4) (B), Internal Revenue Code of 1939.

manufacturing operations, such as the cement industry. As a result of discussions between representatives of the cement industry and the Internal Revenue Service, a ruling was issued in 1953 designating the end of mining at the point where raw materials are ready for introduction into the kiln for burning. At this stage, the raw mix is known as "kiln feed," which is never sold in commerce, and, thus, there is no representative market or field price which could serve as the measure of gross income from mining.

For such situations, Regulations had been promulgated under the 1939 Code in 1940 prescribing that a constructive gross income from mining be determined by means of a proportionate costs and profits computation.[3] That is, gross income from mining was considered equivalent to "the representative market or field price of the first marketable product resulting from any process or processes, minus the costs and proportionate profits attributable to . . . processes beyond the ordinary treatment processes." Thus, the object of the computation in the cement industry is to move from the known, the selling price of the first marketable product, to the unknown, a constructive selling price of kiln feed, by subtracting from the former the costs and proportionate profits applicable to the manufacturing processes. Up until the time the government changed its administrative practice in the early 1960's, as discussed below, the proportionate profits computation had been *traditionally applied on the basis of direct mining processing and direct manufacturing processing costs.*

Although disputes arose between the mining industry and the government during the 1950's as to where mining processes ended for depletion purposes, in 1960 the U.S. Supreme Court settled the matter for past years in its decision in the *Cannelton* case (*U.S.* v. *Cannelton Sewer Pipe Co.*, 364 U.S. 76), holding in effect that integrated miner-manufacturers should compute their gross income from mining on the same basis as their nonintegrated miner counterparts. This problem was resolved for years after 1960 by the enactment shortly thereafter of the Gore Amendment on June 30, 1960 (Public Debt & Rate Extension Act of 1960, P.L. 86–564), fixing the cutoff points for all minerals. The cutoff point for cement was set at the same point as provided by the 1953 ruling. At this time, the representatives of the cement industry believed that the controversy with the government was at an end because the method for computing percentage depletion at the cutoff point had been well established. And indeed a number of cement companies were able to settle their differences with the government utilizing the proportionate profits computation based on the long-standing practice of utilizing in the computation only direct mining and manufacturing processing costs. Thus in 1960 the cement industry had every reason to expect that the proportionate profits workback computation would be applied on the same basis as in the past.

CEMENT'S SPECIFIC PROBLEM

In the early 1960's the government reversed its prior application of the proportionate profits computation by erroneously insisting that certain additional costs be included in the computation as manufacturing costs which are not manufacturing costs, such as transportation and selling costs. This reversal of prior practice resulted in a substantial reduction in the depletion allowance and immediately precipitated numerous administrative and judicial controversies, many of which have continued to this date.

Because of the complexity of the subject and the highly technical nature of the computation, the courts have come up with a variety of interpretations for applying the proportionate profits computation. The result of these interpretations has caused considerable uncertainty for the industry, with some cement companies having their tax status open as far back as 1951.

Recently the Treasury Department has attempted to deal with this problem by regulatory action, and final regulations were issued in 1968 dealing partially with the proportionate profits computation. However, the 1968 regulations continued to ignore prior administrative practice and were met by large-scale protests from the mineral industries. Some relaxation of the harsh results of the 1968 version

---

[3] See Regs. 118, Sec. 39.23(m)–1(e)(3).

was contained in a discussion draft published on March 27, 1969, which, however, has no legal effect and the 1968 regulations continue as the official Treasury position.

Although there are several different items of costs involved in the dispute, the cement industry, in order to put an end to the controversy, wishes to concentrate on the two most important items, i.e., *transportation costs* paid to third parties for shipping cement to customers, either directly or through a terminal, warehouse, or other distribution facility (described herein as purchased transportation to the customer) and *selling expenses* (including trade association dues).

TECHNICAL EXPLANATION OF THE PROBLEM

In the early 1960's the government changed its position to include in the proportionate profits computation as manufacturing costs certain items that had never been so included before. With respect to the two items discussed, the government contended that the cost of purchased transportation to the customer and selling expenses should be treated as manufacturing costs, allocating profit thereto. The cement producers contended that the Treasury's prior administrative practice was a correct interpretation of the law. The prior practice was that (a) the cost of purchased transportation should reduce the selling price of the first marketable product without attributing profit thereto, and (b) selling expenses be spread between mining and manufacturing in proportion to the direct processing costs thereof.

In the cement industry, it is the predominant practice for producers to prepay the cost of transporting the cement to customers so that, in effect, cement is sold on a "delivered price" basis rather than f.o.b. plant or terminal.

The formula for determining "gross income from mining" as set forth in the 1968 regulations:

$$\frac{\text{Mining costs}}{\text{Total costs}} \times \text{Selling price of first marketable product}$$
$$= \text{Gross income from mining}$$

requires the cost of such transportation be included in the denominator, with the result that the producer is treated as having earned a profit on such purchased transportation, even though, on the face of it, would be impossible for the producer to make a profit from the customer by charging him more for public transportation than the customer would have to pay if he bought the transportation directly. It is interesting to note that if one accepts the government's contention that the cement industry makes a profit from transportation, then the producer shipping the greatest distance would make the largest profit. In fact, however, the direct opposite result occurs. The fallacy in the contention that cement producers make a profit on purchased transportation to the customer is established by the fact that after the product is shipped only a few hundred miles the cost of transportation is equal to the value of the cement. If a producer is to penetrate his competitor's market area, he must meet his price. If he ships cement farther than his competitor, he will pay more for the transportation and therefore realize less for his product. This, of course, results in a lower rather than a greater profit.

Secondly, the government contends that expenses incurred to sell cement should also be included in the denominator of the proportionate profits fraction, with no part thereof treated as allocable to mining.[3] It is clear that such expenses relate to the entire product, both mined and manufactured, and are incurred to dispose of the product, not to create it. Obviously, there can be no gross income of any kind, mining or nonmining, without sales and the consequent costs thereof. Selling expenses should be treated like general and administrative expenses, which the government concedes should be allocated to

[3] While there is recognition in pending proposed regulations that at least some portion of selling expenses should be attributed to mining, the portion would not exceed half of the amount allocable on a pro rata basis. There is no certainty that the proposed regulations will be finalized and, furthermore, the Justice Department in litigating is opposing any allocation by an automatic formula.

both mining and manufacturing operations. A substantial part of the industry's selling expenses represents dues paid to trade associations, such as the Portland Cement Association.[4]

REQUESTS FOR CONGRESSIONAL ACTION

The cement industry requests that members of the Senate Finance Committee consider the enactment of an amendment to the Tax Reform Act of 1969, which is intended to end this long controversy between members of the cement industry and the government.

The proposed amendment should provide that if the proportionate profits method is used in computation of gross income from mining (1) purchased transportation to the customer rendered by an unrelated party, such as a common or contract carrier, be subtracted from the selling price of the first marketable product in determining the gross income therefrom, and that no profit shall be allocated to such transportation in the computation; and (2) selling expenses, like general and administrative expenses, be allocated between the mining and nonmining phases of the business in the proportion that the direct costs of mining processes and the direct costs of nonmining processes bear to each other.

SUMMARY

Currently, long after the mining cutoff point for the cement industry was fixed by statute, the industry and the government are unable to agree on the calculation of gross income from mining for the purposes of computing the percentage depletion deduction. Unfortunately, the reversal of prior administrative practices by the government has cause a seemingly unending controversy between the government and industry over this matter. The cement industry is firmly convinced that the only way to bring this wasteful dispute to a conclusion is by requesting Congress to enact amendatory legislation which will state clearly and concisely the manner in which the proportionate profits computation is to be applied.

Respectfully submitted.

CEMENT INDUSTRY TAX COMMITTEE OF 1969,
By ROBERT W. FORT, *Chairman*.

Representing the following cement producers:

Alpha Portland Cement Co., American Cement Corp., Ash Grove Cement Co., Columbia Cement Co., Division of PPG Industries, Inc., The Flintkote Co., General Portland Cement Co., Huron Cement Division of National Gypsum Co., Ideal Cement Co., Kaiser Cement and Gypsum Corp., Keystone Portland Cement Co., Lehigh Portland Cement Co., Lone Star Cement Corp., Louisville Cement Co., Marquette Cement Manufacturing Co., Martin Marietta Corp., Missouri Portland Cement Co., The Monarch Cement Co., Monolith Portland Cement Co., Northwestern States Portland Cement Co., Southwestern Portland Cement Co., Universal Atlas Cement Division of U.S. Steel Corp., and The Whitehall Cement Manufacturing Co.

STATEMENT OF THE STRUCTURAL CLAY PRODUCTS INDUSTRY DEPLETION COMMITTEE, WASHINGTON, D.C.

MEMORANDUM IN SUPPORT OF A 15-PERCENT DEPLETION ALLOWANCE FOR BRICK AND TILE CLAY

---

[4] Pending proposed regulations recognize the principle of allocating trade association dues to mining.

I. Summary Statement

This statement is being presented in behalf of the approximately 467 brick and tile manufacturers to request a *correction of an inequity* in both the rate of the depletion allowance now granted our industry and the point of application of that rate in computing the allowance. We are currently operating under most inequitable legislation starting with the Gore Amendment to the Public Debt and Tax Rate Extension Act of 1960 which was enacted without any hearings being permitted our industry to express our views or to point out the inequities created. The Gore Amendment eliminated the previously court accepted principal of "first commercially marketable product" and by establishing the arbitrary "cut-off" point at the pug mill destroying about 80% of the depletion established for brick men by previous legislation and court decisions. This most drastic action has been a serious blow to the progress and economic stability of our entire industry.

In 1963 we requested the Congress to rectify these inequities and after hearings the Senate voted a rate of 15% allowance to clay which was the same as limestone but failed to modify the cutoff point. When the bill was considered in conference, the conferees went only part way in rectifying the inequity by raising clay from 5% to 7½%, *not* to the *15%* allowed limestone for cement.

The clay industry has been laboring under this inequity for the past six years because the Congress has refused to consider any amendments to the Depletion legislation.

Now with consideration being given to a tax reforms bill depletion allowances are also being reconsidered and the inequity between limestone and clay used for brick and tile should be eliminated.

Another potential inequity has been created between clay and other minerals in the pending House bill H.R. 13270. An effort has been made by the House of Representatives to cut oil depletion allowance from 27½% to 20% or by 27.2%.

However in cutting clay depletion allowance and in order to arrive at a round figure, 5% was given clay resulting in a 33% cut, which is a much larger percentage cut than the 27.2% cut in oil depletion.

Here again limestone was cut from 15% to 11% which is only 26.6%. This also continued the inequities of clay against limestone used for cement. Our request is that brick and brick and tile clay be increased in rate from 7½% to 15% and that the point of application of this rate be, instead of at the pug mill, applied at the point of entrance into the kiln which would give us the same depletion now enjoyed by our most direct competitor, cement. Today in the marketplace of construction, the principal competition for the wall treatment lies between the cement and burnt-clay producers. Cement, under the depletion allowed limestone, is favored by a 15% rate and by application of this rate at the point much further along the line of production than that allowed clay producers under the Gore Amendment. We have charts which illustrate certain points of direct comparison between clay and cement. The first illustrations show the origin and formation of clay and limestone (Figs. 1, 2 and 5). Nature has been generous in creating limestone of the types used in cement making compared with the stingy distribution of clay. This map (Fig. 3) illustrates comparatively, the relative abundance and scarcity of the two minerals. We also show on this map (Fig. 4), the wide distribution of clay plants which must locate on clay beds for their raw materials and near markets because of the mass and weight of clay and its products involved in costly transportation. Fig. 6 shows the number and location of cement plants.

It can be seen that usable brick and tile clay is scarce in nature. Compounding this scarcity is the inexorable spread of civilization. As towns in America located along rivers, grew up, and spread out, they covered vast areas of valuable clay deposits, removing them forever from use. Today, science is being drawn on more and more in the constant search for suitable clays.

Though unevenly distributed, clay is found in many parts of the country. Because of this and the fact that clay's heavy mass which is a very low-priced commodity, limits the shipping distance and the marketing area for a given manufacturer's products, the U.S. structural clay products industry is decentralized in a large number of relatively small plants.

In a typical case, a manufacturer will locate his plant at or near the clay pit to minimize transportation costs. Since the clay from that pit will have a unique color and texture that cannot be duplicated with other clays, that manufacturer is out of business once that deposit has been exhausted. He then must locate a new deposit, build another plant, and begin all over again with an entirely new product.

Whereas suitable clay is scarce, limestone of the quality used in cement manufacture is a sedimentary rock of wide distribution. Usually of marine origin, it frequently consists of calcium carbonate derived from sea shells formed and deposited on ocean floors over eons of time. Such shells, in fact, are still recognizable in many limestone deposits. In others, their derivation has been obscured by the action of waves and currents and by chemical action.

Limestone occurs on every continent in formations ranging from a few inches in thickness to hundreds of feet. It is especially abundant in the eastern two-thirds of the U.S., which was once awash beneath ancient seas. Geologists and mining engineers, in fact, estimate that limestone of the quality used in cement plants is much more abundant in the U.S. than is clay.

Limestone is the chief constituent of hydraulic (portland) cement, which provides the structural clay products industry with its chief competition in every building market, as shown in the Figure No. 7. The competitive imbalance between the two minerals is obvious: the scarcity of brick and tile clay and the problem created by its varying composition contrasted with the abundance of limestone and the fact that variations in quality of limestone when used for such purposes present less problems.

Fig. 9 illustrates most clearly the similarity of the steps of production of clay products and of cement. It shows also how much more of the production process is permitted depletion application in cement than in a clay product. Our request is for the granting of depletion on clay production processing equal to that allowed cement producers. Fig. 7 is displayed to illustrate the direct competition of the clay products to the cement products. We call your attention to the almost exact horizontal product mix of each of these industries. As you see, item by item, they offset each other. As you see also, from (Fig. 8), ours is a small competitor in total dollar volume of business, number of employees, and size of plants.

We are that "small business" group that form the economic background for many small communities over the nation. Relief from the present depletion restrictions would render needed stimulus to this cause of small producers. We realize that much testimony will be presented directed to the *maintenance* of present rates and depletion allowance. In the interest of equitable tax revision, we feel it is equally urgent to request for our industry restoration of a part of our denied depletion and to urge equity in adjusting our rate to overcome the competitive disadvantage placed against us. We will appreciate your consideration.

II. Brick and Tile Clay

Origin

As has been seen, clay is the random creation of glaciers, wind, and water interacting on ancient rocks (Figs. 1 and 2). Clay occurs in three principal forms, all of which have similar chemical compositions but different physical characteristics. They are: Surface clays, which may be the upthrusts of older deposits or of more recent sedimentary origin; shales, which are clays that have been subjected to intense pressures until they have hardened to a slate-like consistency; and fire clays, which usually contain fewer impurities than shales or surface clays and which have more uniform chemical and physical properties.

Very thorough testing of clay reserves must be undertaken to predict their performance in advance. This work entails a great deal of time and money and is becoming increasingly necessary as known reserves dwindle.

Properties

Clays are complex materials, surface clays and fire clays differ from shales more in physical structure than in chemical composition. Chemically, all three are compounds of silica and alumina with varying amounts of metallic oxides and other impurities. Although, technically, metallic oxides are impurities, they act as fluxes, promoting fusion at lower temperatures. Metallic oxides influence the color of the finished product.

To satisfy production requirements, clays must have plasticity which permits them to be shaped or molded when mixed with water and they must have sufficient tensile strength to maintain their shape after forming and drying. When subjected to certain temperature ranges, the clay particles must fuse together. In addition, uniform density, hardness, and regularity of form are necessary.

To control as much as possible any variations in the end product, manufacturers often adjust various ingredients. For example, silica will reduce shrinkage in the kiln, but too much will reduce the cohesion of the clay Lower fusion temperatures can be made possible by the inclusion of carbonate fluxes, but they have a strong effect on color, as does iron oxide, which improves strength.

Scarcity

Usable brick and tile clay is scarce in nature and becoming scarcer as known deposits are exhausted and the urbanization of America continues to spread out over usable deposits, removing them forever from use. Available brick and tile clay in the U.S., in fact, is estimated to be many, many times scarcer than limestone suitable for cement manufacture (Fig. 3).

Mining and Manufacturing Processes

Once a clay deposit has been located, tested, and found suitable for brick and tile manufacture, the mining process begins. Surface clays and shales are mined in open pits through the use of power shovels or shale planers. Some blending of raw materials is done at this stage to obtain a uniform composition. A shale planer helps to get a well-blended mixture since it makes a uniform cut from top to bottom of the bank.

Once dug, the clay or shale mixtures are transported to storage bins in the plant, either by trucks or by rail. Raw materials equal to several days' production usually are kept in reserve.

The first step in processing clay is crushing, which breaks up large chunks and removes any stones that might be present. Crushing is done either in a granulator or by heavy conical rolls.

The clay next is ground in any of several types of grinders. In a typical grinding operation, huge wheels weighing 4 or 5 tons each revolve in a circular pan filled with clay, grinding and mixing as they pass. At this point, some plants then screen the clay by sifting it through an inclined vibrating screen. The clay is now ready for tempering.

The object of tempering is to process the clay into a homogeneous and plastic mass ready for molding into units of a desired shape. This is most commonly done by adding water to the material in a pug mill. The pug mill consists essentially of a chamber within which revolve one or two shafts with blades or knives which thoroughly reduce and mix (called pugging) the material.

Now the clay is ready to be formed, and one of two principal methods is used – either the "stiff-mud" or the "soft-mud" process, depending on the qualities of the clay itself.

In the stiff-mud process, the clay is delivered to an auger machine which forces the plastic mass out through a molding die in a continuous stream called a column, much like toothpaste from a tube. The die molds the mass into the desired shapes for brick, hollow tile or other forms and, as the column is extruded, it passes through a machine which cuts it into the desired lengths. In the size of the die and in cutting to length, allowance is made for the shrinkage that will result from drying and burning.

De-airing is an important development in the stiff-mud process. It is accomplished by use of a de-airing chamber attached to the auger machine, through which the clay passes. The clay is broken up and shredded as it enters this chamber, where a vacuum of from 15 to 29 inches of mercury is maintained. Some of the chief advantages of de-airing are greater strength in the body both before and after firing, increased workability and plasticity, and better utilization of inferior clays.

The soft-mud process is used only for brick and is particularly well-suited to clays which contain too much water in their natural state to be used in the stiff-mud process. The soft-mud process mixes clays with 20 to 30 per cent water. When tempering is completed, the clay is pressed into molds by an automatic machine which sends the molds, presses the clay in, strikes off the excess, "bumps" the molds and deposits the molded brick onto pallets for drying.

In order to prevent the wet clay from sticking, the insides of the molds are either covered with a thin layer of sand or are dipped into water before the clay is pressed into them. Both "sand-struck" and "water-struck" brick derive from this process. Each method produces a characteristic surface texture.

