TAX REFORM ACT OF 1969

HEARINGS

BEFORE THE

COMMITTEE ON FINANCE
UNITED STATES SENATE

NINETY-FIRST CONGRESS

FIRST SESSION

ON

H.R. 13270

TO REFORM THE INCOME TAX LAWS

PART 5 OF 7 PARTS

SEPTEMBER 26, 29, 30 AND OCTOBER 1 AND 2, 1969

GENERAL OUTLINE OF ORAL AND WRITTEN TESTIMONY IN PART 5:

- Corporations
- Farm losses
- General
- Interest
- Natural resources:
  - Hard minerals
  - Oil and gas
- Public utility depreciation
- Real estate depreciation
- Tax-exempt organizations (advertising income)

TAX REFORM ACT OF 1969

FRIDAY, SEPTEMBER 26, 1969

U.S. SENATE,
COMMITTEE ON FINANCE,
Washington, D.C.

The committee met pursuant to recess, at 9:30 a.m., in room 2221, New Senate Office Building, Senator Clinton P. Anderson, presiding.

Present: Senators Long (chairman), Anderson, Talmadge, McCarthy, Williams of Delaware, Bennett, Curtis, Miller, Fannin, and Hansen.

Senator ANDERSON. The hearing will be in order. I will ask Senator Bennett to introduce the first witness.

Senator BENNETT. Thank you.

The first witness this morning will be Mr. Wallace R. Woodbury representing the National Association of Real Estate Boards. Will you come to the table, Mr. Woodbury? Do you have a group of other people with you?

Mr. WOODBURY. Yes, sir.

Senator BENNETT. Mr. Chairman, we are having a regular procession of Utah witnesses. We had one yesterday, and I am very happy to welcome Mr. Woodbury this morning. He and his father before him have been among the leaders in the real estate field in Salt Lake City covering the whole range of brokerage, management appraisal, counseling, mortgage brokerage, and residential, commercial, and industrial development.

Mr. Woodbury also serves as vice president of the Association of Real Estate Boards, and is chairman of their Committee on Taxation of the Realtors' Washington Committee.

Mr. Woodbury, will you identify the gentlemen who are with you?

STATEMENT OF WALLACE R. WOODBURY, CHAIRMAN, SUBCOMMITTEE ON FEDERAL TAXATION, REALTORS' WASHINGTON COMMITTEE, NATIONAL ASSOCIATION OF REAL ESTATE BOARDS, ACCOMPANIED BY EDWIN KAHN, SPECIAL TAX COUNSEL, AND JACK WILLIAMSON, LEGISLATIVE COUNSEL

Mr. WOODBURY. Yes, thank you, Senator Bennett.

Mr. Chairman, and honorable members of the committee, the gentleman on my left is Mr. Edwin Kahn, our special tax counsel. The gentleman on my right is Mr. Jack Williamson, our staff legislative counsel.

Senator BENNETT. Mr. Woodbury, you may proceed with your statement. You may be interrupted during the statement but usually we wait until you finish.

Mr. WOODBURY. Thank you very much, Senator Bennett.

Mr. Chairman, and members of the committee, we appreciate this opportunity to testify on this matter because the problems in this bill affecting the real estate industry affect not only the real esate broker, the risk takers who participate in development, ownership and operation of real estate, the many people who depend upon the construction industry for their livelihood, but also the millions of private corporations and individuals who own or rent property.

The 1962 and 1964 amendments were weighted heavily against real estate. Although useful lives for depreciation were shortened for nonreal estate, they were not so treated for real estate.

Also section 1250 was enacted providing for recapture of accelerated depreciation on a graduated scale if the sale occurs during the first 10 years.

Department of Commerce reports show that the relative portion of the total fixed investment capital commanded by real estate dropped from 34.7 percent in 1961 to 24.6 percent in 1968, leaving only 70.9 percent of the 1961 share of investment capital.

Now, with our housing inventory depleted, and at a time when we are achieving less than 60 percent of our national housing goals, with high interest rates and construction costs to cope with, real estate investment is now facing the lethal ax of an unbalanced tax reform.

Admitting that some inequities exist in the tax laws, our industry has encouraged reform and made specific recommendations to the House in that regard, subject only to the equitable condition that the aggregate of supposed reforms be not so weighted as to further impair the competitive position of real estate in the total market for fixed investment capital.

We unequivocally assert that the bill before you if enacted would dramatically impair such competitive position, with disastrous results.

In the time allotted we shall refer to only a few of the 27 provisions of this bill noted by our counsel as adverse to real estate.

In order to impartially measure the impact of the proposed changes in depreciation and capital gains, we employed Dr. Soelberg and Dr. Stefaniak of the University of Wisconsin School of Business because of their considerable experience both in fields or real estate and computer analysis. They have developed a computer model to test the impact of such proposed changes on investor yield. From a combination of their experience and the market data available to them they selected typical investment characteristics as assumptions. They ran 45 test runs and drafted a report which will be delivered to each of you after today's hearing. It has also been submitted to the Treasury.

We respectfully ask permission, Mr. Chairman, to file this report as part of the record, because we believe it provides meaningful data, and it was not available until the last 24 hours in complete form.

Senator ANDERSON. Without objection that will be done.

(The data referred to was received by the Committee and made a part of the official files of the committee.)

Mr. WOODBURY. Thank you.

Table 4 of the report, and I know you don't have it before you, but to give you an idea of the impact on yield, table 4 of this report shows the yields before and after for new residential, new nonresidential and existing properties, and we can see the changes of yield to the investory by looking at that table. These are reflected as the internal rate of return which we believe to most fairly represent the measure of investors' total benefits. It is also a measure that is used with stocks and bonds and other investments.

Looking, for instance, at the 10-percent downpayment, 90-percent mortgage situation, which would be typical, for instance, on a residential deal, and assuming a mortgage interest rate of 8½ percent, the yields to investors in a new residential property—in the income tax brackets of 35 percent, 50 percent, and 58 percent—dropped 15.5 percent, 20.2 percent, and 27.1 percent respectively as a result of the proposed changes.

On new nonresidential, in those same tax brackets, yields dropped 24.2 percent, 33 percent, and 41.3 percent, and on existing property that is resold, the yields dropped 16.3 percent, 23.4 percent, and 32.5 percent, respectfully, for those tax brackets.

You should note that yields on new residential investments dropped, notwithstanding, the retaining of the 200-percent declining balance method and dropped substantially. Needless to say, compared to other investment yields in the marketplace today, real estate, which was already losing ground since 1961, would not be competive and would either grind to a stop or be greatly retarded for both new construction and resale transactions.

Significantly the small builder-developer owner is the most severely affected, while corporate and other large investors might be able to provide the equity capital for additional projects without resale. The small builder must from time to time resell to generate equity capital.

Moreover, low-cost housing might well be the first to be chopped off. An investor limited by FHA regulation to a 6-percent return from the property has relied on tax yield as a supplement to making the investments competitive. This proposed law not only reduces that yield, but if the developer falls under the limited tax preference rules, he might lose other personal deductions, not related to this property, under the proposed allocation of deductions.

Perhaps the most misunderstood result of these proposals relates to misprojections of Federal revenue to be derived from these changes. Some tax theorists have attacked depreciation deductions as unrealistic on the theory that inflation and other factors offset physical deterioration. They suggest that Uncle Sam should share in these inflationary benefits. They forget that although ad valorem taxes are subject to annual reassessment, the only substantial revenue sources to the Federal Government occurs upon sale.

The Treasury's projections of $1 billion additional corporate tax and $300 million additional individual tax are based on the erroneous assumption that the same number of starts and resales would take place under the new law, which is patently ridiculous when you consider the fantastic drops in yield on real estate investment. Care need be rather taken to avoid cutting off that revenue source altogether.

Rehabilitation must be encouraged by incentives, and we favor the special short-term write-off provisions of this bill.

However, it should be noted that they are utterly useless with a 100-percent recapture of those benefits.

Let us sensibly involve the private sector in solving our urban problems on a broad base.

33-865—69—pt. 5——2

We urge you, therefore, to restore the 150-percent method for all resales.

No. 2, to limit recapture to a reasonable period and if the present 10 year period is deemed unreasonable we would suggest perhaps a period running to 13 years and 4 months which would include total recapture of excess depreciation until the sixth year.

No. 3, we strongly urge you to reject Treasury proposals that would deny the deductibility of costs actually incurred during the course of construction, but which aren't part of this bill at present.

No. 4, we urge you to reject the limited tax preference provision unless it is applied across a very broad base so as not to single out real estate. If the base is broad enough to encompass all sources of preferential income we would then favor such a provision.

Further, we believe you should provide for valid incentives for rehabilitation, and we ask that you reject proposals on interest limits and net losses because the ramifications are very severe in those areas. Thank you very much for the opportunity to be heard.

The CHAIRMAN. I would hope we could reserve questions until we have heard all the witnesses this morning. Then those who want to question could be interrogated, if that is all right with the committee members. In that case members who can't be here for the afternoon can hear all the witnesses. Is that all right?

Senator BENNETT. Mr. Chairman, I would just offer one slight amendment. Can we hear all the witnesses who are going to testify or are all the witnesses going to testify on real estate transactions this morning?

The CHAIRMAN. Essentially that, yes.

Senator BENNETT. Because there is no use in asking a man, reserving a question unrelated to the group.

The CHAIRMAN. That is all right.

Senator FANNIN. Mr. Chairman, do I understand there will be no questions?

The CHAIRMAN. I would hope we could hear all the witnesses first. Then anyone who wants to ask questions can ask them. If that is all right we will proceed that way because some Senators will not be able to be present at the afternoon session.

Senator MILLER. I think this generally is a good approach but I can understand how something significant could come up and if we could limit ourselves to one question on an understanding that this only occur on a rather occasional basis.

The CHAIRMAN. Fine.

Thank you very much.

Senator ANDERSON. Mr. Woodbury, it has been suggested that the "tax reforms" relating to housing are necessary to "slow down" the economy. Would that not justify the proposed reforms?

Mr. WOODBURY. Although the attempted goal of the tax laws is to slow down the economy, it is essentially and economically suicidal to use an essential commodity, such as housing which is already in critical short supply at a time when new family demands are rapidly increasing, as the vehicle to control monetary policy. It is essential that housing rather be encouraged, and other areas less critical be used for physical restraint.

Senator ANDERSON. Mr. Woodbury, if you oppose "limited tax preference," how would you get at the people mentioned in the Treasury report, who have large cash flow incomes, but pay little or no tax?

Mr. WOODBURY. The Treasury report in singling out 155 individuals with large "adjusted gross incomes" who paid no tax was not related to the areas covered by the limited tax preference rules. Real estate depreciation and capital gains have already been reflected in the tax return before determining gross income. Those mentioned by the Treasury received their shelters from interest payments and charitable contributions. We are, in fact, in favor of a minimum tax law. If the limited tax preference provisions were established over a broad base, we would favor them, but the rule is precipitating to a discriminatory tax merely upon real estate income. Even the farmer can be excluded by choosing an accrual method of accounting. We, therefore, oppose the form of limited tax preference as it is now precipitating.

Senator ANDERSON. Thank you.

Mr. WOODBURY. Thank you.

(Mr. Woodbury's prepared statement follows:)

STATEMENT OF WALLACE R. WOODBURY, CHAIRMAN, SUBCOMMITTEE ON TAXATION, REALTORS' WASHINGTON COMMITTEE AND A VICE-PRESIDENT OF THE NATIONAL ASSOCIATION OF REAL ESTATE BOARDS

SUMMARY

Introduction

Several provisions of H.R. 13270 will have an intensely adverse effect on everyone connected with real estate, whether as property owner, investor, builder, broker, tenant, or just as resident or worker in an urban community.

NAREB position on tax reform

Endorses the concept of minimum tax provided that all sources of so-called tax preferences be included in order not to impair real estate's already precarious competitive role in the private investment market. The limit on tax preferences (LTP) in the bill does not meet this criterion. House-approved and Treasury-recommended exceptions would make real estate the principal if not sole target of LTP.

Douglas Commission on Urban Problems recommended that an income tax system should include special preferences to housing investment . . . warned that any "loophole-closing" . . . if applied only or more strenuously to this (real estate) than to other competitive investment fields, would probably curtail the flow of resources and managerial efforts into this area."

Critical condition of real estate industry

For 15 years construction has been accounting for a slowly declining proportion of gross national product. This has made the "problem of the cities" the nation's primary domestic concern. It is essential that the development of commercial structures, industrial and warehousing facilities, as well as housing, keep pace with population growth and the trend toward urbanization, and opportunity for replacement and renewal.

H.R. 13270 will have a depressing effect on real estate construction, improvement and maintenance. It will occur at a time when shortages are developing in residential and non-residential properties, and our national housing goal of 26 million units in 10 years is receding from view.

SUMMARY OF ARGUMENTS AND RECOMMENDATIONS

Depreciation

The 150% depreciation method now available for existing buildings should be restored. Limiting existing buildings to the straight-line method has already had a serious restricting effect on the resale market.

Present accelerated methods (200% double declining balance and sum-of-the-years digits) should be available to non-residential new construction. Elimination of such methods will result in reduced yields to investors. In a competitive financial market investors will seek out other high yield and less risky sources than real estate investment.

Should the Congress enact a provision to recapture a greater portion of depreciation taken in excess of straight-line as ordinary income, there is no logical basis for discouraging real estate investment and construction through denial of existing accelerated methods.

Recapture

The proposal in the bill to recapture as ordinary income all depreciation taken in excess of straight-line, without limitation as to time, is an extremely harsh measure which does not differentiate between a long-term investor and a short-term holder of real estate. The Committee might consider a provision that for the first five years all depreciation in excess of straight-line be recaptured as ordinary income, then reduce the percentage of gain taxed as ordinary income 1% per month. *Certainly an investor who has held property for more than thirteen years is entitled to full capital gains.*

The House-approved bill purports to retain an incentive for new residential construction and for rehabilitation of low and moderate income housing by allowing more rapid depreciation. Such incentive is almost completely neutralized by the harsh recapture provision in the bill.

Limit on tax preference

The LTP should be abandoned altogether unless all sources of so-called preferential income are included. The House has eliminated the oil industry; the Treasury wants to eliminate tax-exempt interest on local and state bonds and appreciated value of assets donated to charity. This leaves real estate and the so-called gentleman farmer as the only targets for LTP—an unnecessary and inequitable discrimination that should be repudiated by the Committee.

Limitation on deduction of investment interest

The Treasury Department has properly recommended that this provision be eliminated from the bill. The provision is discriminatory, unworkable, and would discourage holding unimproved land for future development.

Installment sales

As presently drafted the proposal on installment sales reporting would discourage the development of unimproved property because builders must await development and adequate outside financing before they can pay fully for the land and incur tax liability. The House bill greatly over-reaches the problem at which it is aimed and its retroactivity is unconscionable. The provision should be deleted until a provision can be formulated which would not interfere with legitimate and necessary methods of financing real estate transactions.

Hobby losses

Loose general language in this provision would deter the holdings of property in deteriorating neighborhoods because lack of current profit would create a presumption that the venture is not profit-motivated and all deductions would be disallowed. Abandoned buildings are proving a tremendously vexing problem to urban areas; this provision in the bill would aggravate this problem because it would have the effect of further increasing the cost of holding property in blighted areas.

Allocation of deductions

The Committee should recognize that interest, taxes, and casualty losses for rental real estate are business deductions and should not be subject to allocation; also, interest and taxes on unimproved real estate held for development should be considered business deductions and not subject to this allocation provision.

STATEMENT

Introduction

Mr. Chairman and members of the Committee—

I welcome this opportunity to testify on behalf of the National Association of Real Estate Boards in these hearings on H.R. 13270, the Tax Reform Act of 1969.

First, by way of background, I am a Realtor engaged in the business of real estate brokerage, management, development, appraising, and mortgage banking in Salt Lake City. I am a Vice-President of the National Association of Real Estate Boards and Chairman of the Subcommittee on Federal Taxation of its Realtors' Washington Committee. Our Association consists of more than 89,000 Realtors who are members of more than 1,500 boards of Realtors located in every state in the Union. Our members are engaged primarily in the business of brokerage, management, and appraising. However, the activities of our membership involve all aspects of the real estate industry, such as mortgage banking, home building, and commercial and industrial development.

Our association is familiar with the problem of the large number of individuals and corporations who take the risk of developing and operating real property. The problems of the real estate industry affect not only the risk takers who participate in development and operation of real estate, but also the hundreds of thousands of people who depend upon the construction industry for their livelihood, and the millions of individuals and corporations who rent or own real property. [1]

Several provisions of this bill will have an intensely adverse effect on everyone connected with the real estate industry, whether as property owner, investor, builder, broker, tenant, or just as resident or worker in an urban community. This is our first opportunity to comment on these provisions. The House Ways and Means Committee requested testimony on the possible modification in the treatment of real estate where accelerated methods of depreciation are used, and we testified on that.[2] The bill before this Committee is not limited to this provision, but it attacks the real estate industry in a variety of ways with a number of novel and complex provisions:

(1) Severe limitations on the availability of accelerated depreciation.

(2) A harsh and unfair rule for recapture of accelerated depreciation on disposition of the property:

(3) Application of the Limit of Tax Preferences (LTP) with particular emphasis on real estate deductions;

(4) Application of the allocation of deductions with particular emphasis on real estate deductions:

(5) Limitations on deductibility of investment interest; and

(6) A "hobby loss' rule designed for gentleman farmers which literally would apply to all real estate which fails to produce taxable income.

We believe it is desirable for this Committee to valuate the operation of these proposed adverse changes in the light of their actual impact on private property ownership and the real estate industry today.

However, before discussing the status of the industry, I believe it is desirable for the Committee to be aware of the position our Association took last winter on the question of tax reform. We also wish to call attention to the report of the Douglas Commission on Urban Problems with respect to our industry and the tax laws.

Position as to Tax Reform Taken by NAREB in March 1969

Probably the single most significant fact with respect to the consideration of tax reform was the disclosure by Acting Secretary of the Treasury Joseph Barr in January 1969 that for the year 1967 there were 21 individuals with adjusted gross incomes in excess of $1,000,000, and 154 individuals with adjusted gross incomes in excess of $200,000 who paid no federal income tax.

It should be noted that the principal causes of this result for these taxpayers were the deduction for charitable contributions (49 cases), personal interest (72 cases), and state and local income taxes (12 cases) (Treasury Tax Reform Proposals, April 22, 1969, page 67, table 5). These cases could not have resulted from accelerated depreciation of real estate and capital gains, since these items are taken into account before arriving at adjusted gross income.

Some of the provisions of the tax reform bill are directed toward preventing these results. Many other provisions appear to be not so directed.

In March 1969, prior to the hearings before the House Ways and Means Committee on tax reform, the Realtors' Washington Committee of the National Association of Real Estate Boards met to consider an official position to recommend to the Board of Directors of our Association on the subject of tax reform. Notwithstanding the fact that representatives of various industry groups were taking the position that no changes in the tax laws were necessary, the Realtors' Washington Committee responsibly recognized that there were some tax inequities and recommended a positive approach to prevent these inequities. Specif-

---

[1] $7.3 billion of multifamily residential housing was put in place in 1968; commercial construction in 1968 amounted to $8.3 billion. Real estate construction provides employment for more than 3.2 million people.

[2] The sole real estate issue proposed for testimony by the Ways and Means Committee read: "As to possible modification in the tax treatment of real estate where accelerated methods of depreciation are used."

ically, the following resolution was recommended for adoption by the National Association's Board of Directors:[3]

"The National Association of Real Estate Boards urges that no changes be made in the tax laws which will impair the competitive position of real estate in the investment market.

"To assure that all persons assume a share of the burden of taxation, we recommend that the Internal Revenue Code be amended to provide for a minimum income tax, which would be applicable if it exceeds tax liability under the regular rates. Such a minimum tax should be based on an expended income base, which must include the following without exception: (1) the excluded one-half of long-term capital gains, (2) tax-exempt state and local bond interest, (3) percentage depletion in excess of cost depletion of property, (4) excess of fair market value over basis of property contributed to charity, (5) intangible drilling expenses, and (6) excess of accelerated depreciation over straight-line depreciation (with appropriate adjustments to basis). Such expanded income base should be subject to a graduated rate not in excess of one-fourth of the regular ordinary rates.

"We vigorously oppose the imposition of a capital gains tax on the appreciated value of capital assets at the time of death of an owner; but we support a change in the tax law so that heirs and legatees succeed to the cost basis of the decedent with an appropriate adjustment for inheritance or death taxes paid."

NAREB continues to adhere to this position. We favor the approach now known as Limit on Tax Preferences (LTP), which has the same purpose as the minimum income tax, which would get at these inequities *provided that the approach is applied across the board to all areas considered productive of potential tax inequity and not directed primarily toward real estate.* We would similarly favor alternative approaches directed at accomplishing the same goal, particularly if simpler than the intricate, complex provisions of the House bill.

We have serious objections to the bill as passed by the House and to Treasury proposals made to this Committee, not because we object to changes to prevent tax inequity but because under the proposals essentially only real estate (and so-called gentleman farmers) would feel the hot breath of LTP. As passed by the House, five items would be included in LTP:

(1) tax exempt interest;

(2) certain farm losses;

(3) the excess of the value of property contributed to charity over adjusted basis;

(4) the excess of accelerated depreciation of real property over straight-line depreciation;

(5) the 50% long-term capital gains deduction.

Specifically omitted were percentage depletion and intangible drilling expenses.

Further, Treasury now proposes to omit from LTP tax-exempt interest and the excess value of appreciated property contributed to charity. Treasury proposes to add percentage depletion and intangible drilling expenses plus two real estate items: (a) the excess of losses during the construction period over income and (b) the excess of rapid amortization of rehabilitation expense on low and moderate income property over straight-line depreciation which deduction was created by Section 521 of the bill itself.

If the Treasury proposals are adopted and the House view prevails on the oil industry, the only areas reached by LTP provisions would be real estate (three separate provisions plus the long-term capital gains rule) and the so-called gentleman farmer.

Report of the National Commission on Urban Problems (Douglas Commission) As to Real Estate and the Tax Laws

Moreover, the provisions of H.R. 13270 are also inconsistent with the Report of the National Commission on Urban Problems. In Chapter 7 at page 10 the Commission stated:

". . . our special concern here is with the effect of present arrangements upon incentives for investment in housing, and it seems clear (1) That *existing tax provisions* have been 'institutionalized' into a complex set of economic relation-

---

[3] Approved March 26, 1969, by NAREB Executive Committee. Subsequently approved by the Board of Directors May 13, 1969, with an amendment to add the following to the end of the second paragraph: "We recommend a 5-year carryover of any disallowed deduction as an offset to future income from the six items recited above".

ships that *involve* a large volume of investment as well as the provision of *rental housing for about one-third of all American families;* and (2) That *any 'loophole-closing'* efforts, if *applied only or more strenuously to this than to other competitive investment fields, would probably curtail the flow of resources and managerial efforts into this area. . . .*" (emphasis supplied)

The provisions of LTP which apply "loophole-closing" more strenuously to real estate than to other competitive investment fields will do exactly what the Douglas Commission said it would do, that is, curtail the flow of resources and managerial efforts into this area—at the same time that this area needs greater efforts rather than less.

The Douglas Commission (page 11 of the same chapter) recognizes that "the Nation has an obvious stake in adequate investment in commercial as well as residential plant." It goes on to state that because of the particular public and social concern with housing, the question arises whether the income tax system should include some special preference to housing investment, and this question is considered in the final section of the chapter where the Commission makes its three recommendations.

The first of these recommendations is that the Treasury Department make an intensive analysis and submit explicit findings and recommendations concerning tax law changes best suited to provide materially more favorable investment in new residential construction (including major rehabilitation) than for other forms of real estate investment. This recommendation does not mean that the income tax laws should be changed in the manner proposed by H.R. 13270, so as to impose severe burdens on all real estate investments with slightly lesser burdens on housing. Such provisions seriously impair the competitive position of real estate as an investment. Rather, the Commission appears to contemplate only those changes in the tax law which would give new preferences to investments in residential construction.

Such new preferences are more specifically identified in the other recommendations of the Douglas Commission—that preferential depreciation allowances or investment credits be provided for investment in governmentally-subsidized low and moderate income housing and that there be especially generous tax treatment of investor-owners' expenditures for maintenance and rehabilitation of older rental residential structures (for example, the rapid amortization of rehabilitation provided by Section 521 of the House bill).

Critical Condition of the Real Estate Industry

We believe that at this point it is desirable for the Committee to consider the present state of the real estate industry.

Necessity for commercial and industrial as well as residential real estate

First, as we discuss in more detail below, the proposed bill attacks all aspects of the real estate industry but places special additional burden on commercial and industrial real estate as compared to residential real estate. This is inconsistent with the needs of the country.

We are not a nation of dormitories. Although housing is in critically short supply, the development of livable communities entails more than the erection of suitable living quarters. Unless a concept of the "total community" remains viable, through equal treatment and encouragement of residential, commercial, and industrial development, we shall find ourselves unable to provide effective housing relief. Those who need housing the most will be unable or unwilling to remove themselves to a sterile community which is inaccessible to employment, shopping, and services.

Today, about 75% of our population live in an urban environment. If current projections materialize, 85% of the population will be living in and around cities by the year 2000. It is essential that the development of commercial structures, industrial and warehousing facilities, as well as housing, keep pace with population growth and the trend in urbanization, and provide opportunity for replacement and renewal.

By common consent the problems that we lump together as the "problems of the cities" are the nation's primary domestic concern. Solutions to these problems are being sought under programs that we know as urban renewal, model cities, and other actions to rebuild vitality into the hearts of our cities. None of these programs can succeed if the end product must be confined to providing new residential dormitory space around the fringes of these areas. An era of true urban renewal and rebirth of our great city centers must rest on a balanced program of providing facilities for every type of urban land use, including needed commercial and industrial development and upgrading of existing facilities to make the result a viable community.

Impact on new construction

Secondly, these provisions of H.R. 13270 will adversely affect construction of buildings, an essential element for the replacement and renewal of the nation's physical plant in general, and the urban community in particular. Construction by the private sector of the economy has not been keeping pace with the current boom, and it will suffer even more under the proposed provisions.

Over the past 15 years construction has been accounting for a slowly declining proportion of gross national product. Construction's share in current dollars dropped from almost 12% in 1955 to 10% in 1967 and held at that level last year. More significantly, while public construction more than kept pace with the rise in gross national product, private construction failed to enjoy a similar increase in rate.

Despite accelerated depreciation as an investment attraction, the rate of growth *fell behind other sectors of the economy*, whether viewed as a share of gross national product or as a share of gross private domestic investment.

Shortage of supply

Third, the depressing effect of these new provisions of H.R. 13270 on real estate construction, improvement, and maintenance is occurring at a time when there is developing a real shortage of supply in both residential and nonresidential properties.

Occupancy rates in habitable residential properties are higher than at any time since the period immediately following World War II. Rates are impressively high also in commercial and industrial structures.

Results of the Census Bureau's sample survey of residential vacancies show a decline in the rental vacancy rate from 7.2% in the first quarter of 1960 to 5% in the same quarter of this year. Our routine NAREB market report indicates a similar level of scarcity at all price levels.

Similar occupancy trends have been experienced in the nonresidential component of the market. Our Spring 1969 report indicated that the demand for commercial and industrial space more than kept pace with additions to the inventory over the past four or five years. The market readily absorbed the volume of office space added by both new construction and renovation, with the result that, last spring, vacancy rates in prime location center city buildings were 2% or less in nearly one-half (47%) of the nation and 3%–5% in 31%. In office buildings located in the suburbs a vacancy rate of 2% or less was reported for 45% of the nation and 3%–5% for 42%. At the same time, the demand for industrial space is accelerating and vacancies in both manufacturing and warehousing structures and single-story design were lower than the previous year in more than three-fourths of the country. The Building Owners and Managers Association's survey of office space occupancy showed continuation of the upward trend this year. An increase of 2.7% in occupancy over May 1968 was reported.

Those who desire to occupy residential and nonresidential property will be the sufferers as a result of the effect of the new tax provisions in reducing the supply of new real estate or usable improvements to real estate.

Furthermore, the Ways and Means Committee made at least one significant factual error in its decision. The House Report (page 166) states: "The present [depreciation] treatment creates a tax environment favorable to frequent turnover which tends to discourage long-range 'stewardship' and adequate maintenance." In our judgment, there is no factual basis for this statement. The truth is exactly the reverse. It is precisely the owner who is going to sell who must maintain his property in order to make it as attractive as possible to prospective purchasers; if he does not, he will either be unable to sell or he will have to take a substantial discount because of poor maintenance. It is precisely the owner who is going to hold for a long time (either by choice or because he is "locked in") who can skimp on maintenance, doing only enough to keep tenants minimally satisfied.

Finally, it should be noted in the revenue considerations applicable to these provisions that the one certainty of the government obtaining revenue is the case where the taxpayer will sell his property at a gain. *Discouraging such sales is bound to decrease the federal revenue.* No revenue is obtained because of increases in value in the absence of a sale. It is true that decreasing the depreciation deduction may improve revenue collections, but this is true only to the extent the taxpayer is in fact operating his property at a profit, so that the depreciation deduction offsets what would otherwise be taxable income. The taxpayer must reduce his tax basis by allowable depreciation regardless of whether or not it produces a tax benefit. Accordingly, this depreciation deduction (whether or not it produces a tax benefit) does tend to result in a potential gain on the sale of the property if the property does not decline in value as rapidly as the applicable depreciation. The tax on this gain (and in the usual case on the greater gain which results from appreciation in value of land) is not obtained by the government except in the event of sale.

Thus, we have two situations which are *not* taken into account in this bill. One is the fact that discouraging sales may result in property not being properly maintained. Secondly, it will tend to decrease revenue because of the postponement of collection of the tax now collected when sales are made at a gain.

Importance of real estate industry to the economy

The enormous potential impact of a cutback in real estate construction on the economy can be seen from the following figures: [4]

	Private construction	Private nonfarm housing starts	Contract construction employment
	Billions	Thousands	Millions
1963	$43.9	1,581.7	3.0
1964	45.8	1,502.3	3.1
1965	50.3	1,450.6	3.2
1966	51.1	1,141.5	3.3
1967	50.6	1,268.4	3.2
1968	57.0	1,483.6	3.3

The Economic Impact of H.R. 13270

The newspapers are full of stories that the main effect of the tight money policies of the Federal Reserve System, inaugurated in the beginning of this year, has been felt by real estate. Mortgage money is less and less available and at higher and higher cost. The financial squeeze has caused a real estate recession which has already caused untold hardship to tenants, to home owners, to construction workers and suppliers. The ripple effect from them to the rest of the economy is substantial. Tight money was the first punch against real estate in 1969.

If the tax reform bill is enacted as approved by the House, and even more so if the additional Treasury proposals recommended at the eleventh hour are enacted, these proposals will be the second punch. Taken together this one-two punch will cause a serious real estate depression with grave consequences for the entire economy.

Analysis of Adverse Provisions of H.R. 13270

We shall now address ourselves to some of the major provisions of the pending bill which will cause the adverse effect on real estate which we have described above.

Depreciation of real estate

Congress thoroughly considered the application of accelerated depreciation to real estate in connection with the Revenue Act of 1964. As a result of its consideration, the Congress decided to leave unchanged the provisions for accelerated depreciation of real estate. It did enact a recapture provision now incorporated in Section 1250 of the Internal Revenue Code. Under this provision, gain on the sale of a building, to the extent of depreciation taken, is taxable as ordinary income in full if the property is sold in the first year, and to the extent of all or a portion of the excess of the depreciation taken over straight-line depreciation if the building is sold after the first year and before the end of the tenth year. This excess is treated as ordinary income under a sliding scale dependent on the

---

[4] *Source:* Census Bureau, Department of Commerce; Bureau of Labor Statistics, Department of Labor; Department of Research, NAREB.

period the property is held, starting at 100% for the first eight months after the first year, and decreasing 1% a month from the 20th month until the end of the tenth year.

This is the existing law. It provides an adequate solution of the problems considered by the Committee. The 1964 law recognized that the problems arise only when there is a too rapid turnover of the property. Depreciation does in fact take place; buildings are in fact used up and are subject to obsolescence. After property has been held a substantial period of time, such as the period recognized in Section 1250, its sale at a gain does not represent any error in the computation of depreciation, but instead represents an appreciation in value of the remaining property which is the result of the same economic factors that cause appreciation in value of other investments (often appreciation in value of non-depreciable land).[5] Usually these factors are either inflation, a good income-producing record, or scarcity. This appreciation in value arises not from the property used up with the passage of time, but the remaining property. This appreciation in value is as much a capital gain as the appreciation in value of vacant land held for a number of years, or the appreciation in value of stock listed on the New York Stock Exchange. It might be noted that many listed stocks represent interests in corporations which take substantial deductions each year for depreciation, depletion, or both, and there is no recapture provision applicable to such stock.

An additional reason why accelerated depreciation is proper is because the Treasury requires real estate to use antiquated, unrealistically long useful lives which have not been revised for 27 years.[6] The combination of accelerated depreciation and overly long useful lives produces a barely adequate, not an excessive, deduction.

We might further note that the law enacted in 1964 has been in effect for only a little more than five years. There has been no new information produced before this Congress to indicate that any change in the law is necessary. On the other hand, we feel that the changes now incorporated in this bill would be disastrous for the real estate industry, as well as for millions of people affected by it.

First, this bill would change the existing laws relating to the depreciation deductions allowable for real estate. Presently, all new real estate construction (residential, commercial, and industrial) is eligible for the double declining balance or sum-of-the-years digits method of depreciation. All used buildings are presently eligible for the 150% declining balance depreciation method.

The bill would continue double declining balance and sum-of-the-years digits methods of depreciation *only for new residential rental housing.* Other new construction would be limited to 150% declining balance depreciation. *All* used property (residential, commercial, and industrial) would be limited to straight-line depreciation.

Furthermore, the bill would change the recapture provisions of existing law so as to eliminate the provision under which recapture decreases over a 10-year period. Instead, it would treat as ordinary income all of the gain on the sale of a building—whether residential, commercial, or industrial, and whether new or used—to the extent of the excess of accelerated depreciation taken after July 24, 1969 over straight-line depreciation.

---

[5] It was for this reason that the Ways and Means Committee in 1962 decided not to act on a Treasury recommendation for full recapture of real estate depreciation. ". . . Committee decided not to apply this treatment to buildings or structural components of buildings at this time because testimony before the Committee indicated that this treatment presents problems where there is an appreciable rise in the value of real property attributable to a rise in the general price level over a long period . . ." H. Rept. 1447, 87th Cong., 2nd Sess. (1962), p. 67.

[6] The Treasury in 1962 provided guidelines as to the useful life of property. For property other than buildings, these were far more liberal than the previous administrative rules (which were last revised in 1942) and represented a realistic acceptance of the increasing impact of technological obsolescence. This obsolescence is also true of buildings. The Treasury guidelines in 1962 recognized obsolescence for farm buildings by reducing the prescribed useful life of farm buildings from 50 years to 25 years. *However, in the case of all other buildings it either retained or increased the previously prescribed useful life,* requiring the use of periods that run from 40 to 60 years, and also eliminated the advantages of the building component method for shorter life portions of the building. The past Administration's Treasury Department officials have admitted that this was not an adverse factual determination by the Department but merely its reaction to Congress not adopting its 1961 recommendation as to real estate. "Since no action was taken by the Congress to provide recapture of excess depreciation on real estate, the administrative revision of depreciation guidelines in 1962 was confined, in effect, to personal property. While guideline lives were provided for buildings, they were essentially the same as those in Bulletin F with the exception of farm buildings."—Tax Reform Studies and Proposals, U.S. Treasury Department (February 5, 1969), p. 447.

The bill does have one provision that provides a new incentive for rehabilitation if made to older residential property with low and moderate income tenants where unit expenditures for rehabilitation are between $3,000 and $15,000. Such rehabilitation costs would be written off on the straight-line method over a five-year life. However, the Treasury has requested this Committee to neutralize almost all of the benefits of this provision by providing that such deductions for renovation be treated as excess depreciation to be recaptured as ordinary income when the property is sold.

We cannot be too emphatic in our assessment of the adverse effect of the provisions limiting depreciation and increasing recapture. The depreciation deduction is directly related to the effective yield of an equity investment in real estate. In turn, the effective yield is an important factor in determining the value of the real estate investment. Hence, the reduction of the depreciation allowance results in a reduced yield; and the reduction in yield results in a reduced value. New construction is at a cost level which does not justify its being undertaken for the type of yield that would be available if this bill were enacted. The immediate effect of this bill will be that investors, who will seek the same yield they are presently receiving for the type of risk they are taking, will no longer invest in new construction. They will seek other sources of investment which are available to them, many of which have been considered in connection with this bill and left undisturbed.

We have already noted above the serious adverse effect on the nation from a drying up of new construction and a slowing down of the real estate industry. We are convinced that the House-passed bill contains the seeds of erosion of the privately financed real estate industry. We believe that this Committee must come to grips with the needs of the country for continuation of a healthy urban environment by rejecting the House approach.

Furthermore, the one area of buildings not subject to cutback in accelerated depreciation—that is, residential construction—is in fact penalized almost as much as other types of construction because of the recapture rules. Double declining balance depreciation will not be the needed adequate incentive for residential construction if the benefits given with one hand are taken away with the other hand by the harsh recapture rule of the House bill. Indeed, the President's Committee on Urban Housing (the Kaiser Committee) concluded that recapture under *existing law* had an adverse effect on investment in low and moderate income housing and recommended deletion of the present recapture rule for low and moderate income housing. ("A Decent Home"—Report of the President's Committee on Urban Housing, pp. 83–85) Similarly, the advantage purportedly given through a five-year useful life for rehabilitation costs would be largely removed if the same recapture provisions are applicable to these expenses.

The total recapture of the excess of accelerated depreciation over straight-line depreciation will virtually freeze or "lock in" any new investments which are made in real estate, and quickly stagnate the flow of capital into the industry, at the same time cutting down the flow of revenues to the Treasury. Obtaining equity financing is becoming very difficult if not prohibitive. The equity invested in real estate is a non-liquid asset. It is not traded on an established exchange or in an established market. It may or may not be readily saleable. This significantly increases the risk as compared to other investment opportunities, and demands a commensurately higher projected yield on the investment. The recapture provisions of the bill will significantly reduce the yield in the event of sale and greatly increase the cash payment requirements, while the allowance of only straight-line depreciation to a potential buyer will drastically reduce the already inadequate market for used buildings. The combined effect of these provisions will be, initially, a sharp acceleration of the present drop in real estate construction and development (because the return is inadequate). This must ultimately be followed by sharply increased rents to restore a competitive return to the investor before a belated increase in construction. This is highly inappropriate at a time when construction of housing units is less than 60% of the national goal. Many hundreds of thousands of persons will live in inadequate housing during the adjustment period.

It is our firm belief that existing methods of depreciation of real estate must be continued in order to maintain and increase the flow of equity capital into the real estate industry, consistent with the national housing goals and the maintenance of a viable real estate industry.

However, our Association recognizes that some changes may be made in the Section 1250 recapture period witout producing an excessively drastic effect on real estate. The present Section 1250 provides for total recapture of the excess of accelerated depreciation over straight-line depreciation during the period from the 12 through the 20th month, declining 1% per month therafter, so that at the end of ten years there is no recapture. If the Committee deems it necessary, the period of total recapture of such excess could be extended for four years, from the 12th through the 60th month, thereafter declining 1% per month. We believe that any capital gains thereafter resulting would surely be a consequence of capital appreciation and not unrealistic depreciation deductions. The market adjustment which such a change would necessitate, though adverse to real estate, might, we think, be within acceptable limits.

This change could be made very simply by changing the number "20" in Section 1250(a)(2) to "60". This change would eliminate eight pages of complex provisions in Section 521 of the bill, leaving only those provisions which grant a five-year write-off for certain rehabilitation costs.

Limit on tax preferences

The limit on tax preferences (LTP) provision has been publicized as the "minimum income tax" which sets a 50% limitation on the use of certain "tax preferences." The President has hailed the original proposal as a "major step toward assuring that all Americans bear their fair share of the federal tax burden." (Message from the President, April 21, 1969) However, the present posture of LTP is that it means "Let Them Pay"—and "them", we regret, are primarily investors in real estate.

We have supported, and we continue to support, a minimum tax proposal which would apply equally to all forms of income, and would maintain the equilibrium among investment opportunities.

As originally recommended by the Administration, the preferences included in LTP were:

(a) Percentage depletion on minerals and intangible drilling and exploration expenses in excess of normal deductions under regular accounting rules;

(b) The excess of accelerated depreciation over straight-line depreciation on buildings;

(c) Farm losses arising from unrealistic accounting methods;

(d) The excess of market value over basis of property contributed to charity.

The LTP proposal which is contained in HR 13270 added tax-exempt interest on state and local bonds to the items of tax preference recommended by the Treasury, and deleted percentage depletion and intangible drilling and exploration expenses.[7] The Treasury Department, in its statement of September 4, 1969, has again insisted that tax-exempt interest be excluded as a preference item, and the Department has changed its mind regarding the preference status of gifts of appreciated property to charity by urging its deletion from the list of tax preferences. Furthermore, the Treasury has recommended the *addition* of two more *real estate items* to the list of tax preferences: interest, taxes, and rents paid on real property during the period of construction of improvements thereon, and the rapid amortization of rehabilitation expenditures for low cost housing.[8]

Thus it appears highly possible that all that will be left of the widely touted minimum tax proposal is a higher tax on real estate investors (and some so-called gentlemen farmers), while buyers of tax-exempt bonds, owners of oil properties, and donors of appreciated property to charity will continue to have substantial opportunity to escape income tax. The result of this situation would inevitably be an outflow of equity investments in real estate toward these other opportunities for investment where current yields and market prices will remain stable. This is not tax reform but tax discrimination against real estate.

This is an intolerable situation for the real estate industry. The current market for various investment opportunities has been developed over the years so that investment yields are balanced in the context of relative risk, liquidity, management problems, and other factors which enter into one's judgment in choosing among available investment opportunities. In addition to upsetting the established investment yields from real estate through the drastic cutback

---

[7] The bill also includes as a tax preference the excluded one-half of longterm capital gains, but it has been acknowledged that this is virtually meaningless because it would rarely affect the tax liability of a taxpayer.

[8] In addition, the Treasury has recommended that tax preferences should include accelerated depreciation in excess of straight-line depreciation on certain leased personal property, and percentage depletion and intangible drilling costs in certain cases.

in depreciation allowances and provisions for recapture contained in the bill, the present status of the LTP proposal singles out real estate as the almost exclusive object of LTP.

Further, the mechanics of LTP are such that it is quite impractical to attempt to compute its effect on a projected investment yield. LTP only affects tax liability when the items of "tax preference" exceed other income. Therefore, a taxpayer must (1) project his other income for each year of his projected investment in real estate—usually an impossible feat, (2) project the amount of his "tax preferences" for each such year—also usually impossible, and (3) compute the effect on his tax liability for each such year. Aside from the effect on the market price of real estate, it seems obvious that it would be simpler to choose a form of investment which is not subject to LTP rather than make these complicated and estimated computations in order to determine the merits and desirable terms of a real estate investment.

We, therefore, believe it is inappropriate, and misleading to the public, to impose a "minimum tax—on investment in real estate," and we believe that enactment of the LTP in such form would result in an unprecedented unheaval in the real estate industry. If there is to be a minimum tax, it should be a true minimum tax, which treats all investments alike. It would also be desirable if such an approach were mechanically much simpler than the complex LTP proposal.

Limitation on deduction of interest

Section 221 of the bill would impose an annual limitation on the amount of the allowable deduction for interest expenses paid by non-corporate taxpayers on funds borrowed to purchase or carry property held for investment. The maximum interest deduction each year would be $25,000 plus a taxpayer's net investment income and his net long-term capital gains.

The apparent purpose of the limitation on the interest deduction is to provide a "matching" of interest expense deductions with the income from the investment in respect of which funds were borrowed giving rise to the interest expense. It is assumed that a taxpayer would thereby be precluded from offsetting other income with interest expenses for an investment which is not yet producing income. The approach adopted in the bill is in lieu of an actual tracing of an interest expense to a particular investment, which would obviously be administratively unworkable.

However, the House-passed provisions do not work, and the Treasury Department has recommended their deletion.

This provision discriminates between a taxpayer who has current income-producing investment and a taxpayer who incurs an interest expense but has no current investment income. In the former case, the taxpayer may deduct his interest expense to the extent of his investment income even though the income-producing investment is unrelated to the interest expense, while the deduction may be denied to the taxpayer who is making his initial investment even though he has other non-investment income. Even worse, the carryover provisions of the bill do not allow the interest expense to be offset against the income from the investment at such time as the taxpayer receives it.[9]

If a taxpayer buys unimproved real estate and an interest deduction (for the mortgage loan incurred to carry it) is disallowed under the bill, he will not be able subsequently to deduct the interest from future income from any improvements he puts on the property (unless it is under a net lease), because the rents are considered business income against which the "investment interest" may not be a deduction. Whether or not the deduction will be later available will turn on whether or not the taxpayer net leases the property in the future. This startling

---

[9] Some of the anomalies of the provision are: (1) The bill provides that the disallowed interest deduction may be carried over from one year to the next only to the extent a taxpayer has taxable income (which cannot be offset by the interest deduction) for the year of disallowance. If a $100,000 interest deduction is disallowed in 1970 when a taxpayer has $80,000 of taxable income, only $80,000 may be carried over to 1971; and if the taxpayer has only $20,000 of earned taxable income in 1971, only $20,000 of the original $100,000 originally disallowed interest would seem to be available as a carryover to 1972. (2) Also, it appears that even though an interest deduction has been disallowed in one year, the carryover may be disallowed in a subsequent year under the allocation of deductions rules of the bill. (3) Furthermore, the bill discriminates against taxpayers who have investments in two or more partnerships as opposed to a single partnership because the disallowance provisions apply at the partnership level first and then a second time at the partner's level. Therefore, the interest deduction of a taxpayer from one partnership may be prevented from offsetting his investment income from another partnership.

result is obviously unfair. Also, the taxpayer has the unanswered question of whether there is proportioning if the taxpayer builds a shopping center and some stores are under a net lease and others are not, such that all of the income is reportable but only a portion of the actually paid expenses would be deductible.

Installment sales

Section 412 of H.R. 13270 would amend the provisions of the Code relating to the installment method of reporting income from the sale of real property by providing a definition of an installment transaction which precludes from installment treatment those transactions in which the payments are not spread out in a prescribed manner over the installment period.

Although the primary purpose of this provision is to preclude deferral of income in a corporate "reorganization" transaction where the acquiring corporation gets a stepped-up basis for the acquired property, the definition is drafted so that it inappropriately affects the legitimate purchase money financing of many real estate transactions. For example, it is common in real estate transactions for sales to be made with relatively small payments to the seller for a substantial period, such as during the development of unimproved property, thereby allowing the buyer to use his resources for the development until adequate outside financing can be arranged. The provisions of the House bill would preclude this type of financing arrangement by imposing an immediate income tax liability upon the seller in such cases even though he has not received the proceeds of the sale to which the tax liability is attributable.

We submit that it is *not* an abuse of the installment method to allow this type of financing, and that the remedy contained in the House bill greatly overreaches the problem at which it is aimed. We urge the Committee to examine this matter and to formulate a provision which will not interfere with the legitimate and necessary methods of financing real estate transactions.

Hobby losses

Section 213 of H.R. 13270 would provide a new "hobby loss" provision which would deny a taxpayer the deduction for losses from a business activity where the activity was not operated with a reasonable expectation of realizing a profit from it. In addition, where an activity has been carried on at a loss in excess of $25,000 for three out of five consecutive years, it would be deemed—unless shown to the contrary by the taxpayer—that the activity is carried on without a reasonable expectation of realizing a profit.

Although included in the provisions dealing with farm losses, the provisions would literally apply to real estate.

The purpose of this provision is to preclude the utilization of losses by taxpayers to offset their other income where the losses are not incurred in a *bona fide* business activity.

It is submitted, however, that the test provided for determining the validity of a "business" activity fails to take into consideration an increasingly common business situation where there is *no* realistic expectation of realizing a profit but with respect to which a deduction should nevertheless be allowed: the case of a business property which has so declined in value that there is no reasonable expectation of selling it at a profit, and the taxpayer is holding it for sale at a loss or is waiting for some improvement in the market which will reduce his loss.[10]

One effect of the "hobby loss" provision would be to accentuate urban blight by destroying the market for many properties in difficult geographic areas. There are 12,000 to 15,000 abandoned buildings in New York City alone, presumably because the cost of demolition exceeds residual value. Many more abandonments would follow enactment of the hobby loss provision since it would have the effect of further increasing the cost of holding property in blighted areas.

Furthermore, the presumption that there is no reasonable expectation of realizing a profit from an activity when there are losses in three out of five consecutive years poses an unfair burden upon the legitimate real estate developer of unimproved property, where rezoning, development, and "rent-up" costs may produce losses for an extended period. Although this presumption may be

---

[10] The Treasury proposal of September 4, 1969, that "profit" be defined to include any reasonably anticipated long-term increase in the value of property does not seem adequate to cover those cases where there is no existing market for the property and where the property may even be expected to decline in value during the period when a buyer is being sought. It would tend to create "panic" sales.

rebutted, it is an inviting sword to be used by the government in highly inappropriate cases—"You have losses and are therefore deemed not to have a reasonable expectation of realizing a profit." The Commissioner of Internal Revenue already has a general presumption of correctness in his favor when he asserts a tax liability. The addition of a new statutory presumption in this fashion would be an invitation for Revenue agents to conclude that hard, factual analysis of each situation is unnecessary: the presumption gives the answer.

It is therefore submitted that if there is to be a test relating to expectation of profit, this added presumption is unnecessary and likely to cause undue controversy because it implies the rejection of factual analysis.

Allocation of deductions

This provision is directed at personal deductions. We believe it desirable that the Committee recognize that interest, taxes, and casualty losses for rental real estate are business deductions not subject to this section, and that interest and taxes on unimproved real estate held for development as rental property are also business deductions not subject to this section.

The CHAIRMAN. The next witness will be Mr. Louis R. Barba, first vice president of the National Association of Home Builders.

STATEMENT OF LOUIS R. BARBA, FIRST VICE PRESIDENT, NATIONAL ASSOCIATION OF HOME BUILDERS; ACCOMPANIED BY HERBERT COLTON, GENERAL COUNSEL; AND JOSEPH McGRATH, STAFF VICE PRESIDENT AND LEGISLATIVE COUNSEL

Mr. BARBA. Mr. Chairman, and members of the Committee, my name is Louis Barba, I am the First Vice President, National Association of Home Builders. I have with me our General Counsel, Mr. Herbert Colton, to my left, and to my right is Joseph McGrath, our Staff Vice President and Legislative Counsel.

The National Association of Home Builders consists of approximately 51,000 members in 473 affiliated State and local associations. Our members build over 75 percent of the residential construction in this country, including both single family housing and apartments. They thus perform a vital economic and social function, a function which the Congress has recognized and encouraged for the past 35 years.

Attached as an appendix is a more extensive statement of our views on H.R. 13270. Since our time is limted, I can sum up these views in a sentence or two. H.R. 13270 would completely cancel that 35-year effort insofar as rental housing is concerned. It would drastically curtail the flow of investment capital at the very time when our industry already faces critical credit problems.

While the bill would retain 200 percent accelerated depreciation on new rental housing, it would almost completely negate this (1) by the provisions which greatly increase recapture; (2) by restrictions on depreciation which may be taken by a second owner; and (3) by inclusion of accelerated depreciation in the limit on tax preferences and the related allocation of deduction.

The bill would practically destroy the resale market for depreciable real estate. Owners of "locked in" rental housing could not afford to sell their property at any point prior to the end of its useful life, which could be 40 years or more. This is because under the bill any sale prior thereto would result in recapture as ordinary income of the entire amount of excess accelerated depreciation over straight-line.

Facing such a "lock in" developers would not dare build; investors would not find rental housing attractive; and those few who did invest would not be able to revolve their funds for reinvestment in new construction.

We oppose Section 421(b) which removes the present concept of a cumulative percentage reduction in depreciation recapture.

We also object to and recommend elimination of the provisions in the bill which would limit "second owner" depreciation on rental housing to straight-line. We recommend the existing 150 percent depreciation for second owners of residential rental housing be retained.

The total impact of the proposed increased depreciation recapture plus the restriction to straight-line depreciation on used rental housing, and the interaction of these two proposals, will assuredly have a disastrous effect on the housing industry. Owners of rental housing will not sell—because of the substantial depreciation recapture—and potential purchasers will not be interested in buying—because of the limitations to straight-line depreciation. Investment funds will be diverted from new rental housing—always and inherently a highly dubious investment on a pure economic basis—into other more attractive forms of investment.

The homebuilding industry supports the concept of a minimum income tax. We believe everyone in the United States should pay a fair share of taxes.

However, we think the proposed limit on tax preferences and allocation of deduction provisions would further significantly diminish the stimulation of accelerated depreciation for residential rental housing, in that they include the excess of accelerated depreciation over straight-line as a "tax preference." The effect of such treatment under the LTP proposal would be to generate additional income to the investor to the extent of a portion of the excess depreciation.

The potential damage is compounded by the failure of the bill to relate the LTP proposal to the bill's other proposals to increase depreciation recapture, as discussed above. As now proposed, an investor partner in rental housing would be required to recognize ordinary income twice on the same dollar of accelerated depreciation.

This is the "coup de grace" to an industry which would be already well-nigh mortally wounded by the recapture and second owner-depreciation provisions. We recommend that this double penalty for investment in rental housing be eliminated.

We also recommend elimination of the excess of accelerated depreciation over straight-line as a factor in computing the allocation of deductions.

We additionally urge the committee to reject the recommendation made by the Treasury to expand LTP to include as a "tax preference" the amount to excess interest, taxes, and rent over receipts—if any—from unimproved real property during the period of construction. This militates directly against new construction.

NAHB supports the proposals in the pending bill—section 521(a)—to provide special depreciation benefits for rehabilitation of low-cost rental housing.

However, the incentive for such rehabilitation—the proposed 5-year writeoff of expenditures—is also substantially destroyed by the inclusion of such expenditures in the computation of depreciation recapture under section 1250.

We recommend that rehabilitation expenditures which qualify under this proposal be excluded from the application of depreciation recapture under section 1250.

We also urge the committee to reject the proposal of the Treasury that such expenditures be included as a "tax preference" within the LTP concept.

We object to the proposed limitation under section 412 of the bill in the use of the installment method of reporting gain to the extent that this limitation would operate on the sale of unimproved land to be used for residential construction. The proposed limitations on the installment method should be amended expressly to exempt a sale which involves unimproved real property where the taxpayer establishes that the property is bought and will be used for the construction of single family or multifamily housing.

NAHB strongly objects to the enactment of section 121 of the bill which would limit the deductions incurred by a membership organization in furnishing services to its members to the amount of income derived from members or from transactions with members. Such provision would, if enacted, severely curtail the performance by NAHB, as a membership organization, of its sole function of furthering the interests of the homebuilding industry.

The problem presented by section 121 of the bill arises with respect to the income derived by NAHB from the conduct of its annual convention, which constitutes one of the largest trade shows conducted in the United States. It is undertaken for the sole purpose of educating its members; it presents to its members the new products and techniques in the homebuilding industry to enable them to construct better and more efficient housing.

Income from the convention is derived from the rental of exhibit space to manufacturers and other organizations directly related to the homebuilding industry which, through exhibits, display such new products and techniques. While a member of NAHB seeing a product which is of interest to him may request to be contacted by the respective exhibitor at a later date, there are no sales transacted at the convention and it cannot, therefore, be considered as a "sales facility."

In most industries the rapid technological advance which this country has been experiencing makes it imperative that associations provide such "trade shows" in order that their members be kept abreast of the new developments and techniques in order to effectively operate and thereby improve business conditions in their industry. Indeed, the association conducting such "trade show" would thereby be directly promoting the common business interests of its members and more nearly achieving the purpose for which it was formed.

The proposed limitation on deductions should thus be inapplicable where, as in the case of the NAHB convention, the income is derived from an activity which "contributes importantly" to the performance by the membership organization of its express function.

We propose that this committee add to the pending legislation an amendment which would allow a taxpayer to exclude from income the first $750 of interest income on deposits in thrift institutions.

Thrift institutions are finding it increasingly difficult to attract consumer savings and we think this is one way of attracting savings.

The Internal Revenue Code currently provides a deduction for stock dividends as encouragement for investment in stocks. We believe savers require similar treatment.

Further we urge the Congress to increase the attractiveness as investment instruments of mortgages on single-family housing by giving preferred tax treatment to interest income from single-family home mortgages.

Finally, we propose that Congress condition the continued tax exemption of the income earned by pension, retirement, and similar funds on investment of a percentage of assets in residential mortgages.

The Congress should determine whether the pension funds high percentage of investment in equity risk securities is sound and in the long-term public interest. We believe that residential mortgages, now almost completely neglected by pension funds, could and should become a much safer investment resource for pension funds and that conditioning their continued tax exemption on such investment is necessary to achieve the needed shift in their investment emphasis.

The CHAIRMAN. Thank you very much.

Mr. BARBA. Mr. Chairman, I just read parts of the total statement and we are going to turn over the whole statement so it can be put in the record.

The CHAIRMAN. Your entire statement, of course, is already printed in the record.

Mr. BARBA. We ask for the inclusion in the record of these two tables on the impact of recapture under proposed revision of section 1250 and on the impact of proposed restriction on depreciation by purchaser of building acquired after July 24, 1969.

The CHAIRMAN. We will print that.

(The data referred to follows:)

I. IMPACT OF RECAPTURE UNDER PROPOSED REVISION OF SEC. 1250

[$4,000,000 apartment building, completed December 1968, 40-year useful life]

End of year	Straight line (2.5 percent)	Double declining balance (5 percent)	Cumulative depreciation		Amount of proposed recapture	Additional recapture over present sec. 1250	Additional recapture percentage
			Straight line	Double declining balance			
1	100,000	200,000	100,000	200,000	100,000	0	0
2	100,000	190,000	200,000	390,000	190,000	7,600	4
3	100,000	180,500	300,000	57,0500	270,500	43,280	16
4	100,000	171,475	400,000	741,975	341,975	95,753	28
5	100,000	164,900	500,000	905,875	405,875	162,750	40
6	100,000	154,655	600,000	1,061,530	461,530	239,996	52
7	100,000	146,925	700,000	1,208,455	508,455	325,411	64
8	100,000	139,580	800,000	1,348,035	548,035	416,507	76
9	100,000	132,600	900,000	1,480,635	580,635	510,959	88
10	100,000	125,970	1,000,000	1,606.605	606,605	606,605	100
11	100,000	119,670	1,100,000	1,726.275	626.275	626,275	100
12	100,000	113,685	1,200,000	1,839.960	639.960	639,960	100
13	100,000	108,000	1,300,000	1,947,960	647,960	647,960	100
14	100,000	102,600	1,400,000	2,050,560	650,560	650,560	100
15	100,000	99,375	1,500,000	2,149,995	649.995	649.995	100

II. IMPACT OF PROPOSED RESTRICTION ON DEPRECIATION BY PURCHASER OF BUILDING ACQUIRED AFTER JULY 24, 1969

[Assume: 10-yr.-old building purchased Jan. 1, 1970—$2,400,000 purchase price—remaining useful life, 30 yrs.]

End of year	Net income before depreciation	(0.5) 150-percent depreciation	(0.33) straight-line depreciation	Taxable income— Using 150-percent depreciation	Taxable income— Using straight-line depreciation	Additional taxable income under proposed restriction
1	$216,200	$120,000	$80,000	$92,200	$136,200	$40,000
2	218,900	114,000	80,000	104,900	138,900	34,000
3	221,600	108,300	80,000	113,300	141,600	28,300
4	224,300	102,885	80,000	121,415	144,300	22,885
5	227,000	97,740	80,000	129,260	147,000	17,740
6	229,700	92,855	80,000	136,845	149,700	12,855
7	232,400	88,210	80,000	144,190	152,400	8,210
8	235,100	83,800	80,000	151,300	155,100	3,800
9	237,800	79,610	80,000	158,190	157,800	(390)
10	240,500	75,630	80,000	164,870	160,500	(4,370)
Total						163,030

The CHAIRMAN. Mr. Barba, is not a great amount of the Federal tax involved here merely a tax on the fact that the purchasing power of the dollar has declined?

Mr. BARBA. The answer is "Yes."

The CHAIRMAN. Could you illustrate?

Mr. BARBA. Certainly. What is considered a gain and would, under the House amendments to section 1250, be taxed to a great extent as ordinary income, would in many cases represent a mere price level change. By this I mean that the cost of constructing a similar building will in many cases have increased in proportion to the increased value of the building being sold. There is in effect no real gain here, just a recognition that the inflation we have been experiencing since the Second World War, especially rampant now, has driven up the cost of everything. The brick placed in the apartment building when it was built, say 10 years ago, has gone up considerably in cost, and the wage that must be paid to the man that lays that brick has also gone up considerably. The owner of an apartment building who wants to take the so-called gain realized out of the sale of this building, and invest in the construction of a new building, needs a reasonable portion of the increased value of the old building. He needs this just in order to remain in the same relative equity position with respect to the greatly increased cost of constructing the new building as he was in with respect to the old building he just sold. This so-called gain then is not a real gain, but just a recognition that the price level has gone up as a result of inflation.

From my own experience in constructing apartment buildings, I have found that the cost of the typical apartment has increased better than 15 percent over the past few years. Unless I, as an owner of such a building, or others in the same position can realize some gain out of the building, there is absolutely nothing in profit left for me or anyone else who puts an apartment project together.

To require the recapture of all excess depreciation over straight line as ordinary income, and tax it as such, will simply serve to kill off the incentive for any person to undertake such a project.

I am representative, I believe, of the builders of this country. I am involved in all aspects of the building business. And when I find myself having to sell a project on the basis of the House-passed proposals on depreciation, I have no reason to sell; I have no reason to maintain the apartment; and, in fact, I have no reason to build it in the first place. The House provisions will kill off the incentives needed to build apartments.

We are going to need apartments more than ever in the years ahead, because of the young people in the 20 to 30 age group and the older people whose children have left home, who are increasing in number tremendously. They desire to live in apartments. If the incentive to build apartments is taken away—and the incentive under present law is not that great—then these apartments will not be built in any volume approaching the need. Those that are built will demand rents considerably higher than we are now used to, and in many cases too high to be afforded by those wo desire reasonable apartment living conditions.

What will result if we go this route will be an increased involvement of the Federal Government by way of subsidies. The higher the rent necessary to attract investment into apartments, the smaller the number of people who will be able to afford them without some type of governmental assistance. This we believe to be undesirable and we believe the Congress would agree with us.

The CHAIRMAN. Mr. Barba, what would you suggest as an alternative?

Mr. BARBA. Naturally, we would prefer to have these present provisions on recapture left as they are.

Mr. COLTON. We could submit, if agreeable, a suggestion with respect to the sliding scale amendment we could live with. We have in the past prepared it, and we could do so again.

(The committee subsequently received the following additional information:)

ALTERNATIVE SUGGESTIONS SUBMITTED BY NAHB

If it be determined to amend the applicable provision of law, notwithstanding our conviction that rental housing production will thereby be seriously constrained with gravely adverse economic and social consequences, we suggest:

1. *The concept of the limited tax preference provision,* by itself and without more, would accomplish the purpose of Congress to prevent undue tax shelter

while it would still permit a substantial (although diminished) source of needed investment capital for rental housing.

2. *With respect to recapture*, the problem of eliminating traffic in depreciation without discouraging legitimate investment in new rental housing construction can best be accomplished simply by amending existing Section 1250 to provide 5-year ordinary income treatment of *excess* depreciation instead of the present eight months, with ordinary income treatment continued at the existing diminishing rate.

3. *Second owner depreciation* should be continued at 150% of declining balance to maintain the same differential in favor of housing over other construction as is provided by the tax treatment proposed in the bill for new owners.

4. In our prepared statement we have made suggestions on other provisions in the bill and on the suggestions submitted to the Committee by the Treasury.

Senator MILLER. I am interested in this section 121 problem that you raised. In looking through the staff analysis the arguments for the House provision are as follows—and I am reading from page 30 of the blue book—"(2) This provision is necessary to prevent exempt membership organizations from attempting to avoid the effect of the unrelated business income rule by giving up their exempt status and deducting the cost of providing services for members from its investment or nonmembership income." You are talking about trade fairs. You make a profit at the trade fair, I assume.

Mr. BARBA. This depends, of course, on how you allocate your personnel and expenses. If Mr. McGrath, in drawing up the agenda for the convention spends *x* hours, that cost probably should be allocated to the convention. The same holds true for other members of the staff who spend a considerable amount of their time in preparing for our convention. So if we properly allocate our time and expenses, we probably earn a much lower amount of profit.

Senator MILLER. You are paying a tax on it. Let's assume you make a profit. Now, you would not be permitted to charge off other expenses relating to services to members. You are concerned about having to pay a tax. The argument for this provision assumes obviously that the trade fair exhibitors are not members of these organizations. Furthermore, it seems to me that the argument implies that the trade fair is not a service to members. It is income from service provided to nonmembers. I think either in the bill itself or in the committee print accompanying it should be made clear that trade fairs should be deemed to be for the service of the members. If that is so, then that is the heart of the problem. I am strongly inclined that way myself. I can see it is a mixed deal. Certainly, it is a service to an exhibitor—if he has a booth, I can see how he could get some future orders. It is also a service to members. It is a mixed situation. Obviously, the nonmembers are looking for business. But the trade fair is also a service to the members. I think we should clear up the matter.

Mr. COLTON. Practically everyone in our entire association devotes some of his time contributing to the trade show, and most of the activities of the association culminate in the convention. The entire building industry comes to the convention to see the exhibits. Many spend their entire time looking at the materials at the convention. In the past when this matter has come up we argued that there is no other way that you can bring home the new ideas. We thought we had made a case to the effect that the trade show exhibition is intertwined with the whole operation of the association, and not merely a trade show where we are providing an opportunity for sales.

Senator MILLER. I am recalling something—many State bar associations have an annual convention, and they aways have exhibits. There was a time when we had to come in for shows. It was decided that they should have to pay a fair rental for their booths. Still it was not a very large rent. The only reason for having that thing there is for the service of the members who come and have a chance to further their business. It seems to me that it would be stretching things to say that you are not going to be allowed to take a deduction. I think that is about the same ball park.

Mr. SILVERSTEIN. My name is Leonard Silverstein and I am tax counsel for NAHB. The argument is that you pay $100 to join a club and get the benefit of $300 of services.

Senator MILLER. In the same way, a member of the bar will pay his fee for going to the tax school.

Mr. SILVERSTEIN. He also gets the benefits from the profit of the show.

Senator MILLER. I understand the problem. I just want to be able to get the language drafted to cover the trade fairs in connection with conventions.

Mr. SILVERSTEIN. There are some magazines that put on shows strictly for profit.

Senator MILLER. Is that what a NAHB trade fair does?

Mr. SILVERSTEIN. There are some types of shows put on purely for profit. However, that is not true in the case of NAHB.

Senator MILLER. Where there is a trade show or an exhibition in connection with an association which provides services to the members through information or education or otherwise, then to my way of thinking that is not to be covered by this provision.

Thank you.

Mr. BARBA. Thank you.

(Mr. Barba's prepared statement follows:)

STATEMENT OF THE NATIONAL ASSOCIATION OF HOME BUILDERS

SUMMARY

A. *Provisions of H.R. 13270*

1. Retention of accelerated depreciation for new rental housing (Section 521(a));
2. Elimination of increased recapture of depreciation on real property (Section 521(b));
3. Elimination of restriction to straight-line depreciation by second owner of rental housing (Section 521(a));
4. Elimination of the treatment of excess of accelerated depreciation over straight-line on rental housing as a "tax preference" for purposes of the Limit on Tax Preferences of individuals (Section 301);
5. Elimination of the treatment of excess of accelerated depreciation over straight-line on rental housing as a factor in computing the allocation of deductions (Section 302);
6. Elimination of rehabilitation expenses (under Section 521(a)) from the computation of depreciation recapture on the disposition of low-cost rental housing (under Section 521(c));
7. Modification of the limitation on installment method to exempt sales of real estate purchased and used for the construction of single-family or multifamily housing (Section 412); and
8. Elimination of limitation on deductions of certain non-exempt membership organizations (Section 121).

B. Recommendations for Additional Provisions

1. Allowance of an investment account for dealers in real estate;
2. Exclusion from gross income of the first $750 of interest income on deposits in thrift institutions;
3. Preferred tax treatment for interest income from single family residential mortgages; and
4. Condition continued tax exemption of income earned by pension funds on investment of a percentage of assets in residential mortgages.

STATEMENT

Mr. Chairman and Members of the Committee, my name is Louis R. Barba. I am First Vice President and Chairman of the Legislative Committee of the National Association of Home Builders. I have with me our Tax Counsel, Mr. Leonard L. Silverstein, and our General Counsel, Mr. Herbert S. Colton.

The National Association of Home Builders consists of approximately 51,000 members in 473 affiliated state and local associations. Our members build over 75% of the residential construction in this country, including both single family housing and apartments. They thus perform a vital economic and social function—a function which the Congress has recognized and encouraged for the past 35 years.

Attached as an appendix is a more extensive statement of our views on several portions of H.R. 13270. Since our time is limited, I can sum up these views in a sentence or two:—*H.R. 13270 would completely cancel that 35-year effort insofar as rental housing is concerned. It would drastically curtail the flow of investment capital at the very time when our industry already faces critical credit problems.*

1. Recapture of Depreciation

While the bill would retain 200% accelerated depreciation on *new* rental housing, it would almost completely negate this (1) by the provisions which greatly increase recapture; (2) by restrictions on depreciation which may be taken by a second owner; and (3) by inclusion of accelerated depreciation in the limit on tax preferences and the related allocation of deductions.

The bill would practically destroy the resale market for depreciable real estate. Owners of "locked in" rental housing could not afford to sell their property at any point prior to the end of its useful life, which could be 40 years or more. This is because under the bill any sale prior thereto would result in recapture as ordinary income of the entire amount of excess accelerated depreciation over straight-line. Facing such a "lock in" developers would not dare build; investors would not find rental housing attractive; and those few wo did invest would not be able to revolve their funds for reinvestment in new construction.

We oppose Section 521(b) which removes the present concept of a cumulative percentage reduction in depreciation recapture.

2. Restrictions on Depreciation

We also object to and *recommend elimination of the provisions in the bill which would limit "second owner" depreciation on rental housing to straight-line. We recommend the existing 150 percent depreciation for second owners of residential rental housing be retained.*

This would be consistent with the proposed retention of 200% depreciation on newly constructed rental housing.

Limitation to straight-line depreciation on property in the hands of a second user penalizes rather than encourages ownership of rental housing in that the differential between the rate applicable to the *first* owner and that applicable to the second owner is greater for rental housing than for other types of buildings.

The total impact of the proposed increased depreciation recapture plus the restriction to straight-line depreciation on used rental housing, and the interaction of these two proposals, will assuredly have a disastrous effect on the housing industry. Owners of rental housing will not sell (because of the substantial depreciation recapture) and potential purchasers will not be interested in buying (because of the limitations to straight-line depreciation). Investment funds will be diverted from new rental housing—always and inherently a highly dubious investment on a pure economic basis—into other more attractive forms of investment.

3. Limit on Tax Preference and Allocation of Deductions

The home building industry supports the concept of a minimum income tax. We believe everyone in the United States should pay a fair share of taxes.

However, we think the captioned proposals would further significantly diminish the stimulation of accelerated depreciation for residential rental housing, in that they include the excess of accelerated depreciation over straight-line, as a "tax preference." The effect of such treatment under the LTP proposal would be to generate additional income to the investor to the extent of a portion of the excess depreciation.

The potential damage is compounded by the failure of the bill to relate the LTP proposal to the bill's other proposals to increase depreciation recapture, as discussed above. As now proposed, an investor partner in rental housing would be required to recognize ordinary income *twice* on the same dollar of accelerated depreciation: first under LTP in the year when excess depreciation is claimed on a property and a second time upon the later disposition of the property by the partnership.

This is the "coup de grace" to an industry which would be already well-nigh mortally wounded by the recapture and second owner depreciation provisions. *We recommend that this double penalty for investment in rental housing resulting from the inclusion of depreciation in the LTP provisions be eliminated.*

Under Section 302 of the bill, individuals would be required to allocate otherwise allowable personal deductions in such a fashion as to result in disallowance of a portion of such deductions by reason of the individual's share of the excess of accelerated depreciation over straight-line. This would further deter equity investment in rental property.

We recommend elimination of the excess of accelerated depreciation over straight-line as a factor in computing the allocation of deductions.

We also urge the Committee to reject the recommendation made by the Treasury to expand LTP to include as a "tax preference" the amount of excess interest, taxes, and rent over receipts (if any) from unimproved real property during the period of construction. This militates directly against new construction. Such expenses are integral elements of the total costs of construction and are incurred prior to receipt of rental income. This normal business activity should not be penalized. The proposal completely ignores the economic realities of construction.

4. Rehabilitation Expenses

NAHB supports the proposals in the pending bill (Section 521(a)) to provide special depreciation benefits for rehabilitation of low-cost rental housing.

However, the incentive for such rehabilitation—the proposed 5-year write-off of expenditures—is also substantially destroyed by the inclusion of such expenditures in the computation of depreciation recapture under Section 1250.

We recommend that rehabilitation expenditures which qualify under this proposal be excluded from the application of depreciation recapture under Section 1250.

We also urge the Committee to reject the proposal of the Treasury that such expenditures be included as a "tax preference" within the LTP concept. Inclusion of such expenditures would deter owners of low-cost rental housing from incurring rehabilitation expenses and completely frustrate the purpose of the proposal.

5. Installment Sales

We object to the proposed limitation under Section 412 of the bill in the use of the installment method of reporting gain to the extent that this limitation would operate on the sale of unimproved land to be used for residential construction. *The proposed limitations on the installment method should be amended expressly to exempt a sale which involves unimproved real property where the taxpayer establishes that the property is bought and will be used for the construction of single family or multifamily housing.*

Builders are hard-pressed to arrange for the acquisition of land on economically feasible terms. They need the greatest possible flexibility in the payment terms for such acquisitions. Buying land for subsequent housing developments ordinarily involves payments to the owners over a long period of years. The proposed percentage limitations under Section 412 of the bill will arbitrarily limit builders unnecessarily in their negotiations. We doubt that it was the purpose of the House that these installment method amendments apply to land purchases.

6. Non-Exempt Organizations

NAHB strongly objects to the enactment of Section 121 of the bill which would limit the deductions incurred by a membership organization in furnishing services to its members to the amount of income derived from members or from transactions with members. Such provision would, if enacted, severely curtail the performance by NAHB, as a membership organization of, its sole function of furthering the interests of the home building industry. It would similarily affect many of our affiliated state and local associations.

The problem presented by Section 121 of the bill arises with respect to the income derived by NAHB from the conduct of its Annual Convention, which constitutes one of the largest trade shows conducted in the United States. It is undertaken for the sole purpose of educating its members; it presents to its members the new products and techniques in the home building industry to enable them to construct better and more efficient housing.

Income from the Convention is derived from the rental of exhibit space to manufacturers and other organizations directly related to the home building industry which, through exhibits, display such new products and techniques. While a member of NAHB seeing a product which is of interest to him may request to be contacted by the respective exhibitor at a later date, there are no sales transacted at the Convention and it cannot, therefore, be considered as a "sales facility".

Except in the "sales facility" situation, the underlying concept of a "trade show" is that it represents an event designed to permit the interchange of knowledge for the benefit of all of its members. The exhibits represent practical workshops at which the dissemination of information as to new developments and techniques is undertaken in order to educate the members of the industry and increase their technical competence.

The "trade show" often makes it possible for members of the industry to become aware of new products and materials which have not otherwise been introduced in their geographical area. In addition, the ability to see the new products and materials in use provides a method whereby the member of the industry can determine the practical application thereof in improving the products or services of such member and his colleagues in the industry.

The non-sales facility "trade show" thus is undertaken for and in fact serves to promote the common business interest of its members through education and information on new products, materials and techniques. Moreover, in most industries the rapid technological advance which this country has been experiencing makes it imperative that the associations provide such "trade shows" in order that their members be kept abreast of the new developments and techniques in order to effectively operate and thereby improve business conditions in their industry. Indeed, the association conducting such "trade show" would thereby be directly promoting the common business interests of its members and more nearly achieving the purpose for which it was formed.

The proposed limitation on deductions should thus be inapplicable where, as in the case of the NAHB Convention, the income is derived from an activity which "contributes importantly" to the performance by the membership organization of its express function.

7. Incentives for Housing

This bill before you presents Congress with a unique opportunity to provide the people of the United States with improved opportunities for attaining the Nation's housing goals. The great problem facing the industry currently is a severe lack of mortgage funds. There is every reason to believe this will continue in the foreseeable future.

We propose that this Committee add to the pending legislation an amendment which would allow a taxpayer to exclude from income the first $750 of interest income on deposits in thrift institutions.

Thrift institutions, primarily savings banks and savings and loan associations, are the primary source of funds for the home building industry. They are finding it increasingly difficult to attract consumer savings because of the competition from other sources offering higher rates than thrift institutions can afford to pay.

The Internal Revenue Code currently provides a deduction for stock dividends as encouragement for investment in stocks. We believe savers require similar treatment.

Further we urge the Congress to increase the attractiveness as investment instruments of mortgages on single family housing by giving preferred tax treatment to interest income from single family home mortgages.

The single family mortgage instrument in today's economic and inflationary climate has completely lost its attractiveness to investors. The national monetary policies for controlling inflation have fallen with catastrophic impact upon the source of mortgage funds for single family home mortgages. The nation can ill afford to have the single family housing industry largely destroyed or curtailed during this current period. Such preferred tax treatment would not only be consistent with the stated national policy of encouraging home ownership, but it will also enable the single family home industry to better ride out periods of severe monetary restraint such as we are now in.

We propose that Congress condition the continued tax exemption of the income earned by pension, retirement, and similar funds on investment of a percentage of assets in residential mortgages.

Pension funds are the fastest growing pool of savings in the country. The Congress should determine whether their high percentage of investment in equity risk securities is sound and in the long-term public interest. We believe that residential mortgages, now almost completely neglected by pension funds, could and should become a much safer investment resource for pension funds and that conditioning their continued tax exemption on such investment is nessary to achieve the needed shift in their investment emphasis.

Appendix

Detailed Statement of the National Association of Home Builders Before the Committee on Finance, U.S. Senate on H.R. 13270

The National Association of Home Builders is the trade associate of the home building industry. Our membership totals approximately 51,000 members who are grouped in 473 affiliated state and local associations and who build over 75 percent of the residential construction in this country. As such, our members have a basic interest in providing adequate housing (both single and multifamily) for all Americans in all income levels at prices and rents they can afford.

Our members therefore have a vital interest in several of the provisions of H.R. 13270, the Tax Reform Act of 1969, which we feel would substantially impair the flow of investment funds into, and the construction of, multifamily rental housing units which this country has committed itself to by the enactment of the Housing and Urban Development Act of 1968. We are concerned that the enactment of these provisions would drastically diminish new multifamily construction and require substantially higher rents on the small amount that would be produced, thereby, of course, raising rental levels generally. It would thus be contrary to the national policy, repeatedly stressed by the Congress, to encourage the construction of necessary housing. It would materially add to the economic difficulties faced by this vital industry in the current critical inflationary crisis.

I. Provisions Affecting Home Building Industry

1. *Accelerated Depreciation for Residential Housing* (Sec. 521(a) of the Bill)—We endorse the provisions of Section 521(a) which ostensibly recognize the importance of residential housing within the economic structure of this nation by retaining the availability of accelerated methods of depreciation with respect to rental housing. This retention of accelerated depreciation with respect to housing is vital in order to provide the flow of investment funds necessary for construction of such property.

However, the purpose underlying the retention of accelerated depreciation for rental housing is almost completely negated by the interaction of Section 521(a) with the following provisions of the Bill: (i) increase in depreciation recapture (Section 521(b)); (ii) restriction on depreciation by purchaser (Section 521(a)); (iii) limit on tax preferences for individuals (Section 301); and (iv) allocation of deductions by individuals (Section 302).

2. *Recapture of Depreciation* (Sec. 521(b) of the Bill)—Under present law, gain on the sale of buildings is taxed as ordinary income to the extent of the depreciation taken on the property after December 31, 1963; however, after the property has been held 12 months, only the excess of accelerated depreciation over straight-line is "recaptured" as ordinary income. The amount of recapture

is then reduced after 20 months at the rate of 1 percent per month so that there would be no recapture where the property has been held for ten years.

Section 521(b) of the Bill would amend Section 1250 of the Code to remove the percentage reduction of the amount of recapture. Thus, where a building is sold after July 24, 1969, the entire amount of accelerated depreciation in excess of straight-line taken after July 24, 1969 would be recaptured as ordinary income to the extent of the gain realized on the sale, regardless of the length of time for which the property was held. The effect of such provision would be to apply to real estate depreciation recapture rules which are substantially similar to those applicable to personal property. However, this ignores the fact recognized by this Committee in 1964 that the circumstances of price level changes in real estate are far more severe than occurs in the case of personal property. Asserted gains which occur with respect to realty held for long periods of time often, in fact, represent mere price level changes. In such event, no economic gain, justifying a reversal of a previously granted deduction occurs. This is especially true in times of rapid inflation such as we are now experiencing.

The economic effect of this provision would be to substantially reduce the yield otherwise available from an investment in real estate and thereby impede the flow of necessary capital into the construction of rental housing. Moreover, the enactment of such a provision would produce a significant "lock in" effect, in that owners of existing rental housing would be unwilling to sell the property at any point prior to the end of its useful life (40 years or more), since a sale prior thereto would result in recapture as ordinary income of the entire amount of the excess of accelerated depreciation over straight-line. This is particularly true where the asserted gain arises from mere price level changes. This will have a substantial impact in the case of rental housing held for ten to twenty years. The owner's investment in such property will thus remain non-liquid and unavailable for investment in the construction of new residential rental property which will be necessary to meet the needs of our expanding population at such future time.

3. *Restriction on Depreciation by Purchaser* (Sec. 521(a) of the Bill)—The likelihood of a "lock in" effect produced by the full recapture of the excess of accelerated depreciation over straight-line regardless of the period for which the building is held is enhanced by the provisions of section 521(a)(4) which would limit to straight-line the depreciation which could be taken on section 1250 property, including rental housing, acquired after July 24, 1969, where the original use of such property does not commence with the taxpayer.

We are mindful of the fact that under our tax laws, depreciation available to a "second user" of property has been at a rate less than that available to the original user. Under present law, the second user cannot avail himself of the double declining balance or sum-of-the-years digits methods of depreciation on such property, but is instead limited to a maximum of 150 percent of straight-line. Consistent with such past precedent, since the Bill limits depreciation on buildings other than rental housing to 150 percent of straight-line, it would appear appropriate to apply the straight-line limitation to the second user of such buildings. However, since the Bill retains the availability of the accelerated methods of depreciation with respect to rental housing, the proposed limitation on depreciation to straight-line of such property by the second user in fact penalizes rather than encourages ownership of rental housing by curtailing depreciation by the second user at a rate which is in fact *greater* than the curtailment with respect to the second user of other buildings. Since H.R. 13270 specifically recognizes the economic necessity of a preferred status for rental housing, it is clearly inconsistent therewith to penalize the second user of such rental housing by providing identical treatment to that of the second user of other buildings.

The interaction of increased depreciation recapture and the restriction on depreciation to straight-line in the hands of the second user would have an adverse effect on the housing industry since owners of rental housing will not sell (in view of the substantial depreciation recapture) and potential purchasers will not buy (in view of the limitation to straight-line depreciation on such property). This "lock in" effect will result in channeling of investment funds into more attractive forms of investment and preclude construction of necessary new rental housing in later years.

4. *Limit on Tax Preference of Individuals* (Sec. 301 of the Bill)—The continued availability of accelerated depreciation for rental housing would be further and significantly eroded by the proposed limit on tax preferences ("LTP") which treats the individual's share of the excess of accelerated depreciation over

straight-line taken on section 1250 property, including rental housing, as one of several designated "tax preferences". Under this formula, an individual investor who provides equity capital to a partnership for the construction of rental housing would be required to treat as a "tax preference", in each taxable year, his proportionate share of the excess of accelerated depreciation over straight-line taken on the rental housing owned by the partnership. The taxpayer would then determine the total of his "items of tax preference" for such year and the LTP would be the greater of one-half of the sum of (i) the items of tax preference and (ii) the adjusted gross income, or $10,000. The excess of tax preferences over the LTP would be the disallowed tax preference which amount would be required to be added to gross income in determining the taxpayer's taxable income for such year.

The effect of treating accelerated depreciation over straight-line on rental housing as a "tax preference" for purposes of the LTP computation will be to discourage the investment of equity capital required for the construction of this much needed housing. Rather than invest in rental housing with all its otherwise attendant economic risks, an outside investor, faced with additional taxable income in the form of the excess depreciation, will instead channel his funds into other forms of investment which would not generate such additional taxable income, thereby depriving the housing industry of the needed source of outside capital. This will impede rather than permit accomplishment of our housing goals as reflected in the Housing and Urban Development Act of 1968.

Moreover, the potential damage to rental housing is compounded by the failure of the Bill to completely interrelate the LTP mechanism with the previously described increase in depreciation recapture. Assuming, as is most often the case, the rental housing is owned by a partnership, the investor partner may be required to include in gross income under LTP his proportionate share of the excess of accelerated depreciation over straight-line in each year. When the partnership later disposes of the property (e.g., after 12 years), there will be full recapture at ordinary income rates on the excess of accelerated depreciation over straight-line taken by the entire partnership to the extent of the gain realized on such disposition. By operation of the partnership provisions of the tax law, the partnership is a conduit and it is the partners who bear the burden of depreciation recapture.

However, no complete mechanism is provided to permit the investor partner to receive full credit, against his share of ordinary income represented by depreciation recapture upon the disposition of the residential rental property by the partnership, for the amount of ordinary income which he was required to include in gross income under LTP in each of the years during which the partnership held the property prior to sale. The Bill provides that the disallowed tax preferences attributable to accelerated depreciation will increase the "basis of the asset to which they relate" for purposes of determining gain or loss upon the disposition thereof (and not for purposes of computing depreciation thereon). In a factual situation involving a partnership, the "asset" for this purpose would likely be the rental housing itself, so that the investor partner's interest in such property would be increased by the disallowed depreciation required to be included in his income under LTP. (This result is by no means certain since the "asset" in question could be the investor's partnership interest). Under this approach, the partner's share of gain on the disposition of the property by the partnership would be reduced by reason of the increase in his share of the basis of the property. However, since depreciation recapture would be the lesser of gain or the excess of accelerated depreciation over straight-line, the increase in basis will not provide the partner with an offset to depreciation recapture where the gain is greater than the excess of accelerated depreciation over straight-line taken on such property.

The investor partner may thus be required to recognize ordinary income *twice* on the same dollar of accelerated depreciation, i.e., first, under LTP, in the year in which the excess depreciation over straight-line is claimed on the property by the partnership, and, second, on his share of depreciation recapture upon the later disposition of the property by the partnership. This result would serve to deter the flow of investment funds into rental housing and negate the objective sought to be achieved by retaining the availability of accelerated depreciation for such property.

5. *Allocation of Deductions* (Sec. 301 of the Bill)—A further deterrent to investment in the construction and ownership of rental housing is provided in section 302 of the Bill which would require the allocation by an individual of

otherwise allowable personal deductions (including interest, taxes, charitable contributions, and medical expenses) and result in a disallowance of the portion thereof attributable to allowable tax preferences, including the excess of accelerated depreciation over straight-line on residential rental housing. The portion of the excess of the individual's share of accelerated depreciation over straight-line for a taxable year which is not disallowed and added to his gross income under LTP is used in determining the portion of such deductions which is disallowed for such taxable year. The portion of the otherwise allowable deductions for such expenses (other than charitable contributions) to be disallowed by reason of the individual's share of the excess of accelerated depreciation over straight-line on rental housing (and other tax preferences) could not be carried forward and claimed as deductions in a later taxable year.

The effect of the enactment of the above-described provisions would be to impose severe tax restrictions which, together with present financial restraints, would seriously impair the ability of our industry to provide the necessary rental housing for our fellow citizens.

Instead of assisting the home building industry in its efforts to meet the critical housing needs of this Nation, the enactment of these provisions would effectively deter equity investment in the construction of residential rental housing. These proposals (a) penalize the equity investor by utilizing the excess of accelerated depreciation over straight-line on rental housing to result in a double inclusion of income by such investor (through LTP in each year and through increased depreciation recapture in the year of disposition), and a disallowance of personal expenses wholly unrelated to his investment in the rental housing, and (b) create a "lock in" effect as to investment in existing rental housing.

It is therefore imperative that this Committee, recognizing the critical nature of the Nation's housing needs, significantly revise the above-described provisions of H.R. 13270 which would operate to deprive the home building industry of equity capital which is the life blood of its continued operation.

Moreover, we urge that this Committee reject the recommendation made by the Treasury representatives during their presentation before this Committee to expand the LTP concept to include as a "tax preference" the amount of the excess of interest, taxes and rent over receipts (if any) from unimproved real property during the period of construction of improvements. The Treasury indicated that such amounts are "part of the economic cost of the improvement and when allowed as a deduction result in excesesive tax benefits to some high-bracket investors". The treatment of such expenses as tax preferences so as to result in additional income to the investors will serve as another severe deterrent to the flow of investment funds into the construction of rental housing and thereby contribute further to the decline in he construction of such housing.

Such expenses are incurred as integral elements of the overall cost of construction at a time which of necessity is prior to completion of the improvements on such real property and thus prior to the receipt of rental income to be derived from the improvements. These expenses are a necessary incident to the construction of the improvements and should not be subject to penalty solely by reason of the fact that they are of necessity incurred prior to the production of income from the improvements. The treatment of such expenses as a "tax preference" fully ignores the economic realities of the construction of rental housing and other improvements and fails to recognize that the investment of owner is earning no return during the construction period. The excessive tax benefits asserted by the Treasury to result from such expenses are instead an ordinary and necessary part of the construction activity and their effective disallowance (by the treatment thereof as additional income to the individuals) will serve to further preclude the Nation from meeting its commitment for the construction of necessary housing.

6. *Rehabilitation Expenses* (Sec. 521(a) of the Bill)—The Bill provides for the depreciation on straight-line method over a period of 60 months of expenditures (having a useful life of 5 years or more) for the rehabilitation of low-cost rental housing, up to a maximum of $15,000 per dwelling unit (apartment). The purpose of this provision is to stimulate and encourage rehabilitation of buildings for low-cost rental housing. NAHB has consistently favored the enactment of a provision of this type in order to provide an incentive for improvement of the living conditions of the economically deprived members of our society.

However, the incentive for such rehabilitation provided by the five-year write-off of rehabilitation expenditures is substantially negated by the inclusion of such expenditures in the computation of depreciation recapture under section 1250. Under Section 521(c) of the Bill, the amount of depreciation recapture upon the sale of low-cost rental housing would include the entire amount of rehabilitation expenditures to which the five-year write-off was applicable or, where the housing was sold after one year, the excess of the depreciation under the special write-off over the depreciation which would have otherwise been allowable on such expenditures, if the useful life had been determined under normal rules. Thus, the owner of such low-cost housing would be required to recognize ordinary income solely by reason of improving the facilities in such low-cost housing.

The inclusion of rehabilitation expenditures to which the special five-year write-off would be applicable within the operation of depreciation recapture is contrary to both the technical requirements of section 1250 of the Code and the purpose underlying special write-off of rehabilitation expenditures. Section 1250 by its terms is intended to recapture only the amount of depreciation which is claimed in excess of the amount otherwise available if the straight-line method were utilized. Section 1250 was never intended, and does not in fact operate, to result in depreciation recapture where depreciation on the building is determined under the straight-line method. Since the special write-off of rehabilitation expenditures expressly provides that it is a depreciation under "the straight-line method" using a useful life of sixty months, there is, in fact, no amount of depreciation *in excess* of straight-line to which section 1250 should be applicable. Furthermore, since the purpose of the proposed write-off of rehabilitation expenditures is to encourage such expenditures, the fact that the taxpayer will be faced with ordinary income (in the form of depreciation recapture) upon the disposition of such low-cost rental housing will significantly deter his incurring such rehabilitation expenditures and thereby defeat the underlying purpose of the special write-off.

We therefore recommend that the rehabilitation expenditures which qualify for depreciation under the five-year write-off provided in Section 521(a) of the Bill should be excluded from the application of depreciation recapture.

Moreover, we urge this Committee to reject the proposal made by the Treasury during its testimony before this Committee that the rehabilitation expenditures under the five-year write-off be included as a "tax preference" within the LTP concept. The allowance of depreciation on such expenditures over a five-year period was not recommended by the House in order to create a "tax preference" which could result in additional income under LTP as a result of incurring such expenditures, but rather as a recognition of the necessity for a tax incentive to encourage the improvement of existing low-cost rental housing. The potential ordinary income which would result from the combined effect of treating such rehabilitation expenditures as part of LTP and as part of depreciation recapture would produce an *"overkill"* which would deter the owner of low-cost rental housing from incurring such rehabilitation expenditures and thereby completely frustrate the purpose underlying this provision.

7. *Limitation on Installment Sales Provision* (Sec. 412 of the Bill)—We object to the proposed limitation of the election of the installment method of reporting gain to designated "installment transactions" to the exent that such limitation would operate to preclude installment reporting of gain on the sale of unimproved land to be used for the construction of housing, both single family and multifamily. Under Section 412 of the Bill, the installment method of reporting provided in section 453 of the Code would be available only to gain on a transaction in which payments of principal or principal and interest are required to be paid periodically and in such amounts over the installment period as prescribed under regulations by the Secretary. Such requirement will be deemed satisfied if (i) such payments are required to be made at least once every two years in relatively even or declining amounts over the installment period; or (ii) at least 5 percent of the principal is required to have been paid by the end of the first quarter of the installment period, at least 15 percent of the principal is required to have been paid by the end of the second quarter of the installment period, and at least 40 percent of the principal is required to have been paid by the end of the third quarter of the installment period. The Ways and Means Committee Report provides that this "latter safe-haven rule should protect legitimate installment sale transactions."

We believe, however, that the importance of ensuring the availability of an adequate supply of land for the construction of housing necessary to meet the Nation's housing needs should be given special consideration in qualifying for installment method of reporting gain on the sale thereof. In view of the substantial increase in the cost of land created by our inflationary economy, builders are hard-pressed to arrange for the acquisition of land on terms which are economically feasible. Acquisition of land under such adverse economic conditions requires that the builder have the flexibility to make the acquisition on terms which permit payment over a period of years other than within prescribed percentage limitations while still permitting the seller to report the gain on the installment method. A limitation on the qualification for installment reporting to sales involving periodic payments qualifying within the strict confines of designated percentages as proposed in Section 412 will substantially impede the ability of builders to acquire land for construction of housing which is desperately needed in this country.

We therefore believe that the proposed limitations on the installment method should be amended to expressly exempt therefrom a sale involving unimproved real property where the taxpayer establishes that the property is purchased and will be used for the construction thereon of housing.

II. Provisions Affecting NAHB

Limitation on Deductions of Certain Non-Exempt Membership Organizations (Sec. 121 of the Bill)—NAHB strongly objects to the enactment of section 121 of the Bill which would limit the deductions incurred by a membership organization in furnishing services to its members only to the amount of income derived from members or from transactions with members. Such provision would, if enacted, severely curtail the performance by NAHB, as a membership organization, of its sole function of furthering the interests of the home building industry. The provision could have the same effect on many of our affiliated local and state associations.

The problem presented by section 121 of the Bill arises with respect to the income derived by NAHB from the conduct of its annual Convention. This Convention, which constitutes one of the largest trade shows conducted in the United States, is undertaken for the sole purpose of educating its members as to the new products and techniques in the home building industry so as to permit its members to construct better and more efficient housing. The income from the Convention is derived from the rental of exhibit space to manufacturers and other organizations directly related to the home building industry which, through exhibits, display such new products and techniques. While a member of NAHB seeing a product which is of interest to him may request to be contacted by the respective exhibitor at a later date, there are no sales transacted at the Convention and it cannot, therefore, be considered as a "sales facility."

Except in the "sales facility" situation, the underlying concept of a "trade show" is that it represents an event designed to permit the interchange of knowledge for the benefit of all of its members. The exhibits represent practical workshops at which the dissemination of information as to new developments and techniques is undertaken in order to educate the members of the industry and increase their technical competence. The "trade show" often makes it possible for members of the industry to become aware of new products and materials which have not otherwise been introduced in their geographical area. In addition, the ability to see the new products and materials in use provides a method whereby the member of the industry can determine the practical application thereof in improving the products or services of such member and his colleagues in the industry.

The non-sales facility "trade show" thus is undertaken for and in fact serves to promote the common business interest of its members through education and information on new products, materials and techniques. Moreover, in most industries, the rapid technological advance which this country has been experiencing makes its imperative that the associations provide such "trade shows" in order that their members be kept abreast of the new developments and techniques in order to effectively operate and thereby improve business conditions in their industry. Indeed, the association conducting such "trade show" would thereby be directly promoting the common business interests of its members and more nearly achieving the purpose for which it was formed.

It is submitted that the proposed limitation on deductions should thus be inapplicable where, as in the case of NAHB Convention, the income is derived from an activity which "contributes importantly" to the performance by the membership organization of its express function. The purpose of section 121 of the Bill is to preclude the use of investment income to offset the loss from conduct of membership operations. Where, however, the income is derived from the performance of an activity (rather than a passive investment) which is related to the fulfillment of its functions, the membership organization is not in fact utilizing unrelated income to offset operating expenses.

Since the purpose of the Convention which generates such income is directly related to, and contributes importantly to, the performance of the underlying purpose of NAHB itself, there should be no limitation placed on the application of such income against expenses of operation of the organization. Indeed, such result would be inconsistent with judicial decisions permitting such offset and would, in the case of NAHB, do violence to its purpose by impeding its ability to provide its members with a form of services, i.e., the knowledge of the latest techniques and products, which would thereby improve the quality of the housing which this country so desperately needs at the present time.

III. Other Recommendations

1. Investment Accounts for Dealers in Real Estate.—We recommend that as part of its consideration of the overall subject of tax reform, this Committee add to H.R. 13270 a provision of vital importance to the home building and real estate industry which would provide for investment accounts for dealers in real estate.

Unlike persons who deal in securities, persons who engage in the realty and home building businesses have no statutory grant (such as provided in section 1236 of the Code for dealers in securities) to earmark realty as investment property, and thereafter dispose of such property as a capital asset.

As a result, the courts have generally precluded home builders from capital gains treatment on realty even under circumstances where the property involved was purchased and sold in unimproved state. The home builder may prevail under present law only by introducing facts sufficient to establish that such realty was not held principally (or of first importance) for the purpose of sales to customers in the ordinary course of business. The judicial decisions, however, create substantial uncertainty as to the tax treatment of realty acquired for investment rather than for development purposes in a given factual situation.

The purpose of such provision would be to remove the existing uncertainty and create express statutory rules which, if satisfied, would permit an electing home builder to make genuine investments in realty and thereafter dispose of such property with a clear assurance of taxation on the gain thereof as a capital gain. Under this provision, in the case of a dealer in real property, the gain derived from the sale of certain property, could at his election, quality for capital gains treatment as gain derived from the sale of exchange of a capital asset.

Adequate safeguards would be provided in the proposal in order to insure that such provision would be applicable only to realty which was held for investment purposes. The category of real property which would qualify under this provision would be limited to property held by the taxpayer for more than 18 months, on which no substantial improvement (i.e., expenditures of no more than 15 percent of the market value of such property) was made during the holding period, and as to which the taxpayer, within 30 days of acquisition, clearly identifies such property as real property held for investment. The manner of such identification would be prescribed by the Secretary or his delegate.

Legislation generally similar to the above is now part of the Code (section 1236) and applies in the case of securities dealers. NAHB believes that home builders and dealers in real estate should be entitled to the same certainty of tax treatment.

2. Incentives for Housing.—This bill presents the Congress with a unique opportunity to provide the people of the United States with improved opportunities for attaining the Nation's housing goals. These goals, set out in the Housing and Urban Development Act of 1968, call for the construction and rehabilitation of 26 million housing units over a ten year period from 1968 to 1978. To meet these goals, it is necessary to produce at an average annual level of 2.6 million housing units. Today we are producing at less than half of that needed average annual level.

The home building industry, because of tight money and excessively high interest rates, is unable to produce anywhere near the volume required to meet these goals and in fact every month is falling further and further behind with an ever declining production level. To encourage the availability of the mortgage money needed to enable our industry to construct the housing needed and desired by the citizens of this country, it is recommended that the following three tax incentives be enacted:

(a) *Allow a taxpayer to exclude from income the first $750 of interest income on deposits in thrift institutions*—Thrift institutions, primarily savings banks and savings and loan associations, are the primary source of funds for the home building industry. They are finding it increasingly difficult to attract consumer savings because of the competition from other sources offering higher rates than thrift institutions can afford to pay.

(b) *Give preferred tax treatment to interest income from single family home mortgages*—The single family mortgage instrument in today's economic and inflationary climate has completely lost its attractiveness to investors. The national monetary policies for controlling inflation have fallen with catastrophic impact upon the sources of mortgage funds for single family home mortgages. The Nation can ill afford to have the single family housing industry largely destroyed or curtailed during this current period. Providing preferred tax treatment on the interest income earned on these mortgages is believed fully consistent with the stated National policy encouraging homeownership. It will also enable this industry to better ride out periods of severe monetary restraint such as we are now in.

(c) *Condition the continued tax exemption of the income earned by pension, retirement, and similar funds on investment of a percentage of assets in residential mortgages*—Pension funds are the fastest growing pool of savings in the country. The Congress should determine whether their high percentage of investment in equity risk securities is sound and in the long-term public interest. We believe that residential mortgages, now almost completely neglected by pension funds, could and should become a much safer investment resource for pension funds and that conditioning their continued tax exemption of such investment is necessary to achieve this needed shift in their investment emphasis.

The CHAIRMAN. The next witness now will be Carl M. Halvorson, president of the Associated General Contractors. Mr. Halvorson, we are familiar with your fine organization. They do a great job and we welcome you here today.

STATEMENT OF CARL M. HALVORSON, PRESIDENT, ASSOCIATED GENERAL CONTRACTORS

Mr. HALVORSON. Thank you very much, Senator.

We have filed a statement with the committee. I won't take the time of the committee to read any of the portions of the testimony that have been submitted, but I would like to make a few general remarks in regard to the bill.

Inasmuch as our membership does somewhere in the area of 75 percent of the contract construction in this country, and much of this construction is in the field of building for various owners of real estate, including housing, commercial buildings, factories, and all the various things that we have for shelter and work space in this country, we are very much concerned with this substantial part of our market. We feel that the retention of the existing rules on depreciation, and on recapture, is a good manner of handling this kind of problem in our society. And we feel further that the disruption of changing these rules would not be to the best interests of our country.

Now, also, there are so many other things in the bill that have an effect on what it costs to do the work in building these buildings and the various public works, that we think that serious consideration should be given to allowing the depletion, for instance, on sand and gravel to stay the way it is.

We believe that tax-free local bonds are essential to create public works. Public works tie this society together, by providing buildings and other types of improvements at the local level. To change the taxing structure on these bonds would inure to the detriment of all real estate activity within the country.

Also, we feel that another important factor of cost of a building, or any kind of structure or public improvement, is the depreciation allowable on our equipment used in the construction thereof. As you know, Congress has changed the law regarding gains on sale of depreciable equipment, so that now such gain is ordinary income to the extent of depreciation taken thereon after 1961. We feel that the operator of a business should be free to use his own best judgment to set the depreciable lives of his equipment. From a broad, long-range position, the Government would not suffer, and such a rule would permit the private operator more flexibility in arriving at depreciation rates to fit his particular use of equipment.

In many cases over the years we have had to buy special tools to do a special job. We have to charge the cost of those tools against that special job. Consequently, we feel that we should be able to recover in depreciation what we charge against that particular item.

We feel, further, that anything that makes a substantial change in the basis on which our economy is run does tend to have a disruptive influence on the overall posture. Consequently, there must be compelling reasons for making these changes or there will be disruptions.

We are actually in a depressed situation in our construction industry right now, despite the fact that there is much work in the "pipeline," so to speak, that has been created in past years. Commercial building, for instance, in the 11 Western States is down 20 percent at present, and public works are down almost 50 percent from what they were a year ago. In view of the cutbacks and other activities that have come out in the past couple of weeks, we think there will develop a very serious situation in the construction industry, which is the largest single industry in this country, within a very short time. Work which presently is underway is very substantial, but, as the work in the "pipeline" depletes itself, we think that we will have very serious problems in this industry.

So, with that, I would conclude my remarks. As I say, we have gone into these factors in detail in the statement. I didn't want to burden you with restating those specific points.

The CHAIRMAN. Thank you very much, sir.

Mr. HALVORSON. Thank you very much.

(Mr. Halvorson's prepared statement follows:)

STATEMENT OF CARL M. HALVORSON, PRESIDENT, THE ASSOCIATED GENERAL CONTRACTORS OF AMERICA

SUMMARY

The 9,000-member firms of The Associated General Contractors of America comprise one of the most significant and most basic of industries. The economic history of the last twenty years amply demonstrates the intimate connection between our health and that of the entire American economy.

As the Congress and the nation undertake this significant reexamination of national tax policy, the members of our association have become increasingly concerned over the multiplicity of recessive measures, not fully thought through in terms of the tax policy, whose primary effect will be upon the construction business.

Existing Depreciation and Recapture Rules Should Be Retained for All Real Estate

Section 521 of H.R. 13270 would deny all accelerated depreciation to used property and restrict depreciation of new nonresidential property to the 150 percent declining balance method.

In doing so Section 521 ignores that the greatest economic wastage of real property occurs in the early years of ownership, and that double declining balance and sum of the years-digits depreciation are necessary to allow recovery of this capital shrinkage. Although opponents of accelerated depreciation rely on data which shows resale prices in excess of adjusted basis, this spread is true capital gains, fully accounted for by the immense inflation in construction costs—more than 30 percent in the last five years and 15 percent just since January 1968—and by the growing scarcity of urban land. The cash flow produced by depreciation—the other factor said to support Section 521—is amply justified by the need to service mortgages in an ever tightening money market and the needs for reserves which are constantly used to renew the property.

Section 521, furthermore, misses the abuses at which it is supposedly aimed. For sound reasons apart from tax policy. new residential construction is exempted from the proposed strictures on accelerated depreciation, even though it is such real estate that is most open to the rapid turnover which is the key to any tax abuse. This part of Section 521 would apply only to industrial and commercial structures, where the opportunities for abuse are negligible and where restrictions on depreciation will greatly decrease the ability of American business to meet foreign competition. Indeed, in this respect Section 521 is directly at odds with the approach of Section 221 of the House bill. That part, in establishing limitations on the interest deduction, recognizes that expenses incurred in a trade or business are not susceptible to abuse and expressly exempt interest incurred in the conduct of a trade or business.

Nor has any cogent case been made for the recapture rules that Section 521 would impose. We did not oppose the adoption of Section 1250 in 1964 because we believed then and believe now that it provides a rational and fair inhibition upon the tax abuse that can exist in this area by measuring the recapture of depreciation into ordinary income by the length of the taxpayer's holding period. Section 1250 presents a carefully designed tool that is entirely responsive to the difficulties that existed. H.R. 13270, on the other hand, would convert all depreciation above straight line to ordinary income upon the sale of real estate, and thereby penalize a bone fide long term investor who has not abused the tax laws and seriously restrict the amount of capital that will be placed into construction of modern facilities.

The Need For Reform of Capital Recovery Rules

The most notable and most serious omission from H.R. 13270 is the absence of the long promised general reform of our capital recovery system. Against the background of the proposed repeal of the investment credit, this reform is more necessary than ever.

The cost of machinery is a major factor in the construction industry, and the five year life applied to most of our equipment ignores the exteraordinarily abusive working conditions and rate of technological change that makes our equipment substantially useless after a year or two of use. For much of the last several years, the investment credit has compensated for the unrealistic useful lives applied in our industry. If contrary to the repeated assurances we have heard in prior years, the credit is not to be a permanent part of our tax structure, there must at the same time be a general reform of capital recovery rules for all industry.

That reform must recognize three principles.

First, average lives must be based upon the optimum practice for each industry. Otherwise the tax code will forestall industrial modernization and build obsolescence into American industry. All American business will suffer an increased disadvantage in competing abroad, where rapid capital recovery has long been a principal tenet of tax and economic policy.

Second, depreciation rules must recognize that some taxpayers have a particular need for rapid replacement. Now that the moratorium on the reserve ratio test is ended, revenue agents will see themselves free to renew the endless haggling over depreciable lives that marked audits for so many years, unless the Congress emphasizes that a businessman's reasonable decision of how to manage his own business should be given the strongest weight.

Third, changes in the depreciable lives must not be viewed as revenue gathering or contracyclical devices. For thirty years our economy was hampered by restrictive depreciation rules based on a depression decision to raise more money by lengthening useful lives. This is poor tax policy and disastrous economics. Depreciation reform should provide a context that invites steady capital investment and provides an assured permanence of statutory structure.

The specifics of depreciation reform should start with four proposals which the machine tool industry previously described for this committee.

Two, elimination of the reserve ratio test and the amendment of Section 167 to eliminate the need to establish salvage value, would simplify tax accounting, eliminate endless controversies on audit, and recognize that in the construction business as elsewhere there is no predictable or readily available salvage market for many capital goods.

The third proposal, to codify the guideline depreciable lives, is highly meritorious, but the Congress should recognize (1) that the guidelines are unnecessarily restrictive in their treatment of the construction industry; (2) that three years rather than five years is a realistic average life for construction equipment; and (3) that some contractors in some situations require even shorter lives.

The fourth proposal—to eliminate the $10,000 ceiling upon the additional first year depreciation allowance of Section 179, with a possible reduction in rate—would help compensate for the loss of cash flow that will follow repeal from the investment credit. An amendment of Section 179(d)(1) to grant the allowance without regard to the useful life of depreciable property would be particularly equitable in its application to the construction industry.

Interest on the Obligations of State and Local Governments Should Remain Tax Exempt

A significant portion of the business of members of our association consists of public construction. By disrupting the financial market for state and local securities—and the financial press shows how severely the House passage of H.R. 13270 has restricted the marketability of these securities—the inclusion of interest on these obligations within the tax preference provisions of the bill will destroy the ability of local governments to supply necessary facilities and services.

We agree that each American should pay some taxes on his economic income. It is incorrect, however, to include interest on state and local securities in the catalog of items not carrying their fair tax burden.

The holder of these securities pays a silent tax, measured by the difference between the interest he receives and the greater interest available on nonexempt securities. Interferences with the tax exempt status of public securities will require a compensating increase in state and local taxes, and there will not be commensurate increases in federal tax collections. This "reform" will increase everyone's taxes and decrease no one's; there is no justification for its enactment.

The Existing 5 Percent Depletion Rate for Sand and Gravel Should Not Be Reduced

For reasons that are unexplained, H.R. 13270 would impose a 20 percent reduction in the smallest depletion rate in the tax code: the 5 percent rate accorded sand and gravel.

Sand and gravel producers face a staggering need to find and develop new supplies in the last third of this century. The average annual output must be doubled to satisfy projected demands. Cost of development and production are particularly high, since deposits must be developed near construction sites and their proximity to metropolitan areas requires extensive expense for rehabilitation after the sand and gravel is removed.

The proposed reduction in depletion rate can only increase the cost of construction contractors, who are the primary consumers of sand and gravel. Both considerations of tax policy and the economics of an industry that has already suffered immense inflation in cost require continuation of the 5 percent rate.

The "Country-By-Country" Limitation On Foreign Tax Credit Should Not Be Changed

Section 431 of the House bill would impose an additional inhibition on the ability of smaller businesses—those who lack a large base of foreign income—to compete abroad. The danger perceived—the possibility of a double tax benefit for those who have loss years followed by successful years in foreign countries—exists only for activities in countries not allowing loss carryovers in their tax structure.

But the effect of the denial of the carryover is to increase the effective tax rate in those countries, and the limitation of the American tax credit in turn would increase the effective total tax burden beyond the amount the American tax code would impose on the net results of the foreign business. Thus, this provision not only would impair the United States' position in foreign commerce, but it also would frustrate a prime function of the foreign tax credit.

H.R. 13270 Would Subject the Construction Industry To a Multiplicity of Recessive Yet Inflationary Pressures

Each of the parts of H.R. 13270 which I have discussed would inhibit new construction, raise the cost of construction, or both. H.R. 13270, if not changed, will subject the construction industry together with the entire economy to a multiplicity of pressures that are both recessive and inflationary. These parts of H.R. 13270 are not sound as tax reforms, they are economically dangerous, and they should not survive the scrutiny of the Senate.

STATEMENT

My name is Carl M. Halvorson, and I am a general contractor in Portland, Oregon. I appear before the Finance Committee in my capacity as President of the Associated General Contractors of America.

The Associated General Contractors, as our name suggests, is a trade association of construction contractors. We have about 9,000 member firms who come from all fifty of the United States, the District of Columbia, and Puerto Rico. Our business includes all manner of heavy construction; our members build about 75 percent of the contract construction in the United States. I need not dwell at length on the place the construction industry has in the American economy. We are among the most basic of industries. The health of the construction business is essential not only to the contractors of our association and their employees and suppliers, but as well to every economic activity in the Nation.

We appreciate the Committee's courtesy in extending to us the opportunity to express our views on H.R. 13270. This, of course, is one of those periodic occasions when our country re-examines and reassesses its tax policies. The decisions of this Congress will establish national tax policy for many years to come. This consideration, above all else, causes us to view with no small measure of alarm five pending tax proposals, which we believe are poorly founded as a matter of tax policy, inconsistent with a goal of orderly economic growth, and unusually discrimnatory in their cumulative impact upon the business of the members of our association.

Existing Depreciation and Recapture Rules Should be Retained for all Real Estate

Section 521 of H.R. 13270 makes two important changes in the depreciation of real property which are the source of our gravest concern about H.R. 13270. Above all other provisions of this Bill, Section 521 will inhibit the formation of new capital for investment in construction and have a serious recessive effect upon the economy.

The first change would deny accelerated depreciation to used property and restrict depreciation on new nonresidential property to the 150 percent declining balance method. The double declining balance and the sum of the years-digits methods would be forbidden. In addition, the Bill would require that all accelerated depreciation taken on all buildings after July 24, 1969, be converted to ordinary income when the building is sold. These changes do not constitute rational tax policy and do not respond to the supposed evils that are cited in their support.

The proposals are premised on the abuses which can occur upon the use of accelerated depreciation followed by rapid resale of real property. We all know that this combination presents an opportunity for the deferral of ordinary income and its conversion to capital gains. Such tax avoidance devices were becoming common at the time Section 1250 was added to the Internal Revenue Code in 1964 for the purpose of restricting capital gains treatment of accelerated depreciation to owners who held property for a reasonably long period of time. The general approach to Section 1250 is a rational and fair one and we did not oppose its enactment. But we believe the present proposal suffers from a host of defects.

First, it is economically unsound to conclude that only straight-line depreciation reflects economic wastage. The greatest risk of loss and the greatest physical deterioration occur in the early years of ownership. The initial owner—the person who puts up the capital to construct a facility—takes these risks. At no time since the adoption of accelerated depreciation methods in 1954 has anyone produced persuasive evidence to indicate that this is not so or that double declining balance and sum of the years-digits overstate the economic wastage inherent in these initial risks.

Histroically, two factors have been relied on by those who nevertheless argue for elimination of these methods. First, they point to resale prices, which generally exceed adjusted basis. Second, they point to the existence of cash flow in excess of the amount needed to service the mortgage. Although both premises are repeated in the House report, each is fallacious.

Comparison of resale prices to adjusted basis fails to take account of inflationary pressures on real property values. Enormous increases in costs of land, labor, and materials have inflated property values even beyond the general rate of inflation. This is reflected in the report which the Bureau of the Census issued this month entitled "Value of New Construction Put in Place."[1] That report, in evaluating recent construction in terms of 1957–1959 dollars, shows an inflation of over 40 percent in the last ten years. Construction costs have increased by 30 percent since 1964 and at least 15 percent just since January 1968.[2] Thus, a building built in 1964 should have increased in value by at least 30 percent to keep pace with the inflation in building costs. The squeeze on urban land should increase the value even more.

It is, therefore, not surprising that resale price often exceeds adjusted basis. But this only proves the great inflation we have suffered in the last five years. It does not show that accelerated depreciation methods are now overly generous. Rather the increases in property value are true capital gain because they represent a true increase in the dollar value of the invested capital, an increase caused by the combination of inflationary pressures and the growing scarcity of land.

Insofar as the excess of cash flow is concerned, the first critical point is that the tighter money becomes, the smaller that excess is. The second point ignored in the House is the need of a cash reserve for repairs and maintenance. The creation of such a reserve is the prime economic function of depreciation, and, in a soundly managed operation, the reserve is constantly being used for renewal of the property.

My next point is that the real estate provisions of this Bill are not responsive to the abuses its sponsors claim to perceive. Rapid turnover is the key to any tax abuses which exist. The feared deferral and conversion of ordinary income occurs only if the property owner holds real estate for a short period of time and resells it without making the repairs necessary to account for the physical deterioration occurring during his ownership. This abuse is most readily achieved and most commonly occurs in residential property. For purposes of national policy with which we agree—to encourage the badly needed expansion of the housing supply—H.R. 13270 exempts residential structures from the proposed restrictions on accelerated depreciation. The tax consequence, however, is that the double declining and sum of the years-digits depreciation would continue to be available in the area that is most susceptible to abuse and would be denied only to industrial and commercial structures, where rapid turnover is not as likely and long-time ownership is the rule.

Oddly enough, this treatment is exactly the opposite of that provided in Section 221 of the Bill, which limits the deduction of interest on loans used to carry investment assets. Section 221 directly recognizes that expenses incurred in a trade or business do not lend themselves readily to abuse, and interest paid in the conduct of a trade or business is exempted from the limitations established in Section 221.

The same approach should be applied to real estate. Industrial and commercial facilities do not invite turnover and do not allow postponement of repairs in the manner of residential housing. They are simply not the proper target for restrictions on accelerated depreciation.

The restrictions of Section 521 would also increase the competitive disadvantage American business experiences in foreign markets. Tax structures abroad place high priority on the rapid recovery of capital investment, even allowing depreciation writeoffs substantially in excess of economic wastage. America must compete for the construction budgets of domestic and foreign industries, and the inevitable result of Section 521 would be to encourage domestic capital to go abroad, and foreign capital to remain beyond our boundaries.

These factors all show the unreason of restricting the depreciation available to industrial and commercial facilities. Since there are other sound reasons for

---

[1] Construction Reports, Value of New Construction Put in Place July 1969 (issued September 1969), United States Department of Commerce Publication C30–69–7.

[2] See Tables 2, 3, and 18 of Publication C30–69–7.

not applying this part of Section 521 to residential housing, it simply should not be enacted.

The recapture provisions of Section 521 are equally unjustified. This part of the Bill and the existing provisions of Section 1250 of the Internal Revenue Code are both intended to inhibit the rapid turnover that facilitates the use of accelerated depreciation to convert ordinary income into capital gains. Here, however, the similarity ends. While Section 1250 uses the carefully designed method of measuring the recapture of depreciation into ordinary income by the length of the taxpayer's holding period, Section 521 would recapture all accelerated depreciation, whatever the length of the taxpayer's holding period.

The hearings and the reports are entirely devoid of any justification for this change. There is no demonstration that Section 1250 has worked badly and there is no reason to believe that it has. Surely, Section 1250 should be left as it is until there is acceptable evidence that the statute still leaves room for abuse.

But if the rules are to be changed, the basic structure of Section 1250 is the only one consistent with sound tax policy. All should agree, I believe, that the man who holds real property for ten years is not the source of tax abuse. The problem is to determine the minimum holding period necessary to deter avoidance. We believe that the twenty month minimum now established in Section 1250(a)(2) is long enough, since the section retains a prorated recapture for holding periods between twenty months and ten years. If the Congress concludes, however, that abuse still exists, it would not be a fair or rational solution to penalize the bona fide long term investor as H.R. 13270 would. The proper response would be to extend the minimum holding period, while adjusting the rate of recapture[3] to retain ten years as the holding period when recapture ceases to apply.[4]

The Need for Reform of Capital Recovery Rules

We recognize that today is not the appropriate time to present testimony relating to the proposed repeal of the investment credit. I must, however, start with that as background, for heavy machinery is one of the major costs in our industry, and repeal of the investment credit without adoption of long needed reforms or our capital recovery system will impose a substantial and unwarranted tax increase upon our industry.

Most of our machinery and tools are now treated as having a five year useful life. Superficially this appears to be generous. When viewed against the demands of the construction business, however, this rule, which revenue agents refuse to vary on audit, ignores the actual shorter useful lives of our equipment and therefore artifically exaggerates the true income of the construction business.

The purchase price of construction equipment is high, yet its useful life is relatively low. It is worked hard and it is worked out of doors under widely varying conditions. The life of this equipment is shortened by differences in the competence of operators, the unavailability of proper maintenance in this field, and the inherent difficulty of excavation and other aspects of construction work. For any one contractor, the useful life of his equipment varies with the type of work he does and the abilities of the men in his employ. The same machine may be useless after six months on one kind of job, but have a life of several years in other work. Our continuing need to find and accept technological change further quickens the obsolescence of our tools and equipment. And to compound these difficulties, many members of our association are called upon to do specialty and nonrecurring work which requires equipment that is useful only to that contractor and only on that job.

The end result is a great need for depreciation rules realistic enough to accommodate the unusual circumstances of our industry. The five year useful life now generally applied to us[5] is not a reasonable expectation for the average

---

[3] If, for example, the minimum holding period were extended to 36 months, 1.2 percent per additional month of ownership would then represent an appropriate adjustment to recapture.

[4] In addition to these difficulties, the recapture provision of the new Bill is most inequitable. Real estate is a relatively risky and nonliquid investment. Persons placing money in real estate must plan for a relatively long period. The amount of depreciation available and the presence or absence of recapture is one of the determinants that influences the investment decision. This Bill changes the rules in mid-stream for all existing or committed real estate, since the recapture rules apply to depreciation attributable to periods after July 24, 1969, regardless of the acquisition date.

[5] The far longer 12-year life applied to equipment designed for maritime construction constitutes an extreme imposition upon the economics of the construction industry. In addition to all the problems of land-based construction, maritime equipment is exposed to unusually inhospitable and corrosive working conditions. It should have no longer a depreciative life than land equipment, and often should be depreciated over its use in a particular job.

piece of construction machinery. The use of this life has denied us deductions that reflect true costs of operation. The investment credit has helped compensate for this defect, so long as it has existed. If the Congress now allows the administration to withdraw from the repeated assurances that the investment credit could be a permanent part of our tax structure, then it is essential that the Congress at the same time provide a general overhaul of our capital recovery structure.

I emphasize that we do not seek specific relief for the construction industry. Rather, we see our problem as one facet of a general pattern of unrealistic tax depreciation rules which repeal of the investment credit will impose on business. We believe that the adjustments to the rules for our industry would be part of a general reform of the capital recovery structure.

That reform should begin with recognition of three essentials of any rational capital recovery policy.