Other brick finishes are provided by machine attachments which will scratch, roll, brush, or otherwise roughen the surface of the clay leaving the die.

After the brick or tile units are formed they must be dried before burning. As the units move off the cutting table, they are loaded onto dryer cars so that air can circulate freely around them. There are many different types of driers, but the purpose of any drier is to remove as much free water from the units as possible in the shortest possible time. The time required will vary with different clays but usually is from 24 to 48 hours. The heat and humidity in the dryer tunnels must be closely monitored during this period to prevent excessive cracking which would destroy the units.

A third method of manufacture, very little used in brick and tile manufacture today, is the "dry press" process where clay in a nearly dry state is molded into shape under high pressure.

Burning is the next step in the manufacture of structural clay products and requires from 60 to 100 hours to complete. Several types of kilns are used, including scove, round periodic down-draft, and tunnel kilns. Fuel may be coal, oil, natural gas or, in some cases, wood.

In the scove and periodic down-draft kilns, the dried units are set by hand according to a prescribed pattern that permits the free circulation of hot kiln gases. In a tunnel kiln, the units are loaded on special rail cars that move through the tunnel at a regulated speed.

The burning or "firing" of clay products may be divided into three general stages: dehydration or "water-smoking"; oxidation or "blue-smoking," and partial vitrification or "hardening." These stages accompany rising kiln temperatures and produce certain physical changes in the units. Temperature and the rate of temperature increase must be carefully regulated according to the type of unit and the characteristics of the clay. All kilns are equipped with recording pyrometers so that the burner can have a constant check on the firing process.

After maximum temperature has been reached, the kiln is allowed to begin cooling gradually. Sometimes this is preceded by "flashing," a step which involves creating an atmosphere in the kiln insufficient for complete combustion. Done skillfully, flashing will produce different colors and shades of colors, depending on the type of clay being fired. Cooling usually takes 48 to 72 hours and the rate of cooling has an important effect on color, while units cooled too rapidly will crack and check.

After cooling the kiln is unloaded, the units are sorted and graded, and either loaded directly for shipment or sent to storage.

Clay Depletion Allowance

Minerals in the ground, whether solid, liquid, or gas, are a form of capital. When a mineral such as clay is extracted from the ground, the value of that clay deposit is to that extent depleted. And at the same time that the clay products manufacturer is depleting his mineral deposit, he is also depleting his plant, and he is also depreciating the expenditures he makes to promote the particular clay products coming from a particular clay deposit.

Congress more than 40 years ago recognized the depletion problem that faces producers in extractive industries when it enacted a "discovery value" depletion provision in the Federal income tax law. This was followed several years later by a more practical percentage depletion allowance, which continues in force to the present. In addition to the compensation of producers for the exhaustion of their reserves, the granting of depletion allowances also encourages the search for new reserves. This contributes to national wealth and purpose.

By the Revenue Act of 1951, the mineral "brick and tile clay" was, for the first time, granted a depletion allowance. That rate was limited to 5 per cent of the gross income from mining. That depletion allowance and the point at which it was applied was carried forward without change into Section 613(b)(5) of the 1954 Code.

Why should a depletion allowance for brick and tile clay be applied at a point in the manufacturing process, rather than when the mineral is extracted from the ground? The answer to that question can be found in the following definition of "gross income from the property." It was written into Section 114(b)(4)(B) of the 1939 Code by the Revenue Act of 1943:

> "As used in this paragraph the term 'gross income from the property' means the gross income from mining. The term 'mining' as used herein shall be considered to include not merely the extraction of the ores or minerals from the ground but *also the ordinary treatment processes normally applied by mine owners or operators in order to obtain the commercially marketable mineral product or products (emphasis added).*"

The same language was carried forward without change into Section 613(c) of the 1954 Code.

In the Senate Report that accompanied the above quoted provisions of the Revenue Act of 1943, the Senate Finance Committee stated:

> "The purpose of this provision is to make certain that *the ordinary treatment processes which a mine owner would normally apply to obtain a marketable product shall be considered as a part of the mining operation (emphasis added)*. . . The law has never contained such a definition, and its absence has given rise to numerous disputes. The definition here prescribed expresses the congressional intent of these provisions as first included in the law. . . . It is therefore made retroactive to the date of such original provisions."

The intent of Congress in granting a depletion allowance to brick and tile clay therefore was that it be applied at that point in the mining-manufacturing process where the first *commercially marketable mineral* was produced.

This was well understood by Senator Walter F. George, of Georgia, who was Chairman of the Senate Finance Committee when the depletion allowance for brick and tile clay was written into the Revenue Act of 1951. In a letter dated June 4, 1955, to T. Coleman Andrews, then Commissioner of Internal Revenue, Senator George said:

> "I personally recall the discussion in executive session between members of the Senate Finance Committee when this statute was under consideration. At the time it was not only understood but I pointed out what I knew and believed to be the facts about brick manufacture. . . . Brick clay at this time has no commercially marketable value until it is baked or cooked. The Senate Finance Committee certainly understood this clearly before the (1951 Revenue) Act, giving depletion allowance to brick clay, was passed. . ."

Regardless of the law and Congressional intent, the Internal Revenue Service refused to recognize the "first commercially marketable product" as a finished brick or tile and clay manufacturers were forced to lengthy and expensive litigation in Federal courts to establish the right to a proper depletion allowance for the brick and tile clay. Over fifty Federal court cases were brought, including one Supreme Court case involving brick and tile clay. This litigation extended over a period of some 10 years. While the clay manufacturers were successful in all of these cases, the Internal Revenue Service refused to recognize the court decisions.

Finally, in a Supreme Court case involving depletion allowance on clay used for clay sewer pipe, the United States Supreme Court rendered a decision adverse to the sewer pipe manufac' .rer. Almost simultaneously, Congress enacted the so-called "Gore Amendment" (Public Law 86-564, 26 USC 611, Ju.ie 30, 1960), modified the Revenue Acts of 1951 and 1954 concerning clay depletion, and applied the 5 per cent depletion allowance at the point after "crushing, grinding and separating the mineral from waste, but not including any subsequent process. . ." – in other words, at the pug mill, a point at which clay is not salable and never has been. In 1963 in an attempt to rectify the inequity existing between clay and limestone used for cement the rate was raised from 5% to 7½% which only partially removed the inequity.

Since brick and tile has no determinable value at this point, a 7½ per cent depletion allowance recognized at this point can not be calculated without using some mathematical formula.

As shall be seen in a succeeding section, Congress has visited a double inequity upon the structural clay products industry in both the *rate* of depletion granted brick and tile clay and the *point* in the production process at which depletion is reckoned, as compared with limestone, the chief constituent of hydraulic (portland) cement, which provides the structural clay products industry with its chief competition (Fig. 9).

Number of Brick and Tile Clay Plants, Their Distribution, Number of Employees, and Dollar Volume

At the present time there are an estimated 467 companies of relatively small size producing structural clay products (Fig. 4). Their products include brick, hollow tile of all types, and architectural terra cotta, but do not include thin wall tile, sewer pipe, flue linings, or drain tile. Types of brick include building brick, facing brick, sewer brick, paving brick, and glazed brick. Hollow masonry units include structural clay tile and structural facing tile, both glazed and unglazed. Architectural terra cotta includes ceramic veneer and ornamental sculpture.

These plants occur in every state, but concentrate in such relatively clay-rich states as Illinois, Indiana, Iowa, Ohio, Pennsylvania, New Jersey, North Carolina, and Texas.

The 467 structural clay products companies employ an estimated total of 37,300 workers, largely in production. The estimated total value of brick and tile shipments in 1968 was $516,000,000 (Fig. 8).

III. Limestone

Origin

Limestone is a whitish rock usually of organic origin (Fig. 5). Much limestone is composed almost entirely of shells, shell fragments, or the remains of other sea creatures. The origin of other limestone deposits is often difficult to determine.

Properties

Except in the case of relatively small amounts of high purity limestone used for chemical and metallurgical purposes, the relative purity of limestone is not too important in determing its use. Because of this and its great abundance, limestone is widely used for a great number of purposes.

Abundance

Limestone occurs on every continent and provides ample evidence of the extent to which the seas once covered the land. In the U.S., limestone is especially abundant in the eastern two-thirds of the country. Geologists and mining experts estimate that limestone of the quality suitable for cement manufacture is much more abundant in the U.S. than is clay (Fig. 3).

Mining and Manufacturing Processes

Limestone is quarried by blasting, then loaded and transported to crushers. If intended for use in cement manufacture, shale is added at that point, usually in the proportion of one part shale to four parts limestone. After the limestone has been crushed and sifted through a vibrating screen, it is next pulverized in a hammer mill and stored.

Limestone is the chief mineral used in the manufacture of portland cement. In modern manufacture, a suitable mixture of limestone, shale, and other minerals is ground together either wet or dry in the proper proportions. If mixed wet, the resultant slurry is pumped into a series of large mixing tanks and from there it is pumped into the kiln. If mixed dry, the ground raw material is carried by a conveyor to storage bins, and from there it is fed into the kiln after it has been damped to control dust.

In either form the raw material enters the kiln at the top end close to the chimney and is met by hot gases. The raw materials thus are dried and, as the kiln revolves, they fall downward toward the clinkering zone. There, under high heat, elements of the limestone and shale partially fuse or "clinker" together. The clinker is removed, cooled, mixed with a little gypsum or water to regulate the setting time, and then is ground to the finished product – portland cement.

Limestone Depletion Allowance

Like brick and tile clay, limestone has enjoyed a percentage depletion allowance since 1951. Unlike brick and tile clay, however, limestone used in making cement has enjoyed a substantially higher depletion percentage – 15 per cent – and that percentage has been applied at a point in the portland cement manufacturing process – at the "introduction of the kiln feed into the kiln" – at which the portland cement industry enjoys a substantial tax benefit (Fig. 9).

Number of Portland Cement Plants, Their Distribution, Number of Employees, and Dollar Volume

Portland cement plants are relatively few in number, represent a considerable capital investment, and lend themselves to automated processes (Fig. 6). These facts are reflected in Department of Commerce figures which show that, at the end of 1962, there were only 188 portland cement plants operating in the U.S., yet their value of shipments totaled $1,238,133,000, although the estimated number of workers employed was only 33,000 (Fig. 8).

Because the location of portland cement plants reflects high construction volume as well as available limestone deposits, the bulk of such plants is in the eastern half of the U.S. and on the West Coast.

IV. The Directly Competitive Nature of Structural Clay Products and Portland Cement

Portland cement provides the chief competition for the structural clay products industry in every one of its markets (Fig. 7). For every structural clay product there is a competitive concrete unit, assemblage of units, or application. Portland cement and its end products are also very competitive with structural clay products in price.

Contrasted with the portland cement industry's relatively few plants and large dollar volume, the structural clay brick and tile industry is composed of a large number of taxpayer companies located in every one of the 50 states. These small independent businesses compete with each other under highly competitive conditions and, therefore, it is traditionally an industry which operates with a very small margin of profit.

Consequently, any factor which creates for one of those businesses a substantial disadvantage in comparison with its competitors may well prove disastrous to that business.

V. **Conclusion**

It is respectfully requested that Congress correct two serious inequities that presently exist in the application of depletion allowances to brick and tile clay and to limestone used in making cement.

First, the structural clay products industry requests that the present 7½ per cent depletion allowance granted brick and tile clay be increased to 15 per cent to remove the competitive advantage now given limestone, which enjoys a 15 per cent depletion rate.

Second, it is requested that the point in the production process at which the clay depletion allowance is applied be advanced from the pug mill to the "introduction of the kiln feed into the kiln," which is the point just before the minerals are burned and the point at which the 15 per cent depletion allowance for limestone currently used in cement manufacture is reckoned.

With these inequities removed, the delicate competitive balance that has existed between the structural clay products and the portland cement industries will have been restored.

+++ ESTIMATE BASED ON U.S. DEPT. OF COMMERCE 1964-66

FREEPORT SULPHUR CO.,
New York, N.Y., October 7, 1969.

Hon. RUSSELL B. LONG,
Chairman, Committee on Finance,
U.S. Senate, Washington, D.C.

DEAR SENATOR LONG: As Chairman of the Board of Freeport Sulphur Company, I wish to make known to you our objections to the provisions of H.R. 13270, the tax bill passed by the House and now under consideration of your Committee, which would adversely affect the present income tax treatment of sulphur and other minerals.

The wisdom of maintaining the existing law has been demonstrated. Discovery of sulphur reserves and development of productive capacity, achieved at great expense and great risk, are evidence that the allowance has accomplished precisely what Congress intended. Similarly—in oil and gas, in nickel, copper, and other minerals—tax provisions have encouraged Freeport and other companies to take risks in both foreign and domestic exploration and development which would otherwise have been too great to assume.

We are convinced that nothing should be done to reduce the incentive to take such risks. We are convinced that it is in the interests of the nation and of the public that the depletion allowance and the foreign tax credit continue to spur the search for sulphur and other vitally needed minerals.

For the above reasons which are set forth in detail in the attached statement, Freeport Sulphur Company respectfully requests that your Committee reject Section 501(a), Section 431, and Section 432 of H.R. 13270, and any other proposals which would have the effect of reducing the mining industry's present incentives to find and develop mineral reserves.

Respectfully,

THOMAS R. VAUGHAN.

Attachment.

STATEMENT OF FREEPORT SULPHUR CO. IN OPPOSITION TO THE PROVISIONS OF H.R. 13270 AND TO TREASURY DEPARTMENT PROPOSALS THAT WOULD ADVERSELY AFFECT THE U.S. MINING INDUSTRY

Freeport Sulphur Company operates sulphur mines located in and off the coast of Louisiana. Freeport also mines china clay (kaolin) in Georgia, potash in New Mexico, and phosphate rock in Florida; and we produce oil in Louisiana, Kansas, New Mexico, Oklahoma, and Texas. At the present time our company is actively investigating the feasibility of mining a copper deposit in Indonesia, nickel deposits in Australia, and asbestos n Mexico. We own a large deposit of pyrrhotite in Virginia, which we hope in time to develop, and we are exploring for oil and various minerals in other states and elsewhere in the world. In addition to our mining and oil activities, we own and operate a large phosphoric acid plant in Louisiana.

For the reasons discussed below, Freeport believes that Congress should reject so-called tax reform proposals which would add heavily to the weight of the tax burden on the natural resource industries. Specifically, we respectfully urge that your Committee reject Section 501(a), Section 431 and Section 432 of H.R. 13270. In support of our position we present the following.

I. WHY PERCENTAGE DEPLETION RATES SHOULD BE RETAINED AT THEIR PRESENT LEVELS

Section 501(a)

The depletion allowance recognizes that production of minerals such as sulphur, is distinctly different from, say, manufacturing. Mineral production involves *constant sale of capital assets.* While a manufacturing firm can produce indefinitely with a constant flow of raw materials, a mining company cannot replenish a mineral deposit when that deposit becomes exhausted. Every mining company, by its very nature, is constantly mining itself out of business.

A mining company's only recourse is to find new properties, new reserves. This is a formidable and financially risky job, because the odds against the explorer are very great and the odds against successful development of a find may be greater still. Where, as in the mining business, failures far outnumber successes, the rewards of success must be great enough to underwrite the inevitable losses which have gone before and will come after, if exploration and development are to continue.

We submit that encouragement of mineral exploration and development was never more important than it is now. The Bureau of Mines is predicting that United States minerals demand will increase by more than four times by the year 2000, whereas domestc mineral production projected on the basis of 20-year trends can be expected to do little more than double by 2000 A.D. Furthermore, the Bureau of Mines is predicting a five-fold increase in worldwide demand for minerals by the end of the century.

Thus we are faced with a widening gap between domestic mineral supply and domestic mineral consumption. The problem of obtaining adequate supplies from foreign sources is complicated by an even more rapid increase in foregn demand for minerals. Such a situation clearly calls for increasing—and not dampening—mineral-exploration incentives.

A. Sulphur

H.R. 13270 would reduce the percentage depletion rate for sulphur from 23% to 17%. Sulphur, a basic element, is an important commodity to our economy. Almost everything we eat, wear or use requires the use of sulphur in some stage of its preparation.

Sulphur exists in many forms and is produced in 55 countries. More than one half of the sulphur being produced and consumed in the Free World is in the form of elemental sulphur or brimstone. The largest domestic sources of brimstone are the salt dome type deposits located in the Gulf Coast area, which are mined by the Frasch hot-water process. Only one in 13 of the domes so far discovered in the United States has been found to contain sulphur in commercial quantities. Of the 348 discovered domes, only 26 have produced sulphur commercially, and nine of these have been exhausted.

Freeport is one of many companies which have incurred great risks and expense to prospect domes which in the end proved to be worthless. Because nearly all of the land-area salt domes in the Gulf Coast region have been explored, we and others have turned in recent times to the open Gulf of Mexico where the search is far more costly. Freeport paid the Federal Government $12,000,000 for the right to explore for sulphur at several locations beneath the Gulf of Mexico off the coast of Texas and then spent another $3,000,000 in exploratory drilling at the locations during 1966 and 1967 and found nothing. At the same time other companies spent more than $20,000,000 in the same general offshore area and found nothing.

By 1980, it has been projected, United States consumption of brimstone will exceed United States production by 100%. From this fact alone it is clear that sulphur producers should be encouraged to explore for additional reserves. Obviously, any reduction in the incentive that U.S. companies now have would seriously jeopardize our long-term national interest and security.

B. China clay (kaolin)

China clay is a scarce type of clay having many important industrial uses in producing paper, rubber, porcelain, whiteware, and paint. The domestic industry is small, and the great bulk of the production comes from rural areas in Georgia and South Carolina.

China clay is presently allowed a 15% rate of percentage depletion, but H.R. 13270 would reduce that rate to 11%. Any reduction, we submit, would harm a small industry and a rural area of the country without any significant increase in revenue. The proposed cut in rate to 11% would produce less than $1,000,000 of additional revenue from all of the U.S. producers combined. This amount, although not substantial from the Treasury's revenue standpoint, is significant from the china clay industry's viewpoint. To the extent that the amount could not be passed on to the consumer, this increase in cost (together with other rapidly accelerating costs) would require a serious reduction in research and development, and reduce the producers' return on investment to such an extent that additional capital may not be available for industry growth. To the extent that the additional tax could be passed on, the resulting increase in prices would adversely affect not only our domestic economy but also our balance of payments, since the major foreign producer (almost as large as all the U.S. producers combined), is ready, willing, and able to increase greatly its sales in the U.S. markets.

C. Other minerals

Freeport, in order to replenish its mineral reserves and to maintain itself as a going mining concern, is engaged in a worldwide search. The finding and development of such reserves not only keeps Freeport alive as a company but is necessary to supply the rapidly increasing demand for minerals of every kind.

Freeport is currently studying the feasibility of developing a copper deposit in West Irian (Indonesia) which will require a very large investment. The importance of this activity is demonstrated by present estimates that Free World demand for copper will more than double in the next 20 years. While the United States leads the world in both production and consumption of copper, the extent to which it meets its future requirements from domestic sources is likely to decrease. Imports will have to supply an increased percentage of future United States demand for this key commodity. The proposed changes in H.R. 13270 relating to percentage depletion and foreign tax credit would substantially increase the cost of projects such as Freeport's Indonesian project. Exploration of this property was the first foreign investment project authorized by the Indonesian Government following the overthrow of the Sukarno regime in 1965; it is important to our country's relations with the Indonesian government.

The commercial development of this deposit requires the solution of formidable problems. The deposit lies on the face of the Ertsberg (a Dutch name meaning ore mountain), a primitive area in the forbidding Carstensz Mountains in West Irian, at an elevation of 11,500 feet above sea level and 60 miles inland from the southern coast. The 60 miles of terrain which lie between our base camp on the coast, with its tropical climate, and the site of the deposit, with frequent subfreezing temperatures, is exceedingly rugged. The first part consists of estuaries and mangrove swamps, followed then by coastal plain and jungle, and finally by a jagged mountain range. Equipment and supplies for the exploration had to be flown to the site by helicopters brought from the United States.

In Australia, Freeport is investigating the feasibility of mining nickel from the Greenvale deposit discovered in Queensland, and is preparing to develop a second nickel deposit, discovered at Nepean in Western Australia.

Since it seems unlikely that the United States will ever obtain much of its primary nickel from domestic sources, Freeport's nickel activities are important to our country. Foreign resources are available only if extraction of nickel from low-grade deposits can be accomplished at realistic costs. Any increase in costs of a U.S. company due to changes in depletion and the foreign tax credit would discourage exploration and development of such prospects. Since foreign producers can avail themselves of tax incentives afforded by their governments, which recognize the significance of minerals to their respective economies, the proposed changes in H.R. 13270 would worsen the competitive position of United States producers.

Another provision of H.R. 13270 would eliminate entirely the percentage depletion deduction in the case of foreign oil and gas deposits. We concur with the Treasury's position made before your Committee on September 4 to the effect that "this provision (should) be deleted from the bill" since "the elimination of percentage depletion on foreign deposits of oil and gas is unlikely to increase U.S. revenues significantly, and will merely increase the burden of foreign taxes on U.S. businesses."

We urge rejection of Section 501(a).

II. WHY THE PROPOSED CHANGES IN THE COMPUTATION OF THE FOREIGN TAX CREDIT SHOULD BE REJECTED

As domestic sources of vital minerals shrink, foreign exploration and development becomes increasingly significant.

Since 1918 the United States has allowed a credit against the U.S. tax liability on foreign-source income for income taxes paid to foreign governments on such income. The purpose of this credit is to achieve equality of treatment between taxpayers and to prevent international double taxation. Many countries (for example, the United Kingdom, France and The Netherlands) prevent international double taxation simply by not taxing foreign income of their citizens which has already been subjected to foreign income taxes. The number of tax treaties in which the United States and other countries are parties attest to the widespread insistence that double taxation be avoided.

Section 431

Where a U.S. taxpayer uses the per country basis in determining its foreign tax credit, Section 431, contrary to existing law, would not in every instance allow a full credit for foreign income taxes paid. Specifically this Section, by means of a complicated formula, would require a taxpayer who reduces his U.S. tax on U.S. source income by reason of a loss from operations in a foreign country to pay back this benefit when income is later derived from that country regardless of whether or not foreign taxes are actually paid on this income. This proposed requirement would result in many instances in subjecting foreign source income to double taxation and would therefore substantially restrict the effectiveness of the foreign tax credit as a means of eliminating the double taxation of income, thus unfairly increasing the tax burden on U.S. companies and making them less able to meet foreign competition.

We urge rejection of Section 431.

Section 432

This section would introduce a special limitation on the amount of credits allowed for foreign income taxes paid in connection with foreign mineral producing activities in situations where the foreign income taxes paid are deemed to be royalties.

We believe the tests proposed to determine when foreign income taxes are to be deemed to be royalty payments are artificial and inequitable.

We support the statement presented before your Committee on September 4 by Edwin S. Cohen, Assistant Secretary of the Treasury for Tax Policy:

> "If, then, this separate limitation in the bill regarding mineral income is not justified on the ground that any foreign tax in excess of the effective U.S. tax on mineral income is a royalty, it works unfairly for mineral companies as compared to all other U.S. taxpayers with foreign operations. It completely denies mineral companies the opportunity, available to other taxpayers, to average the excess of foreign tax over U.S. tax on mineral income against any excess of U.S. tax over foreign tax on their other foreign income."

We urge rejection of Section 432.

As an alternative to Section 432, the Treasury Department proposes that companies be denied the use against non-mineral income of excess foreign tax credits created by the U.S. percentage depletion deduction on foreign mineral income.

This complex proposal would arbitrarily increase tax burdens on foreign mineral income under the assumption that there is some special problem in current laws covering the taxation of such income. We believe this assumption to be erroneous.

We urge rejection of this proposal.

Finally, in connection with Sections 431 and 432, it would in any event appear wise to postpone action in view of the Treasury Department's statement before your Committee on September 4:

> "We plan to present recommendations to Congress on this subject as a part of comprehensive proposals relating to the taxation of foreign source income which we are presently developing. . . ."

III. CONCLUSION

The real beneficiaries of mineral tax laws have been the American people, who have seen an increasing supply of basic materials and energy sources at reasonable prices. Our standard of living is higher than that of any other nation, and we have the highest per capita production and consumption of minerals of any country in the world.

The wisdom of maintaining the existing law has been demonstrated. Discovery of sulphur reserves and development of productive capacity achieved at great expense and great risk, are evidence that the allowance has accomplished precisely what Congress intended. Similarly—in oil and gas, in nickel, copper, and other minerals—tax provisions have encouraged Freeport and other companies to take risks in both foreign and domestic exploration and development which may otherwise have been too great to assume.

We are convinced that nothing should be done to reduce the incentive to take such risks. We are convinced that it is in the interests of the nation and of the public that the depletion allowance and the foreign tax credit continue to spur the search for sulphur and other vitally needed minerals.

For the reasons set forth above, Freeport Sulphur Company respectfully requests that your Committee reject Section 501(a), Section 431, and Section 432 of H.R. 13270.

LONGVIEW, TEX., *September 22, 1969.*

Re Tax Reform Bill.

DEAR SENATOR YARBOROUGH: Regarding the Tax Reform bill that was passed by the House of Representatives, which reduced the Oil & Gas Depletion Allowance and of which certain Senators also are now advocating a large cut; I would appreciate it very much if you would ask these certain Senators "Just who is going to find new reserves and operate the industry in the future, if the incentives are taken away from the highest risk business in this country?".

Our country must have large reserves of Oil & Gas for its future energy needs and for any defense emergency that may come, but if the incentives like the Depletion Allowance and intangible drilling expenses are taken away, young men starting to college will have no interest in studying Geology, and/or Oil Engineering. Losing them out of this field of business will be a loss to the country, and more especially to the Independent Producer. All these crys of "Cut the Depletion Allowance," "Import More Foreign Oil", "Lower the Price of Crude Oil", dampens the interest in this field for our young students. If you will check the records of the various Universities you will find that the number of students who are taking courses pertaining to oil and gas is about 50% of what the number was 10 years ago, and yet our energy needs in the future are going to be greater than in the past, so that we will be needing more, not less, Geologist and Engineers.

Ours is a big risk business, and I am a good illustration of that, during the past two years I have participated in the drilling of 37 dry holes on wildcat blocks of acreage. It takes money to wildcat and find oil, and many times the Independent has to borrow to run this risk in drilling and to do business; so there must be a fair incentive for a young Independent to take this risk. Let's not take that chance away from him by removing all incentives.

We must find more reserves of oil and gas in the 48 states, as we cannot always depend on foreign crude oil—nor can we even depend on the new Alaskan reserves, as they are highly vulnerable to military attacks both at the production site and in transit.

I realize a few men, in the past, made gigantic fortunes in the oil business, but most of these fortunes were made when drilling was shallow; labor and supplies were comparatively cheap. Its a new day now, drilling is deeper and costs are way up.

For the future, and the good of our country, I hope that reason will prevail and that our future energy requirements will not be jeopardized by persons who have not really studied all the facets in the finding a barrel of crude oil.

Kindest regards,

Sincerely,

JOE MUCHER.

STATEMENT SUBMITTED BY MOBIL CORP., NEW YORK, N.Y.

A. I. CRITERIA FOR TAX REFORM

For tax reform to be tax improvement it should meet certain constructive criteria.

In his message of April 21, accompanying his original tax reform proposals, President Nixon set out a number of such criteria.

In the next few paragraphs we restate President Nixon's tax reform criteria and give the reasons why we think that HR 13270 and the Treasury suggestions of September 4, 1969 do not measure up to these standards.

1. *"The American people need and deserve a simplified federal tax system."*—HR 13270 has 367 printed pages of legislation which, as one member of the Ways and Means Committee stated, will add another 20% to the bulk of the Internal Revenue Code.

The Bill has already been characterized as "the Lawyers and Accountants Relief Act of 1969."

It introduces a wide new variety of complexities and administrative burdens to the tax law without the benefit of adequate hearings on the specific proposals. The usual Treasury staff study did not take place with respect to many of the provisions and the necessary and useful reviews by the appropriate committees of bar and accounting associations have not yet occurred in the normal manner.

The complex approach and the rapid timetable that has been adopted have produced many inconsistencies, gaps, and probably unintended results. We comment on these in connection with sections 431, 432 and 501 in Part B. Similar problems exist in many of the other sections. The section relating to deferred compensation is a case in point of added complexity. The taxation of "deferred compensation" at rates other than those applicable in the year of receipt will require annual recomputation of taxable incomes for 10, 20 or 30 back years by persons who receive compensation on a deferred basis.

2. *A program of tax reform should be developed within the limits of fiscal responsibility. We should "repeal the tax of inflation", "a cruel and unjust tax."*—The House Bill, especially after the Ways and Means Committee corrected a "2.4 billion misunderstanding," creates hope for relief among millions that may have to be paid for with inflation. Inflation should be brought under control before new deficits are generated by reductions in government revenues. Until we have achieved more stable economic growth, it seems a mistake to enact nominal tax relief that can only complicate the government's ability to achieve a balanced program of fiscal responsibility.

3. *Tax Policy should be equitable; it should not "soak" any group or give a "break" to any other.*—The revenue raising aspects of the bill are intended to increase annual revenues by $6.9 billion after all the reforms have been phased in. Practically all of it will come from corporations. We respectfully suggest that the result is: "soak" the corporations.

Among corporations, the oil industry is particularly "soaked" by changes raising its taxes: Depletion reduction and elimination; foreign tax credit reduction and production payment elimination would have to be borne in addition to the taxes resulting from the revenue raising measures (such as repeal of investment credit and the cutback in certain depreciation) applicable to corporations in general.

Among individuals, investors in oil and gas operations are subjected to significant tax increases. Furthermore, professionals and the salaried corporate management group are especially hard hit by the cumulative impact of the following: increase in capital gain holding period; elimination of capital gains alternative 25% tax; reduction of capital gains treatment of lump sum distributions from qualified pension and profit sharing plans; disallowance of interest on certain invested borrowings; allocation of deductions; elimination of restricted stock; and substantial elimination of deferred compensation.

4. *Tax Policy should carefully distinguish between tax preferences that provide "social benefit" and "should be expanded" and those that are "inefficient or subject to abuse" and "should be ended".*—In the House Bill tax preferences have in many cases been viewed as evil per se and their incentive aspects not adequately considered. Examples: capital gains rates are increased and the holding period is lengthened (even if the gain is due largely to inflation); the deduction for charitable contributions of appreciated property is substantially reduced; accelerated depreciation on buildings, including new and rehabilitated housing, is subject to recapture; interest on state and local bonds is subjected to tax.

The massive attack on the preferences applicable to oil and gas—motivated by "symbolism"—is especially unfortunate. Some of the most significant changes enacted by the House—those involving percentage depletion and foreign operations—were not recommended by either the Nixon or the Johnson Administrations. As recognized in the studies and proposals for tax reform developed by the Treasury Department during the Administration of President Johnson:

> "The tax treatment of this industry, however, is only one aspect of many relating to our energy industries and therefore bears a relationship to our overall energy policies. These policies are of importance to national security, our balance of payments, foreign trade, and other important areas of public concern in addition to tax fairness."

President Nixon has assumed personal responsibility for the oil imports program and has commissioned a comprehensive review of the entire problem. The decision as to whether the provisions relating to oil and gas are "inefficient or subject to abuse" and should be ended *or* provide necessary "social benefit" and "should be expanded" should be made with reference to our overall policies as to petroleum needs and national security, and ought not to be taken until the President has had the opportunity to reach a decision based on that study and to communicate his balanced evaluation to the Congress.

5. *Good tax reform requires that we "thoroughly review the entire Federal Tax system" and consider "recommendations for basic changes, along with full analysis of the impact of those changes".*—The single most frequent criticism of 1969 tax reform action to date is that it has been done too hastily. We have not had a thorough review of the entire Federal tax system. The Ways and Means Committee wisely deferred consideration of the estate and gift tax provisions of the Code. The Treasury has appropriately stated that the deferred compensation provisions require more study. The same deliberate approach should be adopted in other cases—especially the provisions relating to oil and gas.

Hasty action—and some members of the Ways and Means Committee stated that haste in July made it impossible for them to fully analyze the impact of the changes included in H.R. 13270—is not likely to lead to lasting tax reform. Drafting of provisions affecting the oil and gas industry can only suffer if it must be done before the results of the President's review of imports and the Treasury's study of the provisions regarding taxation of foreign income are available. Repeal of the investment tax credit is premature while the President's newly appointed committee is considering the impact of taxes on business. While all desire tax reform now we respectfully suggest that sound tax reform requires the opportunity to fully analyze the impact of the changes being considered. If too short a timetable is set it will be difficult to avoid having sound economics overwhelmed by political symbolism.

A. II. H.R. 13270 IS ANTI-OIL. THE TREASURY SUGGESTIONS OF SEPTEMBER 4 PROVIDE SOME IMPROVEMENTS IN CERTAIN AREAS BUT ARE WORSE IN OTHERS

A. Termination of investment tax credit

Section 703 would terminate the investment tax credit. The investment tax credit termination would affect all business and not merely the oil industry. Its weight would, however, bear particularly hard on capital intensive industries of which the oil business is a prime example. The effective date provisions bear heavily on all industry—especially industries such as oil that have long lead times in their capital investment programs. The investment tax credit was enacted as a permanent part of our revenue system. It has served its purpose to assure the modernization and competitiveness of U.S. industry. Its long term effect is anti-inflationary. In the short term termination will produce confusion; it will not aid the short term fight against inflation.

B. U.S. percentage depletion reduced to 20% (discussed in detail in part B)

Sec. 501 would reduce the allowable rate of percentage depletion on U.S. oil and gas wells to 20%. This would have an adverse effect on the U.S. oil and gas industry that would be serious—far more serious than is suggested by the "CONSAD Report". Such a cut would require an increase in gasoline prices or it would result in an appreciably lower flow of capital into the business. The Treasury did not propose a cut and in his recent press conference the President reaffirmed that he believes it would be unwise to reduce the rate. We strongly urge that the reduction should not be enacted.

C. Foreign percentage depletion eliminated (discussed in detail in part B)

Sec. 501 would eliminate percentage depletion of foreign oil and gas wells. Sec. 501 would treat foreign oil and gas in the same category as air, dirt, seawater and other inexhaustible sources. Every other mineral that is granted percentage depletion in the U.S. is also entitled to the deduction abroad. Most of the important minerals—as in the case with oil and gas today—are entitled to use the same rate at home and abroad. The Treasury has recommended that the rate for foreign depletion be the same as domestic; we strongly support the Treasury position.

D. Production payment financing. (Discussed in detail in part B)

Sec. 501 would treat the sale of production payments as a loan regardless of fact that the sale is recognized as such under applicable state law. This change will unwisely eliminate the utility of such sales as a source of capital for oil operations.

E. Foreign tax credit. (Discussed in detail in part B)

Sec. 431 provides for the recapture of foreign losses through a complicated limitation on future allowable foreign tax credits. As proposed it would operate unevenly and we believe illogically. The major difficulty of the proposal however is that it is an oblique attack on the expensing of intangible drilling expenses by companies doing business abroad. The restriction of this incentive raises serious policy questions. No such change should be made at least until there has been a careful consideration of our overseas petroleum policy objectives.

Sec. 432 would limit the use of surplus foreign tax credits arising from foreign mineral activities (narrowly defined). The reason given by the Ways and Means Committee for the provision was the difficulty of distinguishing between foreign income taxes and other payments such as royalties. The Treasury recommends elimination of Sec. 432, pointing out that normal royalties are paid overseas as they are in the U.S. We concur in the Treasury's recommendation.

The Treasury, however, in lieu of the House proposal, has suggested that surplus foreign tax credits arising as a result of the percentage depletion deduction be restricted.

The Treasury has also suggested that consideration be given to a further restriction in cases in which the effective foreign income tax rate is greater than 60%. The Treasury also announced that it is conducting a comprehensive review of the taxation of foreign income.

We believe that the foreign tax credit should apply uniformly to all taxpayers and that there should be no special discriminatory provisions applicable to mineral activities. We oppose enactment of Secs. 431 and 432.

In any event no changes in the foreign tax credit provisions should be made pending the review that Treasury has undertaken.

F. LTP and allocation of deductions

Secs. 301 and 302 provide for a limitation on tax incentives currently granted to individuals. Among the incentives to be limited are intangible drilling expenses and percentage depletion. The Treasury has recommended that these provisions should apply more onerously against oil and gas investments than has been provided in HR 13270. The underlying concept of the limitation provisions is questionable and there does not seem to be a persuasive rationale why oil and gas investments should be treated more severely than other worthwhile investments such as municipal bonds.

On September 4 the Treasury also proposed that in certain undefined circumstances intangible drilling expenses that had been deducted would be "recaptured"—i.e. restored to income at ordinary rates—when the property is sold. While it appears that this provision would be limited to certain situations that would have been covered by the LTP provisions but for a Treasury proposed 60% rule—it is not clear that it is so limited (no statutory language was proposed). Even if it is so limited it seems unfair, and where applicable, could be a greater burden than the relief from LTP originally granted under the Treasury proposal.

G. Gasoline tax deduction (September 4 Treasury proposal)

The Treasury proposed on September 4 to increase income taxes on gasoline users who itemize their deductions and thus currently claim the present allowable deduction for state gasoline taxes. For a state that charges a 6¢ gasoline tax, this would result in an increase in the after tax cost of gasoline from 1¢ to 4¢ per gallon, depending upon the consumer's marginal income tax rate. This proposal would pyramid a large new gasoline cost on top of the predictable increases that the remainder of the proposed legislation would force.