First, depreciation lives must be based on the best practice which recognizes the problems inherent in each taxpayer's business. Whatever average lives are used as benchmarks must account for and depend upon the best practice for the industry. A technological revolution is fully upon us, in an unprecedented sweep. In construction and every other business, scientific invention speeds progress beyond prediction; equipment becomes obsolete and requires replacement with amazing frequency. Unless depreciation lives are consistent with optimal replacement practices which keep pace with technology, the tax code will build obsolescence into American industry. Here again, American business would be disadvantaged in foreign competition. American firms seek contruction jobs abroad; success benefits the American economy, while diminishing balance of payment and gold flow problems. The principal foreign industrial nations, as a foremost matter of tax policy, provide depreciation methods designed to give the maximum possible incentive to renewal of capital equipment. We cannot compete meaningfully abroad unless depreciation reform in the United States eliminates our continual lag behind the practices of other countries and provides us with the cash flow necessary to maintain a competitive technology.

Second, depreciation reform must recognize that some taxpayers must replace equipment even more rapidly than the industry optimum. This is particularly so of the construction business. Up to the early 1960's, the construction industry, more than any other, suffered continual harrassment from Internal Revenue agents who refused to recognize the depreciation problems of individual contractors. Now that the moratorium on the application of the reserve ratio test has ended, we have every reason to expect a renewal of hostility on the part of auditing agents. The need for a realistic approach on audit will be even greater if the investment credit is lost, yet repeal of the credit may well serve to encourage the Internal Revenue Service to return to practices that for thirty years inhibited capital investment. Depreciation reform must therefore reiterate that the special problems of individual taxpayers must be recognized; a businessman's reasonable decision of how to manage his own business should be given the strongest weight.

Third, changes in depreciation lives must not be viewed as a revenue gathering or contracyclical device. Ever since Bulletin F was adopted during the Great Depression, the tax collector has been tempted to raise more money by lengthening useful lives. This very thought was suggested this year as one of the reasons for changing the rules for real estate depreciation. This approach runs counter to every basic of rational tax policy. As a matter of economic policy, it invites disaster. The question is one of confidence. Orderly economic growth requires a climate for orderly capital investment. The planning which must underlie rational investment is impossible if depreciation rules are hostage to unpredictable change. Only meaningful depreciation reform, in a context which provides permanance of structure, can restore the confidence shaken by a retraction of the assurances that the investment credit was here to stay.

The specifics of depreciation reform should start with the proposals offered to this Committee on September 11 on behalf of trade associations representing the machine tool industries. Two of the proposals, elimination of the reserve ratio test and the amendment of Section 167 to eliminate the need to establish salvage values, would simplify tax accounting and eliminate endless controversies of no lasting significance with revenue agents. The elimination of salvage values is particularly essential to our members, for the economic fact of life is that these values are generally nil in the construction business, and for many of our items there is no predictable or readily available salvage market.

We also agree that the guideline depreciation lives of equipment should be codified, but with recognition of the economic realities of the construction business. Three years rather than five years should be established as a realistic life for construction equipment, and the codification should expressly allow for those instances where the practices of particular taxpayers require shorter lives.

The fourth proposal was that Section 179 be amended to eliminate the $10,000 ceiling upon the additional first year depreciation allowance, with a possible reduction in the rate of that allowance from 20 percent to 15 percent. Such a change would be particularly equitable if applied to the construction business. Therefore, we urge that Section 179(d)(1) be amended to allow the application of the provision to depreciable property without regard to its useful life. As short lived as our equipment is, the greatest amount of wear and tear occurs in the first year of use. A great amount of the equipment is virtually useless and unsalable at the end of the first year. Such an amendment would help compensate for the loss of cash flow that would follow repeal of the investment credit, cash that is necessary to enable us to keep our tools and equipment modern and usable.

Interest on the Obligations of State and Local Governments Should Remain Tax Exempt

A significant portion of the business of members of our association consists of public construction. That construction depends on the existence of regular and orderly financial markets where local governments may market their securities. The experience of the money markets over the last several months demonstrates that unfortunate portents for public finance inhere in the inclusion of interest on the obligations of state and local governments within the definition of tax preference items in Section 301 of H.R. 13270.

We do not disagree with the basic purpose of Section 301—to require each American to pay some tax on his economic income. We dispute, however, the inclusion of interest on state and local obligations as an item that does not bear a fair share of the national tax burden.

As a formal matter, the holder of these obligations pays no tax on his interest income. As a consequence of the present tax exemption, however, the holder receives a lower yield. In substance, he pays a silent tax measured by the difference between the interest he receives and the greater interest available from securities not enjoying an exemption.

In addition, unlike the other items included in the definition of tax preference, this is not a situation where the elimination of one man's exemption will decrease his fellow citizens' taxes. The obvious and expected effect of the proposed legislation will be a significant increase in the yields on state and local obligations. That increase must be satisfied through increases in the taxes imposed by the issuer of the obligation. And it is not realistic to expect that the Federal taxes paid by purchasers of these obligations will exceed the additional burdens being placed on state and local taxpayers. It is more likely that high bracket taxpayers will take their money out of state and local securities and place them either in other tax exempts or in situations that offer a potential for capital gains. This is already being demonstrated, for nearly every day the financial press reports instances of the difficulties state and local governments have been having in borrowing funds since the House passed H.R. 13270. Thus, this is a so-called "reform" that will increase everyone's taxes, and decrease no one's, achieving all this while diminishing the ability of state and local government to provide needed facilities and services.

The Existing 5 Percent Depletion Rate For Sand and Gravel Should Not Be Reduced

The proposed 20 percent reduction in depletion on sand and gravel is the fourth aspect of H.R. 13270 of concern to the construction industry. Sand and gravel now have the smallest depletion rate in the tax code: 5 percent. In contrast to most minerals, depletion rules provide sand and gravel with a less favorable method of capital recovery than would be available if the ordinary capital gains treatment were available. Nevertheless, Section 501(a) of the House Bill would reduce this modest depletion rate to 4 percent.

The House Report focuses on petroleum. It fails to offer a single word of explanation or justification for changing the rate for sand and gravel. This smallest of depletion rates seems to be a victim—perhaps an unintended victim—of the emotions stirred by oil and gas depletion rates.

We in the construction industry are the primary consumers of sand and gravel. It is a basic construction commodity. The demands for it are enormous. Production now exceeds 900 million tons annually. As large as that is, the United States

Bureau of Mines, in a study entitled "Cumulative Demand Projections For Sand and Gravel," projects a demand during the last thirty years of the twentieth century "in the range from 57.2 to 65.6 billion tons." This means that the annual output of sand and gravel must be doubled during the last third of this century, even though a study conducted in 1963 showed a life expectancy for reserves of only 24 years.

In consequence, sand and gravel producers face a staggering need to find and develop new supplies between now and the year 2000. Furthermore, the high costs of transporting this material requires that deposits be developed near metropolitan areas; this in turn adds further to the cost, for the proximity of the site to urban areas requires extensive cost for site rehabilitation after the sand and gravel is removed.

This, I submit, constitutes the strongest of cases for not lowering the already low depletion rate for sand and gravel. The proposed reduction in rate can only increase the cost of sand and gravel and thereby increase the cost of construction. The construction industry is already suffering from a rate of inflation far higher than the national average. Here H.R. 13270 would add to that inflation without the slightest justification in tax policy or economics.

The "Country-by-Country" Limitation on Foreign Tax Credit Should Not Be Changed

Section 431 of H.R. 13270 would impose an additional burden on United States contractors who seek to do business abroad by imposing new restrictions on the "country-by-country" foreign tax credit. The hardship would be particularly severe for the contractor least able to bear it—the one doing his initial work overseas or who has a limited amount of overseas work in only a few countries. He is the one who normally uses the country-by-country limitation, since he lacks the large base of foreign income available to companies with more developed business throughout the world. The effect, moreover, would be particularly magnified in its influence on the balance of payments, for these are the same businessmen who most tend to repatriate investment and profit.

The asserted justification for the proposed changes is that a United States' taxpayer with losses in a foreign country may receive a double tax benefit if, in the year of the foreign loss, he offsets it against domestic income, and then in a better year takes a credit for foreign taxes. This danger, however, is mostly theoretical, and where the danger is real, the effect of H.R. 13270 would be to impose a form of double taxation on American businesses doing business abroad.

The asserted double benefit cannot be realized in respect of activities in countries which provide for loss carryovers in their tax laws, since the taxpayer sets off losses before taxes become due to the foreign authority. The problem can only arise in those countries, usually undeveloped, which do not allow loss carryovers in their tax laws. The result in those cases is an increased effective tax rate in profitable years. The existing United States law allows a taxpayer to mitigate the impact of this increased effective rate by the use of foreign tax credits. This well serves the function of foreign tax credits—to allow United States business to conduct international trade in a climate where the combined foreign and domestic tax burden does not exceed the United States rate. Because the proposed change in the country-by-country credit would apply only where the foreign country imposes an increased effective rate, H.R. 13270 would create a form of double taxation by imposing a total tax burden in excess of the United States rate.

We strongly urge that this limitation be deleted because its impact will be on smaller business and the result will be a deterioration of the American position in foreign markets. If it remains, however, it should be amended so that the United States "recapture" will not bring the total foreign and United States taxes above what the United States taxes would have been if the foreign operations in all the years in issue had been carried on in the United States.

H.R. 13270 Would Subject the Construction Industry to a Multiplicity of Recessive Yet Inflationary Pressures

To this point in my presentation, I have focused on specific aspects of H.R. 13270. Now I should like to view them from the perspective of the Bill's overall impact on basic construction.

The changes in rules for depreciation and the changes in the tax exempt status of interest on state and local obligations will serve to decrease the amount of new construction. At the same time both changes will increase the costs to users of new property. The repeal of the investment credit without compensating depreciation reforms and the reduction in depletion on sand and gravel will directly increase our costs. The Bill also would impose new and serious impediments to the investment of foreign capital in the United States and to the ability of American businesses to compete in foreign markets. Tight money and construction cutbacks have yet an additional negative impact on our industry.

The Bill then has the recessive effect of inhibiting construction while at the same time adding to inflationary pressures. Each of these aspects of the Bill feeds upon and re-enforces the other, and they are further multiplied by the other contracyclical measures the Administration has taken. Although H.R. 13270 is called a tax reform bill, the features I have discussed here simply cannot be justified as attacks on demonstrated abuses. They are poorly conceived, dangerous to the American economy, and should not survive the scrutiny of the Senate.

The CHAIRMAN. The next witness is Mr. Leon H. Keyserling speaking for the Realty Committee on Taxation.

We are happy to welcome you back here, Mr. Keyserling. You have been gone altogether too long. I am always pleased to hear your views on matters that have to do with economics, taxation, and national growth.

STATEMENT OF LEON H. KEYSERLING,[1] APPEARING FOR REALTY COMMITTEE ON TAXATION AND AS INDEPENDENT ECONOMIST

Mr. KEYSERLING. Thank you, Mr. Chairman.

Mr. Chairman, and members of the committee, the provisions of the bill relating to the housing and other real estate are inseparably related to the provisions of the bill as a whole, which must be viewed in the perspective of general economic and financial considerations. Thus, I appear here only in part on behalf of the Realty Committee on Taxation, and more basically as an independent economist concerned with the public interest.

Many provisions of the bill are good, but I concentrate on those needing repair. Those needing repair bear the same defects as, and would aggravate the current consequences of, the errors in the massive tax cuts of 1963–65, and especially 1964, which I opposed on grounds vindicated by time.

Like its forerunners, the current bill overstimulates heavy investment, at the expense of consumption, and thus augments the main source of rampant current inflation combined with inadequate real economic growth. Its personal tax cuts are highly inequitable, especially in view of those in 1964. It hands out bonanzas to some types of industries and investment requiring restraint, but cruelly discriminates against housing and supportive aspects of urban commercial contruction, despite universal consent that urban rescue and renewal is our most critical domestic priority. It would thus add greatly to unemployment. In the very name of reform, it violates the justice which is the essence of reform. It is pennywise and pound foolish, with respect to recapture of federal revenues.

Specifically: excluding the reforms—I believe analysis of the bill excluding the reforms extremely important for various reasons which I shall state shortly, although I, of course, favor those reforms directed toward more equity in the tax structure—the House bill, by some of its provisions, cancels out the effect of repeal of the 7-percent investment tax credit, and the Treasury proposal increases net stimulus to inflationary investment by $1.1 billion. Even with the reforms,

[1] Former Chairman, Council of Economic Advisers, consulting economist and attorney.

not even the House bill tightens up enough on inflationary and postponable types of investment. I favor a tightening up on the net allocation to investment as affected by tax policy by about $6 billion. This would leave much more room for correcting the unwise and untimely provisions bearing down upon investment in housing and also nonresidential construction, and also for the further equitable changes in the tax structure to which I shall refer.

As to the personal tax cut inequities: Without the reforms, neither the House bill nor the Treasury proposal gives more than 20.8 percent of the personal tax cuts to those with incomes up to $5,000 who constitute 47 percent of total returns, while they give 13.4–17.2 percent to those with incomes of over $50,000 who constitute only 0.4 percent of all tax returns. (The housing provisions further discriminate against those in need of better housing at lower costs, and thus would hurt their incomes still more. This shows the seamless-web connection between the various provisions of the bill.) The other distributions, between the two extremes cited, are similarly inequitable. The provisions without reforms are, as I have said, extremely important, because the reforms are more uncertain of enactment; they do not impact equally upon all those even within the same income group; and we know from experience that, if the reforms are modified or mutilated, the regular rates do not tend to be adjusted accordingly. They certainly weren't in 1964. But, even with the reforms, the distribution of the cuts is highly inequitable.

By the most meaningful test, effect upon after-tax or disposable income, the House bill, with or without the reforms, increases such income by less for those with incomes from $5,000 to $20,000 than for those with incomes from $20,000 to $50,000; and, without the reforms, increases disposable income by immensely more for those over $50,000 than for any other group. The Treasury proposal is far more regressive. Even with the reforms, both the House bill and the Treasury proposals are not nearly progressive enough. In this connection, taking all forms of nationwide taxation into account, those with incomes between $3,000 and $4,000 pay a higher share of their incomes in total taxes of all kinds than any other group up to $15,000, and almost as high a share as those with incomes between $15,000 and $20,000.

I suggest no change in personal tax payments, before or after reforms, for those with incomes of $50,000 and over, and I seriously question substantial, or perhaps even any, such reductions for those with incomes of $20,000 and over. This approach would leave that much more for net tax reductions for those lower down in the income structure.

The CHAIRMAN. Mr. Keyserling, I would suggest you read it a little more slowly if you are so disposed. With all the background you have has as Chairman of the Council of Economic Advisers, I am not going to cut you off at 10 minutes.

Mr. KEYSERLING. I think I will get through in 10 minutes, but thank you very much, Mr. Chairman, for your consideration.

Coming to the provisions relating to housing and nonresidential commercial investment, let me here emphasize, since the Chairman has been so gracious with me as to time allowance, that economists in general, the Council of Economic Advisers in particular, businessmen, and even sometimes the Congress, look at the provisions of a tax bill without sufficiently relating one provision to the other, and without relating the provisions of the bill to the general economy and to our economic and social objectives as a nation and a people. But all of these factors interrelate. What is done with respect to the taxation of low income people through tax cuts interacts with what is done to them with respect to housing. This is because the cost at which they can get housing affects their incomes available for all these other purposes. This bill, in its current from, has the multiple impact of being inequitable in what it does to them on its straight tax reduction provisions, and also in what it does to them with respect to the investment provisions of an ad hoc nature which bear upon housing and supportive nonresidential construction investment (as against the bills treatment of other investment).

Now, another ironical thing which I want to reemphasize for the benefit of some of the Senators who were not here when I started—that is off the record.

Senator WILLIAMS. We will read it, we can't hear all of it.

Mr. KEYSERLING. What is that?

Senator WILLIAMS. I say we will read it because we can't hear all of them. We get the same thing over and over.

Mr. KEYSERLING. But anyway, to reemphasize what I said earlier, everybody is saying we want to get the reforms, and we don't want the bill without the reforms. But the repeal of the 7-percent investment credit by itself is more of a reform than that repeal together with some other parts of the bill. This is because these other parts would give back to the same people who would be hit properly by the repeal of the 7-percent investment credit more than that repeal would take away from them. This, in itself, would repeat the errors which I protested against in earlier years, despite the fact that the main source of the current inflation is the 13-percent annual rate of growth in the very type of investment which is the most inflationary thing in the whole economy. We are trying to stop this by the 7-percent investment credit repeal, and that is fine.

But when one looks at the bill as a whole, it does not do what the public thinks it is trying to do.

Now, I say we should tighten up much more than the bill does on these types of soaring and overebullient investment, instead of tightening up on housing and supportive nonresidential commercial investment, which are falling dangerously short of meeting our nationwide needs.

The provisions of the bill relating to housing and nonresidential commercial investment are the best single example of starving the lean while other provisions feed the fat. The widespread impression that the bill draws a sharp dichotomy between housing and nonresidential commercial construction investment is entirely erroneous. The preponderance of the provisions of the bill inimical to real estate generally are also highly inimical to housing. In any event, urban rescue and renewal do not depend upon housing alone, and I think I have been sufficiently partial to housing for a long time, and still am.

Housing, especially for the poor and others of low income who cannot move out of cities, is intimately associated with and supported by commercial structures—stores, community and recreational facilities, and professional space. These are even sometimes in the same project as housing, built by the same people. And if they were both built by more of the same large-scale people, we would have a better chance of moving forward on the rescue and renewal of our urban areas at the tremendous pace which is imperative on all grounds.

Vastly accelerated investment along these lines can provide vast expansion of employment, to serve vital national needs in the years ahead, and to counteract technological displacement in other key sectors. Such programs and projects are essentially long range, and we cannot afford to stunt them further now, even if (contrary to my conviction) stunting them now would be anti-inflationary. It would really be inflationary by aggravating critical current shortages and thus driving up rents still further.

Here we have a bill which really, on the investment side, operates almost exclusively against housing and supportive nonresidential commercial investment. Meanwhile, what are the facts? Private nonfarm housing starts declined, on a seasonally adjusted annual basis, from 1,845,000 units in January 1969 to 1,314,000 units in July, or 28.8 percent, and the ênd if not yet. The ratio of housing and commercial construction investment (combined) to GNP declined from 7.13 percent in 1950 to 4.39 percent in the second quarter of 1969; and the decline in this ratio has been almost constant. As a percentage of gross domestic investment, the decline was from 40.8 percent in 1954 to 29 percent in the second quarter of 1969. During 1961–68, measured in uniform dollars, the average annual growth rate of investment in commercial construction was only 4.9 percent, and in housing only 0.5 percent. This occurred during a 7-year period when we all talked about doubling this rate of housing starts, and enacting legislation toward that end. Meanwhile, during the same period 1961–68, the average annual rate of growth in real terms was 5.2 percent for GNP, and 9.9 percent for investment in producers' durable equipment, the latter of which this bill would further stimulate, as I have said.

In vivid contrast with the trends just cited, balanced goals for the whole U.S. economy require an annual average growth rate through 1977 of 5.9 percent for commercial structures, and 11.2 percent for residential structures, compared with 5.3 percent for GNP, and 4.1 percent in producers' durable equipment.

These are not just my goals. These are the goals, of course with some variations, embodied also in the housing programs of the Government as legislated by the Congress; they are the goals embodied in the studies of other economists. So, while we are all doing other things to try to get housing growing faster than the rest of the economy, we are, through this bill, discriminating against it and supportive nonresidential commercial construction, in the face of the gross disparities in what has actually been happening, and is still happening with a vengeance.

Real estate has been faring worse, by various financial tests, than any of seven other basic industries which I have analyzed. Viewing net income as percentage of new worth, the figure in 1965 for real estate was 3.5 percent, compared with 6 percent for finance and insurance, 10.3 percent for manufacturing, and 8.2 percent for all industries. In real estate, long term debt comes to almost 50 percent of total assets, compared with 12.2 percent for all industries. Since 1951, rising interest rates alone have imposed an excess cost aggregating more than $17 billion in connection with mortgages on one to four family homes alone. The rising interest burden, and I underscore this, the rising interest burden has already imposed upon housing and supportive nonresidential commercial investment a toll which has exceeded many, many times the total benefits flowing to these sectors through all types of Federal tax concessions.

Now, I come to Federal costs. In terms of Federal costs, the vital areas needing the most help have been given the least, and, in the main, vice versa. In 1966 (I have no later comprehensive data from official sources), of the $43.1 billion value of depreciation and depletion allowances, 45.7 percent went to manufacturing, and only 5.8 percent to real estate. During the fiscal years 1964–69, viewing more than $6.7 billion of average annual net expenditures for Federal subsidy programs, 57.9 percent were going to agriculture, 10.5 percent to air transportation, and only 2.9 percent to housing. It follows with certainty that any recoupment of Federal revenues which could result from further tightening up on the tax treatment of housing and nonresidential commercial investment would be a mere bagatelle, compared with the potentials for recoupment along beneficial rather than damaging lines, when measured in terms of economic activity and human well-being. What has already happened to housing alone since January 1969 (the 500,000 reduction in the annual rate of housing starts, and the bill would make this worse), implies on an annual basis a loss of $3.8 billion in Federal revenues at existing tax rates, $109 million in State and local property taxes, and involves 1.7 million man-year jobs.

My full statement analyzes in detail the relevant sections of the bill. Briefly, the provisions which would be damaging to both housing and nonresidential construction investment include substitution, in the case of used buildings, of straight-line depreciation for the presently allowable 150-percent declining balance method; the recapture provisions; the treatment of "excess" depreciation under LTP and allocation of deductions; the limitation on interest deductions; the "additional preference" Treasury proposal; and certain retroactive features of the bill. Applicable to new nonresidential structures but not to housing (and I stress that the other provisions I have mentioned are applicable to housing, although a lot of people believe this bill lets housing off), there is also the undesirable substitution of 150-percent declining balance method for the double declining balance method.

I respectfully submit that we should be considering methods to accelerate housing and nonresidential commercial investment, instead of adding to its present plight. And insofar as the overall economy is now deemed to be too tight to ward off excessive inflationary pressures (my full testimony sets forth why I believe this to involve a mistaken diagnosis as to the causes of recent and current inflation), we should further tighten up on those other sectors where the national interest so permits, and there are many of these.

As to the entirely laudable desire for reform, I read an article in Reader's Digest this week, by a former Internal Revenue Commissioner, purporting to reveal the horrible advantages that some people take by means of accelerated depreciation on housing and other real estate. I am against these misdeeds just as much as is, and my entire record proves this. But the provisions of the bill which are designed to catch those individuals or business entities who are getting away with too much in some industries, by delimiting some special tax incentives, do not apply the same method to those in other industries who are generally or even to a greater degree getting away with something. I am talking now about the glaring cases. This distinction is made by the bill, apparently on the ground that such other industries need further stimulation. But even if some of these other industries require further stimulation, that is no justification for anyone getting away with something in such industries. So if we are trying to catch those who are taking advantage of a tax provision, they shouldn't get away with this, if they happen to be in the airline industry or in the trucking industry, any more than in the housing industry, or in nonresidential commercial investment. Yet these provisions to catch those who are getting away with something is focused upon these two last-mentioned sectors predominantly.

The appropriate method to catch the recreants, in other words, those reducing their taxes too much, or to zero, is by limiting total allowable deductions, so as to permit none to pay too small a percentage of their incomes, or zero percentage, in taxes. The provisions toward this end should be further strengthened. But enlargement or contraction of special or ad hoc tax incentives should relate to the condition of each particular industry as a whole, and its relationship to national needs. The treatment of housing and nonresidential commercial investment does not do this, and I earnestly hope that this committee will help to correct this dangerous imbalance.

I request that my full testimony with charts, and my prepared summary thereof as earlier submitted, be inserted in the record at an appropriate point.

The CHAIRMAN. Mr. Keyserling, your statement in the record here is about 110 pages long. I want to promise you that over the weekend I am going to study everything you have said here plus these charts. I regard you as one of the best economic advisers in this Nation by any standard, and what you have said here certainly deserves the utmost of consideration. As far as I am concerned I will give it every bit of study. I think I generally agree with your conclusion that where someone—because of something we put in the law for a worthwhile purpose—achieves some kind of advantage by taking advantage of several deductions or maybe a dozen different deductions in the law and pays very little taxes, we ought to go back and tax him on a different basis. But that need not necessarily serve to totally eliminate something that is in the law for a good reason.

Mr. KEYSERLING. Mr. Chairman, let me just give you some examples of why this is sound. All national tax policy deals with the general situation, and must. Any major sector of tax policy which is liberal enough to do the job it is intended to do will be too lenient for a few, and if we make it tight enough to catch those few, it will cut off the head of others who need to be encouraged or helped. We must consider the greatest good of the greatest number.

Let us look for a moment at the old age insurance system. Now, part of that is paid for by the Government, that is, paid for by the general public. Yet nobody says that is unfair that people get their benefits, including the part paid for by the Government, because they may have assets of a million dollars, or $10 million. If we wanted to become particular as to them, we wouldn't give these benefits to them. But we want a generalized system, and we try to catch them under other sectors of the tax laws. It is true of almost any other tax provisions of any kind, including personal and corporate income taxes, special tax concessions, et cetera, that the provisions best designed for overall purposes work unfairly in some glaring cases. But I view it to be pure sensationalism to let the tail of these glaring cases swing the elephant. Limitation of deductions is the correct remedy.

Yet, what is proposed in the bill, because of these few glaring cases, is to further jeopardize an entire industry, although on net balance the existing special incentives to this industry are the most beneficial, and in fact, to date among the very few ad hoc special tax concession provisions which are genuinely desirable in terms of the national interest.

The CHAIRMAN. Thank you very much, Mr. Keyserling.

Mr. KEYSERLING. Thank you, Mr. Chairman.

The CHAIRMAN. Thank you very much. I was going by the Miller modification of the Long motion.

(Mr. Keyserling's prepared statement follows:)

STATEMENT OF LEON H. KEYSERLING* IN PART REPRESENTING REALTY COMMITTEE ON TAXATION AND IN PART AS INDEPENDENT ECONOMIST

SUMMARY

Mr. Chairman and Members of the Committee:

General considerations

I appreciate this opportunity to add to your consideration of one of the most momentous economic and financial measure in many a year. The Bill in its present form contains many essential and desirable provisions. But I shall concentrate upon what I regard to be the need for improvement, as that should be most constructive and helpful to this Committee. Clearly implied in these comments will be my attitude toward those provisions which appear to me to be sound and good.

The major portion of my testimony relates to general economic and financial considerations and their bearing upon the general provisions of the Bill, because I am profoundly convinced that we all tend to pay too little attention to these ultimate matters when considering tax proposals. In these phases, I appear independently, as I have so many times previously before this Committee. My specialized comments bearing upon the provisions of the Bill dealing with housing and other real estate investment is made on behalf of the Realty Committee on Taxation, although my conclusions in this area are also arrived at independently, and I hope objectively.

The past is prelude, and my previous testimony before this Committee and elsewhere on the massive tax cuts and concessions of 1962–1965 is highly relevant to the current Bill. I felt in the years gone by that these massive tax cuts and concessions were greviously misdirected in large degree. They surrendered too much Federal revenues, in terms of national and international needs dependent upon public spending; misallocated resources between investment and consumption so as to impair economic equilibrium and work against maximum economic growth, production, and employment; and aggravated inflation and the balance of payments problem by ignoring the real causes thereof. On both economic and social grounds, they helped too much those who needed help least, and helped too little those who needed help most, both on the individual and business entity side.

I submit that the more recent developments have very substantially vindicated my earlier concern. Although inflation is now rampant, our real rate of economic growth since 1966 has been much too low, is much too low now, and this in itself aggravates rather than curbs inflationary pressures, and adds to unemployment. The most urgent of our domestic priorities are being relatively

*Former Chairman, Council of Economic Advisers. Consulting economist and attorney.

neglected. Fiscal policy is still highly contributory to resource misallocation. The current Bill, if properly corrected, affords a tremendous opportunity to use the mighty weapons of fiscal policy to learn by experience, correct the errors of the past, and put us on the right course.

But the Bill in its current form, in very large measure, does not do this. On equitable grounds, it makes a highly improper distribution of tax relief, especially when added to the gross inequities of the 1964 measure in this respect. On economic grounds, it does not go nearly far enough in the direction of redressing the imbalance between investment and consumption. Its specialized or *ad hoc* provisions discriminate against those lines of endeavor which need most to be stimulated greatly, most especially housing and supportive nonresidential construction investment, while dealing lightly or even favorably with lines of endeavor which have been and now are running relatively much to fast.

Misallocation of investment provisions of the bill

Specifically, excluding the tax reforms, the House Bill does not appreciably affect net investment allocations as affected by tax policy, and the Treasury proposal increases them by 1.1 billion dollars. This is ironical, in view of the proposal to repeal the investment tax credit on the ground that investment in general is grossly excessive. Even with the reforms, the House Bill reduces the allocation to investment as affected by tax policy by only 3.9 billion dollars, and the Treasury proposal by only 2.5 billion. This is not nearly enough. I favor a tightening up on the net allocation to investment as affected by tax policy by about 6 billion dollars, which woud leave much more room for reconsideration and revision of some of the provisions bearing down upon the tightening up of investment upon housing and also nonresidential construction, for reasons which I shall subsequenty disclose.

Inequitable features of personal tax cut provisions

The inequitable features of the current Bill, also highly undesirable from the functional economic viewpoint, are as follows: Without the reforms, neither the House Bill nor the Treasury proposal gives more than 20.8 percent of the personal tax cuts to those with incomes up to $5,000 who constitute 47.0 percent of total returns, while they give 13.4–17.2 percent to those with incomes of over $50,000 who constitute only 0.4 percent of all tax returns. The distributions between these two extremes are subject to the same type of inequity, I believe that the provisions viewed without reforms are more important than those viewed with reforms. The reforms are more debatable and uncertain of enactment; they do not impact equally upon all those in any given group; and we know from experience that, if the reforms are modified or mutilated, the regular rates do not tend to be adjusted accordingly. But even with the reforms, the distribution of the tax cuts is highly inequitable.

And by the far more meaningful test of effect upon after-tax or disposable income, the House Bill with or without the reforms increases such income by less for those from $5,000 to $20,000 than for those with incomes from $20,000 to $50,000. Without the reforms, the House Bill increases disposable income by immensely more for those over $50,000 than for any other group. The Treasury proposal is far more regressive in these respects. Even with the reforms, by this vital test, both the House Bill and the Treasury proposals are not nearly progressive enough, especially in view of the imperative need to counteract in part the highly regressive features of the 1964 tax cuts. This imperative need is best illustrated by the fact that, taking all forms of nationwide taxation into account, those with incomes between $3,000 and $4,000 pay a higher share of their incomes in total taxes of all kinds than any other group up to $15,000, and almost as high a share as those with incomes between $15,000 and $20,000. Those still higher up, by all equitable tests of progressivity, do not pay a sufficiently higher proportion of their incomes in taxes of all types.

All things considered, I suggest not reducing at all the personal tax rates, before reforms, of those with incomes of $50,000 and over, and I seriously question whether there should be substantial, or perhaps even any, such reductions for those at $20,000 and over.

The amounts thus saved should be used for further reductions for those lower down in the income structure, with emphasis on progressivity.

General comments on defects in provisions relating to housing and nonresidential construction investment

The extent to which the foregoing provisions of the Bill depart from desirable allocations of tax changes, both on economic and social grounds, are paralleled by comparable departures with respect to the more specific or *ad hoc* features of the Bill, especially those bearing upon housing and what I regard to be the intimately associated factor of investment in nonresidential construction. And because our economy and the problems of our people are a seamless web (and so is fiscal policy), the generalized and specialized departures from desirable tax changes have mutual and cumulative effects.

The widespread impression that the Bill draws a sharp dichotomy between housing and nonresidential commercial construction investment is erroneous. As I shall disclose, the preponderance of the provisions of the Bill inimical to real estate generally are aso inimical to housing.

Even more important, we are here again dealing with a seamless web. Urban rescue and renewal do not depend upon housing alone. Housing, especially for the poor and others of low income who cannot move out of cities, is intimately associated with and supported by commercial structures—stores, community and recreational facilities, and professional space. And investment in all of these can provide vast expansion of employment in sectors where such expansion is essential in the years ahead, to counteract the trends toward technological displacement in other key sectors.

The alarming long-term decline in housing and nonresidential construction investment, especially when related to current and future national needs

The data which I shall now present demonstrate the absolute contrast between the severe and prolonged deterioration in these vital sectors and the provisions of the Bill designed to provide them with even less tax incentives than they now have. This, although on all sides, including other long-range Federal programs involving scores of billions of dollars over the years ahead (in declarations of Congressional intent, but not in actual appropriations), we have been proclaiming that the rescue and renewal of our urban areas is our most critical domestic priority.

Private nonfarm housing starts declined, on a seasonally adjusted annual basis, from 1,845 thousand units in January 1969 to 1,314 thousand units in July, or 28.8 percent, and the end is not yet. The ratio of housing and commercial construction investment (combined) to GNP declined from 7.13 percent in 1950, and 5.93 percent in 1959, to 4.39 percent in the second quarter in 1969; as a percentage of gross domestic investment, the decline was from 40.8 percent in 1954, and 39.4 percent in 1958, to 29.0 percent in the second quarter of 1969. During 1961–1968, measured in uniform dollars, the average annual growth rate in investment in commercial construction was only 4.9 percent, and in housing only *0.5 percent*, while it was 5.2 percent for GNP, and 9.9 percent for investment in producers' durable equipment. In contrast, and in line with balanced goals for the whole U.S. economy, the annual average rate of advance through 1977 in commercial structures should be 5.9 percent, and in residential structures 11.2 percent, compared with 5.3 percent in GNP, and 4.1 percent in producers' durable equipment.

Disparities in Federal stimuli provided

The vital areas needing the most help have been given the least, and, in the main, *vice versa*. In 1966, of the 43.1 billion dollar value of depreciation and depletion allowances, 45.7 percent went to manufacturing, and only 5.8 percent to real estate. During the fiscal years 1954–1969, viewing more than 6.7 billion dollars of average annual net expenditures for Federal subsidy programs, 57.9 percent were going to agriculture, 10.5 percent to air transportation, and only 2.9 percent to housing.

The lowly financial position of real estate

Contrasted with the belief that real estate is "in clover", that industry is doing worse by various financial tests than any of seven other basic industries which I have analyzed. Viewing net income as percentage of net worth, the figure in 1965 for real estate was 3.5 percent, compared with 6.0 percent for finance and insurance, 10.3 percent for manufacturing, and 8.2 percent for all industries.

The toll of rising interest rates

The impact of rising interest rates has borne most severely upon housing and other aspects of real estate investment, because, in real estate, long-term debt comes to almost 50 percent of total assets, compared with 12.2 percent for all industries. Since 1952, rising interest rates alone have imposed an excess cost aggregating more than 17 billion dollars in connection with mortgages on 1 to 4 family homes. The rising interest burden imposed upon housing and supportive non-residential commercial investment has exceeded many, many times the total benefits flowing to these sectors through all types of Federal tax concessions.

Under these conditions, it would seem to be an upside-down public policy, or fiscal policy, to make the public stimuli available to these sectors, including those in tax form, even less favorable than they are now, and increasingly discriminatory as against other sectors. This is true, not only in terms of economic and social considerations, but also in terms of the revenue problems of the Federal Government viewed more narrowly. Any recoupment of Federal revenues by further tightening up in these sectors would be a mere bagatelle, compared with the potentials for recoupment along beneficial rather than damaging lines when measured in terms of economic activity and human well-being.

Specific provisions of the Bill relating to housing and nonresidential commercial investment

There is not room, in this very abbreviated summary of my testimony, for me to deal fully with the specific provisions of the Bill which would have these deleterious effects. But briefly, the provisions which would be damaging to both housing and nonresidential construction investment include substitution, in the case of used buildings, of straight-line depreciation for the presently allowable 150 percent declining balance method (sec. 521); the recapture provisions (sec. 521); the treatment of "excess" deperication under LTP and allocation of deductions (secs. 301, 302); the limitation on interest deductions (sec. 221); the "additional preference" Treasury proposal; and certain retroactive features of the Bill. Applicable to new nonresidential structures but not to housing, there is also the undesirable substitution of 150 percent declining balance method for the double declining balance method. These technicalities are dealt with in detail in my full testimony.

Summary related to housing and nonresidential commercial investment

If there were time, I respectfully submit that this Committee should be dealing with methods to accelerate housing and nonresidential commercial investment, instead of adding to its present plight. The least that should be done now is not to do the latter.

The difficulty with some of the so-called reform provisions of the Bill, relating to housing and nonresidential commercial investment, is that the baby is being thrown out with the bath. In the laudable desire to catch those who are "getting away with something", scores of thousands of worthy and essential enterprises will be hit who are not now getting away with anything, but instead serve the national interest. Indeed, while the Bill in its present form attempts to catch those who are geeting away with too much in some industries, by delimiting some of the special tax incentives they have enjoyed, such as accelerated depreciation, it does not apply the same method to those in other industries who are generally or even to a greater degree getting away with something. The Bill makes this distinction on the ground that these are the industries requiring stimulation. But that is no justification for anyone getting away with something in such industries.

The appropriate method to catch those who are getting away with something is by limiting total allowable deductions, so as to permit none to pay too small a percentage of their incomes, or zero percentage, in taxes. The provisions of the Bill intended to do this should be further strengthened. But the enlargement or contraction of special tax incentives should relate to the condition of the industry affected, and its relationship to national needs. That has been forgotten thus far, in the treatment of housing and nonresidential commercial investment. I earnestly hope that this Committee will help to correct this dangerous imbalance.

STATEMENT

Mr. Chairman and members of the committee, I appreciate this opportunity to appear before you, during your consideration of one of the most important tax measures, and in fact one of the most important economic measures, in many a year. Those in the Congress and elsewhere who have thus far toiled so diligently this year to make our Federal tax system more equitable, and to improve it as a fiscal weapon toward achieving and maintaining the maximum employment, production, and purchasing power objectives of the Employment Act of 1946, deserve the commendation of all thoughful citizens. I have high hopes that changes in the Bill now before this Committee will bring about improvements in it which are still vitally needed.

General considerations

I appear here today on behalf of the Realty Committee on Taxation (an Appendix to my testimony describes this Committee) with respect to those provisions in the Bill bearing upon housing and other aspects of real estate investment, although all of my analysis and conclusions have been arrived at independently, and I believe in the public interest. However, a major portion of my testimony deals with portions of the Bill other than those affecting real estate. This is in part because I believe this is essential to shed adequate light upon the portions dealing with housing and other aspects of real estate investment, and in part because I cannot refrain from this opportunity once again—as many times in the past—to bring my general economic and fiscal views before this Committee. This major portion of my testimony is offered, not on behalf of the Realty Committee on Taxation, but rather in my independent capacity as an economist who has tried to devote a major portion of his time and efforts to problems of the American economy and the American people.

Some provisions of the Bill, even as it now stands, would greatly improve the equity of the tax structure, and help to close some unconscionable tax loopholes which have persisted for far too long. But viewed as a whole, the Bill, in my judgment does not go nearly far enough in the direction of improving the equity of the Federal tax structure. In addition, on net balance, the allocation of the various tax changes proposed, based as they are upon faulty economic diagnosis, would worsen rather than improve the economic equilibrium, and thus militate against restoration of maximum employment, production, and purchasing power. And in the name of reform, some of the proposals if enacted, especially those bearing upon housing and related commercial construction, are ill-designed and ill-timed, would further distort the treatment of our great national priorities, would conflict seriously with other programs and objectives to which the Federal Government on a long-range basis is committing billions of dollars, and would seriously increase unemployment and work against economic growth. The net relinquishment of Federal revenues which would result from the Bill as now drawn might not be too large if the composition of the proposals were drastically changed, but is much too large so long as these proposals retain their current composition. This is because some of the reductions and concessions are unwarranted both economically and socially, and should have substituted for them a larger prospective revenue take by the Federal Government and the allocation of these revenues to the services of our great domestic public priorities. In all of these connections, I shall say something about the problem of inflation.

We are far too prone to consider current tax proposals without an adequate review of the lessons of the past, and without setting these tax proposals in the controlling perspective of our overall economic and financial capabilities and needs, as well as our social objectives as a nation and a people. In order to help restore the balance on these scores, I shall refer, at various stages in my testimony, to my studies and findings in opposition to the massive tax cuts of 1964, and indeed to the whole series of changes in the Federal tax system during 1962–1965. At various times in the past, these studies and findings have been brought to the attention of this Committee, by my direct testimony and otherwise.

In brief, my line of argument has consistently been that these 1962–1965 tax cuts and concessions, and especially those in 1964, would undoubtedly stimulate the economy for a while after their enactment. But I pointed out insistently that, in the longer run, they would work against adequate economic growth, because the allocation of the cuts and concessions were so far out of line with the requirements for economic equilibrium at reasonably full resource use. I also forecast that these tax actions would increase the problem of inflation and the balance of payments, because they were founded upon incorrect diagnosis of both of these problems. I insisted that the distribution of these tax cuts and concessions were indefensible from the viewpoint of equity. Last but not least, I took the position that such huge amounts of tax cuts and concessions were at the expense of imperatively needed domestic priority-spending programs which, in words but not in action, had long been declared for by almost all responsible groups, including the Federal Government itself. Because in my judgment some of these errors are now being repeated in the current Bill as now drawn, and because they are highly relevant to the specialized subject of housing and other aspects of real estate investment, I feel justified in the review of developments to date, which I now will undertake.

The core problem of inadequate economic growth

My *Chart 1* shows that we have fallen far short of achieving the goal of sustained and optimum economic growth. From the enactment of the massive tax cuts in 1964 to the middle of 1965 or thereabouts, the rate of real economic growth was rewardingly high. But by then, definite signs of serious faltering were clear. But we were "saved" for a time by the vast and unexpected increase in defense spending due to the Vietnam war (by which I imply no evaluation of our international policies). However, even with these vast increases in defense spending, the real growth rate of the economy dropped to 2.5 percent from 1966 to 1967, and averaged annually only 3.7 percent during the 1966–1968, compared with the 5.1 percent averaged annually during the 1960–1966 with remarkably stable price levels. It is now estimated that the real rate of economic growth during 1969 may be only in the neighborhood of 3 percent, and might get even lower before it gets better. This is a dangerously poor performance, in view of our domestic and international obligations and burdens, and in view of the fact that maintenance of so low a growth rate for much longer will lead to serious increases in unemployment. Even today, unemployment, when fully measured, is far too high among vulnerable groups, and we should all know by now what this imports in terms of civil and social unrest and disorder, apart from being unacceptable on all other grounds.

Considering also that plants in general are now operating on the average at only about 84 percent of capacity, when they should be running well above 90 percent, the clamor about an "overheated" economy is a profound and costly error, in terms of the relationship between our human and other production capabilities and our actual production of goods and services. The term "overheated" is properly applicable to the excessive price inflation, but it is utter confusion—for reasons which I shall demonstrate—to mistake this rampant price inflation for an "overheated" or overstrained economy in a true sense. Entirely to the contrary, the rampant inflation is in large measure due to the very fact that the economy is not performing adequately in real terms.

My *Chart 2* depicts the costs of deficient economic growth in the U.S. economy. I estimate that, during the period 1953–1968 as a whole, we forfeited more than 917 billion dollars of total national production (measured in 1970 dollars), and lost more than 38 million man-years of employment opportunity, in consequence of the deficient average annual economic growth rate. In 1968 alone, our economy was operating almost 82 billion dollars below total national production, and this was accompanied by more than two million man-years of excessive unemployment (based upon the true level of unemployment, including full-time unemployment, the full-time equivalent of part-time unemployment, and concealed unemployment in the form of nonparticipation in the civil labor force due to scarcity of job opportunity). And if the rate of real economic growth during 1969–1977 should average annual approximately the same as during 1953–1968, we would forfeit considerably more than a trillion dollars of total national production, and experience more than 31 million man-years of unemployment in excess of the minimum unemployment consistent with maximum employment. When we see and hear on all sides the evidence of a nation torn by the perilous conflict between those who insist that we "cannot afford" to keep our guard up in the world if we attempt to vindicate our great domestic priorities, and those who insist that we "cannot afford" to vindicate our great domestic priorities unless we let down our guard all over the world, I am amazed that economists and others have in so great degree lost sight of the potentials and implications of the great nonsecret weapon of America's productive power if fully called forth.

To indicate these potentials, my *Chart 3* sets forth a balanced series of goals for the U.S. economy, projected from actual levels in 1968 to the years 1972 and 1977, and set forth at the fiscal 1969 price level as estimated at the time of the President's fiscal 1970 Budget submission. One aspect of this portrayal, which is especially relevant to the Bill now before this Committee, are the uniquely high rates of expansion set forth as needed for residential construction. Another aspect, extremely relevant to the current Bill in general, are those portions of the chart which indicate how much we can afford (without appreciable changes in tax rates at the Federal level, and without distorting traditional ratios between private and public endeavors) to enlarge the Federal, State and local levels those types of public spending which are the only means of vindicating the most urgent of our domestic priorities—if only we restore and maintain the maximum rate of real economic growth to which we are committed by the Employment Act of 1946, and even more importantly are committed to by the realities apparent everywhere on the current scene.

Economic equilibrium and tax policy

To maintain the economic equilibrium required for optimum economic growth, we must examine the requirements for equilibrium, and also examine the high relevance of Federal tax policy to the maintenance of such equilibrium. In this connection, my *Chart 4* sets forth a series of balanced goals for the Federal Budget, geared to economic growth and priority needs. I will not dilate here upon the various programs set forth in this model Federal Budget, except to say that their realization would bring us close by 1977 to a land in which we no longer suffered from substantial poverty, slum living for one-sixth of our people, poisonous airs and waters and neglected natural resources, vast disparities in agriculture and rural life, ramshackle and understaffed public schools, and health services beyond the reach of scores of millions of our people at costs within their means. A distinctive feature of this chart is the indication that Federal outlays recommended for 1977 would be smaller in ratio to our national production than in 1969. Another feature of this projected 1977 Federal Budget is that, in absolute amounts, quite reasonable or even liberal allowances are made for national defense, space technology, and all international, without any sacrifice of the great domestic priorities. Looking at the composition of the tax changes proposed in the current Bill as it now stands, I cannot believe that these proposals stem from an adequate analysis of our economic, financial, and social problems and potentials in full perspective.

Most seriously of all, I do not believe that the proposals in the current Bill in its present form are designed to stimulate and activate the full but not excessive rate of real economic growth which we need and can achieve. The long term departure from adequate economic growth, not only to an extraordinary extent during 1953–1960, but also to a lesser although serious extent during 1960–1969, has been occasioned fundamentally by a gross misallocation of economic activity and the incomes supporting and inducing such activity, from the viewpoint of economic equilibrium. Each period of real economic slow-down or stagnation or recession has been preceded by a relatively excessive expansion of the ability to produce as represented by private business investment, and especially private investment in plant and equipment, at the expense of relatively inadequate expansion of ultimate consumption in the form of private consumer spending and public spending at all levels, combined. My *Chart 5* demonstrates this for the period 1961–1968. Measured in constant dollars, while total national production grew only 42.2 percent, private business investment in plant and equipment grew 65.5 percent. While wages and salaries grew only 44.5 percent and farm proprietors income only 3.6 percent, corporate profits grew 55.4 percent, personal dividend income grew 58.0 percent, and personal interest income grew 84.9 percent. During 1967–1968, a reaction set in, which almost brought to a halt the expansion of private investment in plant and equipment, due to obvious overcapacity; but even so, corporate profits grew 7.1 percent while wages and salaries grew only 5.6 percent and farm proprietors' net income only 1.4 percent. We all know that, during 1969 to date, private investment in plant and equipment is again proceeding at a fantastically high and dangerously nonsustainable rate relative to the rest of the economy, while progress in the real incomes of wage-earners and farmers and millions of other people of lower and moderate incomes has been virtually brought to a halt, or even set back in real terms, due in large part but not entirely to rampant price inflation.

Federal spending for some of our public domestic needs is being cut back drastically. Total Federal spending on the domestic scene is being held for below either our economic equilibrium or our social needs. And total Federal spending, in fact, is insufficient to close a reasonable portion of the gap between other types of spending and the spending requirements for maximum employment, production, and purchasing power and optimum economic growth.

Certainly, these disparate trends all along the line must be promptly and vigorously corrected, lest we instigate an even more deficient real economic performance than is currently in process, instead of moving in the directions we ought to go. All of these considerations, as I shall show, are directly related to the portions of the Bill bearing upon housing and other real estate investment.

Current tax bill, investment and consumption allocations

Bearing these considerations in mind, I turn now to specific consideration of the current Bill, beginning with an analysis of its allocations between the investment fuction and the consumption function, which, as indicated above, I hold to be fundamental to all other considerations. First of all in this connection, I call the Committee's attention to my *Chart 6*, making manifest my early protest against the unsound nature of the allocations between the consumption function and the investment function, as embodied in the tax cuts and concessions during 1962–1965. In view of what has happened since, I hardly see how many responsible economists could now challenge the validity of the position I then took, although I had mighty few supporters at that time. Be that as it may, I feel that the proposals in the current Bill, while less egregiously so than earlier, run counter to the considerations of an appropriate and viable balance between investment and consumption.

This crucial subject is dealt with on my *Chart 7*. Excluding the proposed tax reforms, it indicates that, on net balance, the House Bill would increase the after-tax benefits to investment only nominally, while the Treasury proposals would increase the after-tax benefits to investment by 1.1 billion dollars, in both instances allowing for the effects of the repeal of the investment tax credit. Taking into account the entire train of events to date as I have discussed them above, and the allocation to the investment function in the neighborhood of 8.6 billion dollars by the tax actions of 1962–1965, I can find no justification whatsoever for the current proposals, excluding the proposed tax reforms. It seems to me highly inconsistent and ironic that, despite all of the furor about excessive investment and the need to restrain it by repealing the investment tax credit (which repeal I highly favor), the effect of without reforms of the House Bill is to cancel out a major part of the impact of the repeal of the investment tax credit by other concessions to saving for investment purposes, while the net effect of the Treasury proposal is to far more than counteract such repeal (for details, see third following paragraph).

I deem this analysis of the impact of the current proposals excluding the tax reforms to be more significant than the analysis including such reforms. The reforms are more controversial than the other sections of the proposed Bill, all experience indicates that there is much more doubt as to how the reforms will come out in the final legislation, and besides, some of the so-called reforms are highly undesirable for reasons which I will disclose as my testimony proceeds.

However, if the tax reforms are included, as shown on the lower portion of my *Chart 7*, the House Bill would result in a net after-tax tightening up on the investment function in the amount of 3.9 billion dollars, and the Treasury proposals would do this in the amount of 2.5 billion dollars. These provisions do not go far enough.

My own suggestion is as follows: the investment tax credit should be repealed. The additional tightening up on investment (related both to after-tax funds available directly for investment and after-tax personal income saved for investment purposes) as embodied in the House Bill, including the reforms, should be enacted, subject to some modifications which I set forth below. Investment in many basic areas is far too ebullient. Profit margins in general are high enough and in many key instances far too high. And even from the viewpoint of investment and profits in the long-run, the best results will be obtained by more accent upon private and public consumption to restore the economic equilibrium, and thus to promote the higher rate of real economic growth, in which business shares very generously. It follows that, while I favor the small additional incentives to investment in the form of accelerated depreciation for anti-pollution efforts, etc., I favor neither the 2.0 billion dollar after-tax benefits to investment embodied in the House Bill (with or without the reforms), in the form of the estimated impact upon personal saving for investment of personal tax cuts less the impact upon individuals of the repeal of the investment tax credit, nor the 3.3 billion dollar after-tax benefits to investment embodied in the Treasury proposals (with or without the reforms), including also corporate tax relief. The about 6 billion dollar decrease in the after-tax allowance to investment which I favor could beneficially be utilized in the form of additional Government revenues distributed to the great priorities of our domestic needs, which are now being so seriously starved. Even this would be beneficial to investors in the long run by adding to economic growth, human justice, and social contentment. As I shall make abundantly clear as I proceed, while I favor this *amount* of net tightening up on investment, my comments are not applicable to housing and related real estate investment. Further desirable tightening up in other areas would yield this 6 billion dollar net without tightening up on housing and related real estate investment.

Equitable considerations in the tax bill

I turn now to equitable considerations as distinguished from the purely economic equilibrium considerations set forth above, although I must stress most emphatically that the whole problem of departures from economic equilibrium is at bottom a problem of serious income maldistribution. Improved income distribution would do more than anything else to help restore and maintain that balance between investment and consumption which is essential to optimum economic performance, and to the achievement of the enlarged public revenues (at any given tax rates) which flow from such optimum performance.

In this context, I turn first of all to my *Chart 8*, which indicates as of 1967 the annual money incomes before taxes of various income groups, as these groups relate to poverty, deprivation, comfort, and affluence. I will not linger upon this demonstration, except to state that it indicates dramatically the need to use Federal tax policy to improve income distribution. The chart also shows 1972 and 1977 goals for the reduction of poverty, within the model for balanced economic growth earlier set forth in this testimony. My *Chart 9* shows even more vividly and terribly indefensible income distribution in the U.S. from 1947 to 1966, and further indicates a totally unacceptable amount of improvement over the years. In 1966, as to families, the top one-fifth income grouping received 41 percent of total income; the two top fifths received 65 percent of total income; the lowest fifth received only 5 percent; the lowest two-fifths only 17 percent; and the three fifths counting from the bottom received only 32 percent. As to unattached individuals, the situation was, in some respects, very much worse.

To divert for a moment, this whole problem of income distribution and the need for vast improvement is intimately associated with housing conditions, home construction, urban renewal, and related aspects of other real estate investment. These activities not only increase incomes directly by adding to employment opportunity, but increase it indirectly by income-aids to many forms of housing, and by removing the oppressive housing conditions which impair morale, health, productivity, and incentives. In due course in my testimony, I will develop the truly dangerous extent to which a number of provisions in the current Bill, as now written, would devastatingly affect these lines of enterprise.

In view of rapid inflation and other developments, it may well be that the distribution picture in 1969 is even more shocking than it was in 1966.

Mindful of this core problem of income distribution, I have not only emphasized for many years the value of maintaining a highly and even increasingly progressive Federal tax structure, but also have called attention to how misleading it is—though many who know better do so—to look only at the Federal income tax structure, in appraising whether or not we have anything approximating an equitable tax structure in the U.S. In 1966, as shown on my *Chart 10*, scrutiny of the Federal income tax structure alone would indicate a moderately progressive tax system, although not nearly as progressive as I think it should be. But people do not only pay Federal income taxes. They also pay social security taxes; State and local income, sales, and gasoline taxes; and personal property and real estate taxes. Taking all of these types of taxes into account, those with incomes under $3,000 in 1966 paid 14.1 percent of their incomes in taxes of all kinds, contrasted with the 3.7 percent which they paid if one looked only at the Federal income structure. To be sure, these people and some others will pay no Federal income taxes if the proposals now before this Committee are enacted, and that is all to the good. But taking into account what has been happening to other types of taxes, many of these people will probably pay a higher percent of their income in total taxes after this Bill is enacted than in 1966.

Turning again to 1966, those with incomes of $3,000–3,999 paid 19.3 percent of their incomes in all forms of taxes, or *more* than those in the groups running from $4,000 up to $14,999, and almost as much as those running from $15,000 to $19,999. Those from $20,000 to $49,000 paid 24.2 percent of their incomes in all kinds of taxes, contrasted with 19.3 percent for those from $3,000 to $3,999, while if one looks at the Federal income tax alone the contrast would appear to be between 18.7 percent and 6.6 percent. Those with incomes at $50,000 and over paid 38.8 percent of their incomes in all forms of taxes, which in my view was not nearly enough when compared with some of the other groups, particularly in view of the unique opportunity which many within these groups have to avoid if not to evade taxes. Further, comparison between this 38.8 percent figure and the 33.6 percent figure which indicates the share of these peoples' incomes which they pay in Federal income taxes alone shows vividly how much less heavily other types of taxes serve (proportionately) to increase the tax payments of these people when compared with those down in the income structure.

These were the reasons why, prior to enactment of the massive tax reductions in 1964, I protested the distribution of the tax cuts on the grounds that they were grossly inequitable. I insert in the record, at this point, my *Charts 11, 12, 13, and 14*, shedding light upon what happened in 1964. It is true that these charts were developed in 1963, and are not exactly in accord with what actually happened in 1964. But they are close enough to tell the essential story. And it should be remembered that most of the reforms were sidetracked in 1964, so that the portrayals without the reforms are the really significant ones.

The current consideration of what is hailed as "the greatest tax reform bill on record" provides a challenging opportunity, not only to avoid repeating in full measure the errors of 1964, but to commence to redress vigorously the worsening of the tax structure then accomplished, by a really progressive treatment of any tax changes put into effect henceforth. But by this entirely fair test, the Bill in its current form is woefully deficient.

As my *Chart 15* shows, looking at both the House and the Treasury proposals, and also looking at the Bill without the reforms and the Bill with the reforms, those with incomes under $3,000, aggregating 38.8 percent of all tax returns, would receive only 9.0–13.7 percent of the total tax cuts. Those with incomes of $3,000 to $5,000, aggregating 16.2 percent of total returns, would receive only 7.8–14.1 percent of the total tax cuts. Meanwhile, those with incomes of $20,000 to $50,00, coming to only 2.3 percent of total tax returns, would receive 10.6–16.1 percent of the total tax cuts. Those with incomes of $5,000 to $10,000, aggregating 33.9 percent of total tax returns, would receive only 22.1–30.7 percent of the total tax cuts. Those with incomes of $10,000 to $20,000, aggregating 16.4 percent of total tax returns, would receive 28.5–34.4 percent of the total tax cuts.

Without the reforms, those with incomes of $50,000 and over, coming to only 0.4 percent of the total tax returns, would receive 13.4 percent of the tax cuts under the House Bill, and 17.2 percent under the Treasury proposals. And in many ways, the comparison shown on the chart without the tax reforms are more significant than those shown with the tax reforms. This is because the tax reforms are the most debatable and the most uncertain as to enactment; because we know from experience that, when the reforms are dropped or mutilated, there are unlikely to be corresponding adustments with respect to the general tax rates; and because the tax reforms bear down so very differently upon different people in the same income groupings, depending upon the nature of their incomes. For example, under the Treasury proposal, those in the $10,000 to $20,000 income group would get a much higher percentage of the total tax reductions with the reforms than without them, while the over-$50,000 income group would receive an immensely greater percentage without the reforms than with them.

I know that it will be argued, as it has been, that under a progressive tax system, it is "natural" that a larger percentage of the tax cuts (relative to numbers of taxpayers) should go to those higher in the income structure than those lower down. The first answer to this is that it is hardly true. It is perfectly feasible to realign the composition of the tax cuts in the current Bill to achieve the reverse. In the second place, even if it were true, this would merely cast doubt upon tax cutting as the desirable measure now to be used, in either economic or social terms. If under tax cutting, it were not feasible to direct a larger percentage share of the benefits of total action taken by the Government to those lower down in the income structure than the current Bill does in its present form, in that event devices other than tax cutting should be used toward these essential ends—for example less tax cutting in the higher parts of the structure, and more Federal spending directed toward the needs of the poor and deprived.

Beyond all this, the really meaningful thing is not the percentage tax cut, but the percentage *increase in after-tax income*. As shown by my *Charts 13 and 14* already referred to, I indicated how bad the 1964 tax action was by this test. And as shown by my *Chart 16* while it would appear by looking at the percentage cuts in their taxes which would be applied to various income groups that the proposals in the Bill are quite progressive, the true and very different picture is shown by looking at the percentage increases in after-tax income, which is what really counts.

Looking first at the House Bill as is shown on the lower half of *Chart 16*, with or without the reforms, the income groups under $5,000 would be treated relatively well, though not nearly well enough. But those in the $5,000 to $10,000 groups would be treated the same as those in the $10,000 to $20,000 groups, and less favorably than those in the $20,000 to $50,000 group. Those above $50,000 would be treated immensely more favorably than others if one excludes the reforms, and in some ways the exclusion of the reforms is very pertinent, if not most pertinent. For as I have said, nobody knows what is going to happen to the reforms; we have learned from experience that the general changes in the structure are not revised when reforms are dropped in the process of legislation; and beyond all this, there will be many in the over-$50,000 group who will not be affected by the reforms in a degree comparable to others in this same group.

Coming over to the Treasury proposal, as shown on *Chart 17*, those in the income group $20,000 to $50,000, in terms of percentage increase in after-tax income, would be treated much more favorably than those between $3,000 and $20,000, with or without reforms. Without the reforms, those at $50,000 and over would be treated immensely more favorably than all others.

My position on this entire issue is extremely simple. To make the tax structure more equitable, to serve better our economic equilibrium needs, and to commence to redress some of the gross regressiveness brought into being by the 1964 tax changes, I submit that this is not the time at all to reduce one iota the personal tax rates, before reforms, applicable to those with incomes of $50,000 and over. All things considered, I have considerable doubts as to whether such tax reductions, before reforms, should be extended to those with incomes over $20,000. The amounts saved by forgoing these types of tax reductions should be used toward increasing the tax reductions or concessions lower down in the structure, with emphasis upon progressivity. With respect to those over $50,000, the only group where the reforms as against the tax reductions without the reforms changed the picture much, I do not believe that any of the reforms enacted to apply to these groups should result in their getting any tax reductions without reference to the reforms. The need for reforms does not depend upon the general tax structure as applied to these groups, and those among them who are getting away with what the reforms are designed to avert should not thereby be entitled to reductions in their general tax rates.

Everything else being equal, tax reduction of all kinds is fine for everybody. But everything else is not equal. What I am urging in essence is that, on all valid grounds, we should use any changes to be made in the personal income tax structure, whether considered with or without the effective reforms, to begin to redress the gross maldistribution of income after taxes which is now so unfair to our people and injurious to the economy. This in itself would be the greatest reform of all, and a Bill which does not really do this anywhere near adequately is using the glamorous word "reform" to mask the real results which would flow from its enactment.

In addition, I believe that the minimum tax provisions in the Bill should be very considerably strengthen. Among other advantages of doing this, it would reduce the real or alleged need for some of the so-called reforms, with which I shall deal in detail when I come to those provisions in the Bill which treat housing and related aspects of real estate investment.

I think also that there should be some tightening of existing law related to capital gains, although I am not positive as to the timing thereof, nor have I examined the technical aspects in detail. But, as I later discuss, housing and other real estate investment should not in this connection be singled out for discriminatory treatment.

I also feel that the maximum tax provisions should be eliminated or very substantially modified, for reasons going to the general issue of restoring a sufficient degree of progressivity in the Federal tax structure.

On revenue and other grounds, these changes would leave much more fiscal room for reconstruction of the so-called reforms bearing upon housing and related aspects of real estate investment, although this reconstruction is essential in any event.

Another net consequence of my proposals in their entirety is that they would result in somewhat less net forgoing of Federal revenues than the Bill in its present form, even assuming that tax relief for those in the low and lower-middle-income brackets were carried, as they should be, further than the Bill proposes in its current form.

On the score of general fiscal considerations, I am not interested in improving the revenue position of the Federal Government *per se* as, for reasons fully stated above, I believe that the economy needs net stimulation, not net restraint.

But things being what they are and views being what they are, I feel that the improvements in the Federal reveune picture which would result from my proposals in their entirety would leave more room for more realistic consideration of the so-called reforms bearing upon housing and other aspects of real estate investment, which I shall treat very fully later on in my testimony.

The problem of inflation

The problem of rampant inflation is now at the center of the stage of national attention. It certainly deserves consideration in connection with fiscal policy. In view of the import of my entire testimony, to the effect that we should seek at once to accelerate the rate of real economic growth, I deem it essential to attempt to set the problem of inflation in a more analytic and realistic perspective than I think is represented by recent and current highly unsuccessful efforts to deal with inflation. The materials which I bring before this Committee in this phase of my analysis have been called to its attention by me a number of times in recent years. Only because the issue is so important do I deem it appropriate to say, in passing, that actual economic developments to date have verified to a remarkable degree those conclusions which I commenced to set forth many years ago, and which were viewed with very widespread skepticism when first I set them forth.

Essentially, and contrary to the more common view, I hold that the inflation in the U.S. since the end of the Korean war has been augmented by a dificient rate of real economic growth, rather than sparked by an "overheated" economy. I feel that the effort, through tight money and rising interest rates, to fight inflation has repressed most undesirably the real rate of economic growth, even while it has added greatly to the inflation itself. I feel further that this policy of tight money and rising interest rates has disorted the economic equilibrium, by allocating too much income and incentives to the wrong lines of economic endeavor, and subtracting too much income and incentives from those lines of economic endeavor which require large acceleration, in the interest both of economic equilibrium and our great national priorities. The tight money and rising interest rates have also contributed mightily to the maldistribution of income. As I have frequently commented, they have fed the fat and starved the lean.

There is no better example of this than the housing industry and related aspects of other real estate investment. Here I am not, and for a long time have not been, in a minority; practically all informed persons have recognized the monstrosity of tight money and rising interest rates as applied to these economic sectors. But they have argued that the policy is necessary, nonetheless, to fight inflation by repressing economic growth. That argument also enters into the provisions of the current Bill pointed toward these sectors.

I will not here go into all of my reasons why tight money and rising interest rates are highly inflationary *per se*, but only set them forth very briefly. An increase in the price of steel is more inflationary than an increase in the price of bananas, because steel enters into more products. Money and the cost of money enters into more products than anything else, and thus increases in the cost of money will pyramid into rising costs and prices, including a large portion of those increases in wage demands which are related to that part of the increased cost of living due to rising interest rates all along the line. Tight money and rising interest rates, by repressing the rate of real economic growth and leading to excessive idleness in plant and manpower, reduced seriously the rate of productivity gains. This in itself is inflationary for many reasons, including the reason that it changes adversely the ratio between the trends in labor costs and the trends in money-wage gains.

Instead of elaborating further on a theoretical basis, as to why the repression in the economy which results from tight money and rising interest rates is inflationary *per se*, I now call attention to my *Chart 18*, which is empirical in that it looks at what has actually been happening, instead of indulging in classical theories which do not square with modern realities.

During 1952–1955, as shown on this *Chart 18*, the average annual rate of consumer price inflation was only 0.3 percent, when the average annual rate of real economic growth was 3.5 percent, and unemployment as officially counted averaged 4 percent. During 1955-1958, the average annual increase in consumer prices was 2.6 percent, although the average annual rate of real economic growth was only 0.8 percent, and unemployment averaged 4.9 percent. During 1956-1958, the average annual increase in consumer prices was 3.1 percent, while the average annual rate of real economic growth was only 0.2 percent, and unemployment average 5.1 percent. During 1958-1960, the average annual rate of consumer price inflation fell back to 1.2 percent, while the average annual rate of real economic growth was 4.3 percent, and unemployment averaged 6 percent. During 1960-1968, the average annual rate of real economic growth rose to 4.8 percent, and the average annual increase in consumer prices was only 2 percent. Unemployment average 4.9 percent, but was reduced greatly to 2.6 percent by 1968. During 1960-66, the average annual increase in consumer prices was only 1.6 percent, while the real rate of economic growth averaged 5.1 percent. Unemployment averaged 5.3 percent, but was reduced to 3.8 percent by 1966. During 1966-1968, the average annual rate of increase in consumer prices was 3.7 percent, although the average annual rate of real economic growth fell to 3.5 percent. Unemployment averaged 3.7 percent, or almost the same as the 1966 level. The trends in wholesale prices and industrial prices are shown on the same chart, but I do not analyze them in detail because they tell basically the same story.

Certainly, these trends in the main indicate an inverse or negative rather than a positive correlation between the rate of real economic growth and the rate of price inflation. Nor do they indicate in the main that a movement toward reduction in unemployment promotes an increase in price inflation.

But it may be argued that, while a higher rate of real economic growth or a lower level of unemployment does not in itself promote inflationary tendencies, inflation is nonetheless promoted by an economy *moving toward reasonably full or optimum resource use.* However, this thesis is also discredited by the trends depicted above. For example, during 1956-1958, with unemployment averaging 5.1 percent, and with the sharpest recession since 1952 occurring within that period, the average annual rate of consumer price inflation of 3.1 percent was about twice as fast as the 1.6 percent average during 1960-66 when unemployment averaged 5.3 percent, or about the same. From 1966 to 1967, the price inflation was 2.8 percent, and unemployment stood at 3.8 percent.

The analysis could be further complicated, and my conclusion might be somewhat modified, by the introduction of time-lag factors and some others. But I submit that my analysis and conclusions are in the main sustainable, and most assuredly do not justify the unalloyed policies which are at times deliberately sought to generate excessive deviations from optimum real economic growth, and at least to tolerate excessive unemployment, in the pursuit of a nonsustainable propostion bearing upon the relationship between price trends and these other factors.

My own explanation of inflationary trends—which I commenced to set forth in the mid-1950's before future experience lent much further support to my position—runs as follows: In an economy characterized so largely by administered prices, an inadequate volume of real economic activity and insufficient employment, or even the clear prospect of these, tends to generate protective efforts to compensate for these deficiences through the managerial price-making process. This thesis is perhaps most clearly borne out by the resumption of a relatively high rate of price inflation from early 1966 forward, when the signs became large and unmistakable that the economy was entering a period of severely reduced real economic growth, and when recession talk was in the air.

In some other areas, such as medical care and housing, and at times in the area of farm prices, rising costs or prices have been due to entirely different factors. In the medical field, there have been shortages of facilities and personnel relative to the real need, engendered by long neglect of adequate public spending for these purposes, such neglect being fomented by the avowed desire to fight inflation. In the area of housing, rising costs have not been due to excessive aggregate demand for housing relative to the Nation's needs, but instead have been due in large measure to the fantastically rising interest rates, again allegedly designed to fight inflation. Rising costs to occupants have also been due to the housing shortage.

The thesis that excessive aggergate demand (which in fact we have not had any time in recent years, when measured against the demand required to sustain optimum economic growth and bring unemployment low enough) explains the inflations during recent years, and particularly during 1967-1968, breaks down at all points. It is further corroded by the special industry studies which I have made from 1952 forward, indicating even more clearly the propensity to increase prices more rapidly during periods of relatively high unused capacity and relatively high unemployment than during period of relatively less unused capacity and relatively less unemployment.

Frequently it is argued that the inflation has been of the cost-push variety, occasioned by wage costs per man-hour rising faster than productivity. But this position is completely torpedoed by the empirical evidence.

During 1960-1968, in the total private nonfarm economy, measured appropriately in constant dollars, productivity rose at an average annual rate of 3.1 percent, while hourly wages and salaries rose at an average annual rate of 2.9 percent. It is even more reveling to break this period into two parts. During 1960-1966, productivity rose at an average annual rate of 3.4 percent, while wages and salaries rose at an average annual rate on only 2.7 percent. This was a period when the average annual rate of real economic growth was 5.1 percent. But during 1966-1968, when the average annual rate of real economic growth declined to 3.7 percent, productivity rose at an average annual rate of only 2.2 percent, and wages and salaries at an average annual rate of 3.2 percent.

The trends in manufacturing tell the same story, only more so. During 1960–1968, the figures were 3.2 percent for productivity, and 2.2 percent for wages and salaries. During 1960–1966, the figures were 3.7 percent for productivity, and 1.9 percent for wages and salaries. During 1966–1968, the figures were 1.7 percent for productivity, and 2.9 percent for wages and salaries.

This leads to the implication that the relative trends during 1966–1968 exerted cost-push inflation, and thus explained the rapidly accelerating inflationary trends. I cannot accept the position that the relative trends in wages and salaries and productivity during 1966–1968 justified in any sense the accelerated price inflation during this period, particularly in view of profit margins and aggregate profits. Consumption, supported so substantially by wages, had certainly not been excessive, but rather has been deficient, during the past 2 years, by economic equilibrium tests.

But let us assume for the moment—contrary to my own view—that the relative trends in wages and salaries and productivity during 1966–1968 "caused" or even "justified" the accelerated price inflation. In that event, this happened, not because the rate of advance in real wages and salaries was too high in terms of any equilibrium model for reasonably full use of our potentials, but rather because the rate of productivity growth dropped abysmally. And this happened precisely because of the abysmal decline in the real rate of economic growth coupled with the election (desirable in itself) to translate this into less efficient utilization of the employed labor force rather than into more overt unemployment. Of course, such inefficient utilization is a form of concealed unemployment.

Under these circumstances, how wrong and upsidedown it is to try to stop this kind of cost-push inflation by further repressive measures, designed to reduce still further a seriously inadequate rate of real economic growth.

Further, my basic position is that policies designed effectively to achieve a stable and optimum economic growth would in the long run yield less net price inflation than result from erratic ups and downs in the real economy, rapidly changing labor and business expectations, and general uncertainty. The evidence to date on this seems fairly clear. But even if the evidence were less conclusive or more arguable on rational grounds, we should choose the certain benefits of steady and optimum economic growth and minimal unemployment, instead of committing ourselves to a theory as to the cause of inflation which cannot be squared with what has been happening.

The entirely erroneous proposition that tight money and rising interest rates serve admirably to help contain inflation is essentially allied with the erroneous idea (discussed above) that policies inimical to optimum economic growth and conducive to excessive unemployment help to contain inflation. Consequently, the analysis which I present immediately below is essentially similar in method to that which I used in discussing the inflationary problem generally.

As shown by my *Chart 19*, during the period 1955–1968 viewed as a whole, the average annual growth in the nonfederally held money supply was only 2.5 percent, and the average annual real growth rate in total national production was at the deficient rate of 3.8 percent. I believe that there was a strong relationship between the deficient growth in the money supply and the inadequate economic performance, but I will not elaborate upon this particular point, especially because I believe that too much weight has been attached to monetary policy in the aggregate in this particular connection. Theoretically, and perhaps practically also, a more or less rapid growth in the money supply might affect the level of prices considerably, but should not affect the real trends in production and employment if economic equilibrium were maintained in the fundamental allocation of resource and in income distribution, which can be achieved either at a more or less rapid growth in the nonfederally held money supply.

Nonetheless, what I have just said does not apply to extreme cases. It seems perfectly clear that the extremely low growth rate in the money supply during 1955–1957, and again during 1958–1960, was intimately associated with the recession of 1957–1958 and the minirecession in late 1960 and early 1961. It also seems abundantly clear that the extraordinarily low growth rate in the money supply during 1955–1966 was an important factor in initiating the extremely low real economic growth rate during 1956–1967 and the unsatisfactory average annual rate during 1966–1968. The relatively more rapid rate of growth in the money supply during 1957–1958 and during 1960–1961, and again during 1962–1965, appears to have been conducive to more favorable trends in the real rate of economic growth. The rapid expansion of the money supply during 1966–1968 seems clearly to have helped prevent the very serious deterioration rate of economic growth during 1966–1967 from being continued over a longer period of time. On net balance, in a long-term perspective, it seems quite clear that the monetary policy has been much too tight, and that a relatively liberal monetary policy is highly conducive to satisfactory economic growth.

More seriously, the monetary policy has worked powerfully against economic equilibrium, because it has helped to reallocate resources in directions bearing no relationship to economic equilibrium, and in many cases quite destructive of it. The tightening of the money supply has had practically no effect upon the relatively excessive investment booms in plant and equipment, because those indulging in these booms are not greatly affected either by general shortages of credit or by rising interest costs; they finance mainly out of retained earnings and out of the price structure. On the other hand, a better rate of economic expansion in other important sectors, or, more generally, a relatively larger ultimate demand composed of both private consumption and public demand, would have been much more conducive to economic equilibrium at steady and optimum growth, and these developments have been very harshly impeded by both tight money and rising interest rates.

Most important of all, in the context of the argument that tight money and rising interest rates restrain inflation, let us look at the empirical evidence. The extraordinarily contraction in the growth rate of the money supply during 1955–1957, while it impacted severely upon the real rate of economic growth, was accompanied by a 3.5 percent average annual rise in consumer prices from 1956 to 1957. The greatly expanded growth rate in the money supply during 1957–1958 was accompanied by a reduction in the rate of consumer price inflation to 2.8 percent. During 1958–1961, there was throughout an inverse or negative correlation between the trends in the money supply and the rate of consumer price inflation. During 1962–1965, a sustained and relatively rapid expansion of the money supply was accompanied by remarkable price stability. During 1955–1966, a very sharp contraction in the rate of growth of the money supply was accompanied by a very rapid acceleration of the rate of price inflation. During 1966–1967, the money supply expanded about three time as fast as during 1966–1967, but the rate of consumer price inflation was slightly lower. During 1967–1968, the rate of expansion of the money supply was the same as during 1966–1967, but the rate of consumer price inflation was tremendously higher.

Viewing these relative trends in an adequate time perspective, it appears to be clear that excessive restraints upon the growth of the money supply worked toward more price inflation in the long-run for practically the same reasons that excessive restraints upon real economic growth and employment expansion worked in the long run toward more net price inflation.

Beyond all this, the almost unbelievably erratic changes in the rate of growth of the money supply over the years represents an attempt at "fine tuning" which is utterly impractical, and really indicative of a wayward and thoughtless long-range monetary policy, and general economic policy as well.

Relevance of foregoing discussion to housing and other real estate investment

The foregoing discussion of the problem of inflation is critically relevant, as I have suggested above, to those portions of the pending Bill which deal with housing and related aspects of real estate investment. If the purpose of the Bill (or in any event, its consequences, as I shall show) is to curb certain aspects of housing and related real estate investment in the desire to curb inflation, the remedy is horribly out of line with the purpose, for reasons I have already stated. Shortages in housing and in related or supportive real estate investment manifestly exert a strongly inflationary impact upon the costs borne by those who live in houses, whether they buy or rent. The excessive idleness of plant and manpower today, and the larger excesses which I believe are inevitable in future unless the rate of real economic growth is accelerated, are inflationary for reasons which I have already stated. The corrosive effects of inadequate housing upon human beings and their productivity is inflationary.

But even if we needed to restrain the overall rate of economic growth in order to impede inflation—which I do not believe for reasons already stated—that would be no reason for distorting the economic equilibrium further, neglecting all human social considerations, and directing repressive efforts against the rescue and renewal of our urban areas which depend fundamentally, and by common consent, upon enormous acceleration of housing and related or supportive aspects of real estate investment. If we did in fact need to repress, beyond the effects of current measures, the current overall levels of economic activity, we should by all means cut back even further on some lines of expendable or excessive activity than the current Bill proposes to do. We should correspondingly redirect vastly more of our economic activity toward the great priorities which I have just mentioned. This further fortifies my arguments set forth above, in favor of changes in many provisions of the current Bill. It illustrates the inseparable relationship between these provisions and the housing and real estate provisions, and thus justifies my extensive treatment of these other provisions. I now turn to specific analysis of those provisions of the Bill which bear upon housing and related aspects of real estate investment.

The Role of Housing and Commercial Construction in the National Economy General comments on relevant portions of the current Bill

There is no proposition more generally accepted than the proposition that, even in terms of human and social interests alone, our top domestic problem is the rescue and restoration of our urban areas. Toward this end, the Congress, even as of now, has legislated the objective of—although it has not appropriated the funds for—many billions of dollars on an annual basis, looking a decade or so ahead. Broadly speaking, these efforts are directed toward sustaining an annual volume of home construction in the neighborhood of considerably more than twice the current level.

In recognition of this, there is a general belief that the current Bill as now written does not include housing in the repressive or restrictive changes in the tax laws relating to other aspects of real estate investment. This is incorrect. As I shall show in detail, various provisions of the Bill would be extremely hurtful to housing itself. They would thus run directly counter to the well-night universal view as to the nature of housing needs, and even counter to some of the most important programs of the Congress and the Executive Branch.

Even if what I have just said about the provision of the Bill with respect to housing were incorrect—and they are correct—an attempt to classify various types of housing, maintaining current tax benefits for some types but withdrawing it for others, or maintaining these benefits for new construction but withdrawing it from housing after transfer, is utterly unrealistic. The entire housing market and supply (with perhaps some exceptions at the top of the luxury market) is a seamless web. Construction of almost any type of housing adds to the supply and reduces the shortages. Construction of any type of housing helps to meet the great problem of housing's contribution to needed economic growth and employment in future. Construction of housing for middle-income groups exerts some upward shifting of housing use, and thereby reduces the pressures upon occupancy of unsatisfactory housing, as well as ameliorating somewhat the need for the construction of low-cost, low-rent housing, which involves the largest public costs.

In addition, it is most unrealistic and damaging to draw a sharp dividing line between housing and other forms of commercial construction or investment in real estate, leading to greatly differential treatment of the two, as the Bill in its present form does. Cities are not made up of houses alone. Urban deterioration is not limited to housing. Community facilities, stores, quarters for the occupancy of those rendering professional services, and even some aspects of industrial construction in urban areas, are intimately connected with the solution of the housing problem. They are intimately connected with employment opportunity. Many of these facilities and services are incorporated in the same structures as the housing units.

Moreover, if we are to develop the large-scale ventures which are essential to successful urban renewal, we need increasingly, and on an enormous scale, to promote the entry of large-scale enterprisers who combine housing ventures with the other types of ventures which I have mentioned. It would thus be giving with one hand and destroying with the other hand, if tax legislation were enacted which left the housing aspects of current tax legislation where it now is (which the current Bill does not even do), but draws in the reins sharply on these other types of ventures.

Similarly, there is little or no merit in the argument that, if real estate investment other than housing is further curbed, there will be more investment funds available for housing, and especially low-cost low-rent housing. In the first place, as I have already indicated, the funds now going into these other aspects of real estate investment are too small, not too large, and this even works against adequate housing development and urban renewal. In the second place, even if funds were turned away from these nonhousing forms of investment, they would not go in large measure into housing, and certainly not into low-rent low-cost housing, the stimulation of which is advanced as main reason for turning funds away from these other forms of investment. Practically all of the funds going into low-rent low-cost housing are underwritten almost completely in one form or another by the Government, in small part by direct subsidies, and predominantly by effective guarantees of the private capital flowing into such undertakings. It is therefore chasing a will-o'-the-wisp to hope that the further curbing of these other forms of investment would be of measurably significance for low-rent low-cost housing. To any extent that it might be feasible to transfer investment funds now going into other purposes into housing in general, or especially into low-rent low-cost housing, the sensible approach, as I have proposed earlier in my testimony, is to make the curbs on those types of investment which are now expendible or excessive even more stringent than they are in the Bill as now drawn. I predict that, if the Bill is enacted in its present form, a large portion of the funds now flowing into real estate investment other than housing will (a) flow into forms of investment of far lower priority than either of these two types, or (b) stagnate, thus contributing to more idle manpower and other productive resources.

To indicate the magnitudes at stake, I have estimated in a number of studies, some of which have previously come to the attention of this Committee, that close to half of the total employment problem which will be generated by technological displacement in some industries, and by population growth, during the decade ahead can be solved within the ambit of adequate programs of urban renewal, focusing sharply to be sure upon housing, but necessarily including these other types of related or supportive ventures. Aspects of the basis of these conclusions are indicated on my *Charts 3, 4, 22, and 23*, already discussed.

I am as fully aware as others that some of those who have engaged in real estate investment have taken indefensible advantage of the existing tax laws, to the effect that their tax payments have been excessively reduced, or even reduced to zero. I desire, as much as anybody else, to remedy these evils, and commend the purpose of the House and of this Committee to do just that. But in sober realism, we must now throw out the baby with the bath. All aspects of national tax policy must look at the whole picture, and must recognize that any specialized or *ad hoc* tax policy which is "liberal" enough to accomplish its basic purpose will allow enough room to permit a small percentage of those in the relevant line of endeavor to get away with excesses. Indeed, even tightening up of tax policy along the lines set forth in the current Bill would probably still leave room for some of the powerful, skillful, and well-advised to get away with more than they should, even while these provisions would cripple or destroy hundreds of thousands of essential and useful enterprisers in housing and related aspects of real estate development who are not getting away with anything.

This does not mean that I do not favor appropriate measures directed against those who are getting away with more than they should. I certainly do. The most constructive and useful measure in this direction is the vigorous limitation on tax preferences (LTP), which, as I have indicated above, should be strengthened well beyond the Bill in its current form.

The critically deficient rate of activity in housing and related real estate investment

I now turn to more specific factual illustrations bearing upon what is happening to housing and related aspects of commercial construction. First of all, my *Chart 20* calls the attention of this Committee to the alarming decline in housing starts during 1969. The annual rate, seasonally adjusted, has declined month by month from 1,845 thousand units in January to 1,314 thousand units in June, a staggering decline of about 28.8 percent. This drop is continuing, and the end is not yet. Under these circumstances, I cannot understand why proposed legislation should now take the risk, even if it did not import the certainty, of augmenting this alarming downward movement by removing existing tax incentives. These incentives, in the view of all knowledgeable people, have certainly been stimulative on net balance, even if the stimulation has involved some improper costs as against enormously larger net advantages. Even those not certain that the proposed changes in the Bill would be as damaging as I and other knowledgeable people appraise them to be, it seems to me entirely unwise to introduce into the housing picture any elements of uncertainty at this time, or in the near future.

If we should take this unfortunate course how could we come within hailing distance of more than two million housing starts per year, redress the current conditions and trends within our urban areas, remove the slums within which live at least one-sixth of our people, or alleviate the excessive housing costs being borne by so many other millions of our people, due in large measure though not entirely to the inadequate growth in the housing supply?

My *Chart 21* serves two purposes. It depicts on a long-range basis the role of housing and commercial construction combined in the national economy, and also depicts the ominous relative decline since 1955. In 1955, these two elements of investment (investment in housing and investment in commercial construction) came to 6.41 percent of GNP. Even this was lower than the 7.13 percent reached in 1950. But by 1968, with declines in most years since 1955, the ratio was only 4.35 percent. It was only 4.39 percent in the second quarter of 1969.

Measured as a percentage of total private domestic investment, the ratio of investment in housing and commercial construction to the total was 40.8 percent in 1954, and 39.4 percent in 1958. In 1968, it was only 29.8 percent, and decreased further to 29.0 percent in the second quarter of 1969.

My *Chart 22* approaches the same problem from another perspective. It shows that, during 1961–1968, measured in 1967 dollars, the average annual rate of growth in our Gross National Product was 5.2 percent; in personal consumption expenditures, 4.9 percent; in private domestic investment, 6.2 percent; and in Government purchase of goods and services, 6.0 percent. Again broadly speaking, I think that this represented a reasonably good balance in the long-run, except that the private domestic investment sector did not include nearly enough housing and related real estate investment. Instead, it included far too much investment, relatively speaking, in producers' durable equipment and new plant and equipment. (These separate categories overlap considerably, but are not identical). The average annual rate of growth in producers' durable equipment was 9.9 percent; in new plant and equipment expenditures, 7.5 percent; in commercial structures 4.9 percent; and in nonfarm residential structures only 0.5 percent. The relatively excessive rates of advance in the first two categories was due to excesses during subperiods of very strong and advancing prosperity. This contributed greatly to inflationary pressures, and then to severe cut-backs from time to time which impacted adversely upon the overall economy. These excesses were very substantially due to excessive tax cuts and concessions for these two categories, and also to excessive price-profits trends in many key industries. In vivid contrast, the growth rate in commercial structures relative to need lagged, and the growth rate in nonfarm residential structures was lamentably low. This does much to explain one of our top domestic problems, urban deterioration. Our cities are becoming obsolescent because they are not being renewed, and these two types of activity are at the heart of such renewal.

By this pragmatic test, it appears clear that the housing and related categories, so inseparably connected with urban life, have had incentives which have been deficient rather than excessive. I am not overly impressed with theoretical or mathematical displays that some tax concessions or other benefits are either too large or too small, or with spectacular showings that somebody may be "getting away" with something (although this should be appropriately remedied), or with tenuous attempts to delineate causes and effects with precision. It remains an irrefutable *datum* that we have been moving dangerously too slowly in the residential and construction areas which I have identified. And because adverse changes in the rules of the game always produce unsettling effects which cannot be exactly measured—not only economic and financial, but also psychological—I reach the conclusion that it would be unwise now to tamper adversely with the tax treatment of these two vital sectors. The Congress recently approved, during a Democratic Administration, a tremendous long-range housing and urban renewal program, at great cost to the Government. It appears that this program has also been approved by the current Republican Administration, or at the very least by the HUD Administrator. Why, then, should we retard with one hand what we are attempting to stimulate with the other?

The immense needs of the future

These conclusions are reinforced by looking to the future. My *Chart 23* depicts balanced growth rate goals for important sectors of the economy Aside from matters of detail, these goals are consistent with those put forward by many other private and public research organizations, and are explicit in the approved programs of the Government itself. Projected from 1967 to 1977, the indicated goals are an average annual rate of growth of 5.3 percent in GNP, and fairly similar rates of growth for the main components thereof. Considerably lower GNP goals would not appreciably affect the relationships, which are the real significance of the exercise. Compatible with these major-component projections, the average annual rate of growth projected is 6.5 percent for total fixed investment; 4.1 percent for producers' durable equipment, 5.9 percent for commercial structures; and 11.2 percent for residential structures. The higher-than-GNP rate of growth for commercial structures, and the extraordinarily high rate of growth for residential structures, are designed to compensate for the lag in these two areas during the past years under review, to make the relative growth rates in these two sectors compatible and mutually reinforcing, and to fulfill objectives for urban renewal almost universally shared. They are, for example, entirely consistent with recent housing and urban renewal legislation, and in fact are derived largely therefrom.

It must be perfectly clear, combining pragmatic examination of these goals for the future with a pragmatic examination of the record during the past eight years, that we now cannot afford to inject into urban renewal any factors which would be repressive rather than stimulative, and induce uncertainty instead of legitimate confidence.

Relevant aspects of the Federal revenues and expenditure picture

Let us now turn to the Government revenue and expenditure side of the problem. My *Chart 24* shows the value of depreciation and depletion, in dollar terms, as expressed in corporate income tax rates. In 1966—and the choice of any other year would yield practically the same results—the total value of depreciation and depletion allowances so expressed was 43.1 billion dollars. Of this value, 45.7 percent related to manufacturing; 22.5 percent to transportation, communication, and electrical, gas, and sanitary services; 7.9 percent to wholesale trade; 7.2 percent to the service industries; and only 5.8 percent or 2.5 billion dollars to real estate. Taking into account also that these data relate to all depreciation and depletion, and not merely to that portion affected by special concessions or allowances, it must be manifest that the absolute and relative size of any recoupments the Government might attempt through tampering with depreciation allowances in the case of real estate might be making a mountain out of a mole hill. In any event, it would yield very little additional revenues, relative to the positive arguments which I have set forth against taking this risk.

It is also revealing to look at the picture with respect to the dollar value of Federal subsidy programs, as distinguished from tax concessions in one form or another. My *Chart 25* does this. For the fiscal years 1964-1969 inclusive, the average annual cost of the specified key subsidy programs of the Federal Government came to 6.7 billion dollars. Of these, 57.7 percent went to agriculture; 12.7 percent to health, education, welfare, and labor; 10.5 percent to air transportation; 8.9 percent to maritime; 7.3 percent to nonspecified categories; and only 2.9 percent to housing. In the fiscal year 1969, with the total subsidy figures estimated at 8.2 billion dollars, only 6.8 percent went to housing. Even in this year, the allocation to housing was strikingly small. And yet, its elevation from the five-year average of 2.9 percent to 6.8 percent demonstrates in itself the great effort being made to move forward more rapidly in this critical area. It thus negates the advisability of taking one step forward and another step backward by any distinctly adverse action in this sector.

The role of housing and related real estate in total fixed investment

My *Chart 26* is designed to portray the immense importance of investment in residential and commercial structures, relative to total fixed investment. This facilitates contrast between these magnitudes and the tiny share of tax and subsidy benefits received by the housing and real estate categories, as already portrayed. In 1961, residential and commercial structures preempted 41.9 percent of total fixed investment. By 1968, this had dropped to 31.1 percent, another dramatic illustration of a gravely deteriorating situation. The goals for 1977, to which I have already referred in another connection, contemplate that residential and commercial structures should preempt an estimated 41.0 percent of total fixed investment, coming up close to the 1961 ratio, but running very far above the critically depressed 1968 ratio. Looking at these ratios in conjunction with my earlier data reveals (1) how desperately little Federal help these types of activities have been receiving, by way of tax and subsidy assistance, relative to their magnitude and vital importance, and (2) the basic goals set are incompatible with adverse treatment of housing and real estate at this time.

The lowly financial rewards to real estate

My *Chart* 27 should dispose of any erroneous notion that the real estate industry is "in clover", and should help to dispel the idea that the broken desire to take action against the relatively few who have been getting away with tax-avoidance excesses should be translated into new tax action which would hurt and penalize the industry as a whole, as it labors already under the tremendous burden of rising interest costs and other disadvantages which I have already depicted, and finds itself unable to rise to the challenge of vitally needed expansion of activity. In 1965 (latest year available) net income per the Internal Revenue Code, measured as a percentage of net worth, was only 3.5 percent for real estate, the lowest of the eight specific categories shown on the chart. It was 8.2 percent for all industry. It was 4.4 percent even in agriculture, 6.0 percent in finance and insurance, 8.2 percent in trade, and 10.3 percent in manufacturing. Net income as stated on books of account, as a percentage of net worth, was 4.9 percent in the case of real estate, again the lowest among the eight categories. It was 10.0 percent for all industry, 8.3 percent in finance and insurance, 9.6 percent in trade, and 11.7 percent in manufacturing.

Another vital factor shown on the chart is the ratio of long-term debt to total assets. This indicates the almost unique extent to which real estate has been affected adversely by tight money and rising interest rates. This ratio was 48.4 percent in real estate, contrasted with 12.2 percent for all industry. It was only 2.9 percent in finance and insurance, 10.8 percent in trade, and 13.7 percent in manufacturing.

The impact of rising interest rates

There is one remaining point which I desire to call to the attention of the Committee, involving another tremendous liability under which the home building sector has suffered. My *Chart 28* shows that, comparing the average for 1952 with December 1968, the mortgage yield on new FHA-insured homes rose from 4.29 percent to 7.13 percent, an advance of 66.2 percent (it is much higher now). To be sure, as shown on the chart, other types of bond yields and interest rates have risen far more. Nonetheless, as we all know, the home building industry has been hurt far more seriously by tight money and rising interest rates than almost any other sector. This is because the Government, as well as business in general, finances only a small proportion of its outlays with borrowed money, while the home building industry and home owners, almost by definition, do just the reverse. The adverse impact of rising interest rates upon urban commercial construction is also very great.

It is in fact a gross understatement to say this: The increased costs imposed upon the home building industry and upon home ownership by rising interest rates have been much greater than the net value of benefits conferred in the form of Federal tax concessions and subsidies. This is another example, and a most serious one, of national policies moving in opposite directions simultaneously.

I have very recently made the following estimate: From 1952 through 1968, the *average* interest rates on all 1–4 family nonfarm home mortgages (not the interest rates on new loans, which rose more than twice as much) rose *43.7 percent*. During 1953–1968 as a whole, this imposed an additional interest burden of *17.4 billion dollars*, compared with what interest costs would have been if they had remained at the 1952 level. Even if interest costs are soon stabilized or somewhat reduced, these costs will continue to spiral upward until the interest rates on new borrowings are no higher than the average interest rates on existing loans. And this will *not* come to pass in the foreseeable future. As I have already indicated, the toll imposed upon housing and other real estate investment by rising interest rates exceeds many, many times the benefits conferred upon these lines of endeavor by all tax concessions to them in their current form.

Summary of foregoing housing and real estate portions of testimony: relevance of LTP

In summary of this phase of my discussion, our urban areas are in deep and increasing trouble. They must be resuscitated and renewed. Investment in residential and commercial structures, on a vastly expanded scale, is essential to these purposes. Although the Federal Government has asserted the high priority of these purposes, it has not made manifest that high priority in the relative tax and subsidy help which it has extended to residential and commercial investment.

On the revenue side, any recoupment which the Federal Government might achieve through even less favorable treatment of these sectors would be a mere bagatelle, compared with the potentials for recouping revenues in other ways.

Further—such action would deal a further blow to sectors which imperatively requires even more encouragement than they have been receiving.

In saying this, I stress again that I am entirely in favor of rigorously limiting total allowable tax preferences (LTP), so that none of those in housing and other real estate or elsewhere shall continue to avoid their decent tax responsibilities. But as I have said, the proper way to get at this problem is through LTP, not by placing further *ad hoc* curbs upon nationwide endeavors which need additional stimulation.

It should be noted, in this connection, that the current Bill withdraws accelerated depreciation from some industries and not from others, presumably on the ground that some industries should be further restrained and that others—such as trucking and airlines—should not be so restrained. But insofar as this withdrawal of accelerated depreciation is designed to get at individuals or business entities which are "getting away with something", it is manifest that such practices may exist in various industries, regardless of whether or not they are deemed to be in need of further stimulation or further restraint. This in itself indicates that the withdrawal of accelerated depreciation is a blunderbuss and in fact erroneous tool for getting at those who are "getting away with something", in that it disregards the larger question of the condition of the industry affected thereby, and whether such industry needs further stimulation or further restraint. And if the withdrawal of some current tax benefits from housing and other real estate investment is predicated upon the notion that they should have imposed upon them further restraints, while other industries should not, this notion can find no support in actual economic, financial, or public policy considerations. Nor can it be reconciled with the mandate of our great national priorities.

I therefore respectfully submit that it would not be desirable to reduce on net balance the help and encouragement which housing and other aspects of real estate investment are receiving from the Federal Government. The generally laudable purpose to close what are some loopholes in this sector should not be permitted to carry the day, in view of the far more important damage and dangers which would flow from any such course of action. LTP, strengthened even beyond the provisions of the Bill in its present form, is the proper approach to this generally laudable purpose.

Detailed discussions of specific provisions of the bill relating to housing and nonresidential construction

The larger issues

I now come to my analysis and conclusions with respect to those provisions of the current Bill which bear directly and specifically upon housing and nonresidential construction.

But before proceeding with this phase, I want to warn against the tendency of some of those involved in these matters to bog down in what I regard as overly technical discussions of details, bordering at times upon the captious. These specific provisions of the Bill, technical though they are, present profoundly important issues of general economic, financial, and social policy. I therefore express my profound conviction that the types of materials which I have thus far presented in this testimony go beyond and rise above the technical details, and constitute definitive reasons for not going ahead with the provisions of the current Bill relating to housing and nonresidential construction.

Putting this in another way, no mere permutations of these technical provisions can, in my view, take the place of reconsideration of the fundamental premises of policy upon which these provisions rest—premises which I believe to be demonstrably mistaken. To the extent that there is large merit in what I have thus far submitted throughout this testimony, the problem of correction of the detailed provisions of the Bill relating to housing and nonresidential construction is not a matter of detail. These corrections cannot be effectuated through mere refinements, compromise, or hair-splitting.

Another basic reason why I do not want to get too much into the technicalities is that this Committee has been and will be benefited greatly by the technical discussions of many other witnesses. Some of these witnesses may be more conversant with these technical aspects than I am, and most of these witnesses may not deal as extensively as I do with the larger issues toward which my testimony is primarily addressed.

Nonetheless, I feel it incumbent on me to proceed with some, or even considerable, discussion of the detailed and technical provisions of the Bill relating to housing and nonresidential construction. But even in the course of such discussion, for purposes of clarification and completeness, I will again discuss some of the larger issues, and I hope that this will not prove too repetitive of what I have said earlier in my testimony.

Provisions of the Bill directly affecting both housing and nonresidential construction

The current Bill makes no change in the presently allowed double declining balance method for depreciation of new housing, and this has created the impression in some quarters that the Bill does not affect investment in housing at all. Nothing could be farther from the facts. The current Bill contains a number of provisions that are directly injurious to both housing and nonresidential construction. These are listed briefly.

Used buildings (sec. 521).—For all used buildings acquired after July 24, 1969, the new owner would be required to use straight line depreciation instead of the presently allowable 150 percent declining balance method.

Recapture (sec. 521).—For all buildings sold after July 24, 1969, the excess of accelerated depreciation over straight-line depreciation as taken by the original owner, is to be taxed as ordinary income (to the extent of the gain occurring upon sale).

LTP and allocation of deductions (sec. 301, 302).—For individuals, the excess of actual depreciation claimed on all real property over the straight-line method is considered a tax preference. Under LTP, tax preferences must be included in gross income to the extent that they exceed 50 percent of economic income. Under the allocation of deductions rule (ADR), deductions are disallowed in the proportion allocable to untaxed preference items of economic income. This provision is especially onerous because it requires that excess depreciation be calculated property by property, and in each year.

Limitation on interest deductions (sec. 221).—Except where interest is incurred in consumption or in a trade or business, the current Bill limits individual interest deductions to investment income plus 25,000 dollars. Since rental of real property on a net lease basis is explicitly denied the treatment accorded a trade or business, owners of real property which they lease on a net basis would be denied interest deductions they can now obtain.

There are some who believe the limitation on interest deductions could be used to disallow interest on a construction loan. Others disagree, feeling that the construction of buildings is a trade or business, not an investment. Be that as it may, the uncertainties in this respect add another disincentive factor which might be serious.

Additional preference item proposed by the Treasury Department.—Treasury Assistant Secretary Cohen, in his statement before the Committee on September 4, proposed that a new tax preference item affecting real estate be included both in LTP and ADR. The new preference is the excess of interest, taxes, and rentals paid over receipts (if any) during construction.

Adverse effects of provisions affecting both housing and nonresidential construction

The issue of allowable types of depreciation is central to all provisions of the current bill affecting housing (and other real estate investment), except for the limitation on interest deductions. And even with this provision, as with the new tax preference items proposed by the Treasury, the tax issues are similar to those raised by the tax treatment of depreciation deductions.

The tax effect of accelerated depreciation is to postpone ordinary taxable income from the early years of a project's life, when depreciation deductions are higher than they would be otherwise, to the later years, when these deductions are lower. (Immediate deduction of interest and other expenses, in years when reported income from the investment project is not large enough to cover them, has a similar effect of postponing taxable income.) Postponing taxable income of course postpones taxes, so the effect of accelerated depreciation is an interest-free loan as against straight-line depreciation. Accelerated depreciation is thus more favorable than straight-line depreciation.

But this does not mean that accelerated depreciation is an inequitable tax concession, even in the narrow sense where equity depends solely upon having taxable income equal currently realized economic income. Equity in this narrow sense depends upon having allowable depreciation deductions equal the actual decline in the economic value of a property, and determining the actual decline is a very difficult question of fact.

Assuming for the moment (although I seriously challenge) that some of those who have studied the problem are right in their finding that the actual economic or value depreciation of office buildings, and even of some other real property, is less rapid than straight-line, the primary consequence of allowing accelerated depreciation (under this assumption or finding) is that the postponed ordinary taxable income can be taken at a later date as a capital gain, taxed at favorable rates, instead of as taxable future ordinary income. This is done by selling the property, at some later date, at a price which capitalizes the ordinary income expected to accrue after that date. The current Bill is apparently designed to correct this alleged inequity (in the narrow sense of equity) of the present tax laws. But if the finding is incorrect (which I think to be the case), if the decline in economic value actually does occur at the rate of accelerated depreciation, then the capitalized value of postponed ordinary income only offsets what would otherwise appear on an investor's tax return as a capital loss, and it does not in any way reflect the conversion of ordinary income to capital gains.

In any event, the assumptions and findings which I deem to be so highly questionable (and certainly not supported by adequate empirical testing), have no direct bearing upon the various provisions of the current Bill which affect housing. The most important of the provisions affecting housing are the elimination of accelerated depreciation for purchasers of used buildings, and the recapture provision (sec. 521). These provisions deny the housing investor most of the advantages of the double declining balance method for depreciating new buildings, even though those who have made the findings with which I disagree do not purport to show that accelerated depreciation is inequitably rapid for housing.

The effect of these two provisions on an investor in *new* housing is double-barrelled, because in two ways it makes the tax treatment of investment in new housing much less favorable than the tax treatment of other investments. First, any time this investor wants to sell his building, the price will be depressed because the buyer cannot take advantage of even 150 percent declining balance depreciation. Second, if the original investor does sell anyway, the Bill requires that any capital gains, up to the excess of accelerated over straight-line depreciation, be taxed as ordinary income. This means that only the postponement of ordinary taxable income, but never its conversion to capital gains, will be possible under the new law. This change might conceivably be desirable if it could be shown conclusively that accelerated depreciation as to housing and other real estate investment is always excessive, and that true economic income were being converted into capital gains. But to my knowledge there has been no such showing as to housing, nor do I believe that such showing can be made. Further, it is probable in many cases that the gain being "recaptured" was never ordinary income in the first place, but rather a wise speculation on the value of a particular capital asset.

I have stated earlier in my testimony that some tightening of the tax treatment of capital gains is desirable, and this conclusion might seem to contradict what I am saying here about recapture. However, it is important to note that the recapture provisions of the current Bill apply only to investments in housing and other real estate, not to capital gains generally. This is why I find these recapture provisions so unwarranted, at a time when housing and other real estate investment should be stimulated relative to other kinds of investment, not depressed.

The combined effect of recapture and of straight-line depreciation for all acquisitions of used buildings is to make investment in residential construction much less liquid that it is presently. Since housing generally has such a long life, any decrease in liquidity as apt to depress severely investment in housing, and this is patently undesirable. It is recognized that rapid turnover is a problem, and that present phasing out of recapture may be viewed by some as inadequate to prevent unduly rapid turnover. In that case, full recapture of excess depreciation could be extended to five years, with the recaptured percentage of the excess depreciation declining by one percent per month for 100 months thereafter.

Recapture and straight-line depreciation of used buildings are not the only provisions adverse to housing. The limitation on tax preferences (sec. 301), the allocation of deductions (sec. 302), and the limitation on interest deductions (sec. 221) also affect housing (and other real estate investment) adversely. LTP prevents investors in housing from taking the full benefit of accelerated deductions to the excess of accelerated depreciation over straight-line deprecia-
preferences the taxpayer may have) exceed 50 percent of economic income. ADR

requires that investors in housing (and other real estate) allocate some of their deductions to the excess of accelerated depreciation over straight-line depreciation, leaving lesser amounts to be deducted from income subject to taxation, and this too reduces the benefits that can be obtained from accelerated depreciation. Although these provisions would make investment in housing less attractive to most investors, I believe, as I have explained, that they are the proper way to prevent gross abuse of the tax stimuli favoring investment in housing. However, I do not agree with the Treasury that interest and taxes paid during construction of real property improvements should be included at this time as a tax preference. My reason is that the use of this practice has received much less scrutiny than the use of accelerated depreciation, and it is not clear at this time that treatment of these interest and tax costs as a preference item is justified. It should also be noted that the Treasury proposal discriminates against housing and other real property, in that other kinds of property are not subject to similar tax treatment.

Although I do favor LTP and ADR, as I have explained, I want to emphasize that their application to housing (and other real estate investment) will have an adverse effect. For this reason it is even more important that the other provisions of the Bill damaging to housing not be adopted.

Retroactive features of the bill, and some other technical problems

Before leaving the subject of housing, I should like to point out some retroactive features of the Bil in its current form, and also comment on one other technical problem.

(1) *The following sections of the Bill apply retroactively,* in that they deny certain tax concessions on commitments made before the Bill was reported. This occurs because the income or deduction accrues after the Bill is effective, and thus is covered by its terms.

(a) *Sec. 221, limitation on interest deduction.* The problem here is long-term net leases entered into before the Bill was reported. Interest deductions by the lessor may be limited, even though the investor has a long-term commitment. Also, the lessor is not making unreasonably high after-tax returns over the life of the project—the effect of tax concessions, at least in significant part, is passed on to the lessee in the form of lower rental prices than would otherwise obtain.

(b) *Sec. 301 and 302 LTP and allocation of deductions.* Accelerated depreciation of real property is a tax preference for purposes of LTP and allocation of deductions. Even where a transaction has been committed before the Bill was reported, the transactor loses some benefit from accelerated depreciation. The allocation of deductions is most serious, because it hurts all amounts of accelerated depreciation. The LTP only hurts if the taxpayer has excess depreciation amounts greater than his other income.

(c) *Sec. 521, recapture of accelerated depreciation.* Persons who invested in real estate before the Bill was reported may have done so only in expectation of converting some income to future capital gains, and they have offered lower rentals in anticipation of this tax advantage. The rental commitments continue, but the tax advantage is gone.

(2) *The allocation of deductions to untaxed excess depreciation would not operate fairly.* A taxpayer taking accelerated depreciation only postpones taxable income (and perhaps converts later to capital gains, but not as sec. 521 is now written). However, deductions disallowed are lost forever. Therefore, deductions disallowed on account of excess real estate depreciation should be added back to basis cost for purposes of later determining capital gain. (This treatment would correspond to the treatment of that part of excess depreciation which is itself disallowed under LTP).

Provisions of the bill directly affecting nonresidential construction, and their effects

In addition to all the provisions adversely affecting both housing and other real estate investment, there is one very important provision in the current Bill which applies only to nonresidential construction. This provision, in sec. 521, would limit the use of accelerated depreciation by the original owner of new nonresidential structures to the 150 percent declining balance method, instead of the presently allowed double declining balance method. The 150 percent method is substantially slower than the 200 percent (double declining balance) method, and it therefore reduces very substantially the incentives for investment in nonresidential construction.

The reason given for treating housing and nonresidential construction differently is that "Congress [has] expressed its desire to stimulate construction in low- and middle-income housing to eliminate the shortage in this area" (Ways and Means Report No. 91-413, Part 1, p. 166). However, as I have developed in detail earlier in my testimony, it is entirely unrealistic to posit that better housing in a better environment can be achieved by stimulating residential construction alone. Proper community development requires the blending and integration of housing, appurtenant community facilities, and commercial structures. Without the latter, developers may be unable to open up new areas for housing, because no one wants to live where there are no stores, amusements, or other attractions. This is especially true of low-income persons, because they are known to be much less mobile than persons with higher incomes (the two-car family can live where it pleases; the one-car and no-car family cannot).

Within the cities, it is especially desirable to encourage the development of commercial structures, because such building increase the tax base and provide the cities with sorely needed revenues. These revenues are obtained without placing additional tax burdens on urban residents, and they may thus help to stem or reverse the flow of middle-income families away from the cities, allowing a better mixture of income groups in all residential loci.

It should be clear, therefore, that there is no sound basis for limiting the tax advantages of the double declining balance method only to new housing, because proper and full development of the nation's housing requires a correlative stimulus for nonresidential construction.

The need for favorable tax treatment of new nonresidential construction can also be developed from a more general approach, comparing commercial construction with other sectors of the economy (commercial construction is the largest component of nonresidential, nonfarm buildings, and it is the one on which the Bill in its current form concentrates). As my earlier discussion indicates (see again *Charts 22 and 23*), investment in both housing and commercial structures has been growing much less rapidly than other forms of investment, although sound national economic and social policy requires that both of these sectors grow much more rapidly than they have been growing, and also more rapidly than GNP and other major components thereof.

The deficiency in the pace of housing investment is clearly much greater than in the pace of investment in commercial structures, but that is no reason for removing tax advantages from the latter. The present tax advantages for commercial construction are inadequate in terms of our national needs, and they should be strengthened rather than weakened. In this connection, it should be observed that the current Bill places as great an additional burden on investment in nonresidential real estate as it does on investment in producers' durables. The repeal of the investment tax credit, the only provision directly affecting investment in producer durables, is expected to yield 3.3 billion dollars in 1979, when fully effective (projections based on current volume of activity—see H.R. Report 91-413, Pt. 1, p. 16). This is only 5.6 percent of the 1968 investment in this category. In contrast, the reduction in accelerated depreciation on new nonresidential buildings alone is expected to yield 960 million dollars, or 5.1 percent of the 1968 investment in such buildings, and the other tax provisions affecting real estate will certainly increase substantially the tax effect on new construction in this field, although the Committee Report does not give revenue estimates in sufficient detail to determine these effects exactly.

The immediately preceding discourse implicitly assumes that there is merit in the proposition that commercial buildings (if not housing) depreciate (in an economic or value sense) less rapidly than straight line. For reasons already stated, this proposition has nowhere to my knowledge been vindicated, nor do I agree with it. A recent study by Taubman and Rasche,* made available to the U.S. Treasury, may well have attained some influence in directions contrary to those I recommend. My analysis of this study, showing its shortcomings, is attached as Appendix Two.

The foregoing indicates that the current tax treatment of all real estate investment, both housing and nonresidential, is desirable on the general grounds of public economic policy. However, the current Bill is directed more narrowly to the question of tax equity, and it is important that the tax equity arguments be faced

*P. Taubman and R. H. Rasche, "Economic and Tax Deprecation of Office Buildings" (University of Pennsylvania, Wharton School of Finance and Commerce, Department of Economics, Discusson Paper No. 111, January 1969).

on their own grounds, even though I feel that these grounds are not the best grounds for resolving the basic issues of our national needs for accelerated investment in these sectors.

Equitable considerations

It must be emphasized that tax concessions to the real estate industry do not "enrich" real estate investors generally, as shown on my earlier *Chart 27*. Thus, the current tax concessions available to real estate enable lower rents than would otherwise obtain, and stimulate construction, but they do not provide real estate investors generally with inordinate gains. *This indicates that the equity issue may be somewhat specious: investors in real estate generally are no better off after paying their (allegedly) reduced taxes than other investors paying (allegedly) higher taxes.*

The question of equity is thus transformed into a question of resource allocation—is it proper that real estate investments continue to receive the economic stimulus they now receive from current tax provisions? I feel that the materials I have incorporated in this testimony provide an affirmative answer to this question. This analysis is buttressed by the following additional considerations.

Additional considerations

The increasing burden of State and local property taxes weighs most heavily upon residential and commercial construction, and indeed upon the owners and renters of such properties, including average business people and, most importantly, families of low and lower-middle income. Federal tax concessions for real estate thus serve in part to redress the balance, not disturb it (and they are also a way for the Federal Government to ease the plight of the States and localities).

Second, as already discussed, high interest rates are more burdensome to housing and other aspects of real estate investment than to other industries, because these endeavors are much more dependent upon external financing (rather than retained earnings) and upon debt financing (see again Chart 27). These high interest rates, however, are not necessarily a true measure of either the scarcity or the value of capital for investment, but rather they are contrived by Government policy. It is therefore extremely appropriate that tax concessions to real estate be used to offset some of the distortions caused by artificially high interest rates.

Third, most other forms of investment will retain the advantages of shortened guideline lives and accelerated depreciation, and similar treatment of real estate is again a balancing force rather than a disturbing one.

Consideration of these three factors is an application of what is called the theory of second-best. As a general principle, subsidy for one industry leads to inefficient allocation of resources; but this principle applies only when there are no taxes or subsidies for any other industries. Viewed against the background of an established tax structure, containing many different types of taxes imposed by many different jurisdictions, the simple rule that subsidies cause inefficiency can no longer be applied (if it has any large validity in principle). Given the present tax structure, it seems clear that continued Federal income tax concessions for real estate are appropriate. Of course, major changes in other parts of the structure might be desirable, and it might then become desirable also to modify the tax treatment of housing and other aspects of real estsate investment, but that is not a controlling factor at this time.

Another broad class of reasons for applying only with caution the general rule that subsidies, including those in the form of tax concessions, are inefficient is the incidence of external economies and diseconomies. External factors exist which cause the private signals of market prices to register only partially and inaccurately the values of everyone in the economy. Where this happens, collective action to redirect market incentives is appropriate, and special concessions become necessary. The whole field of housing, urban development, and land use is a classic example of external effects, and there are many economists who argue that such concessions for real estate development are in fact necessary for economic efficiency, not inimical to it.

Finally, in a period of inflation, the Federal tax structure (and income taxes generally) imposes an especially heavy burden on investors holding assets with relatively long lives. The problem is the tax treatment of depreciation allowances, which supposedly enable a taxpayer, in determining his income, to deduct from his revenues the amounts that are only a recovery of his initial capital costs.

Taxation is based upon the principle that a dollar is a dollar, whenever it is received or paid, and the owner of property can only obtain depreciation allowances equal to his original dollar cost, even though some of the depreciation is taken many years after the cost was incurred. This means that, in a period of general inflation, the depreciation dollars deducted from revenue, which are supposed to constitute recovery of cost, are worth less (in purchasing power) than those used to construct or acquire the property. The result is that the taxpayer must pay income taxes on funds whose receipt is necessary just to maintain the value (in goods) of his investment (see Table 1).

The first column of the table shows what would happen in some arbitrary future year *t*, on the assumption that there is no change in the general price level. Revenues, costs and taxes are listed, and in this hypothetical example there is a cash flow (depreciation plus income after tax) equal to 15 percent of the assumed value of the property in that year. This cash flow represents both the recovery of the investor's cost and his income from the investment.

TABLE 1.—EFFECT OF INFLATION ON INCOME AND TAXATION OF OWNERS OF DEPRECIABLE PROPERTY

Year zero:			
Price index	100		
Initial cost of property	$500,000		
Year t:			
Assumed price level	100	200	200
Revenues	$180,000	$360,000	
Operating and maintenance cost	120,000	240,000	
Gross return to capital	60,000	120,000	$120,000
Depreciation allowed	30,000	30,000	60,000
Taxable income	30,000	90,000	60,000
Income tax	15,000	45,000	30,000
Income after tax	15,000	45,000	30,000
Cash flow after tax	45,000	75,000	90,000
Current value of property	300,000	600,000	600,000
Cash flow as percentage of current value	15.0	12.5	15.0

Note: All data are artificially constructed for this example.

The second column of the table shows what would happen on the assumption that the price level in year *t* were double that in year zero, owing to inflation during the intervening period. Revenues, current costs, and the current value of the property are double what they would be with the price index at 100. Allowable depreciation, however, is not doubled, so that taxable income and thus income taxes are more than doubled (in this example, income tax is tripled). The result is that cash flow is less than doubled, and cash flow is therefore a smaller percentage of the property's value than it would be in the absence of inflation.

The third column shows how a doubling of the depreciation allowance (in proportion to the amount of inflation) would exactly compensate for the effect of inflation, reducing income taxes to twice the amount that would be collected in the absence of inflation, and thus restoring cash flow to the same percentage of current value as would be obtained if no inflation had occurred.

I do not contend that depreciation, for tax purposes, be calculated on a basis other than recovery in current dollars of initial cost—any change would make administration of the tax laws very much more difficult. However, it should be observed that office buildings have longer lives than most other assets, so the effects described here have a greater impact on them than on, say, investment in producer durables. For this reason one should perhaps make other adjustments in the handling of depreciation for long-lived assets, *and shorter guideline lives plus accelerated depreciation seem appropriate.*

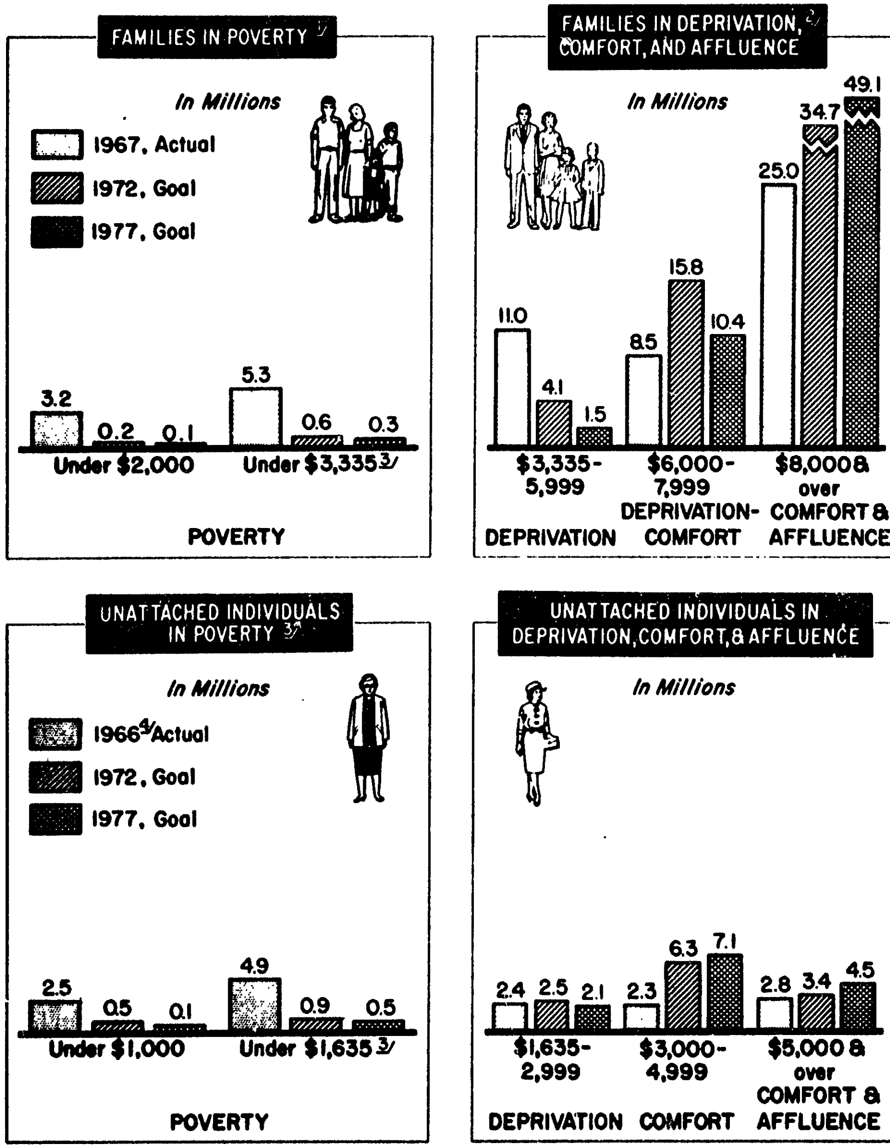
NUMBER IN U.S. LIVING IN POVERTY, DEPRIVATION, COMFORT, AND AFFLUENCE, 1967, AND GOALS FOR 1972 AND 1977

Annual Money Incomes, Before Taxes, in 1967 Dollars



1/ Poverty-income ceilings vary by size of family. The figure of $3,335 applies to a family of four, according to the estimates of the Social Security Administration, Dept. of H.E.W. The average si[illegible] of families in poverty being four, 5.27 million families involve about 21.1 million people.

2/ The average size of families living in deprivation is about 3.0, coming to about 33 million people.

3/ The poverty-income ceiling of $1,635 accords with the estimates of the Social Security Administration, Dept. of H.E.W.

4/ 1967 not available. All projections, however, in 1967 dollars.

Basic Data: 1966, 1967: Social Security Administration, Dept. of H.E.W.; Bureau of the Census, Dept. of Commerce.

APPENDIX 2

THE TAUBMAN-RASCHE STUDY

Taubman and Rasche define economic depreciation as the decline in the market value of the property. They then measure depreciation from a cross section of buildings, and their analysis therefore excludes the effect of changes in the general price level: for data from any one calendar year, general inflation affects equally the rentals and expenses for buildings of all ages. Since the present discounted value (PDV) profile is calculated from this cross section, its shape (but not its height) is unaffected by the general price level. (Of course, the successive PDV profiles calculated from data of different years will be different in height because of inflation.)

The failure of Taubman and Rasche to consider the effect of inflation is the first major defect in their study. As I explained in the body of my testimony, the Federal tax system causes inflation to have its most adverse effect on investments with relatively long lives, such as housing and nonresidential construction. Since the Taubman-Rasche study makes no allowance for this important effect of the Federal tax system, the study is at best of severely limited usefulness in guiding tax policy.

A second objection to the Taubman-Rasche study is that PDV is calculated according to a theoretical formula, and there is no reference to the actual movements of prices for used buildings of different ages. This formula makes no allowance for risk or uncertainty, and it is not clear how the formula values relate to the actual prices of used office buildings.