In sum HR 13270 and the Treasury message of September 4 are anti-oil in general and in their specifics. No other sector of the economy is singled out for such heavy new cumulative burdens. In the next section we discuss why such action would be specially inappropriate at this time.

A. III. ANTI-OIL CHANGES IN THE TAX LAW SHOULD NOT BE ENACTED WITHOUT FULL ANALYSIS OF THE CONSEQUENCES. CHANGES SHOULD BE MEASURED AGAINST U.S. NATIONAL PETROLEUM OBJECTIVES

It is inappropriate to enact anti-oil changes because:

(a) The President is in the process of formulating national petroleum objectives as a necessary part of the Presidential Imports Study.

(b) The facts will show that the U.S. owned oil industry needs to attract more capital in the future than it has in recent years.

(c) Existing incentives and regulations (including those relating to U.S. gas) have produced an industry that:

(1) earns no more than a fair return on capital measured against other industries;

(2) charges prices that have increased less than other prices;

(3) pays a fair share of tax when appropriate account is taken of state and foreign taxes;

(4) has just been able to maintain the level of U.S. reserves (thus resulting in declining reserve/production ratios and a rapidity approaching gas shortage).

It is inappropriate to enact changes in the taxation of oil and gas *now* because:

(a) Changes should be designed to meet our yet to be stated national petroleum objectives.

(b) There is as yet inadequate understanding of the consequences of change. Certain opinions and studies have been published (e.g., CONSAD Report) that come to erroneous conclusions because of invalid assumptions arising from this lack of understanding.

(c) In recent months there have been dozens of proposed changes that have been put forward as ways of achieving greater incentives at lower cost. To date these proposals when studied by the industry have not measured up to the stated expectations of the sponsors.

(d) The existing structure has evolved over forty years. It is not likely that an improved structure will be evolved without a careful objective study by both experienced operators and scholars. This kind of study has not yet taken place. It is most unlikely that changes motivated by political considerations will produce constructive changes in the national interest. We are confident that the industry would stand ready to participate in such a study as it is now contributing to the study of the imports question).

The deliberate approach being recommended need not take undue time. We believe it likely that a statement of national petroleum objectives will be forthcoming as a part of the President's decision on imports. An evaluation of our oil and gas taxation system could be prepared for consideration by the Congress promptly thereafter.

If the Congress feels constrained to act before the recommended studies have been completed, we respectfully submit that it should evaluate any changes in the light of the following: For reasons of:

(1) U.S. international freedom of action.

(2) Balance of Payments.

(3) The interests of our free world allies.

(4) Aid to developing nations.

We require—(in order of priority):

(1) A healthy domestic oil industry that can attract sufficient capital to find sufficient oil and gas in the U.S. to maintain appropriate reserve/production ratios. (Undue reliance on foreign oil should be avoided as long as possible.)

(2) A healthy U.S. participation in the Canadian oil and gas industry. (Canadian oil and gas should not be grouped with other foreign oil in light of geographic, economic, historical and political considerations.)

(3) Adequate and diverse sources of supply of foreign oil in the hands of U.S. companies.

Measured against these standards, we believe that on information now available it would clearly be a mistake to enact the anti-oil provisions discussed in II. above.

A. IV. EFFECTIVE DATES OF CHANGES SHOULD BE EQUITABLE AND GRADUAL

Effective dates of tax reform legislation should be set with two objectives in mind. They should not cause retroactive taxation and, where they will severely affect particular groups of taxpayers, they should be phased in gradually.

Incentive provisions that have been in existence for many years as a result of conscious Congressional policy decisions should in particular be protected from retroactive or abrupt elimination. These provisons have often been challenged in the past but they have to date always been reaffirmed. It would be unfair and inefficient to make changes with effective dates prior to the time the new provisions are signed into law. Earlier dates will catch many taxpayers in midstream and will impose burdens on transactions that never would have been undertaken had the new tax burdens been known in advance.

If changes are to be made in the tax structure applicable to oil and gas—a structure that has existed for forty years—the great number of people working and investing in the petroleum industry will need time to adjust to new tax levels if avoidable inequities and inefficiencies are not to be suffered. A gradual approach to tax increases proposed by H.R. 13270 is particularly appropriate with respect to the oil and gas industry because of the magnitude of the tax increases and the fact that they will fall in large part on income from investments made under present tax law. Thus, for example, if percentage depletion rates are to be reduced, they should, in no event, be reduced by more than one percentage point in any year. Should restrictions be placed on the extent to which foreign losses can be used as deductions, such restrictions should not be placed on losses arising from existing concessions. There should be at least a three-year grace period to minimize inequities relating to existing work commitments. We do not mean to suggest that a gradual elimination of these deductions would not produce undesirable effects. We do suggest, however, that a gradual change would produce fewer undesirable effects than an abrupt change.

There are examples of gradualism in H.R. 13270 and in the Treasury recommendations with respect to tax increases proposed for many groups of taxpayers. The concept is also made applicable with respect to rate reductions. A similar approach is called for to the extent that Congress decides that it should change the taxation of oil and gas at this time. Furthermore, if the investment tax credit is to be permanently eliminated from the Revenue Code, its repeal should be prospective and it should be phased out with a 1% reduction per annum rather than abruptly cancelled.

B. DISCUSSION OF SECTION 431 ("FOREIGN TAX CREDIT REDUCTION IN CASE OF FOREIGN LOSSES"), SECTION 432 ("SEPARATE LIMITATION ON FOREIGN TAX CREDIT WITH RESPECT TO FOREIGN MINERAL INCOME"), AND SECTION 501 ("NATURAL RESOURCES")

The portions of the Tax Reform Act most adverse to U.S. oil corporations are Sections 431, 432 and 501. They are marred by the same flaws that are common to a large part of the Tax Reform Act: excessive and sometimes discriminatory new taxes imposed on a relatively small group of taxpayers; inattention to harmful long term consequences to the country; and statutory drafting that is often difficult to understand.

Section 431 ("Foreign tax credit reduction in case of foreign losses")

(*a*) *Summary*

Section 431 is applicable only to taxpayers doing business abroad and electing the per-country method of computing allowable foreign tax credits. It provides that if such a taxpayer sustains a loss in a foreign country, foreign tax credits attributable to profits subsequently earned there must be reduced under a highly complex formula. The purpose of the Section, according to the House Ways and Means Committee Report (page 117), is to permit the Treasury to recapture the U.S. tax benefits originally obtained by the taxpayer through the deduction of the loss.

(*b*) *Drafting flaws*

There are numerous drafting flaws in this Section. For example, it requires a disallowance of foreign tax credits even where the loss gave no U.S. tax benefit, it provides no time limit within which the recapture can occur, it contains no requirement that recapture can be applied only with respect to profits from the business operation that caused the loss, it can under rather ordinary circumstances cause a double recapture, it does not apply if an election to credit foreign taxes is not in effect in the loss year, and it can result in recapture upon the total abandonment of a loss project where nothing of value is salvaged.

(*c*) *Conceptual error*

More serious than the drafting errors is the misconception of the Ways and Means Committee (page 116 of the Report) that a U.S. taxpayer can now receive a double tax benefit by (i) deducting a foreign loss from domestic income in the year incurred and (ii) claiming a foreign tax credit against U.S. taxes otherwise payable on eventual income from that country. The implications are that the loss is deductible but the profit is non-taxable. The second implication is wrong. The taxpayer would have had no foreign tax credit to apply to the foreign profit if he had not first paid foreign tax on that income. The fact that the tax is paid to a foreign government is of no significance to the taxpayer. His tax burden in both the loss and profit years is exactly the same as if the losses and profits had been incurred in the U.S. (It may even be greater if foreign tax is imposed in excess of the U.S. rate.) This is precisely the result the foreign tax credit is designed to achieve.

(*d*) *Reasons for Rejection*

This Section, by prohibiting the crediting against U.S. taxes of certain foreign income taxes, deviates from the concept that foreign and U.S. income should be taxed in the aggregate at the same rates. This concept of tax neutrality is today firmly embedded in the Internal Revenue Code and in our international network of treaties prohibiting double taxation of the same income. The Section is particularly objectionable because it was included in the Act primarily as an indirect means of attacking international oil corporations' deductions for drilling expenses in foreign countries before profitable production is established. While not denying a deduction for these expenses, the recapture provision is designed to have substantially the same effect. This backdoor and extremely complex approach to the question should be rejected. If the deduction for foreign intangible drilling costs is to be restricted or denied, it should be done openly and only after a thorough survey of the economic and other consequences of such a change.

Section 432 ("Separate limitation on foreign tax credit with respect to foreign mineral income")

(*a*) *Summary*

Section 432 provides that a foreign tax imposed on foreign mineral income can only be used as a credit against U.S. income tax on mineral income from the same country, despite the fact that the taxpayer may have elected the overall limitation. It is designed to prevent heavy foreign income taxes imposed on mineral profits from being applied as credits against U.S. taxes on other more lightly taxed kinds of foreign income.

(*b*) *Justification*

The Committee Report (page 117) justifies this legislation on the basis of the alleged difficulty of determining whether a part of foreign income taxes paid on mineral production is really noncreditable royalty.

(*c*) *Reasons for Rejection*

High foreign taxes on oil production cannot be characterized as disguised royalties. Assistant Secretary of the Treasury Cohen in his statement on September 4, 1969 before the Senate Finance Committee noted that foreign countries often receive royalty payments greater than those paid in the U.S. He also noted that foreign countries frequently impose income tax on non-mineral income in excess of U.S. rates. Mobil Oil Corporation agrees with the Treasury's conclusion that Section 432 would work unfairly for mineral producing companies as compared with other U.S. taxpayers with foreign operations and that it should be deleted.

(*d*) *Treasury substitutes and reasons for rejection*

Mobil does not believe that the Treasury's substitute suggestions are well conceived. These involve a disallowance of excess foreign tax credits to the extent attributable either to percentage depletion or to foreign taxes on mineral income imposed at rates over 60%. Although the first suggestion is much preferable to the total disallowance of percentage depletion on foreign production proposed in Section 501 of the Act, it still would remove, unwisely in our opinion, a portion of the tax benefit stemming from the depletion allowance.

The concept of disallowing credits for foreign taxes in excess of 60% was reviewed by the Treasury before the Senate Finance Committee but was not recommended. In fact, the Treasury concluded that as a general matter, it is difficult to justify dealing more harshly with high foreign taxes on foreign mineral income than on other types of income. We agree that disallowance of foreign tax credits solely because they result from high foreign taxes on mineral income would be discriminatory and believe the idea should be abandoned.

Section 501 ("Natural resources")

Section 501 proposes two important tax changes affecting the oil industry.

Section 501(a) would change current percentage depletion rules and section 501(b) would convert certain mineral property interests into loan transactions.

(*a*) *Summary* (*Section 501*(*a*))

Section 501(a) would reduce percentage depletion rates on income from oil and gas wells from 27½% to 20% for domestic production and to zero for foreign production. Mobil Oil Corporation objects to these changes.

(*b*) *Justification*

Reduction in depletion rates is justified by the Ways and Means Committee (page 137 of the Report) on the grounds that the 27½% rate provides an unnecessary stimulant to drilling and that the revenue cost of depletion allowances and the resulting tax deductions to oil producers are too great.

(*c*) *Reasons for rejection* (*Section 501*(*a*))

The United States, through a multitude of U.S. enterprises, currently controls the ample, secure supply of reasonably priced oil and gas that is vital to the country's safety and well being. To tamper with this state of affairs by reducing or eliminating such a key incentive as percentage depletion without first making a careful forecast of its impact on exploration, production and prices would be a mistake. The only study of this question known to have been available to the House Ways and Means Committee as they considered Section 501(a) is a document entitled "The Economic Factors Affecting the Level of Domestic Petroleum Reserves" prepared for the Treasury Department during 1968 by the CONSAD Research Corporation and forwarded without comment by the Treasury to the Ways and Means Committee on March 11, 1969.

The CONSAD Report is filled with false assumptions, and is based on obsolete data. Perhaps its most significant error was the assumption that wells would continue to be drilled even where it was clear that their costs would not be recovered. The Report is not a proper basis on which to formulate legislative policy. It is submitted that, consistent with President Nixon's decision to retain the present oil import quota system until he has considered the report of the Cabinet Task Force on Oil Import Control, a decision on the merits of reducing domestic or foreign oil depletion rates should be postponed until a complete study, in which the oil industry is permitted to participate, is made of the effects of reduction.

(*d*) *Reasons for retaining foreign depletion* (*Section 501*(*a*))

Whatever decision is made as to the proper depletion rate for oil and gas wells, it should continue to be applicable to foreign as well as domestic production. There is no explanation in the Ways and Means Committee Report as to why the desirability of eliminating percentage depletion on foreign production outweighs its obvious disservice to the concept of tax neutrality except that at page 137 it is stated that foreign depletion "results in a large loss of revenue without commensurate advantages." In its analysis of the revenue effect of this elimination on page 138, however, the Committee Report predicts that all but approximately 10% of the $100 million gross tax revenue gain would, after 1970, be offset by unused foreign tax credits or eliminated by increased foreign taxes. Thus, it appears that the foreign depletion allowance has a net U.S. tax revenue cost of no more than $10 million per year, and that its elimination would soon result in foreign governments receiving $9 in extra tax revenue for $1 received by the U.S. Furthermore, there would be a predictable deterioration in our competitive posture as to new foreign exploration projects. The Treasury opposes the elimination of foreign percentage depletion. Mobil strongly supports the Treasury's position.

(*e*) *Summary* (*Section 501*(*b*))

Section 501(b) of the Act would add a new Section 636 to the Internal Revenue Code to provide that a mineral production payment, whether retained or carved out, would be treated as a loan to the owner of the underlying working interest rather than as a separate property interest held by the owner of the payment. The effect of this new rule would be to include the production payment in the income of the owner of the underlying working interest as the mineral is produced.

(*f*) *Reasons for rejection* (*Section 501*(*b*))

The propriety of treating any production payment as a loan is open to serious question, since in fact no loan exists and no party is obligated to make payments to another from his general funds. This is true whether or not an A-B-C transaction occurs and whether or not the payment is carved out or retained.

On a more practical level, retained payments are normally created when a mineral property is sold, and creating an artificial loan out of a retained payment would presumably reduce the purchase price of the property to reflect the tax that the purchaser would have to absorb on the income accruing to the production payment. The burden would then fall on the seller, typically an independent oil operator, and would strike another blow at the incentive to these persons to search for new oil and gas reserves. As is the case with the other portions of the Act directly affecting the petroleum industry, the effect of this removal of incentives can only be guessed, since no competent analysis has been made.

The proceeds of a carved out production payment are the economic equivalent of prepaid income received by any businessman for services or goods to be delivered in the future. At the insistence of the Internal Revenue Service, the courts have held for many years that prepaid income is taxable when received and not when the contract is completed by the seller. Section 501(b) proposed to reverse this rule for the mineral industry alone, so that the seller of a carved out production payment will not be considered, for tax purposes, to have received income until the actual production of the mineral has occurred. It is submitted that this is discriminatory legislation and should be eliminated.

STATEMENT BY JAYE F. DYER, EXECUTIVE VICE PRESIDENT, APACHE CORP.

UNIQUE FORMULA PROVIDES ECONOMIC THRUST

A unique tax formula has been at work in the United States over the past 35 to 40 years, giving powerful thrust to America's economic growth.

This formula embodies two key elements which, when applied together, have contributed significantly to the generation of the strongest, most dynamic economy in the history of mankind.

Those two elements are:

1. The progressive, confiscatory income tax
2. And, tax incentives

Taken alone, the high income tax rate stifles individual initiative and thereby becomes a deterrent rather than a thrust to economic growth.

But when combined, these two elements tend to encourage the flow of risk capital into the economy. Dollars taxed at lower rates would simply be paid in taxes. When subject to high confiscatory rates, these same dollars are attracted to investments which offer tax incentives.

Thrust has been given to the petroleum industry by this very combination of elements—the rapid increase in income tax rates in the early 1930s, following adoption of the depletion provisions, and then the vitally important provision for expensing intangible drilling costs.

During that 35–40 year period, our gross national product has catapulted from less than $60 billion to nearly $900 billion—testifying to the dynamics of the American economic formula.

To substantially alter either the income tax rates, or tax incentives applicable to the oil industry, would upset the fine balance and do immeasurable harm to not only the petroleum industry but our total economy as well.

INCENTIVES SHOULD BE BROADENED

Rather than reduce such incentives, they indeed should be broadened and put to work to meet other national needs, to solve social and economic problems just as they have helped create a strong and productive petroleum industry.

Similar incentives could attract risk capital into the solution of the shortage of low-income housing, the control of pollution, development of parks and recreational land, rural economic development.

American ingenuity, as demonstrated by your lunar landing, is capable of accomplishing virtually any objective it sets out to achieve. Given the economic incentive, the American investor will tackle any job deemed to be in the national interest. Americans want to invest . . . this is the basic cause of the American economic miracle.

APACHE CORPORATION IS A CASE IN POINT

My company, Apache Corporation, is a case in point. I can categorically state that we would not be in business today if it weren't for the dynamic combination of economic elements I have cited.

Application of that formula has made it possible, over the past 15 years, to build a $59 million corporation owned by 8,000 shareholders, employing more than 2,000 people in 11 states.

Apache's original business, and still our primary endeavor, is the operation of petroleum exploration and production programs for individual investors. Those investors are successful professional men and businessmen who are putting the product of their labors to work creatively. They are risking dollars in the highly speculative business of petroleum exploration in the hope of earning a return commensurate with that risk. Perhaps even more importantly, they are contributing to our National income by the discovery of new energy sources and the multiplier effect of their expenditure as it cycles through our economy.

Employing that private risk capital, Apache explores for and develops new oil and gas reserves throughout the United States and Canada.

For the sake of simplicity, I will deal in round numbers. Over the past 10 years, Apache has put some $100 million of normally taxable income to work in the search for and production of petroleum.

Of that $100 million, approximately $50 million would have been paid in federal income taxes had it not been invested in petroleum exploration and production. Thus, the high tax rates forced $50 million into the private sector of our economy, which was accompanied by another $50 million. It was attracted to the petroleum industry by the existing tax incentives.

Now let's take a look at the economic thrust those dollars generated:

1. The $100 million was paid principally as wages and salaries to employees of drilling contractors, petroleum service companies, and others supplying goods and services. It contributed to finding more than 300 million barrels of petroleum reserves.
2. $37 million have been returned to investors as their share of oil and gas sold thus far, with additional income to flow over a period of 20 or more years.
3. $9.5 million has been earned by the company and its shareholders for managing the drilling activity.
4. Three other company divisions have been spawned by the income and equity produced by oil. One operates public utility firms, another manufactures tools and equipment for industry and government, and the third develops and operates urban and suburban real estate.