On a highly technical level, there are a number of very disturbing elements in the Taubman-Rasche study. A general observation is that the authors do not present an accurate or complete description of their technique, and it is thus very difficult to offer constructive criticism—all one can do is pose queries. Part of the problem is that I have been unable to obtain access to the authors' data in the time available, but I do feel that the authors would have added to the understanding of their study if they had made available a better description of their data base. Nonetheless, these points are in order.

(1) How does the sample of buildings change? Obviously newly built buildings are added, but are existing buildings ever removed, except when they are demolished?

(2) By looking only at existing buildings to calculate average rental rates, the authors introduce a bias. Those buildings whose rentals decline fastest should tend to be removed earliest, so that the cases where depreciation has been most rapid are not included in the sample. (Imagine taking a lifetime earnings profile by looking at a cross section of earnings by age, including only persons actually working. The effects of retirements and of age discrimination in employment would be suppressed.)

(3) The PDV profile depends very much on the shape of the rental curve given by the formula

$$R^*_j = a + b\,(\text{age } j)^3$$

However, the authors do not tell the statistical properties of the regression fit obtained from this equation, nor do they say whether they tried any other formulas, or what kind of fit other formulas might have given.

(4) The calculation of average age within groups introduces both uncertainty and bias. The uncertainty intrudes because the population of buildings from which age is calculated is not the same as the sample (which includes only *some* office buildings). The bias occurs because the authors assume, in calculating average age, that buildings are removed only exactly at the end of 10, 25, or 40 years, or after 60 years. In fact, the percentage of buildings still standing should decline gradually with age, and younger buildings cohorts in each age group should receive greater weight than older ones. Use of a flat amount of involuntary removal within each group biases the average age upward, and this understates the decline in average rentals with age. The result is to understate the rate of depreciation.

(5) To calculate removal date, the authors require estimates of land values (per square foot *of office space*). Whence these estimates (and what is their quality)?

(6) The authors neglect the effect of increases in building size, which causes (*ceteris paribus*) land cost per square foot of newly built office space to decrease over time. However, this effect is not present for an existing structure, whose size is fixed until the building is replaced. Failure to take account of this difference introduces an upward bias in the calculation of office building lives.

(7) The data are troublesome, especially when the rental rates for 0 to 10-year-old buildings are less than for 11 to 25-year-old buildings (1956 and 1957, in Table 3a). The authors explain that these years coincide with peak building construction and depressed rental rates for new buildings. However, this explanation is inadequate. The break in the time series is for the 11 to 25-year-old buildings (which rose in price), not for the new ones; and the operating costs (Table 3b) for the 11 to 25-year-olds also jumped in the same two years, leaving gross margins roughly constant. This suggests something else, like first appearance of 1945–1947 buildings in this group, plus shift of the 1930–1932 buildings to the next age group. If such shifts are so important, then perhaps the use of fixed age groups, with buildings moving through the groups, is questionable.

These seven points should indicate the basis of my grave doubts about the quality of the empirical work in the Taubman-Rasche study. This is especially so because all of the biases identified lead Taubuan and Rasche to find longer lifetimes and less rapid depreciation than is actually present. These biases, plus the two general objections stated at the beginning of this appendix, are my reasons for not accepting the analysis of Taubman and Rasche as controlling in the present situation.

The CHAIRMAN. Mr. Robert Pease who is vice president, Mortgage Bankers Association of America, accompanied by Oliver H. Jones, executive vice president, and Graham T. Northup, director, Government Relations.

STATEMENT OF ROBERT PEASE, VICE PRESIDENT, MORTGAGE BANKERS ASSOCIATION OF AMERICA; ACCOMPANIED BY H. CECIL KILPATRICK, TAX COUNSEL; AND GRAHAM T. NORTHUP, DIRECTOR, GOVERNMENT RELATIONS

Mr. PEASE. Thank you, Mr. Chairman.

My name is Robert H. Pease. I am senior vice president of the Draper and Kramer Mortgage & Real Estate firm in Chicago, and vice president of the Mortgage Bankers Association of America. With me is Mr. Cecil Kilpatrick, our tax counsel, and Mr. Graham Northup, director of Government Relations.

We have filed a statement with the committee, and I would like to give you these additional observations.

The CHAIRMAN. Yes, sir; we have that statement here.

Mr. PEASE. We would like particularly, Senators, to talk to you not just from the standpoint of the mortgage bankers——

The CHAIRMAN. Your statement commences at page 197 of our committee print.

Mr. PEASE. Right.

We would like to talk to you not only from the standpoint of the mortgage banking business but particularly from the standpoint of how this tax bill will affect the housing program that the Federal Government is so urgently trying to foster. The experiences which I am giving you are the result of 35 years in the real estate and mortgage business.

Our firm has probably done more 221(d)(3), more low- and middle-income housing, over 4,000 units, probably well over $100 million, maybe more than any other firm in the country, so that I think the following observations are relevant to the program.

Statement No. 1: The idea that this tax reform bill will help the residential housing program, particularly low and middle income, I think, is absolutely and totally inaccurate. I think it is false. The bill says that new housing can keep its 200-percent depreciation. Then it immediately nullifies this entire provision and, I think, rules out any inventory participation by (*a*) recapturing all depreciation in excess of straight-line as ordinary income; (*b*), making the secondary owner of rental housing use straight-line depreciation the minute he buys this investment. This recapture method, I think, will totally force out the investor, and I am sure that it will ruin the resale market for rental housing. I think that it will ruin the entire housing program.

I would suggest that actually it will probably destroy the housing program. Investors are paying 9½ percent for mortgage money. They are paying 14 percent for construction loans. Labor is rising almost every month. Materials are going up every month.

Now, under these road blocks I don't believe the investors can or will participate in a housing program with the depreciation set up under H.R. 13270.

What do we suggest you do? What do we recommend? Our suggestion is totally unattractive to the speculator, certainly unacceptable to a tax dodger. We think it is fair to an investor and we think it is fair to the Government.

First, permit total recapture of excess depreciation during the first 5 years.

Second, after 5 years allow a reduction of percentage of gain taxed as ordinary income at the rate of 1 percent a month.

Now to sum it all up, this means that an investor would have to hold a piece of property 13 years and 4 months before he could get full capital gains treatment.

I am sure that this is unsatisfactory to any in-an-out operator or to any speculator. We think it will keep the private investor in the housing program.

Statement No. 2. There is another very difficult and extremely important faulty section in this bill. I think that it threatens the entire real estate market. That is the section which will force every buyer of used real estate, after July of this year, to use straightline depreciation. It eliminates 150 percent, and he must use only straightline. I think this will ruin your income property real estate market. I think every owner of real estate today will be forced into a severe loss position when he tries to sell his property because the new buyer must buy only under a straightline depreciation method.

Months ago we started talking about 154 millionaires and somehow or other we wound up writing a tax bill which, I think, is going to have a severe loss on the entire real estate holdings of millions and millions of people in this country. I don't think that is your intention, but it is in the bill.

Statement No. 3. There is nothing very complicated about taking care of the tax shelter abuses. It is done through the limited tax preference, presently in the bill. We endorse it. In fact, we testified before the House Ways and Means Committee earlier this year and endorsed the theory and the practice of limited tax preference.

Now somehow the concept has become current that millionaires are the bulk of the real estate owners in this country. Nothing could be further from the truth. The bulk of real estate owners are janitors, doctors, businessmen, retired investors, teachers, the whole investing public of this country.

If a thief ran down the street I don't think you would shoot him if a hundred people were on the street. Well, you are shooting at the millionaire and you are hitting the millions and millions of real estate investors in this country.

I don't believe that the purpose of this bill is to injure these people that are the present owners of real estate, but I assure you that is exactly what will happen.

We would urge you to leave existing real estate at 150 percent, stretch out your recapture to 13 years and 4 months and then you keep the investor in the program. Leave limited tax preference in, and you knock out the tax abuses. It gives the long-term investor a reasonable incentive to stay in the housing program.

I think that the bulk of the American investing public will be protected if you will leave 150 percent for used real estate, and gentlemen, that is absolutely essential to the housing program because no investor is going to go into a program when his resale market is totally and completely eliminated.

Again I am talking to you from 35 years experience in the business. We are dealing and have dealt for the past 12 years with investors that are going into housing programs, have gone into housing programs, and I think we understand to some degree what motivates them, what has motivated them. I assure you that every housing goal that Congress has set will be totally ruined by the effects of H.R. 13270. Client after client has said to us, in effect, "Why is Washington trying to ruin the real estate market? Why are they so hard on real estate in this tax bill?" I don't think that is the purpose. I think the purpose is to plug some very wide loopholes that have existed in our tax program. This you have done. Now the bill should be amended to give reasonable protection to the long-term housing investor.

I want to close the way I began. Our housing goals are deeply embedded in national policy that we should not and we cannot endanger them. Yet, H.R. 13270 does exactly that. We urge you to change the recapture provision to a 13 years and 4 months provision. We urge you to leave existing real estate at 150 percent. We endorse the principle of limited tax preference.

We think that H.R. 13270 can be a great instrument for tax reform and a great piece of legislation. I would urge you to make these amendments.

There are many other features of the bill about which we would like to have commented. We did not want to take your time. I would hope that you would read the testimony that we have filed. But, again, gentlemen, the housing program of this country is too important and too essential to be endangered by this bill. We urge its amendment.

Senators, thank you.

The CHAIRMAN. Thank you very much, sir.

Senator MILLER. May I ask one question, sir? It is a splendid statement. I have one question on a point you didn't cover. You recommend the LTP approach on capital gains, I am sure, but you didn't mention anything about the allocation of deductions, which, as you know, is one item in this bill that is advocated very strongly by the Treasury in support of the House treatment. What is your position on the allocation of deductions approach.

Mr. PEASE. Cecil, would you care to comment on that?

Mr. KILPATRICK. I am sorry, I am not familiar enough with that particular provision of the bill.

Senator MILLER. Would you care to supply a position on that for the record?

Mr. PEASE. We certainly will.

Mr. KILPATRICK. You have in mind particularly the depreciation?

Senator MILLER. No; I have in mind, I don't believe your statement covered the allocation of deductions provision of the bill and I am wondering what your position is on it.

The CHAIRMAN. I would say after your tax counsel explains to you how the allocation of deductions proposal will work you can comment on it.

Mr. PEASE. We will give you a statement on that, Senator.

The CHAIRMAN. Fine.

(Robert H. Pease's prepared statement follows:)

The statement referred to had not been received at the time of printing.

STATEMENT OF ROBERT H. PEASE, VICE PRESIDENT, MORTGAGE BANKERS ASSOCIATION OF AMERICA

SUMMARY

1. The combined impact of the tax reform proposals contained in H.R. 13270 and the Treasury Department recommendations will strike a devastating blow at our construction industry by:

a. Making less mortgage money available and

b. Making equity investment in real estate unattractive.

2. Less mortgage money will be available because:

a. The bill in inflationary. Inflation makes long-term, fixed-dollar obligations unattractive except at prohibitively high interest rates.

b. The incentives to thrift institutions to invest in mortgages are reduced.

c. No tax is levied on the Federal Land Banks. The privately owned Federal Land Banks remain tax exempt driving taxpaying lenders from the agricultural loan market. This tax exemption is grossly inequitable and a disservice to farmers and ranchers.

3. Less equity money will be available for real estate projects because H.R. 13270 contains the following provisions which would reduce the ability to obtain a competitive profit:

a. The use of accelerated depreciation is restricted.

b. Available remaining excess depreciation is subjected to the Limited Tax Preference.

c. All excess depreciation allowed would be taxed at ordinary income rates at time of sale.

d. Capital gains rates would be increased.

e. Hobby loss limitations are reduced and extended to apply to any enterprise with a presumption that, regardless of the nature of the enterprise, there is no expectation of realizing a profit where such losses occur in three of a five-year period.

f. Deductions for interest on funds borrowed for a newly defined category of investment income, including rent under a net lease, would be limited.

4. In all, eight provisions of the bill, and one omission, are deterrents to realization of the urban and rural development goals the nation established in 1968.

5. Additionally, the provisions of Sec. 221 could impose a heavy tax—which was totally unforseen—on mortgage banking firms which already pay full corporate rates.

STATEMENT

Mr. Chairman, my name is Robert H. Pease. I am Senior Vice President of the Mortgage banking firm of Draper and Kramer in Chicago, Illinois and Vice President of the Mortgage Bankers Association of America. With me this morning are Mr. Graham Northup, Director of Governmental Relations for the Mortgage Bankers Association and Mr. H. Cecil Kilpatrick, the Association's tax counsel. We appreciate this opportunity to appear before this Committee to express our views on H.R. 13270 and other proposed tax reforms. To understand our interest in this legislation, it may be well for me to speak a moment explaining who our Association represents and what our members do.

The Mortgage Bankers Association of America (MBA), now in its fifty-fifth year, consists of more than two thousand members dedicated to the originating, marketing, servicing, and holding of real estate mortgage loan investments. These mainly include:

Mortgage bankers who engage directly in the origination, financing, selling, and servicing of real estate mortgage loans for others;

Investing institutions that acquire mortgage loans from mortgage bankers, including life insurance companies, commercial banks, mutual savings banks, savings and loan associations, fire and casualty insurance companies, investment funds, pension funds, and similar institutions.

At the end of 1968, mortgage company members of the Association were servicing approximately $69 billion of mortgages. Of this, $52 billion consisted of mortgages on single-family properties, somewhat more than 20 percent of all outstanding home mortgage debt.

As originators of home mortgage loans, mortgage bankers have been major supporters of the Federal government's mortgage programs. However, mortgage bankers' interests extend into all fields of mortgage finance: residential, commercial, industrial, agricultural, and institutional. In recent years, mortgage banker members of the Association have accounted for nearly one-fourth of the net increase in the outstanding dollar amount of mortgages on apartments and other types of income-producing property.

As real estate investors we have perhaps been closer to, and therefore more concerned with, urban problems than have many others. We have lived with the developing problems, seen them grow, and seen them culminate in riots and disorders. We know only too well the vital role an adequate supply of mortgage funds can play in alleviating urban pressures and redeveloping our urban and rural areas. Through the years, Congress has sought to assure funds through direct grants as well as through a proliferation of other measures most of which failed because the magnitude of the demand exceeded available Federal resources. During 1967 and 1968 the Senate Banking and Currency Committee and a series of Presidential Commissions engaged in comprehensive reviews of previous programs. In the housing bill of 1968, new goals were established and new directions ordered for our urban development efforts. Reliance on Federal resources was minimized. The new programs sought to tap the wealth of our private sector by encouraging its maximum participation in urban investments. Because this legislation contemplated maximum results with a minimum cost to the Federal government, it was wholeheartedly welcomed by the Congress and the nation. Hope was rekindled in millions that we might now move ahead in our urban efforts unhampered by the limitations of Federal appropriations and red tape but encouraged by Federal guidance and Federal tax incentives. H.R. 13270, if enacted in its present form, will dash those hopes.

H.R. 13270 would reduce the availability of mortgage money

We are concerned about the impact of H.R. 13270 on the overall availability of mortgage funds and the possible distortions that its enactment could have on the use of those funds which are available. Thus, our concern is two-fold. The proposed tax reforms may unnecessarily discourage the flow of funds for mortgages and encourage the use of these funds in other fields. They may also distort the employment of the mortgage funds remaining by over-encouraging some forms of real estate improvements, such as residential, to the detriment of well-balanced development including necessary commercial.

H.R. 13270 is inflationary

Because as early as 1965 we recognized the threat which inflation posed to an adequate continuing flow of mortgage funds, the Mortgage Bankers Association since 1965 has urged fiscal and monetary policies to restrain inflation. We continue firm in our belief that *unless inflation is controlled, there is no hope for an adequate supply of funds or any retreat from the record high interest rates which now prevail.* If we can depend upon the Treasury's projections which have been made for H.R. 13270, we must conclude that its thrust is inflationary. The responsibility rests with the Congress to strike the appropriate balance between the proposed reduction of incentives for industrial investments and the proposed reductions in individual income tax, but we urge the Committee's careful reconsideration of the revenue projections and the proposed tax reductions to the end that the risk of further inflation will be eliminated.

We have attached for inclusion in the record the September issue of *The Capital Goods Review* of the Machinery and Allied Products Institute entitled "Effects of Inflation on Lenders and Borrowers." This article points out most dramatically the effects of taxes and inflation on the returns that are realized on fixed long-term obligations. For example, it notes that the true economic return to a lender in the 20% tax bracket on a loan made at 8% during a period when the rate of inflation equals 5% would only be 1.33%. Put another way, it shows that under the same circumstances if the lender wished to realize a true 5% return on a loan, it would be necessary to charge the borrower 12.81% of interest. Such rates on mortgages would be illegal in many states and offend the public conscience anywhere. It is obvious why mortgages are unattractive investments in periods of inflation.

Though it may be trite to say so, inflation is the cruelest tax of all. It is no service to the voter to hand him a tax reduction in one hand and take it back in inflation. If inflation is allowed to continue, mortgage funds will continue in short supply and then only at a high cost.

Incentives for thrift institutions to invest in mortgages are reduced

Proposed tax revisions can also affect the flow of mortgage funds if they remove incentives for financial institutions to invest in mortgages. Various proposals have been offered for changes in the tax treatment of mutual savings banks, savings and loan associations and, commercial banks. Sections 441 and 442 of H.R. 13270 modify the existing provisions regarding deductions for additions to reserves and requirements respecting the percentages of assets which must be invested in residential mortgages to be eligible for such deductions. The Treasury has suggested, instead, an across the board deduction of 5% of gross interest income derived from mortgages for all banking institutions, subject to certain limitations. Mortgage Bankers pay regular corporate tax rates and are not directly affected by these proposals. However, the testimony of the affected institutions,* to whom we customarily sell mortgages, discloses that *either proposal will have an adverse effect on the flow of mortgage funds at a most critical time.*

The official housing goals for the next decade are well known. Less well publicized are the various studies that have been made on the outlook for mortgage funds during the next decade. These studies, made prior to any suggestions for reduced tax incentives for mortgage investment, range in their conclusions from predictions of tightness to emphatic warnings of critical shortages. None of these studies projects a surplus of credit.

Therefore, we urged the committee to give the most serious and careful study to these proposals. Commercial banks and mutual thrift institutions were created for different purposes and continue to carry out basically different roles in our economy. It is not as important to achieve tax equality between them as to assure their continued ability, and desire, to carry out their historic functions. Reducing the incentives to invest in mortgages for institutions which have traditionally been primary sources of mortgage funds is not desirable at this time.

No tax is levied on the privately owned federal land banks

In this regard the Mortgage Bankers Association urges that you enact legislation to subject the Federal Land Banks to a fair tax. Few realize that these institutions were granted complete exemption from all taxation when created in 1916 and continue to enjoy this tax-free status despite the fact that they have been wholly privately owned since 1954—and that they compete directly, forcefully, and effectively with private taxpaying lenders. Allowing the Federal Land Banks to continue wholly free from Federal, State, and local taxes is a glaring example of legislative oversight which sorely needs correction if we truly seek equity in taxation. A study of this question is attached with the request it be included for the record. We also attach a copy of H.R. 9242 as suggested legislative language to end this unfair tax exemption.

Basically we are concerned that *H.R. 13270 will constrict the availability of mortgage funds* because it is inflationary, because it makes mortgages less attractive as an investment for financial institutions and because, by failing to impose a fair tax on the Federal Land Banks, it drives other lenders from the Agricultural loan field.

Less equity capital will be available for real estate

The bill will also have a serious impact on our efforts to stimulate equity investment in real estate. The existing provisions of law regarding real estate depreciation and capital gains have proved to be effective incentives for equity investment in all forms of real estate development. At this point we think it matters very little that they may not have originally been enacted for this purpose. We have all heard of the tremendous tasks facing us if we are to create a suitable living environment in our nation. Creating such an environment is not solely a question of building housing—and certainly not solely a matter of low- and moderate-income housing. There must also be factories, warehouses,

*National Association of Mutual Savings Banks, September 15, 1969. National League of Insured Savings Assocations, September 15, 1969. United States Savings and Loan League, September 15, 1969. Council of Mutual Savings Institutions, September 15, 1969. All before Senate Committee on Finance during hearings on H.R. 13270.

stores, churches, schools, gas stations, highways, sewer and water systems and all of the other improvements and services which go to make up the living environment. This will require tremendous investments of savings, and unless those investments can be generated from the private sector, the burden will fall increasingly on government. Despite any impressions to the contrary, real estate ventures involve a high element of risk. Many go broke. Very clearly, private capital will be drawn into investments which provide the largest after tax profits. Existing tax incentives are essential to continue to draw private capital into housing and commercial properties.

How, you may ask, would a project sponsor obtain what he considers an adequate profit in the absence of tax incentives? The only answer we know is that he would have to increase the direct return from the project by increased charges to the occupant or occupants. But look at what has happened, for instance, in the urban apartment market. Land costs have sky-rocketed. Materials, labor, mortgage money and all the other components of construction have climbed sharply. The result is that even with the present tax incentives, it is virtually impossible to construct new apartments that low income families can afford. In many of the higher cost areas you cannot build for the middle income people—which means people earning up to $10,000.

Let me give you an example. About four years ago our firm built an apartment building with monthly rents that averaged approximately $53 per room. We owned some additional land adjoining this project and we recently considered building another building adjacent to the existing apartment project. As we already owned the land, the increase in land value did not really affect our decision. We figured current construction costs of the new building, ascertained our new interest cost and gave up the project. We would have had to rent the new building for $75 per room. We felt this was too risky. Even with accelerated depreciation, we were unwilling to build the apartment.

If existing tax incentives were removed, it would be necessary to increase rents even further, which would inevitably result in construction being undertaken only for the most affluent. Lacking a demand from affluent tenants, no construction would be done and available capital would flow to other fields.

Income properties erected for business occupancy contain an even higher element of risk. Particularly is this true of those designed to serve the small businessman. Neighborhood merchants, the "mama and papa" stores, throughout the nation have long protested that urban renewal is putting them out of business because they cannot afford the rents in the new space made available after old stores are torn down. Without tax incentives their rents would be even higher.

H.R. 13270 would allow accelerated depreciation only for new residential structures. Under this condition equity capital for business structures would be non-existent, except of course for the larger more credit-worthy corporation.

We do not concur with the administration position, as expressed by Assistant Secretary Cohen in his appearance before you on September 4th (Sec. 25), that the proposed changes in real estate depreciation and capital gains are either appropriate or are consistent with the achievement of our housing goals; nor are we "Concerned with the continued heavy reliance upon tax incentives" as a means of achieving those goals. May we remind this Committee that for several years the housing and home finance industries, the Department of Housing and Urban Development, and the Congress itself have concerned themselves with questions about tax incentives to further stimulate urban development. Any number of bills are introduced each year proposing new incentives. In 1967 the Senate Banking and Currency Committee asked us informally for suggestions for any needed new incentives. Other Senate committees have held hearings on bills for this purpose, specifically those introduced by the late Senator Robert Kennedy. After much study, it was concluded that existing incentives would suffice if a broader range of investors were encouraged to use them. Consequently, Congress passed a bill last year authorizing the creation of a National Corporation for Housing Partnerships to spread the word and attract new investors. Notwithstanding the Treasury's concern, the Congress has acted—it wants these tax incentives utilized.

Limited tax preference

Why then do we now sek to eliminate most tax incentives and reduce the others? The answer is, very simply, because a smokescreen of 154 wealthy non-taxpaying citizens has been thrown up to cloud the voters' view of this picture. Surely, these wealthy people should pay a fair share of taxes. The Limited Tax Preference, which we strongly support, would assure that they would.

Limited Tax Preference as originally proposed—that is, including income other than that sheltered by depreciation—should be enacted. To do so would be fair and equitable. These 154 people represent only one percent of the taxpayers in the $200,000 and over tax bracket, and we should not eliminate badly needed tax incentives in a hasty effort to respond to public indignation about them.

The Administration urges enactment of some of these proposed reforms in order to maintain the level of Federal revenue for some future unspecified plan of Federal Revenue Sharing. We submit that the present incentives are an effective means of accomplishing that objective. For example, assume we create a property valued at $1,250,000. Further assume the land is worth $250,000 so the depreciable improvements are valued at $1,000,000. Using the double declining balance method, first year depreciation would be $40,000. This means the U.S. Treasury would lose $20,000 of revenue that it might have received if depreciation is limited to straight line. We say "might have received" because it is our experience that many of these projects would not be built without the present tax incentives. Tax authorities tell us that local real estate taxes average 2% of value, which means this project would generate $25,000 of income for the local community the first year. Further, the Federal revenue loss would diminish each year while the local revenue would probably increase, or at worst remain stable. In other words, the *Federal tax incentives for real estate investment directly benefit local communities in an amount which exceeds the Federal revenue loss*. This revenue sharing plan is in operation now.

Let me cite a few examples of how this has worked in my home town of Chicago.

Ten years ago, the area from the 31st to 28th Street and South Parkway in Chicago was one of the worst sections of the city. Few if any taxes were being paid. Most of the buildings were in virtual shambles. It was one of the worst slums in the city. Today this area is one of the fine residential sections of the city with a waiting list for apartments in each of the five multi-story buildings that were built there. This is the site of a project know as Prairie Shores. There are 1700 apartments; the occupancy is 80 percent white, 20 percent non-white and we have not had a vacancy for as long as I can remember. When this project was built, the risks connected with it were very great, and it was extremely difficult to induce people to put equity into the deal. I can asure you that one brick would never have been laid on another without accelerated depreciation.

The benefits to the city of Chicago from this project are almost incalculable. Michael Reese Hospital, which is one the city's finest institutions, was considering moving; they have stayed. Virtually no real estate taxes were being paid on the property. In the last 10 years, regular tax bills have been paid. The entire area has been completely transformed into a community with new housing and new values.

Just a few blocks south of Prairie Shores is the development known as South Commons. It is located in and around 29th Street and Michigan Avenue. It is composed of low-and moderate-income housing projects insured under sections 220 and 221(d)(3) of the National Housing Act. The total investment in this project will be approximatey $20 million. Parts of it have already been built, and construction is proceeding on the balance. I talked with the firm of Baird and Warner, which is the managing partner for the group that runs this development. They said that it would never have been built without accelerated depreciation nor would it have been built without Prairie Shores which was in turn built because of accelerated depreciation.

Sandburg Village is a relocation housing project built under Section 220 of the National Housing Act containing approximately 2600 apartments at North Avenue and LaSalle Street in an urban renewal area of Chicago. This project was developed by Dovenmuehle, Inc. I talked to Mr. Buenger, the President, and he told me that without accelerated depreciation this project would never have been started nor the subsequent addition made. Again, this type of development has changed the entire community. It has brought real estate taxes to the municipality both from the specific project and from the other improvements that have been made because of the change in the neighborhood.

We are most anxious to impress upon you the fact that benefits of accelerated depreciation are very large both to a community and to the general real estate market. These benefits are difficult to measure in dollars, but they are sizeable. I have cited to you three specific examples of areas in Chicago which benefited from real estate development made possible because of accelerated depreciation. The changes brought about by the investment in these projects have completely reversed the real estate market that existed in these areas. Equally important, they have completely reversed the real estate tax base, which was almost totally zero, and have made these areas major real estate taxpayers. The building of these projects has brought other investments into the community, and these in turn have further added their benefits to the areas. We strongly urge you to think of accelerated depreciation as a vehicle for the upgrading of our communities, the building of billions of dollars of new real estate improvements, and the creation of values in our country which are indispensable both for housing people and for buttressing our economy.

Capital gains

It is important to understand that accelerated depreciation and capital gains treatment must be viewed as one when discussing incentives for real estate investment. Allowing excess depreciation but recapturing all excess depreciation at ordinary income tax levels at time of sale merely delays the tax. *The incentive is not in delaying the tax but in increasing the likelihood of return of the investment.* If the investment is to be meaningful, there must be an opportunity to retain the gain. Under Section 521 of H.R. 13270 the present recapture formula (Sec. 1250) would be eliminated. We urge this not be done. We do, however, concur that a modification providing for full recapture of the excess in the event of a sale during the first five years with 1% allowed for each month the property is held thereafter would be acceptable. This would permit the investor who holds a property 13 years and 4 months before selling to pay only the capital gains rate on the amount received over the depreciation value.

Surely, if Limited Tax Preference is enacted and the capital gains recapture formula recast in this fashion, accelerated real estate depreciation can no longer be abused to escape the payment of income tax. Additionally, H.R. 13270 proposes an increase in the capital gains rate.

Section 213 hobby losses

Section 213 of H.R. 13270 broadens the so called "Hobby Loss" provisions by deleting the reference to "individuals" and substituting "taxpayers." Thus, it seems that Section 270 would henceforth apply to corporations. Furthermore, Section 270 has been broadened in its application so that it would now appear to include real estate transactions. While this may never have been intended, it could have serious repercussions in the real estate field, and we urge that it be amended so that it will not apply.

Under a number of the Federal Housing Administration's multi-family housing programs, maximum loans can be as high as $12,500,000. Obviously multimillion dollar projects are a long time in the construction period, two years is not unusual, and it ordinarily takes from 12 to 24 additional months to reach a break-even occupancy level. In other words, there can be three or four years of heavy losses in every large project even though no excess depreciation is used. If Section 213 of H.R. 13270 is enacted, it would mean that every project sponsor would face the task of negotiating with the Internal Revenue Service to overcome the presumption that there had been no expectation of realizing a profit. To create such an impediment to investment is totally unreasonable.

Section 221

Section 221 of H.R. 13270 would limit interest deductions for funds borrowed for investment purposes. It would also broaden the present definition of investment income to include certain forms of rental income.

This represents still another deterrent to investment in real estate and would be particularly harmful to those forms of real estate such as shopping centers customarily occupied on a net lease arrangement. In its present form we consider this Section vague and ambiguous. Assistant Secretary Cohen has stated in his testimony that it fails to correct the problem to which it was addressed and has recommended against its enactment. We concur in his view, for this provision would cause serious disruptions for mortgage bankers on two counts.

Mortgage lenders selling loans to the Federal National Mortgage Association (FNMA) are required to purchase FNMA stock in a specified amount for each loan delivered. In order to retain the servicing on these loans (for which a servicing fee is paid) the seller is prohibited from selling this stock. The stock is therefore effectively restricted. Mortgage bankers sell large quantities of home loans to FNMA. So much in fact, that many find a very high percentage of their capital and surplus tied up in this stock and, to obtain working capital, have had to borrow funds pledging the stock as security. It is clear enough to us that such borrowings are for business purposes—for our business is making and servicing loans—but we find the language of H.R. 13270 far from clear in its definition of the difference between "investment" and "business" purposes. At least one recent court decision (Leslie, et al. v. Commissioner, CCA-2, 69-2 USTC P 9540) further clouds the distinction. Should Section 221 be enacted, it seems clear that our presently allowable interest deductions would be challenged—and very likely denied. We foresee years of litigation before a clear decision is reached.

We are certain that this result was not contemplated when the language of Section 221 was drafted. Mortgage bankers have never to our knowledge been accused by anyone of paying less than their fair share of taxes. The stockholding requirement was authorized by the Congress to expedite the rapid transition of FNMA from Federal to private ownership. To deny the industry the deduction of interest on funds borrowed to offset the burden of holding this stock is not only grossly unfair but would serve effectively to thwart Congress' own expressed desires.

We oppose the enactment of Section 221 not only because of the impact on our business but because:

1. It would seriously impede the needed construction of shopping centers and other business structures under normal and customary financing arrangements. (It should be noted that construction may take a year or more. Section 221 is not clear but is subject to the construction that all interest paid or accrued during that period would be disallowed as a deduction.)
2. It is based on a completely fallacious assumption that the purpose of the borrowing is to acquire property to be sold at capital gains rates later, rather than to produce rental income.
3. To equate the case of one who borrows money to buy low yield stocks, and who therefore is a purely passive investor, with one who borrows to buy or build rental property which will bring in a good yield to justify the investment, is unsound. Therefore we urge that Section 221 not be enacted.

Conclusion

We hope to make one point above all others perfectly clear. *The combined impact of the tax reform proposals contained in H.R. 13270 and the Treasury Department recommendations will strike a devastating blow at our construction industry.* We are absolutely convinced that the House of Representatives was not aware of all the implications of the various individual proposals in H.R. 13270 and had very little understanding of the effect which they would have on real estate investment when considered in their totality. May we just review these in closing?

A. Mortgage funds will be less plentiful because:
1. The legislation is inflationary.
2. Savings and thrift institutions' incentives to invest in mortgages are diminished.
3. The privately owned Federal Land Banks remain wholly tax exempt, driving tax paying lenders from competing for agricultural loans. This tax exemption is grossly inequitable and a disservice to farmers and ranchers.

B. Equity capital is discouraged from the real estate field because:
1. Excess depreciation is denied or reduced.
2. Available remaining excess depreciation is subjected to Limited Tax Preference.
3. All excess depreciation allowed would be taxed at ordinary income rates at time of sale.
4. Capital gains rates would be increased.
5. Hobby loss limitations are reduced and extended to apply to any enterprise with a presumption that, regardless of the nature of the enterprise, there is no expectation of realizing a profit where such losses occur in three years of a five year period. Deductions for interest on funds borrowed for a more broadly defined category of investment income would be limited.

We urge the Committee to consider the combined impact of these various proposals on real estate investment. Although it is right and proper for all citizens to pay a fair share of tax, we should not forget, under the pressure of public indignation over the few who have avoided income taxation, that this nation has developed to its position of world leadership because of a strong and vibrant economy solidly based on the profit motive. The very citizens who are momentarily indignant enjoy the highest standard of living in the world because we have encouraged venture capital. To solve our major domestic problems we must continue to encourage massive investments in real estate development over the next decade.

Capital Goods Review

MACHINERY and ALLIED PRODUCTS INSTITUTE

NO. 79 1200 EIGHTEENTH STREET, N.W., WASHINGTON, D.C. SEPTEMBER 1969

EFFECTS OF INFLATION ON LENDERS AND BORROWERS

There has been a good deal of comment of late about "astronomical" interest rates. While it has been generally recognized that they are in part a response to the prevailing inflationary anticipations (borrowing is made more attractive by the prospect of repayment in cheaper dollars, lending less attractive by the prospect of receiving such dollars), there has been too little discussion of the degree to which they actually reflect and conform to these anticipations. Will the present level of rates maintain *real* lender returns and borrower costs at the level that would obtain without inflation?

This question is obviously unanswerable as stated, since it turns on an unknown: the amount of inflation anticipated. No doubt this varies widely from one forecaster to another, but the real question is how much is being discounted by the *market*. This would have to be inferred from the difference between the present interest-rate level and the one that *would* obtain in the absence of inflationary expectations. Since the latter is indeterminate (history does not disclose alternatives), the inference would be dubious, if not entirely useless.

It is possible, however, to explore the impact of inflation on lender returns and borrower costs by means of hypothetical cases, and to draw some inferences for the present situation. This we propose to do. We shall first work through a simple, round-number example and then give the results for a reasonable range of assumptions.

Example

Suppose a loan of $1,000 with interest at 10 percent payable annually is made by an investor in the 40-percent income-tax bracket. Suppose further that the inflation rate is 5 percent per annum. At the end of the year, he harvests $100 in interest, of which the Treasury takes $40, leaving $60 after tax. In view of the 5-percent inflation rate, however, it requires $1,050 at the end of the year to equal in real terms the $1,000 invested at the beginning. This means that he has to reinvest $50 of his after-tax interest receipts to maintain the integrity of his principal, leaving only $10 of real income. But even this is in year-end dollars, which are smaller than the dollars of investment. In terms of the latter, he has $9.52, and a true rate of return of 0.95 percent. This from a lending rate of 10 percent! [1]

Now look at the same transaction from the side of the borrower. Having borrowed the equivalent of 1,050 year-end dollars, but owing only $1,000, he has in effect had a reduction of real indebtedness by 50 such dollars, and a transfer to equity of that amount. Subtracting this gain from the $100 year-end interest payment, he has a net cost of $50, equivalent to $47.62 in the dollars borrowed, a rate, therefore, of 4.76 percent.

Tax Aspects

The spread between the real *return* to the lender after allowance for the erosion of principal from inflation (0.95 percent) and the real *cost* to the borrower after allowance for the gain to equity from the same cause (4.76 percent) is due, of course, to the difference in the tax treatment of the two sides. Interest receipts are taxable, interest payments deductible.[2] For a *nontaxable* lender, the return would equal the borrower's cost.

[1] The result is independent of the duration of the loan, as may be confirmed by converting the lifetime flow of after-tax receipts into the dollars of investment and solving for the implicit return.

[2] Because of their deductibility, the borrower's cost is independent of his tax status. See "The Cost of Borrowed Capital," *Review* No. 78, June 1969.

There is an obvious anomaly here in the treatment of inflation effects. The $50 that the lender must set aside at year-end to offset the *loss* of his real principal is taxed as income. On the other hand, the $50 *gain* to equity from the reduction of the borrower's real liability is untaxed (deductible as a cost). Clearly this is topsy-turvy. The loser pays and the gainer gets off free.

If the burden were reversed, the lender being granted deductibility for his capital loss and the borrower taxed on his gain, the picture would be rather different. Assuming, for example, a 40-percent tax rate on both sides, the lender's real return would be 2.86 percent instead of 0.95.[3] The borrower's real cost, on the other hand, would be 6.67 percent against 4.76.[4] But since the effect of inflation is ignored for tax purposes, this calculation is of course purely academic.

Lender's Real Return Over a Range of Cases

The foregoing example assumes a single inflation rate, a single interest rate, and a single tax rate. Similar calculations for a range of rates are shown below.

Lender's Real Returns for Various Inflation, Lending, and Tax Rates[a]

Tax Rate (Percent)	Inflation Rate					
	3 Percent			5 Percent		
	Lending Rate (Percent)			Lending Rate (Percent)		
	6	8	10	6	8	10
0	2.91	4.85	6.80	0.95	2.86	4.76
20	1.75	3.30	4.85	−0.19	1.33	2.86
30	1.17	2.52	3.88	−0.76	0.57	1.90
40	0.58	1.75	2.91	−1.33	−0.19	0.95
50	0.00	0.97	1.94	−1.90	−0.95	0.00
60	−0.58	0.19	0.97	−2.48	−1.71	−0.95
70	−1.17	−0.58	0.00	−3.05	−2.48	−1.90

[a]Assumes interest paid annually.

A quick glance at this table suffices to show the effect of even moderate inflation rates on the real returns of lenders subject to income tax. With a 3-percent inflation, a lender in the 30-percent tax bracket gets a real after-tax return of only 3.88 percent from a 10-percent loan rate. With a 5-percent inflation, he gets 1.90 percent. If his tax bracket is 50 percent, his returns are 1.94 percent and zero, respectively. The double tax-and-inflation bite is obviously devastating.

It may be interesting to show these results in a different form. Instead of solving for the real after-tax returns from various combinations of factors, suppose we solve for the lending rates required to yield specified returns. These appear in the next table.

Lending Rates Required To Yield Specified Real After-Tax Returns With Various Inflation and Tax Rates[a]

Tax Rate (Percent)	Inflation Rate					
	3 Percent			5 Percent		
	Required Real Return (Percent)			Required Real Return (Percent)		
	3	4	5	3	4	5
0	6.09	7.12	8.15	8.15	9.20	10.25
20	7.61	8.90	10.19	10.19	11.50	12.81
30	8.70	10.17	11.64	11.64	13.14	14.64
40	10.15	11.87	13.58	13.58	15.33	17.08
50	12.18	14.24	16.30	16.30	18.40	20.50
60	15.23	17.80	20.38	20.38	23.00	25.63
70	20.30	23.73	27.17	27.17	30.67	34.17

[a]Assumes interest paid annually.

Here the picture is, if anything, even more striking. To get a real after-tax return of 5 percent, a lender in the 30-percent tax bracket needs a loan rate of 11.64 percent with a 3-percent inflation and 14.64 percent with a 5-percent inflation. If his tax bracket is 50 percent, he needs 16.30 and 20.50, respectively. Even for a real return of only 3 percent, he needs loan rates of 8.70 and 11.64 percent if he is in the 30-percent tax bracket and 12.18 and 16.30 percent if he is in the 50-percent bracket.

[3] The lender's tax would be $20, leaving $80 after tax. Subtracting $50 for capital erosion, we have $30 (year-end), equivalent to $28.6 in the dollars of investment.

[4] With $50 of the borrower's interest payment taxable, he would pay $120 (100 to the lender, 20 to the Treasury). Subtraction of the $50 capital gain leaves $70 (year-end), of which the investment-dollar equivalent is $66.7.

Cost to Borrower

As indicated earlier, the real cost of debt to the borrower is reduced by the shrinkage of his obligation through inflation. It is the *excess* of the interest payment over this shrinkage.

Since interest cost is deductible, hence independent of the borrower's tax rate, this eliminates one of the variables that must be taken account of on the lender's side, leaving only the inflation and lending rates. If we assume the same values for these rates as before, we get the following:

Borrower's Real Costs for Various Inflation and Lending Rates

Lending Rate (Percent)	Inflation Rate 3 Percent	Inflation Rate 5 Percent
6	2.92	0.95
8	4.86	2.86
10	6.80	4.76

As we indicated earlier, the reduction of the borrower's real cost by inflation is less drastic than the reduction of the lender's real return. Thus, for example, a 5-percent inflation reduces the cost of a 10-percent loan to 4.76 percent, while reducing the real after-tax return to 1.90 percent for a lender in the 30-percent tax bracket and to zero for one in the 50-percent bracket.

The Present Situation

If we take the present inflation rate as 5 percent (recent figures make it even higher), it is evident that current lending rates leave most creditors with net losses in real terms. An 8-percent bond returns less than nothing net to a taxpayer in the 40-percent bracket, as does a 6-percent savings and loan account to one in the 20-percent band. A first-bracket (14-percent) taxpayer is substantially in the red on a 5-percent certificate of deposit; so too, of course, is a nontaxable lender on a 4-percent passbook account.

The Department of Commerce reports "total net public and private debt" of $1,569 billion at the end of 1968. At a 5-percent inflation rate, the shrinkage in the real value of this body of obligations is nearly $80 billion a year. When we consider that the bulk of them bear interest rates well below the current level, this annual erosion is almost certainly in excess of the collective after-tax interest yield to the ultimate beneficiaries (the individuals who benefit either directly or as claimants against financial intermediaries).

It is evident from our earlier table on lending rates required to yield specified real after-tax returns that with a 5-percent inflation and present tax rates there is little possibility of getting a significant real return even from the "astronomical" interest rates now prevailing on new loans. Even if the inflation rate were cut to 3 percent, a modest return would still require higher-than-present rate levels for most lenders and institutional creditors.

Here is the "euthanasia of the rentier" with a vengeance. The stagnationists who espoused this phrase were thinking of a *decline* of interest rates toward zero; the euthanasia now in process is occurring at the highest levels in memory. Inflation is accomplishing what "economic maturity" never did.

The question naturally arises why individuals persist in lending funds either directly or to financial intermediaries at rates that yield negative real after-tax returns. The answer is complex. Many do not fully realize the extent to which their capital is being eroded. Others who understand are at a loss to know what to do about it. Smaller savers particularly are accustomed to accumulate capital in dollar form—life insurance, time deposits, savings and loan shares, savings bonds, etc. While they may acquire a house and consumer durables for their own use, or invest in their own business, impersonal inflation hedges such as common stocks and income real estate are often outside their experience, and even when not are likely to be unsuitable to the purpose for which the dollar assets are held. Whatever the reasons—ignorance, habit, convenience, security—attachment to such assets is not easily dislodged.

It is an interesting speculation how a long-continued inflation at the present rate would affect this behavior pattern. What would it do to the structure of the capital market? How would it affect financial intermediaries? To what extent would creditor-protection devices be applied, such as price-level escalation, equity participation, etc.? These and similar questions are easier to ask than to answer. In any case they are beyond the scope of this essay. It is to be hoped, certainly, that inflation will be brought under control before they are answered by events.

MORTGAGE BANKERS ASSOCIATION OF AMERICA, JULY 31, 1969

THE FEDERAL LAND BANK SYSTEM AND TAX EXEMPTION

When the Federal Land Bank System was created in 1916, it was granted exemption from all taxation. At that time the composition of the agricultural economy and the character of the financial institutions which served it were vastly different from what they are today. In the fifty-three years since, these conditions have changed, but, to the best of our ability to determine it, the appropriateness of the tax exemption has never been reconsidered. We believe the exemption should be repealed.

Changes in the Agricultural Economy

The total number of farms in the United States has been declining, almost without interruption, since the time the Federal Land Bank System was created. According to the 1920 Census, there were over 6.5 million farms in the country with an average size of 148 acres. By 1940, this number had declined to about 6.4 million, and between that year and 1959, it dropped nearly 36 per cent to 4.1 million, while average acreage rose from 167 to 288. In the ten years since then, the number of farms has slipped to about 3.0 million and the average acreage has risen to about 380.[1]

Although the amount of cropland has been declining, the reduction in harvested acreage has not been as great as the above figures might suggest. What has been happening, as these data indicate, is that smaller farms have been disappearing as economic and technological changes dictate larger units.

Harvested acreage declined only 7 per cent betwen 1920 and 1959 to a total of 458 million acres. It is estimated to have dropped another 20 million acres between 1959 and 1961. "Estimates indicate that (if trends in yields since 1950 continue) the food and fiber needs of a population that may be 45 per cent higher by 1980 could be met with 407 million acres of cropland compared with 458 million acres in 1959." [2]

Statistics on numbers of farms of various sizes confirm the fact that the remaining farms are growing larger. Between 1940 and 1959, the number of farms of 100 acres or less declined 52 per cent from about 3.6 million to 1.7 million. In this same period, the number of farms of 260 acres or more increased from 724,000 (.7 million) to 808,000 (.8 million). There was a 35 per cent increase in the number of farms of 1,000 acres or more while the number of farms in all size categories under 260 acres showed a decline.[3]

The changing farm economy and the sharply expanded opportunities for employment in the cities have brought a dramatic decline in farm population. In the short span of 17 years between 1950 and 1967, farm population dropped 53 per cent from 23,048,000 to 10,817,000. Between 1920 and 1967, farm population declined from 30.1 per cent of total U.S. population to 5.5 per cent. In 1966 alone, farm population dropped another 6 per cent in number and its share of total population shrank to 5.9 percent.[4]

Despite these declines in the number of acres harvested, in the number of farms, and in farm population, agricultural production has not declined. According to the Federal Land Banks, "* * * man hours worked in farming have dropped 60 per cent during the past quarter century—yet total farm output rose to 63 per cent, dramatically emphasizing the substitution of capital for labor." [5] Fifty years ago, one farm worker produced food and fiber for eight people. Today, he can produce enough for 37. Put another way, one hour of farm labor yields more than five times as much food and other crops as it did a half-century ago.[6]

Furthermore, even with the decreasing numbers of farms, more farms have sales of $25,000 and over than was true in 1950, the first year in which such data were collected. (No inflationary factor is involved here, since the index of farm prices received has actually decreased in the period.) Between that year and 1964, the number with sales of this magnitude has more than tripled, from about

[5] Advertising supplement to *American Banker*, op. cit., p. 2.
[6] Ibid., p. 1.

103,000 to 337,000, and the proportion of this group to all farms has risen from 2 per cent to 11 per cent. At the same time, the number with sales of under $2,500 has dwindled from 1.6 million to about 350,000 and their proportion from 30 per cent to 11 per cent. (See Table I–A.)

Crucial in this context is the trend away from the individually owned farms, of whatever size, toward a more complex, corporate structure. The step-by-step liberalization of the eligibility requirements of the Federal Land Banks to include corporate borrowers speaks as eloquently as would any data on this subject, were they available.

Changes in the agricultural economy

Furthermore, while the economy it served was in transition, the Federal Land Bank System itself has been undergoing change—in aim, in organiaztion, and in market served.

While the reasons for creating a special credit structure for farm finance are not explicitly stated in the statute creating the Federal Land Bank System, the Farm Credit Administration has, over a long period, offered this definition of purpose:

"This System was created by Congress to meet a definite economic need for a permanent and dependable source of sound farm mortgage credit at reasonable rates and on terms especially adapted to the particular requirements of farmers. It was expected that this farmer-owned credit system designed specifically to provide long-term, low-interest loans on an amortized basis would serve as a pace-setter in solving many of the problems that existed in farm mortgage credit." [7]

At the inception of the System in 1917, the aim appears to have been to provide the farm community—especially the owners of family-size farms—with specialized credit facilities particularly suited to agricultural as contrasted with commercial or industrial requirements. It may be assumed that Congress, in enacting the original legislation, considered the question of taxation of the Federal Land Banks and exempted them in the light of then existing conditions. We doubt, however, that Congress at that time could have foreseen the importance of this exemption—in terms of either competitive advantage or loss of revenue—since taxes at that time did not approach present levels. We find no evidence that Congress, in the years since then, has ever reconsidered this exemption.

But while the tax status has not been altered, there has been considerable broadening of the limits within which the Federal Land Banks can make loans. Take, for example, the maximum loan amount, which in 1916 was set at $10,000. In 1923, the limit was raised to $25,000, though it was required that "preference * * * be given to applications of $10,000 and under." The limit was raised to $50,000 and $100,000 in 1933 and 1949, respectively. In 1955, the maximum was raised to $200,000, and the limit on loans made without prior approval by the Farm Credit Administration was raised from $25,000 to $100,000. In 1959, the ceiling was lifted altogether though FCA approval still had to be obtained on loans of over $100,000.

The result has been a steady expansion of lending activity in the upper ends of the loan range. As Table I shows, 77 per cent of the total amount of Federal Land Bank loans in 1968 (the latest year for which data was available) was for amounts of $20,000 or more. Only 15 per cent was in this category in 1960.

The average size of loan also reveals this trend. From a 1947–49 figure of $4,610, average loan size rose to $21,320—or 362 per cent—in 1965. The average loan size for all lenders, of course, also advanced sharply in this period, under the influence of inflationary trends in the economy generally and of the increasingly larger capital requirements of agriculture, in particular, as its technology advanced and as farm size grew. It is significant, however, that the increase for the Federal Land Banks has been greater than that for all types of lenders and greater than that for any other single group of lenders except insurance companies, which it just matched. Indeed, at least since 1945, the average size of the Federal Land Banks' loan has exceeded that for any other group, except the insurance companies. (See Chart I.)

For example, a Federal Land Bank loan recently made in Alabama was in the amount of $5.4 million.

[7] *Federal Land Bank System and How It Operates,* Farm Credit Administration, Washington, 1965, p. 5. Practically identical passages have appeared in earlier editions of the same document.

Further encouraging the expansion of Federal Land Bank lending activity has been the progressive broadening of the definition of eligible borrowers. In the original legislation, this covered only those engaged in, or shortly to become engaged in, the cultivation of the farm to be mortgaged. In 1933, persons who derived the principal part of their income from farming operations were made eligible. Two years later, "person" was redefined to include corporations engaged in raising livestock. There was, however, the qualification that ". . . no loan * * * be made to a corporation (A) unless all of the stock of the corporation is owned by individuals themselves personally engaged in the raising of livestock on the land to be mortgaged, except in the case where the Land Bank Commissioner permits the loan if at least 75 per centum in value and number of shares of the corporation is owned by individuals personally so engaged and (B) unless the owners of at least 75 per centum assume personal liability for the loan." [8]

In 1961, the restrictions on loans to corporate borrowers were relaxed to state: "* * * but no loan shall be made to a corporation unless the principal part of its income is derived from farming operations and unless owners of stock in the corporation assume personal liability for the loan to the extent required under rules and regulations prescribed by the Farm Credit Administration." [9]

In 1966 and again in 1967, the Federal Land Banks have requested authority to eliminate the statutory loan maximums, the maximum loan which can be made without FCA approval, and the requirements for the assumption of personal liability by stockholders of corporate borrowers.

Greatly liberalizing the scope of Federal Land Bank lending, the Farm Credit Act of 1955 authorized loans for "general agricultural purposes *and other requirements of the owner of the land mortgaged*." (Emphasis supplied.) In the original 1916 statute, it was provided that loans could be made for the following purposes and no other:

1. To purchase land for agricultural purposes.
2. To purchase equipment, fertilizer, and livestock for proper and reasonable operation of the mortgaged farm.
3. To provide buildings and for the improvement of farmland.
4. To liquidate indebtedness existing at the time of the organization of the first Land Bank Association in the county or indebtedness subsequently incurred for the above purposes.

With the 1955 amendment, the purpose of Federal Land Bank operations was, consequently, completely altered. From an organization designed to finance farming operations solely, this newly independent system became one authorized to accept farm assets as security for loans to meet any financial requirement of the landowner.

The Federal Land Banks have undergone a series of organizational changes the most important of which was made in 1953. The Farm Credit Act of that year established the Farm Credit Administration as an independent agency separate from the Department of Agricultural and put the Federal Land Banks on the road to private operation. Since 1947, all federal funds have been out of the System. Thereafter under private ownership and, from 1955, authorized to engage in a broad range of lending business, the Federal Land Banks have moved ahead in the best free enterprise tradition to capture as much business as their unusual competitive advantages make possible.

The steadily growing volume of Federal Land Bank loans—in terms of both number and dollar amount—is shown in Tables II and II–A.

Paralleling this growth has been an expansion in the share of the Federal Land Banks of the total agricultural mortgage loan market—an expansion accomplished, as it must be, largely at the expense of tax-paying lenders. As may be seen in Table II, the percentage of total mortgage lending by Federal Land Banks has grown from 12.3 per cent in 1950 to 24.0 per cent in 1965. In the same period, consequently, the share of individuals in this market has been halved—from nearly 30 per cent to 16 per cent—while farm lending by banks and trust companies has declined from 29 per cent to 20 per cent of the total.

Available data indicate that Federal Land Bank lending, far from being confined to, or even concentrated in, the weaker sector of the farm loan market, is widely distributed among all classes of farmers.

---

[8] 12 U.S.C. 1934 ed., Supp. V. 771 (sixth).
[9] 12 U.S.C. 1958 ed., Supp. V. 771 (sixth).

Given the Federal Land Banks' stated aims and given the fact that their tax exemption and their favored position as a borrower permit them to charge an interest rate lower than that generally available from institutional lenders, it might be expected that their lending would be disproportionately heavier in the lower end of the range, or, at most, would be distributed among the various classes of farms in a rough equivalence to their proportions among total farms. But this is not the case. A study by the Federal Reserve Board, based on data from the Census Bureau's 1960 Sample Survey of Agriculture, provides the data shown in Tables III and IV. While 10 percent of all farms had 1960 sales of $20,000 and more, 17 percent of the farm operators with Federal Land Bank loans were in this category. At the other end of the economic classification, 26 percent of all farms had sales of between $50 and $50,000, but only 20 percent of Federal Land Bank borrowers were in this group. (See Table III.)

The average value of land and buildings operated by farmers with major real estate debt in 1960 was about $50,200; land and buildings of Federal Land Bank borrowers had an average value of close to $55,900. (See Table IV.)

Arguments for taxation

Mortgage bankers feel that the Federal Land Banks should be paying taxes. The Federal Land Banks are, in fact, private enterprise organizations just as surely as any mutually owned enterprise. Even were they not, there are precedents in the Federal National Mortgage Association and the Federal Reserve System for a payment in lieu of taxes or a remittance of profits to the Treasury.

A puzzling aspect of this question lies in the fact that their sister institutions, the Production Credit Associations and the Banks for Cooperatives, are taxed; that proposals for rural electric and telephone banks contemplate that they will be taxed following the retirement of federal capital; and that most people seem surprised to learn that the Federal Land Banks are not taxed. To our knowledge the question of the tax status of the Federal Land Banks was not discussed when the legislation was enacted nor has it been raised in subsequent Congressional hearings.

On the other hand, the tax status of other governmental—or quasi-governmental—corporations has been repeatedly discussed. From hearings and legislation there emerges a consensus that such corporations should be taxed—or, as a minimum, that their tax status should be reviewed—when federal funds are repaid. The failure to provide for either taxation or review in the case of the Federal Land Banks is, we believe, a legislative oversight which should be remedied. Moreover, the exemption imposes an unfair competitive burden on the tax-paying enterprises which also serve the agricultural market. We conclude that the circumstances which led Congress to grant exemption to the Federal Land Banks have changed, that their operations have changed, and that their tax-exempt status is now a proper subject for reconsideration.

TABLE I.—PERCENTAGE DISTRIBUTION OF TOTAL AMOUNT OF FEDERAL LAND BANK LOANS, BY SIZE OF LOAN, SELECTED YEARS, 1960–68

[In percent]

Size of loan	1960	1961	1964	1965	1966	1967	1968
$5,000 and lower	21.9	20.4	2.2	1.4	0.9	0.9	0.8
$5,000 to $8,000	23.3	22.3	5.6	4.3	2.6	2.4	2.3
$8,000 to $10,000	11.2	11.8	5.0	3.7	2.4	3.1	2.2
$10,000 to $15,000	18.2	16.7	13.1	10.3	8.6	8.5	8.1
$15,000 to $20,000	10.2	10.6	10.6	9.9	8.8	9.3	9.3
$20,000 and over	15.2	18.2	63.5	70.4	76.7	75.8	77.3
Total, all loans	100.0	100.0	100.0	100.0	100.0	100.0	100.0

Note: See table IA for greater detail for 1964 and 1965, and a distribution for those years of number of loans by size, which is not available for the earlier years.

[H.R. 9242, 91st Cong., first sess.]

A BILL To amend section 504 of the Internal Revenue Code of 1954, relating to the tax exemption of certain organizations

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That (*a*) section 504 of the Internal Revenue Code of 1954 (relating to denial of exemption of certain organizations) is amended by redesignating subsection (*b*) as subsection (*c*) and by inserting after subsection (a) the following new subsection:

"(b) FEDERAL LAND BANKS AND FEDERAL LAND BANK ASSOCIATION.—Notwithstanding the provisions of any other law, no Federal land bank or Federal land bank association shall be exempt from the taxes imposed by this subtitle on corporations."

(b) The amendments made by subsection (a) shall be applicable with respect to taxable years beginning after the date of enactment of this Act.

The CHAIGMAN. The next witness will be Mr. Harry Newman, Jr., president of the International Council of Shopping Centers. Mr. Newman, will you proceed?

STATEMENT OF HARRY NEWMAN, JR., PRESIDENT, INTERNATIONAL COUNCIL OF SHOPPING CENTERS; ACCOMPANIED BY ALBERT SUSSMAN, EXECUTIVE VICE PRESIDENT; AND ARTHUR GOULD, TAX COUNSEL

Mr. NEWMAN. Mr. Chairman, may I first introduce Mr. Albert Sussman, who is the executive vice president of the International Council of Shopping Centers, on my left; and Mr. Arthur Gould, who is our tax counsel, on my right.

My name is Harry Newman, Jr., and I am the president of the International Council of Shopping Centers.

I am here not only to represent our 3,200 members who are engaged in the development and operation of shopping centers in all 50 States but also to underline some of the grave consequences of the proposed tax reform act.

In its present form we believe—

The bill will put a number of independent developers out of business.

It will prevent thousands of potential entrepreneurs from getting into businesses of their own and seriously discourage expansion of existing small merchants dealing in retail goods and services.

It will put most new centers, esperially small ones, into the deep freeze.

It will drive the large subsantial developers into the arms of the financial giants and accelerate concentration of ownership in their hands.

It will take the private investor and his equity capital out of the market.

Just three provisions of the act will insure these undesirable results:

The change in accelerated depreciation provisions.

The change in the recapture provisions at the time a center is sold.

The imposition of a limitation on deductions of interest.

Before discussing these provisions in more detail, I would like to put their impact into proper perspective, because it is even greater than the House of Representatives and many of our own members initially recognized.

Before World War II, the shopping center as we know it did not exist. Today there are almost 11,000 in existence in the United States—90 percent of them are small—pumping almost $100 billion through their checkstands every year, employing 4½ million people, representing an investment, excluding land, of $54 billon.

These are impressive vital statistics for a latecomer to the real estate field and to the economy, but there is more.

By 1980, there will be more than 22,000 centers, employing 18,440,000 people, reflecting an additional investment of $180 billion in improvements, and producing $200 billion in annual sales.

When we appreciate the present magnitude and the potential for growth of this industry—incidentally, without one single Government grant or subsidy—then we can see more clearly and in proper perspective how serious these consequences can be.

By eliminating accelerated depreciation, especially for the second owner of a shopping center, and by requiring total recapture of excess over straight-line depreciation, the bill will make it uneconomic for the developer to sell his center after the full holding period and even less attractive for a prospective investor to buy it.

Add to these two disincentives the limitation on interest deduction, which was aimed at the passive investor but can now be mistakenly applied to the active developer who is in the business of building, owning, and operating centers, not just investing in them. Then put in the final ingredient, the Treasury's recommendation that all expenses during construction be included as limited tax preference items and be taxed at a time when there is no income. Mix all these ingredients in an existing potful of problems like interest, up 89 percent since 1965; construction costs, up 26.9 percent; property taxes, 28.5 percent; and land cost, 20 percent; and you have a paralyzing, poisonous brew.

What antidote are we going to administer? Higher rents and more inflation?

When you consider that rents have gone up only 12 percent since 1965 compared to the substantially higher increases in all costs, this is obviously not going to solve the problem.

What is left?

Those of us who have been developing or are qualified to develop regional centers have a way out. We can bring in giant financial institutions as partners. Let me read you a paragraph from a letter I received from our then private joint venture equity partner 1 week ago:

> Since we do not know when the tax picture will become clear or even if real estate developing will be an attractive investment vehicle for our clients, I would encourage you to find another equity partner.

So we now are working with a major financial institution. This is one of many such examples, but note that only large projects qualify. It is as easy for an insurance company to make a $20 million loan on a regional center as an $800,000 loan for a neighborhood center, and remember, those small centers represent 90 percent of all centers. It is also easier to buy a development company than to start your own—and insurance company holding companies are in the process of doing both with increasing frequency. All this adds up to one economically undesirable total—economic concentration.

What this all boils down to is this. The shopping center industry can create 14 million jobs. It can provide business opportunities for small merchants and service businesses. It can provide sources for private investment capital. It can produce premium tax revenue for local communities.

It can revitalize the retail sections of urban core areas. But not without important risks.

Although completed shopping centers have an outstanding performance record—almost failure-free—and are therefore regarded as low risks by mortgage lenders, there are in fact many risks and they occur during the development period. Like the oil industry, there are lots of dry roles.

I am here to ask you to retain the incentives for these positive contributions to our economic welfare. Do not take them away and jeopardize an entire industry to correct a few atrocity cases of tax inequity and abuse.

There is a basic social and philosophical principle at stake in this bill. America and its economy have been built by risk-takers, the entrepreneurs. America has motivated men to take these risks by offering them incentives.

Our shopping center industry also has been built by just such risks, skills, and rewards; at a time when it is trying to weather the economic storms for survival, we genuinely hope that you will recognize the industry's contribution to our society and not deprive it of its most dynamic driving force.

In conclusion, let me emphasize that we favor a minimum tax for every taxpayer. H.R. 13270, however, excluded the oil industry from its provisions. The Treasury now recommends excluding interest on municipal and State bonds along with the appreciated value of assets contributed to charity. This would be manifestly unfair to the real estate industry and to the so-called gentleman farmer. In our opinion, there should be a minimum tax and everyone should pay it.

I appreciate this opportunity to present our viewpoint to you and respectfully hope that our comments may help you in your deliberations.

Thank you very much.

The CHAIRMAN. Thank you very much, sir.

(Mr. Newman's prepared statement follows:)

STATEMENT OF HARRY NEWMAN, JR., PRESIDENT, INTERNATIONAL COUNCIL OF SHOPPING CENTERS, NEW YORK, N.Y.

SUMMARY

The International Council of Shopping Centers is a trade organization of more than 3,200 members engaged in the development and operation of shopping centers and in their design, leasing, construction and financing. Many chain and independent retail merchants now operating stores in shopping centers are also members of the council.

Our developer members have built and are operating more than 9,000 shopping centers containg more than 195,000 retail stores in the United States alone. As an industry, shopping centers represent a total investment of more than $54 billion and supply employment for more than 4,500,000 persons.

Before discussing the effect of the Tax Reform Bill on our industry and our view of the consequences for the economy, I would like to express our wholehearted support for the basic aim of the legislation before this committee, namely, the elimination of tax inequities and the minimum-tax approach to achieving it.

The main purpose of our testimony here, then, is to describe to you the grave implications of those provisions in the proposed Act that affect our specialized segment of the real estate industry. In its present form, we believe that the Tax Reform Act of 1969 will have these consequences:

1. It will accelerate the existing trend towards economic concentration of shopping center ownership in the hands of a relatively few large financial institutions and big corporations.

2. It will seriously curtail the construction of smaller centers, which are an essential ingredient in the mass housing programs planned for the next decade. Shopping center developers will not be able to build these centers because they will have no venture capital sources to replace both private investors and those funds normally generated through the sale of their existing centers.

3. This curtailment in turn fill eliminate a sizeable number of the almost 14 million new low-skill jobs which the shopping center industry would otherwise create by 1980.

4. The development of fewer new centers means depriving expanding and/or new municipalities and other local government bodies of desperately needed revenues for their operating expenses from property and sales taxes.

5. Expansion of independent merchants, so-called mom-an-pop operations, local chains and other dynamic tenants will be seriously curtailed and in many cases completely halted.

6. The higher yields needed to attract venture capital as compensation for the loss of present tax advantages will lead to increases in already spiraling rents and thus place further inflationary pressures on the prices of consumer goods and services.

7. In order to survive, independent developers will be virtually compelled to merge with large corporations or be taken over by them in order to obtain the high-risk venture capital essential to develop shopping centers.

8. By withdrawing tax inducements from private redevelopers, while preserving subsidies of billions of dollars from HUD, the Act will seriously discourage urban core retail redevelopments, which, in our opinion, deserve the highest priority in both the private and government sectors.

9. It will create serious difficulties for black business and community groups that are now striving to develop shopping centers in the inner-city core areas of at least 50 major cities.

10. Insofar as the real estate industry is concerned, Section 221 was presumably aimed at the passive high-income investor. In fact under this section's definitions and exclusions, virtually every shopping center owner who is actively operating a center will be subject to the limit on interest deductions because practically every shopping center in the country and its leases qualify as "net leases." This, coupled with the Treasury's suggestion that certain business deductions during construction be singled out for Limited Tax Preference treatment, may well drive most individual investors and developers out of a business already made economically marginal by a combination of tight money, record interest rates and skyrocketing construction costs, property taxes and land prices.

We therefore, recommend that present real estate tax inducements remain in effect, but that an equitable minimum tax law be enacted to correct the few but glaring inquities and abuses of the past.

STATEMENT

Mr. Chairman and members of the Committee, my name is Harry Newman, Jr. I am president of the International Council of Shopping Centers, a trade organization of more than 3,200 members engaged in the development and operation of shopping centers and in their design, leasing, construction and financing. Many chain and independent retail merchants now operating stores in shopping centers are also members of the Council.

Our developer members have built and are operating more than 9,000 shopping centers containing more than 105,000 retail stores in the United States alone. As an industry, shopping centers represent a total investment of more than $54 billion and supply employment for more than 4,500,000 persons.

Before discussing the effect of the Tax Reform Bill on our industry and our view of the consequences for the economy, I would like to express our wholehearted support for the basic aim of the legislation before this committee, namely the elimination of tax inequities and the minimum-tax approach to achieving it.

The main purpose of our testimony here, then, is to describe to you the grave implications of those provisions in the proposed Act that affect our specialized segment of the real estate industry. In its present form, we believe that the Tax Reform Act of 1969 will have these consequences:

1. It will accelerate the existing trend towards economic concentration of shopping center ownership in the hands of a relatively few large financial institutions and big corporations.

2. It will seriously curtail the construction of smaller centers, which are an

essential ingredient in the mass housing programs planned for the next decade. Shopping center developers will not be able to build these centers because they will have no venture capital sources to replace both private investors and those funds normally generated through the sale of their existing centers.

3. This curtailment in turn will eliminiate a sizeable number of the almost 14 million new low-skill jobs which the shopping center industry would otherwise create by 1980.

4. The development of fewer new centers means depriving expanding and/or new municipalities and other local government bodies of desperately needed revenues for their operating expenses from property and sales taxes.

5. Expansion of independent merchants, so-called mom-and-pop operations, local chains and other dynamic tenants will be seriously curtailed and in many cases completely halted.

6. The higher yields needed to attract venture capital as compensation for the loss of present tax advantages will lead to increases in already spiraling rents and thus place further inflationary pressures on the prices of consumer goods and services.

7. In order to survive, independent developers will be virtually compelled to merge with large corporations or be taken over by them in order to obtain the high-risk venture capital essential to develop shopping centers.

8. By withdrawing tax inducements from private redevelopers, while preserving subsidies of billions of dollars from HUD, the Act will seriously discourage urban core retail redevelopments, which, in our opinion, deserve the highest priority in both the private and government sectors.

9. It will create serious difficulties for black business and community groups that are now striving to develop shopping centers in the inner-city core areas of at least 50 major cities.

10. Insofar as the real estate industry is concerned, Section 221 was presumably aimed at the passive high-income investor. In fact under this section's definitions and exclusions, virtually every shopping center owner who is actively operating a center will be subject to the limit on interest deductions because practically every shopping center in the country and its leases qualify as "net leases". This, coupled with the Treasury's suggestion that certain business deductions during construction be singled out for Limited Tax Preference treatment, may well drive most individual investors and developers out of a business already made economically marginal by a combination of tight money, record interest rates and skyrocketing construction costs, property taxes and land prices.

We, therefore, recommend that present real estate tax inducements remain in effect, but that an equitable minimum tax law be enacted to correct the few but glaring inequities and abuses of the past.

WHAT IS THE DEVELOPMENT BUSINESS?

Let me explain something about the nature of the development business before elaborating on the reasons for the ten points of what may seem at first glance to be the shopping center industry's True Bill against the Tax Reform Act.

Shopping centers have enjoyed a remarkable record of successful operation and foreclosures are extremely rare. Because of this performance and the high percentage of so-called AAA-credit, or major chain tenants, in each shopping center, insurance companies and other lenders have come to regard shopping centers as low-risk or no-risk investments.

Once the center is finished, this is an accurate assessment. However, during the development stages, the developer alone, or in conjunction with his equity investor, is exposed to a variety of risks which can jeopardize his investment and, at worst, send him into bankruptcy. These risks and unexpected costs occur from the site selection phase to the point in time after the center is completed and the developer is ready to collect his long-term mortgage funds from the permanent lender. They range from delays caused by frozen ground, snow and rain to strikes, unexpected site conditions, zoning and title problems. They range from mistakes by the architects and engineers to delays because of tenant improvements or tenant bankruptcies. They range from uncontrollable cost increases in construction, financing charges and real estate taxes to breakdowns in deliveries of essential supplies and materials.

There are other hidden risks. For every center that is developed, there are at least 12 that never see the light of day, but may have reached the zoning, layout, or at least the acquisition-negotiation stage. Although it is an extreme example, my company recently investigated 73 individual sites before we found a suitable location for a chain department store. Each of these attempts at finding a shopping center location resulted in relatively substantial expenditures to say nothing of the time involved.

Once the developer has found the site, he must tie up the land on an option or by some other means, so that he has enough time to determine the major tenant's interest in the site. In order to stimulate interest on the part of a supermarket if it is a neighborhood center location, or a department store if it is a regional center site, he must have layouts and economic studies prepared. He must also work out the financial projections for the center to determine the rentals he must get. This involves a high degree of guessing what construction costs and interest rates will be in six monhs, a year, or two years depending on the size and gestation period for the proposed center.

Assuming he gets the tenant's approval of the site, he must then lease enough of the remaining stores to chain stores or tenants with multi-million dollar net worths to enable him to secure a mortgage loan commitment from an insurance company or other financial institution. At this point the developer normally must purchase the land and this requires substantial cash, usually more than he has available because of his investments in other centers. This explains the importance of the equity investor to the developer's continuing activity.

Once the investor has been brought into the development picture, the developer then has to negotiate his contract with the architect and engineers, negotiate a contract with a general contractor, and complete his leasing negotiations for the other vacant stores. He must coordinate the activities and responsibilities of the architect, contractor and tenants, while making arrangements for a construction loan based on the commitment for his permanent mortgage loan. He must then complete the center according to tenants' plans, move them in, and set up the management, promotion and maintenance of the completed center. Then he can at last "close" the permanent mortgage loan, thhe proceeds of which are used to pay off the construction loan. The development process cannot be described adequately in such brief terms, but hopefully we have conveyed to you some idea of the complexities, uncertainties and risks which characterize the business.

ECONOMIC CONCENTRATION

More than 90 percent of the shopping centers in this country are developed by individuals and small independent corporations or partnerships, who provide the skills, manpower and part of the equity investment required for the shopping centers they build. They are not able to develop shopping centers without entering into partnerships with one or more investors in each center. They need these partners to help them put up the equity investment of 10 to 25 percent normally required for each venture.

These equity investments range from $50,000 to several million dollars each, depending on the size of the center, the cost of land and buildings, and the amount of mortgage financing they can obtain. Very few developers who are actively building new centers can afford (or have the funds necessary) to finance their own centers without partners. Because of the high risks involved and the relatively large amounts of venture capital needed, the investor partners who join the developers in their projects are almost always private parties seeking commensurately high returns on their investment. If they are denied the inducement of tax savings, they will have little reason to invest their money in these projects. They will put their money in other types of investment, and developers will have difficulty getting shopping centers built in the future.

To remain in business, developers will have to find other sources of equity funds. They will have to turn to large corporate investors, to public financing and to institutional investors.

What concerns me and I think should concern your Committee is that the Tax Reform Act will make it difficult for the independent shopping center entrepreneur to survive and will result in the increasing domination of our industry by large financial and/or corporate interests.

The Committee should be aware that since the 1966 monetary crisis and credit crunch, the shopping center industry has been plagued by a shortage of mortgage funds, record-high interest rates, accelerating construction costs, rising property taxes and skyrocketing land prices. These inflationary pressures are particularly serious for a high-leverage business like shopping center development where the loan usually represents 75 percent or more of the total project costs. Rents have not risen at a comparable pace and profite margins consequently have been eroded to a point where tax deductions available under the present laws are playing an increasingly vital part in the economics of shopping center development. I refer you to Appendix B, attached to this report, which shows that from 1965 to 1969, land prices, property taxes, construction costs and prime interest rates rose 20 to 88 percent. During the same period, rental income increased only 12 percent.

Even before the Tax Reform Act was conceived, high interest rates and other inflationary pressures started to reshape the shopping center industry. Major supermarket chains, discount stores and traditional department stores began to develop their own free-standing branches, tending to eliminate the independent developer. In addition, lending institutions began to insist on a piece of the equity and demanded a share of minimum and/or overage rents as a prerequisite for a mortgage loan. As a result of these and other factors, the position of the independent developer has been increasingly threatened.

The Tax Reform Act will accelerate the trend towards the concentration of ownership, operating control of the industry, and a virtual monopoly of most new developments in the hands of big corporations and big institutional investors. I am not suggesting that they even want this control, but under the changed dynamics of the industry they will be the only ones who can afford it.

FEWER SMALL CENTERS

Since their inception, shopping centers have attracted hundreds of new business enterprises and opened opportunities for hundreds of individuals and groups to become engaged in development as independent entrepreneurs.

This has, in fact, been the history of my own company. I am before you now to fight for the life of my company and hundreds of others like mine, and to retain our ability to continue as independent enterpreneurs in a competitive, viable economy.

Let us examine for a moment what will happen to neighborhood centers if the private investor and independent developer are eliminated as economic factors.

In order to weigh the importance of the small center in the consumer economy, keep in mind that out of 10,820 shopping centers operating at the end of 1968, 9,300 (almost 90 per cent) were neighborhood or community centers.

Because size is equated with financial return, institutional developers are primarily interested in developing and owning regional centers where the retail action is concentrated in the hands of the large retailers and national retail chains. Smaller centers do not have the "economic glamor" and are too small to attract the financial institution as an investor, joint venturer or developer.

With the private investor removed from the scene, who is going to develop the literally thousands of neighborhood centers needed to service the 2,300,000 new houses scheduled for construction every year for the next decade? Competition will be curtailed or eliminated. Where this happens, the Act will create captive-market conditions which encourage price exploitation and which have been a significant factor contributing to minority unrest and riots in slum areas.

LOSS OF JOBS

The retailing industry traditionally has provided substantial numbers of jobs for people who rank at the lowest economic level in the community. It is questionable if the economy will be able to absorb those individuals who may be displaced from retailing operations, since many of them have very limited employment skills.

Based on the estimate that 2½ new full-time jobs are created for every 1,000 square feet of gross leasable area, almost 14 million jobs can be created by the development of shopping centers in the next 11 years. The Tax Reform Act in its present form will jeopardize a substantial number of those jobs, mostly unskilled, the most difficult to place in other sections of the economy.

LESS TAXES FOR LOCAL COMMUNITIES

Those shopping centers which have been built this year or will be completed by the end of 1969 will contribute $25 million in property taxes to the communities in which they are located.

This is especially welcome because it is premium revenue. Shopping centers, at their expense, provide many of the services normally required from the local municipality, for example, parking areas, sidewalks, malls, landscaping, lighting, security, trash removal, parking lot maintenance and repair. Developers also frequently dedicate land for streets and put in the streets, curbs, gutters and sometimes the sewage system, fire hydrants and the water distribution system.

By 1980, in order to service the projected 30 million growth in population, the number of shopping centers will double, adding viable local tax revenue to local municipalities and communities.

The Tax Reform Act, if passed in its present form, could drastically reduce the number of new centers to be built and deprive new, expanding and redevelopment communities of critically needed tax revenues.

SMALL RETAILERS JEOPARDIZED

The private investor's willingness to risk his money in shopping center development has been largely responsible for helping "mom-and-pop" stores convert to franchise operations. Franchise operations have had a phenomenal growth record. They range from fried chicken and roast beef sandwiches to auto brakes, mufflers and bridal wear. The investor's dollar has also made economically viable the smaller centers with their inevitable complement of barber, beauty, cleaner-type of service shops.

Shopping centers create small retail businesses. If shopping center development is curtailed, there will perforce be fewer opportunities for small retailers to go into business and to expand their operations.

INCREASED INFLATIONARY EFFECTS

At the present time, private investors like lawyers, doctors, small businessmen, etc., who constitute the majority of shopping center equity investors, are willing to risk their savings for an 8 or 9 per cent return coupled with tax advantages which enable them to offset some of their ordinary income.

Remove these inducements, and how marketable a commodity does the shopping center developer have?

Apart from the extensive risks involved during the developmental stage, shopping centers have one other major drawback from an investment viewpoint—lack of liquidity. Unlike shares on the stockmarket, a shopping center with its multiple tenancies and other complexities, and special requirements, not the least of which is a large cash investment, is difficult to sell. By removing the accelerated depreciation provision and other tax advantages for second owners, the new law will make centers virtually impossible to sell.

It might seem that there is a simple solution to this dilemma—increase the yield to compensate for the loss of tax advantages.

The only way to achieve this is to raise rents even further. We have already witnessed the lag in rental increases behind the spiraling costs of development.

In our opinion, rents cannot be increased enough to provide the additional yield which investors in this non-liquid, high-risk field might reasonably demand, without jeopardizing the survival of the retail merchant and placing irresistible pressure on the retailer to try to pass on his increased occupancy cost to the consumer in the form of higher prices.

Neither Congress nor the shopping center industry wants to penalize the consumer and speed inflation in order to correct a few inequities in our tax structure.

MERGE OR SELL OUT FOR SURVIVAL

As cited earlier, the elimination of the private investor and the inability of developers to attract financial institutions as investor-partners will hamstring most independent development activities. In addition, because developers will be unable to sell their centers under the proposed law, new projects will dry up or atrophy. Unable to recoup their investments on existing centers and facing high costs of land and money, developers will not be able to undertake new projects at the very time that the demands for new retailing facilities and their own operational needs dictate that these projects be initiated.

The ultimate effect of the provisions in their present form will be to force shopping center developers to incorporate, to merge with large corporations, or to go out of business.

This trend has already become apparent as a result of prevailing economic conditions. Suppliers of building materials, diversifying corporate giants and insurance companies in the past two years have bought existing development firms with experience and expertise, who were being pinched by under-financing and the critical money shortage.

H.R. 13270 contains a number of provisions, namely Sections 411, 412, 413 and 414, specifically designed to inhibit the trend towards economic concentration which has occurred because of the recent waves of corporate mergers and acquisitions. In fact, the House Ways and Means Committee report notes that "this trend in merger activity raises numerous significant questions, such as its effect on the competitive climate in the United States, and the overall effect of this activity on the U.S. economy." The House considered this trend towards economic concentration to be so disturbing that it deemed it advisable to utilize the tax laws to impose a number of restraints upon such corporate merger activities. Nevertheless, in the very same bill, the House has approved a number of changes with respect to the tax treatment available for real estate activities, which inevitably will lead to economic concentration within the shopping center industry.

The evil of economic concentration within any industry is obvious. If the ownership of shopping centers is concentrated in the hands of a relatively small group of large landlords, the bargaining position of any prospective tenant, large or small, will be seriously compromised.

To see how the proposed legislation, coupled with present economic conditions, will encourage mergers and acquisitions, one need only look at the tract housing industry, where the small independent developer has become an anachronism and virtually disappeared from the scene.

SETBACK FOR URBAN REDEVELOPMENT

Most of the successful urban redevelopment projects completed to date have been the work of private entrepreneurs. Many shopping centers are planned as part of the redevelopment of core areas, but developers have learned that this type of project involves at least twice as much time and documentation as conventional projects.

My own organization's experience is typical. We are general partners in a redevelopment project in the downtown area of Richmond, California, which will embrace 30 city blocks and in its completed form consist of 1,300,000 square feet of retail space. We have spent many thousands of dollars on legal fees, economic studies, plans, renderings and brochures for prospective tenants (See photographs). However, because the proposed project is now ringed by a predominantly black, low-income slum area, we are encountering difficulty and delays in persuading major department stores that the entire environment will be dramatically altered by the proposed development, and that the 825,000 potential customers in the primary and secondary trading areas will insure as profitable an operation as a white suburban community.

As developers we wanted to undertake this project because of the social benefits to the community as well as the prospect of a sound return on our investment of time and money.

HUD's subsidy of the land and the city's willingness to provide a $10 million parking structure have made the project economically viable and have given us a substantial inducement to proceed. Relying on the tax treatment permitted under the present law, we and our partners decided to tackle the special problems involved in a redevelopment project of this magnitude.

It seems paradoxical that with one hand the government could create inducements for developers to tackle such assignments and with the other remove equally significant inducements.

If H.R. 13270 is passed, we would be forced to re-examine our potential return on investment in relation to the additional time and risks this project would entail. Our resopnse, I believe, is typical of others involved in urban retail redevelopment projects.

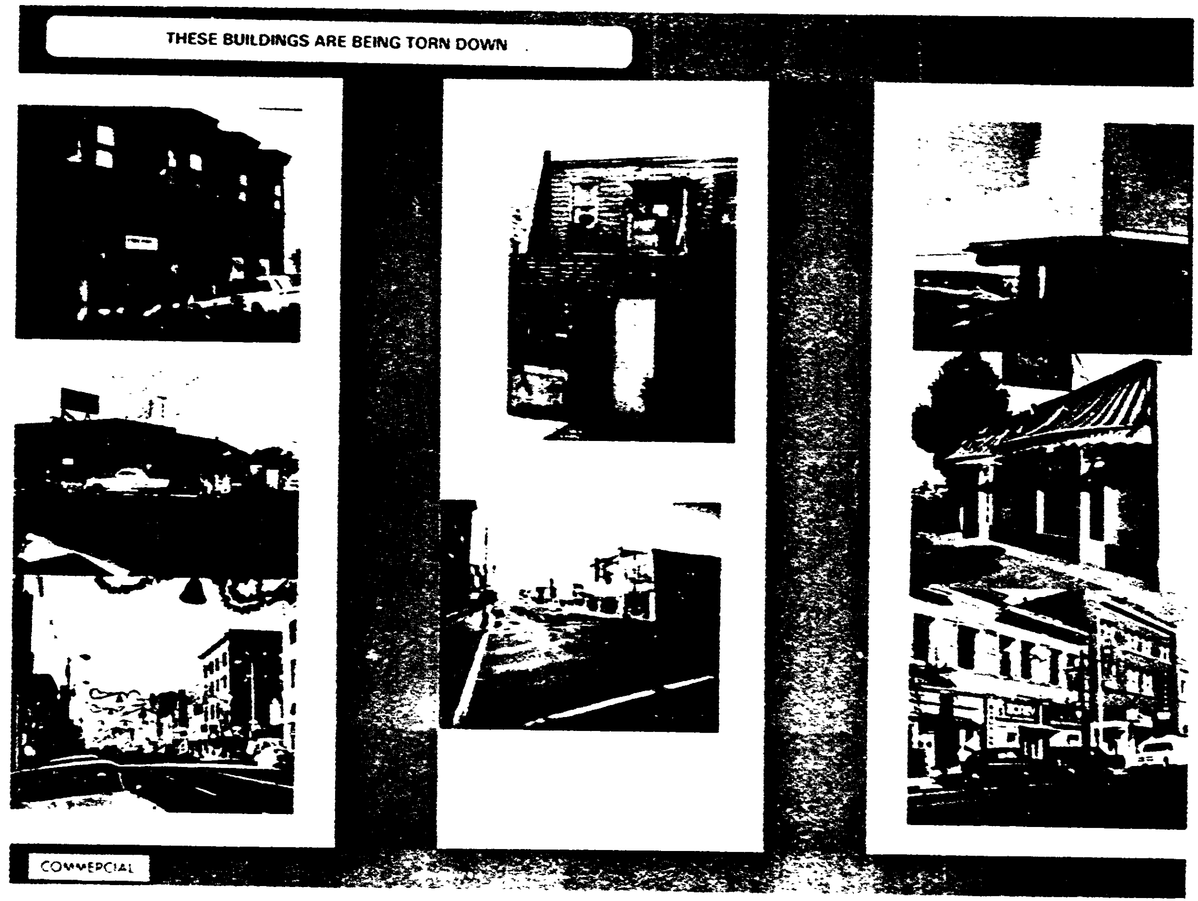
BLACK SHOPPING CENTER DEVELOPMENT

The International Council of Shopping Centers has played an active role in helping to train black businessmen and community groups who are now attempting to develop shopping centers in at least 50 major cities. These centers will help to redevelop slum areas. They will help set up new businesses. They will create jobs for members of minority groups.

These centers need every possible financial assistance to become economically self-sufficient. Unless they are able to avail themselves of accelerated depreciation and other tax reductions, they will have added obstacles to overcome.

NET LEASE HAS WRONG TARGET

In the shopping center industry, Section 221 of H.R. 13270 will apparently apply not only to the passive investor, but also to the active developer. Under the definitions in the law, most shopping centers and their leases would qualify as "net leases." The allowable operating expenses (as defined) rarely exceed 15 per cent of rental income in virtually all shopping centers and/or shopping center leases.



THESE BUILDINGS ARE BEING TORN DOWN
COMMERCIAL

AND THIS IS THE FUTURE RICHMOND...COMING SOON

We cannot believe that the House intended the entire shopping center industry to come within the scope of this provision.

Section 221 will effectively rule out real estate for all investors except those with substantial amounts of liquid funds but seeking a much higher return on investment than is now available.

Shopping center developers are in the "trade" and/or "business" of developing and operating shopping centers. They are not passive investors. Yet the Limitation on the Deduction of Interest applies to developers as if they were passive investors and rules them out of the "trade or business." Section 221 creates other inequities as well, which were pointed out by the Treasury when it recommended that Section 221 be deleted. We strongly support their stand.

CONCLUSION

The shopping center industry is already in a precarious position. Rising interest rates appear to be only a nuisance to large corporations. For shopping center developers, they are a disaster. A 1 per cent increase in the mortgage loan rate, for example, reduced the yield on invested capital in one of our recent centers by 75 per cent. Profit margins are being eroded further by runaway construction costs, land prices and rising property taxes unrelated to income.

The most recent Treasury proposal to treat interest, taxes and rents paid by a developer during the period of construction as Limited Tax Preference items would impose yet another burden upon the developer.

This proposal together with the serious immediate repercussions and long-range consequences of those provisions of the Tax Reform Act affecting our industry have a cumulative effect. They may represent the breaking point for the shopping center industry. Although the economy might conceivably survive its demise, such is obviously not the purpose of either the House or the Senate.

The serious implications of such an eventuality in the form of lost jobs, inadequate retail facilities, inflationary pressures, curtailment of tax revenue for local government bodies, retarded urban redevelopment, and perhaps most serious, accelerated economic concentration cannot be overlooked or underemphasized.

I wish to emphasize that we favor a minimum tax for every taxpayer. H.R. 13270, however, excluded the oil industry from its provisions. The Treasury now recommends excluding interest on municipal and state bonds along with the appreciated value of assets contributed to charity. This would be manifestly unfair to the real estate industry and to the so-called gentleman farmer. In our opinion, there should be a minimum tax and everyone should pay it.

Finally, there is a basic social and philosophical principle at stake in this bill. America and its economy have been built by risk-takers, the entrepreneurs. America has motivated men to take these risks by offering them incentives.

Our shopping center industry also has been built by risks and skills activated by incentives. At a time when it is trying to weather the economic storms for survival, we genuinely hope that you will recognize the industry's contribution to our society and not deprive it of its most crucial driving force.

I appreciate this opportunity to present our viewpoint to you and respectfully hope that our observations may help you in your deliberations.

APPENDIX A—SHOPPING CENTER INDUSTRY STATISTICS

In the aggregate, the shopping center industry in the United States represents an investment of approximately $33.4 billion in construction alone. An additional $21 billion is estimated to have been expended to equip the retail stores in the nation's shopping centers. They currently supply employment for an estimated 4,500,000 persons.

In the next dozen years, 1969 through 1980, shopping center construction (if permitted to occur by the tax law, and by the cost and availability of money) and equipment installed in shopping center stores would require the expenditure of an estimated $180 billion (in 1968 dollars).* This expenditure is exclusive of money spent for land.

By 1980, shopping centers, if built according to our projections, will account for the annual employment of some 18,440,000 persons. Although managers and department heads are highly skilled persons, a very large proportion of retail workers are relatively unskilled and, in a large number of cases, are marginal

*Shopping center construction would make up some 90 per cent of total retail store construction.

employees. The unskilled and marginal employees, many of them part-timers, would in many cases find it difficult to obtain other employment and would have to be supported by the public treasury. Many are employed at or close to minimum wages, adjusted for urban or non-urban factors.

Shopping centers in the United States currently account for 42 per cent of all retail trade, exclusive of automobiles, service stations, hay, grain, feed, fuel, ice and lumber. By 1980, their share of the retail market should approximate 50 per cent.

For 1968, retail sales in shopping centers in the United States were some $87.8 billion dollars. They are projected at $94.5 billion for 1969.

The overwhelming majority of shopping centers in the United States are small projects. Centers of less than 100,000 square feet number 6,500, and centers running from 101,000 square feet to 200,000 square feet number 2,800. To round out the picture, centers from 201,000 square feet to 400,000 square feet number 1,000, and centers larger than 401,000 square feet number 520, as of the end of 1968.

APPENDIX B—A COMPARISON OF INCREASES IN KEY ITEMS OF SHOPPING CENTER COSTS, 1965-69

Item	1965	1967	1969	Increment 1965-69 (percent)
Prime interest rates [1]	4.5	5.6	8.5	88.9
Construction cost index [2]	117.2	130.2	148.7	26.9
Property tax index [3]	128.4	148.1	165.0	28.5
Land price index [4]	100	110	120	20.0
Shopping center rents [5]	$1.83	$1.94	$2.05	12.0

[1] U.S. Housing Foundation, August 1969.
[2] Construction cost index by E. H. Boeckh, commercial and industrial buildings, as reported in Survey of Current Business, U.S. Department of Commerce (various issues).
[3] Price deflator index for retail component of GNP, as reported in Survey of Current Business, U.S. Department of Commerce (national income issue).
[4] Commercial land price index (estimate by ICSC based on 5 percent land cost appreciation per year).
[5] Average rents in regional shopping centers per square foot of gross leasable area—"Dollars and Cents of Shopping Centers," published by Urban Land Institute.

The CHAIRMAN. Now the next witness will be Mr. Philip N. Brownstein, Council of Housing Producers.

Will you proceed, sir?

STATEMENT OF PHILIP N. BROWNSTEIN, COUNSEL, COUNCIL OF HOUSING PRODUCERS

Mr. BROWNSTEIN. Thank you, Mr. Chairman, and members of the committee. I am Philip Brownstein and I am appearing here today on behalf of the Council of Housing Producers.

The council is made up of 15 of the largest producers of housing in the country, and they are concerned about some of the serious consequences which may result from the treatment that is being accorded to real estate in the House-passed measure.

I have a statement that I have filed for the record, Mr. Chairman, and I will summarize briefly the contents of that statement.

It was only about 14 months ago that there was signed into law the Housing Act of 1968 which was indeed a landmark piece of legislation, and which was termed the Magna Carta of Housing.

Here we are 14 months later worrying about how far we are going to miss in achieving the housing goals that were set in that basic legislation, and producing at about one-half the needed rate. It was at that time that Congress accepted the fact that we did have to have housing goals in this Nation and that over the next 10 years it would take 26 million dwelling units in order to meet the need. The goals were based on need.

The housing legislation of 1968 was to produce the tools for achieving those goals. We are already well behind in trying to meet the goals.

In January of this year housing starts were at an annual adjusted rate of about 1,900,000 units. In August of this year they had declined to about 1,300,000 units; more than a 30-percent drop. This is certainly no way to start meeting the goals which require aiming toward an annual rate of nearly 3 million units, and the bill which is before you now is going to be a further retarding measure if enacted.

The treatment which is being accorded the real estate industry can do nothing but depress an industry which already is depressed. The 30-percent decline in housing starts is going to decline further before the end of this year and unless there is a turnaround in the mortgage supply we can expect to approach the million mark.

Rather than seek methods of retarding housing further, I think that our principal objective ought to be how we can stimulate housing construction in order to meet this pent-up demand.

We now have the lowest vacancy rate in many of our major cities that we have had since the end of World War II. We have a vacancy rate in many major cities of less than 1 percent. We are in critical need of low- and moderate-income housing.

The programs that were established in the Housing Act of 1968 were, in large measure, aimed at nonprofit, limited-dividend, and cooperative sponsorship.

If we are to stimulate rental residential construction it will have to be through the stimulation caused through the limited-dividends route, and in the FHA programs the dividend on equity investment is limited to 6 percent.

In these days when high-grade corporate bonds are yielding in excess of 8 percent and yields on Governments approaching that amount, it is not hard to understand that you are going to have very few equity investors going in the program for a 6-percent limited-dividend return.

The reason that they have been active, the reason that they have participated, is because of the incentives that were created through the tax benefits, and if those incentives are removed you are also going to remove the risk capital of the equity investor.

The points to which I would like to address myself, and to mention to this committee, are in two principal areas. First, there is double declining depreciation permissible for new residential construction, but that really is not a tax benefit. It merely is a tax deferral, because the depreciation which is accelerated, that which is taken above straight line, is taxable at ordinary income rates rather than at capital gain rates when the property is sold, and it is taxable in full in the year of sale.

Secondly, the market on existing projects is going to be narrowed very, very sharply because the tax incentives are being taken away from existing projects since they could be depreciated only at straight line.

The investor who acquires an existing project is doing so on the basis of a yield that he expects to obtain. He expects to obtain some part of that yield, currently, through his cash flow and some part through his tax incentive. If he does not get it through the tax incentive there is only one other way that he can achieve the yield that he expects and requires for the risk equity that he puts in and that is through increased rentals. I believe that if you enact this tax bill you are going to see millions of rental units in this country which are going to have the rents raised very substantially, and it is going to hurt worse those people who can least afford it. These are the low- and moderate-income families in our country.

There are two other provisions in this bill that I would like to mention briefly for the consideration of this committee, Mr. Chairman.

One is the proposal on cutting back the depreciation on commercial construction. This is important to housing because commercial and residential go hand in hand, particularly in the development of outlying areas. In the development of new communities, if you can't get commercial property developed then it will not be possible to get residential property developed.

And the final point that I would like to ask the committee to consider carefully is that dealing with the tax treatment of thrift institutions. Mortgage credit is the lifeline of the housing industry, which already is depressed. Mortgage credit is in as short supply as it has been since the credit crunch of 1966, and the thrift institutions have been suffering by withdrawals into other more attractive forms of investment of their savings. They are being hit hard in this pending legislation, and we would urge the Congress to consider the impact that this, too, will have on housing.

We believe that the problem is to get on with the job of providing the housing that the families in this country need, and the council would urge the Congress to consider ways and means of improving the flow of mortgage credit and improving the mechanisms for providing housing rather than this present legislation which will indeed have the opposite effect, Thank you, Mr. Chairman.

The CHAIRMAN. Thank you very much.

Senator CURTIS. Mr. Chairman, are we entitled to one question?

The CHAIRMAN. If you want to, go ahead.

Senator CURTIS. Is it true some savings and loan companies will have their tax doubled by this bill?

Mr. BROWNSTEIN. Senator Curtis, I have heard that it would be very substantial and would in some cases have that effect.

Senator CURTIS. That is all.

The CHAIRMAN. Thank you very much.

(Philip N. Brownstein's prepared statement follows:)

STATEMENT OF PHILIP N. BROWNSTEIN ON BEHALF OF THE COUNCIL OF HOUSING PRODUCERS

SUMMARY

Housing production is totally dependent upon capital availability. In the case of sales housing the need is primarily for mortgage credit. While this, of course, is equally true with respect to the production of rental housing, in the latter case there is the added need for long term equity capital. And this need for equity investors is what is concerning the Council in the tax measures now being considered by the Congress.

Of particular concern to the Council is the proposed elimination of accelerated depreciation on existing residential property and the treatment of recaptured equity as ordinary income to the extent that accelerated depreciation has been taken on new residential property during the period of initial ownership.

The Council is also concerned about the depreciation formula for commercial property. The lack of commercial facilities will seriously hamper the development of new areas, especially those in outlying regions and in new communities.

Since the life line of production of housing is mortgage credit and since the major suppliers of this credit, particularly for home financing, have been the thrift institutions, the Council would urge that this be considered when looking at the tax structure of these institutions.

STATEMENT

Mr. Chairman and members of the committee, I appreciate the opportunity of appearing here today on behalf of the Council of Housing Producers. The Council was founded in February, 1968, to provide leadership in the broader involvement by private industry with government in helping meet the Nation's housing needs. It is comprised of 15 of America's largest housing producers.

The Council completely supports the housing goals established in the Housing and Urban Development Act of 1968 and intends to use all of its resources in trying to see that these goals are achieved. It also supports Secretary Romney's efforts in Operation Breakthrough, and a number of members contemplate submitting proposals for consideration. We are hopeful this will demonstrate that relieved of some of the existing constraints and impediments, meaningful savings in housing construction may be achieved.

Housing, as you know, is always adversely affected disproportionately during periods of monetary restraint. This is now occurring, and as a consequence we are witnessing a substantial decline in housing starts instead of the increase needed to begin meeting our housing goals. The rosey pronouncements which accompanied the passage of the 1968 landmark legislation are indeed taking on a somber hue. Starts have dropped from an adjusted annual rate of nearly 1.9 million in January of this year to about 1.3 million in August. If the trend in the availability of mortgage credit is not promptly reversed, it is likely that by year end housing starts will have declined to even considerably lower levels.

Housing production is totally dependent upon capital availability. In the case of sales housing the need is primarily for mortgage credit. While this, of course, is equally true with respect to the production of rental housing, in the latter case there is the added need for long term equity capital. And this need for equity investors is what is concerning the council in the tax measures now being considered by the Congress.

The Council was gratified that the measure approved by the House recognized the need for continuing accelerated depreciation for new residential construction. Also, the encouragement given to rehabilitation by permitting the amortization of such expenditures over a 60 month period may stimulate activity in this important area which has too long been neglected.

Real estate investments by their very nature lack liquidity and carry a high degree of risk. It is fairly customary that during the early life of a rental project, during the so-called rent-up period, not only is no income generated but, in fact, the project often shows a deficit due to the excess of operating expenses over rents received. In the case of housing projects built under the subsidy programs of HUD and sponsored by limited dividend groups, the return to the investor is limited 6% on the amount of investment. With the yield on Government securities approaching 8% and on good grade corporate bonds exceeding that amount, it is clear that the attractiveness of HUD's limited dividend investment programs is not the cash return. This is also true to a large degree in conventional, non-subsidized projects. The interest of equity investors is sparked largely by the tax advantages which the investor receives. As a matter of fact, the National Corporation for Housing Partnerships, created by the 1968 Housing Act to assist in the production of low and moderate income-housing, and which is just getting underway, depends in great measure of the tax benefits to give its investors a satisfactory return. This was contemplated in the legislation, and it is the basis on which the incorporators and officers have proceeded.

The major concern of the Council with regard to the legislation under consideration is that relating to the depreciation provisions respecting residential property and with the tax treatment provided for recapture in the event of sale. But there are two other important provisions having a bearing on residential property production which will be mentioned briefly.

First, as indicated earlier, the life line of housing production is mortgage credit. The principal suppliers of this credit, especially in the home financing field, have been the thrift institutions—savings and loan associations and mutual savings banks. The effect of high returns on other investments, including government securities, has taken its toll on these institutions as they have suffered heavy withdrawals of savers' funds. This is being felt in the home building industry.

Financing commitments are difficult, and at time impossible, to obtain simply because funds are lacking. Undoubtedly these are matters which the Congress will want to consider when looking at the tax structure of these institutions.

Mortgage investments must be encouraged—not discouraged. To meet the housing goals Congress established by the 1968 Housing Act—26 million units during the next 10 years—capital must be attracted from other sources. The Ginny Mae collateralized mortgaged notes hopefully will attract new credit sources, such as pension and welfare funds, but the investment itself still must be attractive. The entire base of investment capital in housing must be widely broadened if these goals are to be met.

The second item in which we would like to touch is the depreciation formula for commercial property. Residential and commercial development often go hand in hand. In areas being newly developed, adequate commercial facilities are essential if residential construction is to proceed. If construction of commercial facilities should become unattractive to investors, it will seriously hamper the development of new areas, especially in outlying areas and in connection with the undertaking of new communities. We would urge that these considerations be given effect in determining the tax treatment to be accorded commercial real estate.

Of particular concern to the Council is the proposed elimination of accelerated depreciation on existing residential property and the treatment of recaptured equity as ordinary income to the extent that accelerated depreciation has been taken on new residential property during the period of initial ownership.

An investor is willing to risk the capital required to develop residential property only if the prospects for receiving what he believes is an adequate return are reasonably good. Inherent in the plans of many of those willing to supply the necessary equity capital is the contemplation of accelerating the depreciation allowance for a number of years in order to raise the effective yield from the investment to an amount reasonably commensurate with the risks and in keeping with the competitive demand for investment capital. Such plans further contemplate the sale of the property when this yield can no longer be obtained. This can be done because there is a ready market of other equity investors who are looking for investments which supplement a limited return with a tax benefit derived through property depreciation allowances. If the depreciation allowance is reduced and the investment accordingly is no longer as attractive as other investment opportunities, the market on existing projects will become quite limited. This being the case, investors will be most reluctant to undertake new projects knowing that when retention is no longer profitable there may be difficulty experienced in effecting a sale at a reasonable price.

This can have a very serious effect also on the existing supply of rental property. If investors are unable, in effect, to augment their yield through the allowance for depreciation, there is only one other way to increase the yield they believe their equity investment warrants. That would be by increasing rentals to compensate for the return which is otherwise lost. As a consequence, this could mean very substantial rent increases on the hundreds of thousands of rental units in which this would be an important factor. Very likely, the savings in tax to the individual through tax reform measures would be totally lost trough increased rents.

The tight rental housing market with which most areas are faced today, and indeed this is acute in some areas, very nearly eliminates any options on the part of the tenants to seek other accommodations. According to Census Bureau statistics available housing is at its lowest level since 1957 with the vacancy rated at 5% of the supply during the second quarter of this year for rental units and less than 1% for sales housing. Rental housing availability has been shrinking steadily from 7.7% in late 1965 and homeowner vacancies are off from 1.4% in 1966.

Faced with rent increases which must assuredly follow a decrease in the production of rental units, the public must either allot a disproportionate share of their income to shelter cost or possibly go into a substandard unit. The scarcity of available housing actually is a major contributing factor to inflation. Any move in the direction of further retarding housing production by discouraging private investment will certainly be counter productive by worsening the housing shortgage and forcing up rentals thus aggravating inflationary conditions.

The provisions in the House approved bill which would tax as ordinary income all or most of the gain on the sale of investment property, that is the amount attributable to the benefit derived from accelerated depreciation is equally serious. As a matter of fact, it virtually negates the advantage ostensibly given to the

production of new residential construction by permitting accelerated depreciation in the first instance. What it really does is merely defer the tax payment. Not only does it require the taxation of the accelerated depreciation at ordinary income rates, but the bill would also make the entire amount of deferred income payable in the year of sale. This large sum payable in one taxable year would be a further deterrent to equity investors. Given various investment alternatives, it is quite probable that much of the needed capital would be channeled to other sources.

The need is for an inducement to the equity investor to risk his capital so that we can begin a program of housing production which will meet our Nation's needs. Housing production, as pointed our earlier, is suffering from the effects of a restrictive monetary policy. To aggravate further this critical condition by superimposing tax laws which discourage the investment of equity capital in the housing industry could well create an imbalance in the economy of our country which will be borne by the segment of our population who can least afford it, that is the low and moderate-income family that must rent its shelter. We are well behind the production schedule necessary to be maintained in order to meet the 10 year housing goals. We can ill-afford additional impediments which will not only make the goals impossible of achievement in eliminating substandard housing, but may indeed help to bring about even more severe housing shortages in many areas.

The CHAIRMAN. The next witness is Mr. Joseph Sexton, chairman of the Federal legislative committee of the National Apartment Association.

STATEMENT OF JOSEPH F. SEXTON, CHAIRMAN, FEDERAL LEGISLATIVE COMMITTEE, NATIONAL APARTMENT ASSOCIATION

Mr. SEXTON. I am Joseph Sexton of Indianapolis, Ind.

Mr. Chairman, and members of the Senate Finance Committee, I wish to take this opportunity to thank you for the privilege of appearing before you today on behalf of the National Apartment Association. It is an organization of some 16,000 members involved in the ownership and management of apartments throughout the United States.

Our general prepared testimony deals with the problems involved in our industry today and I wish to elaborate upon this as well as upon the tax bill as approved by the House of Representatives.

During the past 8 months housing starts in the United States have dropped from 1,900,000 to 1,340,000—a 35-percent drop. Because of this drop in production, vacancies in apartments, especially in the medium- and low-rent range (are almost nil at the present time. Our national housing goal was set at 2.6 million units by the Housing Act of 1968, which this Congress enacted.

The Douglas Commission on Urban Problems, the Kaiser Committee on Urban Housing, and the Joint Economic Committee, as recently as April of this year, have all recommended that added incentives be granted the housing industry to stimulate construction of single and multifamily residences. In the face of this, the pending tax reform bill would bring about a further reduction in starts of multifamily residential construction as well as rent increases for many American families.

The further reduction will be brought about because the returns to equity capital will be so greatly impaired by this law as to reduce capital investment in apartments. It would tend to flow to mortgages, bonds, and other forms of investment, which have as good or better yield without the corresponding risk.

Real estate, being a nonliquid asset is not looked upon with favor by equity investors as a desirable form of investment. It takes the tax incentives which are currently provided to stimulate this type of development.

The National Apartment Association recommends that H.R. 13270 be amended to retain the 150-percent declining balance method of depreciation on used apartments. The straight-line method is unrealistic in the light of the long useful lives which the Treasury has insisted upon, lives which do not reflect technological obsolescence. So unrealistic is the straight-line method, that denial of the 150-percent method will seriously limit the resale market, thereby discouraging the development of new multifamily projects.

Our association strongly objects to the harsh recapture provision in the House bill which would tax all the gain on the sale as ordinary income to the extent of the depreciation taken in excess of straight line. No attempt is made to differentiate between the short-term holder and the long-term investor; certainly this underscores how unreasonable is this provision. Our association recommends instead that during the first 5 years of the holding period the depreciation taken in excess of straight line be taxed as ordinary income but thereafter the percentage of gain taxed as ordinary income be reduced 1 percent per month. Certainly, one who holds property more than 13 years should be entitled to have all his gain taxed at capital gains rates.

We further recommend that, in view of the desire of our Government to stimulate more housing, reexamination of the limited tax preference penalties on real estate be examined.

The limit on tax preferences (LTP) was originally devised to prevent high-income persons from escaping taxation. As it has now been watered down, hobby farming may escape it by the use of accrual method of accounting; oil is exempted from it; in the bulk of the income from municipal bonds which is exempted, the Treasury has recommended elimination not only of any reference to State and municipal bonds but also the appreciated value of assets donated to charity. Thus, the prime target of the limited tax preference plan now turns out to be real estate, the one area in our economy which can stand the least the cutback which would inevitable result from the provisions in the House approved bill. While our economy grew at a rate in excess of 5 percent in the last 8 years and capital investment grew at a rate of almost 10 percent, housing starts grew at a rate of only one-half of 1 percent. If this proposed House bill is adopted in its present form it will create an economic condition in which the shortages will be further compounded, in which rents will be forced to rise because of a lack of adequate return to the investor.

This will cause extreme dislocation to our economy and will produce more people in need of subsidized housing, which is just the opposite of our national goal. Our goal should be an increase of supply through tax incentives, if necessary, rather than a reduction of supply through elimination of existing incentives.

Retention of existing law will hold down rental increases throughout the country except to the reasonable extent made necessary by increases in construction costs, land costs, and interest charges.

Real estate which had the least amount of claimed escape in dollars and the various problem areas presented by the Treasury Department has received the greatest amount of penalty at a time when all segments of Government feel that housing needs the greatest incentive.

We sincerely hope you will consider the following amendment:

1. Permit the 150-percent depreciation method for used income property.

2. Revise the recapture provision to provide that during the first 5 years of the holding period the depreciation taken in excess of straight line be taxed as ordinary income but thereafter the percentage of gain taxed as ordinary income be reduced by 1 percent per month.

3. Reexamine the limited tax preference penalties on real estate.

Your favorable action on these proposals we feel will be a great help in accomplishing our goal of providing adequate housing for the American society in the years to come.

Because of the limitations of time I respectfully request that the balance of my statement be incorporated in the record. Gentlemen, thank you.

The CHAIRMAN. Thank you very much, Mr. Sexton.

(Joseph F. Sexton's prepared statement follows:)

STATEMENT OF JOSEPH F. SEXTON, CHAIRMAN, FEDERAL LEGISLATIVE COMMITTEE OF THE NATIONAL APARTMENT ASSOCIATION

STATEMENT

Mr. Chairman and Members of the Senate Finance Committee, I wish to take this opportunity to thank you for the privilege of appearing before you today on behalf of the National Apartment Association, an organization of some 16,000 members involved in the ownership and management of apartments throughout the United States.

Our general prepared testimony deals with the problems involved in our industry today and I wish to elaborate upon this as well as upon the tax bill as approved by the House of Representatives.

During the last 8 months, housing starts in the United States have dropped from 1,900,000 to 1,340,000—a 35% drop. Because of this drop in production, vacancies in apartments, especially in the low and moderate rent range, are almost nil at the present time. Our national housing goal was set at 2.6 million units by the Housing Act of 1968, which this Congress enacted.

The Douglas Commission on Urban Problems, the Kaiser Committee on Urban Housing, and the Joint Economic Committee, as recently as April of this year, have recommended that added incentives be granted the housing industry to stimulate construction of single and multi-family residences. In the face of this, the pending tax reform bill would bring a sharp reduction in starts of multi-family residential construction as well as rent increases for many American families.

This further reduction will be brought about because the returns to equity capital will be so greatly impaired by this law as to reduce capital investment in apartments. It would tend to flow to mortgages, bonds, and other forms of investment, which generally provide more yield without corresponding risk.

Real estate, being a non-liquid asset, is not looked upon with favor by equity investors as a desirable form of investment. It takes the tax incentives which are currently provided to stimulate this type of development.

The National Apartment Association recommends that H.R. 13270 be amended to retain the 150% declining balance method of depreciation on used apartments. The straight-line method is unrealistic in the light of the long useful lives which the Treasury has insisted upon, lives which do not reflect technological obsolescence. So unrealistic is the straight-line method, that denial of the 150% method will seriously limit the resale market thereby discouraging the development of new multi-family projects. The July 24th cut-off date has already had a serious impact by discouraging investors from purchasing apartments!

Our Association strongly objects to the harsh recapture provision in the House bill which would tax all the gain on the sale as ordinary income to the extent of the depreciation taken in excess of straight-line. *No attempt is made to differentiate between the short-term holder and the long-term investor; certainly,* *this underscores the unreasonableness of this provision.* Our Association recommends instead that during the first five years of the holding period the depreciation taken in excess of straight-line be taxed as ordinary income but thereafter the percentage of gain taxed as ordinary income be reduced 1% per month. Certainly, one who holds property more than thirteen years should be entitled to have all his gain taxed at capital gains rates.

We further recommend that in view of the desire of our government to stimulate more housing, re-examination of the limited tax preference penalties on real estate be examined.

The limit on tax preferences (LTP) was originally devised to prevent high income persons from escaping taxation. As it has now been watered down, hobby farming may escape it by the use of accrual method of accounting; oil is exempted from it; the bulk of the income from municipal bonds is exempted, the Treasury has recommended elimination not only of any reference to state and municipal bonds but also the appreciated value of assets donated to charity. Thus, the prime target of this area now turns out to be real estate, the one area in our economy which can stand the least the cut-back which would inevitably result from the provisions in the House-approved bill. While our economy grew at a rate in excess of 5% in the last 8 years and capital investment grew at a rate of almost 10%, housing starts grew at a rate of only ½ of 1%. If we do not stimulate housing, we will find a situation in which the shortages will be further compounded, in which rents will then be forced to rise because of lack of supply. This will cause extreme dislocation to our economy and will produce more people in need of subsidized housing which is just the opposite of our national goal. Our goal should be an increase of supply through tax incentives, if necessary, rather than a reduction through elimination of existing incentives.

Retention of existing law will hold down rental increases throughout the country except to the reasonable extent made necessary by increases in construction costs, land costs, and interest charges without the added problem of a market which has imbalance on the demand side which is now occuring.

It is indeed strange that real estate which had the least amount of claimed escape in dollars and the various problem areas presented by the Treasury Department has received the greatest amount of penalty at a time when all segments of government feel that housing needs the greatest incentive. We feel that your amending this legislation will enable us to accomplish our goal of providing adequate housing for all American families in the years to come.

Because of the limitation of time on this presentation I respectfully request that the balance of my statement be incorporated in the record.

The multi-family residential real estate industry

(a) *Scope of the Industry.* Multi-family residential real estate is a billion dollar industry in the United States. As of the end of 1968 there were 68,000,000 housing units in the United States, including both multi-family and single family units. The number of multi-family units (5 or more units under one roof) added annually over the past few years is as follows:

1966	345, 700
1967	392, 200
1968 (Value: $7,300,000,000)	548, 800

The apartment industry employs an enormous number of construction workers, consumes a huge amount of construction materials and employs many additional personnel as managers and operators of apartment projects.

The apartment industry is one of the significant areas in the American economy where the small businessman is a key factor. The typical apartment builder is a small businessman. Past experience has demonstrated that events having an adverse effect on the apartment industry (such as expensive or unavailable financing) not only have a serious effect on the tenant (Housing shortages and higher rents) and the apartment industry as a whole but have a particularly serious effect on the small builder. Big builders can ride out these problems. Small builders often cannot.

(b) *Typical Example of an Apartment Project.* In order to illustrate the applicability of the tax provisions involved to a typical apartment project, let me set forth an example of a typical residential project within my own experience. The figures on page 5 use a hypothetical 6% mortgage such as might have been obtained 2 or 3 years ago; the figures on page 6 use the actual 7½% mortgage committed for last summer. (Such a mortgage today would carry an interest rate of at least 8½%.)

81-UNIT APARTMENT PROJECT

Land	$175,000
Building	825,000
Total	1,000,000
Mortgage	750,000
Equity	250,000
Total	1,000,000

1ST YEAR, 6 PERCENT MORTGAGE, 8 PERCENT CONSTANT[1]

[Figures are rounded]

	Occupancy			
	100 percent	95 percent	90 percent	80 percent
1. Gross annual income	$160,000	$152,000	$144,000	$128,000
2. Operating expenses (not including debt service)	64,000	64,000	64,000	64,000
3. Net income (before debt service)	96,000	88,000	80,000	64,000
4. Interest on first mortgage	45,000	45,000	45,000	45,000
5. Net income (after interest deductions)	51,000	43,000	35,000	19,000
6. Depreciation (40 years, DDB)	41,250	41,250	41,250	41,250
7. Taxable income (5 less 6)	9,750	1,750	(6,250)	(22,250)
8. Mortgage amortization	15,000	15,000	15,000	15,000
9. Cash flow (5 less 8)	36,000	28,000	20,000	4,000
10. Return on equity (percent)	14.4	11.2	8.0	1.6

[1] Annual payments of principal and interest equal 8 percent of the original principal amount of the mortgage loan.

81-UNIT APARTMENT PROJECT

Land	$175,000
Building	825,000
Total	1,000,000
Mortgage	750,000
Equity	250,000
Total	1,000,000

1ST YEAR 7½-PERCENT MORTGAGE PLUS 2½ PERCENT OF GROSS[1]—9.1 PERCENT CONSTANT[2]
[Figures are rounded]

	Percent occupancy			
	100	95	90	80
1. Gross annual income	$160,000	$152,000	$144,000	$128,000
2. Operating expenses (not including debt service)	64,000	64,000	64,000	64,000
3. Net income (before debt service)	96,000	88,000	80,000	64,000
4. Interest on 1st mortgage	56,250	56,250	56,250	56,250
5. Net income (after interest deductions)	39,750	31,750	23,750	7,750
6. Depreciation (40 years, DDB)	41,250	41,250	41,250	41,250
7. Taxable income (5 less 6)	(1,500)	(9,500)	(17,500)	(33,500)
8. Mortgage amortization	12,000	12,000	12,000	12,000
9. Cash flow (before mortgagee share)	27,750	19,750	11,750	(4,250)
10. Less 2½ percent gross[1]	4,000	3,800	3,600	3,200
11. Cash flow	23,750	15,950	8,150	(7,450)
12. Return on equity (percent)	9.5	6.5	3.3	[3]

[1] The lender receives 2½ percent of the gross revenue as additional interest over and above the 7½ percent.
[2] Annual payments of principal and interest equal 9.1 percent of the original principal amount of the mortgage loan.
[3] Negative.

Note: The foregoing example illustrates a number of points which are typical of multifamily real estate.

(1) The net return to the investor is very sensitive to changes in occupancy. A drop from 95% occupancy to 80% occupancy reduces an 11.2% return with a 6% mortgage to 1.6% and reduces a 6.5% return with the 7½% mortgage to a cash loss of $7,450.

(2) The net return to the investor is also very sensitive to financing changes, shifting from a 6% to the 7½% mortgage drops the return at 95% occupancy from 11.2% to 6.5% and at 90% occupancy from 8% to 3.3%.

(3) Variations in operating expenses can have a significant effect. For example, 40% of the gross income has been used as the estimate of operating expenses. I know of instances in which actual operating expenses have been higher. Furthermore, when there are vacancies, operating expenses are often even higher because of turnover expenses such as repainting.

(4) From the time land is contracted for until cash flow begins will take a minimum of 18 months to 2 years during which land must be acquired, the site developed, the building constructed and rented. During that period of time, the investor gets no return on his investment and runs the highest risk that something may go wrong which may prevent completion of the project.

(5) If the House-approved bill is enacted without change, the marginal investment (maximum 9.5% return plus some tax benefits) described in the example on p. 6 would be even less attractive with these results: (1) rents would have to be higher on new projects to justify such an investment and (2) many such projects would not be built, with these further consequences: (a) an increased housing shortage, (b) higher rents on existing projects, and (c) more tenants now in non-subsidized housing would be forced into subsidized housing.

(c) *Recent Trends.* The Committee will recall the credit crunch of 1966 when it became clear that there was a significant shortage of capital in the United States, one result of which was that interest rates rose sharply in a trend which is continuing. This shortage of capital continues today. The result is and has been hardship for many areas of American business but the heaviest burden has fallen upon the real estate industry which has found sharply increased costs for financing when it was available and that traditional sources of mortgage financing began allocating more funds to areas other than real estate where they could get higher or equal returns on a shorter term basis with less risk, less bother and less administrative expense.

When a recent Wall Street Journal article is headed "Housing Shortage is Worst in 20 Years, Survey Finds," (3/7/69) if the tax provisions are to be modified they should be made more favorable to real estate investment.

(d) *Capital Supply.* Funds for the acquisition of land and construction of apartments come from two sources, funds lent by mortgage lenders and risk equity capital put up by investors. The apartment industry competes with all other industries in the United States for capital funds. Whenf bonds of good publicly traded corporations, which are readily marketable and salable on a day-to-day basis and which are commanding returns as high as 7% are available, many funds which would otherwise flow into real estate mortgages at 8% or 8½% will instead flow into these corporate obligations. Similarly, when investors who might otherwise invest in real estate equities get returns of 7%–8% on corporate obligations and 8% on first mortgages which have substantially less risk than equity capital, funds tend to shift away from equity investment. Without the risk capital of the equity investor it is not possible to build apartment units. Present financial trends in the United States have combined to cause a slow down in the flow of both mortgage funds and risk equity capital to the apartment industry thereby holding back needed apartment construction.

What does the risk capital equity real estate investor obtain for his investment? To attract this capital today when he could get an 8% return on a first mortgage and a 10 or 11% return on a commercial real estate investment the equity investor in apartment projects is looking for a 12% or better cash return on his investment. At the same time, it should not be overlooked that the owner of an equity interest in an apartment project has a non-liquid asset. It is not traded on an exchange or over the counter. It may or may not be readily salable. When things are going well, when apartments are full, when vacancies are low, when rental income is adequate in relation to operating costs, when apartments have waiting lists, then equity interests in apartments can be sold relatively easily. However, as any of these factors start to soften, the situation changes sharply and in years when the operating costs have increased much more sharply than rents have increased, when financing costs and real estate taxes have increased more than rents have increased or when significant vacancies develop, the real estate investor finds that his investment is either not salable or salable only at a loss. The non-liquid nature of the investment significantly increases the risk.

Fortunately, under the tax laws equity investors in real estate find tax benefits which have helped to attract the risk equity capital which has made possible the construction of the apartment units which have been built over the last several years. Given the serious disadvantages which real estate has in raising capital as compared to other forms of capital investment, if these rules were changed adversely to real estate it would be even more difficult to obtain capital and fewer units would be built, with serious adverse consequences not only to tenants seeking housing but also to the many persons employed in the construction of apartments. Some of the large corporations engaged in building apartments would still be able to withstand these trends, but the typical small builder of apartments would not. In our considered opinion the elimination of accelerated depreciation on new construction and elimination of the 150% method on existing apartments would result in a sharp cut back of rental housing with a serious housing shortage as well as increased rentals as an inevitable consequence.

THE RESIDENTIAL HOUSING SUPPLY AND TAXES

(a) *The Housing and Urban Development Act of 1968.* § 1601 of the Housing and Urban Development Act of 1968 provides:

"The Congress finds that the supply of the Nation's housing is not increasing rapidly enough to meet the national housing goal, established in the Housing Act of 1949, of the 'realization as soon as feasible of the goal of a decent home and a suitable living environment for every American family'. The Congress reaffirms this national housing goal and determines that it can be substantially achieved within the next decade by the construction or rehabilitation of twenty-six million housing units, six million of these for low and moderate income families."