The U.S. Treasury, too, has benefited directly from this economic thrust. As the attached chart (Chart I) shows, each dollar of tax incentive will generate $1.20 of taxes as it flows through our economy prior to reaching the Treasury.

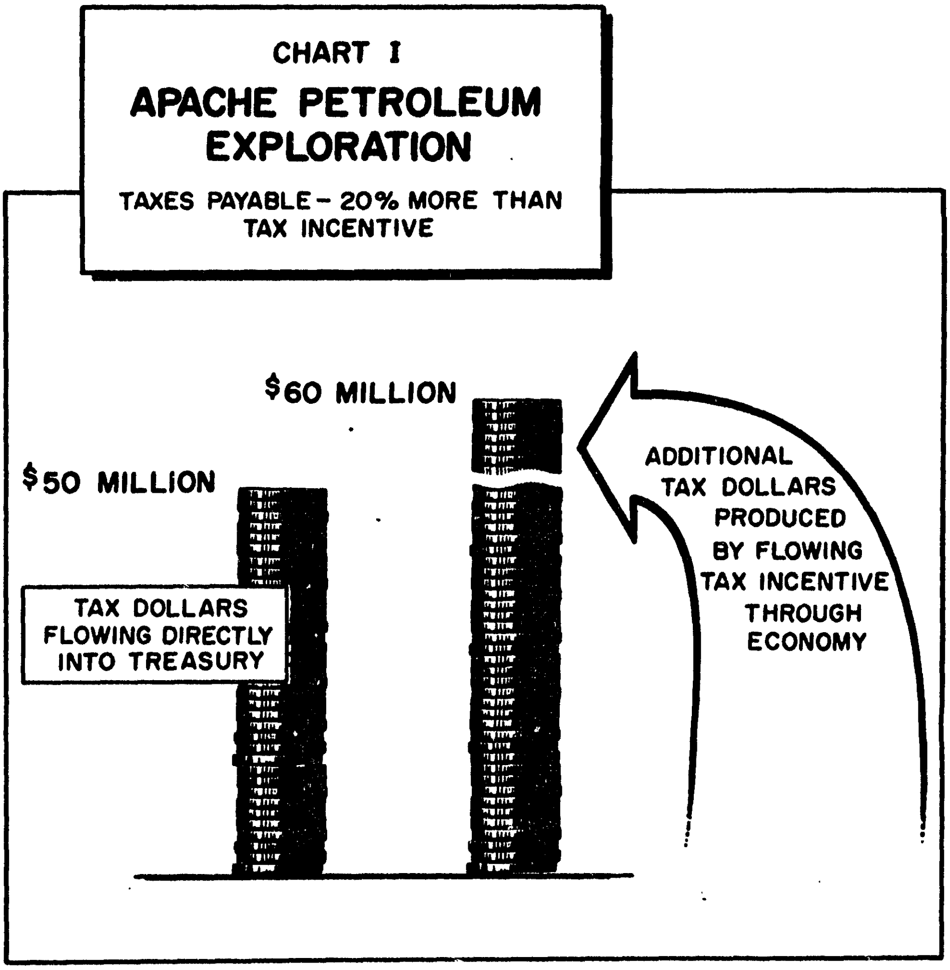

CHART I
APACHE PETROLEUM EXPLORATION
TAXES PAYABLE – 20% MORE THAN TAX INCENTIVE
$60 MILLION
$50 MILLION
TAX DOLLARS FLOWING DIRECTLY INTO TREASURY
ADDITIONAL TAX DOLLARS PRODUCED BY FLOWING TAX INCENTIVE THROUGH ECONOMY

1. Expenditures for services generates about $35 million of income taxes paid by wage earners.

2. Corporate suppliers will pay about $4.4 million in corporate income taxes.

3. Investors will pay about $21 million of income taxes on the production revenue derived from their share of the discovered petroleum reserve.

4. Therefore the $50 million tax incentive will provide about $60.4 million in taxes.

This represents only a portion of the multiplier effect caused by our confiscatory tax incentive system. Further, it is probable that none of the $100 million would be available if it were not for the incentives of the depletion provision and the deduction of intangible drilling expenses.

U.S. CAPITAL DEVELOPED CANADIAN INDUSTRY

Another case in point is the development of the petroleum industry in Western Canada. There is very little tax incentive for Canadian citizens to invest in petroleum exploration. But U.S. taxpayers derive the same benefit from an investment in that country as the United States. So, here again, the magnet of opportunity, supported by our dynamic tax formula, has attracted U.S. risk capital, totalling some $10 billion during the last 22 years, to the development of the vast Western Canada oil industry. By comparison, it is estimated that only $4 billion of Canadian capital has been invested there. Thus, major impetus to an important Canadian industry has been provided by U.S. dollars.

In passing, I would venture that the recent Alaskan oil discoveries, so important in our total domestic reserve picture, would not have been made were it not for the combination of tax elements cited here. Petroleum exploration of the North Slope began in about 1944 under the auspices of the federal government. Little economic value has been contributed to the nation by that activity. On the other hand, the petroleum industry, operating under the tax incentive system, began significant exploration in 1964, and this year—five years later—has increased the domestic reserve by at least 20% and has provided the State of Alaska with more than $1 billion and a continuing source of income for several decades.

WHY INCENTIVES ARE NEEDED

Critics of petroleum tax provisions are saying: "Why so much fuss about oil? The industry appears to be in robust health. World-wide supplies are almost limitless. A little belt-tightening in the interest of tax reform is a small price to pay."

These premises may all be true, considering the industry on a global basis.

But the very factors taken into account in initially establishing the tax structure for oil are even more salient today for the very survival of the domestic oil industry.

Other testimony, I am sure, has discussed these factors in detail, and I will not attempt to reiterate that evidence. Let me simply cite some of the key reasons why oil tax provisions should be preserved:

1. Our nation's defense and economic well-being require an adequate domestic source of oil.

2. A high risk factor works against the attraction of all but very speculative capital.

3. High costs have reduced the amount of drilling activity.

4. As a nation we are rapidly consuming known existing reserves, thus bringing about an impending shortage.

The threat of a petroleum shortage is not a theoretical one. It exists here and now and is most vividly seen in the diminishing availability of natural gas.

John G. Winger points out in the August 26, 1969 issue of "The Petroleum Situation" published by Chase Manhattan Bank, that conditions could rapidly reach a critical stage for the nation's natural gas industry and its customers.

As he indicates, gas is found incidental to the search for oil. And if the industry severely curtailed its hunt for oil in the United States, very little additional gas would be found, and although gas can be imported, the potential sources are limited and more costly.

On the basis of Chase Manhattan surveys, Mr. Winger has expressed the opinion to us that at least $3 billion *more per year* must be spent in the U.S. for oil exploration and development just to maintain our current level of self-sufficiency.

ECONOMIC PHILOSOPHY IN QUESTION

In reality, the point we face today in the discussion of so-called tax reform is a philosophical one: Who spends more productively, government or private enterprise?

The alternative to incentive is subsidy.

Speaking for but one small segment of a giant industry, I unhesitatingly go on record as being opposed to subsidy. Just as strongly do I urge the continuation of existing oil tax incentives:

1. The 27½% depletion allowance.
2. The deduction of intangible drilling expenses.

These are not "loopholes" in themselves. Their misuse is. And certainly I concur that the 155 millionaires who reportedly escape all taxes indeed are misusing these incentives.

Rather than diminish or curtail the incentives which, when harnessed to the progressive income tax system have given dynamic thrust to our total economy, let us expand those incentives and broaden them to other areas. In the hands of creative, motivated men they can produce solutions to our most crying national needs. And all America will benefit.

STATEMENT OF HENRY C. VAN RENSSELAER

Application of H.R. 13270 to Independent Canadian Oil and Gas Companies

My testimony is submitted as a United States citizen and as a Vice President and director of Bow Valley Industries, Ltd., an independent Canadian oil and gas company whose common shares are listed on the American Stock Exchange. I am deeply troubled over the effect of the provisions of H.R. 13270 relating to the elimination of foreign depletion and the provisions of that Bill and of the Administration's proposals relating to limitations on the use of deductions for intangible drilling expenses. I am concerned that enactment of any of these proposals will reduce the availability of Canadian oil and gas to the United States and will adversely affect the future of independent Canadian oil and gas companies. I am also concerned that enactment of any of these proposals will impede the economic growth of western Canada, and, concomitantly, reduce western Canadian purchasing power for United States products.

The interest of the United States in the continued development of Canadian oil reserves which are linked to the United States by pipeline and secure from the viewpoints of national defense and political stability is clear. It is even more clearly in the interest of the United States consumer that Canadian gas reserves, which now stand at 47.6 trillion cubic feet and are expected to eventually exceed 700 trillion cubic feet, be developed rapidly enough to prevent a major escalation in past prices in the United States, where domestic reserves are not at present considered adequate to accommodate the future market. In 1968, 47% of total Canadian gas sales of 1.29 trillion cubic feet went to the United States, the export percentage having risen from 14% since 1957.

Either the elimination of foreign depletion or the adoption of the restrictions placed on the use of deductions for intangible drilling expenses under the Allocation of Deductions provision of H.R. 13270 would have a substantial adverse effect on the future exploration for oil and gas in Canada. Enactment of the proposal of the Administration also to include intangible drilling expenses in the Limit on Tax Preferences unless at least 60% of the taxpayer's gross income is derived from the sale of oil and gas would be even more damaging.

Total oil and gas exploration expenditures in western Canada last year were just under $500,000,000, with independent companies drilling 59% of the exploratory wells. A survey conducted by the Independent Petroleum Association of Canada among the 125 companies comprising its membership reveals that in excess of $100,000,000 of the Canadian independents' annual exploration budget currently comes from United States individual and corporate participants with the greater part coming from individual spending. An example of the impact of the proposed legislation on this exploration is the case of our company, whose exploration program amounted to $4,004,128 in the fiscal year ended May 31, 1969. $3,307,084, or approximately 82.5%, was provided by a small group of United States individual investors who have notified us that they expect to terminate their activities with our company if Congress eliminates depletion on Canadian oil and gas production or restricts the use of deductions for intangible drilling expenses.

The elimination of foreign depletion would have a particularly serious effect on U.S. oil and gas investments in Canada due to a provision in Canadian tax law (to which the U.S. individual or corporate participant having operations in Canada is subject) classifying gains from sales of oil and gas property as ordinary income. This provision of Canadian tax law was enacted in 1962, at which time the Canadian law was also changed to permit certain purchasers of oil and gas properties to currently expense the cost of all land or production acquisitions. Under the combination of Canadian and United States tax laws to which a United States investor would be subject, in the absence of U.S. depletion there would be no way for such an investor to realize on his investment without paying either Canadian ordinary income rates with a top bracket of 80%, in the event of a sale, or United States ordinary income rates with a top bracket which is presently 77% (including the surcharge), in the event the property is held for income. Thus, if the U.S. depletion deduction were eliminated for Canadian oil and gas production, the U.S. investor would be taxed full ordinary income rates in Canada if he sold his interest and at full ordinary income rates in the United States if he operated it.

The proposal to restrict the full benefits of the deduction of intangible drilling expenses under the Allocation of Deductions provisions of H.R. 13270 is an additional factor making individual investors in Canadian oil and gas drilling ventures reluctant to make forward commitments at the present time; the threat of enactment of the Administration's proposal relating to including intangible drilling expenses in the Limit of Tax Preferences in the case of taxpayers deriving less than 60% of their gross income from oil and gas is even more serious. This is so because the exploration programs of a number of individual investors (who typically do not derive 60% of their gross income from oil and gas) have, to date, not been particularly profitable even under present tax laws. In the case of exploration programs managed by my company, investors over the last ten years have participated in 265 exploratory wells without experiencing a really significant discovery. While our exploration is primarily designed to find major reserves, and is, therefore, involved in a large percentage of high risk ventures, our results are closer to typical than the sensational discovery and "get-rich-quick" story which the public popularly identifies with the oil and gas independent.

The independents are the high-risk exploration arm of the Canadian oil and gas industry. Using their own cash flow and acting as managers for U.S. individual investors the independents habitually drill prospects which the major companies consider too risky to drill in their lower tax brackets. As a consequence, the independents drill many dry holes but they also make many of the major discoveries, indicating that exploration for oil and gas is a long way from being a precise science and that it still takes a lot of drilling and, at times, exploration concepts not necessarily developed by the major companies to find large reserves. In fact, the three most notable gas discoveries in western Canada during the past few years—Edson, Quirk Creek and Strachan-Ricinus—involving reserves expected to exceed 5 trillion cubic feet were all made by independents who use exploration funds provided by U.S. individual investors. During the same period the largest oil discovery in Canada was made by a small independent company in the Zama-Rainbow country in the northwestern part of Alberta. The company in question had experienced a decade of disappointing exploration results and investor discouragement. The discovery was made in an area written off by the major companies as gas-prone and opened up a trend which now has in excess of a billion barrels of proven oil reserves.

The exploration for oil and gas is a high risk business and cannot compete for capital with less risky investments unless the tax benefits are correspondingly high. Even under present tax laws the rate of return on invested capital for the oil industry is comparable to the rate of return of other less risky industries. Any cutback on the ability of taxpayers to deduct intangible drilling expenses or to secure depletion deductions on production will deal a severe blow to the independent segment of the oil and gas industry due to its reliance on exploration funds from individuals and corporations with non-oil and gas income. The result would be a further concentration of the industry in the hands of the larger companies and a lower level of exploration activity and eventual higher prices to the consumer.

Whatever the justifications may be for eliminating depletion on foreign oil and gas production, these arguments are not applicable to the Canadian situation. The discovery of additional Canadian oil and gas reserves is important to the United States for economic and defense conditions; recent discoveries on the North Slope of Alaska have served to confirm the potential of the Canadian Artic as a future major source of supply to North America. Accepting that fact, it is essential that a full tax deduction for drilling expenses be accorded to encourage investment in the type of expensive, high risk exploration ventures typical of northern development. The acknowledged argument in favor of domestic depletion—the stimulation of discovery and development of oil and gas deposits to make the United States self-sufficient and independent of questionable supplies of foreign oil and gas—has equal validity in support of depletion for Canadian oil and gas production.

In sum, I urge your committee to:

(1) retain the depletion allowance for oil and gas production in Canada; and

(2) retain the present unencumbered deduction for intangible drilling expenses.

There is, of course, well established precedent for shaping U.S. law and policy to take into account the special relationship between the U.S. and Canada, and especially their economic interdependence. Examples in point are the recent favorable treatment given Canada under the interest equalization tax and the Foreign Direct Investment Regulations. Furthermore, in view of the emerging unified Continental oil and gas policy, it would make no sense to discriminate against Canadian oil and gas exploration and production through U.S. tax legislation.

October 2, 1969.

APPENDIX E

WRITTEN TESTIMONY RECEIVED BY THE COMMITTEE EXPRESSING AN INTEREST IN THE SUBJECT OF NATURAL RESOURCES (OIL AND GAS)

Written testimony received by the committee expressing an interest in the subject of natural resources (oil and gas)

CONGRESS OF THE UNITED STATES,
HOUSE OF REPRESENTATIVES,
Washington, D.C., October 7, 1969.

Senator RUSSELL LONG,
Chairman, Senate Finance Committee,
U.S. Senate, Washington, D.C.

DEAR SENATOR LONG: When Congress first instituted percentage depletion in 1926, it did so in reaffirmation of its belief expressed in the discovery depletion provisions of 1918, that an equitable system of taxing petroleum income was in the national interest. The Congress knew then that a society which was fast moving to higher levels of manufacturing and agricultural productivity would require plentiful supplies of economical and efficient fuel to energize its production machinery. It knew also that the high risks of exploring for oil and gas required fair incentives to attract investment of the capital needed to do the job.

This is why percentage depletion was enacted and this is why Congress has reaffirmed the provision after many, many examinations of the original provision.

How wise was the decision to provide incentives for capital investment is brought home to us in our daily lives through enjoyment of the highest standard of living in the world, a standard of living made possible in America by the effective and widespread use of petroleum which now provides 75% of the energy used by machines for producing goods; for generating power; for transportation; and for planting and harvesting our rich agricultural produce.

The United States now faces the greatest challenge in its history for finding oil and gas. In the next ten years, we need to find about 80 billion barrels of oil according to the Department of the Interior. We are advised that the capital requirements to explore for and to develop these new reserves are about double the average annual rate of investment for the last decade.

New capital certainly cannot be attracted and much of the presently employed capital cannot be expected to remain in this risky business if producers are burdened with the inequitable measures proposed in H.R. 13270. Exploration is vital to our national economy and to our national security. We must not in the future turn out to be a have-not nation dependent upon foreign powers for our energy supplies. Our national mineral resources policy should continue to encourage exploration and development of domestic petroleum reserves needed for the future. The policy has worked well in the past. It is required for the future.

I represent a District which has for many years been an important supplier of oil and gas to the people of the State of California. Thousands of people are employed in the petroleum industry of California, and California is the largest petroleum consumer in the nation. We need all the oil and gas we can produce in California and must also import supplies from other states. The future well being of the people of my District and of my State is heavily dependent upon adequate supplies of oil and gas.

Many of my constituents are small independent producers who would be especially hard hit by the provisions of H.R. 13270. Many of them would find their operations uneconomical if H.R. 13270 were enacted, and would find it necessary under the burdens of H.R. 13270 to shut down and abandon some of their present producing properties. This would be an irreparable loss to the people of California; would cause loss of employment; and would defeat the very purpose of the taxing statutes by drying up forever the sources of revenue which produce taxes. And I submit that what is a loss to the people of California is also a serious loss to the nation.

I have received letters from hundreds of people in my District protesting the anti-petroleum provisions of H.R. 13270. They object to any reduction in depletion. They also object to the other provisions of H.R. 13270, and to the related

33-865—69—pt. 5——73

proposals of the Treasury Department which are applicable to individuals in connection with including percentage depletion and intangible drilling costs in the computations under the Limited Tax Preference and allocation of Deductions provisions. They see these as little more than a thinly disguised and indirect attack on percentage depletion and intangible drilling costs. I concur in these views.

I most respectfully urge your opposition to all these unwise proposals which would undermine the incentives needed to help assure an adequate supply of domestic oil and gas for our economic well being and our national security.

Please make this letter a matter of record of the hearings presently being conducted by the Senate Finance Committee on tax revision.

Sincerely,

BOB MATHIAS,
U.S. Congressman.

STATEMENT SUBMITTED BY JOHN M. EVANS, DENVER, COLO.

Re proposed reduction of oil and gas depletion allowance.

GENTLEMEN: This statement is submitted on behalf of my wife and members of her family, several of whom own some mineral interests. The only income received from these interests is from leasing and, in a few instances, some oil and gas royalties.

The legislation now under consideration proposes to reduce the oil and gas depletion allowance from 27½ per cent to 20 per cent but it still allows a 50 per cent deduction on sale of long term capital assets.

One who owns minerals owns a capital asset. Oil or gas in place may be lost by migration but, of course, that is true of the surface of the land which may be lost by erosion or land slide, and land may be lost by the shifting of a stream which is a property boundary. Personal property which is a capital asset may be lost in many ways. Therefore, the migratory nature of oil and gas does not prevent its being a capital asset and it is so treated for most purposes in our Internal Revenue laws.

If the mineral owner's lessee achieves production of the oil or gas, the owner sells his share of the oil or gas (the royalty) just as the owner of any other capital asset sells his property and when the oil and gas deposit is depleted, the capital asset is gone for good.

We submit, therefore, that it is inequitable and discriminatory to allow the owner of a capital asset a 50 per cent deduction while allowing the mineral owner only 27½ per cent, using a cost base of zero on the oil and gas deposit, which is not usually the case. To reduce the depletion allowance from 27½ per cent down to 20 per cent would merely increase this discrimination.

An additional indirect effect of reducing the depletion allowance will undoubtedly be the reduction of the frequency of leasing, thus further reducing the income of the mineral owners.

Most of the arguments we have read in favor of reducing the depletion allowance, charging income tax "avoidance", seem to be directed toward the lessee-producers and statistics are generated to show how depletion and development costs as well as other deductions are pyramided to avoid paying what is argued to be a fair share of the over-all tax load. The statistics I have seen do not bear out the tax avoidance charges as a general proposition because I believe the figures show that oil companies have consistently paid a higher percentage of their gross receipts in income taxes than have manufacturing companies. However, if it is felt that the total deductions available to producers are too great the solution is not to reduce the depletion allowance but rather to place a lower over-all ceiling on the total deductions.

WASHINGTON, D.C., *September 29, 1969.*

Hon. RUSSELL B. LONG,
Chairman, Committee on Finance,
Old Senate Office Building,
Washington, D.C.

DEAR SENATOR LONG: The tough limitations section of the House passed tax bill is a crippling blow to and could be a disaster to our nation's natural resources development. The tax provisions that have been the most effective part of the economic incentives for oil and gas are the very ones being diminished in H.R. 13270. Development of natural resources are a vital part of the national interest.

An analysis of the House passed tax reform bill clearly demonstrates that it would penalize a people and an industry at a time when capital expenditure requirements are at an all time high. Nearly one half of the capital requirement is obtained via this capital recovery tax method. In fact the capital requirements are now lagging for oil and gas. They should be nearly doubled each year for the next ten years in order to provide the general public the amounts of energy and fuels to meet their increasing needs. For the past two decades there has been a consistent relationship between the amount of capital invested in search of oil and gas and the proven reserves actually found. For the past nine years we have been falling behind; we are not finding as much oil and gas as we are consuming.

The House passed bill has had a chilling effect on the whole energy-fuels industry as well as all natural resources industries. It is restrictive and unacceptable, coming at a critical time when the national economic policy should be updated to implement and encourage innovation and new ideas in natural resources development giving opportunity to young men and women to develop them. The House Bill in its present form threatens to undermine the uniquely American energy-fuels system that is the one big part of modern technology whether in the home or on the highway, whether in the factory or on the farm, in peace or war, in the air or on the seas. The United States needs a growing, continuous and uninterrupted supply of domestic oil and gas. Without it, the United States of America would not be as we know it today or hope it will be in the future.

Sincerely,

ELMER L. HOEHN,
Former Administrator, Oil Import Administration.

POWDER RIVER OIL CO.,
Houston, Tex., September 5, 1969.

Hon. Senator MIKE MANSFIELD,
U.S. Senate,
Washington, D.C.

DEAR SENATOR MANSFIELD: We are an independent oil producer, with production in the state of Montana, as well as other states in that area. Amidst all the threats of legislation adverse to the oil industry, we want to point out a fact that possibly has escaped your attention, and that being the taxes we are presently paying to the state of Montana applicable to our interests there.

To refresh your memory, we are subject to five different types of taxes levied directly upon us: Crude Oil Production and License Tax Valorem Tax on personal property, Net Proceeds Tax and Individual Income tax. That is five not counting Unemployment Compensation Insurance, which is in reality a tax, and hidden taxes. In the year of 1968 we paid the State of Montana in excess of $82,000.00, and that was only the beginning. In 1969, the Montana Legislature enacted tax increases. In 1969, we expect to pay the State of Montana in excess of $101,000,000 in taxes, or a little over 8.6 % of our anticipated gross receipts from all sources in all the states where we operate. This figures to be in excess of 55% of our net income for Federal Income Tax purposes before deducting state taxes. Because we are a nonresident, our taxable income for Montana Income Tax can be greater than our overall taxable income for Federal Income Tax. Such was our situation for 1968, when our Montana Income Tax liability exceeded our Federal Income Tax liability.

We realize that all levels of government must have taxes, but there are so many of them that it is overpowering the source of the funds. There is the City, County, State and Federal, not to mention the School District, Road District, Water District and Hospital District, and all of them crying for more money. You may have heard, the legislature in our home state of Texas is at present in a second overtime period trying to write a tax bill to provide more revenue.

We don't oppose taxation. What we do oppose is this all our war on the petroleum industry. While all the others are enacting outright tax increases, the Nixon Administration is encouraging an attack on the other end by supporting a move to enact legislation that would cut the percentage depletion allowance and is rattling sabres at the intangible development charge-off. And, lest we forget, there is the Task Force on Oil Imports. The industry simply can't afford unrestricted oil imports that would ultimately result in decreasing our domestic reserves and create a dependence on foreign oil.

Senator Mansfield, we simply ask that while you are studying all of the proposals that will be presented to Congress relating to the petroleum industry, that you bear in mind the situation that exists in the states, particularly in Montana, and we think you will agree that the petroleum industry needs your help.

Very truly yours,

RICHARD C. MERCHANT, *Controller.*

TEXACO, INC.,
New York, N.Y., September 30, 1969.

COMMITTEE ON FINANCE,
U.S. Senate,
Washington, D.C.

GENTLEMEN: As Chairman and Chief Executive Officer of Texaco Inc., I feel it necessary to submit our views in opposition to the provisions of H.R. 13270, the Tax Reform Act of 1969, and to the proposals recommended to the Committee by the Treasury Department that would adversely affect the present income tax treatment of the oil and gas industry.

Based upon Treasury Department estimates, the so-called reform measures of the proposed Tax Reform Act would raise $1.6 billion of additional revenue in 1970, and of that amount over $500 million, or about one-third, would come from the petroleum industry. Furthermore, these figures do not take into account the additional tax burden that would be placed upon our industry by the concurrent legislative proposals to repeal the 7% investment tax credit and to impose a 10% income tax surcharge.

Most of the additional revenue that would be raised by provisions of the proposed Act that affect the oil and gas industry would result from reduction in the percentage depletion rate on oil and gas production from 27½ percent to 20 percent. Such a cutback in this long-standing incentive that has proven its value in generating and attracting the funds needed by the industry to explore for and develop new petroleum reserves would not be in the best interests of our nation and its citizens.

Our nation presently consumes almost 14 million barrels of petroleum products daily. This present demand is projected to expand to over 18.5 million barrels a day by 1980. To meet this demand and to maintain at least our present ratio of reserves to production, the industry must find some 70 billion barrels of new domestic reserves by 1980. To finance this search, the present $4.5 billion annual outlay for domestic exploration and development will have to be increased to over $7.5 billion. Continuation of the present tax incentives is essential if the industry is to generate and attract the funds needed for these outlays.

The present tax incentives are integrated into the economics of the oil and gas industry, and they should not be cut back. They have served the nation well, as is made clear by the industry's record of prices, profits, and taxes:

As to prices.—Prices of petroleum products have remained consistently low despite the inflation experienced in our economy. In terms of constant dollars, gasoline prices are lower now than in the 1920's even though there has been a tremendous increase in quality of the product.

As to profits.—The industry's tax incentives have not resulted in excessive profits. In fact in 1968 and over the last ten years the average rate of return on investment in the petroleum industry has been lower than the average for all manufacturing industries.

As to taxes.—The industry bears its full fair share of the nation's tax burden. Any valid comparison of tax burden must take into account all types of taxes paid. Total domestic taxes paid by the industry now amount to over $11 billion a year, comprising direct taxes of $2.5 billion and taxes on products of $8.5 billion. The direct domestic tax burden alone for the most recent year for which figures are available (1966) was 6.03¢ per dollar of revenue for the petroleum industry, as compared with 4.75¢ per dollar for industry in general.

Data compiled for the 21 largest United States oil companies show that their direct tax payments made to all jurisdictions in which they operate, both domestic and foreign, amouneted to more than 64% of their net income before such taxes for the year 1967. Texaco's tax payments were comparable, amounting to 60.3% for that year.

Our views on the necessity for continuing the present tax provisions relating to the oil and gas industry coincide fully with those summarized in the Department of the Interior's 1968 report, "United States Petroleum Through 1969," as follows:

"Both intangible expensing provisions and percentage depletion have been long-standing and durable features of the tax treatment of the petroleum industry, despite repeated efforts to change, reduce or eliminate them. They are an integral part of the petroleum industry's structure of income and expense, and the available evidence suggests that any substantial change in them would have a direct and significant effect upon the future availability and cost of oil and natural gas."

In addition to reducing the percentage depletion rate for domestic production, the proposals in H.R. 13270 would eliminate percentage depletion on foreign oil production. They would also restrict the effectiveness of existing treatment under which foreign income taxes are allowed as credits against United States taxes in order to minimize double taxation of foreign incomes.

These additional proposals would impair the ability of American oil companies to meet the severe competition of foreign controlled companies, which in many instances operate under an umbrella of subsidies granted by their home governments. If geographically dispersed petroleum reserves are to be developed by American rather than foreign owned companies, it is imperative that the United States companies remain competitive. If the United States were to impose discriminatory taxes or foreign tax credit restrictions to which foreign competitors are not subject, the result would be an eventual reduction in our foreign reserves to the detriment of our national security and our balance of payments. Furthermore, it has been recognized by Treasury officials of this and prior Administrations that the effect of repeal of percentage depletion on foreign production would be to penalize American companies, with no benefit to the United States Treasury; it would only result in foreign countries increasing their effective tax rates to "sponge-up" any additional tax revenue that otherwise would accrue to the United States. Hon. Edwin S. Cohen, Assistant Secretary of the Treasury, testified to this effect before the Committee on Finance on September 4, 1969.

Today unprecedented demands for revenue are being made to finance ever-growing government services. Along with these revenue demands, many proposals have been made in the name of tax reform. Where tax reform is necessary, it should be accomplished. And funds for legitimate governmental purposes should be raised. However, the increasing revenue demands and the proposals for tax reform must not be permitted to lead this nation into taxation policies which are unsound and which would be detrimental to national security and the overall best interests of our country.

Accordingly, and for the foregoing reasons which are elaborated upon in the attached statement, I respectfully urge that the Committee take no action that would reduce the long-standing and effective tax incentives applicable to the petroleum industry.

Very truly yours,

J. Howard Rambin, Jr.

Statement of Texaco, Inc., in Opposition to the Provisions of H.R. 13270 and to Treasury Proposals That Would Adversely Affect the U.S. Petroleum Industry

The provisions of H.R. 13270 and the Treasury Department proposals that would adversely affect the petroleum industry by impairing the value of existing tax incentives to search for and develop new petroleum reserves should be rejected. Also, the restrictions upon the foreign tax credit as proposed in H.R. 13270 and by the Treasury Department would reduce the effectiveness of the credit in minimizing double taxation of foreign income and should not be adopted.

A. THE PERCENTAGE DEPLETION RATE SHOULD NOT BE REDUCED

The proposal in H.R. 13270 to reduce the percentage depletion rate on domestic oil and gas production from 27½ percent to 20 percent is not in the best national interest, as can be demonstrated by a review of pertinent consideration.

1. The industry's record as to prices, profits, and taxes

The 27½% rate for percentage depletion has been part of the statutory pattern of taxation for more than 40 years, and is an integral part of the economics of the oil and gas industry. Any objective review of prices, profits, and taxes of the petroleum industry will demonstrate that the present percentage depletion rate has proven effective, and has not resulted in economic distortion that require correction.

a. *Prices.*—Percentage depletion has helped our industry set a record that is second to none. It has fostered exploration for and development of new reserves, thereby providing an increasing supply of petroleum at consistently low product prices.

At September 1, 1969 the average retail service station price of regular gasoline, exclusive of excise and motor fuel taxes, was 23.99¢ per gallon, as compared with the 1957–59 average of 21.59¢ an increase of 11.1%. This compares with an increase of 29% in the consumer price index during the same period. Since the 1957–59 period, total taxes on gasoline increased from an average of 9.02¢ per gallon to 11.11¢, an increase of 23%.

Further, in 1926, the year percentage depletion was adopted by Congress for petroleum production, the average domestic retail price of gasoline was 21¢ per gallon. In September 1969 the average retail price of a far better quality of gasoline was up only about 3¢ per gallon from 1926, or about 15%, while the consumer price index more than doubled.

Also, at September 1, 1969, the average domestic tankwagon price of regular gasoline to dealers, ex tax, was 17.20¢ per gallon, an increase of only 5.3% from the 1957–59 average price of 16.33¢. This compares with an increase of 13% in the general wholesale price index for the same period.

The average well-head price of domestic crude oil in August 1969 was $3.10 per barrel, compared with $3.00 during the period 1957–59. Therefore, crude oil prices increased only 10¢ per barrel, or 3%, over this ten-year period, as compared with the 13% increase in general wholesale prices.

b. *Profits.*—The oil and gas industry does not make excessive profits. The annual study of corporate profits by the First National City Bank of New York for the year 1968 showed that the rate of return on the net assets of the oil and gas industry for that year was 12.9%, compared with 13.1% for all manufacturing industries. During the period 1965 through 1967 this rate of return on net assets was 12.5% for the petroleum industry compared with 13.5% for all manufacturing industries. During the decade 1959–1968 the oil industry rate of return was 11.5% as compared with 12.1% for all manufacturing industry. In 1968, 19 of the 40 major manufacturing industries surveyed were more profitable than the oil and gas industry.

A May 1969 *Fortune* magazine survey of the 500 largest domestic industrial corporations showed seven oil companies numbered among the 25 companies having the highest volume of sales. However, only one of these seven companies that ranked in the top 25 on the basis of sales made the list of the top 100 companies having the highest ratios of net income to invested capital, and that company (Texaco) ranked only ninety-ninth.

c. *Taxes.*—A study published in July 1969, by Petroleum Industry Research Foundation, Inc., entitled "Economic and Social Implications of Removing the Percentage Depletion Provision", showed that the domestic tax burden of the industry, excluding motor fuel and excise taxes, was higher than that of all business corporations. The data are as follows (cents per dollar of gross revenue) ·

	All business corporations	Domestic oil and gas industry
1964	4.31	4.82
1965	4.62	5.43
1966	4.75	6.03
3-year average	4.56	5.43

In 1966 the petroleum industry's direct domestic tax payments amounted to $2.5 billion (exclusive of motor fuel and excise taxes), or 6.03¢ per dollar of gross domestic revenues, compared to 4.75¢ for all business corporations, as shown above. If motor fuel and excise taxes were included, the petroleum industry's domestic tax burden for 1966 would amount to 21.3% of gross domestic revenues. For 1965, if motor fuel and excise taxes were included, the ratio of the total domestic tax burden to gross domestic revenues would be 20.8% for petroleum and 6.6% for all business corporations.

The magnitude of the tax burden on the oil industry is further demonstrated in a study of 21 of the largest domestic petroleum companies compiled by Price Waterhouse & Co. at the request of the Mid-Continent Oil & Gas Association and submitted to the House Ways and Means Committee. This study showed that U.S. income taxes applicable to adjusted income (generally U.S. source income) of the 21 companies amounted to 19.1% for 1966 and 19.4% for 1967. The study also showed that total U.S. and foreign income taxes of the 21 companies amounted to 36.6% of net income before such taxes in 1966 and 37.1% in 1967. Finally, since it is neither fair nor accurate to evaluate the oil industry's tax burden solely in terms of income taxes, the study showed that the total direct taxes of all kinds of the 21 companies amounted to 64.3% of net income before such taxes for the year 1966 and 64.2% for 1967.

Texaco is one of the 21 companies for which the foregoing data were compiled. Its direct tax payments constitute one of its largest costs, amounting in the year 1968 to over $1.2 billion. That amount was more than total payments made to employes and more than three times dividend payments to stockholders. The direct tax payments of $1.2 billion were exclusive of $1.3 billion of motor fuel and other taxes collected from consumers and paid to governments. The nature and extent of Texaco's tax payments are discussed more fully in Exhibit "A", attached hereto.

2. Petroleum reserve requirements

The ratio of domestic reserves of crude oil and natural gas liquids to annual production was 10.3 to 1 in 1968. This ratio is down from 13.5 to 1 in 1958. Our industry will have to discover some 70 billion barrels of new reserves in the period 1969–80 to meet anticipated demand and to maintain the present ratio of 10.3 to 1. This amounts to about 70% more than the 41 billion barrels found in the period 1957–68.

The magnitude of the task of discovering 70 billion barrels is best seen when we estimate the amount of money that will be required to attain this goal. It is estimated that some $90 billion (or an average of $7.5 billion a year) will be needed to carry out this undertaking. This amount is two-thirds greater than the $4.5 billion a year that the industry is currently spending for this purpose. The tax burden of the oil industry should not be increased by changing the present tax treatment.

3. The risks inherent in exploration and development of oil and gas reserves

Congress in adopting the depletion provision gave recognition to the particular risks in the oil and gas business. The risks are no less today than they were years ago. Wells are being drilled deeper and in more inaccessible areas, fields being discovered are generally smaller and less profitable, costs are increasing, and despite improved technology the only way of proving an oil and gas reserve is by drilling.

Ample evidence of the degree of risk involved is the fact that in 1968 only 1.9% of new field wildcats found a significant quantity of oil compared with over 3% in the late 1940's.

4. The national security

The present tax treatment of the petroleum industry has been one of the most significant factors in enabling this country to develop and sustain the petroleum productive capacity and reserves that have been essential for national security. The importance of the petroleum tax incentives will become even greater in the future as the costs and risks increase in exploring for and developing the volume of reserves needed to satisfy steadily increasing demand for petroleum products.

It is not enough that the United States maintain oil reserves with producing capacity only adequate to meet our normal requirements. The Middle East crisis which started in mid-1967 dispels any such notion. At that time it became necessary virtually overnight for the industry to draw some 500,000 barrels a day of additional domestic reserves for emergency shipments to the United States East Coast, Canada, and our Western European allies to replace supplies normally received from the Middle East and North Africa. Any action now which would impair the present incentives to develop new reserves and productive capacity would be to gamble with national security.