In 1968, 1,500,000 housing units were produced and it is estimated that 1,600,000 to 1,700,000 will be produced in 1969. Accordingly, under the present system we are already falling a 1,000,000 units a year short of the national goal for the current period. Actual production of housing units is only approximately 60% of the national goal.

Of the national goal of 2,600,000 units per year 600,000 units are to be low and middle income housing and 2,000,000 other housing. Not only are we not achieving the goals with respect to production of low and middle income housing but we are far short of achieving the overall goal of total housing units. The current financial and capital picture as indicated above is such that the outlook does not look good for the future in terms of expanding the units produced, even if the present tax rules are left the way they have been for 15 years. We believe that when other Federal laws are being designed to encourage housing production, it would be unsound public policy to change the tax rules to make real estate investment less attractive.

(b) *National Commission on Urban Problems (Douglas Commission).* The National Commission on Urban Problems, chaired by former Senator Paul Douglas, has made an extensive study of urban problems including housing. One of its statutory assignments was a study of "tax policies with respect to their effect on land and property cost and on incentives to build housing and make improvements in existing structures."

Federal taxation as it relates to housing is discussed in Chapter 7, "Federal Income Taxation and Urban Housing" which is contained in Part IV of the Report, Investment Structure, Finance and Taxation.

The Commission concluded (p. 7–10):

"(1) That special tax preferences should not be relied upon as the sole or even the primary instrument to deal with urban housing problems;

(2) That, however, some changes in Federal income tax laws and regulations should be made as soon as possible; and

(3) That there should be vigorous official exploration of certain other potentially significant changes that might improve the tax climate for urban housing."

The Commission also stated (p. 7–10):

". . . [o]ur special concern here is with the effect of present arrangements upon incentives for investment in housing, and it seems clear (1) That existing tax provisions have been 'institutionalized' into a complex set of economic relationships that involve a large volume of investment as well as the provision of rental housing for about one-third of all American families; and (2) That any 'loophole-closing' efforts, if applied only or more strenuously to this than to other competitive investment fields, would probably curtail the flow of resources and managerial efforts into this area. . . ."

The Commission made three recommendations (Report, part IV, Investment Structure, Finance, and Taxation, chapter 7, "Federal Income Taxation and Urban Housing", pp. 7-20-7-22):

1. The Commission recommends that the President direct the Treasury Department to make an intensive analysis and submit explicit findings and recommendations concerning tax law changes best suited to provide materially more favorable treatment for investment in new residential construction (including major rehabilitation) than for other forms of real estate investment.

2. The Commission recommends that the Internal Revenue Code be amended to provide specific incentives for adequate maintenance and rehabilitation of rental residential property by allowing, within appropriate limits, for especially generous tax treatment of investor-owners' expenditures for these purposes with respect to structures of more than some specified age, such as 30 or 40 years.

3. The Commission recommends prompt revision of the Federal income tax laws to provide increased incentives for investment in low- and moderate-income housing, relative to other real estate investment, where such housing is governmentally subsidized and involves a legal limit upon the allowable return on investors' equity capital. Specifically, we propose that the Internal Revenue Code be amended to provide especially favorable treatment (whether through preferential depreciation allowances or through investment credits) for investments made under governmentally-aided limited-profit programs for the construction and rehabilitation of low- and moderate-income housing.

We endorse the three recommendations of the Commission. If our national housing goals are to be met, new incentives must be found for new residential construction. Special incentives are also appropriate for low and middle income housing. It seems to us that the investment credit is a tested method of tax incentive through which this incentive for low and middle income housing could be provided.

(c) *The President's Committee on Urban Housing.* On December 11, 1968 the President's Committee on Urban Housing under the chairmanship of Edward F. Kaiser submitted its final report. This Committee had submitted various reports from June of 1967 to that date and made recommendations which became part of the Housing and Urban Development Act of 1968.

One of the major goals which the Committee seeks to reach is to encourage new investment in low and middle income housing. This was one of the purposes of the National Housing Partnership established by the Housing and Urban Development Act of 1968. To reach this goal the Committee relies heavily on tax incentives.

This point can be illustrated by the Kaiser Committee's discussion of § 221 (d)(3) of the National Housing Act. Under that provision a profit sponsor can be set up on a limited dividend basis, can obtain a 90% mortgage insured by FHA, but is limited to a net cash return of 6% on the 10% equity. The report points out that this return is so low that it would not be at all attractive to investors without the Federal income tax benefits under existing law. Furthermore, even with the current tax benefits under existing law the yield is made substantially more disadvantageous by the existing provisions taxing gain on sale (as long term capital gain except to the extent of ordinary income arising from the recapture of depreciation rules of § 1250). Table 2-6 shows yield in relation to tax bracket, disregarding tax on sale. Table 2-7 shows how the yield is reduced because of the tax on gain on sale.

TABLE 2-6.—CUMULATIVE AVERAGE AFTER-TAX YIELD (INCLUDING 6-PERCENT CASH RETURN AND TAX SAVING) ON INVESTMENT OF $408,000[1] (221(d)(3) BELOW MARKET INTEREST RATE PROJECT) FOR INVESTORS IN 30-, 50-, AND 70-PERCENT BRACKET IGNORING TAX CONSEQUENCES ON SALE

Years before sale[2]	Yield for taxpayer 30-percent bracket			Yield for taxpayer 50-percent bracket			Yield for taxpayer 70-percent bracket		
	Annual return[3]	Discount[4] (percent)	Average[5] (percent)	Annual return[3]	Discount[4] (percent)	Average[5] (percent)	Annual return[3]	Discount[4] (percent)	Average (percent)
1	$77,000		18.9	$128,300		31.4	$179,600		44.0
2	38,600	14.5	1'.2	64,000	24.4	23.6	90,100	37.7	33.1
3	49,800		13.5	66,600		21.1	83,400		28.8
4	46,900		13.0	61,800		19.7	76,700		26.3
5	44,100	12.9	12.6	57,200	19.9	18.5	70,200	27.4	24.5
6	39,700		12.1	49,900		17.5	60,000		22.8
7	37,100		11.7	45,500		16.6	54,000		21.5
8	34,600		11.3	41,400		15.8	48,200		20.3
9	32,200		10.9	37,400		15.0	42,500		19.2
10	29,900	11.3	10.5	33,500	16.8	14.4	37,000	23.2	18.2
11	27,600		10.2	29,700		13.7	31,700		17.2
12	25,400		9.9	26,000		13.1	26,600		16.3
13	23,300		9.5	22,400		12.5	21,600		15.5
14	21,200		9.2	19,000		12.0	16,800		14.7
15	19,200	10.2	8.9	15,600	15.0	11.4	12,100	21.2	13.9
16	17,200		8.6	12,300		10.9	7,500		13.1
17	15,300		8.3	9,100		10.4	3,000		12.4
18	13,500		8.1	6,000		9.9	(1,400)		11.7
19	11,600		7.8	2,900		9.4	(5,700)		11.0
20	9,800	9.4	7.5	(100)	13.8	8.9	(9,900)	20.0	10.3

[1] If real equity is less than $408,000, yields would increase proportionately. Assumes that return is received annually, and that entire equity investment must be made at the beginning of construction.
[2] Assumes 1-year construction period and 1-year break even period.
[3] "Annual return" is the sum of columns A (net cash income) plus applicable column B, C, or D (tax savings) in the table in appendix H-2.
[4] "Discount" represents the average cumulative rate of return on the $408,000 equity, discounted in accordance with accepted financial practice.
[5] "Average" represents the average cumulative rate of return on the $408,000 equity, not discounted.

TABLE 2-7. EFFECT OF TAX ON SALE[1] OF 221(d)(3) BMIR PROJECT ON YIELD,[2] TAXPAYER IN 50-PERCENT TAX BRACKET

	After tax rate of return before sale[3] in percent		After tax rate of return after sale[4] in percent	
	Discount	Average	Discount	Average
Sale after 2 years	24.4	23.6	3.3	3.3
Sale after 5 years	19.9	18.5	5.8	4.5
Sale after 10 years	16.8	14.4	9.7	5.6
Sale after 15 years	15.0	11.4	10.7	4.7
Sale after 20 years	13.8	8.9	11.0	3.5

[1] The sale price is assumed equivalent to the unamortized mortgage amount which would be outstanding had the project initially received 100-percent mortgage financing.
[2] If real equity is less tha $408,000, yields would increase proportionately.
[3] See table 3-4.
[4] Table 3-4 yields reduced by tax counsequences of sale. See appendix H-3.

Accordingly, the report concludes that existing tax provisions are not sufficiently beneficial to the investor to make the project sufficiently attractive and recommends that either the tax to be paid on sale should be added to the sale price which FHA can recognize in the case of a sale of a project to a cooperative condominium or noprofit organization, or that a 3% tax credit of the total replacement cost of the project be provided as an additional incentive or that the tax laws be amended to limit the taxable gain on sale to the amount by which the sale price exceeds the original value of the project, that is equity plus original mortgage. This last approach would mean that there would be no recapture, even at capital gain rates, of depreciation deductions. In other words, the Kaiser Committee concludes that many of the existing tax rules are an important affirmative incentive for investment in low- and middle-income housing, but that some of the existing tax rules discourage such investment.

(d) *The Treasury Study.* Under date of February 5, 1969, there was published a three volume document of the Treasury Department entitled "Tax Reform Studies and Proposals" (herin called Treasury Study). While it contains a large number of proposals involving changes in many areas of the Code, no proposals are made with respect to accelerated depreciation (or for that matter with respect to real estate) except for the proposal with respect to Subchapter S which is discussed below. (pp. 29–30)

Treasury made extensive recommendations in 1961 and 1963 with respect to real estate (which were rejected totally by the Congress in the 1962 Revenue Act and were substantially rejected by the Congress in the 1964 Revenue Act). We think it is significant that after four more years of study by Treasury, including contract studies by economists at the University of California (Treasury Study, p. 451), Treasury made no recommendations. Incidentally, we think the results of the study by the California economists should be made public.

The Treasury Study stated the impossibility of making reliable quantitative estimates of the effect of the tax laws on construction and housing supply in the present state of the economic art. (p. 442). It will be recalled that the Douglas Commission expressed concern that restrictive changes in the existing institutionalized tax provisions would curtail the flow of resources and managerial efforts into housing (see p. 11 above).

In part three of the Treasury Study from pages 438 through 458 under the heading IX C Supplementary Material: Tax Treatment of Real Estate there appears a good bit of material in connection with real estate taxation, but there are no recommendations.

The Treasury Study is devoted solely to the tax effects of current law on real estate situations and does not consider the influence of these tax factors on the housing supply. Both the National Commission on Urban Problems (the Douglas Commission) and the President's Committee on Urban Housing (the Kaiser Committee) considered not only the tax provisions but the effect of the tax provisions on the housing supply. Both of these reports recommend adding additional incentives in certain areas of housing and do not recommend any restrictive changes in any of the existing real estate tax provisions. We think it is highly significant that two independent studies which were concerned with the total picture (the relationship of the tax provisions to the housing supply) and were not concentrating solely on the tax aspects alone have come to two general conclusions which are the same, although some of their specific proposals differ:

(1) No change adverse to the real estate investor should be made in the existing rules;

(2) Additional tax incentives in certain areas of real estate are desirable.

The Treasury Study (pp. 451–458) sets forth figures with respect to (1) 14 real estate operators, (2) 19 real estate investors and (3) 17 real estate owners who sold real estate. The figures given do not indicate that the combination of tax losses and cash profits which resulted in many of these instances were the product of accelerated depreciation rather than other factors, such as itemized deductions and the deduction for long term capital gain. Furthermore, these figures relate to only a few taxpayers selected by the Treasury out of the thousands of returns analyzed by its statisticians.

We believe that it would be an enormous mistake to make basic changes in the tax provisions affecting real estate in order to take care of a situation involving a few taxpayers. The information furnished by the Treasury Department in the Treasury Study does not justify across-the-board changes which would adversely affect hundreds of thousands of taxpayers.

The Treasury Study (p. 442) estimates the revenue cost of accelerated depreciation for residential real estate (apparently including both 150% declining balance and other accelerated depreciation) at $250,000,000 broken down (1) $100,000,000 for older housing, (2) $100,000,000 for semi-luxury and luxury high rise construction and (3) $50,000,000 for low and moderate income housing. Presumably, the second category, although labelled "semi-luxury and luxury high rise" must also include middle income garden apartments, since they do not fit either of the other categories.

EXISTING TAX DISCRIMINATION AGAINST REAL ESTATE

There are two important respects in which the current tax rules discriminate against real estate, the first involves the area of useful lives and the second relates to the investment credit.

USEFUL LIVES

In 1962 when the Treasury Department published depreciation guidelines, Rev. Proc. 62–21, 1962–2 C.B. 418, the useful lives contained therein substantially lowered the useful lives of depreciable assets contained in Bulletin F *except in the case of real estate other than farm real estate:*

	Bulletin F (good-average construction)	Guidelines	Change in useful lives
Apartments	40	40	No change.
Farm buildings	50	25	100-percent reduction.
Office buildings	40-45	45	Increase.

The Treasury position was that unless there were to be full ordinary income recapture of real estate depreciation the useful lives would not be shortened.[1] We believe that it is wrong in principle to deny real estate fair and appropriate useful lives merely because Treasury has been unable to persuade Congress to change the tax laws in another respect which has nothing to do with useful lives.[2]

Many examples can be given to illustrate the incorrectness of the guidelines lives: for example, apartment projects built 10 or 15 years ago without swimming pools and/or without air conditioning are today obsolescent and are unable to compete economically with newer projects. Consider the many apartment projects built after World War II under § 608 of the National Housing Act, most of which are today obsolete.

ACCELERATED DEPRECIATION

Section 167(a) of the Internal Revenue Code provides that there shall be allowed as a depreciation deduction "a reasonable allowance for the exhaustion, wear and tear (including a reasonable allowance for obsolescence)" of income producing property. A substantially similar provision has been in the Code since the Revenue Act of 1913.

With respect to short-lived assets straight line depreciation often represents an economically appropriate reasonable allowance for depreciation. In the case of long-lived assets, such as apartment buildings, straight line depreciation would not cause a proper reflection of annual income where the property is held for many years. In the early years there is realistically a larger annual charge for depreciation (especially for obsolescense) as compared to later years. Accordingly, accelerated depreciation is appropriate for real estate. *This fact has been continually recognized administratively by the Internal Revenue Service for twenty-three years.*

Without benefit of specific statutory authority referring to the use of a declining balance method of depreciation, as early as 1927[3] the Internal Revenue Service recognized the existence of such method. Since 1946,[4] the Internal Revenue Service has recognized that a reasonable allowance for depreciation includes depreciation computed on the declining balance method. In a private ruling in 1946, the Internal Revenue Service approved 150% declining balance depreciation for buildings.[5]

In the Internal Revenue Code of 1954 additional accelerated depreciation was extended by statute to new property, including buildings,[6] up to a maximum of

[1] "Since no action was taken by the Congress to provide recapture of excess depreciation on real estate, the administrative revision of depreciation guidelines in 1962 was confined, in effect, to personal property. While guideline lives were provided for buildings, they were essentially the same as those in Bulletin F with the exception of farm buildings." (Treasury Study, page 447.)

[2] An administrative problem which needs to be improved is persistent reexamining by revenue agents of useful lives and changes in useful lives just 2 or 3 years after another agent, in an extensive examination, has adjusted useful lives. I know of a case where the present agent is trying to increase lives from 30 to 60 years where another agent established them just a few years ago. Ths has the effect of repealing double declining balance depreciation by revenue agent action.

[4] I.T. 3818, 1946–2 C.B. 42.

[5] Special ruling, August 30, 1946, 4 CCH 1946 SFTR 6273.

[6] See H. Rept. No. 1337, 83d Cong., 2d Sess. (1954), p. 23; the 200% declining balance method was provided by the 1954 Code for "rental housing and industrial and commercial building" as well as machinery and equipment.

200% declining balance. The Committee Report,[7] Regulations[8] and a published ruling[9] recognize that 150% declining balance had been available under prior law.

In 1964, in response to Treasury criticism that there was a tax abuse where taxpayers took accelerated depreciation and then disposed of the property in a relatively short time, the Congress enacted § 1250 which provides recapture of all or some real estate depreciation, varying with the holding period of the asset. § 1245 provides total recapture of depreciation for machinery and equipment, unrelated to holding period. Unlike machinery and equipment, real estate is (A) long-lived, not short-lived and (B) owned to a significant extent by individuals subject to sharply progressive income tax rates (14 to 70% without the surcharge). Thus, the § 1245 treatment which applies to relatively short-lived assets substantially owned by corporations is inappropriate for real estate.

The Treasury Study contains no information on what the experience has been under § 1250, which has now been in effect over five years.

The term accelerated depreciation is often used to refer to any depreciation in excess of straight line. In the interest of clarity of thinking, two different kinds of accelerated depreciation need to be distinguished, the accelerated depreciation up to 150% declining balance administratively recognized by the Internal Revenue Service for 23 years as being a reasonable allowance for depreciation and the special accelerated depreciation added by statute in the Internal Revenue Code of 1954 for new property up to 200% declining balance.

An apartment is never worth more *physically* than on the day it opens its door. Thereafter, its equipment is old and it is subjected to falling behind in the development of the art. Refrigerator sizes become larger, air conditioning is introduced, swimming pools are added, new types of carpet come in. The constant changes in equipment and furnishings for an apartment are such that any apartment in the first few years of its life suffers substantially more than straight line depreciation as a matter of economics. This can be illustrated many ways. For example, new apartments tend to have dishwashers; older apartments do not. The cubic foot area of refrigerators has expanded substantially over the years. Projects which are ten years old may have 6 cubic foot refrigerators whereas projects which are being done now have 12 or 15 cubic foot refrigerators. A person looking for a new apartment will naturally tend to prefer one which has the larger capacity refrigerator and a dishwasher. The older apartment project is at a significant competitive disadvantage as compared to the new project.

In the current economy depreciable real property which has been held for many years is often sold at a gain. It is incorrect to assume that this gain demonstrates that the depreciation was excessive. To the contrary, the gain is generally the product of either or both inflation[10] of the price level and increase in the value of non-depreciable land which is a clear capital gains.

The Treasury Study argues that present tax laws encourage frequent turnover of properties and, *therefore*, cause inadequate maintenance. page 443) This conclusion appears to rest on two assumptions: (1) the owner who is holding the property for a longer period will maintain the property well; and (2) the owner who is holding the property for a shorter period will not maintain his property

---

[7] "Under this method [the declining balance method] a uniform rate is applied to unrecovered basis of the asset. Since the basis is always reduced by prior depreciation, the rate is applied to a constantly declining basis. The salvage value is not deducted from the basis prior to applying the rate, snce under this method at the expiration of useful life there remains an undepreciated balance which represents salvage value. The rate to be used under this paragraph may never exceed twice the rate which would have been used had the deduction been computed under the method described in paragraph (1). Under section 23(l) of the 1939 Code the declining balance method was allowed in certain instances but the rate was generally limited to one and one-half times of the rate used under the straight-line method. If this method has been used for property acquired prior to December 31, 1953, it may continue to be used but the rate provided for in paragraph (2) will not be presumed to be reasonable with respect to such property. . . ." H. Rept. No. 1337, 83d Cong., 2d Sess. (1954), p. A48. (As is noted, accelerated depreciation also avoids the salvage value controversy and never results in deductions in excess of basis, which is generally cost.)

[8] Reg. § 1.167(b)-0(b).

[9] Rev. Rul. 57-352, 1957-2 C.B. 150.

[10] It was for this reason that this Committee, in 1962, decided not to act on a Treasury recommendation for full recapture of real estate depreciation. " . . . Your Committee decided not to apply this treatment to buildings or structural components of buildings at this time because testimony before your Committee indicated that this treatment presents problems where there is an appreciable rise in the value of real property attributable to a rise in the general price level over a long period. . . ." H. Rept. No. 1447, 87th Cong., 2d Sess. (1962), p. 67.

well. Both assumptions are incorrect. The ultimate test of the quality of a property is how it fares on sale in the market place. It is precisely the owner who is going to sell who must maintain his property; if he does not, he will either be unable to sell or he will have to take a substantial discount of poor maintenance. It is precisely the owner who is going to hold for a long time who can skimp on maintenance, doing only enough to keep tenants minimally satisfied.

For these reasons we urge the Committee to amend H.R. 13270 to retain the 150% method for existing apartments, and to modify the harsh recapture provision in accordance with the recommendation made on pages 1–2 of this statement.

The CHAIRMAN. Mr. Carter Burgess.

STATEMENT OF CARTER L. BURGESS, CHAIRMAN, NATIONAL CORPORATION FOR HOUSING PARTNERSHIPS

Mr. BURGESS. Mr. Chairman, my name is Carter Burgess. I am Chairman of the National Corporation for Housing Partnerships, and I am pleased to have with me today Ray Watt, who is president of this corporation.

We have filed our statement with the committee, and I would just like to review a few of the highlights.

As this committee knows, the National Corporation for Housing Partnerships was authorized by title IX of the Housing and Urban Development Act of 1968. In that same act, Congress ordained or set a goal for the Nation of the construction or rehabilitation of 26 million new housing units by 1978. Of that 26 million units, 6 million are for low- or moderate-income housing.

Our corporation was formed to help give attention and leadership to that low and moderate effort.

We look to corporations at the national level—industrial corporations, financial institutions, labor organizations—to give us the investment funds we need to develop low- and moderate-income housing in cooperation with local developers and investors.

Our national partnership also looks to the local communities of our country where individual investment is very important to the production of housing for low- and moderate-income families.

Mr. Brownstein before me has made many of the same points that we make in our formal statement. And I will try to summarize the details specified in our statement.

I think the main situation that this committee and this Congress has to look at is that the achievement of these goals, and praticularly the 6 million low and moderate goal which is of primary interest to the partnership, depends on the incentives that are on the books today. If the bill you are considering is introduced, these needed incentives are going to be lessened and weakened.

In broad strokes, the bill will affect depreciation and the taxation of that depreciation from our corporate investors standpoint. And, in the case of the individual investors at the local community level, the bill is going to adversely affect them not only through the change in the section 1250 recapture provision, but it will add additional taxation through the limited tax preference and the allocation of deductions. If there are some further adverse interpretations of other technical provisions of the law such as hobby losses, the treatment of interest deductions, both in the construction and investment areas, there will be further lowering of yield to the individual investor. Hanging over all of this, for both corporate and individual investors, is the increase in capital gains.

So my thought to this committee, sir, is that the laws on the books today are not giving you the performance in housing that you want. A weakening, a reduction of the incentives contained in the current laws may seriously impede the achievement of the goal you set in 1968. It certainly is going to hamper the performance of our partnership. We haven't even raised our corporate investment yet and we have high hopes for it.

In conclusion, I would say in the base of the low and moderate area, in particular, either try to give us as much of what existed on the books when we were founded, or if not, there is a proposal in our statement that would provide for certain tax forgiveness upon sale in the publicly assisted low and moderate area. As detailed in our statement, any gain over project cost would still be taxed at capital gain rates.

If you accept the provisions in the bill you must give us this or a similar substitute incentive so that we can hasten ownership for the low and moderate families and, at the same time, not increase the rents.

The CHAIRMAN. What you are saying here, I have read most of your statement while you were summarizing it, what you are saying here is we passed a law saying we want more housing and if we are serious about it we shouldn't pass a tax law to prevent that from happening.

Mr. BURGESS. That is correct.

The CHAIRMAN. Thank you very much, sir.

Mr. BURGESS. Thank you, Mr. Chairman.

(Mr. Burgess' prepared statement follows:)

STATEMENT OF CARTER L. BURGESS, NATIONAL CORPORATION FOR HOUSING PARTNERSHIPS

SUMMARY

Private investment in the development of low and moderate income housing currently depends upon aid provided through both the existing federal income tax treatment of real estate and the federal housing subsidy programs. The changes in present tax law contained in H.R. 13270 will eliminate much of the incentive for equity investment in low and moderate income housing and substantially reduce entrepreneurial interest in this housing.

Although the bill recognizes a distinction between new housing and other real estate development, it jeopardizes the Congress's efforts to promote the private development of politically assisted housing and the sales of such housing to low and moderate income tenants and tenant-oriented organizations.

Significantly, this comes at a time when the nation faces its greatest housing shortage since the immediate post-war years and when the demand for housing by lower income families is particularly acute.

In the Housing Act of 1968 Congress established the goal of the construction or rehabilitation of 26 million housing units, including 6 million publicly assisted units, by 1978. If Congress wishes to achieve these goals, it must not eliminate these tax incentives—at least until it provides a suitable substitute. Since the existing incentives have barely been effective, if private, rather than direct governmental action is to produce decent low and moderate income housing in volume, Congress should, at a minimum, create a new stimulus to development.

It is suggested that H.R. 13270 be amended to provide that upon the sale of a publicly assisted low or moderate income housing project to or for the benefit of persons of low and moderate income, the seller would recognize gain for federal income tax purposes only to the extent that the amount realized on such sale exceeds the cost as determined under Section 1012 of the Internal Revenue Code. Such action by the Committee would maintain or increase the continued interest of private enterprise in the development of low and moderate income housing without any significant loss of revenue and without disturbing the other goals sought to be achieved by the Tax Reform Act of 1969.

STATEMENT

Mr. Chairman and Members of the Committee: My name is Carter L. Burgess. I submit this statement as Chairman of the National Corporation for Housing Partnerships. The Corporation was established pursuant to Title IX of the Housing and Urban Development Act of 1968 as a method of involving American industry more substantially in the national effort to increase the quantity and quality of housing for low and moderate income families.

The Tax Reform Act of 1969, H.R. 13270, substantially modifies current provisions of the Internal Revenue Code related to housing production. In these respects, the Bill jeopardizes Congressional efforts, built upon the combination of federal tax incentives and subsidies, to promote the private development of low and moderate income housing and the sale of this housing to tenants and tenant-oriented organizations. Unless an effective and suitable substitute is adopted, the Corporation opposes the introduction of several of these new provisions.

National Housing Needs

In the Housing Act of 1968, Congress found that its promise of a generation ago to achieve the goal of a decent home and a suitable living environment ". . . has not been fully realized for many of the nation's lower income families." To fulfill this obligation and to meet the growing demand for housing, the 1968 Act set a national goal for the next decade of ". . . the

* * * * * * *

In the year that has passed since the establishment of the national goals, the production of housing, especially low and moderate income housing, has decreased and today the nation faces one of the greatest housing crises in its history. Under the twin pressures of faltering production and rising family formations, vacancy rates have declined sharply.

Mortgage money is limited and its cost is high. Savings flow away from the traditional institutions that finance housing. Costs of land, labor and materials keep spiraling. And, most important, the equity, or "risk" capital, needed to genterate housing production grows scarce, especially for publicly assisted housing. As a result, housing starts by year-end may fall below the one-million level for the first time since 1946. At current rates of production, the nation will be more than 10,000,000 units short of the 26 million goal.

The need for more multifamily rental housing is particularly acute. Rental housing presently accounts for more than 40% of all housing starts. Heavy demand for this housing is already reflected in rapidly rising rents and falling vacancy rates. In Chicago and New York City, rental vacancy rates, for example, are currently below 1%. Given our very rapid urban growth, and the increasing costs of land, labor and material, multifamily rental housing will continue to gain importance in the national housing market. Of the 20 million unassisted units Congress sought to have built or rehabilitated by 1978, nine million are to be multifamily.

Nowhere is the shortage worse than in the area of low and moderate income housing. Today, 20 million Americans live in substandard, overcrowded dewellings. In sharp contrast to the national average of 15%, the poor pay 35% of their gross income for housing. One out of every eight American families cannot pay the market price of housing with 20% of its income. Yet, in 1969, the first year of the ten-year program, the Department of Housing and Urban Development projects only 135,000 publicly assisted units will be produced as compared to the 225,000 unit goal. Moreover, it is precisely in this field that multifamily rental housing will play its most important role. Of the 6 million publicly assisted new units called for over the next decade, 3,000,000 are to be privately owned, rental units.

Public incentives for private production

Private investment and development has produced almost our entire stock of multifamily rental housing. Congress has determined that in the area of publicly assisted rental housing, the private sector should continue to have the major production responsibility. This was made clear in the Housing Act of 1968. To achieve the goal of 6 million new and rehabilitated homes for low and moderate income families, Congress had a choice between

> Programs built upon the existing system of private construction and ownership, aided and regulated by the government but operated within the context of existing real property and tax laws, or

Programs of direct government construction, ownership and management

The Committees of Congress agreed that the solution to the problem of producing housing for low and moderate income families lay:

First, in assisting the poor so they can afford to pay the cost of privately built dwellings, and

Second, in increasing the role of the private sector in the development of the housing by strengthening the capacity of the private organizations already involved.

Thus, Congress decided to build on the system it had developed over the years for involving private enterprise in publicly assisted housing programs. In the 1968 Act, Congress adopted programs, like Section 236, that authorize the Department of Housing and Urban Development to make mortgage interest subsidy payments on behalf of lower income families living in rental housing owned by private organizations willing to accept limited cash returns. This program increases the individual family's ability to pay rent for privately produced housing.

The Housing Act of 1968 also enacted new measures intended to facilitate home ownership on the part of low and moderate income families. The statute added several provisions to the National Housing Act permitting the sale of existing publicly assisted rental projects to tennants on a condominium basis, to tenant cooperatives, and to non-profit corporations and associations established exclusively for the purpose of owning and operating low and moderate income housing. This Congressional action reflects the serious need to encourage participation by lower income families in the management and ownership of their housing.

Congress in the 1968 Act declared that in all these new programs as well as in all existing federal housing programs ". . . there should be the fullest utilization of the resources and capabilities of private enterprise."

Tax incentives and the national housing partnership

The President's Committee on Urban Housing, a group of 18 business, labor and community leaders under the Chairmanship of Edgar F. Kaiser, was commissioned to find ways of attracting the private sector into the development of housing for low and moderate income families. The Committee recommended the creation of the National Housing Partnership as a privately funded, professionally managed instrument that would provide the equity and skills needed to produce this housing in cooperation with local developers and investors.

The Urban Housing Committee analyzed the federal housing programs for low and moderate income families and concluded that a combination of cash distribution and tax savings was essential to private participation in the production of this publicly assisted rental housing. Because the federal housing programs are designed to keep rents low, the amount of cash distribution is limited by law to 6% of the owner's equity investment, *if earned*. Federal laws oblige the sponsor of this housing to sign a contract fixing rents and requiring government approval of all rent increases. In addition, the government regulates the sale during the first 20 years of ownership, making such investments highly non-liquid and allowing little opportunity for profit from increased real estate values.

As a result of these restrictions, the Committee found that the primary incentive for private investment in publicly assisted rental housing has been the tax savings generated as a result of the book losses arising from accelerated depreciation. This tax loss can be used to offset other taxable income of a corporate owner or, in the case of a partnership, of the individual partners. The result is a savings in tax dollars varying with the taxpayer's individual tax rate.

The Committee on Urban Housing also reported that the current tax consequences of sale of such projects, particularly those providing for recapture of certain depreciation under existing Section 1250, seriously diminish the attractiveness of investment in this housing and impede efforts to facilitate purchase of projects by low or moderate income tenants or their organizations.

Consequently, in proposing the National Housing Partnership, the Urban Housing Committee emphasized that ". . . the financial feasibility of the proposal is based upon existing real estate practice and tax laws."

The Committees of Congress that reported the 1968 Housing Act also expressly recognized that the existing tax treatment of real estate, including provisions for accelerated depreciation, was essential to the financial feasibility of the National Housing Partnership and other private businesses organized to develop low and moderate income housing. The Report of the Senate Banking and Currency Committee acknowledged the importance of tax savings in attracting equity capital into housing when it authorized the creation of the National Housing Partnership in Title IX of the Act:

"This title would authorize the creation of federally chartered, privately funded corporations to mobilize private investment and the application of business skills in the job of creating low and moderate income housing in substantial volume. Such a corporation in turn would form a partnership, as its vehicle for participating in developments, projects, or undertakings for the provision of housing primarily for families of low and moderate income, pursuant to Federal programs or otherwise.

"The partnership arrangement makes it possible to assure an adequate return to investors. *Under existing Internal Revenue Service regulations and rulings*, partnership losses for tax purposes flow to the individual partners. In the case of new housing units financed on a 10-percent equity—90 percent debt basis, the annual *accelerated depreciation* of the building cost results in substantial book losses during the *initial ten years* after the project is built. Assuming the member of the partnership is in a relatively high income tax bracket, *his share of the depreciation losses, plus cash income from project operations would provide an after-tax return on his investment which would compare favorably with the return which most industrial firms realize on their equity capital.*" (Emphasis added.)

National corporation for housing partnerships

Pursuant to Title IX, the National Corporation for Housing Partnerships has been established. The Corporation will act as the general partner of the National Housing Partnership and will manage the day-to-day affairs of the Partnership. The limited partners in the Partnership will be corporations seeking a vehicle to invest in low and moderate income housing.

President Johnson chose 15 Incorporators with the advice and consent of the Senate to begin operations. President Nixon asked all of the original Incorporators to continue their task of organizing the Corporation and to work towards completing the initial financing.

The Incorporators have elected me Chairman of the Corporation and selected Ray Watt as President. Edgar Kaiser serves as Chairman of the Incorporators.

We have organized a small group of experts from business, housing and governments to give the Corporation an immediate staff capacity. A line of credit with 15 national banks has been arranged to meet our start-up and organizational requirements. We are currently seeking to raise $50 million of investment capital primarily to provide a portion of the equity needed to build 120,000 rental units for low and moderate income families.

Working with local sponsors, the National Partnership will organize local partnerships and invest the "risk" capital needed for these entities to develop publicly assisted rental projects. We will also provide technical assistance, processing aid, management training and other services to the local partnerships.

Consequences of Tax Reform Act on production of publicly assisted housing

We believe that the potential corporate and individual investors in the National Housing Partnership and in the local partnerships we will organize, will participate in federal housing programs only if they are able to anticipate a reasonable after-tax return comparable to that available from other investments. Yields from investments in housing are comprised of two parts—current yield earned while the project is being operated, and the ability to recover investment upon sale. Since current cash flow in publicly assisted housing is limited to six percent of equity before taxes, and since the timing and pricing of sales are regulated, the availability of adequate yields depends upon the tax treatment of accelerated depreciation and sales. The Tax Reform Act of 1969, would amend the tax treatment of accelerated depreciation and of housing sales, drastically reducing the stimulus to the production of publicly assisted rental housing.

The Tax Reform Act would amend Section 1250 of the Code to deny long-term capital gain treatment on the sale of real estate to the extent of all depreciation claimed in excess of depreciation allowable under the straight line method. Further, in the case of individuals, the Bill would treat the difference between the amount taken for accelerated depreciation and that allowable under the straight line method as an item of "tax preference income." The Bill would also allocate certain of a taxpayer's deductions to accelerated depreciation and disallow them. The combined effect of the change in Section 1250 and the other proposals is to reduce the incentive to investment in publicly assisted rental housing very seriously—particularly for the non-corporate investor. Studies undertaken for us by the accounting firm of Touche, Ross & Co. considered the effect on after-tax yields of the changes contemplated by H.R. 13270 in Section 1250, as well as the introduction of the limitation on tax preferences and allocation of deductions requirement. The studies show that after-tax yields to hypothetical individual investors in a Section 236 project could be reduced by as much as ⅓ to ½. The Touche, Ross & Co. work also demonstrates that the combined effect of amending Section 1250 and increasing the tax rate on the capital gains could reduce after-tax yields to a hypothetical corporate investor upon sale by as much as 15%.

In conventional rental housing this reduction in yields will, as others have pointed out in detail, have the effect of increasing already high rents. But in publicly assisted housing, where rents and resale are regulated, where the amounts of federal subsidies are limited and where tenants are of the most modest means, there is no way to recoup this reduction and keep investment reasonably attractive. The result is that private investment in such housing will inevitably decline below its already low level. In other words, if H.R. 13270 is passed in its present form, this nation simply will not meet its goals for low and moderate income housing.

The Corporation does not oppose the enactment alone of the limitation on tax preferences and allocation of deductions—even though they have some adverse impact on yields, particularly if sale occurs in the early years of ownership. We do oppose the amendment of Section 1250 as proposed in H.R. 13270 and point out that the adoption of the limitation on tax preferences and the allocation of deductions *as well as* the amendment of Section 1250 will seriously impair the development of decent homes for the poor. Unless a suitable and effective substitute is also intoduced, we would oppose the change in Section 1250 and the adoption of the other provisions.

Limitations on tax preferences

As indicated, the Corporation does not oppose inclusion of accelerated depreciation in the proposed limitation on tax preferences. The Corporation does oppose the proposal advanced by Secretary Kennedy in his testimony of September 4 to include as an item of preference the excess of interest, taxes and rent over receipts from unimproved real property during the period of construction. This amendment would lower yields to an individual investor in all housing, and particularly for low and moderate income units, further than is already contemplated in H.R. 13270.

Amendment of section 1250

Existing Section 1250 seriously diminishes the yield from investments in publicly assisted rental housing, and discourages sale of this housing to tenants at an early date. In both these respects, it already runs counter to objectives specifically expressed by Congress in the 1968 Housing Act. Yet, Section 521 of the Tax Reform Act would amend Section 1250 to provide for the recapture at ordinary income rates of all depreciation in excess of straight line depreciation upon the sale of the property. Such a change in the tax law would exacerbate an already difficult situation by making the tax consequences of sale of projects to or for the benefit of their tenants still harder to bear.

Consequently, we oppose Section 521 of the Bill unless a substitute measure is adopted permitting investors to sell low and moderate income housing to organizations of tenants on a basis that will allow them to recover their investments after taxes. We are prepared to offer such an alternative.

Recommendation

We suggest that the Committee implement a recommendation of the President's Committee on Urban Housing which would establish a new tax incentive that will directly and meaningfully enhance the production of publicly assisted rental housing. We suggest and we are prepared to support an additional provision in the Bill that would, in the case of an approved sale of a qualified low and moderate income housing project, forgive all tax to be paid on gain from the sale unless the gain exceeded the cost of the project as determined under Section 1012 of the Internal Revenue Code. Any gain in excess of such cost would be taxed at capital gain rates.

Under this proposal, a qualified project would be developed under the assisted housing programs of the federal government and similar state and local programs. A sale would be any sale of a qualified project for the benefit of individuals or families of low or moderate income in accordance with the regulations prescribed by the Secretary of the Treasury. In any event, governmental control of the price and timing of sales would insure that the economic benefit of this provision would inure to the acquiring low and moderate income tenants.

By reducing the tax on disposition of these projects, this provision would lower the regulated sale price of a project. The debt service requirements of the subsequent owning group would also be reduced, permitting it to set and maintain low rents. Such sales might be directed to low or moderate income families on a condominium basis, or to a cooperative formed by tenants, or to a non-profit group created for the purpose of owning this housing.

Following a sale to the tenants or to a tenant oriented organization, there will be little or no loss of Treasury revenue on account of depreciation of the project or on account of interest on the purchaser's mortgage. If the sale is made to a non-profit organization, the organization will of course not take any income tax deductions. If a sale is made to tenants themselves, or to a tenant cooperative organization, no depreciation deductions will be allowable because the use of the property by the owner is for a residence. Interest deductions will be allowable, but tenants will be in sufficiently low income tax brackets so that even if they do not elect the standard deduction, the loss of revenue will be slight.

This change in the Bill could be introduced without altering the proposed limitation on tax preferences or allocation of deductions.

The Corporation staff is prepared to discuss the details of this suggestion with the Committee staff at any time.

Before closing, let me point out two further provisions of the Tax Reform Act that we believe require technical clarification.

Hobby losses

Section 270 of the Internal Revenue Code imposes limitations on so-called "hobby losses"—individual deductions attributable to the operation or trade of a business that has produced deductions substantially in excess of gross income for a period of five consecutive years. This provision currently has no effect on the Corporation's operations.

Section 213 of the Bill would amend Section 270 to provide that, in the case of individuals, deductions:

"attributable to an activity shall be allowed only to the extent of the gross income from such activity unless such activity is carried on with a reasonable expectation of realizing a profit."

The House Committee Report states that the purpose of this amendment is to deny deductions in excess of gross income from an activity:

"where taxpayers are not carrying on a business to realize a profit, but rather are merely attempting to utilize the losses from an operation to offset their other income."

Whether an activity is being carried on with a reasonable expectation of profit will be determined, according to the Committee Report ". . . on the basis of all the facts and circumstances." The proposed amendment would create a rebuttable presumption that an activity was not being carried on with a reasonable expectation of profit if total deductions allowable with respect to that activity exceed gross income from that activity by $25,000 in three of five consecutive years.

The proposed section might be interpreted to deny to individual investors the right to use tax losses from housing investments to shelter income from other sources. Although few local investors in publicly assisted rental projects in which the Partnership participates would make investments large enough to generate sufficient losses to bring them within the statutory presumption, the Commissioner would be allowed to show the absence of a profit expectation under all facts and circumstances, without regard to the presumption.

It is our understanding that this new provision is not intended to affect real estate but is directed at certain agricultural investments. We suggest that clarifying language be added to make the section clearly inapplicable to investment in low and moderate income housing.

Limitation on interest deduction

Section 221 of the Bill amends Section 163 of the Code to limit the amount of "investment" interest that may be deducted by an individual taxpayer in any taxable year to the sum of his net investment income and $25,000. The House Committee Report states that ". . . interest on funds borrowed in connection with a trade or business would not be affected by this limitation." Rental housing, the Report continues, will be considered trade or business rather than "investment" property if the sum of the deductible business expenses of operating the property equals or exceeds 15% of rental income and the taxpayer is not guaranteed a specified return in whole or in part against loss of income.

Though Section 236 or equivalent projects will always meet these criteria, we suggest that the language be clarified to indicate that such projects would not in any case be considered "investment" property and that interest on mortgage indebtedness incurred would not be subject to the proposed limitation.

Conclusion

The National Corporation strongly supports efforts to bring equity and order into federal tax law. But, we do not understand how Congress could limit the basis for our operations when the Congress itself recognized the importance of this pattern when authorizing Title IX only a year ago. We do not understand how Congress could virtually assure that the national housing goals, which it proclaimed one year ago, will not be attained—as this is the inevitable consequence of acceptance of all of the provisions in the Bill. We do not believe that fairness and social justice are achieved by abolishing the primary means for attracting the private capital needed to produce decent, safe and sanitary housing for low and moderate income families.

Thank you for the opportunity to present the views of the National Corporation for Housing Partnerships.

The CHAIRMAN. Now, the next witness would be Mr. Brewster Ives, director and past president of Tenant-Owned Apartment Association.

STATEMENT OF BREWSTER IVES, DIRECTOR AND PAST PRESIDENT, TENANT-OWNED APARTMENTS ASSOCIATION, INC.; ACCOMPANIED BY STANLEY NITZBERG, TAX COUNSEL

Mr. IVES. Mr. Chairman, and members of this committee, may I introduce Mr. Stanley Nitzberg, who is the tax counsel for the Commerce and Industry Association of New York who is accompanying me and sitting on my left.

I appear on behalf of the Tenant-Owned Apartment Association which represents the great majority of cooperative apartment buildings and cooperative apartment owners in the metropolitan area of the city of New York. Our association was formed 40 years ago, and I have been a director of it since its inception as well as its past president.

It has been devoted to the welfare of cooperative projects and furtherance of responsible homeownership in urban areas.

I would like to depart from our formal statement, which contains the detailed analysis of section 302 relating to allocations of deductions. I have nothing to add to that technical discussion as it is beyond my personal sphere of activity. But the association and myself are primarily concerned with the problems which face cooperative apartment homeownership.

We are involved in all city problems that affect housing. For instance in one city, New York, last year, we took an active role in dealing with a fuel delivery crisis that threatened the health and welfare of our city residents. We are concerned with crime control, traffic regulations, air pollution, sanitation, noise abatement, playground as well as school facilities as these are other areas which have been of real interest to co-op homeowners and which clearly affect city residents. Our association has spearheaded many of these campaigns, and has actively participated in virtually all of them. I mention this because it demonstrates the close role that cooperative apartment ownership plays in the community welfare.

Most private cooperative ownership is through middle income and upper income families. They are in every sense of the word homeowners taking an active interest in civic affairs. Why? Because they have a very substantial stake in the community and want to protect their homes and do all they can to improve their living conditions. Because of this they become better citizens. Homeownership, including cooperative ownership, is the backbone of this country and must be encouraged. These are the responsible citizens who care about the future of our cities, and of our States and of the entire country.

The expenses incurred by a homeowner for interest and tax payments have always been deductible in computing their taxable income. This has been recognized from the beginning as an essential part of their home investment. Homeownership in our larger cities is to a great extent cooperative homeownership. There is no reason to treat cooperatives differently from one-family dwellings and, incidentally, in section 212 it is our hope that you will clarify this so that the rights of a homeowner go on and flow to cooperative apartment owners at the same time. This has always been a sacred principle of our association that cooperative owners are allowed exactly the same rights as all other homeowners. Their tax payments to local governments are equally substantial and equally important to local government activities and services. The interest charges on loans made to purchase their apartments to carry their equity are equally high and a burden to carry.

Urban centers, as you well know, are being plagued by the flight of middle and upper income wage earners to the suburbs. Those who have been able to retain their apartments in the cities have done so at substantial personal cost. Beyond the price paid for the exposure to crime and air pollution, is the out-of-pocket dollar expense of the carrying charges of cooperative apartments.

If this section further discourages cooperative apartment ownership by resulting in higher carrying charges, which it most certainly will, so that these become nondeductible either in whole or in part, it will only stimulate a new urban exodus.

We feel it is essential for a healthy city to maintain a good cross section of the population, both social and economic. My own experience in New York City, which is over 40 years, has demonstrated that an overconcentration of low-income people in any one area dooms that particular area to further disintegration. You can't get away from it.

Who are the cooperative owners today in our cities? They are a fair cross section of the urban population. They are active businessmen, they are widows, they are families that are established in the community. Among them is a concentration of many of the economic and business leaders throughout the country. They are the ones who keep our cities alive. Building after building that I can think of contains the ownership of some of the great leaders of industry and business in this Nation. Leading citizens in every walk of life.

New York City would be nothing without the island of Manhattan. By the same token, New York would be nothing without those leaders in business, who have stimulated new investment, who have stimulated new jobs, and who keep the financial community going. These people should not be attacked but should be encouraged to stay right where they are.

Cooperative homeownership means to New York, to any city, better maintained buildings. You can go up and down the avenues and into the side streets and you can see with your own eyes the buildings that are under residential rent control, and you can spot the cooperative buildings in a minute. They are all up to snuff, they are well maintained. They are properly staffed, they are well policed, properties that have become really the backbone of the city. The rental buildings are deteriorating, and you can see it with your own eyes. Cooperative buildings maintain their own security forces. We are obliged to do this because the city simply can't furnish us with the security that we need.

Today in the city of New York certainly 90 percent of the unsubsidized housing that we have is cooperative, and this has been true over the last 4 to 5 years with all new residential construction. It is a trend that should be encouraged not discouraged. New buildings in order to get off the ground have to follow the cooperative form of ownership. It is the only way we can get them built.

I only heard yesterday from another builder who said, "Tell the committee that I am not going ahead with any job,"—and it is a very big housing job—"if the tax reform bill in its present form is maintained," and this again and again has been the answer. Buildings, new residential buildings, have virtually stopped because of the mere threat of this tax bill.

Cooperative homeownership means the hope for the future survival of our cities. Let's take the case of Battery Park City which will become one of the largest, will be in fact the largest, urban development that has ever been undertaken in this country. It is the kind of development that points to the future in the the way of community planning, because there we hope to provide office buildings, apartment houses that are low income, middle income and high income, mixed together, with open spaces, playgrounds schools, churches, shopping centers. This is the kind of development that will hold essential businesses in the city. Yet the residential tenancies will have to be on a cooperative ownership basis because it is the only way they can be successfully promoted. The high- and low- and middle-income groups will be subsidizing the low-income groups, but they will be all in the same immediate area. This is a land fill project starting with the Battery and going up the North River, over 100 acres. No one is being displaced, and it will be a pattern for city living for the future because it is a city in miniature itself. It will have its own police headquarters, its own fire department. It will be a self-contained unit for working and living, and this whole project now is in jeopardy because of the provisions of this bill.

The slowdown that has occurred already has resulted in a 50 percent drop in sales of cooperatives in the last 2 months simply because the tax deduction and the interest deduction is jeopardy. It is an integral part of a cooperative owner's purchase. His carrying charges have reached the point where this is simply going to be the straw that breaks the camel's back.

It is for all these reasons, as well as those detailed in our formal statement filed with your committee, that we request that the provisions of this tax reform bill be revised.

Thank you, gentlemen, for your time.

Senator McCarthy. Thank you very much, Mr. Ives.

(Brewster Ives' prepared statement follows:)

STATEMENT OF BREWSTER IVES, DIRECTOR AND PAST PRESIDENT, TENANT-OWNED APARTMENT ASSOCIATION, INC.

SUMMARY

1. Proposed Section 302, Allocation of Deductions, is an unreasonabe attempt to limit allowable deductions because of source of payment. It will cause serious financial reverses to cooperative apartment home ownership and result in further problems for our beleaguered cities.

2. It should be made clear that proposed Section 221, Limitation on Interest, is not applicable to interest on loans taken to purchase or carry cooperative apartments and to the deduction now allowed under Section 216(a)(2), IRC.

STATEMENT

I appear on behalf of the Tenant-Owned Apartment Association, Inc., which represents 218 buildings and more than 2,200 cooperative apartment owners in the New York metropolitan area. Our Association is devoted to the welfare of cooperative projects and the furtherance of responsible home ownership in urban areas. We wish to comment on Section 302, relating to allocation of deductions, and Section 221, relating to deduction of interest.

Section 302

We do not believe that the treatment provided by Section 302 is proper. As stated in the Report of the House Committee on Ways and Means (Part 1) (at page 82) Section 302 is intended to disallow expenses on the theory, and to the extent, that they may reasonably be assumed to have been met out of tax-free income. The expenses subject to allocation are personal expenses (e.g., medical expenses, interest and real estate taxes in respect to residence) which cannot be considered as costs of earning tax-free income. Hence, a partial disallowance was thought to be appropriate because tax-free income was deemed to constitute the cash source for the payment of these expenses. Consistently with this approach, the disallowance of these expenses under Section 302 is roughly in proportion to the tax-free income.

We respectfully submit that the proposed treatment is improper for two reasons. First, it assumes that the source of payment of the personal expenses in question is solely out of income, and not to any extent out of capital. Since such expenses are not costs of earning income, taxable or otherwise, this assumption is without basis. However, even if it is assumed that the source of payment is solely out of income, this would provide no sufficient reason for disallowance of the expenses, because the source of payment of an expense is irrelevant to its deductibility. Indeed, if Section 302 were enacted, it would constitute the sole example of which we are aware in the entire Internal Revenue Code where the *source* of a payment determines its allowability as a deduction. Personal expenses of the type allocated under Section 302 are not costs of earning income, and have never bo so viewed or treated. Such expenses are allowable under the Code irrespective of their personal character. And, as stated above, the source of payment of an expense has no bearing on whether or not it should be allowed. Therefore, proposed Section 302 is without support in reason.

The disallowance of allocable personal expenses under Section 302 is related directly to the amount of the taxpayer's allowed "Tax Preferences". Thus, if the taxpayer has no allowance Tax Preferences, his personal deductions will not be allocated or partly disallowed under Section 302. No policy has been expressed in the House Report for the disallowance of personal expenses as such. Since the amount of disallowance of deductions depends on the existence and amount of allowed Tax Preferences, Section 302 represents, in substance, only a further attack on Tax Preferences. It is respectfully submitted that if a policy to disallow Tax Preferences is to be effected it should be done directly and without relation to personal expenses.

Apart from deficiencies inherent in the basic research of Section 302, as discussed above, its application to deductions arising from cooperative apartment ownership flies in the face of national concern to preserve the great cities of this nation in spite of their ever mounting problems. The enumeration of such problems here is unnecessary in view of the attention which they continue to receive by Government, and in the media and literature of our times.

The desirability of halting and reversing the seemingly irresistible flight to the suburbs of middle and high income taxpayers, one of the greatest of the problems facing the cities, is both apparent and urgent.

The proposed disallowance under Section 302 of expense otherwise allowable under Section 216 of the Internal Revenue Code, in connection with cooperative apartment ownership, would substantially aggravate this problem by adversely affecting the tax consequents of cooperative apartment ownership provided under present law. Cooperative apartment tenancy occurs almost exclusively in the cities and such apartments are owned primarily by middle and high income taxpayers. The effect of Section 302 on existing tax deductions available to cooperative apartment owners would result in substantially increased occupancy costs. This would make city living less attractive and stimulate further departures to suburbs. Certainly the continued presence of such residents in the cities, together with that of less affluent persons is highly desirable to maintain a proper balance. In view of continued concern with the urban crisis, legislation which would promote further deterioration of our cities seems most inappropriate.

Section 216 of the Internal Revenue Code of 1954 and comparable predecessor provisions have been included in the Internal Revenue Code since 1942, over 26 years. There can be little doubt that the price and value of cooperatives apartments in the market has been importantly affected by available tax alowances and that the elimination thereof in whole or in part will seriously depress such value by increasing net occupancy costs. Furthermore, the pressure caused by resulting sales of cooperative apartments would disrupt the existence of an orderly market, further depressing values. Moreover, it is contrary to our system of laws to enact legislation which would retroactively affect transactions concluded in partial reliance on predictable consequences based on then existing law.

The enactment of Section 302 will arrest the constantly growing acceptance of the cooperative form of urban home ownership. The need for providing acceptable residential accommodations for the middle and upper income segment of the urban population to insure the survival of cities is beyond question. Cooperative home ownership involves these groups in the future of urban centers and helps to preserve the stability of our cities.

Section 221. Interest

Under present law, individual taxpayers may deduct interest paid or incurred during the year without limitation on the amount of such deduction. Section 221 would limit the deduction of investment interest to $25,000 in excess of net investment income and long-term capital gains.

The Report of the House Committee on Ways and Means (Part 1) states (at page 72) that interest incurred for purposes such as "a home mortgage" would not be affected by this limitation. No express reference is made, however, with respect to interest attributable to the ownership of a cooperative apartment. To avoid problems of statutory interpretation which might be presented in the future, we believe it necessary to have an expression from this Committee that interest incurred on loans obtained to purchase or carry equity ownership of a cooperative apartment or amounts deductible under section 216(a)(2) IRC, on account of interest of a cooperative housing corporation, will be similarly treated under this provision. This treatment is consistent with that provided in Section 221 for interest on loans to acquire single family residences, and represents a continuation of the policy first expressed by Congress in 1942 that ". . . tenant stockholders of a corporative apartment (be) in the same position as the owner of a dwelling house so far as deductions for interest and taxes are concerned." S. Rept. 1631, 77th Cong. 2d Sess. (1942), at page 51.

The statutory language in Section 302 of the Bill indicates that amounts deductible under Section 216(a)(2), IRC, are not intended to be affected by Section 221 of the Bill. This is supported by the fact that new separate subsections 277(c)(1)(A)(i) and 277(c)(1)(A)(vii) are respectively provided for interest under Section 163, IRC, and amounts deductible under Section 216, IRC, including amounts deductible under Section 216(a)(2), allocable to interest of a cooperative housing corporation. The use of such separate provisions in the enumeration of items subject to allocation of deductions under Section 302 clearly indicates that the term "interest" in Section 221 was not intended by the statutory draftsmen to describe amounts deductible under Section 216(a)(2), IRC.

There can be little question that interest incurred to purchase or carry the equity in a cooperative apartment and amounts otherwise deductible under Section 216(a)(2), IRC, should not be, and are not, within the intended limitation applicable to investment interest under proposed Section 221. This should be made clear by an expression to that effect by this Committee.

The CHAIRMAN. Mr. Doughty.

STATEMENT OF WILLIAM H. DOUGHTY, PRESIDENT, NATIONAL ASSOCIATION OF REAL ESTATE INVESTMENT FUNDS; ACCOMPANIED BY H. CECIL KILPATRICK, TAX COUNSEL

Mr. DOUGHTY. Mr. Chairman, and members of the committee, my name is William H. Doughty, and I am president of the National Association of Real Estate Investment Fund. With me is our tax counsel, Mr. H. Cecil Kilpatrick.

I have no intention of reading at any length from the prepared statement already on file with you but, with your permission, and in the interests of brevity, I shall refer to a few notes that I have made from it.

The real estate trusts which are members of the association have more than 65,000 shareholders, and the object I seek here is the fair and proper handling of the taxation of those shareholders.

The provisions dealing with the taxation of such shareholders enacted in 1960 appear in sections 856 to 858 of the Internal Revenue Code.

The legislative history of the 1960 act set forth in my prepared statement makes it plain that the purpose was to permit large numbers of small investors to pool their funds in a trust investing in real estate and real estate mortgages, and that this trust would not itself be subject to income tax on distributed income, provided 90 percent or more of its income were distributed each year. The trust could thus act merely as a conduit for the income paid to its shareholders.

The committee report on that 1960 bill stated that it would extend the same type of tax treatment to the shareholders of these trusts as has been given for years to the shareholders of mutual funds under sections 851 to 855 of the Code, and I quote "Thus, this secures for the trust beneficiaries the same type of tax treatment that they would receive if they held the real estate equities and mortgages directly."

Section 452 of the bill you are now considering would appear to take away this equality of tax treatment. For example, a man of substantial means, owning business or residential property leased to tenants, would be entitled to deduct accelerated depreciation in full against rents both under the present law and under the bill as it is now written.

However, section 452 provides that a corporation using that method and getting the same rental would, in determining the amount of its earnings and profits available for dividends to its shareholders, be limited to straight-line depreciation. The result would be an increase in the taxable amount of dividend distributions.

I am not a lawyer, but our counsel has advised us that the use of the word "corporation" in the context of section 452 includes real estate investment trusts and, therefore, would result in the shareholders of these trusts being subjected to tax on greater amounts than if they held the property directly.

Since this construction of the bill would violate the legislative purpose and intent of the 1960 enactment, namely to secure for the trust beneficiaries the same type of tax treatment as if they held the real estate directly, we hope that such a construction results only from inadvertence.

Whether inadvertent or intentionally, we ask that if section 452 is retained in the bill it be amended to exclude real estate investment trusts from a class of taxable corporations subject to the rule.

At the end of my prepared statement there is a suggested form of amendment to accomplish this. Thank you, Mr. Chairman.

(William H. Doughty's prepared statement follows:)

STATEMENT OF WILLIAM H. DOUGHTY, PRESIDENT OF THE NATIONAL ASSOCIATION OF REAL ESTATE INVESTMENT FUNDS

SUMMARY

1. Under section 452, a *corporation* which uses the rapid depreciation methods (allowable under section 167(b)(2) of the Internal Revenue Code) must, for the purpose of computing its earnings and profits, deduct only straight-line depreciation. The result is that the stockholders may be taxed on distributions in excess of those which would be taxed under present law.

2. The Internal Revenue Code defines the term "corporation" as including a real estate investment trust, though such a trust is not taxed on its real estate investment trust income if it distributes 90% or more of such income to its shareholders.

3. On the other hand, an individual owner of real property is allowed to use the accelerated depreciation deductions to reduce his taxable income from the property.

4. The application of the rule of section 452 to real estate investment trusts would frustrate the legislative intent expressed when the special provisions for taxing their shareholders were enacted in 1960. The expressed purpose at that time was to secure for the trust beneficiaries the same type of tax treatment they would receive if they held the real estate directly, by permitting pooling arrangements by small investors, in order that they might secure the benefits normally available only to those of larger resources.

5. To preserve and continue the purposes thus expressed for the enactment of the real estate investment trust provisions, the above mentioned rule as to the determination of a corporation's earnings and profits available for dividend purposes should not apply to the shareholders of such trusts.

STATEMENT

I am William H. Doughty, president of the National Association of Real Estate Investment Funds, president of Chinnock & Doughty, Chicago, and trustee of Bradley Real Estate Trust and of Chicago Real Estate Trustees. NAREIF was founded in September, 1960, with the following aims and purposes:

To broaden public understanding of the importance and value of real estate investment trusts to the American economy and the investing public,

To promote the purposes and effectiveness of these trusts by any means consistent with the public interest,

To provide a national medium for the exchange of ideas and information regarding the establishment and efficient and proper operation of such trusts,

To cooperate with and appear before governmental departments, agencies, and committees on matters affecting the industry,

To provide a national association of respresentatives of real estate investment trusts and of individuals who have a business or professional interest in such trusts,

To establish suitable liaison and cooperate with local, regional and national groups of other associations.

Members abide by a rigid code of ethics adopted by the Association.

Thirty-eight leading trusts, of both the equity and mortgage types, are members of the Association. These trusts account for the major portion of the total assets of the industry and have in excess of 65,890 shareholders who have pooled their funds for real estate investment. An additional group of 75 firms directly associated with the industry are also members of NAREIF.

My purpose in asking to appear before you is to call attention to what we believe was an inadvertent error or oversight in the drafting of section 452 of the House bill.

Under that section, a corporation which uses the rapid methods of depreciation (allowable under section 167(b)(2) of the Internal Revenue Code) must, for the purpose of computing its earnings and profits, deduct only straight-line depreciation. That is to say that, where a corporation computes its taxable income by using accelerated depreciation, its shareholders may be taxed on distributions in excess of those which would be taxed under present law.

On the other hand, an individual who owns such property would be allowed the accelerated method of depreciation to reduce his taxable income from the property.

It is the use of the term "corporation" in this section of the bill that causes us justifiable concern. That term is defined in the Internal Revenue Code in a way which includes real estate investment trusts, which we respectfully assert should not have the same rule applied to them, since this would involve a complete reversal of the policy announced by the Ways and Means Committee in reporting out H.R. 12559, which passed the House on June 29, 1960, and was added by the Senate as an amendment to H.R. 10960. H.R. 10960 was enacted as Public Law 86-779, 74 Stat. 998, approved September 14, 1960, which added sections 856-858 to the Internal Revenue Code.

The report of the Ways and Means Committee on the substantive provisions of H.R. 12559 which have now become law was House Report No. 2020, 86th Congress, 2d session. The reasons for the enactment, set forth in that report, were as follows:

"The omission of the corporate income tax in the case of distributed earnings, which present law provides for regulated investment companies, secures for investors in these companies essentially the same tax treatment as they would have received if they had invested directly in the operating companies. H.R. 12559 extends this same type of tax treatment to real estate investment trusts specializing in investments in real estate equities and mortgages as distinct from the stock and security holdings of regulated investment companies. *Thus this secures for the trust beneficiaries the same type of tax treatment they would receive if they held the real estate equities and mortgages directly* and, therefore, equates their treatment with that accorded investors in regulated investment companies." (Emphasis supplied.)

The Committee report further stated that this tax treatment is desirable, since this investment method constitutes "pooling arrangements whereby small investors can secure advantages normally available only to those with larger resources" which advantages include "the spreading of the risk of loss by the greater diversification of investment * * *; the opportunity to secure the benefits of expert investment counsel; and the means of collectively financing projects which the investor could not undertake singly." The intent that real estate investment trusts should be a vehicle for public and not concentrated investment in real estate is further evidenced by the requirement, in section 856 of the Code, that there be at least 100 owners of shares in order for the conduit tax treatment to apply.

That report further stated that "the real estate investment trust taxable income [i.e., income determined after allowable deductions, including depreciation] will be taxable to the beneficiaries as ordinary income."

Section 452 of the pending bill clearly would frustrate the stated purpose of the real estate investment trust provisions to "secure for the trust beneficiaries the same type of tax treatment they would receive if they held the real estate equities * * * directly."

It should be pointed out, that as a part of the price for securing this conduit tax treatment for the shareholders of real estate investment trusts, which would otherwise be taxable as corporate income, the trusts are denied the following benefits of ordinary business corporations:

1. The trust may not hold any property primarily for sale to customers in the ordinary course of its trade or business.
2. At least 75% of the value of the trust's assets must be represented by real estate assets, cash and cash items, and Government securities.
3. Not more than 25% of the value of the trust's total assets may be represented by other securities; not more than 5% of such value may be represented by securities of a single issuer; and the Trust may not own more than 10% of the outstanding voting securities of such an issuer.

4. The deduction for dividends received, allowable to other corporations under section 243, is not allowed in computing the real estate investment trust income.

5. The net operating loss carryovers and carrybacks, allowed to corporations by section 172, are not allowed to real estate investment trusts.

These restrictions were imposed, in the words of the Ways and Means Committee's report, in order to "draw a sharp line between passive investments and the active operation of business."

To preserve and continue the purposes thus expressed for the enactment of sections 856-858 of the Code, it is requested that section 452 of H.R. 13270 be amended by adding thereto a paragraph reading as follows, or its equivalent in purpose and effect:

"(3) The provisions of paragraphs (1) and (2) shall not apply to real estate investment trusts, as defined in section 856."

Senator McCARTHY. Thank you very much, sir. You understand that if members have questions you will be notified and we will call upon you sometime later.

Do you have a question now Senator Bennett? If so go ahead.

Senator BENNETT. Have you dismissed the witnesses?

Senator McCARTHY. No. It is all right if you have a question.

Senator BENNETT. I have no question of these witnesses but I have a shotgun question for all the witnesses who have heretofore testified this morning: Is there any major phase of or any major effect of this bill on the real estate industry that has not been brought out by some witness or another?

Is there any witness who appeared who feels that there is something else that must be testified to that has not already been developed?

Mr. KILPATRICK. Senator, we have been asked in connection with the mortgage bankers presentation——

Senator BENNETT. Yes, I understand you are going to submit a statement.

Mr. KILPATRICK. Yes.

Mr. WOODBURY. Yes, Senator Bennett. In our written statement however, we have covered it, the question of installment sales and many technical provisions in the bill that are inadequately handled and create redundancies.

Senator BENNETT. But that information is in the testimony.

Mr. WOODBURY. Yes, it is.

Senator BENNETT. It is before the committee. Then I have no other questions, Mr. Chairman.

The CHAIRMAN. I just want to present here for the benefit of the committee and our witnesses today some indication of what our problem is with this tax bill. Here are the statements that we were favored with printed on both sides of these pages, and we have one volume of our hearings almost printed. These are the prepared statements we asked for in the hope of summarizing this testimony. Here is our explanation of the bill prepared by our staff with arguments for and against each House provision. This is the House committee report on the bill, and here are the statements that have been submitted to us.

This is the testimony presented orally and the questions asked by the witnesses before this committee which we have heard thus far and here are summaries prepared by our staff to put in a capsule what the witnesses are testifying before the committee, to summarize that before they appear.

In addition to that we have 368 pages of complexity in this bill to study which usually takes you 10 times as long to read as it does reading prose. And how many amendments do we have? And we have almost an equal number of pages of amendments and that is just the beginning of the amendments.

So when we try to expedite these hearings I hope the witnesses will understand that we are trying to meet a deadline of October 31 to report this bill. That is the reason why we have had to use every device available to us to move expeditiously and to summarize and, at the same time, try to consider the points made.

We do believe the witnesses have made a fine presentation here this morning as they have on previous occasions. I for one am going to undertake to read in detail these statements insofar as they eloborate on the points that have been made.

I yield to Senator Miller.

Senator MILLER. I was just going to comment that in addition to that one might take into account the bills, the committee reports, and the hearings reports of the legislation on the floor of the Senate which also must be voted on during this period of time by members of the committee, and then I would guess that perhaps we could add an equal sized bundle for each of the members of the Finance Committee representing the correspondence that has piled up in our baskets.

Senator CURTIS. Mr. Chairman, I would like to get into the record on that point, that it is the taxpayers I feel sorry for, and I am alarmed at what this bill will do to our economy.

Now, our good chairman here is not responsible for this. He didn't fix this deadline of October 31. The Congress of the United States is being clobbered over the head by some of its leaders to enact a bill that will have a serious impact upon our economy. Many of its provisions will bring in no income, it will be a hardship on many people and many concerns and to do it in such a short time is just not possible. And so while I am concerned about my colleagues with the amount they have to read, and I know that is true, it is the people who are going to have to live under this tax bill that I am concerned about.

The CHAIRMAN. I want the witnesses to know that in addition to Senators who generally read what is in the full statements we have two good staffs. One is the Finance Committee staff and one is the staff of the Joint Committee on Internal Revenue Taxation. Both staffs read everything that is prepared in these statements, and study the points and make sure that the best points made are pointed out to the Senators. They will both be with us when we meet in executive session, and I am going to ask that they be sure that the various points that are made here so very well are brought out before the members of the committee in executive session. So all of these points of testimony will definitely be considered.

Thank you very much, gentlemen, and members of the committee.

Did you have any questions?

Senator CURTIS. Can we question some of the witnesses?

The CHAIRMAN. By all means.

Senator BENNETT. I have no questions.

The CHAIRMAN. I asked Senators to make available to me the names of witnesses they would like to interrogate.

Senator CURTIS. I wanted to ask Mr. Newman a few questions.

The CHAIRMAN. Mr. Harry Newman. Senator Curtis wants to call Mr. Harry Newman.

Senator CURTIS. If he is not here I will pass.

The CHAIRMAN. He has retired. Let me assure Mr. Keyserling I am going to study that 110 pages prepared here. I want to thank Mr. Keyserling.

Thank you very much, gentlemen.

(Whereupon at 11:30 a.m. the hearing was recessed to reconvene Monday, September 29, 1969 at 9:30 a.m.)

TAX REFORM ACT OF 1969

MONDAY, SEPTEMBER 29, 1969

U.S. SENATE,
COMMITTEE ON FINANCE,
Washington, D.C.

The committee met pursuant to recess, at 9:30 a.m., in room 2221, New Senate Office Building, Senator Russell B. Long (chairman) presiding.

Present: Senators Long, Anderson, Byrd, Jr., of Virginia, Williams of Delaware, Curtis, Miller, and Hansen.

The CHAIRMAN. The committee will come to order.

There will be other Senators arriving at the hearings as it proceeds, and I have been advised one or two of them will not be here at this time, but they will be along as the committee conducts its hearing.

The first witness will be Senator Frank Moss of Utah. We are proud to have you today. You understand the problem, I am sure. The others will be along.

STATEMENT OF HON. FRANK E. MOSS, A U.S. SENATOR FROM THE STATE OF UTAH

Senator MOSS. I sure do, Mr. Chairman. And I appreciate the opportunity of coming and being able to lead off this morning.

I know this committee has a long and burdensome task of hearing all the witnesses who want to be heard and should be heard on this most important measure that is being considered by your committee, and I congratulate you and the committee members for your diligence.

I will stick rather closely to my text so as to conserve time.

Mr. Chairman, I appreciate the opportunity of appearing before you and our other distinguished colleagues of this committee. You have a formidable job ahead of you and I will not take very much of your time.

The burden of what I want to say is this: If we expect to stem the so-called taxpayers' revolt in this country we must do more than make token changes in our tax structure. We must come up with genuine reform, we must follow it with tax relief for the middle-and low-income taxpayer, and I think we must do it now, this session.

The House of Representatives has passed a bill which is admirable in many ways, and I commend them for their achievement, but there is still much work to be done. The House bill will serve as a vehicle for our own efforts in the Senate. It should be made the foundation for a much broader bill which I feel this committee must report and the Senate must pass.

We have patched the IRS Code up so many times, often with the intent of closing some glaring loophole, and all too often with the consequence of opening up a more expensive one, that our tax structure seems to be held together in places with little more than a string and baling wire. We have tried to assist industries in trouble, and to make it profitable and attractive to explore and develop our natural resources, and to accelerate or slow down our rate of economic growth, and we have succeeded in some respects. But we have ended up with a tax structure which is so complicated that the average person cannot understand or deal with it. While it may be a tax attorney's bread and butter, our tax structure tempts many taxpayers to spend time and money just looking for tax shelters.

The main result, however, of all this patching and tinkering is that our tax structure is no longer based on the democratic principal of strict ability to pay. It is filled with inequities. Some rich people get by without paying any taxes at all—while families on moderate incomes are so heavily taxed that they cannot keep up the payments on their homes, send their children to college, and do many of the other things that they would expect to be able to do. The tax structure has grown into a monstrosity that is both unfair, and results in gross inequality. There is a growing sense of outrage in the country—and a sense of grave injustice.

As we work toward tax reform, I suggest that we keep two overriding objectives in mind.

Our first objective should be to make the tax structure as equitable as possible. Fundamental to any system of taxation is a common belief in its fairness. Yet at the root of the long overdue "Taxpayers' Revolt" is the public realization that some wealthy persons and corporations are not paying their fair share.

Our second objective must be to provide significant tax relief for those who need it most—the moderate and lower income taxpayers. The revenue for this relief can be obtained by fulfilling our first objective—that is, plugging up the loopholes.

I shall not detain the committee by detailing the already well documented tax loopholes. Others are more expert than I on this complex subject, but I believe the Congress must do something about the following loopholes:

> (1) the untaxed appreciation of assets transferred by noncharitable gift or at death; (2) the tax-exempt status of municipal bonds; (3) hobby farming; (4) accelerated depreciations of real estate; (5) the 25-percent maximum and the 6-month holding period for capital gains; (6) the oil depletion allowance, and (7) the unlimited charitable deduction. In addition, I recommend the repeal of investment tax credit and the establishment of a minimum income tax.

The House bill, as I said, made a good beginning, but it did not plug all these loopholes. Specifically, I hope that this committee will not ignore, as did the House bill, the appreciation of assets transferred at death. The committee should also seek a better solution to the taxfree bond dilemma. As for the hobby farmer provision of the House bill, I find Senator Metcalf's proposal much more satisfactory.

I would like also to comment on some of the changes the Nixon administration has recommended. The President, I am afraid, has remembered those who financed his campaign rather than his rhetoric about the forgotten man. Mr. Nixon's forgotten millionaires will appreciate and probably remember his efforts to emasculate the minimum income tax provision. By removing income from tax-exempt bonds and the appreciation on charitable donations from the limited tax preference category, the Nixon administration would continue to make it easy for some millionaires to pay little or no taxes. Not only does the President seek to preserve the tax-free bond loophole, but he will not even let the minimum income tax provision catch just half of the privileged income of those individuals who are obviously exploiting this loophole. One cannot help but suspect that the Attorney General's influence extends even to tax legislation.

Mr. Nixon's forgotten American was even more forgotten when the administration recommended cutting the average taxpayer's relief by $1.7 billion and turning $1.6 billion of it over to corporations in the form of a 2-percent reduction in the corporate tax rates.

After ramming through a 10-percent surtax, it seems inexcusable to me that President Nixon should want to take away half of the tax relief which the House bill promised the average taxpayer.

I believe that if the Congress attacks the major loopholes with vigor, we can increase Treasury revenues by at least $8 billion. But this money should be transformed into tax relief for the average taxpayer. I will not squabble over the specific form that this relief takes—but I am determined that the reliefs be directed to the middle and lower income wage earning taxpayer.

And finally, I suggest, that in making our reforms we keep our eyes open for ways to simplify the filing of tax reforms. The present system is so complex that even taxpayers of modest means—people who are living on retirement income, as an example, must pay a tax attorney or an accountant to get help in filling out their comparatively meager returns. This is indefensible.

Mr. Chairman, if we don't succeed in achieving genuine tax reform—if we don't require rich people to pay their share of the tax burden, and if we don't relieve the middle income citizen who has had his backbone bent by taxes for far too long, I think we may have a tax mutiny on our hands in this country.

Although the lobbies are active in opposing some of the reforms which the House passed, and some which have been suggested for consideration by the Senate, I think many of them have seen the handwriting on the wall, and they know that the time for change has come. Our people are clamoring for reform, as they have never been before, at least in my time. The Senate is in the mood for genuine tax reform. I think we can pass a bill which does an effective and far-reaching job.

We have the best opportunity since I came to the Senate to make some really effective changes in our tax structure.

We have an opportunity to return our tax system to the principle on which it was based—the principle of ability to pay. So I say let us seize this opportunity now.

Thank you, Mr. Chairman.

The CHAIRMAN. Thank you very much, Senator Moss. If it is all right with the committee, we will continue under the same rules we were proceeding last Friday. If the Senator wants to ask one question, he can ask one, otherwise I will call the witness back.

33-865 O—69—pt. 5——13

Senator CURTIS. Do you favor the House bill?

Senator MOSS. Not in its entirety but I think it is a good beginning. It has very good features in it and I think with a few refinements some of which I tried to suggest in very broad outline that the Senate could take the House bill and make it into an excellent tax bill.

Senator CURTIS. Would you elaborate on that, not now but for the record, if you will elaborate on that for the record.

Senator MOSS. I will be glad to.

Senator CURTIS. Get it back to us.

Senator MOSS. And submit it in writing; yes, sir.

(The committee subsequently received the following additional statement from Senator Moss.)

It would not be possible for me to comment on all the many provisions of the House tax reform bill, so I will mention only some of its major inadequacies:

First. I believe that the House bill should be amended to include a tax at capital gains rates on the appreciation in assets transferred at death. Such a tax should not apply to transfers to charities, to transfers between spouses, nor to estates valued less than $60,000.

Second. The House bill provision concerning tax-free bonds does not seem satisfactory to anyone. In my colloquy with Senator Hansen I offered three suggestions. But let me emphasize, that unless and until a substitute means of assisting local governments with their borrowing costs is instituted, I would not favor removing the tax-free status of municipal bonds.

Third. I oppose the hobby farmer provisions of the House bill. Senator Metcalf's solution is a much better one. His bill would limit to $15,000 or to the amount of "special deductions" (listed in the bill), whichever is higher, the amount by which a "farm loss" may offset nonfarm income. "Special deductions" are those that are clearly beyond the taxpayer's control—fire, storm or other casualty, losses and expenses from drought, taxes, interest, theft of farm property, and recognized losses from sales, exchanges and involuntary conversions of farm property. Neither the House-passed bill nor the Administrations' proposal contain comparable provisions to protect legitimate farmers from being penalized for having incurred an economic loss in a given year.

Fourth. I oppose the 7½% tax on foundation income. I believe we must and can prevent the abuses of the tax exempt privilege by some foundations, but I see no reason to punish all foundations. The revenue gain is minimal compared with the good works that would be left undone.

Fifth. I would include under the limited tax preference provision all forms of income with exclusion. In order to have a true minimum income tax, we cannot allow any escape hatches from paying income tax on at least 50% of an individual's income.

Senator HANSEN. Let me compliment you on your statement.

First of all let me say I am sure you are aware, Senator Moss, that the national Governors' conference has gone on record as being 100 percent opposed to the changing of the tax-free status of State and municipal bonds, and yet, as I understand your statement, you favor taxing these bonds. Do I infer from this that you and Governor Rampton are on opposite sides of this argument in the State of Utah?

Senator MOSS. I don't think we are on opposite sides, although I admit we have a difference of opinion on the matter, which I have discussed with the Governor at some length.

As I see this tax-free municipal bond situation, there are two factors to it: One is enabling the municipalities and the lower governmental units to obtain the capital funds they need at a reasonable cost—a lower cost than they could obtain on the open market without the tax-free status.

The second is the fact that we have a number of our people, and they generally tend to be the wealthy people, that by buying enough of those bonds end up paying little or no income tax.

But before we can correct the inequities caused by the tax-free status of municipal bonds, we must create a satisfactory mechanism for assisting local governments in meeting their borrowing cost. I have suggested three possibilities, and there may be more.

One is to set up what might be called an urban bank or some such name as that, where they could borrow the money from a Federal lending institution at a fixed interest rate.

Senator HANSEN. Who would subsidize that rate?

Senator MOSS. It would be the Federal Government.

Senator HANSEN. Who is that, all taxpayers?

Senator MOSS. All taxpayers; that is right, because this is coming again into tax equality.

Second, I think a regular pattern of subsidization by the Federal Government of the difference between a low fixed interest rate and that rate they would have to pay in the open bond market to take care of times like this of high interest rates would be equitable. This is desirable because the whole pattern of Federal financing now is to try to get money back into the smaller governmental units. I think that this can be done, at some expense to the Treasury, that is true, but it would remedy one of the great inequities, and that is having people with a large amount of money put it into tax-exempt bonds with the result they have an income which can be toted up at the end of the year on which they owe no tax at all.

They probably don't draw as much percentagewise on their money as they might have in the stock market, but nevertheless they still have large incomes on which their tax is totally excused, and this is the place where I think the inequity creeps up.

Senator HANSEN. Excuse me.

Senator MOSS. I just wanted to add one factor. I know there has been a discussion as to the exact amount of the tax leak. I may not have authoritative figures, but I have been given to understand that the advantage that the lower governmental units get in selling their bonds at a lower price is more than offset by the revenue loss that the Federal Treasury suffers.

A third possibility would be to have the Federal Reserve purchase local government bonds, but at a low interest rate.

Senator HANSEN. I realize my time has passed, Mr. Chairman.

The CHAIRMAN. Thank you very much, Senator.

Senator MOSS. Thank you.

The CHAIRMAN. Incidentally, if Senators want to they can prepare written questions to submit to witnesses when they are through, and at the request of any Senator we will ask any witness to come back for interrogation after we have heard all witnesses. Thank you very much, Senator Moss.

Senator MOSS. Thank you.

The CHAIRMAN. The next witness is the former Governor of Texas, the Honorable John B. Connally on behalf of the Livestock Producers Committee.

We are certainly happy to have you here with us today, Governor Connally. Being from the neighboring State of Louisiana I know you served more than once as Governor of Texas.

STATEMENT OF HON. JOHN B. CONNALLY, ON BEHALF OF THE LIVESTOCK PRODUCERS ASSOCIATION

Mr. CONNALLY. I want to extend to you my deepest thanks for the opportunity to appear here today and, if I may, I would like to present most of my testimony in a standing position, and also would like to use a few charts to put into perspective the problem about which we speak when we talk about the farm and ranch situation and farm losses in the United States.

I want to first point out that in the past——

The CHAIRMAN. If you would care to have it that way, Governor, you can put this chart right over here where the audience can see it as well as all members of the committee.

Mr. CONNALLY. Within the time allocated to me, Mr. Chairman, it is obvious I cannot even begin to go into the real economic situation regarding the agricultural pursuits of this Nation but I do have a few charts that I think in themselves will somewhat briefly explain the situation.

We have shown on this first chart food expenditures in relation to income. The green line reflects the disposable personal income in the United States on a per capita basis from 1965 to 1969.

You will see the trend of the disposable income is up. The red line reflects the food expenditures on a per capita basis. This trend is downward which is good, and the difference between the two is constantly becoming greater.

On the bottom chart, during this same period of time, is reflected the cost of food as a percentage of income, and it is down from about 18 percent in 1965 to 16 percent today. Food expenditures in the United States represent only 16 percent of the disposable income of the American people. This is the lowest in the history of the United States, the lowest of any civilized nation in the history of the world.

One other important factor in talking about farm and ranch incomes, and the tax measures respecting those who pursue agriculture in this country, is shown by the prices paid for necessary purchases, and prices received by farmers and ranchers for commodities they sell; keeping in mind that ranching is one segment of our society that basically operates in a free market.

This again takes the period from 1950 to 1969. The green line reflects the prices received by farmers and ranchers for the commodities which they produce. The red line reflects what farmers and ranchers paid for the items which they purchased, and may I at this point say to you that agriculture is today the biggest business in the United States of America. Four out of every 10 jobs in the United States are either directly or indirectly related to agriculture.

For instance, farmers and ranchers are the largest consumers of petroleum products in the United States of America. Last year their purchases of rubber alone were sufficient to put tires on 6 million automobiles. They spent $51 billion for fertilizer last year. I will have some other statistics to give you in just a moment.

The net effect is that only in the period from about 1951 when we saw livestock prices at an all-time high, to about 1954, farmers and ranchers were receiving more for their commodities than they paid for their purchases; but since about 1959 the trend has been just the reverse.

Now, when you talk about cattle in particular, and this is the thrust of most of the provisions with respect to the tax bill as passed by the House of Representatives, H.R. 13270, this next chart shows the average annual price received by Texas producers for calves, and this is basically what they sell.

Again you will recall in 1951, farmers received approximately 30 cents per hundredweight for their feeder calves. This is the highest price in modern history. But in spite of all of the talk of the housewives about high food prices in this Nation, it is significant that in the succeeding 18 years prices received by ranchers for their calves have never reached the point that it did in 1951. It has increased a little bit here during this year, and this chart reflects that uptrend, because this chart was prepared on the basis of prices received during approximaely the first 6 months of this year. It is significant that in June the prices were going up. Since June, the prices have dropped 20 percent, already this year.

So the significance of this chart simply shows that in 18 years the prices received by ranchers for their calves has never reached the point that it did in 1951, which again bears out that the biggest bargain in the American economy today is beef so far as the prices received by the producer is concerned. Referring back to the first chart, this is further borne out by the fact that only 16 percent of the disposable income in the United States today is expended for food.

Here is an equally significant chart. When we talk about those who go into farming and ranching, this chart clearly shows the personal income of the farm population. Now, admittedly the farm population is decreasing in this country, it has every year for many, many years since the beginning of World War II and, in my judgment, it is going to continue to decrease.

It is significant that today approximately 5 percent of the American people feed themselves and the other 95 percent. There are only approximately 5 percent of the people of the United States directly engaged in agriculture. This again is the lowest figure of any civilized country on the face of the earth, lower than it has ever been in all our long history.

The red portion of this chart shows the personal income from farm sources. The green portion of the chart shows the ascending line and trend of income of the farm population from nonfarm sources.

Senator CURTIS. Mr. Chairman, may I ask a brief question for clarification. That is based on a farm unit, where the husband is farming and maybe the wife is teaching school or holding a town job?

Mr. CONNALLY. Yes, sir; that is it.

Speaking of the average farm family today, the farmer is 51.3 years of age, he has a family of 3.6 in the family. This represents the entire farm family income.

But it is clearly shown here, the trend of nonfarm income is on the ascendency.

Forty-six percent of all of the farm population of this Nation receive nonfarm income, or income from outside sources; 32 percent of all of the farm population of this country receive income from over 100 days a year of nonfarm work. Now this becomes significant because we are talking about what we can do, what can be done, to get at those few people who take advantage of or abuse the tax laws with respect to farming and ranching.

Now, there are certain significant things that I think all of these charts lead us to and that is simply there is no question in my mind but what if we are going to continue to have the type of agricultural business that we have had throughout the history of this Nation, if we expect 5 percent of the people to produce the food and fiber for 100 percent of the people, then we are going to have to have constantly an infusion of new capital into farming and ranching.

I am concerned by some of the comments made before this committee and before the House Ways and Means Committee with respect to abuses. I obviously can't cover every facet of the proposed bill or all of the testimony which has been given, but let me address myself to two or three things.

First, people are continually talking about "hobby" farming and I submit to you, Mr. Chairman, and members of this committee, there is no such thing as a "hobby farmer." This is a misnomer and a misconception and a contradiction in itself. There is no such thing as a hobby farmer in this country because the present laws prohibit it. Section 162 of the code itself, and Treasury regulation 1.62–12 prohibit it. They say, in effect, in the legitimate sense you have to operate a farm and ranch for a profit, not for pleasure. The courts have so held. I am not talking about section 270, where you have to make a profit once every 5 years. That is a separate thing.

There are two basic tests as to the legitimacy of a farmer and rancher in America today. One is a subjective test arising of section 162 of the code. The other is an objective test contained in section 270. The subjective test I say to you is a meaningful test if properly applied by the Internal Revenue Service; two-thirds of all the cases taken by the Government to the Tax Court have been won by the Government in dealing with the subjective test of section 162. You don't have to operate 5 years before IRS can throw your expenditures into question. Section 162 simply provides that they can question you and look at you every year, and if you do not operate for profit, can disallow your losses.

I was struck by Senator Metcalf's testimony here last week, when the committee was so overburdened they couldn't hear us all, and I again want to express my gratitude for the opportunity of being here today. He was talking about an individual whose name is in the record so I don't mind using it, Mr. Stevens, who bought a ranch in his home State. The Senator alleges that Mr. Stevens charges off hunting and chain link fences as a ranch expense, and so forth. I haven't seen the man's tax return. I doubt that he does it, but if he does try it, I sure doubt that the Internal Revenue Service allows it, because they don't have to allow it under the present law. As a matter of fact, I would make the assertion that they don't allow it under existing law; and I know of a number of cases where they don't.

Any time they determine that a farm or ranch is being operated as pleasure and not for profit they can disallow all of the expenses with respect to that operation under existing law.

The Chairman. We'll just get that tax return and find out who is right and who is wrong about it.

Mr. Connally. All right, sir.

Second, some allegations have been made by various witnesses before this committee that we need to reform the tax laws with respect to farming and ranching. It has been said that we need EDA, we need allocations of deductions, we need limited tax preference, we need to change section 270, in order to drive the price of land down. Well, I submit to you that there are only three times that anybody who owns land ever wants to drive the price of land down: First, when he is buying land, he wants to buy it as cheaply as he can. Second, when the Board of Equalization meets to establish an ad valorem tax value, he is not too interested in land prices being high. The third is when he dies, the estate wants to get as cheap a price on the land as possible. But these are the only times in a man's life when he ever wants cheap land prices.

I submit to you if you ever break the price of land in this country you place in jeopardy every rural community in the United States, and every taxing body depending upon the value of the land. This includes every independent school district. I submit to you gentlemen, that the whole policy of this country has been to try to foster a return to the ranch and to the farm, to keep people out of the urban centers, to try to make it attractive to live on the farms and ranches, and I think that should be considered when this committee, this distinguished group, considers the tax laws of the country.

I submit to you finally, and I know, Mr. Chairman, my time is limited, there are provisions in the House bill that, in my judgment, would cure whatever abuses presently exist today.

Number 1, they have suggested that you prohibit the exchange of bull calves for heifer calves.

Number 2, they suggest that the holding period for breeding stock be increased. I personally don't think we ought to. I think it is unfair to require them to be held any longer than they are today. But the National Livestock Tax Committee accepts it and I would not vigorously oppose it.

Third, they recommend that there be a recapture of depreciation on breeding stock, and with this I agree.

Fourth, they recommend that in the sale of land that you recapture certain expenditures such as, for soil and water conservation, land clearing practices, et cetera; if the expenditures were made within 5 years preceding the sale.

I submit to you that these provisions will knock out substantially all of those who would attempt to use the tax laws of this country, not for the purpose of entering into farming and ranching on a legitimate and profitable basis, but rather to do it as a pure tax dodge. Thank you very much, Mr. Chairman, gentlemen.

The CHAIRMAN. Thank you very much.

Thank you very much, Governor Connally.

Senator CURTIS. Mr. Chairman, may I just observe that I want to congratulate you on your very forceful statement. It is sound, it has no answer. I hope that your testimony will be compulsory reading for everybody in government, including the Consumers' Council, and while I am going to resist as long as I can the time when we will appoint a Democratic Secretary of Agriculture but when that time happens you are my candidate. [Laughter.]

Mr. CONNALLY. Thank you very much, Senator Curtis. I am not sure you are my friend. [Laughter.]

Mr. CONNALLY. But I appreciate your sentiments.

The CHAIRMAN. Thank you very much, Governor.

As you know, we are trying to move on with the hearings otherwise I would like to interrogate you at some length about it, but I promise to read your entire statement.

(Gov. John B. Connally's prepared statement follows:)

STATEMENT OF JOHN B. CONNALLY, HOUSTON, TEX., ON BEHALF OF THE LIVESTOCK PRODUCERS COMMITTEE

I. INTRODUCTION

My name is John B. Connally of Houston, Texas, where I practice law. I am appearing here on behalf of the Livestock Producers Committee, a group of approximately 50 farmers and ranchers in the Southwestern United States. I should add, however, that since I was raised on a farm and have owned farms and ranches in Southwest Texas since 1951, I am also appearing on my own behalf.

II. CURRENT ECONOMIC SITUATION IN FARMING AND RANCHING

Many of you are familiar with the deplorable economic situation of the farmer and rancher in the United States. Nevertheless that economic situation should be outlined and illustrated as a backdrop to an examination here of some of the provisions of "The Tax Reform Act of 1969" with respect to agriculture.

One of the witnesses before the Ways and Means Committee in the hearings on this bill referred to the "tragic cost-price squeeze" on those engaged in American agriculture. I could not agree more; we have a crisis arising from the costs of the farmer-rancher rising faster than the proceeds from his production. For all of this century those in the agricultural business have bought in a seller's market and sold in a buyer's market.

This "squeeze" is illustrated graphically by Chart 1. You will note that since 1950, the earliest year shown, the major costs of producing livestock have risen steadily but the retail price of livestock, particularly beef, has risen only slightly. Now only 16% of the consumer's disposable income, the lowest percent in modern history, is spent on food, which is the greatest bargain in the American marketplace.

A rancher has been able to absorb these spiraling production costs without comaparable meat price increases only by cutting his profit margin to the vanishing point. For example, to obtain an economic profit of $3,100 in the cattle business today, a recent Texas A&M University study concluded that an investment of $112,000 was needed, a return of less than 3%. Even that return is inflated because *it does not include anything for the rancher's labor or overhead.* If the rancher paid himself just the minimum wage, his "profit" from this $112,000 investment would vanish, to be replaced by a loss.

In spite of this bleak economic picture, obviously the livestock industry has survived, and continually developed better quality products, without receiving any of the approximately 3 billion dollars in direct annual payments that the United States Government has made under the crop price support programs.[1]

This remarkable result has been achieved partly through the dedication to a way of life of those living on farms and ranches, demonstrated as a heritage of their forebearers, but perhaps more importantly, it has come from a continual infusion of new capital from the other segments of the American economy. That new capital is evidenced by the increasing amount of nonfarm income that is earned by farmers and ranchers. Some of that money comes from the earnings of those who have lived on a farm or ranch all of their lives, but more of it at the present time comes from those who live part time in urban communities but desire to return or begin to spend time and money in the rural community. These are the people who are experimenting with the new types of livestock that give more eatable beef per animal than ever before, who produce more calves per mother cow than ever before and who bring that calf to market at a greater weight; these are the people who are developing the new grasses and weed killers; these are the people who have spent the enormous sums necessary for soil conservation and to restore the water level.

[1] Although there is a meat import quota, the quota level has never been invoked.

The need for outside capital

As much as we would like to think of agriculture as being a self-supporting, self-perpetuating industry, the data demonstrates that capital outside of agriculture is a necessity for its survival. Agriculture, in fact, requires great quantities of new capital, usually far beyond the quantity commonly available to the typical farm or ranch producer. This is particularly true when we look at the capital requirements to build up cattle breeding herds and similar livestock ventures. Not only do the animals themselves require a tremendous maintenance cost, but for the first year or two and maybe even three, they must be maintained with no basic return to the herd. Some individuals, of course, purchased mature breeding stock but most herds are started with young heifers or even calves born on the place. Regardless of the acquisition age the incidents of nonfertility, disease problems, and wrong types of animals often requires heavy culling during the first few years of a breeding herd development. Revenues during this period are extremely low and the results frequently lead to unprofitable operations for several years.

In a recent publication from Purdue University the author made the following statements regarding capital availability: [2]

"Financing and capital availability has played an important part in the development of the beef industry. The quantity and availability of capital has influenced the development and production of feeder cattle, cattle feeding, processing, and the distribution of beef to varying degrees almost since the establishment of the industry.

"This willingness and ability of outside financing to invest in the various aspects of producing cattle and feeding them had undoubtedly been a factor contributing to the continued expansion of the industry during recent years. . . .

"Cattle feeding certainly could not have progressed to the point it has in terms of size and scale of operation without the availability of large amounts of capital. . . . Investments totaling several millions of dollars in both fixed and operating capital are not uncommon for these operations."

Outside capital flowing into agriculture has resulted in improved land, developed new breeding stock, refined technological developments, and has paid for public and private agricultural research.

Beyond this, as General Rudder will discuss more fully, it has also been responsible for thousands of demonstration farms at the local county level. The entire concept of demonstrations, which are usually handled by the local county agricultural agents, depend upon the ability of the agricultural producer to withstand the additional costs involved in adjusting his production, maintaining additional records, and encompassing additional cost expenditures, to demonstrate a new technological development or new technique to his neighbors.

It must be recognized that much of the land clearing, brush removal, stock pond building and improved pasture development which has occurred in the United States in the livestock production areas has, in fact, been accomplished by the larger producer. The real issue at stake is whether or not this individual will continue to improve the agricultural productivity of the Nation's farmlands, if he is discouraged by the Federal Tax laws.

The battle against brush is a continuing one, and it is one in which, even for all the monies which have been expended, we seem to be losing. Massive water development plans for the Southwestern part of the United States can, in fact, transform these arid regions into virtual productive gardens. In the meantime, however, such areas, of the country must depend upon the private and personal sector of the economy to provide stock ponds for livestock and privately financed irrigation projects in order to maintain the productivity of the area. All this can be placed in jeopardy and good sound range management conservation measures abandoned if the present tax laws are changed (except for the provisions suggested herein).

The tremendous investment involved in land improvements is emphasized in the *Journal of Farm Economics* by Philip M. Raup.[3]

"In accounting for recent land-value increases it is also appropriate to examine recent investments made in land and consequent improvements in the quality of the land input. One of the most prominent investments in quality improvements

---

[2] Jack Armstrong, "Cattle and Beef Buying, Selling and Pricing Handbook," Purdue University, May 1968.

[3] Philip M. Raup, "Land Values and Agricultural Income: A Paradox?" *Journal of Farm Economics*, December 1965.

has been soil conservation, including structures, land-protective measures, and tillage practices. Another prominent investment in land has resulted from rural electrification, improved water supply, and water distribution and storage systems.

"Between 1932 and 1959 a total of 7 billion dollars was spent for conservation purposes in the U.S. Some part of this, and perhaps the major part, has had long-run effects on the quality of the land factor, and should be reflected in higher values."

Frequently, it is these farmers and ranchers with substantial outside capital who have been the major supporters of agricultural research at the Experiment Station in land grant universities through private research fund donations. A study performed in California and reported in the *Journal of Farm Economics* indicates that not only has the financial support of such groups and individuals been quite substantial but that the time lag between the initial project instigation and the actual accomplishment of the technological advancement has been shortened considerably through the use of these additional funds.

Probably no one statement has best expressed the real needs for increased capital in agriculture than that made by Mr. Gene L. Swackhamer with the Federal Reserve Bank of Kansas City.[4]

"The change in agriculture that we now perceive is not a sudden development—only our attention has made it seem so. Small-unit agriculture was the dominant feature of our agrarian past. The family farm was cherished and protected because it represented the very best that our democratic society could offer to man. The farmer was laborer, manager, and generally, land-and-capital owner all in one. At his best, he was an entrepreneur in the truest sense.

". . . Yet, almost from the day the first fence went up in the prairie, agriculture was undergoing change.

". . . Land, labor, and capital are still agriculture's principal resources, and the farmer is still the entrepreneur masterminding their productive combination. Yet, the mix of resources is ever changing and the entrepreneural role of the farmer is much changed from the nearly self-sufficient status of pioneer farmers.

". . . In addition to changes in farm size, the land tenure pattern of farming has moved toward part ownership. As reported by M. L. Upchurch, Administrator of the USDA's Economic Research Service, only 7 per cent of full owners had farms with sales of $20,000 or more in 1964, compared with 24 per cent of the part owners and 16 per cent of tenants.[5]

". . . Capital has become agriculture's fastest growing productive resource. This, too, can be seen in Chart 1. The use of purchased nonfarm resources such as machinery, equipment and production items has increased the need for agricultural credit. The use of credit in agriculture has been expanded rapidly since 1950, while the total farm economy has been growing at a more modest rate. Cash receipts from farm marketings have increased at a 2.5 per cent average annual rate, compared with non real estate farm debt which has increased at an average annual rate of 8.6 per cent. The average annual increase in realized net form income since 1950, however, has been only about .8 per cent—reflecting increasing input prices relative to product prices, and the use of a higher proportion of purchased inputs. Clearly, accumulating sufficient capital for efficient farming is a problem—implying that the need for farm credit will continue to be extensive.

Another aspect increasing the capital requirements for maintaining a large beef breeding herd is the growing size of the market. Today the United States has become a major exporter of beef breeding cattle. During the year 1968, exports of beef breeding cattle reached an all time high of slightly over 20,000 head. This represented an increase of 17% over the 1967 level. Most of this increase was due to increased exports to Chile and Canada, although Mexico continues to be the leading export outlet for U. S. beef breeding stock. Venezuela ranks as the second most important market with Canada third, and Chile fourth.

Other countries which purchase substantial numbers of U. S. beef breeding cattle are Guatemala, Costa Rica, Ecuador, Brazil, Panama, Republic of South Africa and the Philippine Islands.

---

[4] Gene L. Swackhamer, "Growth of Corporate Farming." Statement before the Colorado Feeder's Association, February 8, 1968.

[5] M. L. Upchurch, "Farming and the Rural Scene—Changes in Organization, Opportunities and Problems." A talk presented at the 45th Annual Agricultural Outlook Conference, Washington, D.C., November 14, 1967.

The Hereford breed led all others numerically in 1968, but the Brahman breed ranked second in importance. It is interesting to note that high on the list of breeds of cows exported are the American developed breeds of Santa Gertrudis, Beefmaster, Brangus, Charbray and Braeford as well as various other cross-breds that were not identifiable as to breed.

The exportations of beef breeding cattle requires tremendous capital. This capital is utilized in advertising, contracting, litigation, foreign trips and numerous merchandising techniques required to conclude such sales. Such foreign sales cannot be undertaken by individuals with limited capital. The beef breeder who desires to enter this foreign market must have the financial resources to withstand all the normal market development costs involved.

The leading State in the United States for the exportation of beef breeding cattle is Texas. Not only does Texas account for well over one-third of all the beef breeding cattle exported from the United States but it, together with Florida, accounts for almost 60% of the total of such exports. Two-thirds of all the exports of beef breeding cattle in the United States are from the States of Texas, Florida, Arizona, New Mexico and California.

The Ports of Houston and Galveston are the major points of debarkation for the United States exportation for beef breeding cattle, particularly those destined for Latin America countries.

The exportation of beef breeding cattle represents a rare event to the agricultural field; it is one of the few livestock commodities that is exported from the United States, and one of the even more rare commodities that is exported for cash, and not under a government subsidized program. Such exportations, therefore, accomplish numerous goals: (1) they gain foreign exchange for the United States; (2) they provide higher quality animals to foreign countries which, in turn, can be utilized to upgrade their own domestic herds, and (3) they offer the seed of a new commodity—beef—which can be used to raise the standard of living in these underdeveloped countries.

The magnitude of agriculture's economic impact upon the supplying industries is tremendous, and can be best illustrated by the following passage which is taken from the introduction in the *Yearbook of Agriculture*, 1968:[6]

"In the mid-1960's, farmers were spending annually about 3.4 billion dollars for new farm tractors and other motor vehicles, machinery, and equipment—providing jobs for 120,000 employees.

"They annually purchased products containing about 5 million tons of steel and 320 million pounds of rubber—enough to put tires on nearly 6 million automobiles.

"They use more petroleum than any other single industry—and more electricity than all the people in industries in Chicago, Detroit, Boston, Baltimore, Houston, and Washington, D.C. combined."

It has been noted by the U.D.A. that the innovators of the agricultural community are also the principal purchasers of farm real estate. So too are these larger more progressive producers, the big users of the latest technology, the newest equipment, the larger quantities of fertilizer, and also the experimenters of new breeds, techniques and production methodology.

As the price of labor increases because of higher wage rates, agricultural producers are moving toward more labor-saving devices. The result is an increased reliance upon more capital expenditures for such equipment. This concept of increasing capital requirements as labor requirements decrease on the farm is examined by an agricultural economist in the *Journal of Farm Economics:*[7]

Is it possible that withdrawal of labor has forced the producer's attention to labor-saving techniques and to equipment that can be used effectively only with relatively large acreages? As labor becomes scarce and increases in value, operators shift to capital substitutes that can enjoy economies of scale over lower ranges of input. The tractor, for example, permits substantial economies of scale up to a given level of rate of use per year. To put it to work requires more land. Greater efficiency can be achieved by adding more acres, and part of this economic advantage can be bid into the price of land needed to bring unit cost down. This can lead to an active demand for land, associated with withdrawal of labor. It is possible to conclude that a withdrawal of labor con-

[7] Raup, op. cit. note 3.

tributes to an increase in the price of land or creates offsetting forces that keep the value of land from falling relative to labor.

"A great man once wrote:

" 'No man is an island, entire of itself; every man is a piece of the continent, a part of the main; . . . ' ".[8]

I most respectfully say to you that agriculture is not an "island" unto itself that can or should be blocked off from the infusions of capital so necessary to it; it is a "part of the main" stream of progressive America.

Let us be honest with outselves. A small ranch can no longer support a family. No return of less than 3% or a loss is going to attract new capital so desperately needed. The farmers and ranchers need a continuation of most of the present provisions of the Internal Revenue Code in the manner I shall indicate.

III. THE FARM LOSS PROBLEM

I do not say that the provisions of the Internal Revenue Code with respect to farming and ranching should be left as they are. As is so often the case, over the years practices develop that are in essence abuses of the spirit of the Internal Revenue Code and the regulations thereunder. This is true in every area of tax law.

Now in the last few years it has become apparent that some people have gone into the livestock industry solely, or primarily, for the tax advantage. Neither the Livestock Producers Committee, nor any other person that knows the agricultural industry defends these "abuses." So far as I can tell there is no person appearing before this Committee that defends that taxpayer who has been called a "Wall Street cowboy."

Today I speak only for the farmers and ranchers who are engaged in the agricultural business for an economic profit. Naturally there is a problem in distinguishing the legitimate farmer-rancher from those who seek only a "tax profit." As indicated above with respect to capital needs, the fact of nonfarm work or income is not an appropriate test. Leaving aside capital requirements, practicality requires a recognition of the fact that, according to the latest census figures, 46% of all farmers and ranchers in the United States reported some days of work off their farms and 32% reported such work amounted to 100 days or more. The importance of non-farm work can be judged from the fact that last year it provided well over half of the total income of those farmers with less than $10,000 in farm sales. Even the farmer whose farm sales exceeded $40,000 derived 17% of his income as the result of non-farm work.

These figures demonstrate that whether you are large or small the rancher or farmer has "outside" income in an increasing amount.

In addition, legitimate farmers and ranchers cannot be separated from the "tax profit" investor by the amount of non-farm income test as proposed in essence in H.R. 13270 or by other bill before this Committee. In justification of such test the Ways and Means Committee Report stated that as a taxpayer's adjusted gross income increased, the average size of his loss also increased. This is only to be expected in a normal business operation. All other things being equal, if there is to be a loss, a large business probably in a risk operation will lose more actual dollars than its smaller counterpart.

Yet it is important to note that the same statistics show that the losses represented a smaller percentage of adjusted gross income as the size of the enterprise increased. I have here a chart which illustrates this (Chart No. 2). For example, farmers and ranchers with adjusted gross incomes of less than $15 thousand had an average net farm loss of over 22% of their adjusted gross incomes. Farmers and ranchers whose adjusted gross incomes were in excess of $100 thousand had net farm losses amounting to about 6% of their adjusted gross incomes.

IV. STATUTORY CHANGES CONGRESS SHOULD ADOPT

There are certain concrete steps that can be taken by Congress to prevent the "tax profit investor" from utilizing the present law (or at least one interpretation thereof). The Livestock Producers Committee urges your approval of four provisions of H.R. 13270. These are:

1. Extension of the recapture of depreciation provisions to breeding animals.
2. An increase in the holding period for which breeding animals must be held in order to obtain capital gains treatment on their sale.

---

[8] John Donne, "Devotions No. XVII."

3. Clarification of the non-applicability of the tax-free exchange provision of the Internal Revenue Code to exchanges of male and female calves.

4. Recapture on disposition of land improvement costs, which were deducted currently, in the same manner that depreciation is recaptured on depreciable realty.

In my judgment these changes will put a reasonable stop to schemes which derive their profit from offsetting ordinary income deductions with capital gains in those cases where there is no real objective of an economic profit. In other these words steps will eliminate the "tax profit investor."

V. THE "OVERKILL" PROVISIONS

Nevertheless, the Treasury and the Ways and Means Committee have not stopped with these changes, but have gone on to far more radical provisions that will substantially destroy the essential qualities of American agriculture that I outlined above.

Pesticides, for example, although once hailed as the salvation of agricultural industry, are now being severely restricted for possibly causing detrimental affects on human beings through the animals and foods we consume. In our quest to eliminate certain harmful insects, we have gone too far and the benefits previously praised have now boomeranged and bombarded us with disaster.

So too will be the effect of provisions designed to make farming and ranching undesirable to the so-called "tax farmer" but also unattractive to those who have capital from non-farm sources that could be placed into agricultural enterprises. Care must be taken, not only to protect the small farm and ranch operations, but also the larger ventures that have provided an abundance of food and fiber for the American citizen. We cannot afford to jeopardize the American consumer by artifically and suddenly revolutionizing the economic base of the agricultural industry. As any economist would admit, the institutional influences upon the agricultural economy of the United States are profound. Any drastic changes, therefore, in the institutional perimeters must be carefully analyzed so that their economic impacts are thoroughly understood and that they would be in the long-run beneficial to the general welfare.

H.R. 13270 imposes unique restrictions on the agricultural industry. The House Bill: (1) creates The Excess Deductions Account concept, (2) singles out farm losses for treatment as a tax preference item under both the Limitation on Tax Preferences and the Allocation of Deductions, and (3) creates a presumption that a ranch is a hobby if its losses exceed $25,000 in any 3 out of 5 years.

Aside from the disastrous rejection of needed capital by these provisions of the Bill, these extremely complex concepts have a further basic difficulty. (The provisions also contain a number of apparent technical deficiencies which are discussed in Exhibit "A" hereto.)

VI. THE OBVIOUS DIFFICULTIES OF THE ACCOUNTING PROBLEM

A fundamental difficulty of the "overkill" provisions arises from the use of what the Treasury described as "deviations from good accounting practices." As an example, the Treasury stated that normally in businesses where the production or sale of merchandise is a significant factor, income can be properly reflected only if the costs of the merchandise are deducted in the accounting period in which the income from the sale of that merchandise is realized, i.e., the accrual method of accounting. As a policy of long standing, farmers and ranchers have been permitted to use the cash accounting method in which such expenses are deducted in full when incurred. The Treasury added that these agricultural provisions "were permitted for farm operations in order to spare the ordinary farmer the bookkeeping chores associated with inventories and accrual accounting." Apparently the Treasury would agree that those farmers and ranchers who have outside income of any substance should be restricted in the use of the cash accounting rules because some of that non-farm income might be offset by the farm losses.

This kind of reasoning will ont stand examination. Congress' past approval of the rancher's use of the cash method of accounting does not stem solely from a desire to spare him accounting problems. The most important reason for using the cash method is that under the peculiar nature of the agricultural business, the accrual method of accounting does not yield more accurate results. The typical rancher raises livestock both for sale and for adding to his breeding herd. If it were possible to always know which animals were destined for which purpose, then it might be possible to make allocations of ranching expenses between animals held for sale and breeding stock so that the accrual method of accounting would give a more accurate picture of income. Unfortunately, the rancher does not konw this until many months after the animal is born.

Moreover, many agricultural operators engage in both farming and ranching operations. The difficulty in accurately allocating expenses in such situations has been succinctly summarized by the Attorney General of the United States in a brief recently presented to the United States Supreme Court:

"[T]he nature of farming and ranching operations makes an effective accrual method of accounting difficult to operate. Each employee almost invariably worked on numerous phases of the farm's profit-making endeavors, such as planting and harvesting crops, raising livestock, repairing fences and barns, etc. Thus, it was exceedingly difficult to allocate salaries and the other expenditures among those farming operations." [9]

Frequently there is no way in surveying a farm loss that a farmer or rancher can tell how or in what percentage his loss arose. Yet the penalty provisions provisions apply. For example, suppose the loss can be allocated to a maize operation; the farmer-rancher loses his capital gain in culling his breeding herd in an equal amount. It is difficult to see any logic whatsoever in such result.

In summary, the provisions of H.R. 13270 require that every substantial farmer or rancher keep his books of account on the strict accrual basis or face the possibilities that a part of his usual deductions will be disallowed and that part of any capital gains he might have in future profitable years will be converted into ordinary income. Yet even if the expert accounting help is available to the farmer or rancher, the Attorney General of the United States has admitted before the U.S. Supreme Court that an "effective accrual method of accounting" is exceedingly difficult "to operate."

VII. RISE IN LAND PRICES

A major complaint raised before the Ways and Means Committee, as to this Bill, as well as by other bills pending before this Committee, is related to higher land prices for the small farmer.

This complaint can be considered only if answers are provided for the three basic questions:

1. Are "tax-profit" farmers really pushing up the price of land?
2. Do high land prices work for or against the bona fide farmer?
3. Do higher farmland values benefit the general public?

If we examine these questions separately and in detail, the results will demonstrate that the complaint is not only, in fact, unfounded, but may be premised on the opposite of the actual situation.

Are "tax-profit" farmers really pushing up the price of land?

An analysis completed in 1967 at Texas A & M University dealt with the Texas farm and ranch land market. The authors in their publications state:

"Factors considered relevant to a general analysis of Texas land market activity are per acre price, volume of land sales, size, mineral activity, availability of credit, interest rates, veterans land board activity and land use." [10]

Although the research study devotes considerable time and detail to each of these various influences upon land prices and statistically quantify some of their magnitudes, they no where mention the "tax-profit" farmer as a factor. If, in fact, the "tax-profit" farmer does exert an economic influence upon land prices, it must fall into a long list of other probably more important factors which these economists have readily identified. The study adds:

"Per Acre Price . . . . From 1947–49 to 1965, the relationship between average per acre land price and volume of land sales was that of an inverse correlation, land prices have consistently increased while the volume of sales has declined.

"Size . . . As a result of large tracts of land being divided and sold in smaller units, the median size land sale in many areas of the state has decreased since 1954. Agricultural use of the smaller tracts of land is primarily that of enlargement of existing farms and ranches. The smaller tracts are also being used for part-time farms, rural homesites, status, investment, speculation, and recreation. In this type of land market, small tracts with a variety of possible uses usually receive a higher per acre price than large units.

---

[9] Petitioner's Brief in *United States* v. *Catto*, 384 U.S. 102 (1966).

[10] F. B. Andrews and Alvin B. Wooten. "Trends in the Texas Ranch and Land Market, Texas Agricultural Experiment Station, B1063, Texas A. & M. University, April, 1967.

"Mineral Activity . . . Mineral rights influence land prices and land market activity in some areas of the state as evidenced by the fact that sellers retained some or all of the mineral rights in 58 percent of the 1965 land transactions.

"Sales Involving Credit . . . The availability of credit is closely associated with the volume of sales. Easy credit encourages sales while a tightening of credit usually results in a decrease in sales volume. For example, in 1960, 50 percent of the total land transactions were mortgaged. In 1963, 73 percent of the total land transactions were mortgaged, and volume of sales increased approximately 27 percent over the 1960 level. Then in 1965, mortgaged sales accounted for only 60 percent of total sales, and volume of sales decreased approximately 40 percent.

"Interest Rates . . . A change in mortgage interest rates could alter the demand for loans and be reflected in land market activity. Decreasing or low interest rates tend to encourage mortgage loans and increase land market activity. Increasing or high interest rates tend to discourage mortgage loans and restrict land market activity.

"Veterans Land Board . . . Since its beginning, the Veterans Land Board has been responsible for 34,500 land transfers involving 2 million acres of land. . . . In the ranching area of Texas, characterized by large land holdings, the Veterans Land Board is inactive. In other areas of diversified land use, characterized by small land holdings, the Veterans Land Board strengthens the demand for land.

"Land Use . . . A change in land use from traditional agriculture to multiple use or to higher and better use is usually accompanied by an increase in land value. For example, nearly 28 million acres of land used for agricultural production are also leased for wild game hunting. Multiple use of these acres produces income from both sources, and these lands should command a higher price than comparable land deriving income from only one source.

"Many land markets have felt the impact of the urban demand for land. This impact on land market activity has been reflected through increases in land prices. In some counties located near large metropolitan areas, up to 65 percent of the 1965 land transfers involved out-of-country buyers."

The implication in the concept that "tax-profit" farmers and ranchers are forcing land to extremely high levels is based upon the idea that so-called "bona fide" farmers and ranchers must pay higher than economically sound prices for it or are not buying at all. It is true that the rate of increase in land prices has been due to active farmer and non-farmer demands. The Economic Research Service of the U.S. Department of Agriculture released a special study entitled *Farm Real Estate Market Developments* in December 1968. This publication pointed out that farmers represent nearly 2 out of every 3 buyers of land and have bought this land primarily for the enlargement of their operation. They have, in general, tended to be the more progressive operators in their area. In contrast, the nonfarmers which have purchased land have been in the market for investment and other reasons.

Despite the many different motives for entering into the land market, land values still correlate annual returns to land, the same as average dividend yields do with common stock. Land values have appreciated annually at 5.3%, resulting in a total return of 8.8% per year upon sale. The report, in its summary, concludes with this statement:

"Although local nonfarm demand will influence future land values in many areas, farm real estate price trends will generally bear close resemblance to the economic health of commercial agriculture."

The following quotations appear in the same article:

"Farm operators, who make nearly 2 out of every 3 purchases of farmland, generally are buying for farm enlargement. Because of the cost-price squeeze, increased output is one means of maintaining or increasing future income. Acreage expansion can increase production efficiency, particularly in the short run when adequate machinery and family labor are already available. And as long as these fixed costs remain fairly constant with additional acreage, the farm enlargement buyer may economically justify bidding up prices for an add-on unit.

"Enlargement buyers tend to be the more progressive and efficient farm operators in their community.

"Despite the complexity of market forces, the farmland market, in general, remains sensitive to expected economic returns.

"Although yearly increases in land values need bear no relation to annual returns in the short run, price trends do resemble movements in annual returns over time. For 1958–62, residual returns to land averaged around 3.5 percent of market value. Returns in the 1963–67 period were closer to 4.0 percent. Increases in land values showed a similar annual pattern—4.4 percent in 1958–62 and 6.6 percent in 1963–68.

"Perhaps the most substantial evidence that land values still depend heavily on agricultural returns is presented by regional data. Variations in rates of return among regions in 1966 and 1967 tended to parallel the regional pattern of land price movements. The Delta region, which has had the Lake States region, second only to Mountain States for the smallest increase in land values for the last 5 years, showed one of the lowest average returns to real estate during 1966 and 1967.

"If past rates of annual appreciation in land prices are considered along with net returns from farm production, the total returns would sufficiently explain the active farmland market of recent years."

This change in value of farmland as it relates more to the productivity of the land is dramatically illustrated by the fact that the major increases in dollar value of farm land have occurred during the last decade in the Delta and the Southeastern States of the United States, the Southern Plains and the Appalachian area. In contrast, some of the smallest gains have been recorded in the Lake States, the Mountain States and in the Corn Belt.

Probably no one statement can better summarize the future of the farmland market than the following paragraph which is taken from the same article:

"Urban influence will increasingly affect rural land markets. Numerous 'mini-booms' will erupt whenever and wherever rapid urbanization occurs. However, even though industrial and population centers are expanding dramatically, an enormous expanse of farmland will remain untouched by urbanization. Consequently, future value trends for land remaining in agricultural use will probably bear close resemblance to the economic health of commercial agriculture, and will continue to be influenced by national, agricultural and economic policy."

The proportion of voluntary sales to total farm real estate transfers has increased quite substantially. In 1955, for example, voluntary sales accounted for 70% of all total farm real estate transfers. By 1960, this figure has increased to over 80% and in 1968 was recorded at about 85%. In contrast, estate settlements and foreclosures have moved to much less significant levels. Farmers and ranchers are thus reaping the benefits of the higher land values and are probably carefully considering this land price appreciation in their total income expectations.

In a more recent issue of the "Farm Real Estate Market Development," (March 1969), under a heading entitled *Farmers Dominate the Market*, it emphasized that farmers made 59% of the purchases in the farmland market during the year ending March 1, 1968. This article stated:

". . . In terms of acreage, active farmers buy 3 acres for every two acres they sell, and therefore are increasing their land holdings.

"Despite dramatic increases in average farm size during the past 2 decades, farmland continues to be bought and sold in relatively small acreages. More than 7 out of 10 transfer in the year ending March 1, 1968, were less than 180 acres.

"Forces on the demand side of the market also encouraged transfer of relatively small tracts—the most important of these being farm enlargement. Purchases for farm enlargement accounted for 5 percent of sales occurring during the year ending March 1, 1968."

Do high land prices work for or against the bona fide farmer?

Land is recognized as the principal asset of the American farmer and rancher. According to USDA figures farm real estate represented on March 1, 1968, almost 81% of the total farm assets. Rising farmland values have, of course, forced land into this unique asset position, although it has been the major asset for numerous years. The total value of farm real estate has increased from $130 billion in 1960 to $194 billion in 1968.

This USDA publication emphasizes the extent of bigness already in the industry, that expansion can occur as easily through land rental as purchase, and that the higher land prices provide farmers more credit since land is his principal asset.

The ability of land to serve as a larger credit base which can be used to finance additional land purchases is also brought out by Professor Raup in his article.[11]

---

[11] Raup, op. cit., note 3.

Still other concepts of farmland value gains are tied to technological advancement in the society. The following statements are indicative of these ideas:

". . . The evidence, both theoretical and empirical, indicates that the expectation of rising income from technological advance in conjunction with supported farm prices (and from increasing urban demands as well) has been important in contributing to the rise in farmland prices. Expected income increases, because technological advance lowers unit costs and increases individal farm incomes with supported prices. thus providing an incentive to expand farm size, which in turn puts an upward pressure on land prices. Farmland prices rise as many farmers bid for land to capture the gains of technological advance on individual farms thus vanish as the competitive process of acquiring land forces up land prices and absorbs the gains from technological advance.

"But someone gains. The retiring farmer or landowner who sells farmland at an inflated price reaps the benefits of the technological advance. And this process will continue to push up farmland prices as long as farm prices are relatively stable and the march of technological advance continues." [12]

If as some witnesses before the Ways and Means Committee said, the effect of H.R. 13270 will result in lowering farmland prices, the result would be disasterous. As indicated above, many farmers and ranchers have borrowed funds and pledged their lands as collateral. A reduction in farm land prices would almost certainly mean that many outstanding loans based on increased land value would be in jeopardy and could be called under the terms of most loan agreements because of inadequate security. In turn, this could have the adverse compounding effect of causing businesses in local communities dependent upon farming and ranching to close their doors. The trickle of unemployed from rural to urban communities would increase substantially.

The ad valorem tax base

The property tax payments so important for local and county government programs, including such essential items as schools and roads, also would be in great danger if, some contend, there would (and should) be a decrease in farmland value as a result of enactment of the House Bill. It is inconceivable that the present local governmental fuctions could continue with a meaningful reduction in the price of land.

During the past 25 years taxes on farm real estate have increased almost five fold; those taxes have gone primarily to support rural schools, which expenditure does not substantially benefit the non-farm resident. Hence, it is important to note that the farmer residing on the farm benefits as to the cost of education of his children (as well as other benefits) from the infusion of outside capital into property purchases.

VIII. THE COMPETITION ALLEGATION

Another complaint before the Ways and Means Committee comes from the assertion that the outside capital creates unfair competition for the "family" ranch. The idea apparently is that the farmowner with non-farm income in high income brackets does not have to depend on farm operations for a livelihood; the high income bracket taxpayer can demand less for his products than the regular farmer, who needs to make a profit to be able to stay in business.

This assertion cannot stand analysis. *There is no set of "farm loss" circumstances under which an economic loss produces a more favorable tax result than an economic profit.* The greater the economic profit from a farm, the greater overall economic benefit to the farmer or rancher. If the economic profit of the agricultural enterprise can be increased, the farmer or rancher is financially better off, despite the imposition of income taxes on the farm profit, simply because the increased economic profit is never going to be taxed at 100%.