Presently, the domestic percentage of Free World reserves is on the wane - down from 15% in 1959 to 12% in 1965 to about 10% at the present. We can ill afford any further decline. In fact, with increasing costs and risks, enhanced tax incentives would be warranted.

B. FOREIGN DEPLETION SHOULD BE RETAINED

The provision in H.R. 13270 to eliminate percentage depletion on foreign oil and gas production is contrary to the national interest.

The tax laws of twenty-four countries contain some type of percentage depletion provision. Many of the provisions are modeled after the U.S. law, and the reaction in these countries could be detrimental to U.S. taxpayers if our government were to eliminate percentage depletion on foreign production. In at least one country there is a provision for automatic nullification of the local percentage depletion provision in the event a foreign producer loses its right to percentage depletion in its home country.

Elimination of percentage depletion on foreign production would increase the tax burden of U.S. companies without increasing revenue of the U.S. government. This conclusion is supported by the testimony of Assistant Treasury Secretary Cohen before the Senate Finance Committee on September 4, 1969, as follows:

"Our analysis of this provision indicates, in the light of our foreign tax credit provisions, that after a brief period it will probably result in foreign countries increasing their effective tax rates on income from oil and gas production to 'sponge up' any additional tax revenue otherwise accruing to the United States. Thus the denial of foreign depletion will increase the effective U.S. rate of tax on such income, which tax the foreign governments will then offset by increasing their rates. The end result will be that the U.S. taxpayer will pay additional tax to those countries, but no additional tax to the United States.

"For these reasons, the elimination of percentage depletion on foreign deposits on oil and gas is unlikely to increase U.S. revenues significantly, and will merely increase the burden of foreign taxes on U.S. businesses."

Elimination of percentage depletion on foreign production also would damage U.S.-owned companies from a competitive standpoint. U.S. petroleum companies compete with foreign-owned companies for the opportunity to develop and operate foreign oil fields. Many of these foreign-owned companies are strong, aggressive companies owned or controlled by foreign governments or, if privately owned, enjoy special tax or financial benefits from their governments. The following are examples:

Soviet bloc governments engage directly in oil production and export about one million barrels of crude oil daily, thus adding to the competitive forces which U.S. companies must meet.

Germany has adopted a system of subsidized loans to German nationals engaged in foreign petroleum exploration and development; also, overseas losses from petroleum operations can be offset against income otherwise taxable in Germany.

The U.K. grants cash incentives for oil and gas exploration and development.

French companies are permitted to deduct overseas exploration expenses from income derived in France.

Japan, in addition to financial aid to Japanese companies exploring overseas, grants bonus exploration deductions and has committed itself to support exploration in Alaska, Southeast Asia, Africa and the Persian Gulf.

The Netherlands does not tax profits earned abroad, even when they are repatriated, as long as the profits are subjected to taxation in the foreign country.

Elimination of the tax benefit for depletion on foreign production would place U.S. petroleum companies at a competitive disadvantage at the very time when foreign competition in this field is most intense.

Since its inception in 1926, percentage depletion has been applicable to both domestic and foreign petroleum operations, recognizing the principle of taxing both domestic and foreign income alike. The availability of this tax incentive in the case of foreign production has helped produce results that are consistent with our foreign policy objectives, and has fostered the military security and economic strength of the United States. The elimination of foreign depletion would inhibit such a positive contribution to our nation's goals in the future.

We, therefore, urge the adoption of the Treasury Department's recommendations that percentage depletion on foreign oil and gas production be retained, and that the provision in the House Bill to eliminate foreign depletion be rejected.

C. FOREIGN TAX CREDIT PROVISIONS SHOULD NOT BE CHANGED

1. Section 431 of H.R. 13270

Under this provision, a taxpayer who elects the per country limitation and who reduces his U.S. tax on U.S. income by reason of a loss from operations in a foreign country would have to restore this tax benefit when income is later derived from that country. Recapture would also occur when the taxpayer disposes of property used in the business that generated the loss, whether through abandonment or otherwise.

Section 431, in contrast to existing law, would deny full credit for foreign income taxes actually paid in the case of taxpayers who have elected the per country limitation, and through its complex procedures could subject foreign source income to double taxation. The proposal, therefore, would restrict the effectiveness of the foreign tax credit, which is intended to eliminate double taxation, and would increase the tax burden on U.S. companies and make them less able to meet the competition from foreign-owned companies. Accordingly, and for all of the reasons cited in part "B", above, Section 431 should not be enacted.

2. Section 432 of H.R. 13270

This provision would provide a separate foreign tax credit limitation in the case of foreign mineral income so that excess foreign tax credit generated with respect to such income could not be used to reduce U.S. tax on other foreign income. This rule would apply where (1) the foreign country from which the mineral income is derived exacts a royalty from mineral income; (2) the foreign country has substantial mineral rights in the property; or (3) the foreign country imposes higher taxes on mineral income than on other income.

Section 432 is allegedly designed to deal with the problem of distinguishing foreign royalty payments (deductible or excludable items) from foreign tax payments (creditable items). A royalty is paid to a government in its position as an *owner* of property. A tax is paid to a government in its position as *sovereign*. The two items are clearly distinguishable, and there is no necessity for a provision such as proposed in Section 432.

Assistant Secretary Cohen, in testifying before your Committee, recognized the fallacy of Section 432 when he stated:

"On further examination of the tax and royalty structure applicable to the international minerals industry, we do not feel that it is proper to characterize all foreign taxes on mineral income in excess of U.S. taxes on such income as disguised royalties. . . ."

"If, then, this separate limitation in the bill regarding mineral income is not justified on the ground that any foreign tax in excess of the effective U.S. tax on mineral income is a royalty, it works unfairly for mineral companies as compared to all other U.S. taxpayers with foreign operations.

"It completely denies mineral companies the opportunity, available to other taxpayers, to average the excess of foreign tax over U.S. tax on mineral income against any excess of U.S. tax over foreign tax on their other foreign income. This result occurs even though the foreign tax on the mineral income is at a reasonable rate judged by world standards and even though such averaging is precisely the purpose of the over-all limitation."

We concur in the present Treasury position of urging the rejection of Section 432 as passed by the House.

We do, however, oppose the Treasury's alternative proposal to deny the use of excess foreign tax credits that are generated by reason of the allowance of a U.S. deduction for percentage depletion on foreign petroleum production as an offset against U.S. taxes on other foreign income. Aside from complexities involved, this is merely an attempt indirectly to limit application of the percentage depletion provisions. Also, the proposal would restrict intended benefits of the foreign tax credit and would make U.S. petroleum companies less able to compete with foreign companies for foreign oil reserves. The proposal, therefore, should not be enacted.

In summary, the nation's present tax incentives, in conjunction with its crude import policies and its conservation practices, have worked well to serve the interests of the national security and the needs of the American consumer in normal times and during emergencies. It would, in our judgment, be a serious mistake to make any change in the tax incentives that would impair their effectiveness.

EXHIBIT "A"

TEXACO INC. STATEMENT WITH RESPECT TO TAX PAYMENTS

Due to current interest regarding taxation of the United States oil industry, Texaco presents the following information regarding its tax payments.

Texaco Inc. and its subsidiaries and affiliates conduct operations in every state of the United States and in virtually every country in the free world. Its direct tax payments, including its equity portion of payments by subsidiaries and affiliates, constitute one of its largest costs, amounting in the year 1968 to over $1.2 billion. That amount was more than total payments made to employes and more than three times dividend payments to stockholders. The direct tax payments of $1.2 billion were exclusive of $1.3 billion of motor fuel and other taxes collected from consumers and paid to governments.

Texaco's direct tax payments include income taxes, oil and gas production taxes, property taxes, and in the more industrialized countries, particularly in Europe, import and border taxes, and turnover taxes. Regardless of type and the precise manner in which imposed, all of these direct taxes constitute a cost of doing business. They are all a direct charge against income from operations.

The income taxes included in Texaco's total direct taxes represent payments to Federal, state and local governments in the United States and also payments to governments outside the United States on income earned abroad. In accordance with long-established principles of taxation applicable to all U.S. taxpayers, income taxes imposed by governments outside the United States are allowed as credits against United States income taxes applicable to the same income. This treatment is necessary in order to prevent double taxation which would make it impossible for U.S. companies to compete abroad.

Texaco's tax payments for the past three years were as follows, in millions of dollars:

	1966	1967	1968
Direct taxes:			
Income taxes	$365	384	472
Production and property taxes	87	101	106
Import and related taxes	554	533	487
Other taxes on operations	127	138	182
Total direct taxes	1,133	1,156	1,247
Product taxes collected from consumers	794	1,092	1,334

The income tax payments of $472 million for 1968 were equivalent to 36% of Texaco's net income for that year before deducting such taxes. The corresponding ratio of income tax to net income before such tax was 33.5% for the year 1967 and 35.1% for 1966.

Total direct tax payments of $1,247 million for the year 1968 were equivalent to 59.8% of net income for that year before deducting such direct taxes. The corresponding ratio of total direct taxes to net income before such taxes was 60.3% for the year 1967 and 62.7% for 1966. These direct tax payments are exclusive of product taxes collected from consumers and paid to governments. They are also, of course, exclusive of taxes paid by Texaco's more than 200,000 stockholders on dividend payments of $1.1 billion in the last three years.

The foregoing tax amounts and income data are those of Texaco Inc. and consolidated subsidiaries plus Texaco's equity interest in non-consolidated affiliated companies.

Texaco as a leading world-wide producer, refiner, and marketer of petroleum and its products bears a heavy tax burden—with direct tax payments of approximately 60% of its net income before taxes. Texaco's tax payments contribute substantially to the public revenues of the United States and of all countries in which it operates.

MILLER & CHEVALIER,
Washington, D.C., September 26, 1969.

HON. RUSSELL B. LONG,
Chairman, Committee on Finance,
U.S. Senate, Washington, D.C.

STATEMENT IN SUPPORT OF PROPOSAL TO RESTORE THE PERCENTAGE DEPLETION ALLOWANCE TO CANADIAN GAS PRODUCTION

DEAR MR. CHAIRMAN: The tax reform bill as passed by the House (H.R. 13270, § 501) provides that percentage depletion will not be allowed for foreign oil and gas wells and that for domestic oil and gas wells the present rate of 27½% is to be reduced to 20%. This statement does not deal with the question of the level of the depletion rate, but only with the question whether the same depletion benefits should be extended to gas wells in Canada as in the United States.

Except for an infant industry in liquified natural gas, the economies of which are not yet well established, gas consumers in the United States are dependent on supplies which can be delivered by pipeline. As a practical matter, therefore, deficits in meeting United States requirements for natural gas must be made up, and are now being made up, primarily from Canadian production. If the total of domestic (contiguous United States) and Canadian supplies are inadequate for the United States market, the result will be a shortage in meeting market requirements with serious impact on both price and availability of gas within the United States.

Large-scale imports of gas from Canada began more than a decade ago. They have grown from year to year as demand increased without comparable growth in the United States reserves. In 1967 imports of natural gas into the United States from Canada (513.3 billion cubic feet) increased 18.9% over the prior year and were 42.2% of Canada's net production. Imports from Canada amounted to 3.07% of total United States production as compared to .4% ten years earlier. An even greater acceleration in the growth of imports will be required in the future. In 1968 for the first time in the history of the natural gas industry, consumption of United States gas reserves was greater than newly-discovered reserves in the United States. The growth in demand, now at a rate in excess of 6% a year, will continue to mount with increases in population, industry and income. Irrespective of short-term changes in the ratio of reserves to requirements, over the long term the shortage in domestic production is bound to increase. It bears emphasis that gas is not a renewable resource and that each year a substantial part of finite reserves is withdrawn from natural storage for use within the United States. The long-range resource strategy therefore must be to encourage the greatest possible development of the large Canadian gas resources to serve the United States and Canadian markets, so that the United States may continue to benefit from Canadian supplies in excess of Canadian needs. A continental approach to natural gas resources is essential in the interest of the United States. This approach is also in the interests of the Canadians, whose resources are far greater than those of the United States in relation to population and demand.

The retention by the Congress of the percentage depletion allowance for domestic production, although at a reduced rate, can only signify Congressional recognition of the need for the depletion allowance as an incentive for exploration for new petroleum supplies. The explanation of the House Committee on Ways and Means, in recommending elimination of percentage depletion for foreign oil and gas wells was that its action would permit "percentage depletion for these items to be confined to areas where it will achieve its objective of stimulating exploration and discovery of domestic reserves" (Report of the Committee, p. 138). The Committee's reasoning—that percentage depletion would encourage exploration and discovery of new wells (Report, p. 137) — is entirely sound, but its finding that "the granting of percentage depletion to income from foreign deposits results in a large loss of revenue without commensurate advantages" (Report, p. 137) misses the mark with respect to Canadian gas. As United States gas markets grow, there is substantially the same advantage in the assurance of supplies from Canadian sources as from domestic sources. In effect, United States consumers are already drawing on a common pool to meet United States requirements. It would be little short of disaster to shrink the pool to the reserves within the boundaries of the 48 states. Yet such a result would be implicit in withdrawing the benefits of the depletion allowance for Canadian gas production.

The fact that the United States can rely on Canadian commitments almost to the same extent as for its domestic supplies in itself argues strongly in favor of extending equal encouragement to United States taxpayers producing gas in Canada by the allowance of percentage depletion on the Canadian production.

We note that Assistant Secretary Cohen, in his statement to your Committee on September 4, 1969, recommends the deletion of the provision in the House bill which would deny percentage depletion to United States taxpayers on for 'gn mineral production. We urge your Committee to accept this recommendation.

Respectfully,

MILLER & CHEVALIER.
By DAVID W. RICHMOND.

SOUTHERN NATURAL GAS CO.,
Birmingham, Ala., September 10, 1969.

Re Natural Resources—Percentage Depletion, Section 501—H.R. 13270.

Hon. RUSSELL B. LONG,
Chairman, Committee on Finance,
U.S. Senate, Washington, D.C.

DEAR SIR: Section 501 of H.R. 13270 would reduce the percentage depletion rate for gas and oil wells from 27½% to 20%. We are opposed to the enactment of Section 501 because it is a demonstrable fact that our country's gas and oil reserves are declining at a rapid rate and there is insufficient new exploration. If the percentage depletion rate is reduced, present shortages of gas and oil energy supplies will be compounded and our nation's security and standard of living will be seriously affected.

The Committee's Print (pp. 77–78) offers seven reasons against the passage of legislation which would tamper with existing depletion allowance rates. However, one stands out above all the rest:

"(6) Proved oil reserves today are declining at a rapid rate in this country, and there is insufficient new exploration. What the industry needs is more, not less, stimulation to seek new deposits."

If depletion-aided oil and gas production were in fact a get-rich-quick bonanza of tax-free funds, new capital and new businesses would flood the field and the search for oil and gas would be booming because businessmen and investors tend to go into enterprises that return high earnings. In fact and despite the growth in energy demand and the slump in available reserves, men and money have been going elsewhere to seek profits.

The record shows that in the past 10 years oil-well drilling has slumped by a third in the U.S.A. and about 50% of the nation's independent oil companies have abandoned the business. U.S. oil reserves amounted to 13.3 times annual production in 1959, and declined to 10.3 times annual production by 1968, whereas domestic demand increased 41% during the same period. Although these trends must be stopped and reversed, the proposed change will achieve just the opposite result.

An adequate supply of oil and gas is essential to national security. Petroleum provides the fuel for planes, ships and vehicles and the basic ingredient of conventional explosives. In addition, petroleum supplies are indispensable to our standard of living because America enjoys a "high-energy civilization."

An adequate supply of petroleum depends, however, on a fair rate of return to the petroleum industry, commensurate with the inherent and substantial risks involved. Nevertheless, the rate of return on net assets invested in the petroleum industry (11.5%) is comparable to that for manufacturing generally (12.1%—1959–1968). Thus, although the present percentage depletion provisions have encouraged the exploration for oil and gas, they certainly have not generated unduly large profits for the producers. Rather, the consumers and the nation generally have benefited through the availability of oil and gas in ample quantities and at reasonable prices.

Southern Natural is a publicly-held natural gas company engaged in the production and purchase of natural gas and in the operation of an interstate natural gas pipeline system throughout the Southeast. Domestic, commercial and industrial customers, as well as numerous municipal gas distribution systems and other interstate pipeline companies, depend upon us to maintain gas supply and transmisson facilities. Our operations affect individuals and companies in Texas, Louisiana, Mississippi, Alabama, Georgia, Tennessee, South Carolina and Florida. Our operations are dependent upon the availability of gas and the availability of gas is directly dependent upon the activities of those who search for it. Hence, our interest in it is basic both to us and the region which we serve. It also has enormous material consequences to our nation.

We are vitally concerned with the availability of gas supplies and the adequate deliverability of gas. The mounting evidence shows, with disturbing clarity, that our nation's gas reserves are in serious jeopardy and that the ratio between gas reserves and gas consumed is decreasing. For example, recent pronouncements of the Federal Power Commission, the Bureau of Mines and industrial leaders authoritatively demonstrate these alarming facts. Of particular significance is the fact that during this session of Congress four members of the Federal Power Commission officially advised Representative Boggs of the House Committee on Ways and Means that a reduction in present tax allowances is "likely to result in applications to increase the Commission's area rates for natural gas sold in producing areas, and that such changes in the tax law, unless offset by rate increases or other relief, would also tend to reduce the level of exploration effort upon which new supplies of natural gas depend, at a time when the adequacy of gas supplies has been called into question." Even in dissent, the Chairman noted that the elimination or reduction of the statutory depletion allowance would tend to increase the cost of gas. We urge you, therefore, to take the common-sense, practical approach and permit the allowance to remain as it is.

Although your Committee Print (p. 77) lists four arguments for adoption of the changes in the depletion allowance, we submit that there is only one real reason why changes are being suggested at this time. This argument—or "reason" is:

"(2) Percentage depletion is symbolic of a preference-prone tax structure that discriminates against persons whose incomes are wholly or principally from fully taxable wages and salaries. To leave it unchanged would invite the breakdown of our voluntary, self-assessment system of taxation."

As we have already shown, the practical effect of the percentage depletion provisions in our tax laws has been to make available more oil and gas and at lower prices than would otherwise prevail. To suggest, therefore, that the economic welfare of the petroleum industry be sacrificed as a "symbol" of a preference-prone tax structure is to make a mockery of the tremendous efforts of that industry in that past and to scorn its endeavors for a better present and a progressive future.

We are convinced that the petroleum industry is being offered as a scapegoat in 1969, at a time when the problems of 1979 and 1989 and 1999 should have the foremost place in your minds. Our customers need gas now and will need more of it then. We must satisfy their needs to survive and they need us to survive. Above all, the entire nation needs gas, as an energy, if its security and standard of living are also to survive. Shortsighted symbolic sacrifice, if inflicted, will be disastrous to all of us and to our country.

Respectfully submitted.

PETER G. SMITH,
Vice President, General Counsel and Secretary.

STATEMENT ON BEHALF OF GEOTHERMAL RESOURCES INTERNATIONAL, INC.

INTRODUCTION

This statement is submitted on behalf of Geothermal Resources International, Inc. (hereinafter "GRI") to request the Senate Finance Committee to clarify existing law with respect to the definition of "gas" as that term is used in the Internal Revenue Code of 1954. The Tax Court of the United States has recently held in *Arthur E. Reich, et al., v. Commissioner* (52 TC No. 74, July 31, 1969) that geothermal steam is a gas. Accordingly, the Court held that participants in successful steam drilling ventures are entitled to deduct percentage depletion. Moreover, that the petitioners were entitled to elect to expense the intangible costs of drilling and developing geothermal steam wells. It is our understanding that the Internal Revenue Service, undaunted by this setback, intends to continue to disallow both depletion and intangibles for all taxpayers engaged in this industry and to force such taxpayers to litigate these issues. To obviate this wasteful expenditure of both time and money, we respectfully request your Committee to direct in the legislative history of H.R. 13270 that the term "gas" as used in the Internal Revenue Code includes geothermal steam. A summary of the reasons for this action is set out below.

BRIEF HISTORY OF GRI

A brief discussion of GRI's activities is included in this statement since we believe GRI is typical of the small young company which is pioneering the use of geothermal steam as a source of electrical energy in the United States. GRI is the survivor of a 1965 merger involving four small corporations, each of which had prior to the merger either been engaged in the drilling for geothermal steam or owned interests in land believed potentially capable of producing geothermal steam. GRI is presently engaged primarily in the business of drilling for and producing geothermal steam for sale as a source of energy for generating electric power to be used by industry as well as other consumers of electric power.

Since 1966, GRI has restricted its drilling efforts to areas in Sonoma and Modoc Counties, California, but, with advances in technology and the availability of land for additional drilling, GRI hopes to expand these operations. In the summer of 1967, GRI drilled the GRI-Rorabaugh #1 steam well as a discovery well in an area now designated by the company as the Rowan Steam Field in the Geysers area of Sonoma County, California. The well was completed at a depth of 6,676 feet after encountering the tope of the productive interval at a depth of 6,400 feet. The company subsequently drilled six additional wells, designated GRI-Rorabaugh #2-7 (all located in close proximity to the well #1), two of which are presently capable of producing geothermal steam, and four of which may well produce steam upon the completion of remedial drilling. GRI has financed the drilling of these wells in part through private equity offerings under permits issued by the California Commissioner of Corporations. Without the availability of the right to expense intangible costs of drilling and developing geothermal steam wells and the right to deduct percentage depletion on income received from successful wells, GRI will be unable to secure the additional capital needed for further exploration.

DISCOVERY OF GEOTHERMAL STEAM

Actually, in a few foreign lands, geothermal steam is old hat. For example, Icelanders use natural steam to heat their homes, and Italians built the first power station using natural steam at Larderello in 1904. The Italian field now boasts a 400,000 kilowatt rating which is nearly matched by similar fields in New Zealand. Most of this activity occurred many years ago but recently in other foreign countries, there has been a surge of interest in the geothermal process. Countries now exploring and developing geothermal steam include Mexico, Japan, Russia, Nicaragua, El Salvador and Guatemala. Research on the subject is being sponsored in some less developed countries by the United Nations.

In the United States geothermal steam has, until recently, been considered uneconomic. However, with technological improvement and more complete geological surveys, the use of geothermal steam to generate electric power holds great potential. Recently, Union Oil Company of California, Magma Power Company and Thermal Power Company formed a joint venture to drill for and sell geothermal steam from Northern California wells to Pacific Gas & Electric Company. Although no one knows the ultimate potential of geothermal steam, some forecasters give it only a small percentage of the market—perhaps 2 or 3 per cent, but in such a huge market even 2 or 3 per cent is a tremendous amount of electric energy. It is estimated by Dr. James McNitt, formerly a geologist for the California Division of Mines and Geology and now a geologist for the United Nations, that there are more than 1,000 known geothermal regions in Western United States. Of these, he says, only 11 have been drilled extensively enough to assess their potential.

Drilling and geological evaluation indicates that the techniques used to locate oil and natural gas are applicable in the search for natural steam. The entry of prominent oil companies into the natural steam industry has resulted in an accelerated application of petroleum exploration methods. In addition to field mapping, such procedures as sub-surface studies through electric log correlation, gravity surveys, magnetometer surveys and heat sensing surveys are now commonly employed in the quest for steam accumulations. Steam wells, like oil wells, may be drilled with rotary or cable tool drilling equipment, and although the drilling technique is quite similar to that used in oil, the blow-out preventive equipment on steam wells must handle much higher temperatures than comparable equipment on oil wells.

The first step in drilling a steam well is to select the well site and stake the point where a drill will pierce the surface. The site is graded and leveled to accommodate the drilling rig as well as the other equipment necessary for operation. The well site includes mud sump or pit varying in size in relation to the depth the well will be drilled and a well cellar to accommodate the blow-out prevention equipment. The equipment used in the actual drilling of the well includes the mast or derrick, pipe rack and 40-foot lengths of pipe, drill collars and bits, mud tank for drilling fluid, diesel engines to power the mudpump, portable generators and floodlight equipment, christmas tree or well head equipment to contain high pressures and the various hand tools and rig safety devices used in any drilling operation.

The derrick is rigged up over the drillpoint and drilling commences to a shallow depth, whereupon surface or guide casing is cemented into place. Drilling is then continued through water-bearing horizons, perhaps, to a depth of 2,000 feet, whereupon a second string of casings, known as the water string, is run to depth and cemented into place to prevent contamination by surface waters. Drilling continues to the projected depth usually between six and nine thousand feet. GRI's wells have depths ranging from 6,500 feet to 7,280 feet with the total footage drilled to date approximately 50,920 feet, including five redrills. A reservoir of steam was encountered in the GRI-Rorabaugh #1 well at about 6,400 feet below the surface of the ground, and the cost of this discovery well was approximately $250,000. The cost of the second well was nearly $750,000 while the remaining wells have been drilled at an average cost of approximately $475,000. The high cost to drill the second well was due to mechanical and other difficulties encountered during drilling and should not be considered as truly representative of the cost to drill an ordinary steam well. Although a supply of steam has been discovered at relatively shallow depths at a cost of $50,000 to $75,000, in GRI's experience such finds represent rare exceptions rather than the rule.

Once a well is determined to be capable of producing steam, both in quantity and pressure sufficient to warrant the expense of completion, a pipeline gathering system, consisting of large diameter fully insulated pipe is attached to the wellhead. This system runs to a point where pressure regulating equipment necessary to control the steam pressure and/or volume is located. The pressure regulating equipment is connected to a steam turbine by expansion joints and pipelines. The controlled steam pressures and/or volume is used to turn the turbine which, when directly connected to a generator, produces electricity. At the point where the steam has spun the turbine, its energy is, for all practical purposes, dissipated. It is uneconomic to transmit steam for long distances, and accordingly, electric power plants which use geothermal steam as a power source, must be located at, or very near, the steam wells. Transmission lines from these power plants are then connected to the grid system.

Recently, GRI retained International Engineering Company, Inc. to prepare an analysis of the cost to construct a 300 megawatt plant, exclusive of transmission, interconnections and switching costs. This analysis presupposed the construction of two 50 megawatt and two 100 megawatt plants, and the total estimated cost was $32,000,000. Although the tremendous costs connected with the development of geothermal steam as a power source for the production of electric energy exceed similar costs for oil and natural gas, the benefits to be derived from the use of geothermal steam are well worth the expense.

BENEFITS OF GEOTHERMAL STEAM

The use of geothermal steam as a power source for electric energy has several significant advantages, not only to the consumer, but to the general public. Based on our experience (and the experience of the Union Oil—Magma—Thermal group), we project that geothermal steam, when produced in adequate volume, will compete very favorably with other sources of electric power. Indeed, once the generating plants are constructed, we project that electric energy produced from geothermal steam can be sold at from 25 to 40 percent less than the current cost of producing such energy under conventional methods per kilowatt hour. These figures are real—not mere projections. For example, the Union Oil—Magma—Thermal joint venture is selling steam to Pacific Gas & Electric Company at a profit and Pacific Gas & Electric, through its well-site turbines, generates electric power at a cost 20 percent below that for conventional fuels.* Presently, Pacific Gas & Electric has a total rated capacity in its geothermal power system at the Union Oil—Magma—Thermal wells of 82,000 kilowatts, and Pacific Gas & Electric has recently announced two additional units to be completed in 1971 and 1972, raising its capacity to 192,000 kilowatts.

In addition to lower prices, geothermal steam has two other significant benefits—the complete lack of air and water (thermal) pollution. Nuclear power, viewed by many as the key to generating electricity in the future, has one serious drawback—it contributes substantially to thermal pollution. As this Committee is well aware, air and water pollution are high on the list of the serious problems facing this nation. The production of electric energy from geothermal steam not only is free from air pollution but also creates no water pollution which would endanger fish or other aquatic life. Moreover, no demand is made on existing water supplies.

The availability of a low cost power source of electric energy which is completely free from air and water pollution can not be overlooked. Initially, the beneficiary of such power will be California, the state with perhaps the best known smog problem. Various sources estimate that the power demands in California will double in the next seven years and will continue to double every ten years thereafter. It would, however, be clear error to suggest that only California will benefit from geothermal steam as a power source. Some estimate that geothermal steam could be used on a nationwide basis. We are unable to confirm or deny such estimates, but we are convinced that it can be of significant benefit to all Western and Southwestern states within a relatively short period of time.

CONGRESSIONAL ACTION IS NECESSARY

As noted above, the Tax Court of the United States held in *Arthur E. Reich et al.*, v. *Commissioner* (52 TC No. 74) that geothermal steam was a gas as that term is used in the Internal Revenue Code of 1954. Nevertheless, the Internal Revenue Service intends to continue to litigate this issue forcing taxpayers to expend both time and money in defense of court-approved deductions. Further, and perhaps of even greater significance, taxpayers in the geothermal steam industry will be unable to raise additional capital to finance new exploration and development of steam wells so long as IRS continues its present policy. In an effort to change that policy, we request this Committee to clarify the legislative history of the term "gas" by stating in its Committee report on H.R. 13270 that the term gas includes geothermal steam for all relevant provisions of the Code.

There should be little doubt that geothermal steam is a natural resource which should be developed as a polutant-free source of electric energy. The discovery of, and drilling for, geothermal steam utilizes the techniques of the petroleum and natural gas industries. The entry of prominent oil companies into the natural steam industry has resulted in an accelerated application of these exploration methods. The expert testimony presented in the *Reich* case *supra* establishes that geothermal steam is contained in a closed reservoir, in a finite amount, with no significant liquid influx. The only recourse we have to stop further IRS attach is for this committee to direct in a legislative history of H.R. 13270 that geothermal steam is a gas for all relevant provisions of the Internal Revenue Code.

Geothermal Resources International, Inc., stands ready and willing to supply any additional information which the Committee might desire and to assist the Committee or its staff in any way.

Thank you for the opportunity of presenting our views.

---

CONSAD RESEARCH CORP.
Pittsburgh, Pa., October 9, 1969.

Senator ALBERT GORE,
U.S. Senate,
New Senate Office Building, Washington, D.C.

DEAR SENATOR GORE: Please find enclosed, *per* your request. CONSAD Research Corporation's comments on Mid-Continent's Oil and Gas Association Critique of CONSAD's report, prepared for the U.S. Treasury Department, entitled "The Economic Factors Affecting the Level of Domestic Petroleum Reserves." I hope you find these comments useful: essentially, as our comments indicate, we believe Mid-Continent's Critique to be so replete with inconsistencies and out of context references that it appears to be an outright attempt to obfuscate, confuse, and mislead.

Thank you for your interest in this matter.

Sincerely,

WILBUR A. STEGER.

Enclosure.

COMMENTS ON MID-CONTINENT (MC) OIL AND GAS ASSOCIATION CRITIQUE

I. INTRODUCTION

The critique and evaluation of the CONSAD report entitled, "The Economic Factors Affecting the Level of Domestic Petroleum Reserves," by the Mid-Continent Oil and Gas Association is so replete with inconsistencies and out-of-context references that it appears to be an outright attempt to obfuscate, confuse, and mislead.

The MC report is notably lacking in *constructive* criticism. At no point does the report indicate how the CONSAD model might be improved, how the data might be improved, or what alternative methods and models might be used for analysis to develop more accurate estimates of the effects of the special tax provisions. This suggests that perhaps the authors prefer to have no analysis made.

The inability of the MC report to find any serious fault with the CONSAD report conclusions after apparently concerted study only serves to increase the credibility of these conclusions.

The covering letter contains a glaring inconsistency, which is repeated in the body of the report. In paragraph three, the MC cover letter implies that the CONSAD model is erroneous because when extrapolated to below-cost prices it indicates that firms would continue to find and develop reserves. In paragraph five, the CONSAD report is deprecated for extrapolating a considerably smaller amount. Thus, the MC report indicates that extrapolation beyond the range of the data is justification for placing no credence on the results, then proceeds to extrapolate even further to illustrate the "inappropriateness" of the CONSAD model. The MC report also seriously overstates the amount of CONSAD's extrapolation. The price change equivalent to the elimination of percentage depletion is about 35 cents (not 75 *cents* as stated in the MC report) which is a comparatively small extrapolation—the largest year-to-year price change in the data was 30 cents.

II. OBJECTIVES OF CONSAD STUDY

The CONSAD study was designed to evaluate the efficiency of the special tax provisions in encouraging petroleum producers to maintain reserves *above* those necessary to support current production. The primary justification voiced in recent years in defense of the special tax provisions regarding the petroleum industry was the necessity of encouraging a large reserve level to insure adequate supplies of oil in time of a sudden increase in demand due to a national emergency.

Although the MC statement of a fixed technology relationship between reserves and production is not supported by available data, the existence of such a relationship would not prevent producers from maintaining excess reserve stocks if economic incentives were offered to encourage this. The CONSAD study was aimed at determining the effectiveness of the special tax provisions in increasing oil reserves *above* those levels needed solely to support production.

The conclusions of the study that the special tax provisions were inefficient means for achieving such an objective remains a valid conclusion. Throughout the study, CONSAD took pains to *inflate* the effectiveness of the special tax provisions as an incentive for holding reserves. Consequently, if better data became available, its analysis would probably show that these tax provisions were even less efficient than is concluded by the CONSAD report.

If the intent of the special tax provisions is to encourage consumption of petroleum products by keeping prices below their free market levels, the CONSAD study offers no evidence as to the effectiveness of the tax provisions.

It is very possible that petroleum production will decrease if the special tax benefits are reduced or eliminated. Such a decrease would take place if the producers passed the added tax burden on to consumers and consumers then reduced their consumption. A decrease might also occur if producers were currently producing at the limit of available capacity, since the tax increase would make marginal wells unprofitable to operate. Such a producer-initiated decrease might not occur if production restrictions, such as allowable production days, were relaxed, allowing more efficient production from existing wells.

III. SPECIFIC COMMENTS ON THE MC REPORT

Examination of many of the allegations made in the MC report leads only to the conclusion that the authors of this report either (a) did not read the report, (b) did not understand the report or the economic theory on which it is based, or (c) both. The concluding statement in the summary says that "The model used is especially subject to criticism because it is based on the improper assumption that industry exploration and development expenditures are not dependent on an adequate rate of return." No such assumption is either explicit or implicit in the CONSAD models, and such a statement implies a rather extreme lack of knowledge of the contents of the CONSAD report.

The technique of quote-out-of-context is used on page two of the MC report to attempt to invalidate the supportive evidence of CONSAD's third model. What the CONSAD report actually stated was that the quantitative estimates obtained from the model of the individual firm could not be used as estimates of industry reaction, since all the various types of firms in the industry were not represented in the model.

The CONSAD report stated that the third model would substantiate the first model if the indicated reserve changes were of the same order of magnitude, and were changes in the same direction. The results obtained from the third model *did* substantiate the results of the first (or neoclassical) model.

Surprisingly enough, after indicating that only the first CONSAD model was worthy of comment, much of the MC report is devoted to specific criticisms of minor points concerning the other models discussed in the CONSAD report.

On the question of uncertainty, the MC report is somewhat erroneous in stating that the CONSAD report assumes perfect knowledge. The report does not assume this, nor is such an assumption implicit in the methodology.

Another out-of-context quote is provided on page 15, where Eisner's objections to Jorgensen's model are noted. The remainder of Eisner's article goes on to propose modifications in Jorgensen's model similar to those used by CONSAD (the CONSAD model is credited to the Eisner article quoted in the MC report).

The MC report appears completely confused on page 21, where the CONSAD report is taken to task for using a 12:1 reserve ratio figure is not, of course, used anywhere in the model. It is mentioned as historical background, but the data used in the model were actual reported reserves and production.

The MC report seems confused again on page 31 when it indicates that "This approach leads CONSAD to compare the price of a *full* barrel of reserves with the cost of only a *fraction* of a barrel." This is not true, but as the MC report offers no explanation of its statement, no comment can be made.

There are two important points to be made concerning the "apparently incorrect information," cited in the MC report (Section IV). The first of these is that careful reading of the report would make it quite clear that all of the items cited were presented as background information in the study and do not form the basis for any results derived therein. The second of these is that, with one exception, the statements in the CONSAD report were true when the data was being collected and the report was being written. The use of 1968 data, which were obviously not available when the report was written, (the study involved over a year of continuous effort) to illustrate the "incorrectness" of statements in the CONSAD report cannot be interpreted in any other way than as an obvious attempt to discredit the CONSAD report, since anyone with any knowledge of the petroleum industry would be aware of the basic sources of the CONSAD statements.

Most of the discussions in Section V, *Doubtful Petroleum Economics*, is replete with the same sort of out-of-context quoting of the rest of the MC report. The only relevant information presented here is that in reference to Professor McDonald's work on the non-neutrality of a flat-rate corporate income tax. It is interesting to note the omission from the MC report of Professor McDonald's conclusion that a percentage depletion rate of 14% would provide the desired neutrality.

Professor McDonald's work, however, does not examine the *efficiency* of percentage depletion as a method for compensating the non-neutrality of the flat-rate corporate income tax. It is certainly possible, and a subject worthy of further study, that some more direct method of compensating investors for the risk elements in petroleum investments would provide the desired neutrality at a much lower cost to the economy.

IV. CONCLUSION

CONSAD would welcome some meaningful critiques of its work, with the ultimate objective of imposing the reliability of the conclusions. Unfortunately, the Mid-Continent report is totally useless for this purpose.