The fallacy of such assertion comes from the premise that a farmer or rancher will sell his product for less than its market value. There is no evidence to support such illogical, unreasonable course of action. On the contrary, the livestock industry traditionally is one in which the seller gets all he can in a buyer's market.

---

IX. SUMMARY

In conclusion, there are certain changes I believe should be made in the Internal Revenue Code to eliminate what I call the "tax-profit" operation.

However, the other proposals in the House Bill (Excess Deduction Account, farm losses in the Limitation on Tax Preferences and the Allocation of Deductions and the so-called hobby loss change) would cause at least two disastrous economic changes to the substantial farmer or rancher. These are: (1) the drying-up of new capital so badly needed in agriculture, and (2) chaos from an impossible accounting situation.

As to the farmland price situation and the alleged improper competition, the facts demonstrate that arguments based hereon for his Bill, or others, cannot in my opinion, be supported.

Gentlemen, while I am grateful for your attention to my remarks, I appreciate even more your consideration of the problems of the American farmer and rancher in light of federal tax laws and the proposals for changes therein.

EXHIBIT "A"

TECHNICAL DEFICIENCIES IN H.R. 13270

1. It is not clear whether the Excess Deductions Account under the proposed Section 1251 can ever have a negative balance. According to subsection (b)(3):

"If there is any amount in the excess deductions account at the close of any taxable year (determined before any amount is subtracted under this paragraph for such year) there shall be subtracted from the account—(A) an amount equal to the farm net income for such year . . . ."

Thus it would seem that a negative balance is permitted since the year's farm net income could easily exceed the amount in the account.

If a negative balance in the Excess Deductions Account is intended, the proposed Section 1251 does not appear to allow credit (i.e. subtractions) for profitable years prior to the first year of a farm net loss. The proposed Section 1251(a) states that it "shall apply with respect to any taxable year only if—(1) there is a farm net loss for the taxable year or (2) there is a balance in the Excess Deductions Account as of the close of the taxable year after applying subsection (b) (3) (A)." In the preceding profit years, there is by definition no farm net loss nor is there any balance in the Excess Deductions Account at the close of any of those taxable years. There is no balance in the account because additions to the account are made for farm net losses (which did not arise) and subtractions are made only if there is an amount already in the Excess Deductions Account.

2. Proposed Section 1251(e)(2) defines "farm net loss" as including those special deductions allowable in respect to land under Sections 175 (relating to soil and water conservation expenditures) and 182 (relating to expenditures by farmers for clearing land). When the net farm loss is added to the Excess Deductions Account, it has the effect of adding a portion of these special land expense deductions with respect to the account. The balance in the Excess Deductions Account will affect the character of gain on sale or exchange of land only to the extent of the land's "potential gain." Proposed Section 1251(c)(2)(C). If no deductions under Sections 175 or 182 have been taken with respect to the land within 5 years, the "potential gain" in the land is zero (Proposed Section 1251 (e)(5)) and thus any gain attributable to those expenses will never be recaptured. Yet such conservation and clearing deductions will remain in the Excess Deductions Account and will convert the capital gain on the sale of some other asset which is totally unrelated to the land, such as breeding stock, into ordinary

3. Proposed Section 1251(b)(5)(B) provides that upon the gift of farm recapture property the donor's Excess Deductions Account is transferred to the donee if the potential gain on the farm recapture property given in any one year

income.

period exceeds 80% of the potential gain on farm recapture property held by the donor immediately prior to the first of such gifts. This rule appears to lead to unintended hardships for the uninitiated and to be of little effectiveness for the careful planner.

If, for example, a rancher should give half of his ranch (and presumably one-half of the farm recapture property and one-half of the potential gain thereon) to one son, the donee would not be required to take any of his father's Excess Deductions Account. If more than 12 months later, the rancher gave a second son the remainder of the ranch, that donee would be required to take his father's entire Excess Deductions Account. With careful planning, however, the strictures seem easily avoided. For example, a farmer could give his son an undivided 80% interest in the farm without causing a transfer of his Excess Deductions Account. Twelve months and a day later, he could give the son another undivided 16% (being 80% of the remaining 20% of the original farm). At this point he will have transferred approximately 96% of the original farm without a transfer of the Excess Deductions Account. By waiting another 12 months and a day, the remaining 4% of the original farm could be given to a charitable organization who would then succeed to the entire Excess Deductions Account. The farmer could then again take up farming with no balance in his Excess Deductions Account and the son would have received 96% of the original farm with no transfer of the account.

4. The proposed Section 1251(d)(6) provides that in certain transfers of farm recapture property to corporations, the "stock received by a transferor in the exchange shall be farm recapture property." Securities received in this exchange are not so treated. This permits the avoidance of the Excess Deductions Account rules by careful planning. The farm recapture property can be transferred to a corporation for all of its stock and bonds equal to almost all of the value of the transferred property. Such an exchange generally will be tax free under Section 351 of the Internal Revenue Code. The bonds (i.e., "securities") can then be sold and none of the gain thereon would be affected by the balance in the Excess Deductions Account because the bonds are not farm recapture property.

5. The depreciation which contributed to a taxpayer's farm net loss will be included in addition to the Excess Deductions Account. When that depreciable property is sold, the gain equal to that depreciation will be recaptured and treated as ordinary income under the provisions of Section 1245 of the Internal Revenue Code. Since the tax benefits arising from the depreciation deduction will have been totally eliminated by the sale, there appears to be no reason to leave any of that depreciation deduction in the Excess Deductions Account where it will reduce the amount of capital gains on the sale of some other asset. The depreciation deduction ought not to be recaptured twice.

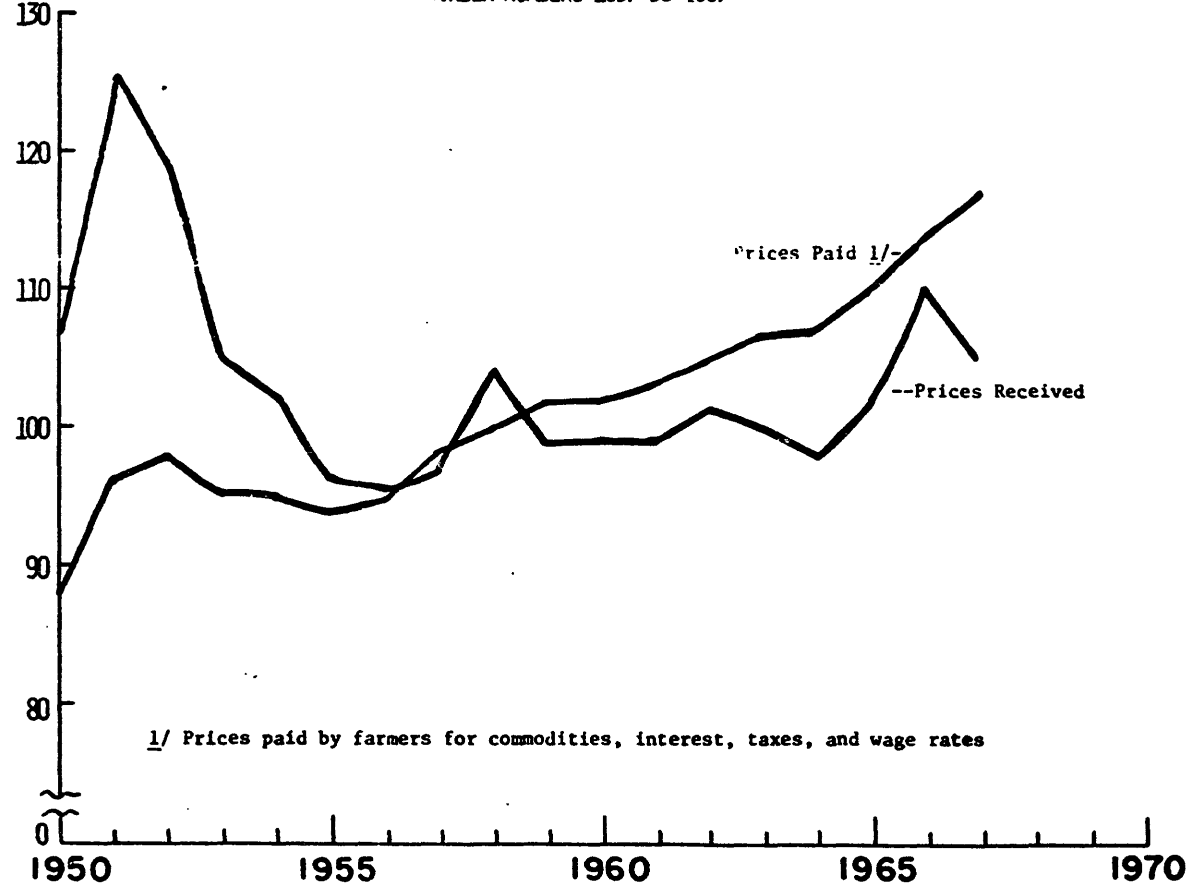

CHART 1

Mr. CONNALLY. May I now introduce to you Gen. Earl Rudder, the chancellor of the A. & M. University system who is one of the distinguished citizens not only of our State but this Nation. He was the colonel commanding the ranger force that landed on Omaha beachhead. I recall Gen. Omar Bradley said of him he was one of the two finest officers under his command during World War II.

I would like to present Gen. Earl Rudder who also has a statement.

The CHAIRMAN. Good to have you today.

Senator CURTIS. Mr. Chairman, Nebraska beat Texas A. & M. Saturday 14 to zero. I can't say I am sorry, but I am sorry they had to do it to such nice people.

The CHAIRMAN. General Rudder.

STATEMENT OF EARL RUDDER, PRESIDENT, TEXAS A. & M. UNIVERSITY

Mr. RUDDER. Mr. Chairman, and members of the committee, I will tell you, Senator, you didn't get a first on that because Senator Long's great school over in Louisiana beat us the week before by a bigger score than you did.

I come to you this morning with Governor Connally not only as an executive of one of our great land-grant universities of this Nation, and we have many of them, and I know that we are all quite proud of the program that they have had back through the years, in fact a little over 100 years right now. I also come to you as a cattleman and I know something of the work that is being done in these land-grant colleges, and I also know something of the problem that faces this committee in looking at what sort of moneys are going to be allowed to be spent for the development of the ranches and the farms of this Nation.

I would like to point out to you a thing which I am sure you know and you have seen, but today farmers and ranchers are getting older and older and the young people just are not staying on the land and one of the reasons they are not is that good chart Dr. Uvacek had a moment ago—the farmer's income stays kind of level and everybody else's income goes up, and the youngsters we have today are adroit and smart and they say there isn't much opportunity for them on the farm, "I am going where the opportunity is," so the average age is 51.3 years as the Governor has already pointed out to you, and the average household on the farm is 3.6 people. They have lived there for 15 years, they have a high school education. The value they have in the investment in the farm is an average of $51,000 and they work 79 days on the average off of the farm.

I submit to you gentlemen, simply this: It seems to those of us who may live off the farm and go back there and work and spend some money and develop it, and so on, are somewhat suspect with what to do with our money. However, the fellow who lives on the farms, goes off and works and brings money back, he seems to be legitimate.

Also another thing that I have observed, in the testimony and reflected all over our Nation today, is it seems, that the person who is successful and makes a little money is already a suspect. We have got the greatest Nation on the face of the earth and, as the Governor pointed out in his chart there, the lower one, we see here he is not spending more money, the average man is not spending more money, for food that he needs, he is spending percentagewise less money all the time, and I ask you why? One of the reasons, in my opinion, is because the land-grant colleges of this Nation, and Nebraska is one of them. The illustrious Cliff Hardin, Secretary of Agriculture, I like to call him a good friend of mine—but he wasn't so good last week—I told him if he had any influence out there, to remember also that these private ranchers have worked diligently in research and extension, and they have been partners with this Federal Government at least since 1862.

As the Governor so ably pointed out a while ago, 5 percent of our people produce the food and fiber needed for the 100 percent. Where else in the world does this happen? It is a pretty good system that allows this to happen.

Well, suppose we were Russia today, I am told they have 50 percent of the people producing food and fiber for the 100 percent. This is where the United States was in 1900, 69 years ago.

Suppose we had to go back to that? That means we would have to take out of the work force today some 45 percent of the people and put them back to producing food and fiber. Well, I don't know where we would get the people to carry on this GNP escalation that is essential if we are going to survive as a prosperous nation.

A lot of it has been done because of your land-grant colleges and also a lot has been done because people are willing to work at two jobs. There are not many people in town that don't work at one job and then another if they can't make a living on one and this is what the farmer has done.

Out in west Texas at the turn of the 1950's we had a little community there of 5,000 people. The people over here in Baltimore, the Martin bomber people, needed an outboard section of the Martin bomber built and they started building it before the Korean war and we ended up in Brady, Tex., some 1,500 miles away, producing the outboard section of the Martin bomber in this little community, and I venture to say there wasn't a single person there who had any expertise or skill in building a wing of the bomber but in a very few short weeks, with the direction of some of the experts in the business, we were producing the outboard section of this Martin bomber at Brady, Tex., for less money and a better quality than they could produce it right here in Baltimore. We were shipping it all the way up here.

Well, I saw those farm people there, and this is a rural community, there wasn't any industry in the community, I saw them convert from the way of life that we had, and you will recall in 1950, 1951, Governor, it was the beginning of the 6-, 7-year drought and there wouldn't have been a farmer left in that community if they hadn't had something to supplement their income with.

So I think it is a real healthy situation that the farmer goes into the city and works in the communities and works, and vice versa.

I have some good friends who are so-called windshield farmers, but I know their families are much better off because when Friday afternoon comes they load up and go out to this farm. I agree with the Governor there isn't such things as a hobby farmer, they are all trying to make money out of it.

So I beg you not to completely wipe out this way of life of ours. This way of life of ours has helped build this Nation to what it is.

In addition to this through your agriculture program through the years we have put in great assets of this Nation. As I said, I happen to be a cattle farmer. I went to our great grains program 5 years ago; and 3 years ago I got rid of all the brush. For 3 years nothing happened because it was dry. This year, 3 years later, we have grass out there almost as high as this table. It is because you wrote a law making it possible for me to put some of my dollars in with the Federal dollars for soil conservation and today we are going to have the best production in the history of this ranch, which has been in our family for 40 years and I guess I will make money or break even with it this year.

I say unless we continue to do research and find better ways of doing it, and certainly you share with us here, that the time will come when we won't be able to produce the necessary food and fiber, when prices that we pay for food and fiber won't go down as shown on the chart; but will go up instead.

I can remember back in the 1930's, and I think most of you are old enough to remember, that we plowed down pigs, corn, hogs, cattle, and everything. It could easily have been said then "that we don't want any more research. We are not going to spend any more money on research, we are not going to spend any more money developing these places," but if we had we would still be back with the Russians today.

So I beg of you to stay partners with these land-grant colleges, let us put money in, and let's develop farms and ranches. I agree with Governor Connally you already have got the means to go in and pick out these people who are trying to dodge taxes, and pick them off. You will find in farming and ranching today that the $53,000 that I spoke of a moment ago is the average investment; but for the cattle raiser that is going to get $3,100 return, he has to have an investment today of something like $112,000. That is a pretty good sized investment, and that doesn't include anything for his labor. That doesn't pay him anything for his own effort.

Today some of the big ranchers, and some of the people that have some money, put some money into these research programs, and I am afraid under the proposed law that you have before you now, that this will cease to happen.

We have a ranch in South Texas today that gives Texas A. & M. University, $200,000 a year in range research. Why? It is in order that we might develop better methods, better ways of growing grass and producing the food and fiber that this Nation needs at a more economical rate.

Another thing I would like to point out with respect to cattle breeding: we don't develop a new breed just overnight. A lot of people would say LSU and Nebraska, and so on, have produced all the new great breeds of this Nation. Well, this simply isn't so. We have helped them, it is true, but it is usually somebody who has got enough money and backlog of capital that can go into this breeding program that will take anywhere from 3 to 10 years to develop a new breed. So these people, in my opinion, have got to be given some latitude.

The farmers of Texas have given plots for the developing of new crops and seeds and this sort of thing. There are 4,486 plots furnished by farmers and ranchers in Texas to assist Texas A. & M.'s research program.

So I simply say this: If we try to roll back every ounce of investment on the part of the individual we are likely to kill some of the great jumps that we have made forward in this agriculture production.

Remember under the system that we now have we have moved further, quicker than any other nation on the face of the earth, and I just hope that we don't do anything that will cause this to come to an abrupt end.

Thank you, sir.

Mr. CONNALLY. Mr. Chairman, may I very briefly introduce two other gentlemen at the table, Mr. Marvin K. Collie, who is my partner, and who has been a distinguished tax lawyer since 1941 and Dr. Ed Uvacek, one of the agricultural economists from Texas A. & M. University who is responsible for the preparation of the charts.

Again may I express my gratitude to you for the opportunity to appear here today.

The CHAIRMAN. Thank you very much for a very fine presentation.

(Gen. Earl Rudder's prepared statement follows:)

STATEMENT OF GENERAL EARL RUDDER, PRESIDENT, TEXAS A&M UNIVERSITY

INTRODUCTION

Gentlemen, while I am the President of the Texas A&M University System, I am also a cattleman, a native of the Southwest, and an individual quite familiar with the problems currently being experienced by agricultural producers of this area of the Nation. Although it would be difficult for me to refrain from the inclusion of some academic material pertinent to the situation, this testimony is offered to you primarily from the viewpoint of these latter positions.

I have been concerned about those individuals who have ranches or farms but apparently intend only to have some type of "tax profit." Certainly no one can defend such individuals as a matter of equity because it is readily recognized that they would, in fact, have some distorting affect upon the agricultural economy. I am here to try to put the problem into its proper perspective. Certainly some congressional action is warranted, but we should not have the severe economic upheaval due to "over-kill" provisions.

Care must be taken, not only to protect the small farm and ranch operations, but also the larger operations that have provided economical food for the American citizen.

Let us first examine the make-up of the modern American farmer and rancher, the plight he is currently facing, and the benefits which have accrued to the American consumer under the current framework of agriculture which has developed.

THE MODERN FARMER AND RANCHER

In order to better understand the type of agricultural environment in which we are currently operating, let's briefly look at the farmer and rancher of the 1960's. Today's average farmer or rancher is 51.3 years of age, has an average household size of 3.6 persons and has lived on his farm for over 15 years. He has completed 4 years of high school, operates a 351.6 acre farm which has a value of close to $51 thousand, and works about 79 days off the farm each year.[1]

Governor Connally has mentioned the "outside" work and income of the farmer or rancher. I would like to develop this topic further. This work outside of the farm is quite interesting, in that it has become a way of life for most farm families. For example, according to the latest census, 46% of all farm operators in the United States reported some days of work off their farms and 32% reported such work amounted to 100 days or more. There is a significant regional difference in this proportion too. Almost one-half of the farm operators in the Western region of the country reported some off-farm work while this proportion was 49% in the South and 43% in the North. Of all farm operators working off their farms, 69% reported working 100 days or more, and 56% reported

[1] This data from 1964 Census of Agriculture, U.S. Department of Commerce.

working 200 days or more. In the West, 62% of the operators reporting work off farms, worked 200 days or more, whereas, in the North only 52% reported 200 days or more.

As might be expected, the proportion of farm operators working off the farm and the number of days that they worked varied according to the age of the operators. Sixty-three percent of the operators under 35 years of age reported working off their farms, while 54% of the operators in the 45 to 54 age bracket showed off-the-farm work. In essence, this data merely emphasizes the fact that the modern day farm operator spends a considerably larger proportion of his time working off-the-farm than most people realize.

Not only is off-farm work important in a time aspect—it represents an important soure of income to such farmers (Figure 1). In the latest issue of the *Farm Income Situation* released by the U.S. Department of Agriculture, some rather interesting information is offered regarding net income realized on farms versus off-farm income. The report shows, for example, that in 1968, operations which had less than $2,500 farm sales reported, 85% of the total income of the farm operator's family came from off-the-farm sources. The larger size classifications of farms, those with less than $10,000 farm sales during the year, relied somewhat less upon off-farm income, actually 53% of their total income. Moving to the largest category of farms, those with $40,000 sales or more, off-farm income contributed only 17% to the total farm operator's family income. (See accompanying Tables 1, 2 and 3.)

In addition to off-farm part-time employment, supplemental returns from land-based activities such as hunting, fishing, and oil leases contribute significantly to the bona fide farmer or rancher's total family income.

Such activities, to most rural residents, are considered as a part of farm income, although there is a distinction among them for tax purposes. Strangely enough, limitations placed upon the farmers and ranchers with regard to outside income is in direct opposition to the U.S. Department of Agriculture goals and expenditures aimed at stimulating such supplemental income.

In the Yearbook of Agriculture for 1968, *Science for Better Living*, Secretary Freeman made this statement with regard to non-farm income:

"Working closely with farmers and other rural people, the U.S. Department of Agriculture is helping to stimulate a rural renaissance.

"Private enterprise is being attracted to the countryside. Rural people, both farm and nonfarm, are taking advantage of government supported opportunities to establish part-time businesses or trades.

"On thousands of farms, picnic and camp sites, riding stables, game and fishing preserves, winter and water sports facilities have become supplementary and even primary sources of income."

Since agriculture is a highly variable income source, fluctuating with economic conditions in the nation as well as climatic changes, it is also a business enterprise which has tremendous variations in profitability. Net income can sometimes occur, but net deficits are as equally likely. Whenever farm losses do occur, it is obviously to the benefit of the farmer or rancher to use such loss to offset any non-farm income; indeed it is imperative in many cases.

BEEF CONSUMPTION AND RETAIL PRICES

Because of increased production, the development of the commercial cattle feeding industry, and increased efficiency throughout the production and feeding levels of the cattle industry, beef production in the United States increased from approximately 13½ billion pounds in 1955 to almost 21 billion pounds in 1968. Consumer demands also increased substantially during this period so that per capita consumption was able to increase from 82 pounds per person in 1955 to 109 pounds per person in 1968 without any major change in price levels. Some of this increased demand exhibited by the consumer was a result of increased disposable income, although a substantial proportion of it was due to the drastically reduced consumption of other red meats. In fact, during this entire period when beef consumption per person increased 27 pounds, the retail price level for beef showed an increase of only 20 cents per pound.[3] (Figure 2)

Despite this substantial increase in quality, a rise in beef quality, and almost constantly increasing costs of production, the American consumer has been blessed with an average retail price only slightly higher than that which existed

[3] Gene L. Swackhamer, "The Growth of Corporate Farming," statement before the Colorado Cattle Feeders Association on February 8, 1968.

in the mid-1950's. Even a large portion of this small increase can be traced to the increased demands for consumer services at the retail level in the form of packaging, closer trimming, boning, etc.

Although today's consumers are apalled by the relatively high prices of beef in the retail counter, much of the criticism is really focused at the levels for the so-called "high-price beef cuts." Unfortunately, all of a beef carcass is not composed of high-price cuts and many "low-price cuts" are often ignored by the consumer picketers. We must remember that only about a quarter of the total beef carcass yields steaks, another quarter roasts, a third quarter miscellaneous cuts such as hamburger, stew meat, etc. and the final quarter of the carcass is lost through shrinkage, cutting loss, and trimmed fat and bones.

Let's spend a minute examining these retail beef prices that have exited some housewives. The United States Department of Agriculture bases its average retail price for beef on prices collected by the Bureau of Labor Statistics. These are basically gathered for use in preparing the consumer price index. The Bureau's purpose is to measure changes in food prices, rather than their absolute levels. Even though the Bureau goes to considerable lengths to obtain a good sample of cities and types of stores in which to gather these prices, the data really offers servere problems for the Department of Agriculture in that it does not take price specials properly into account.

For example, the advertised price specials that are usually offered on Thursday, Friday and Saturday represent the majority of the retail food sales. Red meat and poultry are the most frequently used items on such sales since they attract people into the store. When the retailer puts a certain cut of beef or broilers on sale during the weekend, the volume of the products sold at these reduced prices is often several times the volume sold at regular prices. Unfortunately, the Bureau of Labor Statistics collects retail food prices on Tuesday, Wednesday and Thursday of the enumeration week, and does not weigh the prices of food according to the specials to reflect this increased volume sold. The average prices reported by the Bureau, therefore, overstate the true average prices of foods. The National Commission on Food Marketing emphasizes this error and worked with the Department of Agriculture in an attempt to revise retail prices for red meats and poultry in recognition of this problem. In the year 1964, for example, the retail value of choice beef was reduced 7 cents per pound, for choice lamb 3.6 cents per pound, for pork 4.1 cents, and for veal 3.8 cents per pound. No data are available with which to compute revised retail prices back into the 1950's, but it can be assumed that there is an overstatement of retail prices occurring back as far as 10 or 15 years. Apparently, however, the use of price specials in supermarkets has increased in the more recent years, so it seems likely that the overstatement is probably greater in the 1960's than it was in the mid-1950's.

Even when this overstatement of the retail prices is ignored, the retail price for beef has shown very little rise during the last 10 to 15 years. (Figure 3) Beef, of course, means cattle, and the prices of high quality fed cattle have reflected about the same basic type of price pattern as the retail beef cuts. The typical rancher, however, does not produce beef, but rather, feeder calves, that today move into a highly merchandized and specialized cattle feeding industry. This cow-calf producer's output is calves, and they are his only major source of income. Prices received by farmers and ranchers for calves, however, during the last 20 year period have been hardly encouraging.

Texas cattlemen, for example, received an average of $26.27 per hundredweight for live calves in 1968. This represented the highest return from calves, with the exception of the record established in 1951, when prices reached over $30 per hundredweight. (Figure 4) Price levels for calves in Texas have remained within a relatively narrow range ever since the latter 1950's, even though as we have indicated earlier, the costs involved in producing such calves has increased at about the same rate as inflation.

The question, of course, is how can cattle producers pay more for the inputs to produce beef, yet still sell the commodity at relatively the same or even lower levels. The answer to this, of course, is that they cannot, at least not without losing money. A recent Texas A&M University study indicated, for example, that in order to attain a $3,000 a year return to labor and management, it would require an average annual investment of about $4,900 in hog production, about $21,000 for broilers, $48,000 in dairy, and a healthy $112,000 investment to get a $3,100 income from the cattle business.[3]

[3] Tom E. Prater, "Investment Requirements for an Approximate $3,000 Return to Labor-Management," Texas Agricultural Extension Service, Texas A. & M. University.

Similarly low returns were found through a research study of costs of western livestock ranches by the U.S. Department of Agriculture.[4] This analysis deals with actual commercial cow-calf reaches in the Northern Plains, Northern Rocky Mountains, and Southwestern areas of the country, during 1967 and 1968. Returns for the Southwestern ranches were consistently lower and yielded about a $6,000 to $7,000 total return to operator labor, management and capital with a $212,000 to $220,000 total ranch investment. Certainly, the investment attractiveness of such a cow-calf enterprise would be quite dubious to a businessman considering this field of endeavor.

According to the 1964 Census of Agriculture, there were about 2.3 million farms and ranches in the United States that reported having cattle and calves. Of that total, however, about 1.3 million reported maintaining beef cows while another 1 million were farms that had no cows other than milk cows or dairy type. Let's now examine these 1.3 million farms and ranches. It is assumed that, since these operations maintain beef cows, they are in the business of raising beef calves. The Census shows us, however, that of these 1.3 million cattle operations, 69% had less than 30 head and there were, in fact, only 3,645 farms in the entire United States that had 500 head of beef cows or more. Of this total a mere 1,010 farms in the whole country had 1,000 head of beef cows or more. (Table 4)

TABLE 4.—*Numbers of cattle and calf farms and ranches, 1964 census*

Farms with cattle and calves	2, 283, 881
Farms with no cows or other than milk cows	959, 969
Farms with beef cows	1, 323, 912

Of the 1.3 million farms with beef cows 69% had less than 30 head; only 3,645 farms had 500 head or more; just 1,010 farms had 1,000 head or more.

EXPECTATIONS FOR PROFIT

At this point one should examine the concept of expectations of profits on the assumption all legitimate farmers and ranchers have this attitude.

In the recent Ways and Means Committee report on this Bill, there was a reference to data which indicated that there was a strong trend toward losses increasing as the taxpayers adjusted gross income increases.

Actually, how profitable is the cattle business? Should one really expect huge profits or substantial losses? According to data collected by agricultural economists at Texas A&M University, it costs an average of about $90.50 to raise a calf, or keep a cow for a year in Texas, if all costs are considered.

This composite acerage costs is obtained by totaling the various expenses involved in maintaining a cow for one year.[5] (Table 5.)

TABLE 5.—*Costs of keeping a cow for 1 year*

	Expense
Land charge*	$28. 70
Depreciation	5. 60
Interest-herd capital**	10. 70
Replacement cost	5. 55
Operating costs	39. 95
Total	90. 50

*Land cost based upon fair lease or rental value.
**Considers cow cost and a portion of the bull.

NOTE.—No charge for labor or management is included.

Let's now look at the return Texas ranchers probably received during the Report's test year—1966. In that year, the Texas calf crop averaged 84%, the average price received for calves was $24.60 per hundredweight and the estimated weaning weight for calves ranged between 350 and 400 pounds. Assuming that our typical cattleman in Texas during 1966 produced a 400 pound calf, sold it for $24.60 per hundredweight, and had an 84% calf crop. Under these conditions

[4] Wylie Goodsell and others, *Costs and Returns Western Livestock Ranches*, 1968, USDA, July 1969.
[5] Tom E. Prater, "Estimates on Annual Beef Cow Cost by Areas," Texas Agricultural Extension Service, Texas A. & M. University.

the return per cow would be $82.66. Since our cost estimates, however, were $90.50 per cow, this left the rancher with a net loss of $7.84 per cow during the year.

It is easy to see with these figures that the larger the herd size, the larger the loss would be on any particular operation. Although there may be some economics of scale involved, they are not sufficient enough to change these basic cost figures very substantially. The loss recorded, therefore, of $7.84 per cow during 1966 would mean a $78.40 loss for a 10 cow operation, a $7,840 loss for a 100 cow operation, and a $78.400 loss for a 1.000 cow operation. Thus, our analysis of probable costs and returns of Texas ranchers in 1966 yields exactly the same type of average loss-size operation relationship as the Report figures. A similar computation of the 1967 statistics indicates that the average Texas rancher realized a net loss of only 04.50 per cow during that year, substantially better return situation, but still recording a loss.

These loss situations are more common to the cattle businesses of the Southwestern part of the United States. A recent U.S. Department of Agriculture report shows that cattle ranches which operated in the Southwestern part of the United States during the period of 1963 to 1967 had considerably higher operating expenses per unit of production than did similar types of ranches in the Northern Plains and the Northern Rocky Mountain region. These operating expenses averaged 25% higher in the Southwest, so that it is more likely for difficulties to arise in maintaining profitable operations in that section of the country than in the other. Also adding to this less favorable cost situation is a generally lower livestock price level in the South, and consequently smaller returns.

Expectation, according to Webster, is the prospect of the future. Unfortunately, cattlemen are not noted for their ability as fortune tellers. Even the feeding of cattle is highly speculative and very unpredictable. It is not uncommon to experience severe losses for one, two, or even five years in a row and then do much better for the next five. Most of these unprofitable periods are usually felt when the margin between the price paid for feeders and the price received for finished cattle, falls below zero. (Figure 5)

Agriculture, and particularly livestock production, is a highly risky and variable income generator. Not only is the farmer and rancher subject to the elements of nature, but he is also tremendously affected by national situations, economic crises, government programs, and the whims of the American consumer and her demands. No other segment of the economy involves such a wide array of risk and uncertainty, yet at the same time, offers both a short, as well as hazy, planning horizon.

AGRICULTURE NEEDS OUTSIDE CAPITAL FOR RESEARCH

Governor Connally has referred to some of the reasons for the necessity of outside capital. I want to touch on some aspects of the use of capital in agriculture.

It has not been more than about 40 years since agricultural producers of the United States struggled with primitive tools behind a mule to scratch the surface of the earth. The scientific and technological progress of our agriculture has been so rapid that few of us recognize that back in 1937, it required one person employed in agriculture to provide enough food and fiber for 10 persons in the Nation. Yet, by 1967, just 30 years later, one farmer or rancher produced abundantly for more than 40 persons.

No agricultural commodity has shown more progress than that of livestock, particularly cattle production. The first Hereford bull imported in 1817 by the distinguished American statesman, Henry Clay, bears little resemblance to the modern breed of Hereford cattle so prevalent in our country today. Similarly, the first Shorthorn cattle imported in 1783, the original Brahman stock in 1853, and the initial Angus importations in 1873, held the basic seeds of new breed developments in the United States. Many of these original cattle are hard to identify when reviewing the currently accepted standards of these breeds. Throughout the years since their importation, they have been bred, crossed, and recrossed and now yield superior animals designed to reproduce effectively, gain weight efficiently, and yield carcasses with a high proportion of trimmed retail cuts.

It has been through the efforts of the Agricultural Experiment Stations at land grant institutions such as Texas A & M University, and the U.S. Department of Agriculture that the basic research and extension work was performed. But more than that, it was the brave and industrious cattleman of yesterday using applied research in their own herds who have developed livestock to the point where it now yields more meat, at a reduced cost, with less land, and less manpower than ever in history.

Agricultural research contributions have been tremendous, particularly when you consider the small amounts of funds devoted to it in relation to other research investments. During 1966, for example, the total agricultural research expenditures by the U.S. Department of Agriculture and the State Agricultural Experiment Stations was $331 million. Industry contributions to agricultural research in that same year were $473 million. Of course, we are talking here about total agricultural research spending, not just research for livestock or cattle. Some idea of the small amount of expenditures devoted exclusively to, say, beef cattle research can be obtained from these comparisons. In 1966, the total budget outlay for the U.S. Department of Agriculture was $5.9 billion, of which only $167 million was spent for research. Beef cattle and related research work, including such things as consumer acceptance, control of insect pests, and economic efficiency in marketing represented only $10.3 million of this total. Another $18.1 million were spent by all the State Agricultural Experiment Stations on beef cattle research, bringing the national total to only $28.5 million.[6]

At first glance, this figure looks high, but compare it with the research and development expenditures of 1968 for some major corporations: IBM—$410 million; Texas Instruments—$130 million; Xerox—$76.8 million; and Merck—$55.4 million.[7]

Such public research spending is frequently, however, not all that is required. For example, the screwworm infestation of the Southwest was attacked directly by livestock producers who contributed a total of $4 million to help research efforts to erradicate this economically important pest. Recognizing the concern of the producers and encouraged by their financial backing of the project, the government came to the aid of the program with additional funds and assistance. As an administrator at Texas A&M University, I can ssure you that contributions to our research efforts are frequently made by producers and often represent the final financial push required for success. Such research contributions by private individuals are usually from the more affluent farmers and ranchers, the ones that can afford such generosity.

An economic study performed in California indicated that not only has such financial support of agricultural research by private groups and individuals been substantial, but that the time lag between the initial phases of the project and the actual accomplishment of the technological advancement, has been shortened considerably through the use of these additional funds.[8]

"Much of the work performed in argricultural experiment stations is subsidized by either industry or government. Research on minor crops may well lag behind other research programs unless some minimum industry support is received to enable purchase of needed equipment, materials and labor inputs.

"It would appear logical that given agricultural experiment station research with the minimum backing, then mechanization will be developed sooner or later regardless of industry financial support. At this point, the industry interest is then one of assuring the 'sooner' development rather than the 'later.' Additional financial support would be directed at compressing the probability function to the left, or increasing the probability that the research success would be achieved in a certain number of years or less."

It would be easy for me to claim, at this point, that all the spectacular advancements made in agricultural productivity have been solely due to the university and government achievenments, but this would not recognize the major stumbling block to technological progress—adoption of new technology. Scientists at the institutions and in the research laboratories can experiment and evolve new concepts, techniques and improved varieties. Our extension services then must take this new information out into the field to the producer and show him how to use it. But it requires the cooperation, the field testing, the sacrificing in time and money of the farmer and rancher that produces results and finally develops the new breeds and the modern types. During last year, for example, the Texas Agricultural Extension Service had the cooperative efforts of producers on 4,486 different field demonstrations, of which 1,283 dealt directly with livestock, breeding or feeding.

AGRICULTURE NEEDS OUTSIDE CAPITAL FOR DEVELOPMENT AND EXPANSION

Agriculture is not a self-supporting industry, It requires huge quantities of capital, particularly when we consider the amounts needed to build up a breeding herd or to develop an improved crossbreed.

Fortunately, for us, the tremendous sums of capital required to experiment with new breeds and types has been available in the United States. In many foreign countries, for example, the government is relegated this chore because of the expense and the poor returns on investment. Our livestock producers have been blessed with a realistic Congress which, many years ago, provided some measure of relief for such individuals through somewhat less stringent accounting procedures. The result has been a livestock development in this Nation that far exceeds any other country in the world.

This requirement for high quantities of capital in cattle breed development is emphasized in the Yearbook of Agriculture 1968, issued by the U.S. Department of Agriculture. In a discussion of hybrid vigor and how this was used by corn breeders and later chicken and swine breeders, the author states:

"But cattlemen did not follow their lead immediately.

"One good reason for this lag was that cattle breeding stock represents a high investment because much time passes before a new generation reaches breeding age. So, it is quite expensive to experiment with new cattle breeding systems."

Yet, this did not discourage livestock producers and today United States beef cattle are among the world's most desired types. This expanded size of the market for beef breeding herds has added a new dimension to the capital problem. As Governor Connally has said, the United States is now a major exporter of beef breeding cattle. This exportation of beef breeding cattle offers an extremely favorable situation for the United States, in that it represents a commodity that is exported for cash, and does not have to be subsidized under any direct government program. At the same time, the good will established with these developing countries seems to be far more lasting than that produced with any other agricultural export, probably because such animals really represent years of research and development. Secretary of Agriculture, Orville L. Freeman wrote in The Yearbook of Agriculture 1968:

"But American agriculture is also the world's biggest "storehouse" and research 'factory' for agricultural knowledge. Exporting this knowledge to improve farm production in food-short countries can contribute immensely to world stability and peace—and to the eventual entry of the entire free world into the age of abundance."

Governor Connally mentioned that the innovators of the agricultural community are the utilizers of the latest technological developments, the experimenters of new breeds, and the land developers. Land clearing, stock pond establishment brush control and similar methods of increasing the efficient use of the land are sound management practices for the progressive manager.

The serious consideration here is the diametrically opposed positions which seem to be evolving in the different branches of the government. During 1967 alone, for example, $7 million was spent by the USDA in cost-sharing brush control work with farmers and ranchers of this country. In that same year, slightly over $14 million were expended on cost-sharing stock pond and agricultural reservoir construction. For another branch of the government to now contest, in effect, the legitimacy of these expenditures as a deduction, seems quite inconsistent. Certainly, such improvements add to the productivity of the land and probably to its net worth, but unfortunately in some isolated cases the value is actually decreased since the recreational value is lowered. Likewise land which is left unattended or overgrazed, can easily be lost to brush and erosion, thus lowering its productive value.

The Budget of the United States Government

Fiscal Year 1969 eloquently states the purpose of these cost-sharing programs in this passage:

"This program is designed to encourage conservation by sharing with farmers, ranchers, and woodland owners the cost of carrying out approved soil-building and soil-and-water-conserving practices. These are practices which farmers generally would not perform to the needed extent with their own resources. The rate of cost-sharing averages about 50% of the cost. Cost-sharing may be in the form of conservation materials and services or a payment after completion of the practice.

"Conservation measures offered include those primarily designed to establish permanent protective cover, improve and protect established vegetative cover, conserve and dispose of water, establish temporary vegetative cover, temporarily protect soil from wind and water erosion, and provide wildlife and beautification benefits.

These programs are designed to give technical assistance and aid the conservation operations of the Soil Conservation Service. During the fiscal year 1969, budget recommendations for these services were $203 million. Throughout the federal budget recommendations it is repeatedly emphasized that such cost-sharing assistance is necessary to continue the long term practices that prevent irreparable damage to land resources and that would not be applied if it were not for federal assistance.

If any doubt still exists that agriculture requires outside capital, it can be dispelled by the recognition that even the government has found it necessary to provide funds to agriculture through several major rural programs:[9]

"The Administration conducts two capital investment programs: (a) the rural electrification program to provide electric service to farms and other rural establishments; and (b) the rural telephone program to furnish and improve the telephone service in rural areas. Funds for making repayable loans are borrowed from the Secretary of the Treasury.

"1. *Rural electrification.*—This capital investment program is financed through loans which bear 2% interest and must be repaid within a period not to exceed 35 years. Loans are also made for shorter periods at 2% interest to electrification borrowers to be reloaned to their consumers for the purpose of financing the wiring of premises and the acquisition and installation of electrical and plumbing appliances and equipment, including machinery.

2. *Rural telephone.*—This capital investment program is financed through loans which are made for the purpose of financing the improvement, expansion, construction, acquisition, and operation of the telephone lines and facilities or systems to furnish and improve telephone service in rural areas. The loans bear 2% interest and must be repaid within a period not to exceed 35 years.

Financing farming and rural housing.—Loans of the Farm Credit Administration through the Federal intermediate credit banks for cooperatives are primarily to help finance agricultural production and marketing.

These extremely low rates of interest, and long payment periods provided by government lending emphasized that capital for such agricultural development is not really available even from outside sources.

SUMMARY

Agriculture, in the United States today, is dynamic and growing. In my own State, Texas, agriculture provided the market with almost $3 billion worth of products, during the past year. Except for crude oil and gas, agriculture brings to the State its largest source of income.

This agricultural growth, however, has not just happened. It was a result of a number of significant factors—development of new technology, education and promotion, the action programs of both the Federal and State Departments of Agriculture, availability of resources, and farmers and ranchers willing to adopt new practices. If agriculture is to remain strong, however, it must be guided through new treacherous cross currents—those of growing cities, shrinking resources, the continued price-cost squeeze, and general indifference from the urban-oriented society which it services.

The preliminary Texas water plan, for example, indicates that by 1980, 4½ million acres of cropland, about 3 million acres of which is highly fertile, will be removed from productive use. Most of this will be land destined to become water reservoirs to service the needs of the rapidly growing population centers as well as agriculture and the remaining million and a half acres will be required for urban development, highways, airports, etc. Our principal resource for agricultural production—land, is becoming scarce.

Our Texas Agricultural Experiment Station operates throughout the State. By virtue of its assigned responsibilities, it represents the focal point of coordination for all agricultural research in the entire State. It is important that this knowledge base be maintained in order to stimulate further agricultural development. Such efforts, however, must be supported by a massive, continuous research, education and extension program—a program combining all the diversi-

fied and interdependent strengths of the scientific team expertise that we can muster.

But, the Experiment Station, the Extension Service and the entire University cannot succeed without the efforts and assistance of the dedicated individuals with the will and desire to try "a new idea." These innovators already realize that it may not lead to glory, nor riches, nor even maybe compensation—only self satisfaction that they have contributed.

Texas A&M University stands ready through its basic team to help meet this formidable and challenging task. Gentlemen, we ask not for your praise, but only for your cooperation in this effort.

The CHAIRMAN. The next witness will be Mr. George S. Dillon, on behalf of the Manufacturing Chemists Association.

STATEMENT OF GEORGE S. DILLON ON BEHALF OF MANUFACTURING CHEMISTS ASSOCIATION

Mr. DILLON. Mr. Chairman, and members of the committee, my name is George Dillon. I am president of the Air Reduction Co., Inc. I am appearing on behalf of the Manufacturing Chemists Association. Our member companies produce about 90 percent of the basic industrial chemicals manufactured in the United States.

The chemical industry itself contributes about $46 billion to our gross national product and employs more than a million workers.

We have submitted a written statement commenting on 11 different aspects of the House bill. I would like to spend a few moments with some remarks on the items we consider most significant.

Our primary concern is with the drastic increase in corporate taxes imposed by the House bill.

This increase is a major cause of the imbalance referred to by the Secretary of the Treasury before this committee when he stated that the bill was "weighted in favor of consumption to the potential detriment of the Nation's productive investment" and that such imbalance "could impede the economic growth in the years ahead by curtailing the incentive to make productive investments."

The Treasury Department has estimated that the repeal of the investment credit provisions plus the so-called reform measures would add $4.9 billion to corporate taxes, an increase of some 16 percent.

The funds to pay these taxes must be raised by corporations either through price increases or by a reduction in their capital expenditures. Either alternative is extremely undesirable. The price increases would have an immediate and obvious inflationary effect.

The harmful effect of reducing capital expenditures on inflation is perhaps a little less obvious, but in the long term it is greater than price increases.

The most important contribution that we in the private sector can make in controlling inflation in this country is to produce an ever increasing supply of goods at lower unit costs.

This contribution can't be made unless adequate funds are available for reinvestment in our productive facilities. This bill would drain off such funds and seriously impair our ability to make this important contribution to a stable domestic economy.

The proposed increases have another adverse side effect: They would reduce our ability to compete at home and abroad with foreign producers. Today our foreign competitors continue to enjoy their traditional lower wage rate advantages but, in addition, they have productive facilities as efficient as ours. In many instances these facilities are subsidized by tax concessions granted by their government.

In summary, we believe that the corporate tax increases proposed in the House bill would weaken our efforts to control inflation domestically, and undermine our competitive position in the international marketplace with unfortunate consequences to the U.S. balance of payments.

We endorse strongly the proposal of the Secretary of the Treasury that corporate tax rates be reduced to help offset the impact of the repeal of the investment credit.

I would now like to comment on some specific provisions of the House bill.

Real estate depreciation, section 521.—This provision would limit the depreciation that may be claimed on real property. We recommend that it not be applied to industrial properties such as factories, warehouses and so forth. We suggest that accelerated depreciation continue to be allowed, but if such depreciation is later recaptured through a sale of the property it be taxed as ordinary income, as is presently provided in section 1245 of the code covering sales of personal property under similar circumstances.

Capital gains rates for corporations, section 461.—We see no valid reason to increase from 25 percent to 30 percent the tax on corporate capital gains. We would recommend that capital gains be taxed in the same manner to corporations as to individuals, namely the full rate on one-half of the long-term capital gain.

The computation of earnings and profits, section 452.—This particular provision is intended to prevent tax-free distributions of dividends by certain domestic corporations, particularly in the real estate and public utility businesses. We suggest that it be made clear that it does not apply to foreign subsidiary corporations, where it would impose a substantial and, we understand, a completely unintended hardship.

Moving expenses, section 231.—This provision broadens the moving expense deduction to include the expenses of house hunting and the sale and purchase of houses. We support the new rules but believe that the $2,500 limitation is completely unrealistic. Actually $2,500 barely pays the various fees and other expenses involved in selling one medium-priced house and buying another one, and certainly wouldn't cover a good many of the other incidental expenses such as temporary quarters during a period when the employee is hunting for a new house.

Furthermore, the bill contains another limitation which provides that the moving expense provision will not apply unless the new place of business is at least 50 miles farther from the old house than was the old place of business. Many companies are moving their operations from the congested cities into the suburban areas. The employees of such companies frequently have to move because of the lack of public transport between their old house and the new company location, even though the distance of the trip is not 50 miles longer. We think the 20-mile limitation contained in present law, which is proposed by the Secretary of the Treasury, is more realistic and completely adequate to provide whatever safeguards are required in this regard.

Deferred compensation, section 331.—We recommend that your committee adopt the proposal of the Secretary of the Treasury with respect to this provision; namely, that it be deleted from the bill pending a completion of the Treasury study of this extremely complex subject.

Taxation of lump-sum distributions from pensions or profit-sharing trusts, section 515.—This provision would tax such distributions to the extent attributable to employer contributions as ordinary income rather than capital gains, with some relief through an extremely complicated averaging device. We oppose enactment of this provision.

The current rules, we believe, provide a very simple and equitable basis for taxing as capital gains lump-sum distributions accrued to an employee in pension and profit-sharing trusts over many years of employment, and these provisions should be continued.

I would like to make a final comment on one subject not covered in our formal statement. MCA plans to submit a separate statement to your committee opposing legislation which would make nondeductible treble damage payments. In the event that this subject is considered during these hearings, we respectfully request that our statement concerning this matter also be considered and included in the record.

Gentlemen, that concludes my testimony.

The CHAIRMAN. Thank you very much, sir.

(George S. Dillon's prepared statement follows:)

STATEMENT OF GEORGE S. DILLON ON BEHALF OF THE MANUFACTURING CHEMISTS ASSOCIATION

SUMMARY

1. Corporate rate reduction

The repeal of the investment tax credit and various reform provisions contained in H.R. 13270 would increase the tax burden of corporations by $4.9 billion. This increased burden would affect the ability of corporations to meet their present productivity and employment levels, would lead to increased prices, and weaken the competitive position of U.S. industry in international trade. To offset the adverse effects of this increased tax burden, a compensatory corporate tax rate reduction is recommended.

2. Deferred compensation (section 331)

The proposed new rules for taxation of deferred compensation are unnecessary and unsound and would lead to extremely difficult compliance and auditing problems. We recommend deletion of this provision as proposed by the Secretary of the Treasury.

3. Fifty-percent maximum rate on earned income (section 803)

We endorse the concept of placing a maximum tax rate of 50% on earned income, and recommend that deferred compensation, bonus awards, and all payments attributed to either qualified or non-qualified employer plans which are considered as ordinary income be treated as earned income for the purposes of this section.

4. Restricted stock (section 321)

We recommend that the controlling date for transfers under pre-existing plans be changed from February 1 to April 1, 1970, to give corporations more time to accommodate to this provision.

5. Total distributions from qualified pension, etc., plans (section 515)

We believe the current rules provide a relatively simple and equitable basis for taxing lump sum distributions accrued to an individual over a substantial portion of his employment career and recommend against the change proposed in Section 515.

6. Moving expenses (section 231)

The $2,500 limitation on deduction of certain moving expenses is considered inadequate; the removal of this limitation is recommended.

The bill would change the distance test to qualify for a moving expense deduction from 20 to 50 miles. We recommend retention of the 20 mile test as proposed by the Administration.

7. Effect on earnings and profits (section 452)

The amendment proposed in this section would create substantial hardships in the corporate foreign income area. We recommend that this section be modified to make clear that its provisions do not apply to the computation of earnings and profits of foreign subsidiary corporations.

8. Real estate depreciation (section 521)

We recommend that the new, more restrictive rules on depreciation provided in this section *not* apply to industrial real property, but that full recapture of depreciation be provided for to the extent of gain on later sale of the property.

9. Foreign tax credit (sections 431 and 432)

We recommend: (a) extension of the foreign tax credit to all situations where the U.S. imposes Federal income tax on undistributed profits of foreign corporations under Subpart F; (b) the reduction of the 50% stock ownership test in section 902(b) to 10%; (c) the extension of the foreign tax credit to foreign corporations which are below the second tier and are connected by a 10% stock ownership.

10. Alternative capital gain rate for corporations (section 461)

We recommend against the increase from 25% to 30% proposed in section 461 relating to the alternative capital gain rate for corporations.

11. Natural resources (section 501)

As a reduction of percentage depletion rates would undoubtedly lead to higher costs to the chemical industry for petroleum feedstocks and mineral raw materials, we recommend retention of the existing percentage depletion rates for natural resources.

STATEMENT

Mr. Chairman and members of the committee, my name is George S. Dillon. I am President of Air Reduction Company, Incorporated. I am appearing before you today on behalf of the Manufacturing Chemists Association, a non-profit trade association of 174 United States company members representing more than 90 percent of the production capacity of basic industrial chemicals within this country. In addition, our companies carry on extensive international operations throughout the world.

Based on a detailed analysis of the provisions of H.R. 13270, we find that many of its proposals would, if enacted, have a significant impact upon the U.S. chemical industry. We particularly appreciate, therefore, the opportunity to present to this Committee the Association's views on this comprehensive tax measure.

Corporate rate reduction

The recently passed House tax measure, after full implementation, provides for a net revenue loss of $2.4 billion. Although entitled "The Tax Reform Act of 1969," its major impact represents a redistribution of current tax obligations from individuals to business. The most significant items are repeal of the investment credit, which would increase revenues by $3.3 billion and an individual rate reduction of $4.5 billion. The reform provisions contained therein pale into insignifiance as compared to the economic implications of an additional burden to corporations estimated by the Treasury to be $4.9 billion (an effective tax rate increase of approximately 16%) and a reduction of individual obligations by $7.3 billion. The reports accompanying the proposed bill give no indication of serious consideration of the economic and inflationary impact which these shifts might foment. Assistant Secretary of the Treasury, the Honorable Edwin S. Cohen, in his statement to your Committee on September 4th, has already cautioned against this approach when he stated:

"The resulting shift in emphasis of this magnitude from investment to consumption is in our judgment inadvisable."

Without detracting from the long range benefits to be derived from general rate reductions, fairness and the economic well-being of the United States require that this bill be amended to provide for a corporate tax rate reduction before consideration is given to any general rate reductions. Since the increased burden placed on corporations from repeal of the investment credit represents almost 10 percent of the total revenues from corporations, an equivalent rate reduction seems an appropriate first step. Thereafter, if the Congress determines that it is fiscally possible to provide general rate reductions, it is recommended that such reductions also apply uniformly to corporations and individuals alike.

Assistant Secretary Cohen has endorsed such a proposal for inclusion of corporations in any general rate reduction in the program he submitted to your Committee wherein he stated:

"The program also calls for a corporate rate reduction ultimately reaching two percentage points—relief of the same general magnitude as the individual rate reductions."

The rules prescribed by your Committee do not permit discussion at this time with respect to the provision in H.R. 13270 which could, if enacted, result in repeal of the investment credit. Nevertheless, in considering equitable economic treatment for corporations, it must be pointed out that the 88th Congress had previously incorporated the benefits derived from the investment credit into its determination of an equitable relationship of tax rates for individuals and corporations. First recognizing that the most important change made at that time was in the individual's income tax rate reduction, the Executive Branch, the House Ways and Means Committee and your Committee all pointed out that the disproportionately lower $2.2 billion tax cut for corporations had to be viewed in connection with the reduction provided by Congress in the 1962 Revenue Act in the form of an investment credit and the reform provided in the depreciation guidelines. Cognizance was taken of the fact that together corporations were provided with a tax reduction of approximately $4.5 billion.

Had corporate taxpayers not been assured that the investment credit would be a permanent feature of the tax structure greater consideration would have been given to a larger corporate rate reduction at that time.

Corporations have also been disproportionatley burdened in other ways. Both the 1964 and 1966 Revenue Acts included provisions for the earlier payment of corporate income taxes so that the tax reductions were significantly minimized. More recently, in the enactment of the 10 percent surcharge, corporations were again subjected to unequal treatment in that the surcharge was applied from January 1, 1968, whereas individuals were only affected from April 1, 1968. In addition, your attention is invited to the significant increase in the corporate tax burden in the future stemming from the elimination of the faster methods of depreciation for real estate in the bill before you—when fully effective, approximately $750 million will be added to the corporate tax bill.

Serious consideration must be given to the economic impact of the proposals embodied in H.R 13270 which would significantly increase the effective rate of tax for corporations. A substantial shifting of tax burden as currently proposed in H.R. 13270 will adversely affect the ability of corporations to continue to meet their present productivity and employment levels. There is also widespread agreement between economists and experts on taxation that, to at least some degree, corporate income taxes are pushed forward into prices. An increase in the effective rate of corporate taxes will, therefore, further fuel the inflationary conditions now existing, creating a most undesirable situation compared to the deflationary effect that is so urgently needed currently and which might be achieved through a lessening of pressure on prices if the corporate tax rate were reduced.

The increased corporate tax burden proposed in this bill would place American industry at a serious disadvantage in competing with foreign industry both at home and abroad. Foreign producers have historically had the competitive advantage of cheap labor which we managed to counterbalance through more efficient productive capacity. But foreign producers now have modern machines also, as well as low-wage labor, and their governments grant tax credits to encourage development of the most up-to-date, efficient production facilities. Removal of the investment credit without some compensatory tax relief would, we believe, drastically weaken the competitive position of American industry with unfortunate consequences to our internal economy and to our balance of payments.

Under the circumstances, it is not only equitable but economically essential that consideration be given to a reduction of the corporate tax rate to offset the adverse effects of the repeal of the investment credit. Thereafter, and to the extent fiscally possible, any general rate reduction considered by your Committee should, as recommended by the Treasury Department, include corporations as well as individuals.

Deferred compensation—Section 331

Section 331 of H.R. 13270 provides that deferred compensation exceeding $10,000 will be taxed at the rate applicable to the year of receipt or the year in which such payments are deemed earned, whichever is higher. The 50 percent maximum rate of tax on earned income provided in Section 802 of the bill is specifically made non-applicable to any deferred compensation payment. Thus, a taxpayer receiving deferred compensation would pay the highest possible tax on such compensation.

This proposed provision with respect to deferred compensation appears to us to introduce an entirely new principle of taxation for which there is no precedent and for which no need has been demonstrated.

The House Report states that under arrangements now in effect between employers and employees, some high bracket employees are permitted to defer the receipt and taxation of part of their current compensation until retirement when they presumably will be in lower income brackets. However, the provision in the House bill would seem to go far beyond the indicated objection by indiscriminately covering typical corporate deferred compensation plans which have been in existence for many years and which serve a valid corporate business purpose in attracting and holding employees by giving them a greater stake in the company in which they work. These plans typically cover not just top executives, but hundreds of employees reaching down into the lower levels of management. In most cases, employees are members of such plans for significant portions of their careers. The tax savings, if any, from the deferment of compensation are minimal. There is no guarantee that deferred compensation will, in fact, be taxed at a lower rate when received than when it was earned or credited to an employee and instances where exactly the opposite is true are numerous. In many cases employees have no control over deferment or non-deferment of the compensation. The necessity for penalizing such taxpayers has not been demonstrated.

From the technical standpoint, the provision would introduce entirely new concepts which would lead to extremely difficult compliance and auditing problems. Under career plans with payout of deferred compensation after retirement, 1970 tax rates would become applicable to compensation received well into the twenty-first century. As pointed out by Assistant Secretary of the Treasury Cohen in his testimony before your Committee, the annual accounting concept underlies our entire tax system. This provision would modify both the cash method of accounting and the annual accounting period concept.

We endorse the Secretary's statement and urge that this provision in the House bill be deleted. If any reform is needed in this area, we agree that considerable further study is required before the nature and extent of such reform can be properly identified.

Fifty-percent maximum rate on earned income—Section 803

We strongly endorse the concept of placing a maximum tax rate not in excess of 50 percent on earned income as a tax relief measure for those whose wages, salaries, professional fees and compensation for services are subjected to extremely high tax rates. Large salaries presently paid corporate executives stem in part from the extremely high individual income tax rates and a provision such as this will significantly eliminate tax considerations from salary negotiations.

We note that deferred compensation is specifically excluded from the definition of earned income. However, no definition is given of deferred compensation. In this regard, we feel that bonus awards paid during employment, whether or not in more than one installment, and all payments attributed to either qualified or non-qualified employer plans which are considered as ordinary income should be treated as earned income and entitled to the benefits of Section 802.

Restricted stock—Section 321

Section 321 of the House bill would change the taxation of gain on stock given to employees subject to restrictions However, under the transition rules the new treatment will not apply to property transferred "(3) . . . before February 1, 1970, pursuant to a written plan adopted before July 1, 1969 . . ."

This transition rule recognizes the need of permitting the granting of restricted stock under existing plans for executive performance in the taxable year 1969. However, it is submitted that the period from January 1 to February 1, 1970, is too short a period for a company with worldwide operations to receive audited statements for 1969 and take actions necessary to granting awards and issuing restricted shares. Accordingly, it is recommended that the controlling date for transfers under pre-existing plans be changed from February 1 to April 1, 1970.

Ordinary income treatment of portion of lump-sum distributions from pension and profit-sharing trusts—section 515

The bill would remove the capital gains tax on lump sum distributions from pension and profit-sharing plans in the case of employer contributions made after

1969 which would be taxed as ordinary income with some relief through an averaging device. This new treatment would not apply to amounts already in employee's accounts.

The development of private pension and savings plans has been encouraged by the Congress for many years and should continue. These plans provide economic security for an employee's retirement, disability, unemployment or death, through private savings over and above Government social security which was intended to provide only an average level of subsistence. Favorable tax laws have stimulated the growth of these plans and should be continued in order to provide an incentive for self-reliance, individual initiative and personal thrift.

Current law, which provides for capital gains treatment on such lump sum distributions, was adopted as a solution to the problem of a taxpayer receiving an amount in one taxable year which had been accrued over his entire career with his employer. We believe the current rules provide a relatively simple and equitable basis for taxing lump sum distributions accrued to an individual over a substantial portion of his employment career and should be continued. The House proposal, if enacted, will add many more complexities to the tax law. Instead of paying a simple tax in the year of receipt of a lump sum distribution, an employee will have to divide up his distribution as between the amount accrued through 1969, amount contributed by his employer, and, as to future accumulations, go through numerous steps to compute his tax. These complications will be burdensome to the employee and will also force upon the employer additional and costly record keeping.

The bill also amends Section 217(c) of the Internal Revenue Code which, in essence, provides that the taxpayer's new principle place of work must be at least 20 miles farther from his former residence than was his former place of work, or if he had no former principal place of work, at least 20 miles from his former residence. Under the new provision the 20 mile test is increased to 50 miles. We believe this test is unduly restrictive and support the Treasury Department's similar position on this matter.

We would like to point out that it is not the practice of most employer companies to reimburse employees who relocate solely for their own convenience. Reimbursement is generally limited to those cases where the employer has taken some action which makes the employee's former residence unsuitable. For example, assume an employer is located in a metropolitan area such as New York City. That employer will undoubtedly have employees commuting from Long Island, Westchester County, Connecticut and New Jersey. Should the employer then move his office to New Jersey, it is quite likely that the employees resident in Connecticut, Long Island, and Westchester will either have to move to New Jersey or seek new employment, evven though the new principal place of work might be less than 50 miles farther from his former residence than was his former principal place of work. Accordingly, we would urge you to modify the House provision and continue the 20 mile test now contained in Section 217 of the Internal Revenue Code as recommended by the Administration.

Although it appears that no withholding of taxes will be required on these amounts if it is reasonable to believe that they fall within these provisions, we urge that this be clarified so that there is no doubt but that withholding is not required.

For the above reasons, we oppose the proposals in the House bill relating to distributions from pension, stock bonus, and profit-sharing plans.

Moving expenses—Section 231

Section 231 of H.R. 13270 provides a new moving expense deduction for house-hunting trips, temporary living expenses prior to locating a new home, and for the expenses of selling an old home or buying a new one, subject to a ceiling of $2,500 and a $1,000 limitation on expenses relating to house-hunting and temporary living expenses. The changes proposed by the House recognize the inequity of taxing an employee on reimbursed expenses that he would not otherwise incur absent a request on the part of his employer to transfer from one location to another, but regrettably only provide partial relief from the inequities existing in current law.

A review of the proposed bill, particularly as it relates to the limitation in reimbursements, reveals that most employees who are required to relocate will only achieve partial relief since the $2,500 limitation contained in the bill is clearly inadequate in the case of most moves. For example, assume an individual, upon relocating, sold a $25,000 house in his old location and bought a $25,000 house in a new location. The qualified residence sale, purchase, or lease expenses in this case (lawyer's fee, real estate agent's commission, escrow fee, appraisal fee, title costs, etc.) would be close to the $2,500 limitation, with the result that any reimbursement for house-hunting trips and temporary living expenses would constitute taxable income. We would urge that the dollar limitations contained in the bill be eliminated, providing the individual involved is reimbursed for expenses qualfying under this section and has to account for such expenses to his employer.

Effect on earnings and profits—section 452

This provision amends § 312 of the Internal Revenue Code to require every corporation to use the straight-line method of depreciation for purposes of computing its earnings and profits, regardless of the fact that it may have used accelerated methods permissible under § 167 in computing its taxable income. Under present law, some corporations have been able to use the excess of accelerated depreciation over straight-line depreciation to reduce their earnings and profits to such an extent that they have been able to make tax-free distributions to their shareholders. Such distributions are said to be "an improper tax benefit to shareholders which is generally unrelated to the purposes for which accelerated depreciation deductions are made available to corporations." (H. Rep. No. 91–413, Part 1, 91st Congress, 1st Session, page 134.) The amendment, if adopted, would end that practice.

The proposed amendment, however, creates substantial and apparently unintended hardships in the corporate foreign income area. The denial of the use of accelerated depreciation in the computation of earnings and profits of a foreign corporation will increase the recomputed earnings and profits of foreign corporations for foreign tax credit and minimum distribution purposes and will reduce the amount of the foreign tax credit available to the U.S. parent corporation under § 902 and § 960 with respect to dividend distributions from the foreign corporation. It will also substantially increase the burden of meeting the minimum distribution requirements for corporations which have made that election under § 963.

In addition, the proposed amendment unfairly penalizes the use by a U.S. corporation of a foreign corporation in operating outside the U.S. as compared to the use by the U.S. corporation of a foreign branch. For example, assume a U.S. corporation operates through a branch in Foreign Country A. Assume further that the provisions of A's income tax laws with respect to depreciation allowances and rates of tax are the same as in the U.S. and that an accelerated depreciation method is used. The foreign source taxable income of the branch (which limits the amount of foreign income taxes available as a credit against the U.S. tax) and the foreign tax credit are unaffected by the proposed amendment. On the other hand, where the U.S. corporation operates abroad through a foreign corporation, the proposed amendment would increase the earnings and profits of the foreign corporation and thereby reduce the amount of "deemed paid" credit to which its parent would otherwise be entitled, under present law, to offset against the U.S. tax otherwise payable on the dividend.

Because the purpose of the proposed legislation is to prevent tax-free distributions to shareholders, § 452 should be modified to make clear that its provisions do not apply to the computation of earnings and profits of a foreign corporation less than 50 percent of whose gross income is effectively connected with the conduct of a trade or business in the U.S.

We also urge that serious consideration be given to an approach which would only apply this new principle in situations where the distribution would be tax-free because of the use of the accelerated methods of depreciation. In other words, these new rules would only be applied when the corporation does make a tax-free distribution and not before.

Real estate depreciation—Section 521

Section 521 of H.R. 13270 generally limits the depreciation that may be claimed by a taxpayer on buildings constructed after July 25, 1969, to an amount not exceeding 150 percent of straight-line depreciation and provides that the gain on the sale of depreciable real property after July 24, 1969, will be treated as ordinary income to the extent that accelerated depreciation taken after this date is in excess of allowable straight-line depreciation. This proposed change in law is in response to Congress' valid concern with real estate transactions conducted by speculators which result in large ordinary deductions which offset ordinary income followed by a subsequent sale of the real estate at a time when the gain on the sale constitutes a Section 1231 gain entitled to the more favorable capital gains tax rates. The proposed changes also reflect the fact that the present tax treatment creates an environment favorable to frequent turnover of real estate and tends to discourage long-range stewardship and adequate maintenance of facilities and thus needs to be modified.

We are sympathetic with Congress' concern, but feel that the proposed solution is inadequate and, in fact, inequitable in many situations. There is little reason to apply these new rules to industrial real property—by which we mean factory buildings, warehouses, and similar structures used by a manufacturing concern in the operation of its business. Such property is not acquired for the purpose of generating tax-sheltered income, and its disposition is determined for reasons wholly apart from tax considerations.

We would strongly urge a simplified but tougher tax treatment for the gain on the sale or disposition of real property. This would be accomplished by applying the same recapture rules that Congress enacted in 1962 when it added Section 1245 to the Code, which provides that all depreciation claimed after the effective date of the legislation which is recaptured on sale receives ordinary income treatment. If real estate recapture provisions were to be revised to conform to the personal property recapture provision in § 1245, then it would be permissible to continue to use accelerated methods of depreciation, such as double declining balance and sum-of-the-years digits.

This proposal is advanced on the condition that more realistic guideline lives on buildings are provided by the U.S. Treasury Department. The guideline lives for buildings which the Treasury announced in 1962 are far less liberal than those generally available for machinery and equipment. In fact, in some cases, the building lives are actually longer than those lives provided in the outmoded and obsolete Bulletin F. In the past, Treasury officials indicated that the basic reason for this stringent treatment with respect to buildings is that they have been excluded from the full recapture provisions contained in Section 1245. We believe that, with the modifications suggested in this presentation, Government revenues would be adequately protected and more equitable treatment will be available for the true investor in real estate; industrial, commercial, and residential.

We would also strongly suggest that your Committee consider removal of the reserve ratio test from the guideline rules promulgated by the U.S. Treasury Department. Adoption of such a measure will eliminate complications in the depreciation area and will go a long way toward removing depreciation controversies between the Government and taxpayers at little or no loss of current revenues.

Foreign tax credit—Sections 431 and 432

H.R. 13270 contains two provisions restricting the application of the existing foreign tax credit provisions (Sections 431 and 432) which bear vitally on the extractive industries. While this Association expresses no opinion on the rationale for, and the net effect of, these restrictions, we are concerned that this might be a step toward further changes in present law as it applies to other industries. In this regard, we wish to emphasize that there should be no changes in the application of the present foreign tax provisions which would violate or weaken the philosophy of "tax neutrality" underlying these provisions.

We note that the Treasury Department has suggested that foreign taxes in any country which exceed 60 percent of distributed income from such country (regardless of the source or character of such an income) should not be available as a credit against United States taxes on foreign income from other countries. This Association opposes any such limitation which militates against the presently recognized principle that a taxpayer can look at his foreign operations as a single unit, and, therefore, take into account all foreign income and income taxes for foreign tax credit purposes.

Furthermore, while this subject is under consideration, there are additional reforms which should be considered and adopted in the interest of a fair and equitable tax system.

This Association has urged over the past years that the law be changed so as to broaden the provisions of the Internal Revenue Code permitting foreign tax credits for foreign income taxes paid by foreign subsidiaries.

We specifically recommend:

(1) The extension of the foreign tax credit to all situations where the United States imposes Federal income tax on undistributed profits of foreign corporations under Subpart F; and

(2) The reduction of the 50 percent stock ownership test in Section 902(b) to 10 percent, and also the expansion of Section 902 to cover dividends received from earnings and profits of all foreign corporations below the second tier which are connected in a chain of corporations by a 10 percent or more stock ownership.

The Federal income tax law since 1918 permitted the portion of the United States income tax attributable to foreign income to be offset by foreign income taxes attributable thereto. In addition, since the early 1920's, foreign dividends received by a domestic corporation have received a tax credit determined ratably by the proportion of the earnings and profits distributed. This credit is allowed a domestic corporation under Section 902(a) only where the domestic corporation receiving the dividend owns at least 10 percent of the voting stock of the foreign corporation. A foreign tax credit is also allowed under Section 902(b) for foreign income taxes paid with respect to earnings ultimately received by the domestic corporation from a foreign corporation, 50 percent of whose voting stock is owned by the 10 percent owned foreign corporation. Thus, the foreign tax paid by the 50 percent owned subsidiary passes through its foreign parent corporation to the domestic corporation for foreign tax credit purposes.

(1) We believe that the 50 percent test is too high and that it should be reduced to 10 percent; and

(2) the foreign tax credit should be extended to foreign corporations which are below the second tier and are connected by a 10 percent stock ownership.

Turning now to Subpart F, every United States shareholder who owns directly or indirectly 10 percent or more of the combined voting power of all classes of stock of a controlled foreign corporation is subject to tax on his pro rata share of foreign base company income and the increase in investment in United States property of such corporation. Accordingly, a United States shareholder is subject to tax under Subpart F where there is a 10 percent or more direct or indirect stock owneship of a controlled foreign corporation.

Despite the requirement of current taxation on certain undistributed profits of indirectly owned controlled foreign corporations, there is no allowance for a foreign tax credit for foreign income taxes paid on those profits except in situations where a credit would be allowed had those profits been distributed. In other words, the foreign tax credit provisions were not extended to dovetail with taxing provisions of Subpart F.

The principal objection to broadening the stock ownership requirements for foreign tax credit purposes has been the administrative difficulties of checking the relevant facts necessary to prove the proper credit. However, in view of the recent extensive expansion of the information procurable by the Internal Revenue Service, there no longer can be a valid basis for objection on this ground. The Internal Revenue Service received under Section 6046 an information return from each United States person who owns 5 percent or more in value of stock of a foreign corporation. Moreover, since 1962 a United States shareholder owning directly or indirectly 10 percent or more of the stock of controlled foreign corporations in a chain has been taxed on the ratable portion of their Subpart F income. There should be no objection therefore, from an administrative viewpoint, for providing the appropriate foreign tax credit as we propose.

There can be no question as to the soundness of the foreign tax credit. It prevents in many situations a double income tax burden which would be penal in nature and which, in the long run, would ultimately result in the loss of United States private investment abroad. The foreign tax credit helps place United States business on an equal competitive basis with its foreign competitors. Theoretically, there is no reason for any limitation on the amount of stock which should be owned by the domestic corporation or one of its foreign subsidiary corporations before credit is allowed for the foreign income taxes paid with respect to distributed earnings.

In order to eliminate this potential double tax burden, many corporate managements endeavor to reorganize their foreign subsidiary structures for the purpose of simplification and in order to qualify their subsidiaries for foreign tax credit. This requires in many cases liquidations and reorganizations which fall within the ambit of Section 367 requiring prior clearance by the Commissioner of Internal Revenue before the exchanges can be considered tax-free. However, the Commissioner has taken such categorical positions under Section 367 that it is virtually impossible to obtain favorable decisions. The Manufacturing Chemists Association has made a study of the administration by the Internal Revenue Service of Section 367 and as a result has concluded that the administrative power of the Commissioner through the advance ruling requirements should be eliminated. In brief, the Manufacturing Chemists Association recommends that the question whether there is a plan having as one of its principal purposes the avoidance of Federal income taxes be left to the courts. We hope you will consider revising and liberalizing Section 367 requirements.

Alternative capital gain rates for corporations—section 461

Section 461 would raise the alternative tax rate on net long-term capital gains of corporations from 25 percent to 30 percent. The reason for this change is to provide a comparable increase in capital gains tax to that proposed with respect to individuals, since the capital gains rate for individuals would be eliminated—thereby raising the maximum capital gain tax above 30 percent.

We do not believe that it is necessary to raise the corporate capital gains rate to a comparable level. We believe that long-term capital gains should be taxed in the same manner as is applied to individuals—namely, a full corporate rate should be imposed on one-half of the long-term capital gain. It is inequitable to impose higher capital taxes at the corporate level when the distribution of these amounts will again be subject to tax as dividends. The establishment of a proper corporate tax should apply to the taxable half of net long-term capital gains.

This recommendation is consistent with the Treasury Department's proposal to return to a 25 percent basic rate. We do not subscribe to the alternative proposal of the Treasury Department to apply a 30 percent rate for gains exceeding $50,000.

Natural resources (percentage depletion)—section 501

The chemical industry consumes a substantial amount of petroleum derivatives and hard minerals in its chemical operations. Reduction of percentage depletion rates will result in higher costs to the chemical industry for these feedstocks and raw materials at a time when chemical product prices are severely squeezed. In addition, depletion allowances have helped give this country an adequate supply of energy products at reasonable prices, and reduction of these allowances would result in increased costs for these products. These cost increases would necessitate compensating price increases on the part of the chemical industry further contributing to the inflationary spiral.

For the foregoing reasons, the chemical industry believes that continuation of existing percentage depletion rates is in the national interest, and accordingly strongly urges that these rates not be changed.

Conclusion

Mr. Chairman, I wish to thank you and the members of this Committee for affording me the opportunity to present for your consideration the views and recommendations of the Manufacturing Chemists Association on the Tax Reform Act of 1969.

The CHAIRMAN. The next witness is Mr. Stanley R. Fimberg of Beverly Hills, Calif.

STATEMENT OF STANLEY R. FIMBERG, BEVERLY HILLS, CALIF.; ACCOMPANIED BY EDWARD WEINBERG, ATTORNEY

Mr. FIMBERG. Mr. Chairman, my name is Stanley Fimberg, I am a tax lawyer from Beverly Hills, Calif. I am joined here today by Ed Weinberg, an attorney with the firm of Wyman, Bautzer, Finell, Rothman, and Kuchel, Washington, D.C.

I appreciate the opportunity to appear before this committee to testify regarding provisions which I feel were poorly conceived and which are even more poorly applied because of the variety of technical deficiencies which appear therein.

I will limit my testimony today to just a general explanation of the things that I consider wrong with the provision. A more complete statement has been submitted.

To me the basic fallacy of the provisions, as a tax lawyer, is an attempt, in the name of tax reform, to create a provision which has in it inherent discrimination among various groups of taxpayers.

I know the Honorable Mr. Stanley Surrey appeared before this committee, and dismissed these discriminations in a paragraph, but I submit that they exist and I would like to point them out to the committee, and I submit they cannot be dismissed in a paragraph. I think the Treasury's feelings about these provisions is evident in that they have now asked that they not be supported.

Basically, the new section 221 would limit the interest deduction in a fashion where it would apply differently to taxpayers who are wage earners, taxpayers who have investment income, and taxpayers who are engaged in a trade or business.

I submit that the logic behind these differences is a little difficult for me to grasp, and I think maybe I could illustrate it best for the committee by giving an example of three different taxpayers all of whom were similarly situation except in the nature of earning their income and all of whom would be treated quite differently by the application of this provision.

For simplification I will refer to them as A, B, and C. If taxpayer A is a wage earner and all of his income is from salary he will be limited to a $25,000 deduction with respect to any borrowings which he may use in an attempt to create additional net worth for himself. I am assuming he has nothing, he is trying within our capitalist system to develop assets, and having nothing but his salary he goes to a bank or lending institution and using his ability to earn income, borrow funds, repays the loan, in the process creates capital assets.

If he had $50,000 worth of income and his borrowings created an interest deduction of $50,000, just to make the example simple, he would be entitled to only a $25,000 deduction under this provision.

Suppose taxpayer B doesn't work for a living but has investment assets which produce $50,000 of income. Under this provision he could borrow the same amount of money, pay $50,000 in interest but deduct the entire amount.

I submit I find the distinction between someone who has investment assets already and who is entitled under this provision to borrow in order to create additional assets, and the taxpayer and wage earner who has no assets and whose interest deduction is limited to be somewhat mystifying, but again in Mr. Surrey's argument before this committee or discussion with this committee, he dismisses this with a paragraph, without any logic to support his conclusion.

I suggest that the provision is another example of what can happen when a statute is hastily conceived, because of some general feeling that something is wrong with a section and a result is achieved which I don't believe anybody who would have thought the problem through from beginning to end would have thought was justifiable.

Taxpayer C compared to A and B could be engaged in his own business, borrow as much as he wants and invest it in that business because he is now engaged within a trade or business within the definition of this act and not be limited at all in the amount of interest he could deduct. I think it inappropriate to discriminate among taxpayers one of whom is a wage earner, another of whom earns all of his income from investments, and a third of whom is engaged in his own business, one not getting the advantage of deducting interest beyond the limitation—while two of them being entitled to deduct interest beyond the limitations afforded, the first being put in some special class to be treated differently because his sole source of income is from personal service.

I think it is unfortunate this kind of situation exists, and I would respectfully hope that the committee in its wisdom would provide for its elimination because I think it serves no ends other than to create additional discrimination in the Internal Revenue Code.

I know my time is limited and I would just like to bring to the attention of the committee two very serious technical defects in the provisions over and above the general falacy and policy which I hope I have already discussed to your satisfaction.

One is the provision which discriminates against partnerships and in favor of other types of landholding entites when it comes to real estate investment and with interest reductions with respect to such real estate. Individuals who own property as tenants-in-common would be given totally different treatment than the individuals who own real estate in partnership. From a business standpoint, and totally aside from tax considerations, there are significant reasons why individuals would want to own real estate in partnership when more than one individual is involved rather than tenants-in-common. They deal with economic convenience and convenience of administration and just sensible development of real estate. Yet again section 221, because of its lack of thoroughness in investigating a basic change in the Internal Revenue laws, would discriminate against partnerships and in favor of individuals who held property in some other fashion.

Finally, and one point which I think is probably as vital as anything else I have discussed today, is if the committee in its wisdom decides that this bill should be enacted in substantially its present form, I would call your attention to the effective date provisions because again the bill does something which to my knowledge is very, very seldom done with tax laws, in that it applies the law with a retroactive effect, and it does it in this fashion: It has an effective date provision which provides that it applies with respect to taxable years beginning after the current taxable year. However, it does not take into account the fact that individuals may have entered into contracts and/or may have achieved obligations, without regard to an understanding that the law was going to be changed. I submit that what should be done with this provision is the same thing that the Internal Revenue Service did when it enacted its ruling on prepaid interest which the Ways and Means Committee approved in the committee report, and that was that they do not apply the provision to contracts or obligations which existed prior to the date of the passage of the law.

In other words, what is important here is not when the interest is paid but whether the taxpayer in question was under an obligation to pay that interest because of a contract or obligation incurred before he could legitimately have had any knowledge of the application of these provisions.

I thank your committee very much for allowing me to be here, especially you, Mr. Chairman, and I suggest again I hope you give consideration to this provision which has not received a great deal of notice, public or otherwise, and which I feel is a provision which has much greater impact than it may appear to do.

The CHAIRMAN. Thank you very much.

Senator ANDERSON. Can I ask one question?

Mr. Surrey spent a great many years in tax study and he has been before this committee. Has he one word that you approve of?

Mr. FIMBERG. Oh, yes, sir; I think there are many things that I approve.

Senator ANDERSON. What are they?

Mr. FIMBERG. I approve of many of his statements throughout the tax bill. One statement with which I specifically take issue is the following statement, and I quote, "The Treasury argument that the provision discriminates against the person with earned income and no investment income, but borrowings invested in growth assets is hardly an adequate reason to drop the provision," I do disagree with that, sir.

I disagree that the tax laws should create any further discriminations than they already do. I think the object of tax reform is to try to create tax equality, not further discrimination. But I do not only approve of many of the things Mr. Surrey says, I am a great admirer of his. I just happen to disagree with that particular statement.

The CHAIRMAN. Thank you.

(Stanley R. Fimberg's prepared statement follows:)

STATEMENT OF STANLEY R. FIMBERG, BEVERLY HILLS, CALIF.

Section 221 of H.R. 13270 would amend Section 163 of the Internal Revenue Code of 1954 (relating to the deductions for interest) by placing a limitation on the amount of "investment interest" which certain specified taxpayers could deduct. "Investment interest" is a term which is specifically defined by the new provisions.

The undersigned respectfully submits that the proposed amendment to Section 163 is unsound both from a policy standpoint and in certain respects from a technical standpoint. Further, that the effect of this amendment will result in unfairly penalizing taxpayers who had made certain business decisions and closed transactions before they could have obtained any knowledge of the effect of this proposed new legislation.

A. ANALYSIS OF STATUTE

Section 221 would add a new subsection (d) to Section 163 of the Internal Revenue Code, which new subsection would be entitled "Limitation on Interest on Investment Indebtedness." This section would apply in the case of every taxpayer other than a corporation (except an electing small business corporation as defined in Section 1371(b)). Under this provision, the amount of "investment interest" which a taxpayer covered by the amendment would be entitled to deduct during a taxable year is limited to the sum of (i) Twenty-Five Thousand Dollars ($25,000.00), (ii) the amount of his "net investment income" and (iii) an amount equal to the amount by which his net long-term capital gain exceeds his net short-term capital loss for the taxable year. Additionally, a carry forward provision is allowed to the extent "investment interest" exists but the taxpayer in question cannot deduct the same in the taxable year in question. In essence, this amendment would limit a taxpayer's interest deduction to the sum of (i) Twenty-Five Thousand Dollars ($25,000.00), (ii) his investment income, and (iii) certain excess long-term capital gains.

The key terms which will be discussed herein are:

(1) Investment Income

"The term investment income means the gross amount of income from interest, dividends, rents, and royalties and net short-term capital gains derived from the disposition of property held for investment, but only to the extent that such gross income or such gains are not derived from the conduct of a trade or business." Proposed IRC § 164(d)(3)(A).

(2) Investment Expenses

"The term investment expenses means all deductions allowable under section 164(a) (1) or (2), 166, 167, 171, 212, or 611 directly connected with the production of investment income." Proposed IRC § 164(d)(3)(B).

(3) Net Investment Income

"The term net investment income means the excess, if any, of investment income over investment expenses." Proposed IRC § 164(d)(3)(C).

(4) Investment Interest

"The term investment interest means interest paid or accrued on indebtedness incurred or continued to purchase or carry property held for investment." Proposed IRC § 164(d)(3)(D).

B. BASIC POLICY

(1) The basic policy of the new Section 163(d) is set forth in a Report of the Committee on Ways and Means of the House of Representatives which accompanied H.R. 13270. Such Report is H.R. No. 91-413 (Part I), 91st Congress, 1st Session. The Committee felt it was unfair to allow a taxpayer who borrowed funds to make an investment which did not create a taxable income to deduct that interest against his other income. They felt that the interest was a controllable expense and that a taxpayer should not, through deduction of interest, be allowed to insulate other types of income. The Committee stated:

"Your committee does not believe it is appropriate to allow an individual taxpayer to currently deduct interest expenses on funds borrowed for investment purposes where the interest expense is substantially in excess of the taxpayer's investment income."

The undersigned respectfully submits that the foregoing analysis is unsound. Merely because a taxpayer is primarily engaged in earning income from his personal services and hence is not in the trade or business of investing, if he desires to develop investment assets, the cost of developing such assets is an expense to him in the same way that someone involved in a trade or business incurs expenses to improve that business. Moreover, the basic policy of the statute would tend to be to discourage an individual who did not already have investment assets from acquiring such assets. Because of the high level of ordinary income tax on earnings from personal services the only way an individual who is basically a wage earner can accumulate any capital assets is through judicious borrowing for the purpose of creating such assets. The interest deduction afforded allows him to create a capital asset which he would otherwise not be able to do.

Unless the level of tax on salary income is substantially reduced, even below the top level as provided by the proposed legislation, it would seem that a policy of nondeductibility of interest coupled with a fifty percent (50%) or higher ceiling on salary income results in an unfair burden on the salaried taxpayer, and puts him at a significant disadvantage when compared to the taxpayer who is engaged in his own business. For example, it is not unusual for an individual who is attempting to build up the capital value of the business to expend sums which are deductible, e.g. salaries of employees, purchase of and *payment of interest* on loans used for expansion, inventory, etc., and thereby in effect reduce his taxable income while at the same time increasing the capital value of his business as an asset which he could sell. I submit that the expense of interest to an investor is not sufficiently different from those expenses to receive different treatment. It is just administratively easier. Further, to suggest that interest is a controllable expense is to say it is controllable in the event someone, substantially all of whose income is from services does not want to try to create capital assets greater than whatever small amount of income is left after paying his tax bill on his income from such services. Interest is equally controllable for an individual who borrows funds to expand his business. Surely to state that interest is controllable in one instance and not the other shows its fallacy. For it is only through borrowing that capital assets can be created for such a wage earner. Moreover, such borrowing will be impossible if the interest thereon is not deductible.

(2) A second and more basic problem with the policy of the statute is that it discriminates against individuals who do not have investment assets and who borrow funds in an attempt to create such investment assets, and in favor of individuals who have investment assets and borrow money to create additional investment assets. Under the proposal, an individual who has substantial investment income can borrow funds to create additional investment assets and not be subject to the same limitations as someone who has no investment income. That individual is subject to a flat Twenty-Five Thousand Dollars ($25,000.00) limitation. Such a basic discrimination is unwarranted and is another example of the basic fallacy underlying the provisions.

To illustrate, Taxpayer A has Seventy-Five Thousand Dollars ($75,000.00) of income, all of which is from wages. He borrows Five Hundred Thousand Dollars ($500,000.00) for the purpose of making an investment, and is charged interest of Fifty Thousand Dollars ($50,000.00) on such borrowing. He will be limited to a Twenty-Five Thousand Dollar ($25,000.00) deduction under the proposed amendment. However, Taxpayer B, all of whose income of Seventy-Five Thousands Dollars ($75,000.00) is from investments borrows the same Five Hundred Thousand Dollars ($500,000.00), and pays the same interest. He is not subject to any limitation on deductions of interest because he can offset his excess interest deductions against his "investment income." I think this simple example indicates the flaw in the reasoning behind the statute. Therefore, the attempted distinctions set forth to justify the different treatment given to the investor without other income and the investor with such income or given to the investor and one who is engaged in a trade or business really do not stand up under analysis.

C. DEFINITION OF INVESTMENT INTEREST

(1) Inconsistency between Section 163(d)(3)(D) and Section 163(d)(4)(C)

One of the technical problems with this statute arises because of an inconsistency between the definition of investment interest and a special definition governing rents. It should be remembered that under the policy of the statute, investment interest can be offset against investment income. Rents are considered to be one type of investment income so long as they are not derived from the "*conduct of a trade or business*". Proposed IRC § 163(d)(4)(C). A statutory definition is then set forth as to what is required for rental income to be considered to be derived from a trade or business. On the other hand, the definition of "investment interest" is interest paid or accrued on indebtedness incurred or continued to purchase or carry "*property held for investment*". The problem is whether or not the terms "property held for investment" and "conduct of a trade or business" are synonomous. The problem is illustrated by the following example:

A, an individual, is the owner of an apartment project. Because of the manner in which the business of the apartment project is conducted, the income derived therefrom is considered to be derived from the conduct of a trade or business in accordance with proposed Section 163(d)(4)(C) and hence is not investment income. Assume that gross rents derived from such apartment project are Three Hundred Thousand Dollars ($300,000.00) per year, and that such property is subject to a mortgage of One Million Five Hundred Thousand Dollars ($1,500,-000.00) on which interest in the amount of One Hundred Twenty Thousand Dollars ($120,000.00) per annum is paid. Assume further, that after taking all deductions attributable to the operation and ownership of the property, that A has taxable income of One Hundred Twenty Thousand Dollars ($120,000.00) per annum, and that said taxable income is his only taxable income. The issue is whether or not the One Hundred Twenty Thousand Dollars ($120,000.00) of interest income is deductible by A without limitation or whether or not it constitutes investment interest. From a policy standpoint, the interest should be deductible since the income derived from the property and reportable by A is not investment income, within the definition of proposed Section 146(d)(4)(C).

However, because of the manner in which the statute is drafted, although the rent from the property is not investment income, the interest paid on the mortgage encumbering the property may be investment interest. This would mean that A would not be able to offset such interest against his income from the property and would end up paying tax on such income without the availability of the deduction which is attributable to payments made with respect to the property. Obviously, such a result was not intended and should be corrected. Such deficiency could be corrected by amending the definition of investment interest by providing a sentence at the end: "Any property, the income from which is considered to be derived from the conduct of a trade or business, pursuant to Section 163(d)(4)(C) will not be considered to be property held for investment".

(2) Problem of Construction Interest

Another problem which the statute creates is whether or not interest paid on real property which has been improved by the taxpayer is deductible. Certainly, if interest should be deductible with respect to any type of investment, it should be deductible with respect to an investment where the taxpayer in question constructs improvements on Property. Although there is no question with respect to the deductibility of interest on the construction loan, once the project is completed, interest paid on the underlying indebtedness could be said to be "interest paid on an indebtedness *continued* to *carry* property held for investment." The reason for this is that once the project is completed then the purpose of the loan could be said to be to "carry property held for investment." Certainly any taxpayer who has been involved in the risks of construction will not take such risks if they are penalized once construction is completed. Therefore, proposed Section 134(d) should be amended to provide that a taxpayer who is responsible for the construction and improvement of property is entitled to deduct the interest paid in connection with any indebtedness thereon during the useful life of the Property.

C. PARTNERSHIP LIMITATION

Another provision which is grossly unfair is the proposed Section 163(d) (4(A) which provides as follows:

"In the case of a partnership, the provisions of this subsection shall apply with respect to the partnership and with respect to each partner."

The impact of this provision is to provide that a partnership may not deduct more than Twenty-Five Thousand Dollars ($25,000.00) of investment income, without regard to the number of individuals who are in the partnership. Again, this provision when applied to the ownership and operation of real property is both discriminatory and unnecessary. It is discriminatory in that it discriminates in favor of a particular method of the ownership of property as opposed to another. A group of individuals can get together as tenants in common and own a piece of real property and each individual will be entitled to have the limitation applied to himself individually with no limitation to the tenancy in common. The same would be true as to joint tenants. However, in connection with the ownership and operation of real estate, there are often reasons why it is more advantageous from an overall standpoint to own property in partnerships as opposed to owning it as tenants in common. However, this statute will force people who ordinarly would create partnerships to create tenancies in common, which do have certain business disadvantages. Since the limitation can easily be applied to each partner on a separate basis, there appears to be no reason why the limitation at the partnership level is required. Moreover, there is no reason why a tax provision should cause people to be forced to restructure their legal relationships in some manner which would have most of the benefits of a partnership without being considered a partnership for tax purposes.

D. EFFECTIVE DATE PROVISIONS

New section 163(d) of the Internal Revenue Code is to be applicable to taxable years beginning after December 31, 1969. It is respectfully submitted that the foregoing application is unfair and inconsistent with the normal method of handling changes of this kind. Indeed, the Internal Revenue Service when it enacted its prepaid interest ruling on November 26, 1968, which ruling is referred to with favor in the Committee Report to H.R. 13270, provided that such ruling would not apply to interest payments made pursuant to a contractual obligation entered into prior to November 26, 1968. Similarly the limitations on deductibility of interest provided in new Section 163(d) should not apply with respect to any indebtedness which was either outstanding prior to the date when the bill becomes a law, or with respect to which a binding contract existed prior to such date. In other words, many taxpayers are presently paying interest on obligations which were incurred prior to the time when they could be said to have had any indication that the proposed rules for deductibility of interest were to be changed. Therefore, at a minimum, fundamental fairness would require that the limitation of proposed Section 163(d) should not apply to interest paid in connection with any indebtedness or obligation incurred or contracted to be incurred before the date the statute becomes law.

E. SUMMARY

To summarize, it is respectfully submittted that:

(1) Because of the basic discrimination of proposed Section 163 that the section be deleted in its entirety. For the reasons heretofore indicated, it creates inequities that are antithetical to real tax reform.

(2) If for some reason the committee in its best judgment decides not to delete proposed Section 163(d), at a minimum the changes set forth herein

with respect to: (a) the application of proposed Section 163 to partnerships, (b) the technical deficiencies, and (c) the effective date of legislation should be made in Section 163(d).

The CHAIRMAN. Mr. Frederic Hickman of Northwest Industries, Inc.

STATEMENT OF FREDERIC W. HICKMAN, NORTHWEST INDUSTRIES, INC.

Mr. HICKMAN. My name is Frederic W. Hickman. I represent today Northwest Industries, Inc.

My statement concerns section 411 of the bill which begins on page 219. That section disallows interest on certain corporate indebtedness. The indebtedness involved is indebtedness which has three features. First, it is issued in an acquisition or to provide consideration for an acquisition.

Second, it is convertible into stock or is issued as part of an investment package which includes an option for stock.

Third, it is subordinated to other creditors.

If the indebtedness meets all of these tests then the interest on it is disallowed unless the ratio of debt to equity of the issuing corporation is no greater than 2 to 1, and the projected earnings of the issuing corporation are at least three times the interest expense.

There is an exemption in the bill for interest up to $5 million, but the $5 million is reduced by the amount of interest issued on any other debt issued in connection with past acquisitions.

This provision is an outgrowth of H.R. 7489 which was introduced in the House last February. The original House bill had no ostensible tax reform purpose in the sense that it was closing loopholes or otherwise. It was intended, frankly, to penalize corporate takeover bids which were then much in the news. Several established managements were at that time threatened by takeover bids, that is, there were offers out for their stock to their stockholders.

The original bill would have protected entrenched managements against that kind of threat at the expense of their individual stockholders and at the expense of the free market system.

The transparent purpose of H.R. 7489 is clearly illustrated by the fact that as originally introduced it would have applied only to acquisitions of stock as distinguished from acquisitions of assets.

This is significant because a tender offer for stock goes directly to the stockholders, bypassing the management of the company to be acquired. Thus, stock acquisitions were to be penalized.

Asset acquisitions, on the other hand, cannot be effected without the cooperation and sympathetic collaboration of the management and, as a result were not to be covered by the original bill.

The House bill was generally referred to in the press and otherwise as the anticonglomerate bill. Section 411 is referred to on your hearing calendar as the conglomerate question. The bill, however, would affect other than conglomerates and reach a number of other situations.

The House bill originally introduced was taken up in the House in connection with the general tax reform bill. It underwent a substantial metamorphosis and has now emerged in considerably different form as section 411 of H.R. 13270.

The principal change from the original bill, H.R. 7489, has been to give the proposal a respectable tax reform purpose. The House committee report now states that the purpose of the section is to distinguished debt which is real debt from debt which has so many characteristics of equity that it should be treated as equity by not allowing the deduction for the interest; that is, by treating such interest as essentially equivalent to a dividend.

With that background, I suggest to you that there are three primary defects in section 411 as it is presently drafted. First, it still contains features which have no relevance to the stated purpose of distinguishing between real debt and debt which is more clearly like equity. There are still what may be called hangover aspects from the original bill which seem, frankly, designed simply to penalize corporate acquisitions and takeovers.

The second defect is that the rules which section 411 does prescribe for distinguishing true debt from what we might call equity debt are not good rules. A debt-equity test such as the bill provides is generally regarded in the financial community today as obsolete, and, in any event, both the debt-equity test and the earnings coverage test operate with numbers and in a manner which is totally unrelated to anything in the financial community.

The third principal defect in section 411 of the bill as it now stands is the effective date. The effective date is May 27, 1969. That is the date on which the Committee on Ways and Means issued a press release describing in vague terms the provisions of the present section. The present section, which did not appear until August 2, is quite different in several major respects from what was suggested in very sketchy form in the press release. Thus the adoption of section 411 of the bill would retroactively incorporate features of which no one could have been aware on May 27.

Let me illustrate just briefly one of the provisions of section 411 which is a hangover from the prior bill in the sense that it penalizes corporate acquisitions. Section 411 still applies in a way which favors asset acquisitions as distinguished from stock acquisitions. Debt which is issued for assets is tainted only if more than two-thirds of the assets are acquired. But debt which is issued for stock is tainted if only a single share of stock is acquired. In actual fact, whether or not debt is "true debt" or "equity debt" has nothing whatever to do with whether it was issued in connection with an acquisition; but it surely has nothing to do with whether it was issued in an acquisition for stock or for assets.

At the very least, section 411 should apply equally to stock and to asset situations and should be confined, as the asset situation now is, to acquisitions of at least a majority—at least 50 percent of either the assets or the stock. In that way normal acquisitions of stock for investment purposes, for assured sources of supply, or what have you would be left undisturbed.

A second hangover feature appears in connection with the $5 million exemption.

The original press release indicated that that exemption was to be a flat exemption of $5 million.

It is now, under the current version of the section, reduced by interest on any prior debt used for acquisition purposes. So corporations are now to be penalized for past acquisitions, acquisitions which were in all respects proper at the time they were made.

The company which I represent today is a company which is an outgrowth of the diversification program of the Chicago and Northwestern Railway Co., so that we are particularly aware of railroad factors.

The railroad industry provides a good illustration of the absurdity of the formula for reducing the $5 million exemption. I call your attention to the fact that many existing railroads are the product of acquisitions in the 19th and early part of the 20th century of other smaller roads, a great many of which were acquired by the issuance of debt. Much of the financial debt structure on railroads at the present time is traceable to the refunding of those original obligations. So that, for a railroad, under the very broad language of the bill the $5 million exemption would be reduced by existing funded indebtedness which is attributable to acquisitions which were made back before the turn of the century and which surely have nothing to do with any legitimate tax reform purpose today.

Another factor in the railroad industry that illustrates the eccentricities of the provision for reducing the $5 million exemption arises out of the fact that a number of railroads went through bankruptcy in the 1930's and 1940's. The customary technique in a bankruptcy reorganization is for the assets of the debtor road to be conveyed to the new reorganized road in return for the securities of the new road. Under the very broad language of the bill those securities issued in bankruptcy reorganization situations would technically be debt issued in connection with acquisitions of assets, and would again reduce the $5 million exemption.

So far as the tests in the bill at the moment are concerned, that is the debt equity and the earnings coverage tests, these I have covered in considerable detail in the written statement which I have submitted. I would like to make just a few general points.

Looking first to the debt-equity test, it is generally dismissed today as not constituting a meaningful test. It is just not used, surely not used in the form in which it appears in the bill.

The earnings coverage test is perhaps somewhat more realistic but it has several unsatisfactory aspects which should be noted. It purports, first, to be based on projected earnings, but that is a misnomer because it is really a historical earnings test. It is a measure of the earnings in the last 3 years. In the case of a stock acquisition it doesn't even include the earnings of the acquired corporation unless 80 percent of the stock is acquired. This is another instance of the hangover, penal aspects discriminating against stock acquisitions as dis-

Second, we are not really dealing with earnings at all. We are dealing with earnings and profits, which is a fact which the original press release did not advert to. Earnings and profits may have some resemblance to earnings but it is, as all of you know, a very artificial tax concept and quite different from financial earnings. For example, the use of accelerated depreciation may not reduce financial earnings but it does reduce earnings and profits, so that companies which have been using accelerated depreciation would be discriminated against in the sense that the earnings on their financial statements which would be used by the financial community would normally be substantially greater and, therefore, meet the test more readily than would earnings and profits.

The third thing about the earnings coverage test is that it is unrealistic in the sense that companies do not pay interest out of earnings. They pay interest out of cash and, consequently, it is generally agreed in the financial community that cash flow is a much better test than an earnings test.

So even if you were to adopt something in the nature of an earnings test it should be modified at least by adding back such noncash charges as depreciation and amortization.

Last, there is no support for the 3-to-1 ratio which the bill uses that we can find either in the financial community or in the academic community. The railroad industry data which is reproduced at pages 10 and 11 of the written statement indicate that in only 1 year during the 10-year period ending in 1967 did the railroad industry, taken as a whole, meet its fixed-interest charges out of earnings by as much as three times. Given that kind of data we suggest to you that an earnings coverage test, if one is to be used at all, should be one and a half or, at most, two times the interest charges in order to conform to realty.

We suggest to you that in prescribing these tests, section 411 of the bill has elevated rules of thumb into rigid rules. If we are going to have to live with rules of thumb—we would hope that we were not, but if we are—then we urge that they be good rules of thumb that more closely conformed to what is economic realty.

In conclusion, I would like to submit that section 411 of the bill devises very complex and unrealistic rules to deal with what is at best a minor problem and probably not a tax problem at all. As a solution it will present greater problems than the problem at which it is addressed.

It should be, we submit, deleted from the package of legislation. It is not deleted in its entirety, then we suggest to you that there should be deleted at least those provisions which have nothing to do with separating real debt from debt equity, and that if we must live with rules of thumb they should be at least adjusted to make them as realistic as possible.

Thank you.

The CHAIRMAN. I just want to ask one question. Wasn't this bill really tailored as a tax measure to strike at an antitrust problem and it would appear to be an effort to prevent the acquisition and control of B. F. Goodrich by Northwest Industries?

Mr. HICKMAN. I would hope that the bill was not intended to be that specific but that transaction was surely in the climate at the time. It does seem to us that, to the extent that there is a problem, it is an economic problem, an antitrust problem, and not properly a tax problem at all.

The CHAIRMAN. Well now, hasn't the Antitrust Division of Justice been very active in this area since this problem of conglomerate mergers came up?

Mr. HICKMAN. They have been very active. And since the time the bill has been introduced the stock market itself, which is perhaps the best regulator of any of these activities, has made most of them undesirable and unattractive, and the commotion has largely dissipated at this point in time.

The CHAIRMAN. What is the present status of the proposed merger?

Mr. HICKMAN. The exchange offer by Northwest Industries for stock of B. F. Goodrich terminated last summer. Under the exchange offer Northwest acquired stock of Goodrich which, when added to the substantial block of shares owned by Northwest prior to the offer, brought its ownership to approximately 16.4 percent of the outstanding common stock of Goodrich.

The CHAIRMAN. Thank you.

Senator MILLER. Isn't the main thrust of your criticism that whether we have a transaction involving a merger or some other type of a business transaction that the basic question is whether we have a debt or an equity instrument and, of course, we have had a lot of trouble and a lot of litigation in some cases on drawing a line between whether in a particular case you have a debt or whether in a particular case you have an equity and if you have an interest you don't get an interest deduction. The tax libraries are full of cases like that and, I take it, your point is that if there is going to be any change that we should do it across the board. So that whether you are involved in what the Antitrust Division might have an interest in or whether you are involved in some little insignificant matter in some little town the question still is whether we have a debt or an equity instrument, and if there needs to be some refinement of that, of the definition so that the administrative problem of dealing with that will be eased, that is what we ought to do instead of singling out some particular area such as the House bill has done. Is that the main thrust of your statement?

Mr. HICKMAN. That is exactly the main thrust of my position.

I would like to just add a comment. You referred to the fact that the books are full of cases trying to distinguish debt from equity. Practically all, if not all, of those cases involve nonarm's length transactions which can be cast in the form of debt as well as they can be in the form of equity and there are no market or arm's length factors operating to distinguish automatically. I suggest to you that in this situation all of these transactions are arm's length transactions in which the public accepts these instruments as debt. Under those circumstances it seems to me that to even try to draw this kind of distinction is unwarranted when we have a better public measure than anything the bill could devise.

The CHAIRMAN. Well, of course, if you have an arm's length transaction simply calling something a debt rather than an equity isn't going to satisfy. I don't think the mere fact that you have an arm's length's transaction is necessarily conclusive on the point. That is part of the problem, and to draw the guidelines is difficult. But if guidelines are drawn in arm's length type transactions it would seem to me that they ought to be across-the-board regardless of whether it is something that is in the area of the antitrust interests or something else.

Mr. HICKMAN. I agree.

The CHAIRMAN. Thank you very much, sir.

(Mr. Hickman's prepared statement follows:)

STATEMENT OF FREDERIC W. HICKMAN, CHICAGO, ILL., REPRESENTING NORTHWEST INDUSTRIES, INC., CHICAGO, ILL.

SUMMARY

1. In general

The House Report indicates that the purpose of section 411 is to disallow interest deductions on certain obligations where the obligations, though designated as debt, are more realistically considered as equity. The Report states:

"Your committee does not believe that many corporate bonds and debentures which presently are being treated as debt are, in fact, debt rather than equity. . . . The characteristics of these bonds or debentures, such as convertibility and subordination, in many cases make them more closely akin to stock than to debt. . . . Your committee is particularly concerned with the present situation, which involves an increasing amount of debt used for corporate acquisition purposes, in view of the fact that it normally is much easier to effect a substitution of debt for equity at the time of a corporate acquisition." (p. 104)

In several significant respects, section 411 is not consistent with that stated purpose.

The target at which section 411 is directed is not primarily a tax reform target, and to the extent there is a tax reform target the aim is faulty. The additional inequities and complexities raised by section 411 are not justified by the alleged problem at which it is directed and the section should be deleted.

2. Inconsistent application to stock and asset acquisitions

A. The provision applies to any acquisition of stock but only to the acquisition of ⅔ of the assets of a corporation. No support for this inconsistency can be found in the stated rationale of the section.

B. The provision should not apply to any acquisitions of less than a 50% interest. That would permit noncontrol acquisitions for such ordinary business purposes as investment and assuring sources of supply.

3. Earnings coverage test

A. Earnings coverage tests have been rejected by the financial community as unrealistic. The better test is a cash flow test. Accordingly, the provision should require depreciation and amortization charges to be added back to earnings.

B. The inflexible 3-to-1 earnings coverage requirement is unrealistic. For example, only once in the ten year period 1958–1967 did Class 1 Railroads as a whole have earnings which covered their fixed charges 3 times.

C. The historical earnings of an acquired company should be included in projected earnings even if less than 80% of a company is acquired. The test purports to estimate future earnings and should thus include those which the acquired company will contribute.

D. There should be a second chance to pass the earnings test (and the debt equity test). A deduction should not be lost forever merely because a company has had one bad year.

4. The $5,000,000 exemption

A. The $5,000,000 exemption should not be reduced for interest on debt incurred in connection with prior acquisitions. To do so would penalize companies for events of the past which were consistent with law and sound business policy.

B. To reduce the $5,000,000 exemption for interest on debt incurred in any acquisition—even though it was not the prohibited type of debt—is contrary to the stated philosophy of the provision.

5. Tracing problems

A. The provision encompasses interest on debt issued "to provide consideration for" the acquisition of stock or assets, creating tracing problems whenever a corporation issues the prohibited sort of debt and thereafter, at any time, makes an acquisition.

B. Because the $5,000,000 exemption is reduced for interest on debt incurred in connection with prior acquisitions a corporation is forced to review its entire history to determine if there is debt outstanding which arose in that manner.

6. The effective date provision

A. The May 27, 1969 date is the date of a preliminary press release which was careful to describe its brief description of this provision as tentative. In its present form, § 411 differs substantially from what was proposed in the May 27 press release. Legislation of this drastic sort should not become effective until its scope has been made clear.

B. Many corporations were in the process of acquiring interests in other corporations on May 27. Some leeway should be made for acquisitions in process during the relevant period. The date of enactment is suggested as the effective date.

7. Conclusion

A. § 411 should be deleted. It is not addressed to a genuine tax problem and would create more problems than it solves.

B. If it is not deleted, then it should be modified:

(1) to make the section effective not earlier than the date of enactment.

(2) to delete those aspects which are designed simply to penalize corporate tender offers, namely the provision would penalize acquisition of even a single share of stock and the provision reducing the $5,000,000 exemption.

(3) to make the tests for distinguishing "true debt" from "equity debt" more realistic, by

a. deleting the debt-equity ratio test;

b. modifying the earnings coverage test by making it 1½ to 1, or at most 2 to 1, and by making it conform more closely to cash flow by adding to earnings profits the amount of depreciation and amortization.

STATEMENT

Section 411 of the Tax Reform Act would deny an interest deduction with respect to certain indebtedness incurred after May 27, 1969.

The Committee Report states (and in general the scheme of the section corroborates the statement) that the intent is to deny an interest deduction in situations where the features of the debt and the risk involved are so similar to equity that the debt should be treated for tax purposes as equity. See H. Rep. 91–413 (Part I), Report of the Committee on Ways and Means to accompany H.R. 13270, at page 104 where it is stated:

"Your committee does not believe that many corporate bonds and debentures which presently are being treated as debt are, in fact, debt rather than equity. . . . The characteristics of these bonds or debentures, such as convertibility and subordination, in many cases make them more closely akin to stock than to debt. . . . Your committee is particularly concerned with the present situation, which involves an increasing amount of debt used for corporate acquisition purposes, in view of the fact that it normally is much easier to effect a substitution of debt for equity at the time of a corporate acquisition."

To the extent that this is the purpose of the Bill—i.e., to treat as equity that which is not realistically debt—it is a legitimate revenue concern.

However, certain portions of Section 411 have no relevance to distinguishing debt from equity and are obviously carryovers from an earlier version of the proposal which was intended simply to penalize corporate acquisitions of a "conglomerate" nature. For example, subsection (a) of Section 279, which would be added to the Internal Revenue Code by Section 411, would penalize the past issuance of debt for acquisition—whether or not it has any characteristics of equity—by causing it to reduce the $5,000,000 exemption which the proposal would otherwise allow. To so penalize debt simply because it was issued in connection with past acquisitions may be a proper *legislative* purpose (assuming it is determined such acquisitions are undesirable), but it is hardly a proper *revenue* or *tax reform* purpose.

Whatever may be the ultimate economic and social implications of the diversified expansion by corporate managements through acquisitions financed in part by debt, it is urged that the Committee eliminate from Section 411 those features which have no bearing on determining what is realistically debt and what is realistic equity, or which provide unrealistic rules for that determination.

Finally, it is earnestly suggested that the remedy proposed by Section 411 presents tax problems far greater than those at which the section is directed and that the section should be deleted from the bill.

The degree of ownership required

The current provision defines "corporate acquisition indebtedness" as debt utilized in the acquisition of *any* stock of another corporation or at least *two-thirds* of the assets of another corporation. As there is no distinction between the two types of acquisitions with respect to the type of debt which may be issued, the only possible distinction between stock and asset acquisitions is that generally asset acquisitions are made with the cooperation of the management of the acquired corporation whereas stock acquisitions may or may not be made with management approval. Thus for reasons not disclosed in the House Report, the bill would seem aimed at discouraging tender offers for stock. This goal, whether or not desirable, is not the proper focus of a revenue measure and, of course, has nothing at all to do with the ostensible "debt-equivalent-to-equity" rationale of the bill.

It is submitted that the percentage of ownership, whether acquisition be made of stock or assets, should be limited to acquisitions of control, and that the test should be a consistent one—perhaps 80%, perhaps 66⅔%, and probably in no event less than 50%. In this manner acquisitions for investment purposes, for purposes of assuring sources of supply or for other common business reasons will not be hampered. Moreover, the choice of the form of "friendly" acquisitions of less than two-thirds of a company need not be altered from stock acquisitions to asset acquisitions to comply with the noneconomic requirements of the tax laws.

The debt-equity and earnings coverage tests

In determining whether an obligation which is in form debt is more realistically treated as equity the fundamental inquiry must be whether the degree of risk involved more closely resembles the risk customarily associated with equity investments or whether it is the lesser risk customarily associated with debt. This is a complex, factual question in most circumstances. The bill adopts a double test which is similar to rough rules of thumb often used in the financial community. The bill, however, elevates these rough rules of thumb to ironclad requirements and in some respects does so most unrealistically. If it is possible to provide only a rough rule of thumb in such a statute, taxpayers who must live under it should be provided a standard as realistic as possible and sufficiently generous so that it will only rarely penalize situations which would be clearly proper under a more accurate and sophisticated test.

The definitive analysis of realistic debt levels is a book entitled "Corporate Debt Capacity," written by Professor Gordon Donaldson of the Harvard Business School, and published by Harvard in 1961. With respect to the debt-equity test, i.e., the "balance sheet" standard, Professor Donaldson states:

"The conclusion of this study is that balance sheet ratios are in this respect unnecessarily crude and unreliable and as a result can be a dangerous way of expressing a risk-bearing standard, at least so far as industrial borrowers are concerned." (at p. 150)

The reasons, briefly, are:

(1) simple ratios do not reflect the timing of cash flows—"given any principal amount of debt the hazard to cash solvency could vary significantly depending on the term and the decision on balloon payments";

(2) balance sheet values do not reflect fair market values;

(3) asset composition may change;

(4) off the balance sheet items bear directly on the question of cash solvency.

With respect to the earnings-coverage test, i.e., the "income statement" standard, the book states:

"The use of an earnings coverage standard for debt capacity, by shifting attention away from assets to what they actually earn and away from the principal amount of debt to the related fixed annual cash outflow, moves a long way in the direction of relating the standard to the factors directly involved in cash solvency. Obviously several of the potential misconceptions inherent in the balance sheet standard are avoided.

"In spite of its advantages, however, two major problems detract from the usefulness of the earnings coverage standard. One relates to the question as to whether Net Earnings is an adequate representation of the *cash* available for debt servicing, since in thhe last analysis solvency can only be preserved if the ability to make cash payments on time is assured. The other relates to the question of the precise meaning of the 'coverage' . . ." (at p. 152)

The study concludes that neither the debt-equity nor earnings coverage tests is acceptable; but that corporate debt capacity should be determined in the light of *cash flows:*

". . . The conclusion [is] that the most use*ful approach to an appraisal of risk and a meaningful debt standard lies in such an analysis—but not in terms of accounting values, rather in terms of cash flows.*" (at pp. 154–55)

All of the reasons pointed out by Professor Donaldson as to why the debt-equity test is of limited validity are present here. In addition, while the traditional debt-equity test is deficient in using accounting balance sheet numbers rather than fair market values, the proposed statutory test would substitute an even more artificial balance sheet based on the adjusted basis tax figures. The result is a complete departure from reality.

Moreover, the normal application of the debt-equity test relates only to what is generally referred to as long-term debt, i.e., indebtedness the maturity of which occurs more than one year from the date of the balance sheet. Such a test is irrational as applied to current debt—as Section 411 would provide—because the ratio of debt to equity will vary greatly depending on the sheer accident of whether the corporation has or has not paid off its current debt, a relatively easy matter.

The earnings coverage test, as Donaldson points out, is more realistic than the debt-equity test and a cash-flow test is better than either of them—although all three have serious deficiencies if one attempts to apply them in a rigid formula manner.

If rough rules of thumb such as these are to become statutory requirements, then at least the best rules of thumb should be used. Accordingly, it is urged that the debt-equity test be deleted and that the earnings coverage test be revised to use cash flow rather than earnings as the test of capacity for servicing the corporate indebtedness. While accountants differ in their approach to determining cash flow, the largest single items affecting the difference between earnings and profits and cash flow are customarily depreciation and amortization. Thus, in order to come as close as possible to a cash-flow approximation without getting mired in accounting refinements, it is proposed that the figure used be the sum of the earnings and profits for the year, plus the depreciation and amortization deductions taken in arriving at earnings and profits. This would also eliminate the effect of any accelerated depreciation (which is generally not reflected in earnings in financial statements under accepted accounting principles) and would, accordingly, eliminate the unjustified discrimination in this respect against companies using accelerated depreciation for tax purposes.

The 3-to-1 Earnings Coverage Ratio. The House Committee Report does not reveal from what source the 3-to-1 earnings ratio test was derived and we find no academic or financial authority for it. Our own experience suggests that it is too stringent.

The corporate group which I represent at this hearing is Northwest Industries, Inc. and its subsidaries. That group of companies is the result of a diversification program originally undertaken by the Chicago and North Western Railway Company.

The necessity to diversify is especially great in cyclical industries, such as the railroad industry, for effective long range capital planning is possible only with reasonably stable earnings. Thus, as you perhaps aware, a number of railroads have been recently engaged in diversification activities. Under these circumstances it is significant to note that taking Class I railroads as a group they have only earned their "fixed charges," (defined by Moody's Transportation Manual as interest, accumulating discount on debt and certain roadbed lease charges) three times once in the ten year period 1958–1967. The following table is taken from Moody's Transportation Manuals and shows the times fixed charges were earned for Class I railroads for the longer period 1926–1967. Calculations are based on data as reported to the ICC on a flow-through basis with no recognition of deferred income taxes.

Year(s)	(Times fixed charges earned)
1926–1935	1.51
1936–1945	1.63
1946–1955	2.47
1956	3.12
1957	3.14
1958	2.73
1959	2.68
1960	2.33
1961	2.16
1962	2.67
1963	2.89
1964	2.94
1965	3.14
1966	2.95
1967	2.28

The foregoing data clearly suggests that the 3-to-1 earnings ratio as applied to the railroad industry is a very stringent test, operating to inhibit diversification in an industry which sorely needs it. And because of the cyclical nature of the railroad business, the test would operate much more stringently some years than others.

We submit that if an earnings coverage test is to be used, it should be 1½-to-1, and in no event greater than 2-to-1.

Earnings of the Acquired Company. The earnings coverage test provided by the bill uses the terminology "Projected Earnings," which is a misnomer inasmuch as it is historical earnings which are utilized. The past earnings of the *acquired* corporation, however, are not taken into account unless the issuing corporation has acquired 80% of the stock or substantially all of the assets. This is most unrealistic. The stock or assets acquired in fact do contribute to the earnings which will be available to service the debt, either by means of dividends or other distributions in the event of a stock acquisition, or by means of cost savings or increased revenues in the event of an asset acquisition. Accordingly, it is urged that the test be revised to take into account at least the expected dividend yield in the case of a stock acquisition and a pro rata share of the earnings (preferably earnings plus depreciation and amortization as explained above) of the acquired corporation in an asset acquisition—and preferably, for consistency, the pro rata share of earnings in both instances.

The present provisions of the bill permit the inclusion of earnings of the acquired company only when there is 80% control in the case of a stock acquisition or when substantially all of the assets have been acquired. We submit that there is no reason why such a provision should apply, permitting all of the earnings to be taken into account when a magic point has been achieved and none of the earnings to be taken into account when it has not.

Subsequent Qualification Under the Earnings Coverage Test. As the proposal stands, if a company's *historical* earnings would not cover interest on debt *to be* issued, the interest deduction is disallowed. We submit that the corporation should not be judged solely on the basis of earnings of the recent past, but should be given a chance to prove that it can cover its interest.

The timing of a proposed issuance of equity may be such that a bad earnings history—often the very reason for an acquisition—would result in a disqualification under the 3-to-1 earnings coverage requirement. In circumstances such as these, the corporation should have an opportunity to demonstrate that its debt was truly debt—even under the standards of the provision—by reference to events subsequent to the acquisition. Accordingly it is suggested that the provision be modified to allow a deduction—perhaps retroactively—if the tests are met in, say, two of the three years subsequent to the acquisition or on the basis of the average figures for that three year period.

The $5,000,000 exemption

As referred to above, under proposed subsection (a) of proposed § 279 interest would be disallowed only to the extent that it exceeds the excess of $5,000,000 over the amount of interest on indebtedness issued to provide consideration for the acquisition of stock or assets. As the provision is written, any interest payable on indebtedness incurred to acquire assets or stock, *regardless of when and under* *what circumtances issued*, would reduce the $5,000,000 exemption. Thus this portion of the proposal would apply to interest on any debt—new or old, convertible or nonconvertible—and has no relevance to the question whether such debt is economically the equivalent of equity.

An example of the extreme result of the provision as presently drafted can be found in the railroad industry. Most major railroads today are the result of acquisitions of numerous smaller railroads in the 19th and early part of the 20th century. Much of the present indebtedness of such railroads is likely to be represented by obligations which are refinancings of bonds originally issued for the acquisition of those smaller roads. The broad language of the bill would appear to cause such indebtedness to reduce the $5,000,000 exemption. To enact a new Code section which would cause present exemptions to turn on what happened a century ago is surely absurd. It is totally unrelated to any present-day concern with mergers and acquisitions.

The railroad industry provides still another example of the eccentricity of the provision reducing the $5,000,000 exemption. Many existing railroads are the product of bankruptcy reorganizations in the 1930's and 1940's, in which bonds of the presently existing corporations were issued in exchange for the assets of the debtor corporations. These bonds, too, would appear to be swept up in the broad language of the bill as reductions of the $5,000,000 exemption. Again, the have no conceivable relation to current merger and acquisition considerations.

Further, if it becomes necessary to consider not only the indebtedness on which interest is disallowed but also to analyze all prior indebtedness, whenever issued, in order to determine whether it affects the $5,000,000 exemption, that fact will create acute tracing problems, as each borrowing transaction in the history of the enterprise will have to be analyzed and an attempt made to trace funds during periods long gone.

Finally—and most fundamentally—to reduce the $5,000,000 exemption for those companies which have a history of acquisitions is to penalize companies today for events of the past which were consistent with then applicable law and, indeed, with sound business policy.

Accordingly we submit that the $5,000,000 exemption should be a flat exemption for interest on any corporate acquisition indebtedness. The existing provision reducing the exemption should be deleted as having nothing to do with the termination of whether currently issued obligations are realistically debt or equity and as irrationally penalizing the use of debt in past years.

At the very least, if the $5,000,000 exemption is to be reduced by interest on other than corporate acquisition indebtedness, it should apply only to other indebtedness issued after the effective date of the provision. As so applied it might have some deterrent effect on corporate acquisitions in the future and would not operate simply as a penalty on past acquisitions. (We suggest, however, that if the tax-writing committees are clear that such a blanket deterrent on future corporate acquisitions is desirable they may also wish to consider revision of the tax-free reorganization sections of the Code, which provide the major tax incentive to most acquisitions and mergers.)

The tracing problem

The cornerstone of Section 411 is the definition of "corporate acquisition indebtedness" found in subsection (b) of proposed new Code § 279. That definition includes not only debt issued directly as consideraton for the acquisition of the stock or assets of another corporation but also debt issued for money which is in fact subsequently used for such an acquisition. However, in many, if not most, situations it is impossible to trace whether specific funds have been used to acquire corporate stock or assets. If a company takes in $100,000 from its operations in one year and borrows $10,000 during the same year, how does one know whether it was the dollars from operations or the dollars from the loan that were used to make an acquistion? It does not suffice to rely on simple formalities such as segregated accounts, etc., because they are too easily adjusted one way or the other. Nor is it any help to ignore the formalities and rely upon the "realties" because the reality is that dollars are fungible and it is not possible to say in many cases which dollars went where.

The courts have been struggling for some years with a similar problem under Section 265 of the Code, relating to indebtedness incurred to carry tax-exempt obligations. No satisfactory rule—and not even a clear rule—has yet evolved. It is a bad law which creates unclear standards and it is an abdication of legislative responsibility simply to pass the buck to the courts when it is obvious in advance that the standards set are not susceptible of clear judicial resolution.

We submit that the problem could be largely eliminated without distorting the purpose of Section 411 by confining the term "corporate acquisition indebtedness" to debt issued *directly* as consideration for acquisitions and by deleting the terminology "provide consideration for" in subsection (b)(1) of § 279, which extends the definition to debt issued for cash. Section 411 is directed at what was repeatedly referred to in the House hearings as "funny money," and the House Report emphasizes that the context of an acquisition provides a peculiar opportunity to gain acceptance of such obligations. But if the debt can in fact be issued for cash, then you do not have the kind of "funny money" which proponents of the legislation were decrying nor the peculiar opportunity referred to in the House Report.

Thus, we submit that obligations issued for cash meet the normal arm's length standards of the marketplace—regardless of what the cash may ultimately be used for—and should be deleted from the definition of corporate acquisition indebtedness. There should also be deleted from subsection (h)(1) the reference to "refinancing" of an obligation, since a refinancing involves the issuance of debt for cash and thus also provides assurance that the debt does not constitute "funny money."

The effective date provision

Section 411, as adopted by the House, applies to indebtedness incurred subsequent to May 27, 1969. That date is the date of a preliminary press release issued by Chairman Mills of the Ways and Means Committee outlining in the most general terms various proposed sections. As the Release was very careful to describe its decisions as tentative and as the description of § 411 was general and lacking in important details included in the section as now drafted, it is strongly urged that the effective date for this section be changed to at least the August 1st date of the introduction of the bill in the House of Representatives and, preferably, to the date when the Tax Reform Act of 1969 is passed by both houses of Congress and signed by the President.

The issuance of the May 27 press release does not justify making § 411 effective as of that date, for the section, even in its present form, is substantially different from what was outlined in the press release and will presumably change still further if it is to be enacted.

The May 27 press release indicated that the $5 million exemption was a flat exemption without reductions; the bill, on the other hand, would reduce the exemption in such a way that it would be virtually meaningless for many companies.

The press release indicated a debt-equity test, presumably based on fair market values; but the bill, on the other hand, would use adjusted basis tax figures in determining the equity, which could produce radically different results.

The press release indicated that "earnings," presumably in the normal financial sense, would be used in connection with the earnings coverage test. The bill would use, instead, the very specialized tax concept of "earnings and profits," a radically different thing in many cases. For example, the additional deductions from income attributable to the use of accelerated depreciation reduce "earnings and profits," but may not reduce "earnings."

The press release indicated that combined earnings of the acquired and acquiring companies would be used in connection with the earnings coverage test, but the bill would use combined earnings *only* if there is an acquisition of control, i.e., 80% of the stock or substantially all the assets.

Corporate transactions which would be affected by the bill were underway throughout the period of consideration of the various forms of § 411 and its legislative predecessors and the discussion of their desirability. Such transactions, often major, should not be caught in the web of a half-completed and half-considered bill. Rather, there should be fair and full disclosure of the applicable rules of such a basic and far-reaching change in Federal tax policy prior to its taking effect.

The next witness is Mr. Sidney Kess, national director of taxes, Main Lafrentz & Co.

STATEMENT OF SIDNEY KESS, NATIONAL DIRECTOR OF TAXES, MAIN LAFRENTZ & CO.; ACCOMPANIED BY NEIL WASSNER

Mr. KESS. My name is Sidney Kess. I am a certified public accountant and a partner of Main Lafrentz & Co., an international firm of certified public accountants with headquarters in New York City. I should also like to introduce Neil Wassner, who is a certified public acountant and a manager in our firm, specializing in acquisition work. Our firm has had many years of experience in advising its clients respecting the financial aspects of mergers and acquisitions, including, of course, the tax implications thereof. On the basis of this experience we feel that our comments regarding the proposal to disallow the deduction of interest incurred on certain types of debt used to finance acquisitions would be of value to the committee.

No one will deny that the desirability of mergers is a question of deep social, economic and even political significance. Many authorities feel that conglomerates may well represent a fresh wind of change blowing through the established business community which redounds to the benefit of all because of increased efficiency in asset management. However, whether or not you are in accord with this view should not affect your judgment as to the propriety of amending the Internal Revenue Code in order to cope with this problem.

We believe that the proposed approach to acquisition activity constitutes an improper and dangerous use of the taxing power.

You are all aware, as you pointed out, Mr. Chairman, of the investigation being conducted by the Antitrust Subcommittee of the House Judiciary Committee under the chairmanship of Congressman Celler to gather evidence with respect to conglomerate mergers, on the basis of which corrective legislation will be proposed. You are also familiar with the current efforts by the Department of Justice and Federal Trade Commission to apply existing legislation in dealing with antitrust problems arising in connection with mergers. Therefore, the social and economic effects of mergers are already receiving adequate attention from those branches of the Government which possess the requisite expertise.

Moreover, there were those who had claimed that investors were being duped by "funny money" debt securities issued in acquisitions. Such complaints are also receiving expert attention from those responsible for the self-regulation of the securities industry. As you know, officials of major stock exchanges have refused to list debentures when projections of postacquisition earnings indicated interest would absorb virtually all net operating earnings. If these efforts are deemed to be insufficient, the Securities and Exchange Commission could take steps to deal with disclosure and other aspects of the question within its jurisdiction. Therefore, it is evident that such problems as may exist can be dealt with adequately within the appropriate framework, and that the tax law is not a necessary weapon in any attack upon conglomerates which may be deemed necessary.

Everyone concedes that conglomerate mergers, per se, are neither good nor bad when measures within the framework of their effect on the economy. Yet the express purpose of section 411 is to curb conglomerate mergers. Is it not striking that the tax law is to be used as a means of branding mergers as malum in se, without recourse to any standards of evaluation perfected by economists or the marketplace?

Ideally the tax law should be neutral. It should neither promote mergers nor discourage them, because the tax law cannot differentiate between healthy and unhealthy mergers with respect to competition.

It has been said that the tax law promotes debt-financed mergers by allowing the deduction of interest on debt used to finance the acquisition. This observation touches upon but the tip of the iceberg. All interest is deductible, and accordingly debt-financed internal expansion may also, under this theory, be said to be favored over expansion through issuance of additional equity securities. Why should a debt instrument be treated as equity when used for external expansion but be treated as debt when used to finance internal expansion?

It can also be said that the "reorganization" sections of the code encourage equity-financed acquisitions by postponing the tax on any gain realized by the acquired company's shareholders. The effect of any theoretical "push" toward equity resulting from the reorganization sections, is offset by the theoretical "push" toward debt resulting from the interest deduction. Therefore, at the threshold there is a standoff and thus at present the code can truly be said to be neutral with respect to acquisitions.

Let us now analyze whether proposed section 411 would operate effectively. We submit that the tests it prescribes are based on misconceptions and misunderstandings of the financial facts of life. In brief, section 411 proposed to disallow interest on subordinated convertible debt (or subordinated debt issued with warrants) if a debt to equity ratio and earnings coverage test are not met.

At the outset it should be pointed out that the technique of disallowance of interest reflects the mistaken belief of the proponents of this measure that debt is issued in acquisitions to improve earnings per share of common stock, because interest is deductible whereas preferred dividends are not. In reality, the converse is often true. As a result of an accounting concept known as "pooling of interests" the book value—not the fair market value—of assets acquired may be recorded on the books of the acquiring company provided that equity constitutes the bulk of the consideration. In other words, you are picking up the assets at book value when you have a pooling of interest.

Therefore, taxpayers frequently forgo the benefits of a higher tax basis of the acquired company, and higher depreciation or amortization deductions which would result from debt-financed acquisitions, and issue stock in order to maximize earnings per share by using lower "carried over" book values and correspondingly lower depreciation and amortization deductions in computing income.

Convertible debt will be tainted under section 411. Such a blanket characterization as quasi-equity is erroneous; it overlooks the fact that the relationship of the underlying conversion price to principal amount is the true test. If the conversion price is at or near current market then there may be grounds for equating the debt in some respects, as an economic matter, with preferred stock. However, if the conversion price is substantially below market there is no doubt that the instrument is debt in every sense of the word. The bill does not recognize this critical standard of measurement. It may be noted in passing that convertible debt is characteristically issued at a much lower interest rate than straight debt, and therefore results in lower tax deductions; yet it is convertible debt which section 411 attacks.

Over the years the courts have developed several basic criteria which are used in evaluating instruments that purport to be debt, but which the Internal Revenue Service claims are equivalent to stock interests. Section 411 prescribes two tests which are to be applied to determine whether interest on acquisition indebtedness shall be disallowed; both are contrary to the ground rules developed by the courts. The debt to equity ratio is to be calculated on the basis of tax cost, or what we may loosely describe as the depreciated cost of the taxpayer's assets. Yet the courts look to the portion of the value of the company which is represented by debt to determine when it is truly quasi-equity and do not measure its relation to costs reflected on the balance sheet. Furthermore, under the proposed test, ironically, an "acquisition-minded" company might possess an advantage over a company that has grown internally. This would result from the fact that goodwill and other intangibles are assets which may be recorded on the books of one taxpayer if they were acquired from another entity, but which may not be reflected on the books of another if they were created through internal efforts. This is an accounting concept where we wouldn't be picking up the good will if it were created internally.

Now, any remaining significance of the debt to equity ratio test is further diminished by the fact that differences in accounting methods, with respect to matters such as depreciation and the writeoff of research and development costs will result in two companies of equal strength faring differently under the test.

The CHAIRMAN. I would suggest you conclude your statement. I have read it and I think most of our members have. Our procedure here really is to ask witnesses to summarize their statements.

Mr. KESS. Yes; sir.

Just one last observation. I have been teaching thousands of accountants and practitioners around the country and the thing that has hit me is laws are being written that very often we assume that practitioners understand everything that is going on, and when we add on eight more new pages in a code to deal with a small problem we are certainly complicating the whole tax structure and adding more problems for its administration.

Thank you, Mr. Chairman, for the opportunity of making this statement.

The CHAIRMAN. Thank you.

(Sidney Kess' prepared statement follows:)

STATEMENT OF MR. SIDNEY KESS, PARTNER, ACCOMPANIED BY MR. NEIL WASSNER, MANAGER, MAIN LAFRENTZ & CO.

We fell that proposed Section 411 should not be adopted for three principle reasons.

First, it is our feeling that the section is an improper use of the taxing power. The evils that it seeks to cure could more effectively be overcome through the antitrust statutes or the securities acts. This Section would topply the delicate neutrality respecting mergers of the existing tax statute.

Second, we feel that proposed Section 411 utilizes incorrect standards in differentiating tainted debt from non-tainted debt. The debt to equity ratio and earnings coverage tests fly in the face of long established court decisions used to make this differentiation. The application of these ratios would work with an uneven hand since mere difference in accounting methods between similar companies could lead to dramaitc differences in how they could acceptably finance a merger.

Finally, we think that the proposed Section would add another extremely complex and unnecessary provision to an already over-complicated Internal Revenue Code. The addition of such provisions inevitably leads to breakdowns in compliance and administration.

STATEMENT

My name is Sidney Kess. I am a Certified Public Accountant and a Partner of Main Lafrentz & Co., an international Firm of Certified Public Accountants with headquarters in New York City. I should also like to introduce Neil Wassner, who is a Certified Public Accountant and a Manager in our Firm, specializing in acquisition work. Our Firm has had many years of experience in advising its clients respecting the financial aspects of mergers and acquisitions, including, of course, the tax implications thereof. On the basis of this experience we feel that our comments regarding the proposal to disallow the deduction of interest incurred on certain types of debt used to finance acquisitions would be of value to the Committee.

Improper use of taxing power

No one will deny that the desirability of mergers is a question of deep social, economic and even political significance. Many authorities feel that conglomerates may well represent a fresh wind of change blowing through the established business community which rebounds to the benefit of all, because of increased efficiency in asset management. However, whether or not you are in accord with this view should not affect your judgment as to the propriety of amending the Internal Revenue Code in order to cope with this problem.

We believe that the proposed approach to acquisition activity constitutes an improper and dangerous use of the taxing power.

You are all aware of the investigation being conducted by the Antitrust Subcommittee of the House Judiciary Committee under the Chairmanship of Congressman Celler to gather evidence with respect to conglomerate mergers, on the basis of which corrective legislation will be proposed. You are also familiar with the current efforts by the Department of Justice and Federal Trade Commission to apply existing legislation in dealing with antitrust problems arising in connection with mergers. Therefore. the social and economic effects of mergers are already receiving adequate attention from those branches of the government which possess the requisite expertise.

Moreover, there were those who had claimed that investors were being duped by "funny money" debt securities issued in acquisitions. Such complaints are also receiving expert attention from those responsible for the self-regulation of the securities industry. As you know, officials of major stock exchanges have refused to list debentures when projections of post-acquisition earnings indicated interest would absorb virtually all net operating earnings. If these efforts are deemed to be insufficient, the Securities and Exchange Commission could take steps to deal with disclosure and other aspects of the question within its jurisdiction. Therefore, it is evident that such problems as may exist can be dealth with adequately within the appropriate framework, and that the tax law is not a necessary weapon in any attack upon conglomerates which may be deemed necessary.

Everyone concedes that conglomerate mergers, per se, are neither good nor bad when measured within the framework of their effect on the economy. Yet the express purpose of Section 411 is to curb conglomerate mergers. Is it not striking that the tax law is to be used as a means of branding mergers as *malum in se,* without recourse to any standards of evaluation perfected by economists or the market place?

Ideally the tax law should be neutral. It should neither promote mergers nor discourage them, because the tax law cannot differentiate between healthy and unhealthy mergers.

It has been said that the tax law promotes debt-financed mergers by allowing the deduction of interest on debt used to finance the acquisition. This observation touches upon but the tip of the iceberg. All interest is deductible, and accordingly debt financed internal expansion may also, under this theory, be said to be favored over expansion through issuance of additional effuity securities. Why should a debt instrument be treated as equity when used for external expansion but be treated as debt when used to finance internal expansion?

It can also be said that the "reorganization" sections of the Code encourage equity-financed acquisitions by postponing the tax on any gain realized by the acquired company's shareholders. The effect of any theoretical "push" toward equity resulting from the reorganization sections, is offset by the theoretical "push" toward debt resulting from the interest deduction. Therefore, at the threshold there is a stand-off, and thus at present the Code can truly be said to be neutral with respect to acquisitions.

Section 411 utilizes incorrect standards

Let us now analyze whether proposed Section 411 would operate effectively. We submit that the tests it prescribes are based on misconceptions and misunderstandings of the financial facts of life. In brief, Section 411 proposes to disallow interest on subordinated convertible debt (or subordinated debt issued with warrants) if a debt to equity ratio and earnings coverage test are not met.

At the outset it should be noted that the technique of disallowance of interest reflects the mistaken belief of the proponents of this measure that debt is issued in acquisitions to improve earnings per share of common stock, because interest is deductible whereas preferred dividends are not. In reality, the converse is often true. As a result of an accounting concept known as "pooling of interests" the book value (not the fair market value) of assets acquired may be recorded on the books of the acquiring company provided that equity constitutes the bulk of the consideration. Therefore, taxpayers frequently forego the benefits of a higher tax basis and higher depreciation or amortization deductions which would result from debt financed acquisitions, and issue stock in order to maximize earnings per share by using lower "carried over" book values and correspondingly lower depreciation and amortization deductions in computing income.

Convertible debt will be tainted under Section 411. Such a blanket characterization as quasi-equity is erroneous; it overlooks the fact that the relationship of the underlying conversion price to principal amount is the true test. If the conversion price is at or near current market then there may be grounds for equating the debt in some respects, as an economic matter, with preferred stock. However, if the conversion price is substantially below market there is no doubt that the instrument is debt in every sense of the word. The Bill does not recognize this critical standard of measurement. It may be noted in passing that convertible debt is characteristically issued at a much lower interest rate than straight debt, and therefore results in *lower* tax deductions; yet it is convertible debt which Section 411 attacks.

Over the years the courts have developed several basic criteria which are used in evaluating instruments that purport to be debt, but which the Internal Revenue Service claims are equivalent to stock interests. Section 411 prescribes two tests which are to be applied to determine whether interest on acquisition indebtedness shall be disallowed; both are contrary to the ground rules developed by the courts. The debt to equity ratio is to be calculated on the basis of tax cost, or what we may loosely describe as the depreciated cost of the taxpayer's assets. Yet the courts look to the portion of the value of the company which is represented by debt to determine when it is truly quasi-equity and do not measure its relation to costs reflected on the balance sheet. Furthermore, under the proposed test, ironically, an "acquisition-minded" company might possess an advantage over a company that has grown internally. This would result from the fact that goodwill and other intangibles are assets which may be recorded on the books of one taxpayer if they were acquired from another entity, but which may not be reflected on the books of another if they were created through internal efforts.

Any remaining significance of the debt to equity ratio test is further diminished by the fact that differences in accounting methods, with respect to matters such as depreciation and the write-off of research and development costs will result in two companies of equal strength faring differently under the test. Many companies will suffer from the fact that their assets were rapidly written off for tax accounting purposes. Thus, it is obvious that tax cost as a measure of debt/equity ratio is wrong as a matter of law and reason. To use value, however, opens Pandora's box. Therefore, it is apparent that this test should be jettisoned.

The projected earnings coverage test like the debt/equity ratio test is also contrary to the approach set forth in numerous court decisions. Section 411 would look at the past and freeze the characterization of debt on that basis. The courts, however, have looked at earnings during the period the debt is outstanding. It certainly would be illogical to penalize a transaction which leads to revitalization of an ailing company by a denial of interest deductions on account of past poor performance. In addition, the earnings coverage test measures average historical earnings against "interest to be paid or incurred on total outstanding indebtedness." You are all familiar with what is colloquially referred to as "off-balance sheet financing," *i.e.*, the use of long-term lease commitments as a financing alternative to the purchase of necessary assets with borrowed funds. A company which pays substantial lease rentals (which are the economic equivalent of debt service) would not take into account disquised interest costs in determining coverage under Section 411, whereas a taxpayer whose management chose direct financing would be required to include interest on such debt for that purpose. Again, taxpayers otherwise equal in financial ability would be treated differently under Section 411 as a result of management decisions and business considerations wholly unrelated to the merger in question. Furthermore, we would be faced again with the uneven treatment of otherwise similarly situated taxpayers who have adopted different methods of accounting for depreciation, inventory and various other items, and thus show widely differing earnings.

Complexity

Over the past five years I have lectured to thousands of accountants seeking to improve their command of the already complex Internal Revenue Code. My experience has demonstrated that it is difficult for the practitioner to grasp and retain the myraid of fundamentals contained therein. Section 411, directed at one *non-tax* problem, comprises eight pages of the House Bill. This type of additional complexity should be avoided at all cost when there is a far better alternative, as in this case. Such complexity can only lead inevitably to a breakdown in compliance and administration.

Conclusion

The task of controlling conglomerage mergers is within the province of the antitrust and securities law. It is not one which should be engrafted into the Internal Revenue Code and enforced by revenue agents. The tests incorporated in Section 411 are incorrect, and unrealistic and will operate unfairly as between similarly situated taxpayers. Accordingly, we respectfully submit that the proposed Section be dropped.

We thank the Committee for the opportunity of making this statement.

The CHAIRMAN. I would like to say this to our witnesses. Our procedure here does have to follow the Reorganization Act. That is the only way we will conclude the thousands of pages of testimony we are taking on this bill in 5 weeks. Each witness is invited to submit a summary of the points he wishes to make in his statement. We also have our own staff summarize it for us, which is available to each Senator. We do not wish witnesses to read their prepared statements. We want them to summarize those statements. We will take the responsibility of reading them, and together with our staff we will see that each point that they make is fully considered when the committee does meet in executive session.

Now, the next witness is Mr. T. M. Evans, chairman of the Crane Co.

Senator CURTIS. Mr. Chairman, at this point could I make a request for some material to go into the record. I would like to have the staff prepare an analysis of the House-passed bill which would do this: It would set forth in one column those provisions and describe them in not to to exceed two sentences or a sentence or two that would increase the revenue and how much. Then to set forth in another column those provisions of the bill with a similar brief description that would lessen the revenue, and then in a third column those provisions of the House-passed bill which would not affect revenue and, of course, in the first two lists I would like to have them totaled.

(The following material was subsequently supplied for the record:)

REVENUE EFFECT OF THE PROVISIONS OF H.R. 13270, THE TAX REFORM ACT OF 1969

[Amounts in millions of dollars, for 1970 and 1979, respectively]

Revenue gaining	No appreciable revenue effect	Revenue losing
	A. PRIVATE FOUNDATIONS	
1. Tax on investment income (+65, +100).—A tax of 7½ percent is imposed on a private foundation's net investment income (interest, dividends, rents, and royalties) and net capital gains.		
	2. Prohibition on self-dealing.—Self-dealing between a donor (or related parties) and his private foundation is prohibited. Self-dealing is generally a transfer of money or property between a foundation and a donor other than gifts by the donor. A 3-level set of sanctions (taxes) is imposed on violations.	
	3. Distributions of income.—Private nonoperating foundations must distribute all their income currently (but not less than 5 percent of their investment assets) except in certain circumstances. Graduated sanctions (taxes) are imposed for failure to make timely distributions.	
	4. Stock-ownership limitation.—The combined ownership of a corporation's voting stock which can be held by a foundation and all disqualified persons is limited to 20 percent (or 35 percent if someone else has control of the business). Existing excess holdings must be disposed of within 10 years (with interim requirements at 2 and 5 years).	
	5. Limitations on use of assets.—Any investment made by a private foundation which is made in such a manner as to jeopardize the carrying out of the foundation's exempt purpose is subject to a 100-percent tax. (Under present law, a private foundation loses its exemption if its accumulated income is invested in such a manner.)	
	6. Other limitations.—Private foundations are forbidden to spend money for lobbying, electioneering (including voter registration drives except when conducted on a nonpartisan basis by broadly supported, widely active organizations), grants to individuals not made on an objective basis, grants to other foundations (unless the granting foundation accepts certain responsibilities), and for any other noncharitable purpose.	
	7. Disclosure and publicity requirements.—The requirement for filing information returns available to public inspection is extended to religious and publicly supported charitable organizations (except where the Treasury determines this is not necessary for efficient tax administration) and requires that additional information as to donors, management officials, and highly paid employees be included on the return.	

REVENUE EFFECT OF THE PROVISIONS OF H.R. 13270, THE TAX REFORM ACT OF 1969—Continued
[Amounts in millions of dollars, for 1970 and 1979, respectively]

Revenue gaining	No appreciable revenue effect	Revenue losing
	A. PRIVATE FOUNDATIONS—Continued	
	8. Change of status.—New exempt organizations must notify the IRS if they claim to be exempt under 501(c)(3) and new and existing organizations exempt under 501(c)(3) must notify the IRS if they claim they are not private foundations. If a private foundadation seeks to change its status or the IRS determines that it has committed repeated willful violations, then the organization must repay to the Government the aggregate income, estate, and gift tax benefits (with interest) that have flowed to the foundation and all its substantial donors since 1913 from the foundation's exempt staus unless the organization distributes all its assets to public charities or itself acts as a public charity for 5 years.	
	9. Change in definitions.—A "private foundation" is any organization described in section 501(c)(3) other than: (1) organizations, contributions to which may be deducted to the extent of 30 percent of an individual's income; (2) certain types of broadly publicly supported organizations (including membership organizations); (3) those which are, in effect, instrumentalities of organizations described in (1) or (2).	
	10. Private operating foundation definition.—An "operating foundation" is an organization substantially all of the income of which is expended directly for the active conduct of its exempt purposes provided that either (1) substantially more than half its assets are devoted to such activities, or (2) substantially all its support (other than from endowment) is normally received from at least 5 independent exempt organizations and from the general public.	
	11. Hospitals.—Hospitals are to have the same status as churches and educational institutions for purposes of tax exemptions, charitable contributions, and a variety of other matters whether or not they provide a significant amount of charitable services on a no-cost or low-cost basis provided they meet the the other requirements of 501(c)(3).	
	12. Effective dates.—The above changes generally apply to taxable years beginning after Dec. 31, 1969, except that additional time is permitted in the case of existing organizations to reform their governing instruments to conform to the new law as to business holdings and distributions of income, and the 5-percent minimum distribution requirement will not apply to them until 1972.	

REVENUE EFFECT OF THE PROVISIONS OF H.R. 13270, THE TAX REFORM ACT OF 1969—Continued

[Amounts in millions of dollars, for 1970 and 1979, respectively]

Revenue gaining	No appreciable revenue effect	Revenue losing
	B. OTHER TAX-EXEMPT ORGANIZATIONS	
1. The "Clay Brown" provision or debt-financed property.—All exempt organizations' income is to be subject to tax in the proportion the property is financed by debt except for property to be used for an exempt purpose within a reasonable time and certain other types of property.		
2. Extension on unrelated business income tax to all exempt organizations.—The unrelated business income tax is extended to the income from business activities which are regularly carried on by exempt organizations which are presently not subject to the tax, including churches, social welfare organizations, social groups, fraternal beneficiary societies, employees' beneficiary associations, etc.		
3. Taxation of investment income of social, fraternal, and similar organizations.—The corporate income tax is imposed on the investment income and other unrelated income of social clubs, fraternal and employees' beneficiary associations (except for income set aside by fraternal and employees' beneficiary associations for the exempt insurance function or charitable purposes).		
4. Interest, rents, and royalties from controlled corporations.—Where an exempt organization owns more than 80 percent of a taxab subsidiary, interest, annuities, royalties and rents are to be treated as "unrelated business income" and subject to tax.		
5. Limitation on deductions of nonexempt membership organizations.—In the case of taxable membership organizations, the deduction for expenses incurred in supplying services, facilities or goods to members is allowed only to the extent of the income from such members.		
6. Income from advertising, etc.—Income from advertising (or a similar activity) is included in unrelated business income even though the advertising is carried on in connection with activities related to the exempt purpose.		
The revenue gain from the above provisions applicable to other tax-exempt organizations is (+5, +20).		
	C. CHARITABLE CONTRIBUTIONS	
		1. 50-percent charitable deduction limitation (−20, −20).—The 30-percent limit on charitable contributions is increased to 50 percent except that contributions of appreciated property, which, if sold, would be treated as capital gains, remain subject to the 30-percent limitation.

REVENUE EFFECT OF THE PROVISIONS OF H.R. 13270, THE TAX REFORM ACT OF 1969—Continued

[Amounts in millions of dollars, for 1970 and 1979, respectively]

Revenue gaining	No appreciable revenue effect	Revenue losing
	C. CHARITABLE CONTRIBUTIONS—Continued	
2. Repeal of the unlimited deduction (+10, +25).—The unlimited charitable contribution deduction is eliminated for years beginning after 1974. During the interim period, an increasing limitation is imposed on the amount by which the deduction can reduce an individual's taxable income.		
3. Charitable contributions of appreciated property (+15, +15).—In the case of charitable contributions of appreciated property, either to a private nonoperating foundation or of specified types of property, the taxpayer has the option (a) of reducing his deduction to the amount of his cost or other basis for the property, or (b) taking a deduction for the fair market value of the property and including the appreciation in income.		
	4. 2-year charitable trust.—The rule under which an individual is not taxed on the income from property which he transfers to a trust to pay the income to charity for a period of at least 2 years is eliminated.	
	5. Charitable contributions for estates and trusts.—The charitable contribution deduction is eliminated for amounts set aside for, but not paid out to, charitable organizations by nonexempt trusts.	
	6. Gifts of the use of property.—The charitable deduction for the contribution of the right to use property for a period of time is eliminated.	
	7. Charitable remainder trusts.—The charitable contribution deduction in the case of a charitable gift of a remainder interest in trust is limited to situations where there is a close correlation between the amount to be received by charity and the amount of the deduction allowed when the trust is created.	
	8. Charitable income trust with noncharitable remainders.—A charitable contribution deduction is not to be allowed where a person gives an income interest to charity in trust unless he is taxable on the trust income and the charity is to receive a fixed dollar or percentage amount.	
	D. FARM LOSSES	
1. Gains from dispositions of property used in farming where farm losses offset nonfarm income.—If a taxpayer uses the cash accounting method and has more than $50,000 of nonfarm income, farm losses in excess of $25,000 are placed in an excess deduction account (EDA) and capital capital gains on the sale of farm property are converted to ordinary income to the extent of amounts in the EDA.		

REVENUE EFFECT OF THE PROVISIONS OF H.R. 13270, THE TAX REFORM ACT OF 1969—Continued

[Amounts in millions of dollars, for 1970 and 1979, respectively]

Revenue gaining	No appreciable revenue effect	Revenue losing
	D. FARM LOSSES—Continued	
2. Depreciation recapture.—The present exception for livestock from the depreciation recapture rules which treats the gain on the sale of personal property used in a business as ordinary income, rather than capital gain, to the extent of depreciation claimed on the property is eliminated.		
3. Holding period for livestock.—The required holding period for capital gains treatment in the case of livestock held for draft, breeding, dairy and sporting purposes is extended to a period of 1 year after the animal normally would have been used for such purposes.		
The revenue gain from the above 3 farm provisions is (less than +2.5, +20).		
	4. Hobby losses.—The present hobby loss provision is replaced by a rule which disallows the deduction of losses from an activity carried on by the taxpayer where the activity is not carried on with a reasonable expectation of profit.	
	E. LIMIT ON DEDUCTION OF INTEREST (+20, +20)	
In the case of individuals, the deduction for interest on funds borrowed for investment purposes is limited to the individual's net investment income and long-term capital gains plus $25,000. Amounts disallowed could be carried over to subsequent years subject to the limitation		
	F. MOVING EXPENSES (−100, −100)	
		The present duduction for moving expenses is extended to include expenses for: (1) pre-move house-hunting trips, (2) temporary living expenses at the new job location, and (3) certain expenses incident to the disposition or acquisition of a residence at the old and new locations. An overall limitation of $2,500 is imposed and (2) plus (3) may not exceed $1,000.
	G. LIMIT ON TAX PREFERENCES (+40, +85)	
A limit on tax preferences (LTP) is provided under which an individual must include in income ½ of the amount of his tax preferences which exceed the amount of his adjusted gross income. The tax preferences are: (1) tax-exempt interest (taken into account over a 10-year period), (2) excluded capital gains, (3) appreciation on charitable gifts, (4) the excess of accelerated over straight line depreciation on real property, and (5) farm losses which result from cash accounting. A 5-year carryover is provided for disallowed preferences.		

REVENUE EFFECT OF THE PROVISIONS OF H.R. 13270, THE TAX REFORM ACT OF 1969—Continued

[Amounts in millions of dollars ,for 1970 and 1979, respectively]

Revenue gaining	No appreciable revenue effect	Revenue losing
	H. ALLOCATION OF DEDUCTIONS (+205, +460)	
An individual must allocate his personal deductions between tax preferences and income subject to tax, resulting in a disallowance of the proportion of itemized deductions which tax preferences bear to total income including tax preferences. Tax preferences are the same as those under LTP except that tax-exempt interest on bonds outstanding is not taken into account and a portion of intangible drilling expenses and the excess of percentage over cost depletion are included.		
	I. INCOME AVERAGING (−300, −300)	
		The $133\frac{1}{3}$ percent by which a taxpayer's taxable income must exceed his average taxable income for the prior 4 years to be eligible for averaging is reduced to 120 percent and capital gains and certain other types of income are made eligible for averaging.
	J. RESTRICTED PROPERTY (LESS THAN +2.5, +2.5)	
	A person who received compensation in the form of property such as stock which is subject to a restriction generally is subject to tax on the unrestricted value of the property at the time of receipt, unless his interest is subject to a substantial risk of forfeiture in which case he is taxed when the risk of forfeiture is removed.	
	K. OTHER DEFERRED COMPENSATION (LESS THAN +2.5, +25)	
The tax on deferred compensation is to continue to be deferred until the time the compensation is received, but a minimum tax is to be imposed on certain deferred compensation in excess of $10,000 received in any year.		
	L. ACCUMULATION TRUSTS, MULTIPLE TRUSTS, ETC. (+50, +70)	
In the case of accumulation trusts (including multiple trusts) the beneficiary of the trust generally is to be taxed on distributions of accumulated income in approximately the same manner as if he had received the income when it was earned by the trust.		
	M. MULTIPLE CORPORATIONS (+20, +235)	
A controlled group of corporations is to be gradually limited over an 8-year period to one $25,000 surtax exemption and limitations are imposed on the multiple use of other provisions designed to aid small businesses.		
	N. CORPORATE MERGERS	
1. Disallowance of interest deduction in certain cases (+10, +70).—A deduction is disallowed for interest on bonds issued by a corporation in connection with the acquisition of stock or at least $\frac{2}{3}$ of the assets of another corporation where the bonds have specified characteristics which make them more closely akin to equity.		

REVENUE EFFECT OF THE PROVISIONS OF H.R. 13270, THE TAX REFORM ACT OF 1969—Continued

[Amounts in millions of dollars, for 1970 and 1979, respectively]

Revenue gaining	No appreciable revenue effect	Revenue losing
	N. CORPORATE MERGERS—Continued	
	2. Limitation on installment sales provision.—Bonds, in registered form, with interest coupons attached or which are readily marketable are to be considered payments in the year of sale for purposes of the installment method. The installment method is not to be available unless the payments of principal and interest are spread relatively evenly over the installment period.	
	3. Original issue discount.—A bondholder must include the original issue discount in income ratably over the life of the bond.	
	4. Convertible indebtedness repurchase premiums.—A corporation which repurchases its convertible indebtedness at a premium may deduct as interest only that part of the premium which represents a cost of borrowing rather than being attributable to the conversion feature.	
	O. STOCK DIVIDENDS (LESS THAN +2.5, +2.5)	
	A stock dividend is to be taxable if one group of shareholders receives a disproportionate distribution in cash and there is an increase in the proportionate interest of other shareholders in the corporation.	
	P. FOREIGN TAX CREDIT	
1. Foreign losses (+35, +35).—A taxpayer who uses the per country limitation on the foreign tax credit and who reduces his tax on domestic income by reason of a loss from a foreign country is to have the resulting tax benefit recaptured when income is subsequently derived from that country.		
2. Foreign tax-royalties (+30, +30).—A separate foreign tax credit limitation is provided in the case of foreign mineral income where the foreign government also holds mineral rights so that excess credits from this source cannot be used to reduce U.S. tax on other foreign income.		
	Q. FINANCIAL INSTITUTIONS	
1. Commercial banks—reserves for losses on loans (+250, +250).—In the future, the deduction allowed commercial banks for additions to bad debt reserves is to be limited to the amount called for on the basis of their own loss experience.		
2. Mutual savings banks, savings and loan associations, etc. (+10, +170).—The bad debt reserve provisions are modified by eliminating the 3 percent method and reducing the present 60-percent method to 30 percent gradually over 10 years. The special deduction is to be allowed only if the institution has a prescribed percentage of its investments in residential real property loans and other specified types of investments.		

REVENUE EFFECT OF THE PROVISIONS OF H.R. 13270, THE TAX REFORM ACT OF 1969—Continued

[Amounts in millions of dollars, for 1970 and 1979, respectively]

Revenue gaining	No appreciable revenue effect	Revenue losing
	Q. FINANCIAL INSTITUTIONS—Continued	
3. Treatment of bonds held by financial institutions (+50, +50). Financial institutions are to treat net gains from the sale of bonds as ordinary income instead of as capital gains and will continue to treat net losses from such sales as ordinary losses.		
	4. Foreign deposits in U.S. banks.—The expiration date for the special income tax and estate tax rules regarding U.S. bank deposits of foreign persons is extended from 1972 to 1975.	
	R. DEPRECIATION ALLOWED REGULATED INDUSTRIES	
1. Accelerated depreciation (+60, +310). Regulated utilities are, in general, "frozen" as to their depreciation practices including whether they use straight line or accelerated depreciation and whether they normalize or flow through the tax benefits of accelerated depreciation.		
2. Earnings and profits (0, +80).—Corporations must compute earnings and profits (which determine whether dividends are taxable or not) on the basis of straight line depreciation.		
S. ALTERNATIVE CAPITAL GAIN RATE FOR CORPORATIONS (+175, +175)		
The alternative capital gains rate applied to a corporation's net long-term capital gain is increased from 25 to 30 percent.		
	T. NATURAL RESOURCES	
1. Percentage depletion (+425, +400).—The percentage depletion rate for oil and gas wells is reduced from 27.5 to 20 percent and the rates for all other minerals are comparably reduced except in the case of gold, silver, oil shale, copper and iron ore from domestic sources. Percentage depletion on foreign oil and gas wells is eliminated.		
2. Mineral production payments (+100, +200).—Carved-out payments and retained payments (including ABC transactions) are to be treated as a loan by the owner of the production payment to the owner of the mineral property.		
	3. Mining exploration expenditures.—The general rule of present law under which mining exploration expenditures are recaptured when a mine reaches the producing stage is extended to foreign and oceanographic exploration.	
	4. Treatment processes in case of oil shale.—The percentage depletion cutoff point for oil shale is extended through retorting.	

REVENUE EFFECT OF THE PROVISIONS OF H.R. 13270, THE TAX REFORM ACT OF 1969—Continued

[Amounts in millions of dollars, for 1970 and 1979, respectively]

Revenue gaining	No appreciable revenue effect	Revenue losing
	U. CAPITAL GAINS AND LOSSES	
1. Alternative tax (+360, +360).—The 25-percent alternative tax rate applicable to net long-term capital gains in the case of individuals is eliminated.		
2. Capital losses of individuals (+50, +65).—The amount of an individual's net long-term capital losses that can be offset against ordinary income is limited to 50 percent of such losses.		
	3. Collections of letters, memorandums, etc. (less than +2.5).—Letters, memorandums and similar property are to be treated as ordinary income rather than capital gain property in the hands of the person who created them or for whom they were prepared.	
4. Holding period of capital assets (+100, +150).—The holding period which must be satisfied for a gain on property to be considered a long-term gain is increased from 6 to 12 months.		
5. Total distributions from qualified pension, etc., plans (less than +2.5, +50).—Present capital gains treatment accorded lump sum distributions from qualified employee pension, profit sharing, stock bonus or equity plans is limited to the amount of the distribution in excess of the employer's contribution. The employer contribution will be treated as ordinary income subject to a special 5-year forward averaging rule.		
6. Sales of life estates, etc. (+10, +10).—The entire amount received on the sale of a life estate in property acquired by gift, bequest, or inheritance is to be taxable rather than only the excess of the amount received over the seller's basis for his interest.		
	7. Certain casualty losses under sec. 1231 (less than +2.5).—Casualty losses and casualty gains are to be consolidated in determining whether they give rise to an ordinary loss or to gains which are consolidated with other section 1231 gains and losses.	
	8. Transfers of franchises (less than +2.5).—Transfers of franchises are to be treated as giving rise to ordinary income rather than capital gains if the transferor retains any significant power, right, or continuing interest concerning the subject matter of the franchise.	
	V. REAL ESTATE DEPRECIATION	
1. Restriction on use of accelerated depreciation (+15, +1,210).—The most accelerated methods of real estate depreciation (200 percent declining balance and the sum-of-the-years digits methods) are limited to new residential housing. Other new real estate is limited to the 150 percent declining balance method. Only straight line depreciation is available in the case of used buildings.		

REVENUE EFFECT OF THE PROVISIONS OF H.R. 13270, THE TAX REFORM ACT OF 1969—Continued

[Amounts in millions of dollars, for 1970 and 1979, respectively]

Revenue aining	No appreciable revenue effect	Revenue losing
	V. REAL ESTATE DEPRECIATION—Continued	
2. Recapture of excess depreciation (+5, +125).—Gain on the sale of real property will be treated as ordinary income rather than as capital gain to the extent of the excess of accelerated over straight line depreciation.		
		3. Rehabilitation of rental housing (−15, −330).—A special 5-year amortization deduction is provided for expenditures for the rehabilitation of low cost rental housing.
	W. COOPERATIVES (LESS THAN +2.5)	
	Cooperatives are required to revolve out patronage dividend and per unit retain allocations within 15 years, and the percentage of patronage allocations which must be paid out currently in cash is increased from 20 to 50 percent.	
	X. SUBCHAPTER S CORPORATIONS (LESS THAN +2.5)	
	For subchapter S corporations, the amounts set aside under qualified employee pension plans for shareholder-employees of the corporation must be included in the income of the shareholder-employee to the extent the contribution exceeds 10 percent of his salary or $2,500 whichever is less.	
	Y. TAX TREATMENT OF STATE AND MUNICIPAL BONDS	
	State and local governments are given the voluntary election to issue taxable bonds. If they make this choice, the Federal Government will pay between 30 and 40 percent of the interest on the bond (between 25 and 40 percent for years after 1974).	
	Z. EXTENSION OF TAX SURCHARGE AND EXCISE TAXES AND TERMINATION OF THE INVESTMENT CREDIT	
1. Extension of tax surcharge at 5-percent rate for first half of 1970 (+3, 100,—).—The income tax surcharge is extended at a 5-percent rate from Jan. 1, 1970, through June 30, 1970.		
2. Continuation of excise taxes on communication services and automobiles (+1,170,—).—The presently scheduled reductions in the 7-percent excise tax on automobiles and 10 percent tax on telephone services to 5 percent in 1970, 3 percent in 1971, 1 percent in 1972, and the repeal in 1973, are postponed for 1 year.		
3. Repeal of the investment credit (+2,500, +3,300).—The investment credit is permanently repealed for property acquired or on which construction was begun after April 18, 1969, unless carried out pursuant to a binding contract in effect before Apr. 19, 1969. The available credit is phased out gradually until 1975 and a 20-percent limit is placed on the use of carryover of unused credits.		
		4. Amortization of pollution control facilities (−40, −400).—A taxpayer will be allowed to amortize over a period of 60 months any new certified air or water pollution control facility constructed after 1968.

REVENUE EFFECT OF THE PROVISIONS OF H.R. 13270, THE TAX REFORM ACT OF 1969—Continued

[Amounts in millions of dollars, for 1970 and 1979, respectively]

Revenue gaining	No appreciable revenue effect	Revenue losing
	Z. EXTENSION OF TAX SURCHARGE—Continued	
		5. Amortization of certain railroad rolling stock (less than −2.5, −100).—Railroads subject to regulation by the ICC may amortize over 7 years rolling stock (except locomotives) put into original use after July 31, 1969.
	AA. ADJUSTMENT OF TAX BURDEN FOR INDIVIDUALS	
		1. Increase in the standard deduction (−867, −1,373).—The 10 percent standard deduction with a $1,000 ceiling is increased to 13 percent with a $1,400 ceiling in 1970, 14 percent with a $1,700 ceiling in 1971, and 15 percent with a $2,000 ceiling in 1972.
		2. Low income allowance (−625, −2,652).—The present minimum standard deduction of $200 plus $100 for each exemption with a $1,000 limit is replaced with a low income allowance of $1,100. In 1970 only, the excess of the low income allowance over the present minimum standard deduction is reduced by $1 for each $2 that the taxpayer's income exceeds the new nontaxable income level.
		3. Maximum tax on earned income (−200, −100).—The maximum marginal rate applicable to an individual's earned income is not to exceed 50 percent.
		4. Intermediate tax rates, surviving spouse treatment (—, −650).—Widows and widowers and unmarried individuals age 35 or over are provided a rate schedule halfway between the rates applicable to other single persons and those applicable to joint returns (the former head-of-household treatment). A widow or widower with a dependent child may use the joint return schedule indefinitely rather than for the two years after the spouse's death provided in present law.
		5. Individual income tax rates (—, −4, 498).—All tax rates are reduced by at least 1 percentage point, the top 70-percent rate is reduced to 65 percent, and in all brackets the tax is reduced by at least 5 percent. The reduction takes place in 2 equal stages in 1971 and 1972.

Total tax change	1970	1979	1970	1979
Reform and relief	+4,615	+8,105	−2,167	−10,523
Surcharge	+3,100	....	....	....
Excises	+1,170	....	....	....
Total	+8,885	+8,105	−2,167	−10,523

The CHAIRMAN. We will see that that is done for you, Senator. All right, Mr. Evans.

STATEMENT OF T. M. EVANS, CHAIRMAN, CRANE CO.

Mr. EVANS. Mr. Chairman, I am Thomas M. Evans, chairman of the Crane Co. and the H. K. Porter Co., and I also operate a horse breeding farm, Buckland Farm in Gainesville, Va.

It seems to me there are a number of serious faults in the House approve tax bill, but there are three important points that I would like to discuss briefly.

1. Proposed changes in real estate. Money is tight now and I think we need every incentive to add new capital to the building industry because not only are we short of housing, apartments, factor buildings, et cetera, but also the cost of financing has gone up as well as the cost of building. Consequently, in my opinion, it would be harmful to change the depreciation regulations in such a drastic manner.

2. Proposed changes in donative sales. It seems to me to eliminate donative sales, that is, selling securities at cost and donating the difference, is removing an important source of income for small colleges and other worthwhile charitable organizations. In my opinion, putting a capital gains tax on the gift would not increase the Government revenue, but instead people just would not make the gift.

3. Proposed changes on limitations of deductions allowable to individuals in certain cases. The proposed legislation regarding the horse racing business is, in my opinion, completely unnecessary since the abuse is coming from the provision regarding recapture of depreciation. If the animal is depreciated as a business expense and later sold at a profit, the amount of depreciation taken should be recaptured at regular income tax rates, the same way that machinery sales are taxed to manufacturing business.

Apparently, when the law was written regarding animals used in business, this provision was overlooked and should be put into the law which would eliminate the abuse, and would not hurt legitimate people in the breeding and horse racing business.

Considering the revenue horse racing brings State governments, as well as the employment of unskilled labor that it provides, it would indeed be a mistake to pass this legislation that would practically eliminate any new people from going into the business.

Thank you for allowing me to come before your committee.

The CHAIRMAN. Thank you so much. We are happy to have you here today.

Now, the next witness is Mr. T. F. Dixon Wainwright of Philadelphia, Pa.

STATEMENT OF T. F. DIXON WAINWRIGHT, PHILADELPHIA, PA.

Mr. WAINWRIGHT. Mr. Chairman, and members of the committee, I am an attorney in Philadelphia and a tax practitioner and my comments are directed toward section 412 of the bill which has to do with the installment method of reporting gains. As to the merits of that section I have no comment but my comment concerns the effective date.

The bill provides that these amendments are effective as to all sales or other dispositions taking place after May 27, 1969, and I submit that

that is unfair to the taxpayers who have entered into binding contracts prior to that date.

As a tax practitioner I give advice to my clients in the best way I can, but the tax law, as Senator Moss said this morning, is extremely complicated. It takes a great deal of study so I may not always be right in my advice. But I certainly feel that my advice is nearly worthless if the law can be retroactively changed to affect it.

Thank you, sir.

The CHAIRMAN. Thank you very much, sir.

(T. F. Dixon Wainwright's prepared statement follows:)

STATEMENT OF T. F. DIXON WAINWRIGHT, ATTORNEY-AT-LAW, PHILADLEPHIA, PA.

(Re H.R. 13270, section 412(c) effective date of amendments regarding installment method of reporting gains)

SUMMARY

To the Senate Finance Committee:

The amendments apply to sales or other dispositions occurring after May 27, 1969.

In some instances this effective date will result in inequity and hardship to taxpayers who prior to May 28, 1969 in reliance upon the present law have executed contracts of sale which were binding upon them.

The amendments should not apply in cases where such contracts were entered into before the effective date.

DISCUSSION

Sec. 412 of H.R. 13270 would amend Sec. 453(b) of the Internal Revenue Code (relating to sales of realty and casual sales of personalty) by providing in effect (1) that an installment transaction is one in which the payment of the principal is spread relatively evenly over the installment period and (2) that certain evidences of indebtedness of a corporation shall not be treated as evidences of indebtedness of a purchaser.

As to whether or not the effects sought to be accomplished by these amendments are desirable or not I have no comment.

What would produce improper and inequitable results if it becomes law is Sec. 412(c) of the Bill which reads:

"Effective date.—The amendments made by this section shall apply to sales or other dispositions occurring after May 27, 1969."

There should be an exception for transactions where the contract or agreement of sale had been executed prior to May 28, 1969.

A seller should surely be entitled to rely on the law as to the installment method as it existed at the time that he bound himself by a contract of sale.

It is unfair for the law retroactively to change the tax effect of such a transaction. When a seller has bound himself by a contract prior to May 28, 1969, he cannot change its terms merely because the law changed afterwards. If at the time that he entered into the contract he had had any possible way of knowing that the provisions of H.R. 13270 might become law, he would have demanded a larger down payment from the buyer so that at the least he would have had funds in hand to pay the tax liability, which under the terms of this Bill would now all be bunched in the year of sale.

A typical situation affected by the amendments is a sale of real estate by an individual to a developer who makes a down payment at the time of the sale and gives a purchase money mortgage to secure payment of the balance of the consideration. Normally in such cases it is provided that the principal of the debt will become due in a relatively short period of time, say five or six years. Although there is no schedule for fixed part payments of principal prior to the due date, the mortgagor must pay part of the principal indebtedness from time to time in order to release portions of the land from the lien of the mortgage as the development proceeds. In such a case a landowner who contracted to sell in the proper belief that he had the right to report his gain on the installment method will suffer great financial hardship if the amendments retroactively take that right away from him.

As a tax practitioner I advise my clients to the best of my ability as to the tax consequences of various transactions that they wish to enter into. In order to do so I study the Internal Revenue Code, the Regulations, the cases and commentaries on the law. If I must also take into consideration possible future legislation retroactively effective, my advice would be a matter of guesswork and perhaps worthless. I submit that this is unfair to the taxpayers, because they are entitled to rely on reasonable certainty in the law. Specifically, prior to May 28, 1969 a taxpayer could not know that tax reform would include amendments to the Code with respect to the installment method of reporting and that such amendments would be retroactive.

Admittedly, it is not unusual for a change in income tax rates to be retroactively applied. Tax planning should always take into consideration the fact that there may be such changes. Such increases or decreases, however, are very different from a change in the *method* of taxation. If the latter type of change can be made retroactive, there can be no sound opinion or advice as to the tax consequence of any transaction.

Similarly, a tax practitioner may anticipate that the Internal Revenue Service will issue rulings in regard to the tax consequence of various transactions and that these rulings may be retroactive. Just this month such a ruling was issued in connection with the installment method. (Rev. Rul. 69–462, IRB 1969–35). Such rulings may be anticipated by a tax practitioner because they are *interpretations* of the present law and are not *changes* in it.

In other areas of tax reform H.R. 13270 provides exceptions to effective dates as to obligations binding upon taxpayers which were incurred prior to those dates. Such exceptions are found in Secs. 331 and 703 of the Bill which respectively concern deferred compensation and the termination of the investment credit.

CONCLUSION

It is accordingly respectfully submitted that the amendments proposed by Sec. 412 of H.R. 13270 should not apply to transactions where a bona fide contract of sale binding upon the taxpayer had been entered into prior to the effective date.

The CHAIRMAN. The next witness is Mr. S. Rayburn Watkins, president of the American Society of Association Executives, and Mr. George D. Webster.

STATEMENT OF S. RAYBURN WATKINS, PRESIDENT, AMERICAN SOCIETY OF ASSOCIATION EXECUTIVES, WASHINGTON, D.C.; ACCOMPANIED BY GEORGE D. WEBSTER, WASHINGTON, D.C., COUNSEL

Mr. WATKINS. Thank you very much, Mr. Chairman.

The American Society of Association Executives consists of about 3,000 executives of various types of business and professional associations. You have the printed statement that we would like to have officially put into the record of this hearing.

I would like to comment briefly on three aspects of the bill. They are major to our membership but not major in context with the volume of the total bill.

The first one relates to the proposed taxing of advertising of association publications. It is our position that an association publication ordinarily relates to the tax-exempt purposes of the organization, and that if it does relate to them that the advertising revenue should not be taxable. If, on the other hand, the publication doesn't relate to such purposes, we don't think we have any ground to urge this committee not to tax such revenues.

The figures in our statement show that most of these publications are issued by relatively small organizations, that most of them actually do not produce a profit and, therefore, the total number of tax dollars involved isn't great. However, in the small association it sometimes is important to have this added thrust to its tax-exempt purpose.

The next aspect we would like to comment on is in connection with association-sponsored foundations, and we don't think there is much quarrel with the bill on this point. That perhaps through an oversight we are faced with a situation where an association that might make a contribution to its tax-exempt foundation would be considered a private contributor and, therefore, render some problems for it when, in fact, the association would be getting its money to make the contribution from a large number of its members. If a minor change could be made so that these contributions that really do in fact come from a variety of public sources wouldn't be considered as one contribution from the association and, therefore, render the entire foundation in jeopardy, we would like to submit this proposal for your consideration. We don't think the bill really intended it, but we do believe the way it is drafted it would put some of these foundations in jeopardy of being classified as "private foundations."

The third aspect concerns nonprofit organizations that have given up their tax-exempt status.

The way the bill is presently drafted they would not be permitted to carry forward or backward any losses that were sustained in their operation, and we think that it would be fair to permit that carrying forward and carrying backward if they are to be taxed on their income activities.

I am told that this particular section was drafted to treat such nonprofit organizations as gamblers, and we don't think that legitimate associations really fall in that category. We would like some protection on that.

The CHAIRMAN. Thank you very much, sir.

Senator CURTIS. I have one question.

The CHAIRMAN. Go ahead.

Senator CURTIS. Did you mean to imply that there was no objection to the House bill as it relates to foundations?

Mr. WATKINS. No; I didn't mean that. I merely said the aspect of it that concerns us, as the American Society of Association Executives, is that so many associations collect money from a large number of their members and then will make a lump sum contribution to the foundation. The language of the law as drafted would say that this is a private contribution and, therefore, would cause problems for the foundation. We do not comment on the private foundation aspects of the bill, other than this one comment.

The CHAIRMAN. I hope the staff would see to it that this matter is suggested in executive session.

Thank you very much.

Mr. WATKINS. Thank you.

(Mr. Watkins' prepared statement follows:)

Statement of Rayburn Watkins, President, American Society of Association Executives

SUMMARY

1. The American Society of Association Executives represents the interests of a great many business and professional associations.

2. Under the provisions of H.R. 13270, a number of the activities of our member organizations will be affected in ways which we feel are not consistent with the purposes of the bill and are not supported by policy considerations calling for the proposed legislation.

3. The bill should be changed to preclude the possibility that foundations which are supported by association members through contributions channelled through the association will not be classified as "private foundations" and thus become subject to the restrictions not consistent with the policing intent of the bill.

4. There are a substantial number of policy considerations against enacting the provisions of the bill which would tax advertising revenues of business and professional association journals.

5. The subsection heading of the advertising income provisions should be changed to prevent future litigation to determine the taxing limits of the section.

6. Proposed section 278 of the Code is not supported by any policy for equating legitimately operated organizations with gamblers insofar as their tax treatment is concerned.

STATEMENT

I appreciate this opportunity to appear before this Committee.

My name is S. Rayburn Watkins, and I am appearing on behalf of the American Society of Association Executives, Washington, D.C., of which I am President. This is a professional society, the members of which number over 2,900, each of whom is an executive in an industry or professional association. My organization thus represents almost three times as many industry and professional associations as any other group in the United States. We have members that are classified both under section 501(c)(6) and 501(c)(3) of the Internal Revenue Code, as well as under section 501(c)(4). I am accompanied by the General Counsel for ASAE, George D. Webster, a Washington, D.C. attorney, who also is counsel to many other industry and professional associations.

My testimony today shall be addressed to several provisions of H.R. 13270 which affect my organization and its members. These provisions relate to association-supported foundations, revenues received for advertising presentations in association journals, the over extension of the heading for subsection 513(c) of the Code, and the provisions limiting the deductions of nonexempt membership organizations.

Very often a membership organization will form a foundation for eleemosynary purposes. These foundations are funded by members contributions and are exempt from tax under section 501(c)(3). Frequently the smaller contributions of the members are paid to the member organization which in turn makes one large payment to the charitable organization it has formed.

Under the Act all section 501(c)(3) organizations are private foundations unless they fall within four prescribed exceptions. These exceptions are:

1. That class of organization which will qualify for the 30% charitable contribution limitation under the Act,
2. Organizations which meet the statutory test established to implement the concept of broadly supported organizations,
3. Organizations which exist to perform the functions, etc., of the above two classes of organizations or which are operated, supervised, or controlled by one of these types of organizations and which are not controlled by "disqualified persons" as defined by the Act, and
4. Organizations operating exclusively for testing for public safety purposes.

Under the Act it is possible that a foundation created by a member organization would fail to meet any of these exceptions. Exceptions 1, 3 and 4 would never apply simply by definition. The second exception would not apply where a number of members made contributions aggregating more than $5,000 to the membership organization for the express purpose of passing the funds on to the charitable organization. The membership organization would be considered a "disqualified person" when the funds were contributed to the charitable foundation and the charitable foundation would be a private foundation. Thus, an organization which receives support indirectly from a very broad base and which is not likely to be able to commit any of the culpable acts which the Act is intended to police becomes subject to restrictions which do not cure ills but rather frustrate charitable activities.

It is respectfully submitted that this result could be avoided by the simple addition of language to the support tests found in proposed section 509(a)(2) indicating that the test is to be applied on a *direct or an indirect basis.*

For some time the Internal Revenue Service has attempted to advance an argument that advertising fees for presentations in association journals constitute income which is subject to income tax because it is unrelated to the exempt functions of the organization publishing the periodical. This argument was never successful until the House passed section 121(c) of the Tax Reform Act amending section 513(c) of the Code. This provision accepts the premise that the sale of advertising space in a magazine can be fragmented from the publication of the magazine. The advertising then becomes subject to the tax even though it cannot, without resort to this new fiction, be divorced from the publication of a magazine which is confessedly in furtherance of the exempt functions of the published. I submit that the underlying policy considerations will not support the legislation in point.

A magazine or journal is a unit composed of both the editorial and advertising activities. When these two elements are fragmented by a ficition it then becomes necessary to test each element in terms of its affect on the exempt function of the publishing organization. This means each advertisement must be scrutinized to determine its relationship. To draw the line on an individual basis of advertising and to say that this is advertising which is unrelated and that advertising is related is to open the door to subjective judgment and would present to the IRS and taxpayers generally, an almost insurmountable audit problem and would only breed litigation since in effect each piece of advertising would be another case, i.e., as to whether the advertising was related to the exempt functions of the organization.

Accordingly, the proper measure of the unrelated business tax as applied to the advertising revenues of association publications, should be whether or not the magazine itself is related to the exempt functions of the organization involved, and if it is related in the main to the exempt functions, then no part of its net revenues should be taxed.

It should be further emphasized to this committee that I am advised by my membership that in general there is little net revenue involved in this area. A summary of our membership of over 2,000 industry and professional association executives indicates the following:

1. Approximately 20% have paid advertising in the association publication.
2. 11% of the overall budget of the association is from advertising.
3. The average gross income of the typical magazine selling advertising by the association is $50,000.
4. 60% of the 20% have a loss operation after a proper allocation of expenses.

Any tax which is imposed on the operation of an association journal is an increase in the cost of membership, and thus it is a tax on small association members for acting collectively to advance the interests which each could advance acting alone only at much greater expense. In the main our membership is not composed of the large industry and professional associations but is composed of smaller groups. Of our 2,900 members, over half of the membership involved are associations which have budgets of less than $100,000 per year.

These publications take the form of weekly newspapers and magazines which are generally the spokesmen for the industry as well as also being the educational catalysts for the industry. The magazine and publications of my members are devoted exclusively to reporting news of real importance and general significance to the membership of the particular organization involved. In the case of magazines run by the associations, their chief interest is to carry out the exempt purposes of the particular organization involved. These magazines are not competitive with any other publication because there can be no commercial equivalent to the particular magazines or publications involved. The commercial magazines have an entirely different point of view in that they are operated for profit. Our magazines and publications are operated primarily to seve the exempt purposes of the particular operation involved. Most, if not all, of the publications of my members are made available to the membership and in some cases to some of the non-members. These publications are not available on the newsstand and are not generally available to the public. In many cases, they are "house organs."

To say that these magazines compete in the market place for advertising is a misrepresentation. The answer is that the publications of my members are in a peculiar position of serving the best interest of the industry and in a substantial number of cases the magazines of my members are operated at a loss. They are not operated for a profit as are commercial publications; they are operated to serve the membership of the association involved. If it were not for the association, in the vast majority of cases, it is my opinion that the magazine would not even exist since a commercial publisher would not be in a position to underwrite the loss that would necessarily result.

Many of the educational functions that are performed by associations are paid for in whole or in part in some instances by advertising revenues. This is a subsidy. If this subsidy is denied as it would be if the advertising revenues are taxed, the result could be that many functions performed by private educational organizations would have to be performed by the government, if they are performed at all. The long term result of taxing advertising revenues might well be increased costs rather than increased revenues, for the government.

It is respectfully requested that this Committee refuse to endorse the provisions of section 121(c) of the Act.

Further injustice can be seen in the subsection heading to the proposed sunbsection 513(c) as found in section 121(c) of the Act. The section is headed "Advertising, etc., Activities." It is submitted that in the event Congress decides to tax advertising in trade journals this mandate should be expressed in terms which will not lead to future litigation to determine what "etc., Activities" are.

Some of the members of our organization were originally exempt from tax under section 501(c)(6) of the Code. These members are no longer exempt under that section; however, they do remain nonprofit organizations which seek to advance the common business interests of their members in a collective fashion. Section 121(b)(3) of the Act would create section 278 of the Code: a section limiting the allowable deductions for services to members to the amount of income derived from members. Because of the annual tax accounting concept on which one system is based this woulld mean that a loss in one year from this kind of operation would not be deductible against the very same kind of income in the next year. This section has the effect of equating legitimately operated organizations with gamblers insofar as their tax treatment is concerned. There is no policy to support such treatment, and the section should be deleted or amended to allow carry-over and carry-back of losses.

The CHAIRMAN. Now, the next witness will be Mr. Leon O. Stock.

STATEMENT OF LEON O. STOCK, MEMBER, PEAT, MARWICK, MITCHELL & CO.

Mr. STOCK. Mr. Chairman, I appear here today on behalf of several corporate clients. In listing Crown Textile I made a mistake. I had originally intended testifying on some other subject.

My name is Leon O. Stock. I am a member of the international accounting firm of Peat, Marwick, Mitchell & Co. I appear here on behalf of several corporate clients, Sterling Stores, United Dollar Stores, Diana Stores, Rockower Bros., and Genesco, Inc. I am opposed to the elimination of the multiple surtax exemption as proposed by the House and by the Treasury.

As you may recall, the House bill proposes the elimination over an 8-year period. The Treasury would eliminate the exemptions over a 5-year period. Last March I appeared before the House Committee on Ways and Means and at that point cited as an illustration the unfairness in given circumstances of the elimination. I cited the case of a chain of retail stores operating in small outlying communities, one particular store operating in a small town in Pennsylvania called Honesdale, on the main street. Four doors away, a one-store corporation operated in competition with the chain store, both stores presumably earned less than $25,000 a year after tax. If the one-store corporation is to be subjected to a tax of 22 percent, and the chain store corporation operating four doors away is to be subjected to a tax of 48 percent, then necessarily there must be resulting competitive disparity between the two.

I now have additional facts on nine other chains. One chain which should be unidentified for competitive reasons shows the following salient facts. It consists of 110 retail stores in the outlying communities. It has total sales overall of $14 million. Its net income after tax is $879,000, thereby indicating a ratio of after tax profit to sales of 4.8 percent. Its net average income per store is approximately $6,100. It employs 230 people.

With an individual store in an outlying community earning approximately $6,100, and 40 stores actually suffering losses, there appears to be little competitive margin for increased tax costs. A chain, we all know, is just about as strong as the links that go to make it up, and it would be, in my judgment, a horrible mistake to look at this chain and conclude, that because it has earned $679,000 as overall profit, this chain can stand additional tax costs. One sensible way to evaluate the tolerance of this chain to the additional tax is to look at the profit per unit and the competitive position of each unit.

Now, we have nine other chains where the average profits run below $10,000 per store. There isn't much fat on the carcass, and there are two questions which I think this committee ought to ask itself: First, can these chains operating in outlying communities and earning less than $10,000 per store absorb any additional tax costs without being compelled to re-examine their position in these communities with possible curtailment or elimination of some of the stores thus leaving the consumer then with an increasing price level.

Gentlemen, after much consideration and much discussion with clients, we would like to submit for your consideration some alternative proposals. One, perhaps a moratorium period of 3 years during which no change would be made, followed by the proposal to phase out the multiple surtax exemptions over the next 7 years. Alternatively, a moratorium period for 5 years, with a subsequent phaseout over the succeeding 5 years; and finally, as an alternative, a straight phaseout over 10 years.

Thank you.

The CHAIRMAN. Thank you very much.

Senator CURTIS. I would like to ask something for the record and you can supply it to our staff. I would like to know what the present law is in regard to multiple surtax exemptions, what situations qualify for it, the extent to which it is the same ownership of various smaller corporations, and then I would like to know what the House bill proposes and what change the Treasury proposes.

If you would supply that so that we could have a concise definition of what we are talking about.

Mr. STOCK. I might add, in parting, Senator, that it is significant that the large super grocery chains do not claim the multiple surtax exemption. They either operate through unincorporated divisions or if they do have subsidiaries they file consolidated returns which means only one surtax exemption.

The reason your big companies, J. C. Penny, all of your supermarket chains, do not claim the multiple surtax exemption is because they aren't confronted with any one-man competition, they don't operate a specialty shop on main street in one small town operating against the one-store operators or the franchise operators. They are in competition to some extent with the big chains but none of these chains claim the multiple surtax exemption because they are not up against the little man. I submit very respectfully that discrimination is bad no matter in which direction it is aimed at. Chains operating small units must be given some tax relief.

The CHAIRMAN. What I want are the facts as to how they operate.

Mr. STOCK. Thank you.

The CHAIRMAN. Thank you very much.

(The witness failed to supply the information requested. Leon O. Stock's prepared statement follows:)

STATEMENT OF LEON O. STOCK, MEMBER, PEAT, MARWICK, MITCHELL & CO.

SUMMARY

A. Allowance of multiple surtax exemption justifiable in appropriate circumstances and accordingly should not be indiscriminately or prematurely terminated.

I. Chain store corporations, particularly in smaller communities would be placed at a competitive disadvantage vis a vis. one store corporations and franchised store corporations if tax burden on former is increased through elimination of multiple surtax exemptions. Tax neutrality required if competitive parity is to be maintained.

II. Chain store corporations in smaller communities realized relatively small earnings after tax, leaving little, if any, margin for an increase in tax cost.

III. Inadequacy of after-tax profit may induce chain store corporations to close down, rather than expand, resulting in a likely increase in consumer prices.

B. Suggested legislation for Committee's consideration—please refer to Paragraph X of Statement following this Summary.

STATEMENT

I. This statement submitted by Leon O. Stock, a principal in the international accounting firm of Peat, Marwick, Mitchell & Co., is in opposition to the specific proposal passed by the House to phase out multiple surtax exemptions in the case of controlled corporate groups as defined.

II. On March 24, 1969, the writer appeared as a witness before the House Committee on Ways and Means and expressed the view that the allowance of more than one corporate surtax exemption, in appropriate circumstances, was and continues to be justifiable and, accordingly, should not be indiscriminately eliminated.

The writer then by way of illustration made reference to the case of a retail chain principally in the sale of undergarments in small outlying communities, for example, a store on Main Street in the small town of Honesdale, Pennsylvania, where it is and has been for a long time in competition with a one-store operator several doors away.

III. In the Honesdale illustration, the assumption was made that the competing stores each earned less than $25,000, and that each paid a corporate tax of 22 per cent (plus an additional tax of 6 percent in the case of the chain-store corporation). The conclusion was then expressed that the prevailing substantial tax equality between the two stores would cease to exist if the chain store corporation were required to pay a tax of 48 percent and the one-store corporation a tax of only 22 percent.

IV. Since testifying before the House Committee the writer has been supplied with facts and figures relating to chainstore operations in small outlying communities. Let us consider one such a chain in relation to its last fiscal year which for competitive reasons will remain unidentified:

(a) Number of Stores, 110.
(b) Sales Volume, $14,000,000.
(c) Net income after tax, $679,000.
(d) Ratio of (c) to (b), 4.8%.
(e) Average net income per store, $6,172.
(f) Number of loss stores, 40.
(g) Number of employees, 230.

V. The above-referred to chain consisting of retail specialty stores employing modern methods of distribution brings to the small communites consumer-acceptable products at reasonable prices. Its individual store profits are modest, leaving little competitive margin for increased tax costs.

The types of products and goods sold by chains in the small communities at the retail level include jewelry, woman's wear, undergarments and hardware.

VI. The writer has also been supplied with data on several other retail specialty chains. One such chain, wth sales of $11,619,000 from 87 stores had an average net ncome pér store of only $3,552 after taxes. Of the 87 stores in that chain, 20 stores operated at a loss, and an additional 47 stores had income of less than $10,000 per annum. Only one store in the chain had income of $25,000 or more.

In the 9 chains, in respect of which data has been obtained, the number of individual stores ranged from 32 to 456. Only one chain, and that was the smallest, had more than 50 percent of the stores operating with profits of over $10,000. One chain had more than 93 percent of its stores making less than $10,000, and four chains had more than 72 percent of the stores in each chain making less than $10,000. Percentages of stores with less than $10,000 in profit for the other three chains were 61 percent, 66 percent and 67 percent respectively.

While net income after taxes ranged from $90,000 to $2,023,782 for a total of all stores, the average net from each store ranged from $1,500 to $24,800. The stores in the smallest chain (32 stores) had the highest average net income. The stores in the largest chain (456 stores) had average net income of $4,000 and 119 out of the 456 stores operated at a loss. It is respectfully submitted that looking at the overall results of the chain, rather than individual units in the chain, gives a misleading impression.

VII. Chain store vendors in the small outlying communities are engaged in competition at the grass roots. Taxes, constituting a cost of doing business, may easily become self-defeating insofar as the public revenue is concerned if:

(a) The adequacy of the after-tax income becomes doubtful in the opinion of management and continuation of the business consequently becomes economically questionable.

(b) The chain store is placed at a competitive disadvantage, tax-wise, thereby dictating possibly a termination of the local business in favor of the one-store operator.

VIII. Needless to say, the determination to furnish services, products and goods is dependent on the bottom-line profit and loss figures, i.e., after-tax earnings. Any tax or other economic factor that denies operational adequacy of return can only cause a curtailment or termination of the effected business. This, in turn, could unfavorably effect the consumer principally in one of two respects:

(a) If a corporate store unit in a chain is closed, a competitor in that area may be encouraged to increase his prices because of the lack of competition. In the ghetto communities, prices are sometimes inflated partly because of the absence of responsible competition. Furthermore, an increase in the tax burden would likely lessen the incentive to expand through the establishment of new retail outlets. Again a negative factor leading to possible price increases.

(b) If the closed corporate store unit is located in a smaller community, it may leave the residents of such community, at least temporarily, without any retail medium through which they can satisfy their needs for consumer products or goods.

IX. Accordingly, before any action is taken to eliminate or phase out the multiple surtax exemptions, particularly in the case of the chain stores operating in the small outlying communities, two critical questions should be considered:

(a) Is there enough fat on the carcass to absorb a tax increase such as would result from elimination of the multiple surtax exemptions?

(b) Would the chain store corporation be placed at a competitive disadvantage in relation to the one-store corporation and the franchised store corporation, if the multiple surtax exemptions were eliminated?

The chain store, it would appear clear, would suffer on both counts.

X. Another factor to consider is that chain store corporations may be "locked in" until expiration of their leases. For this reason, as well as others heretofore considered such as the resulting competitive disadvantage of the chain store vis a vis, the one store corporation and the franchised store corporation, the following suggestions are submitted for consideration by the Committee:

(a) Provide a moratorium period of 3 years commencing with taxable years beginning after December 31, 1969, during which no statutory changes would be made in the allowance of multiple surtax exemptions.

(b) Provide the commencement of a phase out period of 8 years, following expiration of the moratorium period of 3 years, during which the multiple surtax exemptions would be scaled down to the point of elimination as provided in the House Bill.

(c) Alternatively, providing a moratorium period of five years to be following by a phasing out period of 5 years, or simply a straight 10 year phase ou tof the multiple surtax exemptions.

(d) Increase in equal annual amounts the dividends received deduction from 85 percent to 100 percent over the phase out period of 8 years.

(e) Permit without the filing of a consolidated return, the operating loss of a member of the controlled group to be allocated to, and deducted by, other members of the group, limited, however, to the same percentage of such loss as the disallowed percentage of the multiple surtax exemptions for the year in which the loss was sustained. Also permit such losses to be deducted in a consolidated return as provided in the House Bill.

XI. The moratorium and phasing out periods would enable the chain store to meet its business commitments in an orderly manner and make whatever adjustments in its operations it may consider necessary or desirable. The annual increase in the dividends received deduction, and the allocation of operating losses from one member to the other members of the group, would compensate appropriately for the gradual denial of the surtax exemptions.

The CHAIRMAN. Well, that concludes this morning's hearings unless some Senator wishes to call back one of these witnesses for further interrogation.

Thank you very much.

We will meet at 9:30 tomorrow morning, we have a longer list of witnesses.

(There follows, written testimony received by the committee expressing an interest in the various aspects of the bill relating to corporations:)

SOUTHERN NATURAL GAS CO.,
Birmingham, Ala., September 10, 1969.

Re Alternative capital gain rate for corporations, section 461—H.R. 13270.

Hon. RUSSELL B. LONG,
Chairman, Committee on Finance,
U.S. Senate, Washington, D.C.

DEAR SIR: Section 461 of H.R. 13270 will increase the alternative capital gains tax on corporations from 25% to 30%. We are opposed to this section because it erroneously assumes that the laws applicable to capital gains of corporations and individuals are comparable, erroneously assumes that corporate capital gains are more in the nature of business income than investment income, and erroneously adjusts the capital gains tax of corporations as an adjustment comparable to the proposed adjustment in individual capital gains tax rates. Its enactment will remove corporate funds which might be used for investment capital and will constitute a permanent surcharge on corporations.

Ever since the passage of the Revenue Act of 1921, it has been accepted that the sale of a capital asset yields a significantly different type of income from that subject to normal income tax rates. However, that which constitutes a capital gain is distinctly defined and is limited to certain definite transactions under existing revenue laws.

Furthermore, the tax treatments of capital gains and losses for corporations and individuals are undeniably different under existing laws. Whereas an individual is, under Section 1202 of the Code, given the benefit of a statutory deduction, generally equal to fifty percent of net long term capital gains in excess of net short term capital losses, no such deduction is available to a corporation. Permission to deduct net capital losses against ordinary income, to any extent, is reserved to individual taxpayers and a corporation may only use such excess loss as a capital loss carryover to be offset against future capital gains, if any. Even in the related area of capital loss carryover the period of availability is limited to five years to corporations even through such privilege period is unlimited as to individuals. In view of these distinctly different tax treatments of the capital gains and losses of corporate as compared to individual taxpayers, we oppose any increase in the alternative capital gain rates for corportions as proposed in H.R. 13270. The proponents of such increase erroneously conclude that the laws applicable to capital gains of corporations and individuals are comparable (Committee Print p. 75). Since this is not true, as we point out herein, the increase provided for corporations should not be promulgated.

The proposed increase in alternative capital gain rates is based on the premise that corporate capital gains, in comparison with those of an individual, are more in the nature of business income not essentially different from other business income. Such premise completely ignores the existence and effect of Section 1221 and other related sections of the Code wherein capital assets are defined. There should be no prevailing doubt that a taxpayer, whether corporate or individual, engaging in the frequent and continuous buying and selling of what would normally be investment property will be denied capital gains treatment on such transactions under already existing revenue laws and court decisions.

The proposed increase in capital gain rates being based on the grounds that corporate activity produces something more in the nature of business income rests also on the premise that a corporation, as an artificial entity, cannot hold any property for investment as is the privilege of the real individual. This distinction is not well taken since it ignores completely the economic facts of life.

An analysis of effective tax rates applicable to individuals and to corporations indicates that the proposed corporate alternative tax rate of 30% is comparable to an individual tax rate of 60%, considering the statutory 50% deduction available to the individual. Such a comparison is based on a tax bracket which approaches the maximum since the indivdual maximum effective tax bracket as applied to long term capital gains utilmately will be 32½%. Such an analysis approximating maximum taxation on a comparable individual basis does not appear to be reasonable or statistically founded.

We also oppose the ncreasing of the corporate alternative tax rates as a comparative raise in the individual taxation of capital gains since such an increase is arbitrary, discriminatory and, in effect, constitutes a *permanent* surcharge on corporations which have gains from the sale of investments held over an extended period of time, usually at a substantial risk. We also point out that the enactment of Section 461 will result in the redistribution of income from the corporate sector—where it might be used for investment—to the individual sector—where it might be used to purchase consumer goods—with adverse effect on our economy.

Respectfully submitted,

SOUTHERN NATURAL GAS CO.,
PETER G. SMITH,
Vice President, General Counsel and Secretary.

STATEMENT BY MICHAEL WARIS, JR.,[1] AND PETER L. BRIGER[2]

SUMMARY

I. *Finance Committee Previously Rejected Identical Proposal*

After very thorough study Congress in 1951 (spearheaded by the Senate Finance Committee) and 1964 rejected virtually the identical proposal presently being advanced by the Treasury to eliminate multiple surtax exemptions. Many taxpayers are required by the very nature of their businesses to operate through multiple corporations. Many businesses have been developed on reliance of the existing rules—particularly in view of past Congressional actions. The law presently contains sufficient measures to eliminate tax abuse and avoidance

[1] Baker & McKenzie, Washington, D.C.
[2] Baker & McKenzie, New York, N.Y.

through multiple corporations. None of the basic facts has changed since Congress last considered the issue. Has Congress been wrong all these years? There is no real justification for changing the law now—and it would be inequitable to do so.

II. *Other Code Provisions Being Disregarded*

The Treasury's basic premise in calling for the termination of the multiple surtax extension (namely, that from an economic standpoint an affiliated group of corporations electing the exemption is a single business unit) is erroneous and misleading. It disregards and is in direct conflict with a number of key provisions of the Internal Revenue Code requiring that related or controlled business entities must be treated as though they were separate and wholly unrelated businesses dealing at arm's length. Moreover, net losses of one member of a group cannot be used to offset the profits of other members. Dividends (which may include intercompany loans) are subject to an effective tax rate of 7.9 percent. The net effect of the Treasury's position is to deprive that class of taxpayers required by their business to use multiple corporations of the only significant tax benefit available to them, while leaving them saddled with numerous detriments due to their need to use separate corporations.

III. *Consolidated Return Regulations Will be Rendered Unconstitutional*

Elimination of the multiple surtax exemption could render the consolidated return provisions unconstitutional to that class of taxpayers required by the nature of their business to operate through a number of corporations. The reason is that such taxpayers will not be left with any real choice of whether or not to file consolidated returns. As was clearly recognized by the Senate in 1928, because of the legislative function delegated by Congress to the Treasury in this area, the existence of a meaningful election on the part of taxpayers as whether or not to become subject to the consolidated return provisions is essential to assure their constitutionality. The Treasury's regulations in this area depart substantially in a number of respects from the basic tax rules provided by Congress in the Internal Revenue Code and in several situations provide treatment for affiliated groups that is substantially more adverse than is the treatment under the Internal Revenue Code for unitary corporate taxpayers operating through branches or divisions.

IV. *Equity Requires More Liberal Transitional Rules—Solution to Constitutional Problem Suggested*

If the multiple surtax exemption is eliminated, a more liberal transitional phase-out period should be permitted to minimize the disruptive financial impact upon those taxpayers which relied upon Congress' prior action in this area. Reorganization expenses incurred by taxpayers in simplifying their corporate structures should be allowed as deductions during this period. The phase-out period should not be commenced until the question concerning the constitutionality of the consolidated return regulations is resolved. This could be accomplished promptly if Congress were to delegate to the Treasury the function of initially drafting the regulations but were to retain for itself the responsibility of actually promulgating the final provisions. It is submitted that a phase-out of the multiple surtax exemption proportionately over 20 years, 5 percent per year, would be an appropriate transitional period.

Statement Before Senate Finance Committee

PROPOSED ELIMINATION OF MULTIPLE CORPORATE SURTAX EXEMPTIONS

(By Michael Waris, Jr. and Peter L. Briger)

I. *Surtax Exemptions Have Repeatedly Gained Congressional Approval After Careful Study—The Same Treatment Is Presently Warranted*

For almost two decades—indeed since the outset of the present system of subjecting corporations to a normal tax and a surtax, the tax statutes of the United States have respected the separate existence of each corporate entity formed and operated for good business reasons. Conversely, corporations formed merely to gain tax advantages have been denied such separate identity for surtax exemption purposes. Now, in the name of tax reform, the House of Representatives has endorsed a Treasury proposal which would jettison this fundamental precept.

More is at stake in this move than the immediate issue of corporate surtax exemptions. Involved here is the far-reaching process of ignoring for an immediate revenue objective a basic legal concept which provides a rational framework on which business affairs can be planned, organized and operated, i.e., the full integrity of the separate existence of each viable corporate entity.

The consequences of taking these extreme steps should be carefully weighed before they are adopted. Aside from the immediate inequities which are discussed below, the disadvantages to the tax structure as a whole should be taken into account. Each time an arbitrary tax rule ignoring legal and factual realities is adopted, experience has shown that other abritrary rules inevitably follow in order to make the artificial creation function. The result is an ever more complex, unwieldy and unworkable Internal Revenue Code.

It is most important to keep in mind that on two prior occasions the Congress has considered this very same issue of eliminating multiple surtax exemptions—once in 1951 and again in 1964. Each time—after thorough study—and based on exactly the same facts and considerations as exist today—Congress refused to accept the same across-the-board abandonment of the separate entity concept which the Treasury for the third time is urging upon it.

Also of great significance is the fact that in the past the Senate has played the leading role in preserving the integrity of the corporate entity—in 1951 reversing the action of the House. Thus, there is a striking revisitation of history in the present posture of this issue—with the Senate again being called upon to preserve a long-standing logical arrangement. Accordingly, to put the matter into clear perspective it will be helpful to examine in more detail the reasons for the prior Congressional action to see whether Congress erred on those two prior occasions—or whether the error lies on the part of those who would effect a change at this time.

A. CONGRESSIONAL ACTION IN 1951

In 1951, without any hearings on the issue, the House of Representatives passed a provision essentially similar to the one in the present House bill eliminating multiple surtax exemptions. The reasons given for the House action have a familiar ring, the report of the Ways and Means Committee stating that to give each member of a group of related corporations a separate surtax exemption "confers an unwarranted tax advantage on business carried out by means of a series of corporations, rather than a single corporation, and sets up an incentive for the artificial splitting up of corporations. This effect of the existing law is difficult to reconcile with the fact that the surtax exemption . . . [was] intended to confer tax advantages on small business." [3]

The 1951 report of the Ways and Means Committee goes on to sound an urgent note also having a very familiar ring currently (so much so that it is difficult to believe that almost twenty years have intervened):

> While these amendments to the surtax exemption . . . would be desirable in any event, they are particularly necessary at the present time. The substantial revenue loss under existing law is difficult to reconcile with the current budgetary stringency, and this revenue loss might be increased by the deliberate splitting up of corporations for the purpose of realizing the unusual tax advantages which present law permits in a period of high corporate tax rates.[4]

Extensive hearings were conducted by the Senate Finance Committee in 1951 and a large number of witnesses testified with regard to the House provision. As a result the House action was rejected. The reasoning of the Senate Finance Committee is clear and concise. It is as convincing and valid today as it was in 1951.

The Finance Committee's basic reason for rejecting the House proposal was that the amendment was so "broad in its attack that, if enacted, it could result in substantial injury to many businesses whose present corporate structure has not been motivated by tax avoidance." [5] After pointing out a number of reasons commonly dictating the use of separate and multiple incorporations as a means of doing business the Committee stated:

---

[3] H.R. Rep. No. 586, 88th Cong., 1st Sess., 1951–52 C.B. 374.
[4] Ibid.
[5] S. Rep. No. 781, 82d Cong., 1st Sess., 1951–2 C.B. 506, 507.

All of these are traditional and legitimate purposes for the creation of new and separate corporations, *yet the House bill would strike these bona fide corporate entities in the same manner as it would treat cases of true tax avoidance.* (Emphasis added.)

The Finance Committee also noted that, although opportunities for tax avoidance might exist through the use of multiple corporations, the predecessors of sections 482 and 269 afforded the Treasury adequate protection in cases where tax avoidance was the principal purpose of utilizing multiple corporations. The Committee concluded that any further study undertaken to develop methods of limiting avoidance in this area "should emphasize the importance of correcting the true cases of avoidance without working a hardship on legitimate business organizations."

In Conference, the House concurred in the action taken by the Senate and offered as an amendment the predecessor of section 1551 of the Code, which is designed to prevent the artificial split-up of existing businesses for the purpose of obtaining additional corporate surtax and excess profit exemptions. This provision was enacted into law as part of the Revenue Act of 1951 and has remained an effective barrier against the artificial creation of multiple surtax exemptions.

CONGRESSIONAL ACTION 1963 AND 1964

Early in 1963 the Treasury Department again proposed the elimination of multiple surtax exemptions for precisely the same reasons as in 1951. In addition the Treasury submitted to the Congress voluminous materials describing in detail the tax savings inherent in the multiple corporate structure. Thus, the Congress was fully informed as to the applicable arguments and the extent of tax savings available to multiple corporate structures by reason of surtax exemptions.

However, as it had done in 1951, the Congress again refused to adopt the Treasury's proposals to eliminate multiple surtax exemptions. Again its reasoning was precise and forceful. The House Ways and Means Committee, now fully in accord with the 1951 thinking of the Senate Finance Committee, stated:

> While your committee recognizes the advantages of use of multiple corporations, your committee believes, as it has in the past, that, where corporations owned and controlled by the same interests engage in different businesses in the same area or conduct the same type of business in different geographical locales, there are legitimate business reasons for use of separate corporations and, therefore, the separate corporations should generally be recognized as separate taxpayers, retaining the benefit of use of multiple surtax exemptions.[6]

From the foregoing, it is apparent that in very recent years Congress has carefully studied and analyzed the desirability of permitting each member of an affiliated group of corporations to file a separate return and claim a separate surtax exemption. On the basis of its repeated and exhaustive consideration of the matter, Congress has twice determined not to eliminate the right to elect multiple surtax exemptions. It has concluded that the proper route to follow in order to avoid abuse of the exemption is carefully to police the area, utilizing the several statutory provisions already available.

The basic facts and conditions relating to utilization of multiple surtax exemptions and the filing of separate returns have not changed to any significant degree since 1964. The Treasury's own statistics do not show that there has been any material increase in the number of affiliated groups of companies electing to claim multiple surtax exemptions. Under all the circumstances, there would appear to be no bona fide reason for Congress to change the ground rules in this area.

One observation regarding the inequity involved in changing the law under such circumstances seems warranted. As was clearly recognized by both the Treasury and Congress, there are certain groups of taxpayers, particularly those in the retail apparel business, the restaurant and quick food service business, and the consumer finance or small loan business, who are forced by the very nature of their businesses to utilize multiple corporate forms of organization. While no taxpayer or group of taxpayers has a vested right in any of the provisions of the Internal Revenue Code, these groups or classes of taxpayers have relied, and it is submitted they acted reasonably in doing so, upon the above-described action of Congress in planning their corporate affairs and in arranging

[6] H.R. Rep. No. 749, 88th Cong., 1st Sess., 1964–1 (Part 2) C.B. 242.

their structure for conducting business. It therefore is extremely inequitable for Congress at this time to reverse the position that it has taken in both 1951 and 1964, particularly since none of the underlying facts or considerations have changed in any material degree.

II

Treasury's case is based on erroneous premise: Its position that an affiliated group of corporations is a single business enterprise is in direct conflict with a number of code provisions treating each member of the group as a separate entity

The basic premise underlying the Treasury's contention that the election of multiple surtax exemptions by an affiliated group of corporations is a tax loophole is that such group of corporations is, for tax purposes, conceptually nothing more than a single business entity.[7] While superficially this argument seems to be valid from an economic standpoint, it disregards and is in direct conflict with a number of key provisions of the Internal Revenue Code.

In recent years one of the provisions of the Code most actively administered by the Treasury Department has been section 482. The heart of that provision is the principle that all related or controlled business entities, in their intercompany dealings, must be treated or regarded for Federal income tax purposes as though they were separate and wholly-unrelated businesses dealing at arm's length.

The net operating loss is another item which causes the Treasury to have double vision rather than the singleness of view it manifests where the multiple surtax exemption is involved. Thus, if one member of an affiliated group which elects the multiple surtax exemption incurs a net operating loss, such loss cannot be used to offset the profits of any other member of the group. Each company is required to stand on its own and is treated as a separate business.

Similarly, if one member of an affiliated group electing multiple surtax exemptions lends money to another member of the group, the Treasury is quite likely to maintain that the intercompany loan is a constructive dividend to the common parent of the group Fifteen percent of the dividend deemed to have been received in such situations is subject to corporate taxation.[8]

As a result of the various adverse tax consequences which accrue to affiliated or controlled groups of corporations electing multiple surtax exemptions when they do not treat each other as if they were separate business entities dealing on an arm's length basis, the Treasury undoubtedly derives a substantial amount of revenue that it would not otherwise receive if the affiliated group could operate as a single corporation or filed a consolidated return. It would be significant to learn from the Treasury the total amount of income tax deficiencies arising in 1968 by reason of constructive dividends. The Treasury has estimated that approximately $235,000,000 of tax revenues was lost in 1968 as a result of the multiple surtax exemption. This statement is misleading. To be truly meaningful this figure should be reduced to reflect the tax collected on intercorporate dividends, the inability of one member of an affiliated group to utilize the net operating losses of other members, and the taxes currently paid on profits generated upon intercompany transactions. Quite possible there may be no loss of tax revenues due to the use of multiple corporations, but, in fact, a net gain in tax collections.

The net effect of the Treasury's position is to deprive related corporations of one of the few significant tax benefits now available to them as separate entities while leaving them saddled with numerous tax detriments flowing from their separate incorporation. The Senate should reject this conceptually inequitable approach.

---

[7] See footnote 7 at p. 243 of the Tax Reform Studies and Proposals of the U.S. Treasury Department issued as a joint publication of the Committee on Ways and Means and the Senate Finance Committee dated Feb. 5, 1969.

[8] Indeed, the predecessor of section 243(a)(1) (which makes some portion of intercorporate dividends subject to full rates of tax) was enacted by Congress specifically to prevent the use of multiple corporations to avoid taxes. Thus, in 1935, Congress reduced to 85 percent the 100 percent intercorporate dividend received deduction, which was designed to eliminate double or multiple taxation of the same income at the corporate level. The deduction was reduced from 100 to 85 percent to prevent the possibility of evasion of taxes under then existing law (which instead of using a surtax exemption, taxed corporations on a graduated basis). It was believed that one possible means of evading the effective graduated tax rate was through the division of existing businesses among numerous subsidiaries or affiliates. H. Rept. No. 1681, 74th Cong., 1st Sess. 1939-1 C.B. (Part 2) 643, 647; S. Rept. No. 1240, 74th Cong., 1st Sess. 1939-1 C.B. (Part 2) 651, 654. This is another clear example of the fact that existing law already contains specifically enacted deterrents to the splitting up of businesses among multiple entities and provides certain carefully considered adverse tax consequences in connection therewith.

Effect of elimination of multiple surtax election will be to force taxpayers requiring multiple corporate structure as a matter of economic necessity to file consolidated returns

If Congress decides to eliminate the multiple surtax election, the direct and necessary consequence of such action will be to force the majority of those taxpayers whose businesses require them to operate in multiple corporate form to file consolidated returns under sections 1501 through 1504 and the underlying Treasury Regulations. In other words, such taxpayers will not be left with any realistic choice of whether or not to elect to file consolidated returns. The elimination of the multiple surtax exemption (and the other ancillary benefits resulting from separate corporate status) will necessarily and effectively determine their course of action. Probably in the majority of cases, the nature of their businesses prevents them from operating through branches or divisions of a single corporation. They are required to utilize a number of corporations through which to conduct their business activities. It seems unrealistic and unfair for the tax laws to provide that, as regards all of the adverse consequences (such as intercompany sales and the utilization of net operating losses), such entities must operate as separate taxpayers engaging in separate businesses, while as regards the surtax exemption to provide that such entities will be regarded as a single business enterprise.

In essence that class of taxpayers, required by the nature of their business to utilize a number of corporations, will have the worst of all possible worlds. Consequently, most taxpayers falling into this class will be compelled to file consolidated returns.[9]

If Congress eliminates the multiple surtax exemption, a serious question will arise concerning the constitutionality of the consolidated return provisions as applied to taxpayers whose business requires them to operate in multiple corporate structure. This question was clearly recognized by the Senate in 1928 when it specifically reviewed the legislative history of the consolidated return provisions and authorized the Treasury to prescribe regulations, legislative in character, concerning the filing of consolidated returns.

Initially, when Congress in 1918 authorized provisions for consolidated returns, it did so by conferring upon the Treasury explicit authority to require that such returns be filed on a mandatory basis. Consolidated returns were regarded by the Treasury as a means of preventing the avoidance or distortion of income as a result of intercompany transactions between affiliated or related taxpayers.

The House, in 1928, after considering the desirability of consolidated returns, eliminated or struck the authorization conferred upon the Treasury in this respect. The Senate Finance Committee, however, reinstated the consolidated return provisions. It noted that provisions for the filing of consolidated returns should be continued because the principle of taxing as a business unit what in reality is a business unit, is sound, equitable and convenient both to the taxpayer and the Government. However, it pointed out, that a number of difficult and complicated problems had arisen in the administration of these provisions and that it was impracticable to attempt by legislation to prescribe the various detailed and complex rules necessary. The Senate Finance Committee indicated that it:

> "* * * found it necessary to delegate power to the Commissioner to prescribe regulations legislative in character covering [the filing of consolidated returns]. The standard prescribed by the section keeps the delegation from being a delegation of pure legislative power, and is well within the rules established by the Supreme Court. (See *Hampton, Jr. & Co.* v. *United States*, decided by the Supreme Court on April 9, 1928, and the cases there cited.) Furthermore, the section requires that all the corporations joining in the filing of consolidated returns must consent to the regulations prescribed prior to the date on which the return is filed." S. Rept. No. 960, 70th Cong., 1st Sess., C.B. 1939–1 (Part 2) 409, 419.

This additional safeguard of requiring an election by the corporate members of an affiliated group constituted clear recognition by Congress that, in dealing

---

[9] This result is clearly recognized by the House bill which includes a provision that losses sustained by a member of a controlled group of corporations prior to the filing of consolidated returns can, contrary to existing law, be taken as a deduction against the income of other members of the group in the same proportion as the additional surtax exemptions of the group. This particular provision is, in fact, an additional factor eliminating any effective or meaningful choice on the part of taxpayers with multiple groups as to whether to file a consolidated return.

with the problems of consolidated returns, the Treasury might find it necessary to adopt new concepts and approaches to cope with the myriad problems involving intercompany dealings. Congress was most certainly aware that such concepts might not always coincide with the tax rules enacted by Congress governing unitary corporate taxpayers. It also was obviously aware of such decisions as *St. Louis Indcpendent Parking Co.* v. *Houston*, 215 Fed. 553 (8th Cir., 1914) and *McKenny* v. *Farnsworth*, 121 Me. 450, 118 Atl. 237 (1922), which prohibit the delegation of legislative authority to promulgate regulations which are inconsistent with existing legislative enactments. It is not surprising then that when the Senate reviewed the feasibility of permitting the filing of consolidated returns under a statute whereunder the Treasury was delegated the task of issuing legislative regulations, the Senate found it necessary to give taxpayers a real and meaningful choice as to whether they would elect to file pursuant to such regulations. See S. Rept. No. 960, 70th Cong., 1st Sess., C.B. 1939–1 (Part 2) 409, 419.

Thus, another fundamental determination involved in the proposal to eliminate the multiple surtax exemption is whether the consolidated return regulations are to be made mandatory with respect to that group or class of taxpayers whose businesses are such that, for all practical purposes, they are required to operate through a number of corporations. In the consideration of this issue, it is important to keep in mind that the Treasury has extremely broad discretion in the drafting and interpretation of regulations under the consolidated return provisions. The Treasury has recently exercised this discretion in 1965 and 1966 by almost completely revising the consolidated return regulations. In so doing, it has in a number of areas provided totally different rules for taxpayers electing to use the consolidated return provisions than those which Congress has enacted as part of the Internal Revenue Code. The so-called "excess-loss" provisions completely alter the Code rules concerning basis in assets and introduce the concept of "negative basis" which the courts upon numerous occasions have held did not exist under the Internal Revenue laws enacted by Congress. See: *Crane* v. *Commissioner*, 331 U.S. 1 (1947); *Jack L. Easson*, 33 T.C. 963 (1960) modified 294 F. 2d 653 (9th Cir., 1961). Moreover, section 704(d) of the Code reflects the studied position of Congress to reject the concept of "negative basis" in matters of Federal income taxation.

It should be further noted that the "excess-loss" provisions of the new consolidated return regulations under certain circumstances provide for materially different and adverse tax consequences for corporations filing consolidated returns than would occur in the same circumstances for a corporation operating its business activities through various branches. For example, it is possible that under Treas. Reg. § 1.1502–19 a consolidated taxpaying group would, in effect, lose the utilization of an insolvent subsidiary member's net operating loss. Such a result would occur through the creation by use of the net operating loss of an excess loss account and the consequent taking of this excess loss account into income as per the regulation. In similar circumstances, a corporation that was able to operate through various branches would be able to utilize the net operating loss of one of its branches.

The mandatory imposition of the consolidated return regulations is further objectionable in that these regulations impose upon that class of taxpayers which require multiple corporations as a necessary means of conducting business an extremely complex and burdensome set of provisions under which to operate. The present regulations have been described by a number of consolidated return authorities or inordinately obtuse and of uncertain meaning in a number of areas of application. See Cuddihy, *Planning for Consolidated Returns Under The New Regulations*, Prentice Hall Tax Ideas, No. 25,007.

In addition, the elimination of any practical alternative or choice to the utilization of consolidated returns would impose upon taxpayers whose businesses require multiple corporations a variety of uncharted, and highly problematical relationships with minority shareholders. Accordingly, such taxpayers will be held to a higher standard of dealing with minority shareholders than would otherwise be encountered. See *Western Pacific R.R. Corp.* v. *Western Pacific R.R. Corp.*, 197 F.2d 994 (9th Cir. 1952) reversed on other grounds, 345 U.S. 247 (1953); Johnson, Minority Stockholders in Affiliated and Related Corporations, 23 NYU Inst. on Fed. Tax. 321 (1965).

In addition to the uncertainties surrounding their application, the recently adopted consolidated return regulations appear to be contrary to statements of Congressional intent or understanding as to the manner in which the consolidated return provisions would operate. For example, the new treatment of intercompany transactions providing for a "suspense account or deferred gain" concept appears to be inconsistent with Congressional intention and long established administrative practices. See H. Rep. 704, 73d Cong., 2d Sess., pp. 16, 17 (1934) where the Ways and Means Committee noted:

> * * * there is no profit recognized for tax purposes on intercompany transactions, and profits on a product of the consolidated group, passing through the hands of the different members of the group, are not taxed until the product is disposed of by two persons outside the group.

See also H. Rep. 2333, 72d Cong., 2d Sess., p. 135 (1942).

The Treasury's adoption of this system of "suspense account or deferred gains" will create in connection with the administration of consolidated returns interminable examinations of intercompany dealings from a standpoint of section 482 and the Treasury's regulations thereunder. This is indeed anomalous since a basic reason which motivated the Congress to retain the consolidated return provisions was to obviate the necessity of detailed administrative policing of intercompany transactions. The Treasury over the years had maintained that the use of consolidated returns would simplify the administration of intercompany transactions.

IV. *If multiple surtax exemptions are nevertheless repealed, more equitable transitional rules should be provided*

If Congress concludes, despite the prior legislative history and the soundness of the considerations militating against so doing, to eliminate multiple surtax exemptions, it then appears incumbent upon Congress to take several corollary steps to minimize the disruptive financial impact of this fundamental change in the tax structure and to avoid forcing a significant class of taxpayers to file consolidated returns under legislative regulations promulgated by the Treasury (which would in any event be subject to substantial question from a constitutional standpoint). The first step would be to provide for a more gradual transition mechanism than is contained in the House bill or in the original Johnson administration proposal. In essence, it is suggested that the reduction in surtax benefits be made at five percent a year over a 20-year period rather than at the 12½ percent per year reduction proposed in the House bill. The basis of this request for a more gradual transition lies in equitable considerations and the need for carefully studying the various ramifications, some of them known, such as providing a proper legal framework for the drafting and administration of the consolidated return regulations, and the fact that many of the ramifications for changing this rule will undoubtedly be unanticipated.

Moreover, this transition or phase-out period for multiple surtax exemptions should not commence until the basic constitutional problem regarding the consolidated return regulations, discussed above, is satisfactorily resolved.

One way for Congress to resolve the constitutional issue promptly would be to institute a new procedure whereby the problem of excessive delegation of legislative authority to the Treasury Department would be eliminated. This could be done by simply expanding the familiar phrase "Under regulations prescribed by the Secretary or his delegate" to read "Under regulations prescribed by the Secretary or his delegate and approved by the Joint Committee on Internal Revenue Taxation or its delegate." In other words, the initial drafting of the consolidated return regulations would be delegated to the Treasury Department, thus obtaining the full benefit of Treasury thinking and expertise in this complicated area. The retention of the review authority of these regulations by the Congress would insure that these important substantive regulations were fully responsive to Congressional intent.

It is submitted that this procedure would not only cure the constitutional question under discussion but would have the salutary effect of minimizing controversies as to the legality of the numerous complex provisions contained in those regulations and should also tend to enhance the coordination of thinking between Congressional and Treasury tax people, a factor with which Chairman Mills and Congressman Byrnes of the House Ways and Means Committee have recently stated needs further development. See the colliquy between Messrs. Mills and Byrnes and former Commissioner of Internal Revenue Sheldon S. Cohen at the Ways and Means Committee hearings on tax reforms, March 28, 1969, Part 12, pp. 4215–4223.

Another step which should be taken if Congress determines to eliminate multiple surtax exemptions is that liberal transitional rules should be enacted to provide assistance and incentives to multiple corporate structures in the reorganization of their business (to the extent they are able to do so—and possibly they may do so to the detriment of their business operations) to achieve simpler corporate structures. The purpose in doing so would be to eliminate the necessity of satisfying the intricate and complex provisions of the Code governing intercompany transactions between related entities. One thing that could be provided for in this respect is to permit taxpayers to deduct during a transitional period to expenses incurred in simplifying and modifying their corporate structures as a result of Congress' action to eliminate the multiple surtax exemption. Normally, the expenses incurred in connection with corporate reorganizations are treated for Federal income tax purposes as capital expenditures.

Much is heard today about the negative effects of certain existing tax rules upon taxpayer morale. Indeed, this is probably the single most important theme which has emerged during the current tax reform program. However, it appears that relatively little concern has been given to the morale of the taxpayers comprising the business sector of the community. The destructive effect on business morale of eliminating the tax benefits flowing from multiple surtax exemptions is a case in point. It takes years of effort and the risk of much capital to develop a going business. Obviously one of the factors taken into account in formulating and developing the structure of a business is the system of taxation to which it is subject. As above discussed, a number of businesses in this country which compete on a local level in small units have found it necessary to conduct their operations through separate corporate entities in each geographical location in which they function. These corporations have been organized, prices structured, profits planned, etc., taking into account the tax effects of multiple surtax exemptions. The loss of this tax benefit will have a significant economic effect on these businesses.

Clearly no one has a vested interest in an unchanging tax statute. Changing times and varying national needs make it inevitable that our tax structure must correspondingly change. Nevertheless, there are times and circumstances when it is reasonable for taxpayers to rely upon the existing provisions of the Internal Revenue Code and the prior actions of Congress with respect to specific provisions of the Code. In some circumstances, it is proper for taxpayers reasonably to expect that those rules will not be changed in the relatively near future. The instant proposal to eliminate the multiple surtax exemption is a dramatic illustration of such a situation. To repeat, not only once before, but on two separate prior occasions—with a substantial number of years intervening between them—Congress reviewed the multiple surtax exemption and found it acceptable. In view of this history and in view of the fact that nothing new in the way of business considerations or national interests has arisen, if the affected taxpayers have no right to expect that the present Congress will act as had its predecessors on two occasions, it seems that at the very least they are entitled, as a matter of equity, that change be made in such a manner as to permit them to alter their corporate structures with a minimum of financial strain. If more liberal transition mechanisms which we have suggested are adopted, the loss from the repeal of the multiple surtax exemption will be nonetheless real to these taxpayers—it will just be more gradual.

A brief reference to the variety of transitional proposals which have heretofore been advanced is enlightening. Under the House bill, the amount of each additional surtax exemption (over one for the group) would be reduced at the rate of 12½ percent a year. Thus, after eight years (really seven given the effective date of the proposal) each affiliated group of corporations would have only one surtax exemption. The Treasury Department's transitional rule as proposed in April 1969 was more strict. It would have immediately limited the maximum number of surtax exemptions available to an affiliated group of corporations to 100 and each year thereafter reduced the number fifty percent so that after five years, the group would have only one surtax exemption. The Treasury Department under the Johnson administration had still another version of the transitional mechanism—its proposal being spread over an 8-year period—starting with a maximum of 500 surtax exemptions per group, reducing the number to 250 the second year, 100 the third year and thereafter by 50 percent until the eighth year when only one exemption would be available to the group.

This review of the various transitional rules already advanced indicates that there is no one perfect or logical formula. In the final analysis the purpose of such a phase-out mechanism is to do equity. It is submitted that under all circumstances an even and gradual reduction—five percent a year for 20 years—would not be unduly considerate of those taxpayers who would be deprived of multiple surtax exemption benefits. (This, of course, assumes that the phase-out will not begin until the question concerning the constitutionality of the consolidated return provisions is resolved.)

The return to Congress of the authority to issue the consolidated return regulations is also necessary to eliminate problems concerning the constitutionality of the consolidated return regulations. The enactment of a transitional rule permitting the deductibility of reorganization expenses incurred in providing a simpler corporate structure is also necessary to provide basic equity to taxpayers that wish to simplify their corporate structures to avoid the burdensome provisions imposed upon taxpayers with multiple corporate structures.

ARTHUR ANDERSEN & CO.,
Chicago, Ill, September 22, 1969.

Re Statement Regarding H.R. 13270 Tax Reform Act of 1969—Original Issue Discount.

Mr. TOM VAIL,
Chief Counsel, Committee on Finance,
Washington, D. C.

DEAR MR. VAIL: Herewith is Summary of Comments and Recommendations.

The provision in Section 413 of the Bill, which would require the holder of an original issue discount obligation to report such income over the life of the bond, should be eliminated.

BASIS FOR COMMENTS

Our conclusion that the proposal is impractical is based on the following reasons:

(1) A cash basis individual should not be required to employ the accrual method. In many situations there is a "non-parallel treatment" for a transaction between an accrual basis taxpayer and a cash basis taxpayer. Under the proposal, the cash basis individual would most likely not understand why he would be receiving a Form 1099 information return for minor amounts which he would *not* have received on registered bonds: therefore, he would be unlikely to comply with the new rules. In addition to the confusion on the part o fthe taxpayers, the review of returns by the IRS would be more difficult under the new system because the reporting accuracy would have to be checked throughout the years rather than only in the year of disposition.

(2) The proposed system, which would differentiate between registered and non-registered bonds regarding information returns. would add to the basic confusion.

(3) It is difficult to understand why an individual should report income from an obligation when he may be suffering an overall loss on the transaction.

(4) Under the proposed rules, considerable additional practical confusion would result if the original holder would not hold the bond to maturity.

CONCLUSION

The foregoing comments are not intended to indicate approval or disapproval of the remaining portions of the Act: instead, they are only indications of technical areas or unintended effects to unsuspecting taxpayers. This statement is submirted as part of a series of letters, each dealing with a particular area of the proposed legislation. It is intended that the comments and recommendations contained herein be made part of the record of testimony relative to the legislative changes contemplated for original issue discount. We shall be pleased to discuss these matters further with you or the Committee, either in person or by telephone. Please call us collect at 312-346-6262 if necessary.

Very truly yours,

ARTHUR ANDERSEN & CO.,
By JOHN MENDENHALL,
Director of Taxes.

(Whereupon at 11:30 a.m., the hearing was recessed, to reconvene Tuesday, September 30, 1969, at 9:30 a.m.)

TAX REFORM ACT OF 1969

TUESDAY, SEPTEMBER 30, 1969

U.S. SENATE,
COMMITTEE ON FINANCE,
Washington, D.C.

The committee met, pursuant to recess, at 9:30 a.m., in room 2221, New Senate Office Building, Senator Russell B. Long (chairman) presiding.

Present: Senators Long, Anderson, Gore, Byrd, Jr. of Virginia, Williams of Delaware, Bennett, Curtis, Miller, Fannin, and Hansen.

The CHAIRMAN. The hearing will come to order.

Today we will hear witnesses address themselves to the part of the House tax reform bill which makes sharp reductions in depletion allowances for hard minerals, and cuts back on the tax advantage of production payments of natural resources.

Our first witness this morning is the Honorable William Proxmire, distinguished Senator from Wisconsin.

Senator Proxmire, we are pleased to have you here to continue our running debates on this subject.

STATEMENT OF HON. WILLIAM PROXMIRE, A U.S. SENATOR FROM THE STATE OF WISCONSIN

Senator PROXMIRE. Thank you, Mr. Chairman. I understand fully the time constraints you are under.

I appreciate the opportunity to testify before the Senate Finance Committee as it considers one of the most important issues facing Congress—tax reform.

I have long felt that the tax privileges of the oil industry constituted one of the most glaring inequities in the entire tax structure. However, because the chairman and I have spent much time discussing this general question and the committee has many other witnesses to hear, I would like to concentrate on two changes in H.R. 13270 which I propose to protect the small, independent oil producers who are doing the actual domestic exploration but which, at the same time, would require the major oil companies that have been enjoying fantastic profits to pay their fair share of the tax burden.

My proposal, which is supported by Senators Brooke, Kennedy, McGovern, McIntyre, Mondale, Muskie, Nelson, Pell and Stephen Young and by the Kansas Independent Oil & Gas Association which represents 1,300 members, makes two changes in the House bill—

1. It eliminates tax credits for foreign taxes which are really disguised royalty payments on overseas production, although it does allow such payments as ordinary business deductions;

2. It establishes a three-tier domestic depletion allowance. It allows the full 27½-percent depletion allowance on the first $5 million of gross income from oil and gas properties, 21 percent on gross income between $5 and $10 million, and 15 percent for everything over $10 million gross: and

3. It would raise at least $475 million a year which is $75 million more than the House bill's ungraduated flat depletion reduction to 20 percent would bring in.

This proposal which is included at the conclusion of my statement is designed to give the small, independent oil producers the incentive they need to explore for domestic sources of oil while, at the same time, closing the major tax loopholes.

Any tax system which requires 2.2 million people under the poverty level to pay Federal income taxes, yet allows Atlantic Richfied to earn over $465 million between 1964 and 1967 without paying 1 red cent in Federal income taxes clearly requires revision. Imagine, gigantic Atlantic Richfield paid less in Federal income taxes than the janitor who cleaned this room last night.

Atlantic Richfield is only one example of the low-income-tax burden borne by the oil industry. The reason the Federal income tax burden on the oil industry is so low is clearly shown when we realize that only 44 to 51 percent of the actual profit of the oil industry is considered to be taxable income, whereas 97 percent of the actual profit for other manufacturing concerns is considered to be taxable income. However, rather than go over the intricacies of the tax structure here, I have included at the end of my statement a copy of an analysis I delivered on the Senate floor.

According to the Treasury Department's "Tax Reform Studies and Proposals," submitted to this committee, the long-term revenue loss to the American taxpayer, as a result of the percentage depletion allowance, was $1.3 billion in 1968. If we include the revenue loss due to intangible expensing, the oil industry received from just these two loopholes a tax benefit worth $1.6 billion in 1968. This money was spent by the American taxpayers just as surely as if Congress had appropriated the money—with only one important difference: No one examined the expenditure to see who was getting it and whether it was worth the cost. I think this point is crucial.

When one compares the congressional scrutiny of programs costing far less than the tax benefits of the oil industry, it is crystal clear that Congress would not have approved anywhere near the $1.6 billion primarily benefiting the gigantic major oil companies. The $1.6 billion in back door spending on just these two loopholes is three times what was budgeted in fiscal 1969 for Federal law enforcement, 15 times as much as the cost of running the Federal judicial system, three times the budgeted amount for school lunch and food stamp programs, five times as much as is budgeted for low-rent public housing, and four times the allotment or the Alliance for Progress.

There is no question in my mind that these tax incentives are probably the mose inefficient way of encouraging domestic exploration and development. Most of the tax incentives are going to the major oil companies, which can accommodate themselves to a changed tax situation quite well. They have the financial wherewithall and knowledge to cope with almost any change in the tax situation, but this is not true for the independent oilmen who seem to be doing most of the domestic exploration and development, if we exclude the outer continental shelf and Alaska. The small oilmen are the ones who are really caught in the cost price squeeze. This is not true for the majors. For example, Standard Oil of New Jersey found enough capital to make Enjay, its petrochemical affiliate, the second largest petrochemical producer in the world without any apparent strain on its capital resources.

My proposal is designed to enable the independent oilmen to continue to explore as they have in the past and, perhaps, with renewed vigor while forcing the major oil companies which have used this gigantic flow of tax-free cash to buy into other businesses to pay their fair share of the tax burden borne by all of us. It would also raise more than three times as much revenue as the Treasury's proposals.

DOMESTIC OIL DEPLETION ALLOWANCE

According to the Treasury Department's tax reform study I mentioned before, the oil depletion allowance is a most inefficient way to encourage the domestic exploration for oil. The CONSAD report upon which the Treasury Department based its conclusions indicated that only $150 million worth of oil at the inflated domestic price was discovered that would not have been found without the incentive of the oil depletion allowance. In other words, the oil depletion allowance and intangible expensing provisions cost the American taxpayers over $10 for every $1 of additional discovered reserves—and this is figured on the inflated domestic oil price which is about $1.50 more per barrel than foreign oil delivered to the United States. So for tax expenditures of $1.6 billion, we encourage the development of only $150 million in oil reserves. How inefficient can you get?

The rationale for the depletion allowance is supposedly rooted in national security. Without the depletion allowance, so the argument goes, we would not explore for the oil which we need in order to protect ourselves from possible interruptions in our oil supply.

This myth was destroyed by the CONSAD report. CONSAD, after a detailed study of the oil industry, found that we would experience a mere 7-percent decline in our discovered oil reserves, from a 12-year reserve to an 11-year reserve. Surely, if the need arose, we could discover the needed reserves within 11 years or, at least, find alternative supplies.

Why then should we continue to pay and pay and pay for something we don't need and only benefits gigantic oil companies fully able to take care of themselves?

The first change I suggest should be made in H.R. 13270 is to include a sliding scale oil depletion allowance for domestic producers so that those most in need of incentives, the small wildcatters, get them. My proposal is to give oil producers grossing less than $5 million a year from oil and gas properties the full 27½-percent depletion allowance, give those oil producers grossing between $5 and $10 million a year a 21-percent depletion allowance and give those oil producers grossing over $10 million a year a 15-percent depletion allowance. These depletion allowances would be applicable only to domestic production; they would not be allowed on foreign production which does not benefit our national security. This would allow the small producers the full benefit of the oil depletion allowance and would help them compete against the major oil companies which have all the advantages big fully integrated companies have over little independent companies.

Along the same line I would like to endorse the provision in H.R. 13270 eliminating the mineral production payments and ABC transactions which allow oil companies to shift taxable income from year to year to minimize even further any Federal income taxes they might owe.

Finally, I would like to suggest to the committee for its consideration a much more radical approach. Much discussion has appeared about the pros and cons of requiring the capitalization of intangibles. I am not suggesting that the committee consider the capitalization of intangibles but, if the committee decides to discuss requiring the capitalization of intangibles, I think they also ought to discuss adopting a direct drilling subsidy. The plan which I have attached to the end of my statement provides a direct drilling subsidy of 25 percent of the intangible costs on exploratory wells. This plan would increase incentives for exploration by 35 percent while, at the same time, bringing in about $285 million a year in new revenue. It directs the incentives to the areas in which they are needed and eliminates them where they are not needed.

FOREIGN TAX CREDITS AND DEPLETION

If national security is really the basis for all the tax incentives enjoyed by the oil industry, I cannot understand why the Internal Revenue Code gives greater tax incentives for foreign exploration and development than it does for domestic exploration and development.

Under the present system, royalty payments disguised as tax payments to foreign governments are written off dollar for dollar against U.S. taxes owed. The only reason for such special treatment seems to be that the mineral rights in these countries are owned by the government rather than private individuals as in the United States. If I were of an ironical frame of mind, I would say that these bastions of free enterprise—the major oil companies—were actually encouraging socialism.

Why should U.S. taxpayers be required to pay taxes to these foreign governments, just because of a quirk in these foreign governments' laws? Make no mistake about it, 50 cents of every dollar paid by the oil companies to these foreign countries is paid by the American taxpayer.

What national security justification exists for that?

This money paid to the foreign countries is clearly a legitimate business expense and should be treated as such. The Internal Revenue Code should allow the oil companies to deduct these royalty payments disguised as foreign taxes from their earnings as a legitimate business expense; but the oil companies should not be allowed to continue to write off such payments dollar for dollar against U.S. taxes owed.

Finally, I think we must ask, What purpose does the foreign depletion allowance serve? If encouragement of domestic exploration and development is the purpose of the depletion allowance, then allowing a foreign depletion allowance is contrary to such a purpose and is clearly contrary to the stated purposes of the oil import program. I am delighted that the House recognized this and eliminated foreign depletion allowances in H.R. 13270.

Between the foreign depletion allowance and foreign tax credits we have encouraged the oil industry to explore abroad to the detriment of domestic exploration. We have, in effect, created a monster. Supposedly, in the name of national security we have enacted tax incentives to explore for domestic sources of oil, yet, the way it works there are even greater tax incentives to explore for foreign oil sources. And, to add the finishing touch, these incentives are theoretically supposed to lower the price of oil. Yet, the oil import program and State market proration laws force the consumers to pay ever higher prices for oil. Thus, not only does the consumer have to pay higher prices for oil than he should, he is forced to bear a great part of the oil industry's tax burden.

The taxpayer has had it. The middle class, the people who live on a salary, can no longer remain the forgotten class, They will no longer continue to subsidize the oil industry by paying high oil prices and by shouldering the oil companies' tax burden. Let us put the oil industry back into a free marketplace and let them compete. The major oil companies are not babies who require constant mothering. They are very powerful. Let us treat them as such.

Mr. Chairman, my proposal is, I think, a moderate one. It will still allow the oil industry to deduct from their gross income their actual costs of foreign exploration and development and their actual cash outlays for royalty payments to foreign countries. At the same time, it will bring in about $2.1 billion a year in new revenue while encouraging domestic rather than foreign exploration which is, after all, the supposed purpose of all the oil industry's tax incentives.

Mr. Chairman, I would appreciate it if it is possible to hold the record open until say the 10th of October for a technical analysis which will be forthcoming?

Mr. Chairman. Thank you very much, Senator. You are the chairman of a committee and you understand the problems that are involved.

Senator Proxmire. I certainly do.

The Chairman. We are trying to report this bill by October 31, and that being the case, I have asked the committee to go along with the procedure whereby we would hear all our witnesses in chief and then if we wanted to call them back to interrogate them we would.

The statement you have made here, Senator Proxmire, illustrates the point I think that if we interrogated you in depth about your views on this matter, no one else would testify this morning. I would hope then that the Senator will come back to answer questions.

Senator Proxmire. You probably have the most difficult job that any committee chairman has in this session.

The Chairman. I am committed to report out a bill as you know. Thank you very much.

Senator Proxmire. Thank you.

(Attachments to Senator Proxmire's statement follow:)

A Program To Increase the Effectiveness of Federal Incentives for Energy Resources Discovery

BACKGROUND

Federal encouragement to the expansion of the nation's resource base is a long standing policy. Implementation of this policy presently includes direct appropriations for geological surveys and support of research and development and an extensive set of income tax incentives designed to favor minerals production. The proposal below is intended to address only a portion of the Federal minerals resource base assurance program, that relating to energy resources. There are two reasons for limiting the proposal to energy resources: energy resources are basic inputs to all stages of the economic process; and the dominant characteristics of the principal energy resource, oil and natural gas, require a continuous high rate of exploration in order to sustain a reliably high level of consumption. The significance and distinctiveness of the energy resources problem is already recognized in Federal programs. Not only are particular expenditure programs designated for oil and coal research and development, but special provisions for the taxation of oil and natural gas have been incorporated in the tax laws.

There are obviously two ways by which to expand the nation's energy resource base: by the discovery of new deposits of energy resources; and by the development of technologies for increasing the recovery of useful forms of energy from known mineral deposits. Presently, the bulk of Federal incentives for energy resources exploration and research are directed toward oil and natural gas, and a preponderant fraction of these incentives are provided via the income tax. Very little Federal support of research and development of technologies for increasing the yield from known mineral deposits is being provided and this is almost entirely in the form of direct expenditures. Since reform of the Federal income tax is now before the Congress, the opportunity presents itself for reviewing and improving the effectiveness of existing tax incentives, and comparing them to the amount of direct expenditure.

PRESENT TAX SITUATION

Of the tax incentives for energy resources discovery and development, those for oil and natural gas are by far the most important. This derives from the fact that, in the cases of coal, oil shale, and tar sands, the other principal sources of energy resources, existing, known stocks are extremely large relatively to current usage. For these minerals, development of economic technologies for their conversion into liquid fuels, not discovery of mineral deposits, is the critical need.

As is well known, the tax incentives for the exploration and development of oil and gas reserves are provided in the tax accounting for investment expenditures relating to discovery and development of reserves. Due to the nature of these minerals, a major fraction of investment expenditures is devoted to well drilling and the equipment of wells. In 1966, for example, the Joint Association Survey (a cooperative petroleum industry endeavor) reported the following expenditures within the United States:

	Amount (millions)	Percent
Exploration:		
Drilling and equipping wells	$832	18.7
Geological and geophysical expense	378	8.5
Land acquisition and rentals	827	18.6
Other	128	2.9
Total, exploration	2,165	48.6
Development:		
Drilling and equipping wells	1,528	34.3
Lease equipment	459	10.3
Improved recovery programs	187	4.2
Other	119	2.7
Total, development	2,293	51.4
Total, exploration and development	4,458	100.0

Under normal circumstances, all these expenditures would be capitalized and treated as the investment cost to be recovered by future production from whatever oil deposits had thereby been discovered and made available for recovery. However, industry practice, reflecting the peculiar technological processes of oil field discovery and the conditions under which individual firms engage in one or more stages of the discovery, development, and production process of the industry, results in normal capitalization of less than the full amount. And, under the tax laws, still less of this investment cost is required to be capitalized and recovered (as depletion and depreciation) from future production.

The major source of difference betwen oil industry capitalization of investment costs and that permitted under the Internal Revenue Code is attributable to the tax treatment of so-called intangible drilling expenses. These expenses include the cost of clearing land preparatory to drilling, the labor and related costs of drilling, etc. In the data above, it is estimated that about 80 percent of the $2,360 million for drilling and equipping exploratory and development wells is considered intangible drilling expense for tax purposes, the remainder being related to depreciable machinery and equipment which is required to be capitalized and recovered over the useful lives of wells. Of course, under normal accounting procedures, and under the tax laws, all non-salvageable costs associated with dry holes would be written-off as an expense. But, under the tax laws, the intangible drilling costs of successful wells also may be written-off as expenses as incurred. Of course, notwithstanding this option under the tax laws to expense depletable investment costs of successful wells, the taxpayer wtih production is nevertheless able to claim percentage depletion in future years.

This then is the substance of the tax incentive to exploration and development of oil gas deposits. The tax treatment of intangible drilling expense applies equally to development drilling as well as to exploratory, and herein lies a significant cause of the dilution of the incentive for exploration, without which there could be little expansion of available oil and gas reserves. The attractiveness of expensing of intangibles to a driller depends upon the likelihood that he will tap an oil pool and thereby become eligible to take percentage depletion against future production income. If he drills a dry hole, his investment cost is lost, and though he has been permitted to deduct his costs (as intangible drilling expense, or dry hold deduction) in arriving at taxable income, this affords him no particular advantage. Now, it is well known that the probability of drilling a sucessful exploratory well is far less than the probability of drilling a successful development well. This follows from the definition of the two classes of wells: "An exploratory well is a well drilled (1) to find and produce oil or gas in an unproved area; (2) to find a new reservoir in a field previously found to be productive of oil or gas in another reservoir; or (3) to extend the limits of known oil or gas reservoir . . . a development well is a well drilled within the proved area of an oil or gas reservoir and completed in a stratigraphic horizon known to be productive."[1] Indeed, over the years 1967–1968 ony 16 percent of wells classified as exploratory were successful while 75 percent of development wells drilled were successful.[2]

Clearly, once a reservoir has been identified by an exploratory well, little more incentive to development is necessary beyond that provided by the marketability of the oil or gas and the prospect of tax depletion deductions to enhance the after-tax return to the developer. Therefore it may be reasonably concluded that much of the tax incentive from intangible drilling expense deductions is channeled to development, where it is less needed because of the availability of percentage depletion, and not to exploration, where some tax incentive designed to recognize the inherent riskiness of exploration and its importance to the maintenance of the national energy resource base would be desirable.

PROPOSED TAX REFORM

Due to the difficulty of consistently identifying expenditures which result in dry holes with producing properties held by taxpayers, it is proposed to continue to permit intangible drilling expenses associated with dry holes to be currently expended. However, it is proposed that intangible drilling expenses

[1] American Petroleum Institute, "Standard Definitions for Petroleum Statistics," July 1, 1969, pp. 27 ff.

[2] American Petroleum Institute, *Quarterly Review of Drilling Statistics for the United States*, for 1967–1969.

associated with successful wells be capitalized for tax purposes and the taxpayer permitted to recover this investment cost through cost or percentage depletion in future years, whichever is more favorable for him.

Finally, in order to direct Federal tax incentives toward exploration for oil and gas deposits, it is proposed that a distinction between exploratory and development wells be established under the tax laws. The Secretary of the Treasury, with the assistance of the Secretary of the Interior, would promulgate regulations defining exploratory wells for tax purposes; it is to be expected they would adapt definitions already established by the American Association of Petroleum Geologists and which have been utilized for well census purposes in recent years. Then, for *all* exploratory wells, it is recommended that a refundable tax credit equal to 25 percent of intangible drilling costs be provided under the Internal Revenue Code. This credit for exploratory wells that turn out to be dry holes would be additional to the expensing of intangibles. In order that maximum effectiveness of this tax incentive be enjoyed by taxpayers engaged in exploration, it is further recommended that no restrictions be placed on the amount of the credit for which a taxpayer may be eligible in a single year, and that unlimited carryforward be permitted. To minimize the possiblity that this incentive will be converted into a tax shelter subject to future attack as a loophole, it is further recommended that the amount of the credit be added to the qualified taxpayer's taxable income. This treatment of the credit has the additional advantage of making the value of the credit slightly larger the lower the income of the taxpayer; as a result, this incentive should provide a positive contribution toward stemming the decline in numbers of independent wildcatters.

The effect of this proposal is shown in Table 1 which compares estimated revenue losses with present law. Altogether, the proposal would entail an annual revenue loss of $510 million as compared with revenue losses of $795 million under present law treatment of intangible drilling expenses; this is a net gain of $285 million in Federal revenues which is available for direct expenditure to stimulate development of economic conversion technologies for coal and oil shale, and to enhance our geologic knowledge of the country, as discussed below, or for general tax reduction. Despite this overall revenue gain, the total tax incentives going to exploration drilling will have been increased $100 million, a gain of more than 35 percent over results under the present law treatment of exploratory drilling expenditures.[3] Naturally, the source which provides this increase in exploration incentives and the remaining $285 million revenue gain is the capitalization of intangible drilling costs on successful development wells. As noted above, present provisions for depletion deductions amply protect the economic interests of taxpayers who operate producing wells.

There are a number of advantages which may be cited in favor of this proposal:

1. It provides a positive incentive to taxpayers to undertake the risky business of exploration. Under present law, the weight of the incentives is in the direction of encouraging further drilling of known deposits rather than discovery of new deposits.

2. It introduces no new problems of definition, adds no complexity to existing law. Intangible drilling expenses, on which the credit is based, is a well established tax category, familiar to both taxpayers and revenue agents alike. While the requirement to capitalize intangibles on successful wells is novel in the tax laws, it conforms with common practice in the oil industry. And though the definition of an exploratory well will also be novel in the tax laws, the distinction is well understood by the industry and amenable to objective determination.

3. It more logically relates tax depletion deductions to the capitalized investment costs they were originally intended to cover. Presently, oil industry taxpayers are required to capitalize virtually nothing to represent their depletable base yet they are subsequently allowed depletion deductions. The proposal would allow generous expensing of all costly dry holes and merely require capitalization of intangibles associated with successful wells, the logical basis for depletion.

[3] See appendix for a numerical illustration of the manner in which this increase in tax benefits comes about under the proposed reform.

PROPOSED EXPENDITURE PROGRAM

It is impossible to design a tax incentive program which will explicitly encourage the performance of research and development needed to develop economic techniques for the conversion of coal, oil shale, and tar sands into liquid fuels. Expensing of research and development expenditures is already provided for in the International Revenue Code, but this is available for all manner of R & D and it is impractical to delimit this privilege so that it may be used to reward only the successful achievement of predetermined results. Similarly, geologic mapping of the country and its continental shelf, if it is to have maximum utility to geologists generally and minerals explorers specifically, must be publicly funded and the results made available to all.

For fiscal 1970, direct appropriations to the Department of the Interior which may be identified with this objective amount to approximately $195 million, a large amount of which naturally funds administration of existing information data, and service functions. This amount, which has not varied appreciably in recent years, could be doubled, with nearly all the increase going to active mapping, research and development, and the construction of oil shale and hydrogenation pilot plants, with the net revenue gain from reform of the tax treatment of intangible drilling expenses, and there would still be $90 million remaining.

This is perhaps not the appropriate forum in which to consider the specifics of a set of increased expenditures directed toward ensuring future energy supplies. However, all who retain confidence in the ultimate virtue of Planning Programming and Budgeting Systems would agree that simultaneous consideration of tax and resources policy objectives is a necessary evolutionary step in the perfection of PPBS. The occasion of minerals taxation reform by this Congress is an unprecedented opportunity to take that step.

TABLE 1.—ESTIMATED ANNUAL REVENUE LOSSES, PROPOSED EXPLORATION TAX INCENTIVE PLAN COMPARED WITH PRESENT LAW

[In millions of dollars]

	Revenue loss under—					
		Exploration tax incentive plan				
				Exploration drilling credit		
Type of well	Present law	Total	Intangible expensing	United States	Other Western Hemsiphere	Rest of world
All wells	795	510	365	100	25	20
Exploratory	280	380	235	100	25	20
Development	515	130	130			

APPENDIX—HOW THE PROPOSED REFORM INCREASES TAX BENEFITS FOR OIL AND GAS EXPLORATION

The tax benefits derived under present law by an average taxpayer who drills exploratory wells with average success are to be compared with the benefits he would derive under the proposed reform of the tax treatment of intangible drilling expenses. Since it is not proposed to alter any other minerals tax provisions, the comparison may be restricted to the tax treatment of intangible drilling expenses.

Assume the average exploratory well driller spends $100,000 which qualifies as intangible drilling costs on a number of wells (he might actually have a one-thirty second interest in 32 wells) and that he experiences the average success ratio of 0.163 (0.837 of his exploratory wells turn out to be dry holes).[1] Under present law, he may expense his entire $100,000 of intangible drilling costs; and if his tax rate is 0.50, he is out of pocket only $50,000 (his tax bill is lower than it would have been by 0.50 x $100,000).

Under the proposal, his intangible drilling costs for exploratory wells are divided into two parts: the one part representing his unsuccessful wells, $83,700, is fully expensed so that he is out of pocket only $41,850 with respect to this deduction, but he also has a taxable grant of 25 percent of this $83,700 which,

[1] Based on United States drilling experience, 1967–68.

at his tax rate of 0.50 nets him $10,462.50 (0.25 x $83,700 x 0.50). Altogether, for his original expenditure of $83,700 on unsuccessful exploratory wells, he is out of pocket only $31,387.50 (the $41,850 after deducting intangibles, less the net value of the credit, $10,462.50). For the other part of his intangible drilling costs associated with successful exploratory wells, amounting to $16,300 in this instance, which must be capitalized, his only tax benefit is the net tax credit $2,037.50 (0.25 x $16,300 x 0.50), so that he is out of pocket only $14,262.50 with respect to this portion of his exploration drilling expenditure.[2] Altogether, then, the taxpayer is out of pocket only $45,650 ($31,387.50 for the unsuccessful wells plus $14,262.50 for the successful wells) under the proposal as compared with $50,000 under present law. In effect, the proposed exploration incentive has reduced the cost of intangibles to this explorer-taxpayer by 8.7 percent.

The difference between this illustrative result and that reported in the text of the proposal is due to two factors: in the revenue estimates, a lower, more realistic average tax rate applicable to the industry was used; this simultaneously reduces the present law tax benefits and increases the value of the credit. Secondly, in deriving the revenue estimates it was assumed that, due to the large volume of excess foreign tax credits held by United States oil companies, a change in the expensing of intangibles on foreign drilling would have no revenue consequences for the Treasury; however, the proposed credit would benefit all foreign exploratory drilling.

[Excerpt from the Congressional Record, June 26, 1969]

SPECIAL TAX TREATMENT FOR OIL INDUSTRY INJURES NATION'S SECURITY

Mr PROXMIRE. Mr. President, I am very grateful to the distinguished Senator from Louisiana for lifting the quorum call. It is most appropriate that he should be the man who should do it, because I am going to speak on oil this afternoon. I expected to make a fairly short speech, and perhaps it will be short.

Mr. LONG. Mr. President, will the Senator yield?

Mr. PROXMIRE. Yes, indeed.

Mr. LONG. If my friend the Senator from Wisconsin can tell me something I do not know about oil, I am very anxious to hear it.

Mr. PROXMIRE. Mr. President, I doubt whether anybody can tell the Senator from Louisiana anything he does not know about oil; he is very expert in this area; as he has demonstrated time and again on this floor, especially when he enlightens this Senator.

Mr. President, the time has come for Congress to take dead aim at the notorious depletion allowance, which too long has served as an obstacle to tax reform. The Senator from Louisiana (Mr. Long) has invited any interested Senator to submit amendments to his committee, and when the tax bill comes to the Senate, I intend to take him up on his offer when the matter is before his committee.

Mr. LONG. Mr. President, will the Senator yield?

Mr. PROXMIRE. Yes, indeed.

Mr. LONG. The Senator is going to get a better chance than that. He is going to get a chance to vote against every businessman in America. We will give the Senator a broad opportunity.

Mr. PROXMIRE. I am sure the Senator from Louisiana will give me every opportunity that I desire to vote on tax legislation, and I certainly do not intend to vote against every businessman in America, I intend to vote against the surtax when it comes up.

Mr. LONG. Will the Senator yield further?

Mr. PROXMIRE. Yes, indeed.

Mr. LONG. Does the Senator know what the biggest loophole is in the tax law? What is the biggest tax loophole?

Mr. PROXMIRE. I would like to know the opinion of the Senator from Louisiana.

Mr. LONG. Capital gains. What is the Senator's opinion on that one?

Mr. PROXMIRE. I think the capital gains law, as presently drafted, could be construed, perhaps, as a loophole. However, I would not want to, although I am

---

[2] This assumes that percentage depletion deductions based on future production, which are available under present law and also under the proposal, would always exceed cost depletion of the capitalized intangible drilling costs. In the event there are instances when cost depletion exceeds percentage, as when start-up problems or the net income limitation come into play, the taxpayer would derive additional tax benefits under the proposed reform.

sure some Senators would, repeal it outright, because there is some merit to it.

Mr. LONG. Will the Senator yield further?

Mr. PROXMIRE. I yield.

Mr. LONG. The Democratic policy committee invited Mr. Stanley Surrey, whom they regarded, I assume, as the best tax reformer there is in America, to come down and explain his views on taxes for them, and he did not even mention depletion among the major items. He said capital gains is the biggest loophole there is. Is the Senator prepared to vote to do something about capital gains?

Mr. PROXMIRE. Mr. President, the difficulty with discussing this whole subject is that it is a matter of value judgments. I am shocked and surprised that Mr. Surrey did not mention oil depletion, because I have great respect for Mr. Surrey, and I think this is certainly something that ought to be discussed by as expert a man as he certainly is.

Nevertheless, I will not defer in my judgment as to where reform should come to Mr. Surrey or anyone else. It is not strictly a matter of expertise; it is a matter of where I think there is more need for reform. I think there is more need in the area of oil depletion than in most other areas. Furthermore, I am sure it is the most notorious loophole.

Mr. LONG. Mr. President, I am sure the Senator from Wisconsin is getting ready to respond to my speech, in which I showed with charts and tables that the oil industry pays more taxes than anyone else.

Mr. PROXMIRE. I am sure they pay less than anybody.

Mr. LONG. It took the Senator from Wisconsin almost a month to prepare that speech. I am sure he is now going to argue that they pay more taxes than somebody.

Mr. PROXMIRE. I intend to show that they pay less taxes than almost everybody.

Mr. LONG. The point is that the biggest loophole in the tax law is capital gains, and if you had any advice, the people advising you would tell you the best loophole is real estate, but moneywise, there is more money in capital gains. So it just depends on whether you are talking about quality or quantity. Qualitywise, real estate; quantity-wise, capital gains. It just depends on what you have in mind, whether you are talking about volume or whether you are talking about percentage points.

Does the Senator know, aside from those two, what is the next biggest steal?

Mr. PROXMIRE. May I say to the Senator from Louisiana, he can talk about quality and quantity all he wants to, but what I am saying is we could reduce the oil depletion allowance and could increase revenues to the Treasury with, I think, a fairly modest reduction, by about $600 million. I realize that there are other areas where the return to the Treasury might be greater. You might consider those loopholes. The Senator has properly pointed out two of them which would raise more money, obviously, than if we would remove the oil depletion allowance entirely, and I have not proposed that, nor does any Senator that I know of. I am proposing to reduce it, at most, to 15 percent for the large producers, and not at all for the small ones.

Mr. LONG. Mr. President, I am going to give the Senator an opportunity to vote on the depletion allowance, as I promised him. Is he willing to do something about capital gains?

Mr. PROXMIRE. I will take a long, hard look at it. I shall not vote for any amendment until I find out what it is. It depends on a number of things.

Mr. LONG. You see, Senator, you can afford, in your position from Wisconsin, to tax the oil people, just like I can afford to tax the dairy farmers. We do not have a great many dairy cows in Louisiana. We run some old, catch-as-catch-can beef cows, but in dairy farming as such we are an importer. So I guess I could afford to put a real heavy tax on the dairy farmers.

Mr. PROXMIRE. We just want to be treated like everyone else.

Mr. LONG. The people of the Senator's State are being treated better than most people, if I do say it, even those in the dairy farming business. The Senator's people get the benefit of this capital gains advantage, and so do mine. If the Senator wants a reform in the tax laws, I would like some indication from the Senator from Wisconsin that he would be willing to vote to do something about capital gains, which is the big one in terms of dollars.

Mr. PROXMIRE. Let me say to the Senator from Louisiana that I will be very much interested in his capital gains amendment. I am sure it will be an amendment that will have a great deal of merit; and if I were to guess at this point, I would guess that I would probably support it. But I think that the Senator would certainly expect any Senator to want to take a look at the amendment, and listen to the argument of the Senator from Louisiana, before he makes up his mind.

Mr. LONG. That is fair. Now, quality-wise, the biggest advantage there is in any business seems to be in real estate. Would the Senator be willing to vote to do something about the tax advanages that exist in the real estate business?

Mr. PROXMIRE. I make the same answer as on the other area, as to real estate capital gains. I think it is just a matter of taking a good look at the amendment, and seeing what the very able staff the Senator has been using suggests, what their arguments are, and what the committee report says, and then make up my mind. I just do not know. Again, I think there is a good possibility I would vote for that.

Mr. LONG. If the Senator is interested in comprehensive tax reform, he ought to be interested in the situation of the people who just do not pay anything, just zero.

There is old Mrs. Gotrocks; she inherited stock in the Houdini Co. let us say. The stock is now worth 10,000 times what it was worth, and it looks as though she is going to owe a 77 percent tax on a million dollars of income that she has spent.

So she takes a million dollars worth of her stock, and puts that over into the Mrs. Gotrocks Foundation. Mind you, she has paid no tax on the enhanced value. When she inherited the stock, it was worth only 1 cent a share, and now it is worth $1,000 a share. But she transfers the stock from Mrs. Gotrocks to the Mrs. Gotrocks Foundation, and as a result of transferring $200,000 worth of stock from her own personal account to her foundation account—which she still controls, and votes the stock—and does not invest a penny of it in charity, mind you, she thereby avoids paying any taxes.

It is not well to do something about that? That is a complete fraud and fake, based on a law that was passed to let a nun who had taken a vow of poverty contribute her money to charity.

Is the Senator willing to confine it to the case of that Philadelphia nun, so Mrs. Gotrocks cannot contribute to the Gotrocks Foundation, and get away with deducting $200,000 in taxes?

Mr. PROXMIRE. I believe I would be very willing to support the Senator's amendment. The Senator has made a very able argument in favor of it.

Once again, I would like to take a look at the whole amendment before listening to the argument and making a final commitment. It sounds as if the Senator is making a strong case.

Mr. LONG. Mr. President, not all of the people in the oil business are successful. I know a lot of them who have lost everything that they put in it.

The successful ones pay roughly one-third of their gross income in Federal income taxes. That is Federal taxes and does not count the fact that they pay many other local taxes. For example, they pay 10 percent of their gross income in my State before getting anything. Actually they pay about 43 percent of their gross in taxes.

Is the Senator all that confident that taxpayers who are paying on that basis are favored taxpayers?

Mr. PROXMIRE. Mr. President, at this point I inquire if I have the floor.

The PRESIDING OFFICER. The Senator from Wisconsin has the floor.

Mr. PROXMIRE. I say to my friend the Senator from Louisiana that I will continue to answer him on that subject in some detail. However, I think it would be much more orderly and useful to the Senator from Louisiana and me if I might proceed for another 15 or 20 minutes before replying further to the Senator from Louisiana.

Mr. LONG. Would the Senator answer one more simple question, yes or no?

Mr. PROXMIRE. I will not agree to answer anything until I know what the question is. I will be happy to listen to the question.

Mr. LONG. Will the Senator yield for one question?

Mr. PROXMIRE. I yield for one question.

Mr. LONG. The best I remember, the last time we debated the matter, I took the floor and the Senator left the floor rather than listen to me. Would the Senator be willing to stay around this time?

Mr. PROXMIRE. All Senators have to leave the floor at times. I had been on the floor for a long time on that occasion. I came back later.

The Senator implied that he had driven me off the floor. I suppose that in some ways the senatorial winds can do all kinds of things.

I did have to leave the floor. It is one of those things that we cannot avoid. However, I did come back before the Senator finished.

Mr. LONG. On the last occasion, the Senator refused to yield for a question. I said that if I knew as little as the Senator did, I would not yield. The Senator did not yield, and when I took the floor, he left.

Mr. PROXMIRE. I listened to the Senator for a long time.

Mr. LONG. The Senator did not listen for long.

Mr. PROXMIRE. I will give the Senator a copy of my speech. If he wishes to, he may follow it, and I will be delighted to answer questions later.

Mr. LONG. I make the same promise. When the Senator gets through, I will consider it here today or on some future day. I will give the Senator a response. I enjoy the running debate.

Coming from a State that produces no oil, the Senator is anxious that we pay all the taxes. If I came from a State that produced no oil, I would be eager for oil producers to pay all the taxes.

I daresay the dairy farmers are not paying as much as the oil people.

The running debate will not come to an end.

Mr. PROXMIRE. I am sure the running debate will not come to an end. However, I am convinced that the dairy farmers of Wisconsin want to pay the same taxes as people elsewhere. They want to be treated the same. We do not want to impose any unfair or discriminatory taxes on people who produce oil in Louisiana or elsewhere.

I strongly favor some depletion allowance which would be favorable to them. I favor repealing other taxes. If we give in on the surtax and do not insist and fight for tax reform, we will never get ahead.

Mr. President, I have always felt that the oil industry pays too little in taxes any way you look at it. My distinguished colleague, the Senator from Louisiana (Mr. LONG), disagrees and on May 16 made a speech on the floor of the Senate defending his position.

POINTS TO BE MADE

Because the subject of the oil industry's privileged tax position is so complex, as a guide to my remarks, I would like to list the points I will make.

First. Both the Senator from Louisiana and I agree that the oil industry pays less in Federal taxes than other industries. The Senator from Louisiana indicated that the oil industry pays 24 percent of its net income in Federal taxes, compared to about 40 percent for all industries. Based on his data, my analysis indicates the disparity is even greater: 22.2 percent for the oil industry versus 44.2 for other industries.

Mr. LONG. Mr. President, will the Senator yield?

Mr. PROXMIRE. I will be happy to yield to the Senator from Louisiana after I have finished. I realize that the Senator disagrees with the statement I have just made. I will be delighted to go over it point by point later on.

Mr. LONG. Will the Senator yield for one simple question?

Mr. PROXMIRE. I yield for one simple question.

Mr. LONG. Mr. President, both the Senator and I agree that the oil people pay less in Federal income taxes. If the Senator wants to use the words "all taxes," then I shall prove that they pay more than anyone else.

Mr. PROXMIRE. I am including everything when I say that.

Based on this data, my analysis indicates the disparity is even greater: 22.2 percent for the oil industry versus 44.2 percent for other industries. However, if book pretax net earnings derived from SEC reports, the figures which are used to determine dividends, are used as the measure, the oil refining industry only pays 11 percent of its net income in Federal taxes, compared to 40.8 percent for all manufacturing concerns.

Second. Even if we add all State, local, and foreign taxes, including severance, property, and production taxes, to the Federal taxes paid by the oil industry, its total tax burden is still lower than just the Federal tax burden on other industries.

Third. Our tax policy should not interfere with the forces of the market economy, unless there is a compelling national need to do so. A nonneutral tax policy adopted without adequate justification causes misallocation and waste of our scarce domestic resources and, thus, injures our national security.

Fourth. Even if we accept the thesis that the oil industry needs special incentives to explore for oil, the present tax structure is an inefficient inconsistent, wasteful, and unfair way of achieving this goal. Let me go over each of those adjectives because I mean each of them. It is inefficient because it costs the American taxpayer over $10 in lost tax revenue for every $1 in additional reserves. It is inconsistent because it gives greater tax incentives to explore for oil abroad than here at home. Foreign royalty payments disguised as taxes are written off dollar for dollar against U.S. taxes owed, whereas such payments here are only deductible from income. It is wasteful because it encourages overcapitalization in the oil industry to such an extent that it takes $2 worth of capital in the oil industry to produce what $1 worth of capital will produce in other industries. Finally, it is unfair because it allows big income taxpayers to hide large amounts of income from taxation thereby shifting the tax burden onto those less able to pay.

Mr. LONG. Will the Senator yield?

Mr. PROXMIRE. I wish the Senator would wait until I finish my remarks so that we may have an orderly debate and have some continuity in my remarks.

Mr. LONG. I have been reading the remarks of the Senator. The Senator has mentioned my name time after time. The Senator has declined to yield to me. I will read the speech and I will ask one simple question and leave. It is this simple. Is the oil industry the only industry receiving benefits on foreign income, or does everybody get such benefits?

Mr. PROXMIRE. There is not any question——

Mr. LONG. The answer is yes, is it not?

Mr. PROXMIRE. Comprehensively, the answer is yes.

Mr. LONG. So, the Senator did not know what he was talking about. He said that everybody gets it.

There is a man whispering to the Senator. He is supposed to know something about taxes. Where did he come from?

Mr. PROXMIRE. This is Mr. Martin Lobel, a very able man who has done some very fine work.

It seems to anger the Senator that Mr. Lobel has whispered to me. He is one of the most efficient men I have known on the Hill. If the Senator wants to attack him, I am sure it will not bother Mr. Lobel.

Mr. LONG. What bothers me is that the last time he whispered something in the Senator's ear, the Senator did not say anything.

I ask the Senator what he said this time?

Mr. PROXMIRE. Some of the advantages of having staff members on the floor is that one can listen to what they say. One does not have to do what people whisper in one's ear, whether it be the Senator from Louisiana or Mr. Lobel.

I am sure there have been things that the Senator from Louisiana has whispered in my ear that he would not want me to say audibly on the floor and that there are things I have whispered in his ear that I would not want him to say audibly on the floor.

Mr. LONG. That is a fair proposition. The Senator may make his speech and I will not interrupt him any more.

Mr. PROXMIRE. Fifth. Congress must take immediate steps to cure this cancer in our economy. Congress must develop a much more rational and less expensive means of achieving the supposed objective of our present system—a secure source of oil during emergencies.

TAX FACTS

On the basic issue, Senator Long and I agree. The oil companies do pay a much lower proportion of their earnings to the Federal Government in taxes than do other industries.

Senator Long's figures show that the oil industry pays about 24 percent of its net income in Federal taxes, while the average manufacturing company pays 42 percent of its net income in Federal taxes.

However, these figures overstate the actual tax burden on the oil industry because net income as defined for tax purposes does not include substantial amounts that have been deducted through the use of tax loopholes. Net income for tax purposes or taxable income, if you wish, is usually lower than actual income or in the accountant's term, pretax book net income and the smaller the basis against which tax burden is measured the greater the apparent tax burden.

The taxable income of the oil industry is approximately half of its actual income. According to the Statistics of Income for 1965, published by the Internal Revenue Service, only 44 to 51 percent of the oil industry's actual income—depending on how one treats the tax credit—is considered to be taxable income, whereas 97 percent of the actual income of all manufacturing concerns, excluding the refining industry, is considered to be taxable income. Thus, any attempt to compare tax burdens on the basis of taxable income is going to greatly overstate the true tax burden on the oil industry, even if, as my good friend Senator Long has done, we add to the taxable income the amounts excluded on account of the depletion allowance. The depletion allowance is only one of many tax loopholes enjoyed by the oil industry. The oil industry also enjoys many other tax loopholes such as intangible expensing which allows the oil industry to write off in 1 year expenses that other industries must capitalize over a number of years. Still another privilege which it enjoys is the ability to write off royalty payments disguised as tax payments to foreign governments dollar for dollar against U.S. taxes owed.

A much more accurate comparison of the tax burden on the oil industry as compared with other industries can be obtained from the actual income figures of the various industries published by the Securities and Exchange Commission and the Federal Trade Commission. These figures I want to emphasize represent the actual income of the industries; these figures are the ones used by the companies themselves when reporting their income to their stockholders. Based on these figures, all manufacturing corporations paid 40.8 percent of their pretax earnings in Federal taxes in 1968, whereas in 1968 the petroleum refining industry paid only 11 percent of its pretax earnings in Federal taxes.

Mr. LONG. Mr. President, will the Senator from Wisconsin graciously yield one more time?

Mr. PROXMIRE. Very well; I yield.

Mr. LONG. Would the Senator mind correcting his remarks and say "income tax"? It is Federal income taxes on which these people receive a break. In terms of overall taxes they pay more than anybody else does. As to one particular tax, the petroleum industry does get a break. It is the only way they can operate, considering that they are the most heavily taxed of all taxpayers in America.

So when the Senator says "Federal tax," would he be willing to say "Federal corporate income tax" or "Federal personal income tax," as the case may be?

Mr. PROXMIRE. I shall talk about the total tax burden in a minute. I do exclude, it is true, the Federal excise tax. My assumption is that that is a tax paid by the user of gasoline. When the Senator from Louisiana and I go to a gasoline station and buy gas, we pay taxes. The dealer indicates the amounts of Federal excise tax and State tax.

My computation, according to the way I have figured the tax, is of the amount borne by the user, not by the industry.

Mr. LONG. The Senator is excluding State taxes?

Mr. PROXMIRE. That is correct. I am speaking only of Federal taxes.

Mr. LONG. Would the Senator mind explaining who pays more money to friendly foreign governments than anybody else on earth, so far as industry is concerned? I am speaking about friendly foreign governments. Who pays more taxes to them than anybody else? The Senator can say it in one word. Can he say what industry it is?

Mr. PROXMIRE. That depends on the kind of taxes the Senator is talking about. Is he referring to income taxes? If he wants to construe royalty payments as taxes, as the petroleum industry is able to construe them, so far as the Internal Revenue Service is concerned, it is true that the petroleum industry does make higher payments; that is true. I do not have any figures to vertify that. If the Senator tells me that that is the fact, I will agree that it is.

Mr. LONG. One of the representatives of the biggest overseas oil company in America—I think it is the biggest oil company in America—is a friend of mine who has the same name as mine, although we are no relation. He is a Texan: I am from Louisiana. I spoke with him about reducing the depletion allowance for overseas oil.

He said, "Senator, you can reduce it all you want to: but after the foreign governments get through 'putting it to us,' we have so many excess tax credits to carry over we will not owe any money here. Cut our foreign depletion all you want to and we still would owe you nothing. The same, however, would not be true of some smaller companies." And what does the other fellow pay to foreign governments? All other countries tax the foreign operations of their companies on a more generous basis than we tax ours—or in some cases do not tax them at all. I think the Senator from Wisconsin knows that, does he not? If he does not, he ought to find it out. Let the Senator's assistant whisper it in his ear.

Mr. PROXMIRE. I will ask Mr. Lobel to take a seat on the couch.

The PRESIDING OFFICER (Mr. SAXBE in the chair). The Senator from Wisconsin has the floor. Does he yield to the Senator from Louisiana?

Mr. PROXMIRE. No: I shall continue with my speech.

Mr. LONG. Does the Senator mean that he is not going to answer my question?

Mr. PROXMIRE. No; I shall not yield further until I have finished my speech, which will be in a relatively few minutes if I am not interrupted.

As a matter of fact, even if we use Senator Long's figures, the disparity between the tax burden on the oil industry and other industries is greater than he has indicated. An accurate comparison of relative tax burdens requires that we exclude the oil industry from the figures for all industries, otherwise the low tax burden on the oil industry which has such a large percentage of all industries' profits will drag down the average tax burden on all industries. Likewise, I have added back into the figures for the oil industry the approximate amount of tax revenue lost because of intangible expensing. On this basis, using Senator Long's own figures, we find that the Federal tax burden on all industries, exclusive of the oil industry, amounted to 44.2 percent of their income, while the tax burden on the oil industry, which is admittedly overstated, amounted to only 22.2 percent.

TOTAL TAX BURDEN

I now come to the subject of the total tax burden. The Senator from Louisiana has just raised the point about taxes by foreign governments.

Even if we include State and local and foreign taxes to the Federal income taxes paid by the oil industry, the oil industry pays less in taxes than most industries pay in Federal taxes alone.

Senator Long inserted a table beginning on page S5261 in the May 16 Congressional Record showing the total tax burden, including State, local, foreign, and Federal taxes of some of the major refiners. These figures include severance, production, and property taxes which, as Senator Long quite correctly pointed out, my previous figures did not include.

Because I have a small staff, I could not go through all the figures as Senator Long's Finance Committee staff did. However, because the amount of taxes paid by Atlantic Richfield seems to be a bone of contention, I did examine those figures in detail. My analysis indicates that Senator Long inadvertently overstated the total tax burden on Atlantic Richfield and, I would assume, on the other oil companies reported.

For example, according to Senator Long's table, Atlantic Richfield paid no Federal taxes on a net pretax income of $145,259,000 in 1967. It supposedly paid 10.5 percent of its income, or $15,254,000, in foreign and State taxes. It also supposedly paid 22.6 percent, or $32,991,000, of its income in severance, production, and property taxes. However, even if we assume that the foreign taxes are really taxes and not disguised royalty payments, these percentages greatly overstate the tax burden on Atlantic Richfield.

In order to find out what percentage of its net income Atlantic Richfield paid in taxes we have to find out what its net income was before taxes. This is done by taking the after tax net income and adding back the amount of taxes paid by Atlantic Richfield.

I can understand how the Senator from Louisiana (Mr. Long) became confused. According to Atlantic Richfield's annual report for 1967, its pretax income was the figure quoted by the Senator from Louisiana, $145,259,000. However, it also stated that its after tax income was $130,005,000. This means that Atlantic Richfield only added back the foreign and State taxes. It did not add back the severance, production and property taxes which the Senator from Louisiana (Mr. Long) has included in his chart. If we add back all the taxes paid by Atlantic Richfield to its after tax income, we find that its total tax burden is much lower than indicated.

Atlantic Richfield paid the following percentages of its total pretax income in taxes in 1967:

Federal taxes	0
State and foreign taxes	8.6
Severance, production, and property taxes	18.5

This means that Atlantic Richfield paid a grand total of 27.1 percent of its income in all taxes, Federal, State, local, and foreign. Compare this with just the Federal tax burden borne by the average manufacturing company of 40-plus percent. And they, too, must pay State and local taxes as does the oil industry, probably at a higher rate because of their greater payroll taxes, and so forth.

TAX POLICY GOALS

Although the analysis of Senator Long's figures shows conclusively that the oil industry does not pay any where near the amount of taxes, Federal, State, local, or foreign, paid by other industries, we ought not to become lost in figures. We ought to look behind the figures. We ought to examine the tax policies which allow the oil industry to escape taxes paid by other industries, what the consequences are, and whether they can be justified.

The Federal income tax is perhaps the best measure for comparing relative tax burdens in various industries since it is by far the most important tax on return to invested capital. As such it should be as neutral as possible; that is, the return to capital invested in one use should not be taxed more heavily than capital invested in another use—unless there is an overwhelming national need.

In the United States, our economic policy has been to rely upon the market forces to allocate scarce economic resources and to intrude upon the market forces only when there is a compelling need to do so. Unequal tax treatment is a clear intrusion upon market forces. If Federal taxes treat income from a certain industry more favorably than other industries, over time under competitive conditions, capital will flow into the favored industry until the return on capital in that industry is equal to the return from capital invested in less favored industries. This leads to a misallocation of scarce capital, inflationary pressures, and waste.

If I may quote from Professor of Economics Walter J. Mead's, testimony before the Senate Antitrust and Monopoly Subcommittee:

"The effect of favored tax treatment is to reduce tax costs for oil companies relative to firms in other industries. These measures taken together substantially raise the expected after-tax profit rates on oil industry exploration and development rates in what would otherwise be submarginal uses of scarce capital. Investment in petroleum exploration and development is indeed expanded to the point where the after-tax return is approximately equal to that which may be obtained on alternative uses of capital * * *

"Oil industry spokesmen have defended their various subsidies with the question 'If we receive all the subsidies which our critics allege, why is our rate of return on invested capital not substantially higher than other nonsubsidized industries?' The answer to this question is that a subsidy will raise the profit rate at the point in time at which it is conferred.

"Its effects, however, are eroded away with time a producers react to their more profitable situation by expanding into otherwise submarginal areas. This expansion leads to a decline in the rate of return toward a normal yield and to resource misallocation as well."

Mr. President, what I am saying is that the subsidy to the oil industry does not result in higher profits. It results in misallocation of resources as more capital enters the oil industry, to take advantages of the tax privileges which the industry enjoys.

NATIONAL SECURITY AND OIL TAXES

"The supposed justified for the special treatment enjoyed by the oil industry is national security although the recent attack on the Treasury Department commissioned study of the oil depletion allowance by the Mid-Continent Oil and Gas Association seemed to be based on the premise that if we change the depletion allowance the price of gasoline will go up.

"The catechism chanted so long by the oil industry that they actually believe it is that if the oil industry does not have all these special tax breaks and other governmental intrusions into the market on behalf of oil then our country would be in dire straits—we would become utterly dependent for oil upon those rascals in the Middle East who are just waiting for that to happen so they can shut us off."

First, a few facts about the domestic oil industry ought to be established. It is a very healthy and powerful industry by any criteria. In 1968 the combined net profits of the 12 largest U.S. oil companies was just a fraction under $5 billion. Each of those 12 companies, moreover, has set new profit records in each of the last 4 years. Just 4 years ago, the profits of these 12 companies total $3.7 billion. During that short span of time, they have, thus, increased their profits by just under $1.3 billion—a 33.5-percent increase.

According to a survey by the First National City Bank of New York published in its April 1969 Monthly Economic Newsletter, a total of 2,250 manufacturing companies showed a net income of $26 billion in 1968. Of the 2,250 companies, the 99 oil companies had a total net income of $6.1 billion or almost 25 percent of the after tax earnings of the entire list. And, according to the same survey, the oil companies as a group enjoyed the second highest return on sales of 9 percent, almost twice the average return for all companies surveyed. Although the oil industry's return on invested capital was 12.8 percent, just under the 13.1-percent average for the entire 2,250 companies, this is the result of our tax policy as was indicated in Professor Mead's testimony. What happens is that capital comes into the hands of industry to achieve that purpose.

Even if we accept the thesis that our national security requires special incentives to encourage domestic exploration for oil, the present tax incentives are inefficient, inconsistent, wasteful and unfair ways of achieving this goal. I will not touch upon the other governmental intrusions into the marketplace on behalf of oil which accentuate the waste of scarce capital such as the mandatory oil import program and State market proration laws which guarantee high oil prices, because I have spoken about them before. However, I do not think we ought to forget that the oil industry is the beneficiary of many governmental favors in addition to all those tax breaks.

No one, least of all myself, would deny that national security should be our prime consideration. However, all the governmental distortions of the free marketplace to benefit the oil industry have actually been impairing our national security. Our national security requires that we have a strong economy which in turn requires that we do not waste our resources. Here we have governmental policies which affimatively encourage waste of scarce capital and, I might add, depletion of our natural resources all, irony of ironies, in the name of national security.

INEFFICIENCY

Almost all the tax benefits enjoyed by the oil industry are tax credits. These are general policy tools which benefit any activity that qualifies under the particular tax provision. Direct appropriations or expenditures, on the other hand, can be as selective or as broad as Congress wishes.

The tax policies we have now are supposed to encourage the exploration for domestic sources of oil, yet they are so general the oil industry receives tax benefits for activities they would have undertaken even without the tax breaks. In other words, although tax credits are supposed to subsidize the exploration for oil they also subsidize all the other activities of the oil companies which they would have undertaken even without the tax subsidy.

The oil depletion allowance and intangible expensing in 1968 cost the American taxpayers $2.25 billion in lost tax revenue according to the Treasury Department's Tax Reform Studies and Proposals submitted to the Finance Committee. However, in order to be fair to the oil industry, I think I ought to use the estimated long range revenue loss of $1.6 billion a year. This $1.6 billion was spent just as if Congress had appropriated it with one big difference: Congress had no say in how it was spent. The big problem with such "back door spending" is that it is seldom reviewed by either Congress or the executive branch, accurate data on its costs and benefits are often difficult to obtain, and too frequently it is wasted on activities which would have been undertaken without it.

This point may be seen easily when we compare the congressional scrutiny devoted to the money spent because of the depletion allowance and the money directly expended for other projects costing far less. The $1.6 billion in back door spending on the oil depletion allowance and intangible expensing is three times what was budgeted during fiscal 1969 for Federal law enforcement, 15 times as much as the cost of running our Federal judicial system, three times the budgeted amount for school lunch and food stamp programs, five times as much as is budgeted for low-rent public housing, and four times the allotment for the Alliance for Progress.

The percentage depletion allowance is an extraordinary tax benefit because it permits the tax-free recovery of an average of 19 times the original investment in an oil well. For this reason, the percentage depletion deduction is a subsidy, not merely a mechanism for the recovery of capital investment. In addition, that portion of the percentage depletion deduction which represents ordinary tax-free recovery of capital investment costs is usually recovered more rapidly than would be allowed by the usual depreciation methods which other industries are required to use. Thus, percentage depletion confers two benefits: deductions about 19 times in excess of actual costs, and accelerated deductions of initial costs.

It is also remarkably inefficient. The Treasury Department estimated in its study:

"The Federal Government is paying, in tax benefits, about $1.6 billion for resources which the market values at $0.15 billion."

In effect, we are paying over $10 for every $1 in additional oil reserves.

But, says the oil industry:

"If we eliminate the depletion allowance our reserves will disappear and we will become dependent upon those who control middle eastern oil."

The Treasury Department analysis indicates that this is just not true. If the depletion allowance were completely eliminated, the Treasury Department report estimates that instead of a 12-year oil reserve we would only have an 11-year reserve. Surely, this is enough time to compensate for any conceivable interruption of our oil supply.

Finally, I might add, the depletion allowance feeds the fires of inflation. We saw, just a few months ago, how the oil companies raised their prices for crude oil in order to get a larger depletion allowance and thus hide more of their income from taxation.

The intangible expensing provisions of the tax code are also extraordinary because they permit the immediate tax-free recovery of most of the costs of exploring and drilling for oil. Other industries can only recover their capital investments over the approximate life of the capital equipment. For example, a farmer in Wisconsin who buys a tractor can only recover his capital investment in it over a period of years as the tractor wears out. If, however, he had enough money to invest in oil exploration and drilling, he could recover his capital investment in 1 year.

As a matter of fact, the American consumer does not even get the benefit of the lower oil prices that he should from these tax subsidies. Theoretically, the oil depletion allowance, intangible expensing, and all the other tax loopholes benefiting the oil industry, are subsidies paid for by the American taxpayer in increased taxes and should result in lower oil prices. Yet, the anachronistic State market proration laws—laws which forbid the oil companies in Texas or Louisiana to pump at more than 50 percent of capacity, and, as a matter of fact, Texas just cut their allowable reduction of 400,000 barrels for July, because that is all the oil companies wanted to buy—keep the price of oil at artificially high levels and thus deprive the taxpaying consumers of the lower prices they should be getting.

I can think of no better way to sum up the deficiencies of these tax provisions than by quoting from the Treasury Department's tax study which I mentioned before:

"Percentage depletion is a relatively inefficient method of encouraging exploration and the resultant discovery of new domestic reserves of liquid petroleum. This is in part due to the low sensitivity of desired reserve levels to the price subsidy represented by percentage depletion, and in part to the inefficiency of the allowance for this purpose, since over 40% of it paid for foreign production and non-operating interests in domestic production."

The report went on to note, and I think this is very significant, because the report is the first impartial analysis of the cost of oil's special tax privileges to the American taxpayers—

"The investigations reviewed during the course of the study were in substantial agreement that the current situation was one of economic inefficiency, and that *any changes were almost certain to be beneficial to the economy in the long run.*"

Let me repeat that:

"Any changes were almost certain to be beneficial to the economy in the long run."

There are so many changes, Mr. President, downward in which the depletion allowance would be reduced.

INCONSISTENT

Although the supposed justification for all of oil's tax loopholes is the alleged need for more incentives to explore for domestic sources of oil, our tax policy is contrary to such a goal, because it gives greater incentives to explore in foreign countries than here at home. This seems unbelievable, but it is true.

Royalty payments which are disguised as taxes to foreign countries, particularly in the Middle East, the area which is most likely to cut off our supplies of foreign oil, are credited against U.S. taxes owed. This means that every dollar paid by the oil companies to these foreign countries in disguised royalty payments is $1 less they owe to the U.S. Government. Yet, such payments here in the United States are only deductible from ordinary income, not from the amount of taxes owed by the companies.

The American consumer and taxpayer is being taken both ways. Not only is he bearing a great part of the oil industry's fair share of the tax burden, because of these great tax incentives to explore abroad, but he is also prevented from benefiting from all this inexpensive foreign oil, because the oil import program limits the amount of the inexpensive foreign oil that can enter the U.S. market. All this is done in the name of "national security."

Surely, this type of thinking could not pass the muster of any rational man. The only reason that the over $1.6 billion in taxes is being spent this way is that Congress has not really reviewed the oil tax situation since 1926, when the depletion allowance was set at its present level. This is the great fault of tax credits. They are not subject to continuing scrutiny and justification. They grow and imbed themselves in our economy until any connection with their original rationale is purely coincidental.

Surely, Congress can devise some much cheaper way to provide for a secure source of oil during emergencies. Between the oil import program and all of oil's tax loopholes, the American consumer and taxpayer is being forced to subsidize the oil industry by over $7 billion a year. It is unbelievable that we cannot devise a much cheaper and more effective way of protecting ourselves from emergency interruptions of our oil supplies.

WASTEFUL

Because all these special tax privileges have riddled the economic fabric of our country, gigantic sums of scarce capital have fallen through these loophoes and been wasted. I have already touched upon this point before and do not wish to belabor it, but I do wish to point out the findings of one of our leading tax experts, Arnold Harberger. Writing for the Joint Economic Committee in its study entitled "Federal Tax Policy for Economic Growth and Stability," he indicated that it takes about $2 worth of capital investment in oil exploration to produce as much product as $1 of capital invested in other industries. This, in effect, confirms Professor Mead's statement about the uneconomic conditions in the oil industry because of the oil loopholes. As a matter of fact, Professor Adelman of MIT estimates that if these economic inefficiencies which are encouraged by our tax laws could be eliminated, the price of oil could drop by as much as $1 a barrel. Professor Steele of the University of Houston went even further. He indicated that about 95 percent of our present output would still be produced if the price of oil dropped from its present level of about $3.50 a barrel to $2 a barrel.

How can we encourage these uneconomic conditions in the name of "national security"?

UNFAIR

Our tax policy is supposed to be fair. Fairness in taxation means two things: First, taxpayers with similar incomes should pay similar taxes, and second, persons wth higher incomes should be taxed more heavily than persons with lower incomes.

Our tax policy so far as oil is concerned is not fair to the American taxpayer. Those taxpayers who derive their income from oil pay lower taxes, if any, than those who get their income from other sources. This is not fair. The source of the income should not make any difference as to the amount of taxes paid. Why should a person whose income is from wages or salary have to pay more in taxes than someone who gets his income from oil?

Second, all the oil tax loopholes allow many high-income taxpayers to escape from paying taxes or from paying their fair share of taxes. This was pointed out dramatically by former Secretary of the Treasury, Joseph W. Barr, in testimony before the Joint Economic Committee. One hundred and fifty-five individuals with adjusted gross incomes exceeding $200,000 in 1967 paid no Federal income tax.

Now, I do not claim that all these 155 individuals with incomes over $200,000 who did not pay any Federal taxes relied exclusively on the oil tax loopholes to escape taxation; but I do say the oil tax provisions are one of the most important loopholes through which this income escaped taxation.

I think that we in Congress should also pay close attention to the statement of Henry H. Fowler, Mr. Barr's predecessor as Secretary of the Treasury:

"Under present law, 2.2 million families with incomes below the poverty level are required to pay Federal income taxes. * * * On the other hand, there are a sizable number of individuals with very high incomes who pay little or no income tax. Indeed, although the Federal income tax is designed and understood to be progressive, the fact is that many persons with incomes of $1 million or more actually pay the same effective rate of tax as do persons with incomes only 1/50th as large."

How can we in Congress allow a system to continue which taxes 2.2 million families with incomes below the poverty level, yet allows people with incomes over $200,000 a year to escape paying any taxes at all? Why should those below the poverty level be forced to pay the taxes that should be paid by the oil barons?

WE MUST DO BETTER

If I may quote from the Department of the Interior's study, "U.S. Petroleum Through 1980":

"(Government) has sought to encourage discovery of oil and gas by favorable tax treatment, by limiting imports, by making public lands available for mineral leasing, and by regulating production to provide order and stability while avoiding the physical waste of resources. In doing so it has involved itself in matters of both supply and price."

We have achieved the goal stated by the Interior Department's report; we have encouraged the discovery of oil and gas. But at what costs?

The cost to the American consumer and taxpayer for just the oil import program and some of the tax loopholes is in excess of $7 billion a year.

The justifications for such excessive costs are unconvincing.

I ask unanimous consent that articles by Patrick Young of the National Observer and Spencer Rich of the Washington Post be printed in the Record at the conclusion of my remarks.

The PRESIDING OFFICER. Without objection, it is so ordered.

(See exhibit I.)

Mr. PROXMIRE. Mr. President, both of these reporters are fine, hardnosed newspapermen beholden to no one and both of these reporters reached the conclusion that the oil industry's defense of its favored position has not been persuasive.

I cannot believe there is not a more efficient and less expensive way of providing for a secure supply of oil during emergencies than the present system. The cost of the present system has run away because its costs have not been visible. I can assure you that if Congress had to make a direct appropriation for such a program the costs would not be anywhere near $7 billion a year. Certainly we need oil for our national security, but we need lots of other things for our national security, too. One of these is a strong economy which does not waste its resources.

I think quite clearly that the oil industry should be placed on an even footing with other industries. The oil tax loopholes should be closed. This would go far toward quelching the impending "taxpayers revolt" by putting fairness back into the tax system.

To conclude, I think then we ought to find out, as the Shultz study of the oil import program seems to be doing, what are our actual needs for oil during emergencies. We should then ascertain what is the most efficient, inexpensive way of assuring that supply. It might be a grant to develop the technology needed to produce oil from oil shale economically or it might be cheaper to discover oil pools on Federal land and then keep that oil in reserve until needed.

Whatever solution we decide upon, one thing is clear: The present privileged position of the oil industry must go.

[From the National Observer, May 26, 1969]

EXHIBIT I

THE UNIQUE STATUS OF AN INDUSTRY: HOW TAX BREAKS HAVE NOUNISHED THE OIL BUSINESS

(NOTE.—This is the last of a series of articles that explore firsthand and in depth the oil industry's singular position and prerogatives in America today. The articles were prepared by staff writers August Gribbin, Michael Malloy, and Patrick Young and senior editor Edwin A. Roberts, Jr.)

"In the late Nineteenth Century, the amassing of great wealth from oil was enhanced by the easy ethics of the age. In more recent times, many new oil fortunes have arisen and swelled, and they have swelled in fair measure because the industry enjoys an assortment of tax breaks that no other business can match.

"Consider:

"Atlantic Richfield Co. reported income before taxes of $377,942,000 in the years 1965 through 1967, but the company paid no Federal income taxes.

"Standard Oil of California reported income before taxes in 1967 of $513,067,000 and paid $6,000,000 in Federal corporate income taxes, or 1.2 per cent.

"How can this be done? How is it possible to earn so much and pay little or no Federal income taxes? The answer is that the Federal tax structure provides a host of unusual tax sanctuaries for the oil industry.

"These tax sanctuaries are related to the controversial Machiasport plan, by which Occidental Petroleum Corp. hopes to erect a huge refinery in the tiny town of Machiasport at the northeastern tip of Maine. The plan represents a sophisticated attempt to hurdle the Federal import quota system for oil. It is the import quota system, which was explained in detail in The National Observer of May 5, as well as restrictions on domestic production, which were examined in The National Observer of May 12, that combine with petroleum's special tax breaks to give the U.S. oil industry a unique status in the economy—and to force the American consumer to pay artificially high prices for many oil products.

"It is this unique status that the battle over Machiasport has placed in the spotlight, and the industry is preparing to meet assaults from any direction.

"CASH FOR CHANCY PROJECTS

"Uncommon tax advantages provide the industry with an uncommonly large cash flow, which the industry argues is required for its gigantic and often chancy operations. What are these tax advantages?

"Take a look at the more important ones:

"Percentage depletion

"Oil and natural gas well operators may deduct 27.5 percent of the gross revenues of each property before paying taxes, unless this figure totals more than 50 percent of the net income of the property before deducting the depletion allowance. Thus, if gross revenues on a property total $100,000, the producer may take $27,500, before figuring his taxes, so long as the net income of the property after expenses is $55,000 or more. If however, the net income was, say, $50,000, the producer would be limited to 50 percent of that, or $25,000.

"Intangible drilling costs

"These include such costs of developing a producing well as wages, fuel, repairs, hauling supplies, and other expenses that do not have a salvage value. These 'intangibles' may be deducted from gross revenues the first year. Similar expenses incurred by other manufacturers must be capitalized and written off over a number of years.

"Foreign tax credits

"U.S. companies operating abroad may claim credit for taxes paid to foreign governments on nearly a dollar-for-dollar basis. Thus if a company owed $75,000 to Uncle Sam on its profits earned in, say, Saudi Arabia and had paid $80,000 in taxes to the Saudi Arabian government, the foreign-tax credit would eliminate the taxes on that operation due the U.S. Treasury. Critics, however, say that taxes paid Middle East governments by U.S. oil companies are based on artificial prices, and that some of these taxes should be treated as expenses of doing business and should not be allowed to fully wipe out the companies' U.S. tax debt.

"Western Hemisphere trade deduction

"This provision allows U.S.-owned companies doing 95 per cent of their business outside the United States but within the Western Hemisphere to a special deduction in figuring their Federal taxes. In effect, it reduces the tax rate by 14 points, currently from 52.8 per cent to 38.8 per cent. This is done before any foreign tax credits or depletion allowances are taken. It is a provision that mostly favors companies in the business of extracting minerals. Like oil.

"These sanctuaries are used in combination with still other advantages. An example will indicate what a resourceful accountant might do for his oilman client.

"Assume the oilman drills a well that costs $100,000 and produces gross revenues of $100,000 in its first year. Between 75 and 90 per cent of his expenses will be intangible drilling costs, which can be written off in the first year. These include rental of a drilling rig and the salaries of crewmen. Assume intangible costs of $80,000 and production costs of $5,000. The gross income of $100,000 minus $85,000 in intangibles and production costs would leave an income of $15,000.

"But he would not pay income taxes on $15,000; he would pay them on $7,500.

"Here's why: The depletion allowance for oil and gas is 27.5 percent of the gross income, but this may not exceed 50 per cent of the net income of the property. In this example, the depletion allowance equals $27,500. But the oilman, because of the 50 per cent limit, could claim only $7,500 in depletion. If he chose this method, therefore, the oilman would have a taxable income of $7,500.

"The next year, however, assuming again a gross revenue of $100,000 and production costs of $5,000, the oilman could take his full percentage depletion allowance of $27,500 and his taxable income would be $67,500.

"But a technique known as 'carved-out production payments' would save the operator many tax dollars. In his first year of operation, the oilman's intangible costs limited the amount of depletion he could claim to $7,500. But if he hold his second year's production in advance—that is, during his first year of operation—he would have a first-year gross income of $200,000. And a gross income of $200,000 minus intangibles and production costs of $85,000 would result in a first-year net income of $115,000.

"The percentage depletion allowance would equal $55,000 (27.5 per cent of $200,000) and the oilman would not have reached the limit of 50 per cent of net income, or $57,500. Thus, although his gross income for the first year was $200,000, he would have a taxable income of only $60,000.

"There is yet another aspect of this device. Since the oilman has already received payment for the oil he produces in his second year of operation, he will have no income at all in his second year. But he will have production costs of $5,000, which he can then report as an operating loss. And so, he will be able to claim a tax refund from the Government on this 'loss' by carrying it to earlier years without affecting the 'loss' to income from other sources.

"The net effect of this maneuver is that the oilman would have taxable income—after selling the production payment—of $60,000 in the first year and minus $5,000 in the second year. Without the sale of the production payment, his taxable income would be $7,500 in the first year and $67,500 in the second year. The sale of the production payment thus reduces his taxable income for the two years by $12,500.

"There is another form of production payment called the 'ABC deal.' It does not lend itself to simple explanation, but perhaps a sample offered in a U.S. Treasury Department report makes the effect sufficiently clear.

"'In a recent ABC transaction,' reports the Treasury Department, 'a major oil company purchased all the coal properties of another corporation, subject to a reserved production payment of $460,000,000 payable out of a large percentage of the net profits to be derived from the operation of the coal properties by the buyer. Under present rules, the buyer excludes from income the $460,000,000 of profits derived from its operation of the coal properties and paid over to the holder of the production payment.

"'This feature alone represents a Federal income tax saving to the oil company of approximately $175,000,000 over the payout period, or an annual tax saving of between $10,000,000 and $18,000,000 per year depending on the actual length of the payout period. (It was estimated that it would take 7 to 16 years to discharge the production payment out of profits derived from the operation of coal properties.)

"'In addition, all of the costs of mining the coal used to discharge the production payment were deducted by the buyer even though it capitalized those costs on its books as a cost of acquiring the coal properties.'

"The Treasury says that in 1966, ABC transactions totaled $1.85 billion (for all extractive industries) and resulted in a loss of revenue to the Federal Government of $85,000,000. Carved-out production payments totaled $540,000,000 in 1966—up from $214,000,000 in 1965—and cost the Federal Government $10,000,000 in revenue.

"FROM THE JOHNSON YEARS

"These figures are taken from reports issued by the Treasury Department during the Johnson Administration; the reports included a long list of tax-reform proposals. They make up four volumes titled *Tax Reform Studies and Proposals U.S. Treasury Department*. The first three volumes are Treasury Department studies. The fourth is an examination of tax provisions affecting the oil and gas industry, prepared for the Treasury by the CONSAD Research Corp. of Pittsburgh.

"Neither the Johnson nor Nixon administrations has endorsed the far-ranging reforms sought by Treasury specialists. But the reports were sent to Capitol Hill and released jointly by the House Ways and Means Committee and the Senate Finance Committee.

"Included in the Treasury's reports is this comment:

" 'In effect, the price of crude oil in the United States is being underwritten by import controls, by state controls on production, and by favorable tax provisions. * * *'

"The oil industry's tax advantages affect not only its less privileged competitors but the whole national economy as well.

"The CONSAD report states: The oil and gas producing industry accounts for about 1.5 per cent of the Gross National Product. [Reckoned at an annual rate of $93.4 billion in the first quarter of 1969.] By most conventional standards it is not a highly concentrated industry, but with so enormous an output, each of the largest firms is a giant in the economy. The five top dometsic producers together account for 20 per cent of the output, the top 20 for 50 per cent.

"According to the U.S. Bureau of Mines, the value of crude oil at the wellhead in 1967 was $9.4 billion, and the value of natural gas was $2.9 billion. The value of natural gas liquids, liquid fuels extracted from natural gas, was $1.2 billion. The value of products shipped from U.S. refineries in 1967—the latest year for which figures are available—was $20 billion.

"The oil industry concedes that it is very big and very important. Indeed, its size and essentiality are often cited by industry spokesmen to defend its preferential treatment by the tax laws, just as they are cited to defend the import quota system and state-enforced controls on domestic production. What the industry prefers not to emphasize are industry profits.

"Consider some statistics contained in the 'Monthly Economic Letter for April of this year, published by the First National City Bank of New York City. A survey of 2,250 manufacturing companies, divided into 41 categories, showed a net income in 1968 of $26 billion. Ninety-nine oil producing and refining companies had a total net income last year of $6.1 billion, or almost 25 per cent of the after-tax earnings of the entire list of 2,250 companies.

"Significant, too, is the percentage of return on sales, also calculated in the First National City Bank study. Fifty-five aircraft and space companies had a return of 2.8 per cent. Eleven auto and truck manufacturers had 5.8 per cent. Ninety-two printing and publishing firms recorded a return on sales of 6.2 per cent.

"The 99 petroleum companies? They enjoyed a return on sales of 9.0 per cent. Only the drug industry scored higher, with 42 drug makers reporting a return on sales of 9.5 per cent.

"The oil industry, however, does not place as much importance on these figures as it does on those that reflect its rate of return on investment. And, indeed, the First National City Bank reports that the average rate of return on net worth for the 2,250 companies surveyed was 13.1 per cent in 1968, up from 12.6 per cent in 1967. The 99 oil companies, however, had a return on net worth in 1968 of 12.9 per cent, compared with 12.8 per cent in 1968. So in terms of return on investment, the oil industry is slightly below the national average.

"Some oilmen, moreover, say the difference is greater than it seems because the figures do not reflect what it actually costs to replace extracted oil.

" 'If oil companies figured in what it is costing them to replace their oil, it could cut their return on investment by one-half,' declares Minor Jameson, Jr., executive vice president of the Independent Petroleum Association of America.

"It is at this point that the debate over preferential tax treatment for the oil industry approaches the heart of the matter. Most independent economists have a ready answer for Mr. Jameson.

"Prof. Walter J. Mead, professor of economics at the University of California, Santa Barbara, told the Senate subcommittee in March of this year:

" 'The effect of favored tax treatment is to reduce tax costs for oil companies relative to firms in other industries. These measures taken together substantially raise the expected after-tax profit rates on oil industry exploration and development investments in what would otherwise be submarginal uses of scarce capital. Investment in petroleum exploration and development is indeed expanded to the point where the after-tax return is approximately equal to that which may be obtained on alternative uses of capital.* * *

" 'Oil industry spokesmen have defended their various subsidies with the question, "If we receive all the subsidies which our critics allege, why is our rate of return on invested capital not substantially righer than other nonsubsidized industries?" The answer to this question is that a subsidy will raise the profit rate at the point in time at which it is conferred.

" 'Its effects, however, are eroded away with time as producers react to their more profitable situation by expanding into otherwise submarginal areas. This expansion leads to a decline in the rate of return toward a normal yield and to resource misallocation as well.'

"And here Professor Mead adds an interesting observation in the light of the industry's particularly visible troubles earlier this year.

" 'The oil spillage case in the Santa Barbara Channel is directly related to the subsidy system. Leases were purchased and drilling occurred in the California offshore area because such operations were made profitable by the subsidy legislation. Under free market conditions, oil prices would be substantially lower, tax costs substantially higher in the oil industry, and the profit inducements to buy leases in the Channel would probably be lacking.

" 'To develop oil from such sources is to use up more economic value than is produced. In addition to this probable waste of resources, we have the external cost (aptly called "spillover costs" even before this oil spillage case) of environmental pollution.'

"Oil industry spokesmen speak frequently about domestic taxes paid as a percentage of gross revenue. The Petroleum Industry Research Foundation, for example, recently published a report showing that the industry paid 5.1 cents on each dollar of gross revenue in 1964 and 1965. This includes Federal, state, and local taxes, but *excludes* state and Federal product taxes. The study showed all business corporations paid an average of 4.5 cents on each dollar of gross revenue.

"THE ACCENT ON GROSS

"So, set forth in these terms, the oil industry pays six-tenths of a cent per gross-revenue dollar more than the average of all industries.

"But the comparison is in gross revenue, and does not take into consideration the cost of doing business. Thus if a company doing $10 billion a year volume had business costs of $9 billion, it would probably pay less in taxes than a $10 billion-a-year business with costs of $5 billion. The oil industry's ratio of expenses to gross revenue is lower than that of many other industries.

"The oil industry contends that in 1966 it was responsible for $10.5 billion in taxes. Testifying before the House Ways and Means Committee, M. A. Wright, chairman of Humble Oil, a subsidiary of Jersey Standard, declared:

" 'Aggregate tax payments on oil industry operations in 1966 were $10.5 billion, including $8 billion of excise and sales taxes on oil products. These payments provided 5 per cent of all receipts of the Federal, state, and local governments.'

"But that $8 billion Mr. Wright refers to was not paid by the oil companies. It was paid by, among other customers, the motorists who buy gasoline at the industry's thousands of filling stations.

"Now consider data from the Treasury's tax-reform study, which shows 'estimates of the effective tax rates actually paid by corporations, as a group and for several industries.' Here are the 1965 figures on 'actual (Federal) tax on total net income:'

"[In percent]

"All industries	37.5
"Petroleum	21.1
"Other mineral industries	24.3
"Lumber	29.5
"Commercial banks	24.4
"Other manufacturing	43.3

"Only mutual savings banks (5.3 per cent) and savings and loan associations (14.5 per cent), among the categories considered, had lower effective tax rates than the oil industry.

"Oilmen contend the price of gasoline has been remarkably stable in a period of general inflation. But, according to the Oil and Gas Journal of April 14, 1969, the average price of regular gasoline—excluding taxes—has increased 7.4 per cent since April 1968, and 5.9 per cent since the last week in December 1968.

"Its many tax privileges give the oil industry tremendous cash flows and thus very great financial leverage. Some critics argue that this gives oil an unfair advantage over competing industries. But the industry insists the nature of its business requires that heavy cash flow.

"'It is essential because so much of our investment is such high risk that it isn't bankable,' says John J. Scott, general counsel of Mobil Oil. Mr. Scott cited as an example Mobil's operations in Venezuela. Prior to and during World War II, Mobil invested between $45,000,000 and $50,000,000 in that country before getting any return on its investment. 'If we did not have the cash flow, we could not have done it,' Mr. Scott says.

"What would happen to the industry's oil reserves if the depletion allowance and deductions for intangibles were eliminated?

"Frank N. Ikard, president of the American Petroleum Institute, offers this reply:

"'I can tell you one thing that is spectacular: The size of the investment in exploration and development the industry is going to have to make to meet the needs of the American people over the next 15 years. As a rough estimate, domestic oil exploration and development outlays will have to be increased about 50 per cent. This means going from a little less than $4.5 billion annually up to somewhere around $6 or $7 billion. An industry that has to make such a big boost in its spending has to make profits to do its job.'

"Some industry sources say oil needs more tax breaks, not less. Harold M. McClure, Jr., president of the Independent Petroleum Association of America, cited figures before the House Ways and Means Committee that showed a 40 per cent reduction in the number of wildcat test wells drilled in 1968 compared with the number drilled in 1956.

"'It should be recognized,' said Mr. McClure, 'that part of these decreases can be attributed to wider well spacing and increased efficiencies in all phases of drilling and producing operations.'

"It's interesting that Mr. McClure should use the year 1956 as a comparative figure for 1968 drilling operations. Says the CONSAD report: 'The number of wells being drilled reached a peak in 1955–56, but has since declined steadily back to its 1949 level, over 30 per cent below the peak.'

"Mr. McClure told the senators further: 'To re-emphasize the degree of risk, only 2 out of every 100 new field wildcats drilled are likely to find a field large enough to be profitable. * * * To sum up the situation as to incentives for petroleum exploration and development in the United States, there is an obvious need for more—not less—economic stimuli.' A wildcat is an experimental or exploratory well.

"Mr. McClure uses the term 'economic stimuli.' In the oil business there are stimuli within stimuli. It is not only the major tax privileges themselves that benefit the industry; it is also the accounting involutions that they make possible. A good example of such an involution can be found in the uses to which the depletion allowance is put.

"Simply stated, oil companies shift expenses, for tax purposes, to the wellhead, where depletion may be claimed, from refinery or transportation costs that do not qualify for this deduction.

"In a Senate speech recently, Sen. William Proxmire, Wisconsin Democrat and critic of oil-industry privileges, described the answers he received from the Interior Department to questions he had posed:

"'Apparently,' said Senator Proxmire, 'Interior had made an analysis which demonstrates that integrated companies shift income from refining and marketing to oil production in order to minimize tax liabilities by maximizing percentage depletion. This analysis is correct as was shown by Texaco's recent action in increasing the price it would pay for crude oil by 20 cents a barrel.

"'Since Texaco produces most of the crude oil it refines, the increased cost on the 11,000 net barrels a day it buys from outsiders will be more than offset by the larger depletion allowances it will claim on the oil which it sells to itself. Apparently, Texaco felt the 1.9 per cent of its income paid in Federal income taxes in 1967 was too high.'

"While Senator Proxmire singled out Texaco as an example, that company is hardly alone in taking advantage of the tax laws as they are on the books.

"One of the laws on the books permits oil companies to deduct from their U.S. tax obligation the income taxes they pay to foreign governments. To get as much revenue as possible from the oil companies, oil nations in the Middle East and elsewhere base their tax schedule on 'posted price,' which are set arbitrarily and are almost always higher than the actual price the companies get for their oil.

"The result is that American companies must pay foreign governments more in taxes than they would if the taxes were figured on the true price for which oil can be sold. Thus, a portion of the foreign tax is considered by many critics as not a tax but a royalty. Therefore, so the argument goes, U.S. companies should be permitted to deduct from their U.S. taxes only that part of foreign taxes that are truly taxes. The other part, which would be considered as royalties, would then be figured as just another business expense.

"The oil companies, who are being overcharged by foreign governments, don't like the system of posted prices any more than the U.S. Treasury Department does, but they say there's nothing they can do about it.

"The House Ways and Means Committee has about two dozen bills of various sorts that deal with reforming the tax structure as it affects oil. One House bill would eliminate entirely the depletion allowance as it relates to foreign wells; Maine's Edmund Muskie has introduced a similar bill.

"Rep. Henry Reuss, Wisconsin Democrat, has introduced a major tax reform package, one section of which would drop oil and gas depletion allowances, presently 27.5 per cent, and allowances for 41 other minerals, presently at 23 per-cent, down to 15 per cent.

"In introducing his bill on Jan. 29 of this year, Mr. Reuss told the House: 'Ideally, percentage depletion should be replaced with cost depletion. But since we are not living in an ideal world, this title provides only that the oil depletion allowance be reduced by less than one-half, from 27.5 per cent to 15 per cent, the percentage now applicable to over 40 other minerals.'

Mr. Reuss and his supporters are not overly optimistic about changing oil's depletion allowance, especially now that President Nixon has reiterated his support of the allowance as it stands.

"Nevertheless, says Mr. Reuss, 'There is a general sentiment among taxpayers that they are getting a little depleted too.'

"In the American system of making law, it is far easier to establish prerogatives than to abolish or reduce them. To the beneficiary, preferential treatment becomes first a comfort, then a custom, and finally a necessity. And the progression can be carried still one step further. What of the nation's best interests? The late Sam Rayburn wasn't the only friend of oil to know when to turn solemnly and face the American flag.

THE DEPLETION ALLOWANCE

The 27.5 per cent depletion allowance for oil and natural gas is probably the best known of all business tax exemptions. Here's how it came to be:

"The Sixteenth Amendment, which became effective on March 1, 1913, made it legal for Congress to assess income taxes. The Revenue Act passed on Oct. 3, 1913, provided that in computing income subject to taxation, producers of ores and all other natural deposits could claim a depletion deduction not to exceed 5 per cent of the gross value of the output at the mine or well.

"In 1916 the law was changed, removing the limitation, but specifying that the total depletion allowable over the life of the property could not exceed the capital originally invested, or, if the purchase of the property was made before March 1, 1913, the fair market value as of that date.

"A second provision was introduced in 1918 allowing 'discovery value depletion.' The estimated discovery value was substituted as the value to be amortized for all wells found after March 1, 1913. It wasn't until 1926 that discovery value depletion was replaced by today's system of percentage depletion for oil and natural gas.

"Under the 1926 law, any oil or gas producer, or anyone with a financial interest in a well, can deduct 27.5 per cent of his gross income realized from the sale of oil or gas, but this must not exceed 50 percent of the net income of the property.

"Why 27.5 per cent? Because the House of Representatives wanted the figure to be 25 per cent and Senate wanted 30 per cent. The 27.5 per cent figure for oil and gas is the highest depletion allowance; other minerals receive smaller allowances. Metals, for instance, qualify for 15 per cent.

"The U.S. Treasury Department reports that, on an average, petroleum producers recover 19 times the cost of their producing wells through percentage depletion."

THE TAXES COMPANIES PAY—FEDERAL CORPORATE INCOME-TAX PAYMENTS FOR 1967 OF THE NATION'S 15 LARGEST OIL REFINERS

Name	Net income before tax	Federal tax	Percent	Earnings after all taxes
Standard (New Jersey)	$2,098,283,000	$166,000,000	7.9	$1,232,283,000
Gulf	955,968,000	74,142,000	7.8	578,287,000
Texaco	892,986,000	17,500,000	1.9	754,386,000
Mobil	594,593,000	26,900,000	4.5	385,393,000
Standard (California)	513,067,000	6,000,000	1.2	421,667,000
Standard (Indiana)	366,847,000	74,021,000	20.2	282,250,000
Shell	342,022,000	44,940,000	13.1	284,849,000
Phillips	227,766,000	52,255,000	22.9	164,015,000
Conoco	241,362,000	30,031,000	12.4	148,962,000
Cities Service	165,289,000	32,347,000	19.6	127,837,000

OIL INDUSTRY LASHES BACK AT CRITICS

(By Spencer Rich)

"The oil industry, under sharp attack by economists before a Senate subcommittee for a system of subsidies that may cost the public anywhere from $2.7 billion to $7 billion a year, got in some whacks of its own at hearings over recent weeks.

"But the industry failed to answer several of the most damaging charges leveled by earlier witnesses. Its case for continuation of at least some lush benefits must be rated as plausible but not quite convincing.

"The basic outlines of the dispute are well known by now. The industry enjoys a number of tax benefits—including a depletion allowance and the overseas tax credit—that are available in equal measure to no other industry.

"The net benefit to the industry in taxes saved as a result of these special provisions may be as much as $2 billion a year.

"In addition, an import quota system started in 1959 limits total annual imports to about one-fifth of the 5 billion barrels of oil consumed in this country annually.

"More important, it keeps low-cost Middle Eastern crude oil, which could be sold at $2 a barrel delivered to the Eastern Seaboard, out of the country except in quota amounts.

"Together with production limitations imposed by the states of Texas and Louisiana, which produce three-quarters of U.S. oil, the import system keeps the domestic price of oil delivered to the East Coast at nearly $3.50 a barrel—or about $1.50 more a barrel than the potential price of imported oil.

"Economists estimated that as a result of this differential, the public pays anywhere from $2.7 billion to $7.2 billion more for its oil than would be the case if the world price of oil were in effect in the U.S.

"Industry witnesses—including Harold McClure of the Independent Petroleum Assn., which represents smaller domestic operators, M. A. Wright of Humble Oil (Standard of New Jersey's operating subsidiary in this country) and Robert Dunlap of Sun Oil—justified this system as necessary to maintain U.S. national security.

"Without the financial incentives provided by tax breaks and import barriers, they said, U.S. discovery and development of new domestic oil reserves would fall off and the U.S. would soon be dependent upon foreign nations for an unacceptably large portion of its supplies. This would make it vulnerable to diplomatic blackmail, they contended.

"Wright of Humble estimated that with continued import barriers, relaxed slightly to allow more foreign oil in as U.S. needs increased this Nation would be able to supply 82 percent of its needs from domestic sources by 1985. With import controls removed, he said, the figure would drop to 46 percent, which he said was too low for national security.

"Sen. Philip A. Hart, (D–Mich.), who presided over the hearings as chairman of the Senate Antitrust Subcommittee, kept digging into this argument at different vulnerable spots, as did some of his staff members. By the time the latest innings were over, he had succeeded in considerably reducing its cogency.

"For example, Hart kept going back to the potential of the nation's huge known reserves of oil shale, which contain at least 600 billion barrels of potentially recoverable oil—over 100 years' supply. The shale, located mainly in Colorado, cannot now be converted into oil at a commercial price and for this reason industry spokesmen pooh-poohed it as a possible national security reserve.

"But they did not really answer the point Hart seemed to be making: the shale is there and if we knew how to convert it we could save a substantial amount of spending on new exploration for well oil. Why not allow much more imported oil into the country, save a few billion dollars a year and devote a portion of that to cracking the problem of making the shale convertible into oil at a competitive price?

"Interior Secretary Walter J. Hickel has estimated it would cost $1 billion to achieve a research and development breakthrough on shale. But even if it cost five times that figure, it would still be equal to only a single year's added costs resulting from oil import barriers. The same argument goes for efforts to convert the Nation's massive coal reserves to oil and gas. The Interior Department is spending only $13 million this year on research on shale and coal liquefaction and gasification.

"Hale and his chief economist, Dr. John Blair, also kept bringing up the problem of tax incentives to domestic exploration, and the industry never answered.

"If the purpose of the whole system of tax breaks and import barriers is to provide U.S. companies with incentives to devote money to exploring for oil here, then why keep in existence tax benefits that encourage money to be diverted into overseas discovery?

"About 25 per cent of depletion allowances claimed by U.S. companies covers overseas holdings. In addition, U.S. law permits oil companies to subtract—dollar for dollar—from their U.S. taxes any taxes paid to foreign governments.

"Royalities can only be deducted from taxable income, but taxes can be taken directly off the tax bill in the full amount paid.

"One apparent result is that a very high proportion of total charges to U.S. companies by foreign governments are classified as 'taxes' by those governments, while a much smaller portion are called royalties.

"Another unanswered question is just how much security the U.S. is actually buying. Nobody seemed to have any hard figures—worked out on a gallons a day basis for various activities—on how much oil the U.S. really needs to protect its welfare. Must it really be 80 per cent? Or could it be less?

"Industry witnesses conceded that at present rates of discovery and increasing demand, the U.S. will be increasing its imports over the next generation anyhow. The inference of industry critics was obvious—why not increase them a little faster and save all that money by getting a bit more low cost foreign crude now?

"The exact character of the national security problem was also a little vague. Wright of Humble appeared to concede at one point that it was not really possible to insist that domestic production remain high in order to plan for nuclear war.

"That kind of situation would alter conditions so radically that normal calculations of oil need would probably be meaningless.

"But then, Sen. Edward M. Kennedy (D–Mass.) indicated, it would be a whole new ball game. In anything short of an all-out war, he argued, at least some U.S. supplies from abroad would be available: from Canada, Venezuela and Caribbean nations, which now supply the U.S. with nearly all its imports; or from one of the many new producers whose desperate race for markets is flooding the world with oil and causing what appears to be a long-term downtrend in oil prices everywhere but in the United States.

"The Hart hearings are now recessed and the dispute is moving to a new arena. In about a week and a half, the Cabinet Committee on Oil Imports, headed by Labor Secretary George P. Schultz, will begin receiving documents arguing for and against the present import program. It is to come up with recommendations on the future of the program in six months."

Mr. PROXMIRE. Mr. President, I suggest the absence of a quorum.

[H.R. 13270, 91st Cong., 1st sess.]

IN THE SENATE OF THE UNITED STATES

Referred to the Committee on Finance and ordered to be printed
Order to lie on the table and to be printed

Amendment intended to be proposed by Mr. PROXMIRE, BROOKE, KENNEDY, MCGOVERN, MCINTYRE, MONDALE, MUSKIE, NELSON, PELL, and STEPHEN YOUNG to H.R. 13270, an Act to reform the income tax laws, viz: On page 273, line 13, strike all through line 18, page 273 and insert the following:

SEC. . PERCENTAGE DEPLETION RATES FOR OIL AND GAS WELLS.

(a) GRADUATED RATES FOR DOMESTIC WELLS.—Section 613 (relating to percentage depletion) is amended—

(1) by striking out in subsection (a) "Specified in subsection (b)" and inserting in lieu thereof "specified in subsections (b) and (d)";

(2) by striking out paragraph (1) of subsection (b) and inserting in lieu thereof the following:

"(1) DOMESTIC OIL AND GAS WELLS.—The percentage applicable under subsection (d)(1)."; and

(3) by striking out subsection (d), and by inserting after subsection (c) the following new subsections:

"(d) OIL AND GAS WELLS LOCATED IN UNITED STATES.—

"(1) PERCENTAGE DEPLETION RATES.—In the case of domestic oil and gas wells, the percentage referred to in subsection (a) is as follows:

"(A) 27½ percent—to the extent that, for the taxable year, the taxpayer's gross income from the property, when added to (i) the taxpayer's gross income from all other domestic oil and gas well properties, and (ii) the gross income from domestic oil and gas well properties of any taxpayer which controls the taxpayer and of all taxpayers controlled by or under common control with the taxpayer, does not exceed $5,000,000:

"(B) 21 percent—to the extent that, for the taxable year, the taxpayer's gross income from the property, when added to (i) the taxpayer's gross income from all other domestic oil and gas well properties, and (ii) the gross income from domestic oil and gas well properties of any taxpayer which controls the taxpayer and of all taxpayers controlled by or under common control with the taxpayer, exceeds $5,000,000 but does not exceed $10,000,000; and

"(C) 15 percent—to the extent that, for the taxable year, the taxpayer's gross income from the property, when added to (i) the taxpayer's gross income from all other domestic oil and gas well properties, and (ii) the gross income from domestic oil and gas well properties of any taxpayer which controls the taxpayer and of all taxpayers controlled by or under common control with the taxpayer, exceeds $10,000,000.

"(2) DOMESTIC OIL AND GAS WELLS.—For purposes of this section, the term 'domestic oil and gas well' means an oil or gas well located on property in the United States or on the outer Continental Shelf (within the meaning of section 2 of the Outer Continental Shelf Lands Act).

"(3) CONTROL DEFINED.—For purposes of paragraph (1), the term 'control' means—

"(A) with respect to any corporation, the ownership, directly or indirectly, of stock possessing more than 50 percent of the total combined voting power of all classes of stock entitled to vote, or the power (from whatever source derived and by whatever means exercised) to elect a majority of the board of directors, and

"(B) with respect to any taxpayer, the power (from whatever source derived and by whatever means exercised) to select the management or determine the business policies of the taxpayer.

"(4) CONSTRUCTIVE OWNERSHIP OF STOCK.—The provisions of section 318(a) (relating to constructive ownership of stock) shall apply in determining the ownership of stock for purposes of paragraph (3).

"(5) APPLICATION UNDER REGULATIONS.—This subsection shall be applied under regulations prescribed by the Secretary or his delegate.

"(e) OIL AND GAS WELLS LOCATED OUTSIDE THE UNITED STATES.—In the case of oil and gas wells, other than domestic oil and gas wells, the allowance for depletion under section 611 shall be determined without reference to this section."

(b) EFFECTIVE DATE.—The amendments made by subsection (a) shall apply to taxable years beginning after the date of the enactment of this Act.

SEC. . ROYALTIES PAID IN FORM OF FOREIGN TAXES.

(a) DENIAL OF TREATMENT AS TAXES.—Section 903 (relating to taxes in lieu of income, etc., taxes) is amended by striking out the period at the end thereof and inserting in lieu thereof the following: ", but such term does not include any amount paid (whether or not denominated or imposed as a tax) to any foreign country or possession of the United States which—

(1) is determined on the basis of the ownership of oil and gas or oil and gas rights by the government of such foreign country or possession, or is otherwise in the nature of a royalty payment, or

(2) is determined on the basis of a constructive or artificial selling price of minerals or mineral products."

(3) Any foreign "tax" as aforesaid or any foreign tax in excess of U.S. taxes on oil and gas properties shall be deemed to be an ordinary and necessary business expense within the meaning of section 162.

(b) EFFECTIVE DATE.—The amendment made by subsection (a) shall apply to taxable years beginning after the date of the enactment of this Act.

KANSAS INDEPENDENT OIL & GAS ASSOCIATION,
Wichita, Kans., October 6, 1969.

WILLIAM PROXMIRE,
New Senate Office Building,
Washington, D.C.

MY DEAR SENATOR: Prior to the hearing before the Senate Finance Committee, we were assured that at least one committee member would inquire why this association had voted so strongly to support your proposed amendment relative to the mineral tax provisions of H.R. 13270. Knowing that our time to testify was going to be so severely delimited, we determined to omit this statement from our formal statement and rely on questions to elicit the information.

Be assured that there is no question about our support for the amendment. We enclose a copy of our formally adopted resolution with respect thereto. Further, we enclose a statement which sets forth our rationale in supporting your amendment.

Respectfully,

V. RICHARD HOOVER.

"We recognize the imperative necessity for tax reform. The oil industry must bear a portion of the cost of this reform. The Proxmire amendment provides tax reform. It reduces both foreign and domestic depletion and eliminates foreign tax credits when they are nothing more than royalty payments. Other sections of the bill have similar merit. To those who are critical of the sliding scale depletion as being discriminatory, we submit that it is compatible with the established theory of the graduated income tax."

RESOLUTION

Whereas, the United States House of Representatives has passed by a vote of 394–30 and sent to the U.S. Senate a "tax reform" bill, some major provisions of which adversely affect established mineral tax policy; and

Whereas, said bill will be referred to the Committee on Finance, where extended hearings will be held, commencing September 4, 1969; and

Whereas, many amendments to the House version of the bill are being suggested, many of which are even more adverse in their effect upon the domestic petroleum industry; and

Whereas, Senator William Proxmire (D-Wisc.) has prepared an amendment to said "tax reform" bill under the number & style of an amendment to H.R. 12290, the terms of which contain reasonal provisions for the small domestic independent operator and producer and that said amendment will be offered in the Senate Finance Committee or upon the floor of the United States Senate; and

Whereas, it is very much to the interest of the State of Kansas, its citizens and the independent petroleum industry to maintain a reasonable tax climate for the exploration and development of the state's petroleum resources; and

Whereas, it is the desire of the Kansas Independent Oil and Gas Association, which represents nearly 1300 small independent producers and drillers in Kansas, to endorse and support this amendment and its provisions.

Now Therefore be it Resolved by the Board of Directors of the Kansas Independent Oil and Gas Association, the same being duly vested with the authority to establish association policy, in meeting assembled this 2nd day of September, 1969, at Wichita, Kansas, that the Association endorses and pledges its full support for the incorporation of the provisions of the Proxmire amendment into any "tax reform" bill ultimately passed by the Congress.

Be it Further Resolved, that an executed copy of this resolution be furnished to Senator Proxmire, forthwith.

TOM L. SCHWINN,
Executive Vice-President.

Attest:

ROBERT L. WILLIAMS, Jr., *Secretary.*

The CHAIRMAN. The next witness is Senator Allott of Colorado.

I am informed that Senator Allott is necessarily detained and that he will be along as soon as he can.

We will call the next witness, Mr. Fred W. Peel, chairman of the American Mining Congress Tax Committee. Mr. Peel, we are glad to welcome you back. We know of the good work you did for us years ago when you were a member of the staff of the Finance Committee and later when you served on the staff of the Joint Committee.

STATEMENT OF FRED W. PEEL, CHAIRMAN OF THE AMERICAN MINING CONGRESS TAX COMMITTEE; ACCOMPANIED BY LAURENCE P. SHERFY, GENERAL COUNSEL

Mr. PEEL. My name is Fred Peel, chairman of the Mining Congress Tax Committee, and I am accompanied by Mr. Laurence P. Sherfy who is general counsel of the Mining Congress.

I am here today to present the position of the American Mining Congress on those provisions of the tax bill that are of particular concern to the mining industry.

I would like to focus first on the depletion rates. To consider these, we believe that you should take into account the problems in the past that the depletion provisions were designed to solve, the extent to which the provisions of the present law have become an integral part of the basic economic structure of the industry, and the role percentage depletion can be expected to perform in the future.

Looking at the history, the Corporate Excise Tax Act of 1909 first taxed mining income, and taxpayers contended that they should not be taxed on this as ordinary income because they were disposing of capital assets. The Supreme Court held against them on that point, however, and said that the profits were taxable as ordinary income, notwithstanding the fact that the minerals could not be replaced as manufactured inventory could be replaced.

Those decisions by the Supreme Court set the stage for the subsequent problems which Congress still has to struggle with, of fitting the disposition of irreplaceable mineral deposits into an income tax system that is designed primarily to tax profits on replaceable items.

The Revenue Act of 1918 first allowed discovery depletion. The depletion allowance was based on the fair market value of the property at the date of discovery or within 30 days thereafter. This discovery depletion was the forerunner of the present percentage depletion provisions of the income tax law. Percentage depletion first came in in the Revenue Act of 1926, applying to oil and gas.

In the Revenue Act of 1932 it was first applied to the hard minerals. It was applied to metal mines, to sulfur, and to coal at varying rates. Discovery value depletion was no longer allowed for those minerals that were allowed percentage depletion.

The Revenue Act of 1942 extended depletion to certain other minerals. Further extensions were made in the 1943 act. Some of these were allowed only for the period of World War II. In 1947 these wartime depletion allowances were made permanent, and certain other minerals were added to the list. In the Revenue Act of 1951, about 30 additional nonmetallic minerals were added to the list at depletion rates varying from 5 to 15 percent.

Then in 1954 virtually all minerals were granted depletion at rates varying from 5 to 23 percent, except for soil, sod, dirt, turf, water, mosses, minerals from the sea water, the air, or similar inexhaustible sources.

The depletion provisions have on a number of occasions been reviewed by Congress, and they have survived constant attack. There were two full-scale efforts by the Treasury Department to eliminate or reduce the benefits of these provisions. These were in 1942 and again in 1951.

On each occasion the Treasury's recommendations were rejected, and actually percentage depletion allowances were extended by Congress at those times to additional minerals.

To summarize, the present percentage depletion provisions are traceable to the very beginning of our Federal income tax. They are a part of our fundamental tax structure, and they have a sound economic justification. There are good reasons for Congress' enactment of those provisions. Furthermore, percentage depletion has now become an integral part of the economics of one of our most important industries.

There are over 15,000 mines in this country today. In 1967 they produced products with a value of $10 billion. They employed 350,000 production workers.

For the future, the Bureau of Mines has predicted that mineral demand in this country by the year 2000 will be four times what it is today. They project a fivefold increase in demand worldwide. Yet based on their projection of the present rate of production domestically our domestic production of minerals is only going to just about double by the year 2000.

In the face of this increased gap between domestic production and domestic demand, we will, of course, have to rely more and more on mineral imports.

In view of the particularly long leadtime in the mineral industry, in exploring for, developing, and getting into production on mines, projection of increasing gaps between demand and production should be of serious concern to Congress.

For most minerals the tremendous future demand can be handled by a four-pronged approach. First, more intensive and extensive exploration. Second, mining lower grade ore deposits. Third, more research in mineral recovery and mining methods. Fourth, more intensive investment input in mechanized facilities. All four of these approaches require more capital, much more capital.

We will over the next 30 years necessarily have to go to the less desirable deposits because the easily discovered, rich deposits have been or are being rapidly mined out.

All of this points toward increased mechanization, increased use of large-scale equipment, and this means heavier and heavier capital investment.

According to the most recent Fortune magazine survey of the 500 largest corporations, mining companies included in that survey had capital assets of $134,000 per employee, by far the largest investment per employee of any category.

Furthermore, additional costs have been imposed on the mining industry in connection with pollution control, mine reclamation, and mine safety. All this adds up to a great problem of finding the money to meet the future mineral demands of the country.

The decisive point is the rate of return after income taxes on the funds that must be tied up in these long-range mining projects. If depletion deductions are cut, some of these projects simply will not pass the test of an acceptable after-tax rate of return at present price levels.

In the long run failure to develop new sources would cut mineral supply. The effect would be to slow down the development of the whole economy, and by imposing higher costs for minerals, would eventually result in passing on the additional tax burdens to the mineral consumers.

Consequently, we strongly urge that depletion rates applicable to the mining industry under present law be retained by this committee.

Turning now to some of the other provisions of the bill; with respect to effective dates, we suggest that all of the tax—imposing provisions of the bill be applied prospectively only. With respect to the amendments to the mining exploration provisions, sections 615 and 617, we suggest that taxpayers who elected section 615 in the past be given a new election—a new choice between section 615 and section 617, since the factors that led them to elect section 615 will no longer be present as that section is being amended.

We also urge that in writing up its report on these changes in the exploration provisions, the committee take this opportunity to make it unmistakably clear that expenditures after a mine reaches the development stage are not to be treated as exploration expenditures for tax purposes. We suggest that the committee state in its report on these mining exploration expenditure provisions that expenditures after the development stage is reached are to be treated as development—or production—expenditures, which we think was the intent when the present treatment of development expenditures was first enacted in 1951.

With respect to the provisions of the House bill affecting foreign mining, we suggest that any cuts in depletion rates on foreign deposits would be detrimental, not only to our mining industry, but to the conutry as a whole.

If our country discourages investment in foreign mining even for a short period of years, we will have to live with the consequences for generations.

We suggest that the entire subject of foreign tax credits and changes in depletion rates on foreign production from the domestic depletion rates be put over for consideration when the Treasury makes the comprehensive proposals that it has promised to this committee on the taxation of foreign income.

I think we should point out that the United States would gain virtually no revenue from denying or reducing percentage depletion on foreign mineral deposits.

With respect to the foreign tax credit provisions in the House bill, section 431 would require taxpayers using the per country limitation on the foreign tax credit to carry forward losses incurred in the Foreign country and use them to reduce income from that country in subsequent years before computing the limitations on the foreign tax credit. This is presented as an effort to eliminate a so-called double tax benefit, according to the report of the Ways and Means Committee, but this is not correct. There is no double benefit. In fact, the taxpayer who pays and claims a credit for foreign income taxes is not paying any less income taxes, United States and foreign, than a taxpayer with the same income and losses whose operations are all conducted in the United States.

This provision, if enacted, would be contrary to the principle of tax neutrality that is used to justify imposing U.S. tax on income from foreign sources. We suggest that if the Government is dissatisfied with the present lack of coordination between foreign taxes and U.S. taxes, that the proper approach would be to negotiate or attempt to negotiate tax treaties dealing with this problem with the various foreign countries rather than imposing a double burden on our taxpayers operating abroad.

Section 432 of the House bill would apply a separate limitation on the foreign tax credit with respect to all mining income from each country, if it meets one of three tests. These tests, according to the House committee report, are designed to isolate cases where it is likely that the income taxes represent at least in part royalties, but in fact these tests would have the effect of bringing virtually every foreign income tax on mining income within the scope of the provision.

The tests are that the foreign country requires payment of a bonus or royalty, holds substantial mineral rights with respect to the property, or imposes any income taxes on mining income at an effective rate higher than on other income. These three tests are treated as conclusive presumptions that the income taxes paid represent royalties to some extent. but they are at best flimsy reasons for even suspecting that the taxes represent royalties. The fact that royalty is paid, for example, is certainly not an indication that the tax paid is also a royalty.

We urge, that this attempt to fragment the foreign tax credit be eliminated from the bill.

The Treasury has opposed section 432 of the House bill, but they have suggested an alternative, which, while it would not be as onerous or as difficult to supply as section 432, would still be subject to serious objection. It is subject to the criticism that it attempts to segregate a specific category of income and compare U.S. and foreign income tax rates on it.

The Treasury proposal would say that, to the extent that an excess foreign tax credit is generated by the fact that for U.S. tax purposes the taxpayer has a depletion allowance, that the unused credit could not be used or applied against other income. While this has the appearance of precision, the appearance is illusory because neither the United States nor most foreign countries really impose taxes on categories of income in that systematic fashion.

If the approach suggested by the Treasury should be adopted the United States would be taking a step toward an infinitely more complex foreign tax credit system in which we would engage in a hopeless attempt to match foreign taxes against U.S. taxes on an item by item basis, for each item of income. Consequently we urge rejection of this Treasury alternative proposal as well as section 432 as it appears in the House bill.

In the Treasury statement there was some comment on the possibility of a 60-percent limit on creditable foreign taxes. The Treasury mentioned this, but then went on to say that they believed it would be preferable to deal with high foreign tax rates in a general context so they did not make a suggestion on the point.

It is difficult to understand why they found it necessary to even raise the point, but we certainly agree that it would be inappropriate to consider any such limitation on the foreign tax credit at this time.

In conclusion, the American mining industry has a vital role in the development and maintenance of our economy. It has performed that role well under our present tax system, and in the process the mining companies have not made after tax profits that are out of line with those of industry in general. With an expanding population and an expanding economy before us, the mining industry has an even bigger job to do. It would be the height of folly to set up tax barriers to block the accomplishment of that job by cutting back on the present tax treatment of the mining industry.

Thank you.

The CHAIRMAN. What is your reaction to Senator's Proxmire's suggestion that depletion allowances are a very inefficient way to discover new reserves?

Mr. PEEL. I think Senator Proxmire's suggestion that depletion allowances are a very inefficient way to discover new reserves was directed at the oil and gas industry, and we would not presume to answer for the oil and gas industry. I do not know whether Senator Proxmire would apply the same tests to the depletion allowances for the hard minerals as he does to the depletion allowances for oil and gas. The depletion allowances for hard minerals have, however, a much broader objective than merely stimulation of discovery of new reserves. The objective is to moderate the tax burdens on the mining industry so that it will be able to finance the whole operation of exploring for—and developing—mineral products. The depletion allowances for the hard minerals industry certainly would have to be judged as having been highly successful in leading to the discovery of new reserves—but I would like to emphasize that that is by no means the only objective of the depletion allowances. If Senator Proxmire has in mind some form of Government subsidy as a substitute for depletion allowances to encourage discovery of new reserves, in our opinion this would definitely not be as efficient as the present depletion allowances.

The CHAIRMAN. Would capital gains treatment, either for royalties or for production working interest be a better answer?

Mr. PEEL. Capital gains treatment is provided under the present law for the recipients of royalties on coal and domestically produced iron ore. This treatment is satisfactory, and we see no reason why it would not be satisfactory if applied to the recipients of royalties on other minerals so long as the royalty payments are excluded by the mine operators as they are under the present law, both with respect to coal and iron ore royalties and with respect to other royalties. It is difficult to answer the question as to whether capital gains treatment for production working interests would be a better answer without knowing more of the details of the proposal and in particular how the losses on loss mines would be treated.

The CHAIRMAN. Would it be a better way to collect income on foreign production merely by imposing a tariff on importation or by making companies bid for the tickets under quota arrangements?

Mr. PEEL. We do not think it would be better to collect tax on foreign production of hard minerals merely by imposing a tariff on importation or by making companies bid under quota arrangements. The mining companies would still be subject to income tax in the foreign countries, which in most countries approximates or exceeds their domestic income tax rate. In addition, either the companies or the U.S. consumers would have to bear the burden of the proposed tariff on imports. Furthermore, since many minerals are imported into this country and then processed into manufactured products that are sold abroad, a tariff of this sort would make our domestic manufacturers less competitive in foreign markets, and thus hamstring our balance of payments. A quota system would have the same consequences if the quotas were set in such small amounts as to create a price for the quota tickets. Some minerals such as manganese are not mined in this country to any appreciable extent, and a tariff or artificial import quota on these minerals would clearly be a burden on the U.S. consumers, and the U.S. exporters of manufactured products using these minerals. There are several mineral import taxes on the statute books at the present time, and I believe all or most of these have been suspended by Congress. In summary, we do not think that tariffs or quotas would be a fair substitute for the present system of taxing foreign mining income.

The CHAIRMAN. Thank you.

Senator CURTIS. What do you think the effect of the enactment of the House bill would be upon the mining industry?

Mr. PEEL. Enactment of the House Bill would affect the mining industry seriously in several respects. First, repeal of the investment credit would be a serious loss to the mining industry since it is a capital intensive industry and future development will require even more intensive use of capital equipment. Second, virtually all branches of the mining industry would be affected by the cuts in depletion rates in the House bill with respect to foreign mines and, with the exception of gold, silver, iron, copper, and oil shale, with respect to domestic mines. Third, the treatment of mineral production payments as loans—which the Mining Congress has not opposed—would drastically reduce the depletion deductions that have been taken in recent years—particularly by the higher cost mines that were not otherwise able to qualify for the percentage depletion deductions at the gross depletion rates. Fourth, the cutbacks in foreign tax credits under sections 431 and 432 of the House bill would subject the mining industry to burdensome double taxation—both U.S. income taxes and foreign income taxes—in many instances. Section 431 would undoubtedly reduce the number of new mines that will be developed in foreign countries. In addition, the mining industry would be affected by various other provisions of the bill that would affect business generally. The overall result would be decisions against developing new mines—particularly high-cost mines and mines requiring large capital investments and particularly foreign mines.

Senator CURTIS. Thank you, Mr. Peel.

Senator MILLER. Mr. Peel, could you give the committee an estimate of the impact on the consumer through possible increased costs resulting from the reductions in percentage depletion in the House bill?

Mr. PEEL. We do not believe it is possible to answer this question with precise figures. The mining industry covers a whole range of minerals with differing production problems and differing market conditions. In those cases where mineral producers treat income taxes as a cost on the same basis as other costs, it would be reasonable to expect that the increased taxes from the reductions of percentage depletion deductions as a result of the House bill would be passed on directly to the consumer in the form of increased prices. In the case of those mineral products whose prices would not be immediately affected by an increase in tax costs of U.S. producers, the ultimate effects tend to be substantially the same because the reduction in after-tax rate of return as a result of lower percentage depletion deductions would reduce the flow of investment into the industry. This, in turn, would reduce the mineral supply and the resultant competition for the smaller supply would drive prices up. There is strong evidence that the longrun effect of reductions in percentage depletion will increase consumer costs in the fact that, in the past, the after-tax rate of return on investment in the mining industry has not been higher than that of industry generally.

Senator MILLER. Thank you.

Mr. PEEL. Thank you.

(Mr. Peel's prepared statement follows:)

STATEMENT OF THE AMERICAN MINING CONGRESS, PRESENTED BY FRED W. PEEL, CHAIRMAN, TAX COMMITTEE

Mr. Chairman, my name is Fred W. Peel. I am the Chairman of the Tax Committee of the American Mining Congress and I appear before you today to present the position of the Mining Congress on the provisions of H.R. 13270 that are of particular concern to the mining industry.

The American Mining Congress is a trade assoication founded in 1897. Its membership is composed of (1) United States companies that produce and process a majority of the nation's ferrous and nonferrous metals, coal, and industrial and agricultural minerals, and (2) United States companies that manufacture mining equipment and supplies. Its headquarters are in Washington, D.C. It coordinates the efforts of the minning industry to present to the Federal Government its views on developing and maintaining a strong and healthy industry.

DEPLETION RATES

In the form in which it passed the House, H.R. 13270 would reduce the present percentage depletion rate for minerals now eligible for 23% to 17%, a 26.1% reduction; for most minerals now eligible for a 15% rate to 11%, a 26.6% reduction; for minerals now eligible for a 10% rate, a reduction to 7%, a 30% reduction; for clay, shale, and slate now eligible for a 7½% rate, a reduction to 5%, a 33⅓% reduction; and for sand, gravel, and other minerals now eligible for a 5% rate, a reduction to 4%, a 20% reduction.

The changes in percentage depletion rates made by the House bill should be considered in the light of (1) the problems of the past that the depletion provisions of the present law were designed to solve; (2) the extent to which the provisions of present law have become integral parts of the basic economic structure of the industry; and (3) the role percentage depletion can be expected to perform in the future.

History of taxation of the mining industry

When the Corporate Excise Tax Act of 1909 was enacted, mining companies contended that profits from mining operations were not subject to ordinary income tax because the miners were disposing of their capital assets—the mineral deposits being wasting, irreplaceable assets. The Supreme Court decided, however, that the profit was taxable as ordinary income, notwithstanding the fact that the minerals could not be replaced as manufactured inventory could. *Stratton's Independence v. Howbert*, 231 U.S. 399; *Von Baumback v. Sargent Land Co.*, 242 U.S. 503. These decisions set the stage for the subsequent problem of fitting the disposition of irreplaceable mineral deposits into an income tax system designed primarily to tax profits on replaceable items. The Supreme Court also held that mining companies were not entitled to depletion deductions under the 1909 Act since there was no provision in the Act for such a deduction.

Ever since the enactment of the first income tax law in 1913, the mining industry has been allowed a deduction for depletion. The Revenue Act of 1913 limited this deduction to 5 percent of the gross value at the mine of the minerals produced. The Revenue Act of 1916 abandoned the 5 percent of gross value limitation and allowed a reasonable allowance for depletion not to exceed the market value in the mine of the products. This Act also permitted the taxpayer to compute his depletion deduction on the basis of the cost of the property or its fair market value as of March 1, 1913, whichever was the greater.

The Revenue Act of 1918 continued the allowance of a depletion deduction based on cost or the March 1, 1913 value, but in addition provided also for discovery depletion with respect to mines "discovered by the taxpayer on or after March 1, 1913 and not acquired as a result of purchase of a proven tract or lease, where the fair market value of the property is materially disproportionate to the cost." In such cases the depletion allowance was based upon the fair market value of the property at the date of discovery or within 30 days thereafter. Discovery value depletion was the forerunner of the present percentage depletion provisions of the income tax laws.

The Revenue Act of 1921 amended the discovery depletion provision to limit the depletion allowance based on discovery value to the net income from the property. The Revenue Act of 1924 further limited the depletion deduction based on discovery value to 50 percent of the net income from the property.

The Revenue Act of 1926 incorporated the concept of percentage depletion into the tax law for the first time. That Act substituted a percentage depletion deduction for oil and gas wells of 27½ percent of gross income from the property, limited to 50 percent of the net income from the property. This deduction was in lieu of discovery value depletion. The administration of the discovery depletion provisions had been difficult and complex. The Senate Committee on Finance recommended the percentage depletion approach "in the interest of simplicity and certainty." No change was made in this Act in the method of computing the depletion deduction in the case of the mining industry.

Apparently as a result of a "Preliminary Report on Depletion" prepared by the staff of the Joint Committee on Internal Revenue Taxation in 1929 that was critical of the application and results of discovery depletion, Congress extended percentage depletion to metal mines, sulphur, and coal mines at the respective rates of 15, 23, and 5 percent on the Revenue Act of 1932. Discovery value depletion was no longer allowed for those minerals. Mines other than those entitled to percentage depletion still had the choice between cost depletion and discovery value depletion.

There were no further changes in the depletion provisions until the Revenue Act of 1942 extended percentage depletion of fluorspar, rock asphalt, and ball and sagger clay at the 15 percent rate applicable to metal mines. The Revenue Act of 1943 also extended the percentage depletion provision to a new group of nonmetallic minerals at a 15 percent rate: flake graphite, vermiculite, potash, beryl, feldspar, mica, lepidolite, spodumene, talc, and barite. With the exception of potash, the extension of percentage depletion to these minerals was for the war period only. This Act also incorporated into the tax law for the first time a definition of "gross income from mining" on which the percentage depletion deduction was computed. This provision was an outgrowth of controversies between the mining industry and the Treasury Department over what operations were mining processes for depletion purposes.

In 1947 Congress made permanent the extension of percentage depletion to the nonmetallic minerals that had been granted percentage depletion in 1943 for the duration of the war and added the names of the following minerals to the list entitled to the 15 percent rate: china clay, bentonite, gilsonite, thenardite or sodium sulfate, trona, pyrophyllite, and bauxite.

In the Revenue Act of 1951 percentage depletion was applied to about 30 new nonmetallic minerals at rates varying from 5 to 15 percent. This Act also changed the tax treatment of both exploration and development expenditures.

When the Internal Revenue Code of 1954 was enacted, all minerals were granted percentage depletion at rates varying from 5 to 23 percent except soil, sod, dirt, turf, water, or mosses or minerals from sea water, the air, or similar inexhaustible sources. With the extension of percentage depletion to virtually all minerals, the discovery depletion provision was dropped completely.

In the 1954 Code and at times subsequent to its enactment, the percentage depletion rates for various minerals were increased. Except for the changes in the rates and except for an amendment clarifying the definition of "gross income from mining," there have been no substantial amendments to the depletion provisions applicable to the mining industry since the enactment of the 1954 Code.

Reviews of percentage depletion

The percentage depletion provisions have survived constant attack since they first became part of our tax laws. Full scale efforts by the Treasury Department to eliminate or reduce the benefits of these provisions were made in 1942 and again in 1950. On each occasion the Treasury's recommendations were rejected and percentage depletion allowances were extended to additional minerals.

The percentage depletion provisions were incorporated into the 1954 Code, which was the product of a thorough review of the whole income tax system. Finally, Congress rejected proposals made by the administration in 1963 that would have had the effect of lowering the depletion deductions of all of the mineral industries.

A discussion of the several previous reviews of these provisions would not be complete without reference to the recommendation made by the President's Materials Policy Commission, the so-called Paley Commission, in its June 1952 report. This report said:

"In short, the device of percentage depletion as an incentive to minerals exploration is not without its limitations. But no alternative method of taxation has come to the Commission's attention or could be devised by the Commission which, in its judgment, promises to overcome these limitations and still achieve the desired results, particularly not without seriously dislocating well established capital values and other arrangements in the industries concerned, with highly adverse effects on supply. Taking the practical situation as it finds it, the Commission believes that any radical alteration of the existing tax arrangements would be undesirable."

To summarize—the present percentage depletion provisions are traceable to the very beginning of the federal income tax. They are a part of our fundamental tax structure and have a sound economic justification. It is important that this background be understood by those aiming at percentage depletion as one of the targets for tax reform. Not only were there good reasons for Congress' enactment, but percentage depletion has become an integral part of the economics of one of our most important industries.

The mining industry today

In the year 1967, there were over 15,000 metallic, nonmetallic, and coal mines in the country. See Appendix A for a breakdown of metallic and nonmetallic mines by size and mineral. The mining industry produced tonnages in 1967 valued at over $10 billion with 350,000 production workers. Their wages and salaries in 1967 totaled almost $2.5 billion. The mining industry's contribution to the overall economy was well expressed by Hollis M. Dole, who, as Assistant Secretary—Mineral Resources, in the Department of Interior, testified before the Subcommittee on Minerals, Materials and Fuels of the Senate Interior Committee on July 9, 1969 that:

"U.S. minerals provide only some 3 percent of the Gross National Product. But this is only the beginning—it is only the point of an inverted pyramid which depicts our industrial economy resting upon a small but absolutely essential minerals base.

"The impact of that 3% GNP directly results in 40% of the GNP and indirectly accounts for nearly 75%.

"Let's look at it another way: if you were to select 100 men as representative of the work force directly dependent upon minerals production in the U.S., you would find that it requires only 3 of these men to mine the ore but it takes 14 to produce the metal and 83 to fabricate, distribute and sell the ultimate product. If we could get our 'man in the street' to appreciate some of these facts, we would be making a good start."

Future mineral requirements

The Bureau of Mines has predicted United States mineral demand to increase by more than 4 times by the year 2000, whereas domestic mineral production projected on the basis of 20-year trends can only be expected to little more than double by the end of the century. The Bureau of Mines is also predicting that there will be a fivefold increase in worldwide demand by the year 2000.

According to the latest Bureau of Census median projection, the population of the U.S. is expected to reach 320 million people by the year 2000. As the standard of living of the expanding population increases, so does the per capita consumption of minerals. These factors are expected to account for a doubling of mineral demand by 1985 and further expansion to more than 4 times present demand by 2000. This is not surprising since, over the past century while our population grew more than 400 percent, our minerals consumption grew more than 4,000 percent. By the year 2000 per capita demand for minerals in the U.S. is expected to rise from $150 per year to approximately $420.

The following table has been compiled from the Bureau of Mines projections of United States demand and production for some of the basic minerals in the years 1985 and 2000. Also included are the projected requirements for these same minerals by the rest of the world based upon a projected world population climb to 6½ billion by the year 2000 coupled with expectations of increased per capita consumption.

FUTURE MINERALS REQUIREMENTS AS PROJECTED BY U.S. BUREAU OF MINES FOR THE YEARS 1985 AND 2000

Mineral element	U.S. demand (projected requirements)			U.S. production (projected upon trend of last 20 yrs.)		Rest-of-world demand (projected requirements)		
	1967	1985	2000	1967	2000	1967	1985	2000
	In million short tons							
Aluminum	3.7	11.6	29.9	0.4	0.4	5.8	12.0	23.2
Copper	1.5	2.6	4.0	.9	2.1	4.0	8.5	11.8
Iron	85.7	118.0	144.0	54.8	38.0	298.9	573.0	807.0
Lead	.7	.8	1.1	.3	0	2.4	3.8	5.0
Magnesium	2.1	3.4	5.1	2.0	3.7	6.5	12.0	16.7
Manganese	1.2	1.8	2.4	.1	0	7.1	13.9	18.8
Phosphorus	3.8	6.4	10.5	5.4	8.8	7.6	21.3	36.0
Potassium	3.4	6.3	10.8	2.7	5.9	10.3	22.5	38.0
Sodium	17.3	32.7	60.4	16.5	28.6	35.4	66.2	102.0
Sulfur [1]	9.3	18.0	32.0	9.1	12.6	18.0	51.0	92.0
Uranium	.001	.05	.2	.001	[2] .049	.001	.08	.2
Zinc	1.3	2.4	3.5	.5	.3	4.0	6.0	8.6
	In million pounds							
Molybdenum	54.5	88.0	130.0	88.9	167.9	82.5	122.0	170.0
Nickel	364.9	470.0	550.0	29.2	87.4	614.0	850.0	1,000.0
Tungsten	13.9	34.4	64.2	9.3	13.5	52.5	96.1	126.5

[1] Millions of long tons.
[2] Based on AEC procurement only.

Source: Compiled from Bureau of Mines commodity statements, Jan. 31, 1969.

The predictions of increased consumption are understandable when one considers the increases that have already taken place. For example, 20 years ago the United States consumed 12 pounds of aluminum per capita; today U.S. consumption is approximately 41 pounds per capita. Over the same 20-year period, Japanese consumption of aluminum has increased from ½ pound to 15 pounds. Copper consumption in the developing foreign countries is increasing at about the same rate. If the rest of the world should increase its per capita consumption of copper by the year 2,000 to our present level, this would require annual production of 15 times the amount now needed.

Our primary concern is with future United States demand. The increasing gap between United States demand and domestic production, of course, will have to be supplied by imports. Pointing out the growing interdependence of domestic and foreign sources of supplies in what is becoming a world natural resources economy, Dr. Walter R. Hibbard, former Director of the Bureau of Mines, said in September of 1966:

"Experience indicates that in mineral-related areas about 60% of the investment flow abroad is to cover depreciation, with the remaining 40% going into expansion. In view of this ratio, it becomes clear that a high level of capital input must be maintained to avoid jeopardizing the total value of these foreign investments. Studies also indicate that the net return on foreign investments must remain close to recent levels. Only in this way can enough new capital be generated to sustain investment rates that can assure a continuing ability to meet expanding demands for products. . . .

"This problem is intensified and complicated by the shifting economic, political, and social patterns that accompany other changes in our world. . . .

"As with the United States, the appetite of West Europe and Japan for mineral raw materials has outrun the capacities of economically viable indigenous resources. . . .

"Today, virtually every industrialized country is actively searching the world for mineral resources that can be developed to help supply their home demands."

In view of the particularly long lead-time in the mining industry, the projections of increasing gaps between demand and production are of serious concern. Lead-time is particularly important in the search for and development of foreign mineral deposits. Should the Congress, upon review in a few years of any additional tax burdens placed on U.S. mining abroad, decide that the additional taxes were a mistake, the opportunities which arose in the interim will have been lost forever, and the U.S. as a nation will become increasingly reliant on foreign-controlled sources of raw materials.

As the report of the Paley Commission made clear in 1952, the problem of meeting future demand for minerals is not one of the existence or nonexistence of mineral resources. Instead, the problem is whether the United States might find itself priced out of world markets for minerals or be forced to rely on less desirable sources. The one meaningful criterion is the cost of producing a unit of a given mineral. This criterion is central to consideration of the tax treatment of the mining industry today, because the tax treatment cannot be considered in a vacuum; taxes are not the only cost increase the mining industry faces. Increasingly, the industry will meet federal, state, and local pollution control, health and safety requirements, increasing acquisition costs—in addition to higher taxes—all at a time when it must somehow find ways of profitably extracting the lower-grade deposits that remain.

Tax treatment and the future

For most minerals the tremendous future demands will be handled by a four-pronged approach:

1. More extensive (and intensive) exploration;
2. Mining lower-grade ore deposits;
3. More research in mineral recovery methods and mining methods; and
4. More intensive investment input in mechanized facilities.

All four of these solutions require more capital—much more capital. As far as the accessible areas of the world are concerned, the deposits that reveal themselves with surface outcrops have already been discovered. Today a minerals exploration program usually starts with aerial photos and may continue with geochemical surveys, aeromagnetic surveys, electromagnetic surveys, ground magnetometer surveys, induced polarization, gravity surveys, and, eventually, diamond drilling or trenching. All of this adds up to tremendous expenditures. Furthermore, these exploration techniques have by no means eliminated the risk that the exploration will be unsuccessful. The process is risky as well as costly.

Mineral deposits are irreplaceable and, by and large, the best ones go first. Thus, as we attempt to meet the increased demand over the next 30 years, we will necessarily be forced to go to less desirable deposits—that is, those with a lower percentage of mineral content, those that are more difficult to extract because of a higher ratio of overburden to the mineral, and those that are less accessible and more distant from markets.

Research and experimentation in methods of improving the efficiency of the recovery of desired minerals from crude ores and the improvement of mining techniques have helped the mining industry to maintain production even though the richer mineral deposits have been depleted.

In general, the great production efficiencies have come from increased mechanization and use of large-scale equipment. If the mining industry is to fill the increased demand for its products from less desirable deposits it will have to turn to heavier and heavier capital investment. The mining companies included in *Fortune* magazine's most recent survey of the 500 largest corporations had capital assets of $134,000 per employee—by far the largest investment per employee for any category of industry. This figure of $134,000 per employee is understandable when you realize that some companies are now hauling ore from open pits in trucks that carry over 100 tons a load. A 100-ton truck may cost as much as $185,000. A dragline operated by two men may cost as much as $10 million.

The magnitude of the total investment needed to put a large-scale, mechanized mine in operation is so great that it presents unique problems of availability of capital. For example, the Kennecott Copper Corporation recently spent $100 million in a program at its Bingham Canyon open pit copper mine in Utah merely to maintain copper production at its past levels. The Freeport Sulphur Company is considering a program for an Indonesian copper deposit in a remote area, where transportation facilities will have to be built as well as mining facilities, and it is anticipated that the cost will be in excess of $100 million.

The long lead-time—which means funds expended may not begin to yield a return for years—intensifies the industry's capital problems. For example, American Metal Climax, Inc. is engaged in a project to bring the Henderson molybdenum mine, located in Empire, Colorado, into production. The total outlay will be approximately $200 million. The mine will have a capacity of 50 million pounds of molybdenum a year. It has already been in development for 4 years, and it will not be producing until the mid-1970's.

In connection with the rising cost of mining, it should be pointed out that additional costs have already been imposed upon the mining industry in connection with pollution control, mine reclamation, and mine safety. Mentioning these facts should not be construed to indicate that the mining industry is opposed to reasonable regulations in these three areas, but merely to direct attention to additional cost factors that already must be taken into consideration by a mining company in determining whether to go forward with a projected mining operation.

The decision to undertake a mining operation is made, in its simplest terms, by comparing the rate of return—after income taxes—on the funds that must be tied up in the project with the after-tax yield if the funds are invested in something else, taking into account differences in risks. In making the necessary projections before a new project is undertaken, a company will make its computations of after-tax rate of return and cash flow on the basis of the deductibility of preproduction expenditures and on the basis of the depletion allowances.

If depletion deductions are cut, some of these projects simply will not pass the test of an acceptable after-tax rate of return at present price levels. In the long run, failure to develop new sources would cut mineral supply. The effect would be to slow down the development of the whole economy and by imposing higher costs for minerals would eventually result in passing on the additional tax burden to the mineral consumers.

It would be a great mistake to view the mining industry as a static industry where the government could reap a windfall in tax revenues by cutting back on deductions on existing operations after the mining companies were committed to these operations on the assumption that the present tax treatment would continue. Entirely aside from the unfairness of such an approach, it would be self-defeating because the mining industry is not a static industry. Our economy is dependent for the foreseeable future on the mining industry making the investments necessary for a tremendous increase in production. We operate in a free enterprise system and we depend upon the after-tax rate of return to direct the flow of capital into one industry or another. Even if the managers of the mining companies wanted to make unprofitable investments in further increases in production, the capital would simply not be forthcoming. Investors would no longer be attracted to the industry. The mining industry must be able to offer investors at least a rate of return that is competitive with other industries. It should be able to offer a better rate than other, less risky investment prospects.

To put it simply, if the country expects the mining industry to generate the investment capital to meet the increased demands of the future as it has successfully met increased demand in the past, then the present depletion rates should not be cut.

In view of the phenomenal projected mineral needs for both the United States and the rest of the world, it seems clear that to achieve any progress we must move forward from existing policies rather than to cut back. Clearly, a cut in depletion would increase costs, rendering already low-grade domestic mines even less economically viable, and making United States-owned foreign ventures less competitive vis-a-vis foreign-owned enterprises seeking the valuable deposits in the emerging countries. This nation can ill-afford such a "giant step backwards."

The importance of the after-tax rate of return is illustrated by the example of one company that has reported to us that it went into a uranium mining operation several years ago, at a time when uranium had an uncertain future, on the basis of a discounted cash-flow rate of return analysis that showed the return on a 1,000 ton-per-day operation would be reduced by more than 75 percent if the 23 percent depletion allowance for uranium were not taken into account. The company reported that it undoubtedly would have decided to discontinue the operation in the absence of the depletion deduction. Another company has estimated that its sales price for uranium would have to be increased more than 10 percent to maintain the same net after-tax income if the percentage depletion allowance were to be eliminated. Another company that has opened a relatively small copper-zinc mine in a depressed area—an operation that required an initial outlay of more than $4 million—reported that under the discounted cash flow method it uses to evaluate investments, it is doubtful that it would have undertaken the project if it were not for the percentage depletion deduction.

Perhaps a more striking example of the importance of the present tax treatment is a case described to us by a company that was considering developing a copper deposit in an African country. This country required, however, that the mine be owned and operated by a corporation organized under the laws of that country. The effect of this would have been that when the income from the mine was first subject to tax by the United States it would be subject to tax as dividend income and thus would not be eligible for a percentage depletion deduction. The company eventually decided to withdraw from the project, though it had spent several hundred thousand dollars on it, because the inability to use the percentage depletion deduction reduced the after-tax return to the point where it was no longer an economically viable investment. This deposit was subsequently developed by foreign companies.

The present tax treatment of the mining industry has been built into the investment structure of the industry, and into its price structure. Decisions to open new mines or expand existing mines have been made on the basis of the present provisions of the Internal Revenue Code. The prices charged for mineral products and, indirectly, prices throughout the economy have been determined by the supply of minerals evoked by the present tax structure.

Annual surveys of the First National City Bank for the years 1960 through 1968 show an average profit after taxes as a percentage return on net worth of 11.2 percent for the mining industry compared with 12.15 percent for manufacturing industries. It is clear from these figures that the owners of the mining companies are not getting an undue profit after taxes because of their tax treatment.

It would be ironic if the Senate should cut back on depletion rates for the mining industry in the same Congress in which it passed S. 719. In passing S. 719, the Senate has endorsed the principle of recognition of the national interest in the American mining industry. Surely the first token of that recognition will not be an increase in tax burden aimed directly at the mining industry.

We strongly urge that depletion rates applicable to the mining industry under present law be retained by this committee.

Inconsistencies in depletion rates under the bill

The blanket reductions were made without regard to the fact that coal logically should have been in a higher rate category than 10% before *any* reduction was applied since all other fuels have higher rates and the general category of "other minerals" has a rate of 15%. For example, if coal were to be treated as entitled to a 15% depletion rate before any cuts were considered, then even the the 26.6% cut proposed in the House bill for minerals entitled to the 15% depletion rate would leave it with depletion at the rate of 11%.

Even those minerals that were expected in the House bill from the cut in the 15% depletion rate (gold, silver, oil shale, copper, and iron ore) were excepted from the cut only with respect to domestic deposits. Since we are concerned with the scarcity of these minerals and since we must rely on foreign sources (except in the case of oil shale), there is no reason for cutting their depletion rate in the case of foreign deposits.

Technically, it is not clear what the provision in the bill for a 15% rate for domestic gold mines and silver mines actually means. With occasional exceptions, gold and silver are produced in this country as by-products from mines whose products of principal value are lead, zinc, or copper. While historically the reference in the law to "metal mines" has been interpreted as providing a depletion rate for metals not otherwise provided for by name in the Code, this interpretation is proposed to be overturned in the pending proposed regulations under section 613. These proposed regulations would treat as eligible for the present 15% rate for metal mines all mineral products from such mines, whether these products are metals or not (unless the products are eligible for a 23% rate under section 613(b)(2)(B)). If this interpretation, which we think is erroneous, should be applied to the House version of H.R. 13270, the 15% rate for gold or silver mines in the United States would presumably not be available for gold and silver produced from other metal mines in the United States. For example, the rate of depletion on silver from a lead-zinc mine might be cut to 11%, even though the depletion rate on the lead-zinc itself would be 17% (23% under present law). Furthermore, under this interpretation, the effect of the language of the House bill would be to reduce the depletion rate on iron ore from a domestic mine from 15% to 11% where the iron existed in the ground in combination with other metals if the predominant value of the product from the mine was of the other metals or minerals. This is not a theoretical example; it occurs where iron sinter (which is in direct competition with the iron in taconites) is obtained from sulfide ore. This is a technical problem that could be solved by deleting the word "mines" from proposed section 615(b)(3)(A).

EFFECTIVES DATES

The bill as it passed the House is inconsistent in its treatment of effective dates for the various provisions. Retroactive application of taxes should be avoided wherever possible. Otherwise, some taxpayers will be taxed under provisions of which they had no knowledge. This is true even though a provisions is made effective on the date of some announcement by the Ways and Means Committee or on the date that some proposal was made by the Treasury Department. All taxpayers cannot be expected to keep in touch that closely with legislative developments. In fact, in a complex area such as the tax law, taxpayers find it difficult to keep up with Changes actually enacted into law.

An example of a retroactive effective date is the one proposed with respect to mineral production payments. Treatment of such payments as loans is made applicable, in the House bill, to production payments created on or after April 22, 1969. Another example is in the application of recapture rules to section 615. These rules would be effective for exploration expenditures after July 22, 1969.

We suggest that all the tax-imposing provisions of the bill be applied prospectively only.

MINING EXPLORATION

The bill makes the so-called recapture provisions of section 617 applicable to expenditures after July 22, 1969 to which section 615 applies. It also allows foreign exploration expenditures to qualify for deduction under section 617 subject to a $400,000 limitation on total expenditures. The net effect of the two changes is virtually to eliminate the difference in tax effect between section 615 and section 617. Under the bill, both sections will apply to foreign as well as domestic exploration expenditures (within the $400,000 limitation) and deductions under both will be subject to recapture—that is, the amount of exploration deduction previously taken on a property that becomes a producing mine will be recaptured either by immediate inclusion in income or by denying an equivalent amount of depletion deductions for the mine. The only difference remaining between section 615 and 617 treatment is that there will be an overall limit of $400,000 on deductions under 615, including domestic as well as foreign exploration expenditures, whereas domestic exploration expenditures in excess of $400,000 can be deducted under section 617.

Under these circumstances, it would be unfair to hold taxpayers to an earlier election to deduct exploration expenditures under section 615 instead of under section 617. The reason for electing section 615—i.e., no recapture—disappears under the bill, so taxpayers should no longer be bound by their earlier election of section 615 now that the terms of the provision on which the election was based have been changed. We urge that taxpayers be permitted another election between deducting exploration expenditures under section 615 and under section 617.

In revising the Code provisions for mine exploration deductions the Committee should take this opportunity to make it unmistakably clear that expenditures after a mine reaches the development stage are not to be treated as exploration expenditures for tax purposes. Instead, they are either development expenditures or production expenditures after the mine has left the exploration stage. It would seem unnecessary to labor this obvious point in view of the statements in this Committee's report on the 1951 Act when the predecessors of the present sections 615 and 616 were enacted, but there has been a persistent misunderstanding of Congress' intent, culminating in an interpretation by the Court of Appeals for the Seventh Circuit in its opinion in *Santa Fe Pacific Railroad Co.* v. *United States*, 378 F. 2d 72 (7th Cir. 1967). Regardless of whether or not the Court reached the correct result on the facts in that case, the opinion misinterpreted the consequences Congress intended to be drawn from the shift from the exploration stage to the development stage. The opinion in the *Santa Fe* case reached the remarkable conclusion that, having provided for deduction of exploration expenditures (within limits) during the exploration stage and having provided for deduction of development expenditures after the mine reached the development stage, Congress meant to treat taxpayers as having exploration expenditures after the exploration stage had ended that were not deductible either as exploration expenditures or as development expenditures.

A fair reading of the Treasury Regulations under sections 615 and 616 bears out our interpretation. See Regs. §§ 1.615–1(a) and 1.616–1(a). We suggest that the Committee state in its report on the mine exploration expenditure provisions of this bill, that expenditures afer the development stage is reached are to be treated as development (or production) expenditures.

MINERAL PRODUCTION PAYMENTS

We believe that we should bring to your attention a discriminatory effect that would result if the provision of the House bill that would treat sales of carved-out mineral production payments as loans is adopted in its present form. Production payments are a type of advance sales. The abuse in the use of carved-out production payments was cited in the Ways and Means Committee report as primarily involving the impact of the 50 percent of net income limitation on the percentage depletion deduction. The discrimination arises from the fact that all other taxpayers have the opportunity of accelerating income for other purposes through advance sales. Under the loan approach in the House bill, this right would be taken away from the mining industry where advance sales are accomplished by carving out and selling mineral production payments.

The American Mining Congress believes that if proceeds from sale of mineral production payments are treated as loans for purposes of depletion computations, the mining industry should not be prevented from accelerating income for other purposes on the same basis as other taxpayers.

DEPRECIATION

Section 521 of the House bill would deny 200% declining balance and sum-of-the-years digits depreciation on new real estate construction (other than housing). The provision in the House bill appears to go far beyond the alleged abuse at which it is aimed. Industrial buildings constructed by the business firms that use them have not been used for quick write-off and resale at capital gain rates. Any possibility of abuse in the case of industrial buildings can be guarded against by providing for full recapture at ordinary income rates of all depreciation deductions previously taken against profit on disposition. It is not desirable to discourage investment in such buildings by denying the depreciation deductions in early years that are provided by present law.

We suggest that buildings constructed by mining companies to house their mining and beneficiation facilities and for related operations be permitted to continue the use double declining balance and sum-of-the-years digits depreciation with full recapture of excess depreciation as ordinary income against profit on sale.

We also suggest preservation of the simplicity and certainty of the depreciation guideline lives by law so that taxpayers may continue to use useful lives at least as short as guideline lives without regard to the reserve-ratio test. Taxpayers who wish to establish useful lives shorter than guideline lives should be allowed to use the reserve-ratio test to establish their eligibility for such shorter lives.

SECTION 213 OF THE BILL

Section 213 of the bill is designed to curb the use of so-called "hobby loss" deductions to offset income. While the problem is one of deduction of expenditures that are for the personal enjoyment of individuals, it is not clear that the provision in the bill would be limited to individuals. If it applies to deductions by corporations, then there is a serious danger that it will, at the very least, create an unwarranted presumption of tax avoidance that will have to be rebutted in lengthy disputes with Revenue agents in the case of many—conceivably nearly all—mining companies. This problem with the House bill arises from the failure of the bill to provide a workable standard for recognizing losses incurred for the personal enjoyment of individuals and from the fact that the bill would apply to an "activity" carried on by a taxpayer, without defining "activity". If an "activity" means sometimes less than a trade or business, then many "activities" carried on by mining companies in the course of conducting their businesses might be considered as carried on without a reasonable expectation of realizing a profit. We urge that, if section 213 is retained in the bill, it be revised to make it clear that it does not apply to unprofitable activities carried on as segments of an overall trade or business conducted with a reasonable expectation of realizing profit.

FOREIGN MINING

Percentage depletion on foreign mines and deposits should be retained

While the House bill does not repeal percentage depletion on foreign mines and deposits in the case of the hard minerals, amendments have been offered to this Committee that would do so. Furthermore, the House bill has cut the depletion rates on all minerals from foreign deposits and has eliminated foreign percentage depletion in the case of oil and gas wells outside the United States.

Enactment of legislation that would eliminate percentage depletion on mines located outside the United States would violate the principle of tax neutrality. Any cuts in depletion rates on foreign deposits would be detrimental, not only to our mining industry, but to our country as a whole.

United States policy toward the development and operation of foreign mining by United States companies should not vacillate from year to year. If our Government discourages foreign mining, even for a short period of years, we will have to live with the consequences for generations. The results of a repeal of percentage depletion for foreign mines by our Government would be irreversible because the foreign mineral deposits that would be developed by nationals of other countries as a result would be lost to our companies forever—even though the minerals are essential to our domestic economy.

The Treasury has stated to the Committee that it is presently developing and plans to present to Congress comprehensive proposals relating to the U.S. taxation of foreign income. A thorough review of our present philosophy toward the taxation of foreign income is certainly desirable, and, with that review in prospect, it seems pointless for the Committee to develop detailed modification of the present system in this bill. Furthermore, if there are basic charges made later in the system for taxing foreign income it will be necessary to adopt complex provisions for phasing out the provisions of sections 431 and 432 of the House bill. We suggest that the entire subject of foreign tax credits and changes from domestic depletion rates be put over for consideration when the Treasury makes its comprehensive proposals.

Minimal revenue from increasing United States taxes

The United States would gain virtually no revenue from denying or reducing percentage depletion on foreign mineral deposits or other similar tax changes. Foreign mining income is subject to income tax in the foreign country, which is eligible for credit against United States tax. Where the effect of eliminating or cutting foreign depletion deductions is to raise the U.S. effective tax rate above that imposed by the foreign country, the foreign country can be expected to raise its own taxes by an equivalent amount.

The sentiment encountered in the countries in which mineral resources are located, even though generous tax incentives are offered by them, is these countries are determined that taxes on income earned therein should be paid there rather than to the country from which the investment originated.

Many provisions in foreign countries for reduced tax rates are explicitly geared to the tax rates in the capital exporting country. For example, in Peru, Article 56 of the Peruvian Mining Code, as amended by Law 16892, promulgated February 4, 1968, after providing for reductions of tax rates on income from mines or ore deposits by executive agreement, provides, "The aggregate of the profits tax rate plus that of the complementary tax, in case of foreign enterprise, shall in no case be less than the global rate of tax charged in the country or countries where the investments originate, provided that the differences entail obligation to pay taxes in those countries." In other countries tax agreements made with individual companies provide for increasing rates to offset any increase in United States tax.

In any event, the existence of an *automatic* provision for increasing taxes to offset an increase in our taxes merely means that the offsetting will take place immediately. In other countries the same result will follow gradually, so that any appreciable increase in revenues to the United States Treasury will soon disappear.

The Committee report on the House bill recognizes, in giving the revenue effect of the provision to deny percentage depletion on foreign oil and gas wells, that any theoretical revenue gain will be eliminated in later years by increased foreign taxes. The report says, "Although a more substantial gain of $90 million appears possible from repeal of foreign percentage depletion, it is assumed that in early years these gains will be partially offset by unused tax credits and in later years will be eliminated by increased foreign taxes." (Part 1, p. 138.) Thus, the effect is to increase the tax cost to United States taxpayers without increasing our Government's revenues. In the words of Assistant Secretary Cohen's statement to the Finance Committee, "The end result will be that the U.S. taxpayer will pay additional taxes to those countries but no additional tax to the United States."

In some countries the tax laws contain percentage depletion deduction provisions modeled after ours—sometimes with the same depletion rates as are provided in our law. Obviously, we could not expect those rates to remain in effect if we were to eliminate or reduce percentage depletion on foreign deposits.

Discriminating against foreign mining violates the tax neutrality concept

If Congress were to change the tax law to discriminate against foreign mining this would be contrary to the principle of tax neutrality that is the theoretical justification for the United States taxing income worldwide.

A strong government can be made for taxing only income that is earned in this country. Our Government has rejected that approach, however, on the theory that, insofar as our tax rates control the situation, the income of a United States-based firm should be taxed on approximately the same basis regardless of where it arises. So long as we follow that principle, we should not discriminate against income from foreign sources. Elimination of percentage depletion on foreign mineral deposits would, of course, do just that.

Thus, if Congress continues the policy of taxing United States taxpayers on their worldwide income to achieve tax neutrality, foreign mining should not be discriminated against in our tax system.

Our reliance on foreign minerals

At the outset it should be recognized that the mining industry must go where the minerals are. And many of them are not in the United States—in some cases domestic reserves can supply a part of our requirements, and in other there are no domestic reserves. The following table shows imports as a percentage of United States consumption in 1967 for the most important minerals:

TABLE 1

Metals and nonmetals—Imports as a percent of consumption, 1967

	(Imports as percent of consumption)
Metals:	
Bauxite	80.5
Beryllium (11 percent BeO)	100.0
Cadmium	13.7
Cobalt	58.8
Copper	33.5
Gold	14.8
Iron Ore	35.0
Lead	41.2
Manganese Ore (35 percent or more Mn)	86.6
Mercury	35.0
Molybdenum	2.0
Nickel	82.3
Platinum Group	91.4
Silver	32.5
Tin	66.3
Titanium:	
(a) Ilmenite concentrate	22.6
(b) Rutile concentrate	100.0
Tungsten	12.3
Uranium (U_3O_8 content)	14.8
Vanadium	.8
Zinc	41.0
Nonmetals:	
Asbestos	89.5
Barite (primary)	38.8
Boron	32.0
Clays	.2
Diatomite	0
Feldspar (crude)	.1
Feldspar	83.6
Graphite (natural)	100.0
Mica:	
(a) Block and film	93.6
(b) Splittings	78.9
Phosphate Rock	.5
Potash (K_2O equivalent)	41.2
Salt	6.9
Sulfur and pyrites	17.6

NOTE.—Data based on 1967 Minerals Yearbook, vol. I and II, Metals, Minerals, and Fuels, U.S. Bureau of Mines. U.S. Bureau of Mines' Commodity Statements (supplement to Bureau of Mines' Strategic Plan), January 1969.

The same point is illustrated by the following table, which shows United States production of a number of minerals in 1967 as a percent of world production:

TABLE 2

United States mineral production as a percent of world production, 1967

(U.S. production as a percentage of world production)

Mineral:	*Percent*
Cement	14
Feldspar	39
Fluorspar	13
Gypsum	42
Phosphate rock	46
Potash	20
Salt	35
Sulphur elemental	47
Bauxite	4
Copper (content of ore and concentrate)	17
Gold	4
Iron ore	13
Lead (content of ore and concentrate)	10
Mercury	10
Molybdenum (content of ore and concentrate)	71
Nickel	3
Silver	12
Tungsten concentrate (60% tungsten dioxide)	14
Vanadium	47
Zinc (content of ore and concentrate)	10

Source: *Minerals Yearbook*, 1967, vol. I II, table 62, p. 59, and vol. III, table 10, p. 37.

Even the present relationship of domestic production to domestic demand understates our future dependence on foreign sources for minerals. As we pointed out earlier in this statement, the Bureau of Mines is predicting United States mineral demand to increase by more than four times by the year 2000, whereas domestic mineral production projected on the basis of 20-year trends can only be expected to little more than double by 2000 Furthermore, the Bureau of Mines is predicting a five-fold increase in worldwide demand for minerals by the end of the century.

Thus we are faced with a widening gap between domestic mineral supply and domestic mineral consumption, and the problem of obtaining adequate supplies from foreign sources is complicated by an even more rapid increase in foreign demand for minerals.

Facing this future, *any* changes in our tax laws that would discourage American mining firms from securing and developing foreign mineral deposits would be contrary to the national interest.

Our interest in controlling foreign mineral sources

There is a clear national interest in the control of foreign mineral sources to assure an adequate supply of basic minerals for domestic need. The world supply of commercial mineral deposits is limited, and other industrialized countries are actively acquiring control of foreign mineral deposits.

A further important advantage of having the foreign sources of minerals for United States consumption owned by United States firms is the assurance of reasonable prices. The United States should not let itself get into a position where it can be exploited by foreign producers withholding supplies from the market or exerting monopolistic pressures to force payment of unreasonably high prices.

Furthemore, foreign operations that are United States owned will buy machinery and equipment from United States manufacturers and the engineering and construction will be performed by U.S. companies. Additionally, U.S. owned companies are more likely to use U.S. smelters and refiners to process their foreign ores and concentrates.

Balance of payments benefits

United States ownership of foreign mineral operations benefits our balance of payments. Direct foreign investment in mining and smelting abroad, according to the Office of Business Economics in the Department of Commerce, produced a total dollar inflow over the eight-year period, 1960–1967, of over $3.2 billion, of which $2.2 billion were from branch profits, $940 million were from dividends, and $85 million were from interest. Reflecting a steadily rising trend, the 1967 figures totaled $596 million, composed of $413 million branch profits, $167 million dividends, and $16 million interest.

Taking into account the inflow from royalties, license fees, rentals, management fees, and service charges, total mining and smelting dollar inflow exceeded net capital outflows by more than $2.1 billion for the eight-year period, 1960–1967. The net capital inflow for 1967 was $320 million. (The outflow figures for these statistics are contained in the October 1968 edition of the *Survey of Current Business* published by the U.S. Department of Commerce. They include reinvested earnings of foreign branches as well as net capital transfers by United States parent companies.)

Thus the mining industry is now making a substantial contribution to our balance of payments—even when only the direct benefits from remitted profits are taken into account. Other indirect benefits include lower cost imported raw materials than would be possible if they were purchased from foreign-owned companies and better opportunities for our exporters to supply machinery and equipment to mines owned by United States firms.

The profits remitted to the United States are derived only in part from supplying minerals to the United States; they also result from supplying foreign ores and concentrates to foreign markets. These foreign markets will offer increasing opportunities as other countries increase their level of industrial activities and require more mineral supplies.

Erosion of tax incentives offered by foreign countries

If depletion deductions are eliminated or reduced, or if changes are made in the foreign tax credit that result in higher effective U.S. tax rates on foreign mining, the tax incentives offered by many foreign countries will be undercut.

A substantial number of foreign countries are still eager to encourage private capital to develop their mineral resources. To make this possible they offer a variety of measures to lower the income tax burdens of the mining companies—resulting in tax rates that are comparable to U.S. effective tax rates with percentage depletion. Typical effective tax rates applicable to mining income are 37% in Indonesia, 40% in Nigeria, 36% in the Philippines, 25% in Thailand, and 33⅓% in Canada.

As an example, in Indonesia, following the overthrow of the Sukarno regime in 1965 by the present Suharto government, the government enacted Law No. 1 on January 10, 1967. The purpose of Law No. 1 was to provide a favorable climate so, as the preamble of the law states, "that foreign capital should be utilized to the maximum extent to accelerate the economic development of Indonesia and to be used for fields and sectors which within a short time cannot as yet be achieved by Indonesian capital itself." Law No. 1 provided the authority for the government in their contract negotiations with potential foreign investors to grant specific tax exemptions and relief in the form of lower corporate tax rates, a tax holiday period up to five years, exemption from taxes on dividends, exemption from import duties, accelerated depreciation, carryover of operating losses, and other tax incentives. Pursuant to Law No. 1, the Indonesian Government, in 1968, promulgated Mining Regulation No. 18/1968. Besides other tax incentives, this law reduced the Indonesian corporate income tax rate of 60% to tax rates as shown in the table on the following page.

[In percent]

Category of minerals	Corporate tax rate: 1st to 10th year	Corporate tax rate: 11th to 30th year
(1) Copper, lead, zinc, iron, titanium, manganese, mercury, molybdenum, antimony, asbestos, chromite, iodine, natural asphalt, diamond, sulfur, kaoline, and jarosite	35.0	42
(2) Nickel, cobalt, bauxite	37.5	45
(3) Tin	40.0	48

These lower tax rates would become meaningless to United States companies if U.S. percentage depletion on foreign deposits were repealed.

Tax treatment of companies from competing countries

United States mining companies compete with companies from other developed countries for the opportunity to develop and operate foreign mines. Many of these countries actively assist their nationals through favorable tax treatment. These include the following:

France: Unless they elect a different type of tax treatment, French companies are exempted from tax on income from foreign sources.

French companies may elect to consolidate one or more of their foreign branches or subsidiaries, subject to Government approval, for an agreed period. In such case nonferrous mining operations have a 15% depletion allowance for three years (with a 50% of net income limitation), with the depletion allowance placed in a reserve for reinvestment within five years. Electing companies can credit foreign tax against French tax, subject to a per country limitation.

Japan: Although Japan has a 48% effective corporate tax rate and a Japanese company is taxed on its worldwide income (with a foreign tax credit allowed), a Japanese company can charge up to 50% of its investment in a less-developed country against taxable income. This is an addition to a reserve that must eventually be restored to income, but, in effect, the taxes may be deferred up to 10 years.

Netherlands: Although the Netherlands provide no specific tax incentives for investments by a Dutch company in a less-developed country, if a Dutch company operates abroad through a foreign subsidiary the profits generated by the foreign subsidiary are not subject to Dutch income tax when they are repatriated. The only requirement for this treatment is that the subsidiary's profits be subject to tax in the foreign country—regardless of the form the tax and no matter how low the tax rate.

If American mining companies operating abroad are handicapped by a heavier United States tax burden they will be placed at a serious competitive disadvantage vis-a-vis firms based in countries whose tax systems do not negate the advantages offered by countries with undeveloped mineral resources or, in some cases, actively encouraged investment in these countries.

Investment by U.S. companies in foreign mining has been concentrated in Canada and in the less-developed countries, as is evidenced by the following table showing mining and smelting foreign direct investment at the end of 1967.

TABLE 3.—MINING AND SMELTING INDUSTRY YEAREND BOOK VALUE BY MAJOR AREAS, 1967

	Millions	Percent
Canada	$2,337	48.5
Latin American Republics	1,218	25.3
Other Western Hemisphere	431	9.0
Africa	398	8.3
Oceania	322	6.7
Europe	61	1.3
Asia	43	.9
Total	4,810	100.0

Source: U.S. Commerce Department, Survey of Current Business, October 1968, table 3, p. 24.

While Canada has by far the largest share of our foreign mining investment, even there a large share of the investment is in areas of Canada that are not themselves developed.

In addition to the obvious economic advantages to the United States of developing the mineral resources of foreign countries, important foreign policy considerations are involved. The United States has a vital interest in helping less-developed countries, and certainly should not revise its tax system to undercut the attempts of these countries to attract private capital for development.

The arguments set forth above with respect to reduction or elimination of percentage depletion on mineral deposits located in foreign countries apply with equal force to any reduction of percentage depletion generally or to changes in the application of the present U.S. foreign tax credit provisions having the same adverse effect on U.S. mining companies operating abroad as the elimination of percentage depletion on foreign mineral deposits.

Foreign tax credit after loss years (sec. 431)

It is a common occurrence in the development of mining properties to incur heavy expenses during the development stage. These result in losses until the producing stage of the mine is reached. In some cases where mines are developed abroad the foreign countries permit these losses to be carried forward or achieve a similar result by making income from the mine tax-free or by taxing it at a reduced rate during the early years of the producing stage. In other cases, however, the foreign country may provide little or no relief from its taxes on the profits afater the initial losses have ceased and the mine becomes profitable.

The House bill would require a taxpayer using the per-country limitation on the foreign tax credit to carry forward losses incurred in a foreign country and use them to reduce income from such country in subsequent years before computing the limitation of the foreign tax credit to be allowed for income taxes paid to that country. Contrary to the Ways and Means Committee report, this adjustment is not limited to cases where the foreign country loss produced a United States tax benefit. This proposed loss carryover, which works to the taxpayer's disadvantage, is unlimited in time—unlike the usual loss carryforward that is limited to five years.

The justification for this provision given in the Ways and Means Committee report is that under present law a United States taxpayer with losses in a foreign country can obtain "what in effect is a double tax benefit." This is not correct. In fact, he pays no less income taxes. United States and foreign, than a taxpayer with the same income and losses whose operations are all within the United States.

The bill does not take account of the fact that a foreign country may allow losses to be carried back to earlier years (as our own tax system does). Consequently, it may require in total U.S. and foreign income taxes far in excess of the ostensible tax rates in some cases. This is illustrated by the following example of a Canadian branch operation of a U.S. corporation, assuming a 50% tax rate in both the U.S. and Canada:

	Taxable income (loss)	Canadian tax	U.S. tax (per the bill)		
			Gross tax	Foreign tax credit	Net tax
1972	$100,000	[1] 0	$50,000	0	$50,000
1973	(100,000)	0	[2] (50,000)	0	(50,000)
1974	100,000	$50,000	50,000	[3] ($25,000)	25,000
1975	100,000	50,000	50,000	[3] (25,000)	25,000
Total	200,000	100,000	100,000	(50,000)	50,000

[1] 1973 loss carried back to 1972 for Canadian tax purposes. Full refund on 1972 Canadian taxes secured, hence no foreign tax credit.
[2] Assumes other U.S. taxable income in 1973 sufficient to absorb the loss.
[3] Special limitation under the bill.

Note.—Total tax: $150,000; overall effective tax rate: 75 percent.

If this provision of the House bill becomes law, the effect will be to impose higher income tax burdens on taxpayers with foreign operations—contrary to the principle of tax neutrality that is used to justify imposing United States tax on foreign income. Essentially, the complaint should be directed against the foreign taxing authority that fails to allow the initial years' losses to be carried forward, rather than against the United States taxpayer. Instead of sacrificing the United States taxpayer as the House bill would do, the Treasury might attempt to negotiate tax treaties with the countries involved to coordinate their tax treatment with our own. We urge that this unjustified restriction on the foreign tax credit be eliminated from the bill.

If this provision is retained in the bill, at least it should be rewritten to establish as a general principle that it will apply only to the extent foreign losses are actually utilized to reduce tax on income from domestic sources and that the losses so utilized will be taken into account in computing the percountry limitations for subsequent years only when the foreign country has not allowed the loss either as a carry-back or as a carry-forward or through the provision of tax holidays or exemptions.

Special foreign tax credit limitation on mining income (sec. 432)

The House bill would apply a separate limitation on the foreign tax credit with respect to all mining income from each country in which any property producing mining income meets one of three tests. The committee report says that these tests are "to isolate those cases in which it is likely that the income taxes represent, at least in part, royalties." The three tests are whether the foreign country:

(1) require payment of a bonus or royalty,

(2) holds substantial mineral rights with respect to the property, or

(3) imposes any income taxes on mining income at an effective rate higher than on other income.

The three tests are treated as conclusive presumptions that the income taxes paid represent royalties to some extent, yet they are, at best, flimsy reasons for even suspecting that the taxes represent royalties. The fact that a royalty *is* paid is certainly not an indication that the tax paid is *also* a royalty. The fact that the foreign government holds mineral rights is no indication that a royalty is appropriate—for instance, taxpayer may by paying substantial royalties to other persons with interests in the minerals or in the surface lands. Finally, the effective tax rate is ambiguous in its application and even if the tax rate is higher on mineral income, the reason may be based on some policy consideration of the foreign government that has nothing to do with substitution for a royalty.

Even if the tests were valid, it would be unfair to impose the special limitation with respect to *all* mineral income from a country because the foreign government holds rights of some sort in a portion of it. Any limitations based on these tests should be applied only to the excess amounts determined to be royalties, rather than applying to the entire amount of the taxes on mining income paid to the country. Furthermore, this provision is more harsh than the Administration proposal that Congress rejected in 1963, which at least would have permitted foreign income taxes paid on mining income in one country to be credited against U.S. taxes on mining income in other foreign countries. Finally, the illogic of this provision can be illustrated by the fact that it will apply to to a situation where the foreign tax rate plus the royalty paid to the foreign government is less than the tax rate paid by other types of taxpayers in the same country.

In many cases mining companies process their minerals in a foreign country beyond the depletion cut-off point under section 613. For example, ore may be mined in a foreign country and converted or transported in nonmining operations in the same country. Under the provision in the bill, the income attributable to processing beyond the depletion cut-off point would not be mineral income and, therefore, would require a different limitation computation for foreign tax credit purposes. The foreign government, however, will continue to impose a single income tax on the profit from the entire operation (as we do in this country), and it would be unfair to divide this tax arbitrarily and compute the foreign tax credit for each portion under a different limitation.

This provision would penalize taxpayers paying bona fide foreign income taxes by presuming conclusively, without any inquiry into the facts, that all the foreign taxes on mining income are royalties. The Mining Congress urges that this attempt to fragment the foreign tax credit be eliminated from the bill.

The Treasury's suggested alternative to section 432

The Treasury opposes the provisions of section 432 of the House bill, citing as the basis for its opposition some of the same objections that we make here. The Treasury has, however, recommended an alternative to section 432 that is based upon the belief that, somehow, there is a "special problem connected with foreign mineral income." The Treasury's alternative would deny use against other foreign income of excess foreign tax credits that result from the U.S. percentage depletion deduction.

This alternative is not as onerous as section 432 of the House bill, and it is not based upon the contrary-to-fact assumption that virtually every foreign income tax on mining income is in part a royalty. There are, however, serious objections to the Treasury's proposed alternative. It is a variation on a proposal that was made by the Treasury in 1963 and 1964 and finally rejected by Congress when the Revenue Act of 1964 was passed.

The Treasury proposal is subject to the criticism that it attempts to segregate a specific category of income and compare the U.S. and foreign income tax rates on it. While this has the appearance of precision, the appearance is illusory because neither the United States nor most foreign countries really impose schedular taxes on separate categories of income without regard to their impact on the taxpayer. Furthermore, it is not fair to segregate the activity of mining up to the depletion cut-off point from all the other related activities that a mining company engages in in a foreign country. Many of these other activities, such as the operation of railroads, warehouse and shipping facilities, stores, and power plants, are required because of the absence of an adequate economic infrastructure to support mining activities in the less developed countries. Also, in more and more cases the mining companies are finding it necessary or advisable to extend their operations in foreign countries beyond the pure mining stage to include further activities such as smelting, refining, and even processing into finished products. It would be highly artificial and unfair to segregate the profits from strictly mining operations from the activities beyond the mining depletion cut-off point and apply a separate foreign tax credit limitation to them.

The principal effect of an excess foreign tax credit is in averaging out the impact of U.S. and foreign taxes over a period of years. The net effect is that the company pays a total tax at least equal to the effective United States tax rate.

If the approach suggested in the Treasury alternative should be adopted, the U.S. would be taking a step toward an infinitely more complex foreign tax credit system in which we would engage in a hopeless attempt to match foreign taxes against U.S. taxes on an item-by-item basis.

We urge rejection of the Treasury alternative proposal as well as section 432 of the House bill.

Sixty percent limit on creditable foreign taxes

The Treasury's comments on the House bill mentioned the possibility that foreign tax credit might be denied to the extent that foreign taxes exceed 60% of foreign mineral income from a particular country. This is not recommended by the Treasury, however, and, after pointing out that not all high foreign tax rates can be properly characterized as royalty substitutes and that it is difficult to justify treating high foreign mining taxes differently from other high foreign taxes, the Treasury statement concludes its discussion of the point by stating, "we believe it preferable to deal with high foreign tax rates in a general context". It is difficult to understand why the Treasury found it necessary to discuss the point at all at this time since it prefers to postpone consideration until it brings up its comprehensive proposals on U.S. taxation of foreign income. We certainly agree that it would be inappropriate to adopt any such limitation on the foreign tax credit at this time.

In a sense, denying foreign tax credit on taxes in excess of a specified rate is a form of interference with the taxing system of a foreign country. Furthermore, if applied to a specific type of income such as mining income, the limitation is subject to the criticism, made above, that it unrealistically fragments the foreign taxes that are imposed on operations in the foreign country as a whole.

Such a provision would clearly seem to violate our obligations under many of our tax treaties. (Indeed, sections 431 and 432 of the House bill probably also violate our treaty obligations.)

Continental Shelf source rule

The Treasury statement recommends that, for purposes of the foreign tax credit, the definition of the United States be amended to include the continental shelf of the United States "with respect to the exploration for natural resources" and that the definition of "foreign country" should include the continental shelf pertaining to the foreign country. We do not understand the scope of this recommendation, and in fact, we do not understand that the scope of the continental shelf itself has been precisely defined. In view of this uncertainty and in the absence of any demonstrated need for immediate action, we suggest that this proposal be deferred and considered in conjunction with the Treasury's comprehensive proposals on the U.S. taxation of foreign income when these proposals are presented to Congress.

We reemphasize our earlier point that any legislation dealing with the taxation of foreign income should be deferred pending completion of the comprehensive Treasury study of this area.

CONCLUSION

The American mining industry has a vital role in the development and maintenance of our economy. It has performed that role well under our present tax system, and in the process the mining companies have not made after-tax profits out of line with those of industry in general. With an expanding population and an expanding economy before us, the mining industry has an even bigger job to do. It would be the height of folly to set up tax barriers to block the accomplishment of that job by cutting back on the present tax treatment of the mining industry.

Respectfully submitted,

FRED W. PEEL,
Chairman, Tax Committee.

APPENDIX A

NUMBER OF DOMESTIC METAL AND NONMETAL MINES IN 1967, BY COMMODITY AND MAGNITUDE OF CRUDE ORE PRODUCTION

Commodity	Total number of mines	Less than 1,000 tons	1,000 to 10,000 tons	10,000 to 100,000 tons	100,000 to 1,000,000 tons	1,000,000 to 10,000,000 tons	More than 10,000,000 tons

The CHAIRMAN. The next witness will be Mr. Brice O'Brien, general counsel, National Coal Association.

STATEMENT OF BRICE O'BRIEN, GENERAL COUNSEL, NATIONAL COAL ASSOCIATION

Mr. O'BRIEN. Under existing laws the coal industry receives an inadequate rate of depletion, 10 percent, compared to the 15-percent rate extended to minerals in the "all other" category. The House bill will cut coal's rate to 7 percent. We urge that coal's rate be increased to the 15-percent level now applicable to all other minerals.

Coal is an important part of the Nation's total energy picture. The country must have an abundant supply of energy, and most of the energy we use must be supplied from domestic sources if we are to maintain any semblance of a balance of payments.

The Nation's total raw energy bill for oil and gas, uranium and coal is curently about $15 billion a year. Energy consumption is growing so fast that the total bill will be about $30 billion a year in another 20 years.

At the present time the U.S. energy market is peculiarly vulnerable to foreign competition. There is a glut of low cost foreign oil which probably will continue for about 25 years until per capita consumption of energy by the rest of the world increases to the levels necessary to provide a decent standard of living for the rest of the world.

In the meantime the cost of finding and producing oil in foreign countries is so low that import controls and tax incentives are essential if we are to supply the major part of our energy needs from indigenous sources, and we must do that. We cannot permit foreign sources to supply the lion's share of our energy, because if we do so, we will have 20 years from now an energy deficit of $10 to $20 billion a year. And no nation on earth could survive with such a huge trade deficit in one single item.

It is sometimes said that coal does not need a good percentage depletion allowance because very little exploration is required. It is true that we have abundant reserves of coal, sufficient to last for centuries, but coal in the ground cannot be used to produce power or steel. To be useful, there must be sufficient incentive to attract the capital necessary to provide productive capacity, to open new coal mines.

The Nation today is short of coal, and the shortage threatens to increase. The risk to capital is a real deterrent to investment whether that risk lies in the possibility of loss through exploration or in the possibility of loss after productive capacity is installed.

The coal industry has been and is now threatened with loss of investment through many government policies including huge expenditures to develop atomic competition, government stimulation of regulations restricting the use of coal, and the possibility of unlimited imports of cheap foreign oil.

I might point out here that there are no import limitations today on residual oil which directly competes with coal, but if the import limits are lifted on crude oil, that also will compete with coal. Crude oil is selling, foreign oil, at about $2 a barrel. It is easy to transport. If the limits are lifted on that we will find crude oil from abroad replacing coal in the interior sections of the Nation.

These problems are compounded at the present time by the possibility that Congress will enact coal mines health and safety legislation which may force the closing of many coal mines. That legislation is scheduled for the Senate floor this afternoon.

In the fact of all these threats, the coal industry must have a good prospect of net return after taxes sufficient to warrant the risks involved in opening new coal mines.

If that incentive is not present, the capital will be invested in other safer ventures.

The Nation must have coal, with the only alternative being a disastrous deficit in the balance of trade. The Nation will not have coal unless the incentives to invest in new coal production are maintained.

We therefore ask on behalf of the Nation that coal be granted the 15 percent depletion rate currently applicable to minerals in the "all other" category.

Moving briefly to some other problems in the bill before us, first with respect to mineral production payments, we do not maintain that the present treatment should be continued as a permanent part of the tax structure. We do, however, point out that this treatment grew out of the position of the Internal Revenue Service, and we feel justified in asking that its repeal not be retroactive.

Instead of applying to such transactions entered into after April of 1969 as provided in the House bill, the repeal of such treatment should apply only to taxable years after the effective date of the bill now under consideration.

Another item, synthetic fuels. You have under consideration special incentives, including the depletion cutout point, for the production of synthetic oil from shale. Whatever additional incentives are allowed for the purpose of stimulating the production of synthetic fuels from oil shale should be allowed also for the production of synthetic fuels from any other mineral including coal.

When Congressman Aspinall asked for this special treatment before the Ways and Means Committee, he specifically indicated it should apply to all minerals used for the same purpose, and we agree. We point out that the prospects are pretty good that synthetic fuels from coal can be stimulated well prior to the time that synthetic fuels from oil shale are a real commercial possibility.

Another subject: With the repeal of the investment credit, there is a growing need to balance the incentives for the investment of capital in depreciable equipment. This can be done by giving legislative sanction to the existing depreciation guidelines, with simultaneous elimination of the need to meet the reserve ratio test.

The Treasury Department instigated the depreciation guidelines, which admittedly are substantially shorter than useful life. The reserve ratio test is designed to take away, as the years go by, the benefit of the shorter guidelines. But worse than that, the reserve ratio test will make the taxpayer pay additional taxes to pay back to the Treasury the benefit of having had the shorter life in previous years.

There is no sound reason except revenue needs for binding the recovery of investment capital to useful life of the equipment.

The liberalization inherent in the depreciation guidelines has already been absorbed from the revenue standpoint. It should not now be taken away as it will be if the reserve ratio test is not eliminated, and even more important, taxpayers should not now be forced to bear the retroactive penalty of having been granted this liberalization for prior years.

One final point. Instead of eliminating fast depreciation for industrial buildings, such buildings should be included within the depreciation guidelines of the particular industry involved, provided that the revenue is protected by taxing at ordinary income rates all depreciation taken in the future and recovered on sale of such buildings. Industrial buildings do not ordinarily change hands unless a complete business is sold. They are not the type of buildings which lend themselves to any real estate tax shelter, and by providing for complete recapture of future depreciation you would eliminate one possibility that they could be a part of the tax shelter scheme.

Thank you very much.

The CHAIRMAN. What is your reaction to Senator Proxmire's suggestion that depletion allowances are a very inefficient way of developing new reserves?

Mr. O'BRIEN. In my opinion, depletion allowances are a far more efficient method of stimulating production—including the finding of new reserves—than any possible alternative. The alternatives are: (1) direct subsidy or (2) incentive through high prices resulting from shortages.

Direct subsidies for exploration or production lead to waste, and temptations for misappropriation of funds, which inevitably accompany the authority to write Government checks payable to private individuals. In addition, subsidies would substitute the judgment of a Government official for the knowledge and carefulness of the industry man who has been investing his own money.

The other alternative—incentive through high prices resulting from shortages—is not available in the case of energy, unless strict controls on energy imports are maintained. Even then, I believe the economy would be stronger if the incentive is furnished by the tax laws. Minerals—including energy—are at the base of the economy, and if a dollar of cost is added at the base, it will pyramid during the various stages of manufacture to the point where the final consumer will have to pay $2 or $3 in the final product cost for every dollar of cost added at the base.

The CHAIRMAN. Thank you.

Senator GORE. I would like to ask one question:

If you maintain that there must be something other than normal profit as an incentive for investment in coal mining operations, do you think it should be borne by all of the consumers of coal, or, through a subsidy in the form of a special dispensation to the taxpayer who operates in the coal business, by the general taxpayer?

Mr. O'BRIEN. There must be a special incentive for the investment of capital, and the reason there must be is to protect the balance——

Senator GORE. I did not ask you if it was necessary. I assume it is necessary. Which would be preferable?

Mr. O'BRIEN. Let me answer it in this way, Senator. I think it is best borne by all of the people of this Nation, because the reason for it is that the people of this Nation must maintain a balance of trade. The benefit is to the people of this Nation, not to the investor in coal. The need for it arises out of the international balance-of-trade problems. I think it is logical that it should be borne by the Nation as a whole.

Senator GORE. Thank you, Mr. Chairman.

Senator MILLER. In your prepared statement with regard to multiple surtax exemptions, you ask that we retain the present tax treatment if the taxpayer can demonstrate "a sound business reason—independent and apart from tax savings—for the use of multiple corporations." Could you give me an example.

Mr. O'BRIEN. In the case of mining, new ventures can be, and often are, extremely risky and may entail possible losses far exceeding the initial capital investment. In such circumstances it may be prudent for the parent corporation to limit liability by establishing a separate corporation.

Other reasons include: Separate methods of financing may require the issuance of bonds which the parent corporation wishes to restrict to the assets of the separate business.

Again, it may be desired to give employees of the new business a "Piece of the Action."

Or, again, it may be desirable, in establishing a business in a separate state, to limit taxing jurisdiction of the new state by establishing a separate corporation.

(Brice O'Brien's prepared statement follows:)

STATEMENT OF BRICE O'BRIEN OF BEHALF OF THE NATIONAL COAL ASSOCIATION

SUMMARY

I. *Instead of being cut to 7% depletion, coal should be given the 15% depletion rate applicable to the minerals in the "all other" category*—because:

(a) The domestic energy market is (and will be for about two decades) peculiarly vulnerable to imported energy, because there is a short-term glut of low-cost foreign oil and residual oil (which competes with coal in U.S. power plants). Without import controls (and there are none today on residual oil) and without appropriate tax incentives for domestic production, the United States within a relatively short period of years would have an "energy" deficit in the balance of trade amounting to $10 billion to $20 billion—and no country could survive with such a huge trade deficit in one item.

(b) The U.S. has abundant supplies of *coal in the ground*—but we already have a coal shortage and it threatens to get far worse. Government policies in fields other than taxation (such as promotion of atomic competition, limitation of coal's sulfur content, and unduly harsh legislation on mining practices) have reduced the incentive to invest in coal productive capacity. That incentive should not be further decreased by detrimental tax changes. Without incentive to invest in coal mining, the Nation's economy will grind to a virtual halt, because coal is essential to the electric power industry and to the steel industry.

(c) The Nation must have adequate supplies of coal. It is better for the economy to stimulate investment in coal mines through special incentives than through the alternative route—high prices which would follow mineral shortages caused by destruction of special incentives.

(d) Coal is far more important to the economy than many of the minerals in the "all other" category, which currently are allowed 15 percent depletion. Coal currently receives 10 percent and this would be cut to 7 percent by the House bill. Instead, coal should be placed in the "all other minerals" category presently receiving 15 percent.

II. The repeal of present treatment of mineral production payments should be prospective only.

III. Any additional incentives allowed for the purpose of stimulating the production of synthetic fuels from oil shale should also be allowed for the production of synthetic fuels from all other minerals (including coal).

IV. Existing depreciation guidelines should be sanctioned by legislation, with simultaneous elimination of the need to meet the "reserve ratio" test.

V. Instead of eliminating fast depreciation for "industrial buildings," such buildings should be included within the depreciation guidelines of the particular industry involved, with the revenue protected by taxing at ordinary income rates all depreciation taken in the future and recovered on sale of such buildings.

STATEMENT

Mr. CHAIRMAN: The United States has a greater supply of coal reserves than any other country in the world. Yet the United States is already faced with a shortage of coal production—a shortage that threatens to develop into a national crisis. These two statements appear to be contradictory—but they are not. I will explain why this situation has come to pass, and I hope you will understand that while the actions you take in the tax treatment of the industry cannot avoid the forthcoming shortage, they can mitigate that shortage in the future.

The coal industry is an important part of the Nation's total energy picture. Without an abundant supply of energy (most of which must come from domestic sources if we are to maintain a balance of trade), the United States cannot remain a first-class Nation. As the Atomic Energy Commission stated in its 1962 "Report to the President."

"Next to the land, the water, and the air, without which we could not exist at all, energy is by far the most important of our terrestrial resources. Without it our industrial society would be impossible. In common with the other three, it has no substitute."

We cannot afford to import a large portion of our energy. In 1967 the Nation's total bill for raw energy was over 15 billion dollars (domestic crude oil at the well, $8.9 billion; domestic natural gas at the well, $2.9 billion; coal at the mine, $2.6 billion; plus *energy trade deficit*, $1.2 billion). Our 1967 energy trade deficit was composed of a deficit in petroleum and petroleum products of about $1.6 billion, deficit in natural gas of about $65 million, minus surplus in coal exports of about $500 million.

Today's $15 billion a year bill for energy will double in about 20 years—to about $30 billion. The cost of finding and producing foreign oil is so much lower than the cost of finding and producing domestic oil that without import controls a very great share of our energy bill will be supplied by imports. With transportation of liquified natural gas, imports of natural gas will increase by leaps and bounds. Even our low-cost coal is vulnerable to imports—we have in recent years lost most of the utility market on the Eastern Seaboard to imported residual oil. Controls on imports are constantly being relaxed, and there are now serious efforts underway in Congress to eliminate such controls altogether.

Domestic energy markets are extremely vulnerable to foreign supplies of energy, and this situation may continue for as much as 20 or 25 years. American coal can be produced more cheaply than coal anywhere else in the world, but there is a "glut" of foreign oil which may exist for two decades or more (until per capita consumption of energy in the rest of the world increases, as it must eventually). Our domestic oil and gas cannot compete with low-cost foreign oil and gas, and even our low-cost coal is vulnerable to foreign residual oil with its low transportation costs.

We realize the subject before this Committee is taxes, not import controls. But the subjects go hand in hand, where energy is concerned. Without import controls, and without adequate tax incentives for domestic energy sources (oil and gas, uranium, and coal), this Nation within 20 years will have an energy trade deficit of $10 billion to $20 billion a year. No nation on earth—not even the United States—can survive with such a huge trade deficit in a single item.

The picture of future coal production is even more alarming than the general energy picture. Our coal reserves constitute about 80 percent of our total energy reserves (including oil and gas, oil shale, and uranium). But coal in the ground cannot be used to make steel. Coal in the ground cannot be used to generate electricity (and over half of the Nation's electricity today is generated by coal).

Until this decade, the coal industry managed to maintain sufficient productive capacity to meet the Nation's needs (in fact, the industry usually maintained substantial excess productive capacity, so much so that it was able to take up a large portion of the wartime energy demand increases). It did this in spite of several handicaps:

(*a*) The natural risks involved in all mining; that is, unexpected natural conditions underground which can, and often do, result in total loss of investment.

(*b*) An inadequate tax incentive—10% depletion, compared to 27½ for oil and gas, 23 for uranium, and 15% for "all other minerals."

(c) An abnormally low rate of profit during the frequent and prolonged periods when coal was in oversupply.

During this decade, however, the situation has changed very drastically, and we are approaching a drastic energy shortage—particularly a shortage of coal productive capacity—which can cause national disaster by shutting down our steel industry and by shutting down a large portion of the Nation's electric power plants. Coal is already in short supply—and some 25 million tons of coal this year will have to be taken out of the limited stockpiles maintained by consumers. Attached to this statement is a reprint from BUSINESS WEEK of July 5, 1969, entitled "The Coal Bin is Running Short." It tells part of the story. It does not tell all of the story. The reasons why our excess productive capacity has disappeared, and the reasons why the situation is going to become much more critical in the future, are as follows:

(1) With the advent of higher wages in the coal mines, it became necessary to mechanize to the greatest extent possible in order to keep coal competitive with other forms of energy. This greatly increased the capital cost of new mines, requiring a much higher "return after taxes" to make the investment attractive enough to induce necessary risk capital.

(2) Early in this decade atomic power "arrived" as a threat to coal's future in its largest growth market—the utility market. It is now clear that atomic power was "oversold" and that even if the best hopes of the Atomic Energy Commission are realized, the Nation will still need two or three times as much coal by the end of the century, for the production of electricity, as it uses for that purpose today. Nevertheless, the damage was done—the supply of capital for new coal mines dried up, and new mines were opened only after the utility customers signed long-term contracts to buy the coal. The utilities underestimated the need for coal—and there does not today exist the coal productive capacity to fill the gap caused by that underestimate. Furthermore, the confidence of the investor in coal's future is still being undermined by an annual expenditure of $200 million by the Federal Government in an effort to improve atomic power's competitive position vis-a-vis coal.

(3) In recent years, stimulated by the Federal Government, states and municipalities have begun to impose restrictions on the sulfur content of coal—without waiting the few years necessary for full development of the technology to remove the sulfur. This, too, has reduced the availability of risk capital for coal mines.

(4) At this moment, the Labor Committees in both House and Senate are pushing legislation on "health and safety" in coal mining. To the extent that such legislation will actually result in improved health and safety for coal miners, we cannot and do not object to it—but we point out that it will of necessity add substantially to the cost of producing coal, with "guesstimates" ranging in the neighborhood of 20 percent.

Far worse, however, is that these bills as they stand will impose "respirable dust" levels so strict (about twice as strict as the British levels, and Britain has been held up as the "model" in this respect) that the levels may be impossible for a substantial number of mines to meet. This means those mines may have to be shut down, and the capital investment therein lost. Far worse from the standpoint of the country, the coal production from such mines will be lost.

With all these threats—and the difficulty of obtaining an adequate trained labor force—some powerful incentives must be provided for people to risk their money in new coal mines in the future.

Tax incentives alone cannot do the necessary job—if you made the coal industry tax-free, it might not be sufficient in and of itself to overcome all the other government-sponsored threats to investment in new coal mines. But tax incentives can help mitigate the situation. By the same token, tax penalties can make the situation worse. Before setting forth our recommendations for changes in the bill before you, let me point out that the bill contains several provisions which are severely damaging to the coal industry and which thereby decrease the willingness of the investor to open a new coal mine.

(a) The bill repeals the present tax benefits of production payments. While we as an industry have not contended that present treatment should be retained, and while we do not now contend that it should be retained, we do want you to realize that the change is adding a heavy burden to the coal industry.

(*b*) The repeal of the investment credit is a particularly severe blow to the coal industry. As previously stated, a modern coal mine requires a great deal of machinery. Repeal of the credit increases the cost of the machinery, thereby increasing the amount of capital which runs the risk of complete loss because of the many government-sponsored policies outlined above.

(*c*) The bill takes away from the smaller companies (the ones that elected section 615) the ability to deduct exploration expenditures without subsequent "recapture."

(*d*) The extension of the surtax is more damaging to the coal industry than it is to other industries, because of our long-term contracts. Most corporations can and do treat Federal income taxes the same way they treat wages or depreciation—eventually they are passed on to the consumer as just another cost. Because of our long-term contracts the coal industry is unable to do that.

RECOMMENDATIONS

I. Coal should be given the 15% depletion rate applicable to "all other minerals" and the limitation on taxable income from the property should be liberalized for the marginal or near-marginal producers.

Coal is limited to 10% depletion in existing law—and cut to 7% in the bill before this Committee. Without disparaging the minerals listed in the "all other minerals" category, we want to point out that few if any minerals are more essential to this country's future economic health than coal is. It should, as a minimum, be given the rate for "all other minerals," which under existing law is 15%. We believe that rate should not be cut; if it must be cut, then coal should be placed in that category and placed at 11%. Preferably, the entire group (including coal) should be put at 15%, because we cannot maintain our economy without the incentives to produce the minerals that make possible our housing, our automobiles, our air conditioning, and the other necessities of a modern industrial society.

The rate of percentage depletion can have an important effect on coal exports. While foreign oil is cheaper than American coal, in foreign markets, as a source of energy, the steel industries of the world must have metallurgical coal. As a consequence, we are exporting today about $500 million worth of coal per year—which the Government regards as a very important asset in the country's fight to maintain a balance of trade. At the present time, because of an unexpected upsurge in world steel production and because of a world-wide tight supply of metallurgical coal, competitive pricing is not the most significant factor in the volume of coal exports. Under normal conditions, however, the export market for metallurgical coal demands competitive pricing. Adding to the tax burden of United States coal exports will, when the current sellers' market comes to an end, handicap the coal industry in its effort to aid in the balance of payments problem through coal exports.

In addition, we urge that consideration be given to liberalization of the allowance for marginal or near-marginal mines. The limitation of the allowance to 50 percent of the taxable income from the property does not impose a burden on the highly successful mines, but it does restrict the allowance of the mines which are marginal or near-marginal from a profit standpoint.

II. *Effective date of production payment change.*

We are not objecting to the repeal of the present treatment of mineral production payments—but we do want to point out that repeal of that treatment does substantially increase the industry's tax burden and thereby increases the need for proper incentives through other features of the tax laws.

In view of the very great lapse of time between the first "notice" of intention to act on production payments (April 22, 1969) and the probable date of enactment of "tax reform" legislation, we believe the effective date of the repeal should be changed to apply only to production payments entered into after the date of enactment of the legislation—or, perhaps, after the end of the 1969 calendar year. We are not trying to defend continuation of this treatment. Nevertheless, it was a treatment that grew out of the position of the Internal Revenue Service. Our people have relied upon that position in "tax planning." Probably it should be changed. But it is not necessary to change it retroactively—and April 22, 1969, is quite "retroactive" for a bill which may become law in December or, possibly, in February of 1970.

III. *Synthetic fuels—cut-off point.*

A Committee amendment was adopted on the Floor of the House to provide that oil shale's depletion shall be computed, roughly, at that point where it is equivalent, or nearly equivalent, to crude oil. When Congressman Aspinall asked for this treatment before the Ways and Means Committee, he included in his request coal and any other minerals used to make synthetic oil and gas.

Depending primarily on import control policies, it may be many years before it is economic to make synthetic gas and oil out of other minerals—such as coal and oil shale. When it does become economic, there should be no discrimination. All the evidence indicates that our vast coal reserves will be more adaptable, from an economic standpoint, for this purpose than oil shale will be.

Any mineral used to make synthetic oil and gas should receive the same tax incentive as *any other* mineral used for the same purpose. We therefore ask you to add to the oil shale amendment a provision which will state, in substance, that:

> Equivalent in result "ordinary treatment processes" will be extended to any mineral used to make synthetic oil and gas, under regulations prescribed by the Secretary, but such treatment processes shall in no event go beyond the point where the product is equivalent in composition and value to crude oil at the well or raw gas at the well.

In testifying before this Committee, Treasury officials objected to the oil shale amendment on the ground that it would extend depletion to cover "manufacturing" activities. They stated, however, they were sympathetic to the objective of giving tax incentives to promote the production of synthetic oil from oil shale, and would attempt to come up with recommendations to accomplish this end. If the Treasury officials do recommend an alternative method of furnishing the necessary incentives, such alternative method should be made applicable to all minerals used for the same purpose.

IV. *Depreciation guidelines and the "reserve ratio" test.*

With the forthcoming repeal of the investment credit, it is imperative that Congress provide a more balanced climate for the investment of capital in new productive equipment. The Treasury Department is currently conducting a study of possible methods of accomplishing this, through depreciation revisions and other possible changes. That appears to be a long-term proposition, and we believe there are two actions which can be taken by Congress now, *without any appreciable effects on the revenue estimates for this legislation*. Those two actions are as follows:

> (a) Provide legislative sanction for the existing depreciation guidelines, simultaneously eliminating the need to meet the "reserve ratio" test.
>
> (b) Permit inclusion of "industrial buildings" within the depreciation guidelines, but provide for taxation at ordinary income rates for all depreciation taken in the future and recaptured on sale of such industrial buildings.

Several years ago the Treasury Department promulgated its shortened depreciation guidelines, to facilitate recovery of capital investment. Unfortunately, Treasury officials felt bound by statute to maintain a tie between these shortened guidelines to "useful lives," and they accomplished this by imposing an impossible, unworkable "reserve ratio" test—which, when fully effective, will limit use of the guidelines to those who actually retire their equipment in the shortened guideline periods rather than in the ordinary 'useful life" period. Former officials of the Treasury Department insisted that this "reserve ratio" test was an incentive to modernize; they contended taxpayers would discard still-useful equipment in order to be eligible for the shortened guideline lives.

We believe the view that the "reserve ratio" test is an incentive to modernize is in error, because the incentive to invest in new equipment depends on the probability of, and the timing of, return of capital. The reserve ratio test, by delaying the return of capital, reduces the incentive to invest in modern equipment and contributes to the inability of the United States to compete with the nations which give more adequate incentive for modernization.

The effect of the reserve ratio test has been postponed, administratively, to the point where it has not been felt in the past but is about to affect many taxpayers—an increasing amount each year. As it becomes effective, it not only takes away the shortened depreciation lives set forth in the guidelines, but it lengthens them beyond the actual "useful lives" to make up for the previous shortening.

The depreciation guidelines constituted an important administrative reform of depreciation—granting an incentive for investment in equipment through shorter capital recovery, and eliminating a great deal of non-productive controversy over depreciation lives. The revenue cost of that reform has already been absorbed. Legislative sanction of that reform, coupled with repeal of the reserve ratio test, will not affect the revenue estimates of the bill before you. Unless Congress takes this action, the administratively-granted reform will be eliminated—with over-compensation, increasing depreciation lives to make up for the previous shorter lives. Without Congressional action in this regard, the reserve ratio test will further retard the investment of the capital necessary to keep the economy going, and further increase the danger of a real depression.

The bill before you limits depreciation on buildings constructed after July 25, 1969, to 150% of straight-line depreciation, and treats gain on sale of buildings as ordinary income to the extent that accelerated depreciation taken in the future is in excess of straight-line depreciation. The "real estate tax shelter" does not involve industrial buildings—those buildings which house equipment which is an integral part of extraction of minerals, manufacture and distribution. Industrial buildings generally are not sold—unless an entire business is sold. At one time, when former officials of the Treasury were instituting the depreciation guidelines for personal property, they indicated they would be willing to consider shorter useful lives for industrial buildings if all gain on sale were treated as ordinary income to the extent of depreciation taken and recaptured on sale.

We believe Congress should provide for taxation at ordinary income rates with respect to all depreciation taken in the future and recovered on sale of "industrial buildings," and in return therefor Congress should permit inclusion of such industrial buildings within the guideline lives (without reserve ratio test) provided for the industries in which such buildings are involved.

V. *Multiple corporations.*

The House bill phases out the use of "multiple corporations." We can and do understand the objective—where a business is split into 50 or 200 corporations for purposes of tax savings, something should be done about it. But there are many situations where multiple, or separate, corporations are required for sound business reasons (other than tax savings). We ask that you retain the present tax treatment of multiple corporations where the taxpayer can demonstrate that there is a sound business reason (independent of and apart from tax savings) for the use of multiple corporations.

VI. *Mineral exploration expenditures.*

Under existing law, many small companies and individuals engaged in the mining industry have elected Section 615, which allows a total of $400,000 exploration expenditures to be deducted without subsequent recapture of the tax benefit. However, after they reach the $400,000 level they are not allowed to take any further deductions. The larger companies have, by and large, elected Section 617, which permits them to deduct exploration expenditures without limitation but subject to "recapture" of the tax benefit if the exploration is successful.

Under the bill as passed by the House, the small companies which elected Section 615 are made subject to "recapture." However, the limitation on their deductions has not been removed. It should be removed, so that 615 taxpayers will be treated the same as 617 taxpayers. We understand this was a legislative oversight and that it will be corrected.

We appreciate the opportunity to present our views to the Committee.

[From Business Week, July 5, 1969]

The Coal Bin Is Running Short

A combination of recurrent strikes in the nation's bituminous coal fields and steadily rising demand for U.S. coal is now beginning to threaten coal supplies for some basic U.S. industries. This week, with production in the year's first half about 16-million tons lower than 1968's first half, thousands of miners began their annual two-week vacation. Their mood was so volatile that nobody could be sure of when they would return to work.

While output dropped demand increased. The National Coal Assn., the coal operators' trade group, last week forecast that demand this year would be 16-million tons above last year's consumption of 549.5-million tons—up as much as the half-year's output was down. "These are the most aggravated shortages we've had since the Suez crisis of 1957," says William Bellano, president of Island Creek Coal Co., third-ranked U.S. producer.

RUNNING LOW

As of now, the main impact of shortage seems to fall on domestic steelmakers. Unable to buy all the coking coal they need for blast furnaces, they are wrestling with what one steel official calls a "hand-to-mouth situation." Metallurgical coal stocks, as of May 1, constituted a 32-day supply (35 to 50 days is normal). But one large steel producer says that if there were a mine walkout of three weeks or so in the next two months, blast furnace operations would have to be curtailed. Another says even a two-week strike could put steel in such a bind it might possibly ask for government help.

Foreign steel producers, notably the Japanese, have increased their demands for U.S. low-sulfur, metallurgical coal. Since air pollution codes are also forcing other domestic coal users into the low-sulfur market—and only 20% of all coal mined is low-sulfur (1.5% or less sulfur content)—an acute shortage has developed in this category.

Meanwhile, coal inventories at electric utilities have decreased from the normal 90-day supply to less than 80. This is not unusually low, says the U.S. Bureau of Mines, and the utilities contend they have plenty of coal. But coal industry officials insist that if production-losing strikes coincide with summertime's peak power demands, some coal-fired power stations might be forced to schedule "brownouts," or temporary power reductions.

STRIKES

Most of this year's drop in production is attributed to work stoppages, such as the strike that closed West Virginia mines (which produce 30% of U.S. coal) for three weeks in February and March. The walkout forced passage of a state compensation law for black lung, coal workers' pneumoconiosis, a disease associated with the inhalation of coal dust. There have been slowdowns and wildcat strikes for many other reasons.

"There's a general unrest stemming from the black lung problem, as well as disappointment with last year's contract," says Otes Bennett, Jr., president of North American Coal Corp. "It worse than I've ever seen it." North American, which has no West Virginia mines, says it lost 300,000 tons of production this year because of wildcats.

Now reports are boiling up from the coal fields that miners will simply stay off the job at the end of their vacations, to dramatize their health and safety demands. In any case, unrest is certain to continue, and most industry and union sources predict further strikes.

Legislators and coal operators have a record of long inaction on miners' problems. So miners are now convinced that only by agitation will they gain a strong federal coal mine health and safety act. Bills are pending in the labor committees of both houses of Congress—and rank-and-filers in the United Mine Workers led by union dissidents and sparked by crusader Ralph Nader and other critics of the UMW leadership, will be staging rallies, marches, and possibly strikes to push for the strongest possible legislation.

Furthermore, a power struggle between UMW President W. A. (Tony) Boyle and his challenger, executive board member Joseph (Jock) Yablonski, may erupt into wilder strife inside the union before next December's election. "I expect sporadic striking to continue in the industry till after the union election in December," says Island Creek's Bellano. "We don't see any evidence that either the international union or the district union offices have got the miners under control."

MORE NEEDED

But if labor unrest explains part of the shortage, it doesn't account for all of it. U.S. productive capacity simply has not kept pace wiht expanding demand in several sectors:

Electrical utilities, which last year consumed 54% of U.S.-mined coal, have increased their demands because of delay in bringing new nuclear-powered generating stations on line.

Foreign steelmakers, especially the Japanese, are rapidly increasing their demands for low-sulfur coal.

When demand began to rise in the mid-1960s—after a decade of shrinking coal markets—the operators didn't want to invest in costly new mines unless a utility would sign a 20-year or 30-year contract for the mine's entire output.

And many utilities underestimated their coal needs because they expected the nuclear power boom to develop faster than it has.

Meanwhile, the low-sulfur coal market is extremely tight because of the new air pollution regulations aimed at cutting the amount of sulfur dioxide spewed into the air by coal-fired boilers. In St. Louis, for instance, many industrial users are unable to buy low-sulfur coal in order to meet new state regulations. And last week Chicago postponed for a year a regulation limiting coal use to 2.5% sulfur coal, because there isn't much low-sulfur coal mined near Chicago.

COAL WAR

The largest low-sulfur coal fields are the Pocahontas fields, in Virginia and southern West Virginia. Almost the entire output of this coal is tied up by utilities with long-term contracts, by U.S. steelmakers, and by the Japanese. The Pocahontas fields are also the largest source of low-sulfur, low-volatile coal for steelmaking; the best coke for blast furnaces is made by blending low-volatile and high-volatile coal.

Japanese steel producers boosted their demands for U.S. coal from 7.8-million tons in 1966 to 15.8-million last year, most of it low-volatile coal. Then, this year, they markedly increased their demands for high-volatile coal.

Though not all coal executives agree, one official of a large company contends that the heavy Japanese demand is upsetting price relationships. "The Japanese are offering more money than the domestic steelmakers. And this is having a disruptive effect on prices."

UPTIGHT

The Japanese, air pollution regulations, the needs of electric utilities, and the demands of the UMW's rank and file must, at times, seem to be closing in on a steelmaker such as, for example, Armco Steel Corp.

Armco owns some "captive" mines, but it must buy about 20% of its high-volatile and all of its low-volatile coal from outside mines. It has built up its inventories somewhat for the mines' vacation period. But "if we had a series of work stoppages, and we had to buy some coal on a spot basis," says an Armco executive, "we might find the supply very tight."

The CHAIRMAN. The next witness is Mr. John R. Greenlee, chairman of the Tax Committee, American Iron Ore Association.

STATEMENT OF JOHN R. GREENLEE, CHAIRMAN OF THE TAX COMMITTEE, AMERICAN IRON ORE ASSOCIATION

Mr. GREENLEE. Thank you, Mr. Chairman.

I am the director of taxes of the Hanna Mining Co. I appear here today in my capacity as chairman of the Tax Committee of the American Iron Ore Association.

Our association is a trade association representing companies which mine over 94 percent of the iron ore produced in the United States and in Canada. We have collaborated in the preparation of and we concur with the statement that has just been presented to you by the American Mining Congress.

We will therefore limit our testimony to certain provisions of the House bill as they specifically affect the iron ore mining industry.

Our statement, which has been filed for the record, summarizes the history of depletion, making reference to discovery value which is the bridge between cost and percentage depletion. Discovery value is based on the capital value credit rather than the cost of finding a deposit. Percentage depletion, when introduced in the Code, was calculated to allow roughly the same amount of depletion as had been realized under discovery value, but with substantially fewer administrative problems.

I would like to emphasize that in addition to operating under the economic laws which hold for all other industries the natural resource industries face at least three particular factors that distinguish it from other types of businesses.

First, we must recognize the irregularity of the distribution of mineral deposits.

We have to take into account the very high risk of exploration and development.

Third, we cannot forget the exhaustability of the capital assets without a reasonable manner of replacement.

The percentage depletion rate of 15 percent on domestic iron ore as set forth in the House bill should be retained. There is equal validity for maintaining the 15-percent rate for foreign iron ore deposits.

In light of the operation of the foreign tax credit provisions the denial of full depletion on foreign iron ore would result in the U.S. taxpayer paying additional tax to foreign countries with probably no additional tax to the United States.

For almost 40 years percentage depletion has been and continues to be a very important factor in the maintaining of decisions to expend money on iron ore in order to maintain a viable healthy iron ore mining industry, and the basic steel industry which it supports. It is absolutely essential to the security of our Nation.

Why is the iron ore industry unique? Iron ore processing plants today require an average investment in the order of magnitude of $150,000 per employee, and this compares to an average of $19,000 per employee for the top 500 industrial companies in the United States as listed by Fortune magazine. Each million tons of capacity in our industry now requires an investment of at least $35 million.

Since 1954 the iron ore industry has invested $2½ billion in mining facilities. The industry faces enormous capital investment programs in the future to provide for our ever-increasing needs and to provide for the needs for an expanding domestic steel industry.

Fundamentally these capital funds can be obtained only by attracting new investment or by retaining profits in the business. Both of these sources exist only if there is an adequate return on investment in the iron ore mining industry.

Let me move now to the foreign tax credit provisions of the House bill.

Senator GORE. Mr. Chairman, may I ask one question right here?

Mr. GREENLEE. Yes, sir.

Senator GORE. With respect to return on investment, as I understand it, all mineral royalties are treated as normal income except in the case of iron ore royalties. Why on earth should iron ore royalties be treated as capital gain income?

Mr. GREENLEE. Senator Gore, you may or may not recall, but we filed a statement with this committee when that subject was enacted into law. Our Association opposed the treatment of iron ore royalties in the hands of lessors. We opposed the capital gain treatment, because of our concern about the right of the operator to an ordinary deduction of this expense.

Senator GORE. You still stand that way?

Mr. GREENLEE. Sir?

Senator GORE. You still take that position?

Mr. GREENLEE. We still take that position, yes, sir.

Senator GORE. Thank you, Mr. Chairman.

Mr. GREENLEE. Yes, sir.

Senator MILLER. May I ask a question?

Do you know about how much the annual depletion amounts to in your industry?

Mr. GREENLEE. Senator Miller, I do not have that information. I just do not know and I do not know how to get at it.

Senator MILLER. Could you give us an estimate? You do not have to do it right now.

Mr. GREENLEE. Surely.

Senator MILLER. I have two questions.

Mr. GREENLEE. Yes, sir.

Senator MILLER. No. 1, what is the estimated annual depletion deduction within your industry, and No. 2, what is the estimated annual expenditure for exploration, research and development for your industry?

Mr. GREENLEE. Senator, we will be glad to try to get that information for you and submit it to you, yes sir.

Senator MILLER. Thank you.

(The following was subsequently submitted for the record:)

AMERICAN IRON ORE ASSOCIATION,
Cleveland, Ohio, October 10, 1969.

Hon. RUSSELL B. LONG,
Chairman, Committee on Finance, U.S. Senate, New Senate Office Building, Washington, D.C.

DEAR SENATOR LONG: On September 30, 1969 during our appearance before the Senate Committee on Finance, we were asked by Senator J. Miller to submit answers to the following two questions for the record:

1. What is the amount of the annual depletion deduction for the iron ore mining industry; and
2. What is the amount of the annual exploration expenditures for the iron ore mining industry?

Reference is made to Part I of the record of Hearings before the Committee on Ways and Means, House of Representatives Eighty-eight Congress, First Session on The Tax Recommendations of the President contained in his message transmitted to the Congress on January 24, 1963. Exhibit 10, dated February 6, 1963 beginning on page 290 of that record makes reference to a survey of the depletion deductions and the exploration and development expenditures by mineral product types and by foreign and domestic properties. The latest group of years included in this survey covered 1958, 1959, and 1960 and preliminary tabulations of that survey were included in the record. The Treasury pointed out that total depletion by type of mineral is not available in the Statistics of Income published by the Treasury and that the survey was undertaken to approximate the depletion total for various mineral categories for these years. This effort was necessarily a sample survey.

To my knowledge, there are no available figures of more recent date that would indicate the amount of the annual depletion deduction and the amount of the annual expendiutres for exploration in the iron ore mining industry. This Association has never, in its long history, collected information of this nature and it would be difficult, if not impossible, to compile such information at this time.

The problem with respect to exploration expenditures is further complicated by the fact that, until Section 617 was enacted into the Internal Revenue Code in 1966, taxpayers were limited to a total amount of $100,000.00 per taxpayer as a deduction for exploration expenditures. Therefore up until that time (1966) there existed no relationship in the iron ore mining industry between annual expenditures for exploration and the deductions allowed.

We sincerely regret that we are unable to furnish the information which was requested by Senator Miller at the recent hearings.

Sincerely,

JOHN R. GREENLEE,
Chairman, Tax Comittee.

Mr. Greenlee. If I may I will continue with the discussion of the foreign tax credit provision.

The present existence of the OFDI rules makes even more important the position we take with respect to the provisions of the foreign tax credit as they exist in the House bill. The extractive industries we think should not be singled out for adverse treatment in the computation of the foreign tax credit. Sections 431 and 432 of H.R. 13270, as they are drafted, miss the point of the foreign tax credit and should be rejected.

The United States historically has predicted its taxation philosophy on the pattern of applying the income tax to all United States citizens on a world-wide basis regardless of residency or souce of income. The U.S. citizen is also taxed by most foreign countries on income arising from sources within their respective borders regardless of his U.S. citizenship.

Without these foreign tax credit provisions, the resulting double taxation of foreign source income would render foreign operations competitively impossible.

The use of the foreign tax credit has been a cardinal part of our law almost from the inception of the initial Income Tax Act. Adequate world-wide long-term reserves of iron ore must be maintained under the control of United States based companies for the economic well-being of our country. It is, therefore, essential to adopt and maintain tax policies which encourage domestic producers to seek the raw materials available for U.S. consumption, regardless of where these raw materials are found.

I would like now to turn to the provisions with respect to the depreciation of real estate. The proposed repeal of the investment credit provisions of the Code brings into sharper focus the restrictive provisions of section 521(a) of the House bill which denies the use of double declining balance or the sum of a year's digits method to new depreciable real property other than residential housing.

Depreciable industrial real estate constructed or acquired for the taxpayer's own use should not be denied the use of accelerated depreciation.

I want to emphasize when making this point that we do not oppose the full recapture provisions as they might be applied to real estate.

In conclusion, I point out that our strong feeling is that the necessity for long-range planning in the iron ore mining industry and the related necessity to consummate long-range financial commitments require reliance on tax grouped rules that exist at the time such commitments must be made. That alone we think makes a strong case for the premise that any change in legislation ought to reflect the fundamental rule of fair play that taxpayers are entitled to the fulfillment of reasonable certainty in their choices of business and investment arrangements.

In conclusion, we therefore strongly urge that the depletion rate for iron ore be retained at 15 percent for both domestic and foreign production. We urge that the present rules with respect to the computation of the foreign tax credit be retained, and the provisions of the House bill relating to this subject be rejected.

We also state that the present accelerated depreciation provisions as they relate to industrial real property should be retained, and section 521(a) of the House bill should be rejected.

Thank you very much.

The CHAIRMAN. It would seem to me from your statement that you are speaking for those who mine iron ore and not for those who own the land.

Mr. GREENLEE. You are entirely correct. We are talking from the standpoint of those who operate the mines.

The CHAIRMAN. Thank you very much.

Mr. GREENLEE. Thank you; sir.

(John R. Greenlee's prepared statement follows:)

STATEMENT OF JOHN R. GREENLEE, CHAIRMAN OF THE TAX COMMITTEE, AMERICAN IRON ORE ASSOCIATION

SUMMARY

Introduction

The American Iron Ore Association endorses statement of American Mining Congress and limits testimony to Sections 431, 432, 501 and 521 of HR 13270 as those sections specifically affect iron ore mining industry.

History

History of depletion traced. Bridge between cost and percentage depletion discussed.

Percentage depletion rates

The depletion rate for iron ore should be retained at 15% for domestic production as provided for in HR 13270. We also believe 15% should be retained for foreign production and we explain this under our discussion on Foreign Tax Credit.

Economic factors and national securiyt

A viable, healthy iron ore mining industry is essential to security of nation. Enormous capital investment has been made by the industry and vast sums will be required in the future to provide the necessary iron ore to maintain our present standard of living. It is necessary to maintain adequate return on investment in iron ore mining industry in order to provide future capital requirements.

Foreign tax credit

Extractive industries should not be singled out for adverse treatment in computation of foreign tax credit. Present rules with respect to computation of foreign tax credit should be retained and the provisions of HR 13270 relating to this subject should be rejected.

Real estate depreciation

Depreciable industrial real estate constructed or acquired for taxpayer's own use should not be denied the use of accelerated depreciation. Section 521(a) of HR 13270 should be rejected.

Conclusion

The necessity for long range planning in the iron ore mining industry and the requirement for long range financial commitments makes a strong case for the premise that changes in legislation should reflect a fundamental rule of fair play that taxpayers are entitled to reasonable certainty in making choices of business and investment arrangements.

STATEMENT

My name is John R. Greenlee. I am the Director of Taxes of the Hanna Mining Company, Cleveland, Ohio.

I welcome and appreciate this opportunity to appear before you today in my capacity as chairman of the Tax Committee of the American Iron Ore Association. The American Iron Ore Association is a trade association representing companies which mine over 94% of the iron ore produced in the United States and Canada. The Association headquarters is located at 600 Bulkley Building, in Cleveland, Ohio.

CONTENTS

The American Iron Ore Association limits its presentation to a discussion of percentage depletion and the importance of percentage depletion to the iron ore mining industry and the Nation; a discussion of Sections 431 and 432 of HR 13270 dealing with the computation of the foreign tax credit; and Section 521 of HR 13270 affecting the depreciation of real estate. The statement consists of seven parts, namely:

1. Introduction.
2. History.
3. Percentage Depletion Rates.
4. Economic Factors and National Security.
5. Foreign Tax Credit.
6. Real Estate Depreciation.
7. Conclusion.

INTRODUCTION

Our testimony today will deal with Sections 431, 432, 501, and 521 of HR 13270 as passed by the House of Representatives on August 7, 1969. Sections 431 and 432 of that bill affect the computation of the credit for foreign taxes, Section 501 is concerned with the taxation of income derived from the mining of natural resources, and Section 521 deals with the depreciation of real estate. We have purposely limited our discussion to the application of these provisions as these proposed changes affect the iron ore mining industry.

We have collaborated with the American Mining Congress in the preparation of the statement presented to your Committee by them and concur with it. We wish to add however, certain points that have particular reference to the iron ore mining industry.

HISTORY

The statement of the American Mining Congress has traced the development of the legislative history of percentage depletion in some detail which we will not repeat. We would add to that history the following additional facts.

In the early years of the income tax, depletion was based on what the taxpayer had paid for the acquisition of the mineral deposit. This was Cost Depletion which is still a part of the law today. Between cost and percentage depletion, which first became a part of the law in 1926, came Discovery Value Depletion. This method is the "missing link" which connects the original cost depletion with percentage depletion. What discovery value depletion sought to do was to allow depletion to be based on the value of the deposit rather than the cost of acquiring it, i.e., the *capital value* created, rather than the *cost* of its creation.

Because of the many difficulties encountered in administration, discovery value gave way to percentage depletion. Percentage depletion represented an effort to allow roughly the same amount of depletion as had been realized under discovery value. Discovery value, as stated earlier, was enacted to prevent the taxation of the capital value created. Percentage depletion was introduced to present similar results but with substantially fewer administrative problems. It again recognized that an equitable tax system must and should take into account the capital value of mineral resources and exclude such value from a tax on income. This is a fact that seems to be lost in the discussions of percentage depletion in the tax reform movement.

We emphasize one fact which we think is not generally understood. Mineral industries must operate, not only under economic laws which hold for other industries, but also under conditions which hold *only* for the mineral industry. There are at least three principal factors that distinguish the mineral industry from other types of business:

1. The irregular distribution of mineral deposits;
2. The high risk of exploration and development; and
3. The exhaustibility of the capital assets without a reasonable manner of replacement.

Certain provisions of the Internal Revenue Code were developed to recognize the unique position of the mineral industries and were inserted into the law for sound and thoroughly considered reasons. They have been reviewed periodically and have been found on a continuing basis to fulfill the purpose and need for which they were originally enacted.

PERCENTAGE DEPLETION RATES

The percentage depletion rate of 15% on domestic iron ore as set forth in the House Bill should be retained for the reasons stated under the caption "Economic Factors and National Security". There is equal validity for maintaining the 15% rate for foreign iron ore deposits for the reasons later discussed under the caption "Foreign Tax Credit". Most importantly, in light of the operation of the foreign tax credit provisions, the denial of full depletion on foreign deposits would result in the U.S. taxpayer paying additional tax to the foreign countries and no additional tax to the United States. No reasonable distinction can be made between domestic and foreign depletion rates as applied to the production of iron ore and we therefore strongly urge that both remain at 15%.

ECONOMIC FACTORS AND NATIONAL SECURITY

A viable, healthy iron ore mining industry (and the industry it supports—the basic steel industry) is absolutely essential to the security of our nation.

For almost forty years, percentage depletion has been and continues to be an important factor in the making of decisions to expend money on mining as compared to other investment opportunities.

What makes the iron ore mining industry unique? Never before in the history of that industry has capital in such enormous amounts been so requisite to survival in the industry. Plants to process the present reserves of iron ore in order to make them acceptable in the current market require tremendous capital investments. For example, the top 500 industrial companies in the United States, as listed by Fortune magazine, require an average investment of $19,000 per employee, whereas iron ore processing plants today require an investment in the order of $150,000 per employee. A capital investment of at least $35 million is needed for each million tons of annual capacity. Since 1954 the iron ore industry has invested $2.5 billion in mining facilities. The industry faces an even larger capital investment program in future years to provide for the expanding needs of our domestic steel industry.

The enormous future capital requirements of the iron ore mining industry may be illustrated by a quote from a recent book, "Affluence in Jeopardy" written by Charles F. Park, Jr., Professor of Geology and of Mineral Engineering at Stanford University:

"In the year 1967 the per capita consumption (of iron) in the United States was about one ton per year; a comparable world figure was 0.17 ton per person. To double the population of the world by the year 2000 and simply to maintain the same per capita consumption of iron means doubling its production, i.e., producing about 550 million more tons annually. Should the present population of the world raise its consumption of 0.17 tons per year to that of the United States, then 3.25 billion tons, or an increase to 6 times our present production, would be required annually. In the event that the population of 6½ billion people in the year 2000 will require one ton per person per year, as we in the United States now do, then the current annual production of 550 million tons would have to be increased 12 times. Such figures clearly show the difficulties inherent in supplying man with the amounts of iron he needs if he continues to expand numerically at the projected rate. Such figures allow for no greater per capita use of iron and steel than that of the United States today, and yet even here people are hoping for higher standards of living that will require greater per capita consumption of both."

Where are these capital funds to be obtained? Fundamentally, capital funds can be obtained only by (1) attracting new investment, or (2) by retaining profits in the business. Both of these sources exist only if there is an adequate return on investment in the iron ore mining industry.

FOREIGN TAX CREDIT

The American Iron Ore Association strongly urges that the present rules for the computation of the foreign tax credit be retained. Sections 431 and 432 of HR 13270 as drafted miss the point of the foreign tax credit. In attempting to eliminate a possible "double benefit" these sections of the House Bill do violence to other sections of the code and should be rejected.

From the enactment of the first income tax law in 1913 the taxation philosophy of the United States has been predicated on the pattern of applying the income tax to all United States citizens on a world-wide basis regardless of residency or source of income. The U.S. citizen is also taxed by most foreign countries on income arising from sources within their respective borders regardless of his U.S. citizenship. Without these foreign tax credit provisions the resulting double taxation of foreign source income would render foreign operations competitively impossible. As a result, almost from the inception of the initial income tax act the device of the foreign tax credit has been a cardinal part of our law. This concept is generally followed for all business operations and is *not applicable exclusively to mineral operations*. The extractive industries should not be singled out for adverse treatment.

Any restrictive changes in the computation of the foreign tax credit should particularly be avoided while the present extremely difficult repatriation rules are being imposed by the Office of Direct Foreign Investment.

Adequate world-wide, long-term reserves of iron ores must be maintained under the control of United States based corporations for the economic well-being of our country. It is essential therefore, to adopt tax policies which encourage domestic producers to seek the raw materials available for U.S. consumption regardless of where these raw materials are found. To do otherwise would result in the development of these additional sources of raw materials by non-nationals who may or may not be concerned with the best interest of the national defense of the United States and the economic well-being of its iron and steel industry. Therefore the encouragement of American companies to secure mineral rights in foreign countries is essential from the standpoint of the continued economic growth of our country.

The present proposals adversely affect our international competitive position. American capital must develop foreign iron ore reserves, not only to complement our domestic supplies but in order that United States controlled operations can effectively compete in the foreign markets for iron ore.

Since foreign income taxes paid by U.S. companies are allowed as credits against U.S. income taxes otherwise payable, the tendency of mineral producing countries is to raise their income taxes at least to a level that will absorb the full allowable credits. Thus any increase in the U.S. effective tax rate would not be likely to increase U.S. tax revenues. This might, however, increase foreign revenues with adverse effect on U.S. balance of payments and with resulting tax disadvantage to U.S. Companies in comparison with their foreign competitors in world markets. This is particularly true with respect to iron ore operations in Canada.

Apart from these considerations, however, Section 431 of the House Bill provides for recapture of foreign tax credit even in cases where no U.S. tax benefit was ever received, and Section 432 imposes foreign tax credit limitations in cases where the foreign government has an ownership position in minerals even though mining companies may pay foreign income taxes at a lesser effective rate than other corporate taxpayers generally. These provisions should be rejected.

REAL ESTATE DEPRECIATION

Section 521(a) of the House Bill denies the use of the double declining balance or the sum of the years-digits methods to new depreciable real property (other than residential housing). The bill would also limit depreciation of used property to the straight-line method. This would result in a serious impact on the cash flow of the iron ore mining industry.

These provisions are broad enough in scope to include depreciable industrial real estate constructed or acquired for use as an integral part of a mining operation. There can be no relationship between the use of such industrial property and the use of certain non-industrial real property which would require a change in the depreciation of real estate. Thus, the reasons set forth in the report of the Committee on Ways and Means are inapplicable to this industry and the industry that it supports, i.e., steel.

Opportunities for tax avoidance which the Committee's action seeks to eliminate do not exist with respect to depreciable real estate used in the iron ore mining industry. We do not oppose the recapture provisions in the bill—these provisions provide ample protection against so-called abuses in this area. A mine building or a beneficiation plant constructed or acquired for the taxpayer's own use should not be denied the use of accelerated depreciation. The restrictive provisions are even more important in light of the proposed repeal of the investment credit.

CONCLUSION

The necessity for long-range planning presents particular problems in the iron ore mining industry. Correlative to this problem and necessary to its solution are long-range financial commitments. In consummating such financial commitments taxpayers must rely on tax ground rules that exist at the time the commitment is made. Any change in legislation—irrespective of its merit—ought to reflect a fundamental rule of fair play that taxpayers are entitled to the fulfillment of reasonable certainty in their choices of business and investment arrangements. A persuasive argument on this ground alone can be made to leave the rules as they are.

In summary, therefore, we strongly urge that:

1. The depletion rate for iron ore be retained at 15% for both domestic and foreign production;
2. The present rules with respect to the computation of the foreign tax credit be retained and the provisions of HR 13270 relating to this subject be rejected; and
3. The present accelerated depreciation provisions as they relate to industrial real property should be retained and Section 521(a) of HR 13270 should be rejected.

The CHAIRMAN. Now, the next witness will be Mr. Kenneth E. Tobin, Jr., managing director of the National Industrial Sand Association and managing director of the National Sand & Gravel Association.

STATEMENT OF KENNETH E. TOBIN, JR., MANAGING DIRECTOR, NATIONAL INDUSTRIAL SAND ASSOCIATION, AND MANAGING DIRECTOR, NATIONAL SAND & GRAVEL ASSOCIATION; ACCOMPANIED BY CHARLES E. BRADY, SALISBURY, N.C., AND EARLE T. ANDREWS, A MEMBER OF THE TAXATION COMMITTEE OF THE NATIONAL INDUSTRIAL SAND ASSOCIATION, SILVER SPRING, MD.

Mr. TOBIN. My name is Kenneth Tobin. I am the managing director of the National Sand & Gravel Association and the National Industrial Sand Association.

With your permission, Mr. Chairman, I would like to divide the time which you have been so kind enough to allot us this morning between Mr. Charles E. Brady of Salisbury, N.C., who would like to present a statement in behalf of the sand and gravel industry of the United States and Mr. Earle T. Andrews of Berkeley Springs, W. Va., who would like to present a statement in behalf of the industrial sand industry of the United States.

Mr. BRADY. Mr. Chairman and members of the committee, my name is Charles E. Brady, and I am president of Material Sales Co. of Salisbury, N.C., a sand and gravel sales organization.

I am also the immediate past president of the National Sand & Gravel Association, and presently chairman of its taxation committee.

Sand and gravel is the basic building material. It is employed in every type of construction, both public and private. Sand and gravel nevertheless is not an inexhaustible natural resource. The very opposite is the fact: In the latest statistical study of sand and gravel reserves in 1963, the National Sand & Gravel Association found that currently held reserves had a life expectancy of only 24 years.

According to the demand estimates of the Bureau of Mines, our industry must produce approximately 66 million tons of sand and gravel between 1970 and the year 2000. Our last year's recordbreaking production was 918 million tons valued at over $1 billion. Now, where in the world is our industry going to find the deposits to produce so much sand and gravel in these 30 years?

Our industry is privately owned and financed in the best American tradition of free enterprise. If we are to continue to explore for and acquire needed additional reserves, in these times of escalating land costs, restrictive zoning codes, and competition from other sources for the use of land containing sand and gravel deposits, we need as never before our modest 5 percent depletion.

I urge you to allow our industry to continue receiving this 5 percent allowance, which it needs to remain healthy. I thank you.

Mr. ANDREWS. Mr. Chairman, gentlemen, my name is Earle T. Andrews. I am a member of the National Industrial Sand Association's Tax Committee and am Chairman of the Board of the Pennsylvania Glass Sand Corporation. With your permission I will read hastily from notes in the interests of conserving your time.

The National Industrial Sand Association is an industry association representing approximately 85 percent of the production of industrial sands in the United States. Industrial sand is a general term for quartzite and also quartz sand and pebbles used or sold for purposes dependent upon their silica content or their chemical or refractory properties.

Industrial sand is a primary raw material used in the manufacture of glass, chemicals, electrical porcelains and other silica based products and as metallurgical sand required in the manufacture of ferrous and nonferrous metal products. These constitute the primary markets although there are over 100 industrial and technical commercial uses requiring the unique chemical and physical properties of industrial sand. We submit that the conclusions of the Ways and Means Committee were not based upon any study of the industrial sand industry or the mining industry generally.

Mineral resources are a wasting asset and percentage depletion recognizes this fundamental reality. Presently available mineral deposits are gradually being exhausted and additional reserves must be found and maintained.

Percentage depletion of the national mineral policy generally has fostered the development of this country's natural mineral resources which is in turn tied directly to the Nation's economic growth.

Tax reform is intended to eliminate inequities and redistribute the burdens of taxation or to simplify the assessment of reliability, but it should not reverse unintentionally the national minerals policy.

Industrial sand is a small industry. As reported by the Department of the Interior, total production of industrial sand in 1967 amounted to 25,323,000 short tons, valued at $85,555,000. The amount of the aggregate depletion deduction for industrial sand is not available.

The total value of the industry's production establishes that the proposed rate reduction will not increase the Nation's revenues substantially. Individual producers of industrial sand will be confronted by a sharp cut-back of almost 27 percent in their allowable depletion deduction.

Percentage depletion has become an integral part of the economics of the industrial sand industry. The proposal rate reduction would be a serious dislocation. Prices would need to be raised substantially to offset the lower depletion deductions.

The impact of the rate reductions is not likely to be overcome satisfactorily by price increase, and the likely consequences include curtailed exploration and development of new deposits, less research into mineral recovery methods, and slower modernization of operating methods. Adequate supplies of industrial sand are not easily located, developed or processed into marketable levels of purity.

Extensive exploration development and sophisticated and expensive processing of the material are required to meet today's demands much less the increasing needs of the future.

The conclusion must be drawn that the proposed percentage depletion rate reduction will affect the capital values, the risk element of industrial sand producers which in turn will adversely affect the supply of this important material.

The other provisions of the House bill applicable to all businesses serve whatever may be the reasonable demands of tax reform on the mining industry.

I thank you and I will endeavor to answer any questions submitted.

The CHAIRMAN. Let me ask one question. To what extent does the cost of washing the sand or cleaning up the sand and gravel raise the depletion allowance from the value of the sand or gravel in place?

It is of very little value where you find it, but you have to wash the gravel, for example. How much does that raise the depletion allowance? It is 5 percent but 5 percent of what?

Mr. ANDREWS. Well, let me answer it this way. First, the industrial sand industry is not engaged in the production of sand and gravel per se. I think you understand this.

Second, we extract an ore from the ground which has the basic crystalline silica content. In this aggregate ore we extract from the ground there are other mineral impurities, coatings on the grain or discrete parts of other minerals and these have to be extracted by processing. Some of this is done by repeated washing. In other cases more solphisticated methods are applied.

But the major part of the cost really accrues in this processing. The material as you extract it from the ground has no commercial value per se. You cannot sell it in that condition.

The CHAIRMAN. I was just trying to determine to what extent that increased the value. It is zero when you extract it from the ground. What is the worth of it by the time you get through washing?

Mr. ANDREWS. Well, the average sales price of industrial sand, for instance, varies from approximately $3 to $4 a ton. Its price as you extract it from the ground would be simply an estimate but it is not sold in that condition. It is not in a marketable state. Just one other statement, Senator, industrial sand and construction sand are two complete and separate entities. They are not interchangeable. They both have certain illogical characteristics. They are not interchangeable. They do not go through the same processing methods. They are mutually exclusive as far as the market is concerned. Thank you.

Senator MILLER. What is estimated total annual amount of depletion—for tax purposes—in your industry?

Mr. ANDREWS. I can only give an intelligent estimate. The depletion allowance for the industry is probably between $11 million and $13 million and the tax benefit therefrom between $5,500,000 and $6,500,000.

Senator MILLER. What is amount of total gross sales of your industry?

Mr. ANDREWS. United States Bureau of Mines statistics show $85,855,000 as the value of the production of our industry for 1967. I would estimate sales of industrial sand for 1969 would approximate $93 million.

Senator MILLER. Thank you, sir.

The CHAIRMAN. Thank you very much, gentlemen.

(Charles E. Brady and Earle T. Andrews' prepared statements follow:)

STATEMENT OF CHARLES E. BRADY, NATIONAL SAND AND GRAVEL ASSOCIATION

SUMMARY

The sand and gravel industry, according to the U.S. Bureau of Mines, is the largest non-fuel mineral industry in the United States and the demand for sand and gravel "is greater than the combined demand for the rest of the non-fuel non-metallic minerals."

In 1968 our industry produced 918-million tons of sand and gravel. According to the Bureau of Mines, the country's need for sand and gravel of suitable quality between 1970 and 2000 will necessitate production of almost 60-billion tons—a staggering figure! To meet this demand for sand and gravel, the basic construction material, we must on the average double our record-breaking 1968 production in each of those 30 years.

Ours is a privately owned and managed small-business industry, making available in every area of the United States a valuable and essential natural resource, without which this country could not fight a war, prepare for the possibility of another war, maintain this country's high standard of living, and make it possible to undertake a program for urban development and housing on a large scale to accommodate the predicted increase of 100-million people in the metropolitan areas by 1992.

Sand and gravel is not an inexhaustible natural resource. There is a widespread assumption in this country that the availability of sand and gravel is unlimited. The very opposite is the fact: in the latest statistical study of sand and gravel reserves conducted by the Association, in 1963, it was estimated then that, on a national average, currently-held reserves had a life expectancy of 24 years. This estimate was based on an annual rate of production which has substantially increased since 1963 and which all forecasts predict will further increase dramatically. Additionally, the average life expectancy of reserve deposits is substantially less in major metropolitan areas where the demand for sand and gravel is the highest.

One day our country will surely discover that the largest member of the mining family is being driven farther and farther away from its point of use and that, therefore, the cost of construction of all types will be substantially increased, because transportation costs are the dominating factor in sand and gravel prices.

Land costs for sand and gravel deposits have risen alarmingly in the last 15 years. These costs will increase, thus aggravating a problem which is more serious in the case of the sand and gravel industry than in any other natural resource industry. Since sand and gravel operations must be located close to the metropolitan areas which provide our principal markets, our industry must pay many times the price for land paid by other natural resource industries. Without a percentage depletion allowance of at least 5 per cent, we will not be able to locate and acquire the land which is necessary to produce the sand and gravel which the country must have in order to sustain its building and construction program.

No other mining industry is so widely dispersed as our industry. Our operations are found in every state of the Union. The modest 5 per cent depletion allowance for sand and gravel has been indispensable to our industry in meeting the heavy capital charges involved in locating and obtaining sand and gravel deposits of the necessary quality and reasonably close to the metropolitan areas which are our principal markets. I have described our 5 per cent depletion allowance as modest. It is! Its continuation is necessary if our industry is going to be able to turn out the billions of tons of sand and gravel which we will be called upon to produce in the years ahead.

STATEMENT

My name is Charles E. Brady. I am Chairman of the Committee on Taxation and past-President of the National Sand and Gravel Association. I am also President of the Material Sales Company, Salisbury, North Carolina. I appreciate the opportunity afforded me by our Committee to speak for the sand and gravel industry of the United States in asking your Committee to continue the present percentage depletion rate of 5 percent for the sand and gravel industry, which the House of Representatives would reduce by 20 percent to 4 percent.

It should be noted at the outset that no public official or any private agency has ever at any time criticized or made objection to the 5 percent rate for the sand and gravel industry, authorized by the Congress in 1951. The House Ways and Means Committee did not give us an opportunity to be heard before it made its recommendation to the House. I have no doubt that many members of the House, had it not been for the closed rule under which the bill was considered, would have voted against the reduction in our modest percentage depletion allowance, had there been an opportunity to do so.

It seems quite obvious that the across-the-board reductions in the percentage depletion allowance for minerals and metals were prompted by the strong criticism of the percentage depletion rate for petroleum. Yet in reducing that particular rate, the House reduced the rate for almost all minerals heretofore granted percentage depletion by the Congress.

Sand and gravel is not an inexhaustible natural resource. Our industry, says the U.S. Bureau of Mines, is the largest non-fuel mineral industry in the United States. In 1968, according to a report of the Bureau, our industry produced 918 million tons of sand and gravel, the value of which exceeded one billion dollars. The Bureau added that the demand for sand and gravel "is greater than the combined demand for the rest of the non-fuel nonmetallic minerals."

Our industry plays a vital role in the Nation's economy, in war and peace. Our industry is proud to be able to say that it has bought and leased land at high cost and has bought and installed equipment at equally high cost without governmental subsidy or financing in any form. Ours is a privately owned and managed small-business industry, making available to the United States in every area of our country a valuable and essential natural resource, without which this country could not fight a war, prepare for the possibility of another war, maintain this country's high standard of living, and make it possible for our country to undertake a program for urban development and housing on a large scale to accommodate the predicted increase of 100 million people in the metropolitan areas by 1992.

Let me go a bit farther in my effort to make it clear to this Committee that ours is indeed an essential industry. Our country could not have airports: our country could not have defense plants, without using sand or gravel or both as the first step in building these structures. We could not have public utilities such as electricity, water, telephone, gas and sanitary facilities; our country could not have homes, schools, colleges, churches, commercial structures, shopping centers, parking lots—all of the essential elements of community living in the United States, unless sand and gravel of a suitable quality is available at an economical price.

I emphasize the latter because there is seemingly a popular assumption in this country that, while other natural resources may be limited in both availability and quality, this is not true of sand and gravel. The very opposite is the fact: In the last statistical study of sand and gravel reserves conducted by the Association in 1963, it was estimated then that, on a national average, currently held reserves had a life expectancy of 24 years. It should be pointed out, however, that this estimate was based on an annual rate of production which has substantially increased since 1963 and which all forecasts predict will further increase dramatically. Additionally, average life expectancy of reserve deposits is substantially less in major metropolitan areas where the demand for sand and gravel is the highest.

One day our country will surely discover that the largest member of the mining family is being driven farther and farther away from the sites at which sand and gravel is used and that therefore the cost of construction of all types will be substantially increased, because transportation costs are the dominating factor in sand and gravel prices. The farther we are removed from the markets we serve, the higher the cost and the greater the price which the country will have to pay to carry on a great construction program.

Let me give you a brief review of how the demand for sand and gravel of suitable quality at a reasonable price has grown in just recent years. Our production in 1955 totaled 592 million tons. In 1956, production increased to 625 million tons; in 1959, production totaled 730 million tons. You will quickly see that as compared with 1955, our production in 1968 had increased by more than 50 percent to 918 million tons, a staggering increase which I believe will impress this Committee.

Even so, however, the American Society of Planning Officials stated that in the 30-year period from 1962 to 1992, construction facilities for the projected increase of 100 millon people in metropolitan areas would make it necessary for the sand and gravel industry to produce 45 billion tons of sand and gravel in these 30 years. Even if our current rate of production were not increased at all in the 30-year period, our industry would still have to produce 27 billion tons of sand and gravel!

The U.S. Bureau of Mines, in a study entitled "Cumulative Demand Projections for Sand and Gravel", estimates that in the period between 1970 and the year 2,000, construction demands would make it necessary for the sand and gravel industry to produce "in the range from 57.2 to 65.6 billion tons." It is clear from these impressive data developed by two reputable organizations, one private and the other public, that our industry must produce close to 66 billion tons of sand and gravel in the next 30 years.

To produce anywhere near that much sand and gravel, our industry must be able to locate and develop land with sand and gravel deposits of suitable quality, locations which are close to metropolitan areas in order to avoid excessive transportation costs. This brings up still another problem: where in the world is our industry going to find the deposits to produce so much sand and gravel in 30 years, and how is it going to be financially able to acquire such land unless the Congress of the United States permits our industry to continue to use its present percentage depletion allowance of five percent?

Due to prevailing misconceptions about the vital role which the sand and gravel industry plays, and due also to expanding metropolitan areas which cover up valuable sand and gravel reserves which will thus be forever unavailable to us for sand and gravel development, our industry has to contend with unduly restrictive zoning controls. Some land planners, uninformed about the growing scarcity of good quality material near enough to the point of use to be economically feasible, have imposed unbearable zoning requirements on the sand and gravel industry.

Yet in other areas, there is a gratifying awareness by land planners that the country must have sand and gravel if it is not to stand still. In some jurisdictions, znoing regulations set aside specific areas for sand and gravel production, the codes stipulating that sand and gravel is an importan natural resource and that it must be made available to the people living in their jurisdictions.

Privately financed non-public construction dominates our country's great construction program. Our country is continuing to move forward with a construction program which, while taking due account of defense and public works, still motivated principally by investors who use their own money to show their faith in our country's future. Reflected here is the characteristic determination of the United States never to stand still in its advance toward a better way of life. To prepare our defenses and to build the things which are essential to our way of life, this country must be able to obtain sand and gravel of good quality at a reasonable cost.

The National Sand and Gravel Association understands and accepts the necessity for intelligent zoning standards. We recognize that there is a growing overall land shortage in our industry. We have cooperated with the Department of the Interior and with the American Society of Planning Officials in the development of performance standards which will reserve to the communities the availability of sand and gravel of good quality and which will demonstrate to the public that we recognize the legitimate public interest in the way we operate. We have done everything within our power to be a good neighbor.

We believe that this image of our industry as a good neighbor is already recognized in responsible circles. In a speech at our 50th Annual Convention in 1966, John A. Carver, Jr., then Under Secretary of the Department of the Interior, said that "your industry was already in the vanguard of a belated national effort" to conserve our country's natural resources. He added this observation of our work: "Let me say, here and now, that the work you have done in encouraging your members to follow the excellent example of those who have been most successful in site rehabilitation is entitled to the highest commendation and and I take great pleasure in extending that recognition—unstintingly." This was a compliment which we shall always treasure.

Land costs have risen at a skyrocketing rate, as you know, in the past 15 years. There is no indication that these costs will decline, thus aggravating a problem which is perhaps more destructive in the case of the sand and gravel industry than in any other natural resource industry. Since sand and gravel operations must be located close to the metropolitan areas which provide our principal markets, members of our industry must pay many times the price for land paid by other natural resource industries.

Our industry must warn the country that without a percentage depletion allowance of at least 5 percent, we will not be able to locate and acquire the land which is necessary to produce the sand and gravel which the country must have in order to sustain its building and construction program—public or private. The 5 percent depletion allowance for sand and gravel has been indispensable to our industry in meeting the heavy capital charges involved in obtaining sand and gravel deposits of suitable quality.

The first step toward sand and gravel production is exploration for new sources of supply, and then a determination of the characteristics and quantities of material. The sand and gravel must be examined as to mineral composition, quantity and nature of impurities, soundness, strength and size of grading. In order to meet the wide range of increasingly strict specifications, the question of whether the material can be economically produced to meet requirements is one that can be answered only by sound engineering judgment, based on experience coupled with careful survey of the deposit and the market for its products.

No other mining industry is so widely dispersed as our industry. Our operations are found in every state of the Union and in most of the counties and cities. I have described our 5 percent allowance as very modest. It is! I sincerely believe that if the Congress were to make an independent analysis of the percentage depletion rate for sand and gravel, it too would agree that the 5 percent allowance is indeed modest and that its continuation is necessary in order to turn out the billions of tons of sand and gravel which we will be called upon to produce in the years ahead.

Our industry has built its own plants and bought or leased its own land. We have not sought or obtained governmental help in financing our industry's operations or in any other device for protecting our industry in one way or another. Ours is a characteristically free enterprise business. We intend to keep it that way. Taxation problems, however, are very real ones and costs of operation mount every year. Essential to our ability to survive is a percentage depletion allowance which reflects the realities in the case of an industry which has never failed the United States, in war or in peace. We ask that the 5 percent depletion rate for sand and gravel be continued.

Statement of Earle T. Andrews for the National Industrial Sand Association

I am Earle T. Andrews, a member of the Taxation Committee of the National Industrial Sand Association of Silver Spring, Maryland, and am submitting this statement on behalf of all members of the Association. I am also Chairman of the Board, Pennsylvania Glass Sand Corporation, Hancock, West Virginia. We appreciate this opportunity of presenting our views to the Committee on the provisions of Section 501(a) of H.R. 13270.

The National Industrial Sand Association is an industry association representing approximately 85 percent of the production of industrial sands in the United States. Industrial sand is a general term for quarzite and also quartz sand and pebbles used or sold for purposes dependent upon their silica content or their chemical or refractory properties. Industrial sand is a primary raw material used in the manufacture of glass, chemicals, electrical porcelains and other silica based products and as metallurgical sand required in the manufacture of ferrous and nonferrous metal products. These constitute the primary markets although there are over 100 industrial and technical commercial uses requiring the unique chemical and physical properties of industrial sand.

Construction sand used as a concrete aggregate and for other general building purposes and industrial sand are dissimilar in origin, in methods or processing and are mutually exclusive in use.

Industrial sand is presently authorized percentage depletion at 15 percent;[1] under the House bill, the allowable rate would be cut to 11 percent. The Ways and Means Committee reported that it believes (1) "that even if percentage depletion rates are viewed as a needed stimulant at the present time they are higher than is needed to achieve the desired beneficial effect on reserves; and (2) "that there is need to strike a better balance than now exists between the objective of encouraging the discovery of new reserves and the level and revenue cost of percentage depletion allowances."

The National Industrial Sand Association opposes the proposed reduction in the existing 15 percent depletion rate. The conclusions of the Ways and Means Committee were not based upon any study of either the industrial sand industry or the mining industries generally. Indeed, it is doubtful that the Committee even considered the impact of the proposed rate reductions on any minerals other than oil and gas.

The United States has long had a National policy carefully designed to assure an adequate supply of mineral raw materials to meet the requirements of an expanding economy and the needs of security, and to bring about an orderly and wise use of this country's natural mineral resources. Mineral resources are wasting assets, and percentage depletion recognizes this fundamental reality—presently available mineral deposits are gradually being exhausted by the extractive industries and additional reserves must be found and obtained.

Percentage depletion and the National minerals policy generally have fostered the development of this country's natural mineral resources which in turn is tied directly to the United States' amazing economic growth. Dr. Walter R. Hibbard Jr., Director of the Bureau of Mines, stated, at hearings on mineral shortages before the Subcommittee on Minerals, Materials and Fuels of the Senate Interior Committee on March 21, 1968, that:

"Our mineral production is 2.9% of the U.S. GNP but it has a direct impact on 40% of the U.S. GNP and an indirect impact on nearly 75% of the U.S. GNP. It makes a dollar turn around several times. It makes resources grist for the economic mill." See Page 32.

Tax reform, whether it be intended to eliminate inequities, to redistribute the burdens of taxation, or to simplify the assessment of liability, should not be allowed to reverse unintentionally the National minerals policy. If the proposed rate reductions are intended to change this policy, as the report of the Ways and Means Committee indicates, the full impact of these changes, not merely the symbolism of reform and the revenue gain, should be thoroughly considered.

Industrial sand is a small industry. As reported by the Department of Interior, total production of industrial sand in 1967 amounted to 25,323,000 short tons and was valued at $85,855,000. The amount of the aggregate percentage depletion deduction for industrial sand is not available, but the total value of the industry's production establishes that the proposed rate reduction cannot increase National revenues substantially. Individual producers of industrial sand, however, will be confronted by a sharp cutback of almost 27 percent in their allowable depletion deduction.

Percentage depletion has become an integral part of the economics of the industrial sand industry. The proposed rate reduction would be a serious dislocation. Prices would need to be raised substantially to offset the lower depletion deductions. The impact of the rate reduction is not likely to be overcome satisfactorily by price increases, and the likely consequences include curtailed exploration and development of new deposits; less research into mineral recovery methods, especially for lower grade deposits; and lower modernization of operating methods. These consequences would be significant in the case of industrial sand. Industrial sand uses require a high purity silica and the present state of technology offers no means of beneficiating a quartz grain in which extrinsic elements in so-called solid solution exceed permissible limits. This is the controlling criterion in the final selection of industrial sand deposits, and the geologic characteristics presently required are restricted to very limited areas.

---

[1] There is no rate specified for industrial sand as such. Quartzite, however, is specifically entitled to depletion at the 15 percent rate. The legislative history of the 1954 Code also states clearly that the 15 percent rate is intended for quartz sand and quartz pebbles when used or sold for purposes dependent upon their silica content or their chemical or refractory properties.

Adequate supplies of industrial sand are not easily located, developed or processed into marketable levels of purity. Extensive exploration and development and sophisticated and expensive processing are required to meet today's demands much less the increasing needs of the future.

The conclusion that must be drawn is that the economic disclosure of the proposed percentage depletion rate reduction will affect the capital values—the risk element—of industrial sand producers with adverse effects on supply of this important mineral.

The other provisions of the House bill applicable to all businesses serve whatever may be the reasonable demands of tax reform on the mining industry.

The CHAIRMAN. The next witness is Mr. S. James Campbell, National Crushed Stone Association, accompanied by Mr. Robert M. Scott, counsel.

STATEMENT OF S. JAMES CAMPBELL, EXECUTIVE VICE PRESIDENT OF HARRY T. CAMPBELL SONS CO., TOWSON, MD.; ACCOMPANIED BY ROBERT M. SCOTT, COUNSEL

Mr. CAMPBELL. Thank you, Mr. Chairman.

Senator, members of the Finance Committee. I am S. James Campbell—

The CHAIRMAN. Excuse me. We have a letter here of introduction sent by Senator Tydings and Senator Mathias. I would like to ask that that be included in the record at this point.

(The letter referred to follows:)

UNITED STATES SENATE,
COMMITTEE ON THE JUDICIARY,
Washington, D.C., September 25, 1969.

Hon. RUSSELL B. LONG,
Chairman, Finance Committee,
U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: This letter must serve as an introduction for Mr. S. James Campbell of Towson, Maryland, as the press of our own Committee business makes it impossible for us to attend your Committee's hearing on September 30.

Mr. Campbell is appearing on behalf of the National Crushed Stone Association. He is executive vice-president of Harry T. Campbell Sons Company, of Towson. Established in 1892, his firm is a major producer of aggregate and related products in the Baltimore area. It also conducts business in Massachusetts, New York, New Jersey, and Pennsylvania. Mr. Campbell has been active in the business since 1946.

The National Crushed Stone Association represents some 500 members, ranging from large corporate enterprises with dozens of quarries to one-quarry family operations. About 65 percent of annual domestic production of crushed stone comes from Association members.

The role of the crushed stone industry in fulfilling the nation's construction needs hardly requires emphasis. We are certain that the Committee will extend every consideration to Mr. Campbell's testimony in its deliberations.

With best wishes.

Sincerely,

JOSEPH D. TYDINGS,
CHARLES McC. MATHIAS, Jr.,
U.S. Senators.

MR. CAMPBELL. I am S. James Campbell, Executive Vice President of the Harry T. Campbell Sons' Company in Towson, Maryland. I am accompanied by Mr. Robert M. Scott, counsel to our National Crushed Stone Association.

I am here today testifying on behalf of the National Crushed Stone Association and all stone producers to let you know why we feel that the present depletion rates granted our industry now should definitely be maintained. The reasons that the depletion was granted by Congress to our industry in 1951, that is to encourage the search for and the production of quality stone, were valid then and are much more valid today.

We believe that tax reform should be based upon true correction of inequities and thereby a need to eliminate or modify the applicable tax provisions. If the reasons for depletion for crushed stone were sound when they were passed, there is no need to consider reduction in depletion as a tax reform today. If the original reasons for such provision require its continuance, then a change in a tax provision is not a reform.

We would like to summarize briefly our statement, which covers the problems of the crushed stone industry, and why we feel the existing rates are all the more necessary. Briefly you have heard from other sources about the vital products that the crushed stone industry produces. They are basic to the economy. The industry does not have the glamor of copper, gold, silver, oil shale, iron ore, but you gentlemen are well aware of the amount of stone that is essential to nearly every facet of our everyday living—just take transportation alone, the stone that goes in the road beds of our railroads, in our highways and airfields. In addition, the building of dams, agricultural limestone, fluxing stone for steel, requires specialized stone products. All of these uses are basic and we need to develop the sources of supply further.

I think you would agree with this. These uses are critical to the economy of the country.

There is a growing demand for our products. When depletion was passed in 1951, our industry was producing 364 million tons of stone, and just 17 years since then, with the assistance of the depletion allowance, we have been able to more than double that rate of production to some 815 million tons.

The Bureau of Mines notes that by 1985 production must be increased between 50 and 75 percent.

To accomplish these goals for this basic material which is important for the rebuilding and the building of our future cities and highways, the depletion allowance must be retained if not increased.

To understand this, and why we are so sincere about our position, the economics of our crushed stone industry will be important to you. It is certainly not an industry to be undertaken by the fainthearted. You cannot just buy land and start digging.

As you may have noted, our industry requires heavy capital investment. A typical crushed stone plant constructed today requires somewhere between a $1 and $2 million investment to open a quarry site and place it in production.

We have detailed in our statement how we have arrived at these costs. Just one example: The primary crusher in a quarry can weigh up to 150 tons, and can cost anywhere from $100,000 to $200,000 for that one single installation.

There are lots of risks that have to be decided upon when you venture into this industry. The first one is to realize that just any stone is not marketable stone. The specifications for our products these days are continually being tightened. Densities, hardness, soundness, gradation, particle shape all control whether or not your stone is marketable.

It is extremely difficult to find this marketable material and it is becoming more costly. As technology has advanced and specifications have been tightened, it is obvious that many sources for stone that were previously considered good reserves are no longer good reserves.

I believe we want to highlight one aspect of our problems that perhaps is more important to our industry than other mining industries, and that is the zoning restrictions we face today. For our particular products, the prime markets are in the urban areas, and in federally sponsored and financed building projects in these metropolitan areas. With increased population growth in urban areas and attention to environmental aspects of our national life, zoning restrictions probably represent the greatest risk problem we face since it is not possible to adequately plan for changing requirements brought about by changes in urban living patterns and aesthetic considerations. This risk is not only getting your property properly zoned initially after it has been found through professional techniques, but being able to maintain appropriate zoning after it becomes a going operation. We have cases where going operations have been zoned out of business. We have cases where reserve land has been taken away from use by our industry, which has completely invalidated the investment values.

The continuing risk factors for our industry perhaps should be emphasized. Long after you have invested your money in exploration for your plant, such risks as development of sinkholes around your quarry property, water intrusions causing flooding and faults can occur, all of which can reduce the quantity of stone which again completely distorts the return on your investment.

Stone is peculiar in that many times while the tests in the lab would indicate it would meet certain specifications, it is impossible to fully predict whether the material will meet the job specifications when it is used. Often after complete investments have been made, your customers inform you unfortunately that the specifications for a particular use are not being met and your investment again can be lost or seriously affected.

Purchasing parties have been changing specifications on our products. There are many examples of these risks. I have with me information on recent cases where the question of whether certain stones are slippery in road surfaces has completely distorted investment in our industry. Certain plants that have produced good materials have suddenly been told their stone no longer meets certain qualifications. We feel there is much work to be done in determining whether these skid resistance specifications are correct or not, but nevertheless they are in effect. They are a fact of life.

The real risk we have is that the ever-expanding national population has brought zoning problems to us along with other regulations that our industry is now facing, such as air and water pollution which have increased as urban areas have developed around our operations.

There are extremely heavy investments required to meet these regulations which our industry is making, in addition to the already heavy investment capital. This is an added problem and presents an added risk if the deposit will continue to meet specifications.

Many areas are requiring our industry to go to underground mining rather than open pits because of their nearness to urban areas. Again the risks in underground mining, as have been noted by others, are greater than open pit. Underground waters and ceiling failures are examples of these risks, just to mention a couple.

Our former rural area locations that now find themselves surrounded by homes are bringing us constant problems. There is many a citizen group, as perhaps you gentlemen are aware, that would like to close down these quarries. This is a real risk. With these risks with which we are faced, we need the current depletion rates to provide the incentive to keep our industry moving forward, to provide the kind of tonnage that we must have if we are going to rebuild this Nation.

We do not believe the House Ways and Means Committee or this committee has heard any testimony to the fact that our risks have not greatly multiplied. Therefore, the depletion rates which were sound when granted are even more sound now.

Percentage depletion for the stone industry is not a loophole. It is not a special provision favoring a few. It is the incentive that Congress has provided to induce a person to invest his money. The problems we have, the risks we have, are easily illustrated by many known situations. Such as:

A single hole operation was successfully sued as a nuisance and the operation completely closed. A 20-foot seam in an operating quarry was found not to meet the current specifications, resulting in the whole quarry operation becoming completely uneconomical. The cost of land reserves of stone has increased the past few years from several hundred dollars an acre to several thousand dollars an acre. A recent purchase of reserve lands cost approximately $5,000 an acre.

Land purchases in a certain State that were thought by professional geologists to contain stone ended up with a limited deposit on top and a steeply sloping bed underneath which was impossible to mine economically. Again the whole investment in that plant, despite the best technology available, was wasted.

Today many specifications call for washed crushed stone for the concrete industry which is a major customer for crushed stone producers. Therefore, we cannot open a stone deposit unless we have a water reserve or water source near that stone deposit.

One final thought. As you have noted, the mining industry needs one of the heaviest capital investment among industry groups. If the investment tax credit is withdrawn, as would seem likely, we suggest that this action is going to have a compounding effect on mining activities. As a result, the mining industry is going to suffer greater tax consequences than will any other industry.

We urge this committee to retain the present rates of depletion for the crushed stone industry, in order that the needs of this Nation will be properly supplied in 1985 to the year 2000.

Gentlemen, the future is in your hands. Thank you.

The CHAIRMAN. Thank you very much.

Senator MILLER. What is the total annual sales of "Agricultural stone" of your industry and what is "agricultural stone"?

Mr. CAMPBELL. Senator, as to the definition of "agricultural stone", I believe the following to be a reasonable one:

> Stone whose chemical content is capable of (1) neutralizing soil acidity, (2) supplementing a soil which is chemically deficient for its normal purposes, or (3) supplementing the dietary needs of poultry or other farm animals.

Agricultural stone basically consists of limestone and dolomite; however, calcareous marl, granite, marble and shell are included in the definition, albeit the quantities are quite small in comparison.

In the year 1968, according to the most recent figures we have been provided by the U. S. Bureau of Mines, the following quantities of these various kinds of stone—and the f.o.b. prices thereof—were either shipped or sold by the industry for agricultural purposes:

	Tons	Amount
Calcerous marl	186,000	−$150,000
Granite	105,000	−994,000
Shell	263,000	−2,378,000
Marble	424,000	−1,313,000
Limestone and dolomite	38,369,000	−68,988,000
Total	39,320,000	73,823,000

Senator MILLER. What is estimated annual depletion allowance—at 15 percent rate—for your industry for agricultural stone?

Mr. CAMPBELL. I can only give you an estimate, as you recognize. If the gross f.o.b. sales price I have stated in answer to your preceding question is multiplied by 15 percent, the answer is $11,073,450. But that figure would be high by virtue of (1) the requirement that sales income be reduced by items such as rents and royalties before the 15 percent is applied; (2) the fact that the f.o.b. sales price figure given above may not accurately reflect the figure against which the Internal Revenue Service permits a producer to take depletion because of the "cutoff" provisions in the tax regulations; and (3) the fact that the amount of depletion a producer can take is limited to 50 percent of its net income. Since there is no information available to the public or to this association that would give the actual amount of depletion taken by each company in its income tax returns, I cannot say whether, or by how much, that $11,073,450 figure would be decreased.

Senator MILLER. Please relate the foregoing to any estimates you wish to submit regarding increased costs to the agriculture industry if there is a reduction in the 15 percent rate to that provided in the House-passed "tax reform" bill.

Mr. CAMPBELL. Applying the same caveats I did in the preceding answer, I estimate that a reduction from 15 to 11 percent would cost the industry an additional $1,500,000 in taxes. Some portion of this increased cost of doing business (higher taxes) would very likely be passed on to the farmer, but I could not predict how much. If a substantial part could not be, the ultimate result of such reduced incentive to the agricultural stone producer could well be his failure to locate and open the quarries needed to supply the farmer. The farmer too late would realize that he no longer had sufficient availability of these important soil nutriments within an economical distance of his farm, and would be faced with the choice of lower productivity of his land or much higher costs of replacement fertilizers for his soil.

Mr. CAMPBELL. Thank you.

(Mr. Campbell's prepared statement follows:)

Statement of S. James Campbell, on Behalf of National Crushed Stone Association

SUMMARY

The reason which caused the Congress in 1951 to grant the crushed stone industry a depletion allowance of 5% on construction aggregates and 15% on chemical and agricultural stone today even more compellingly require the continuance thereof.

Without any question, stone is vital to the growth of this nation. Its use is required to maintain our network of transportation facilities: For highways, for train roadbeds, for airstrips. Stone is needed for dams, for building of all kinds. Stone (agricultural limestone) is essential for a bountiful agricultural production. It is necessary for the production of steel and many other products.

The demand for stone is ever increasing. The U.S. Bureau of Mines projects that stone production will have to increase by 50-75% by 1985 and by approximately 150% by 2000, if the needs therefor are to be fulfilled.

Incentive in the form of the depletion allowance is needed if the production of stone is to meet those projections, for marketable stone is becoming more difficult to locate, the capital investment required to open and develop a stone quarry is becoming greater and so are the risks attendant upon the stone producing business.

The cost of the machines and equipment one must have to open and operate a quarry can easily run between one and two million dollars, and this does not count the cost of the land. Yet a stone producer is never certain after he has located a deposit and made the necessary investment that such investment will not be lost by reason of risks other than those normal to any business. Both the quality and the quantity of the stone may fail in their expectations due to the uncertainties that accompany any mining operation.

But the stone producer is also subjected to other risks of an entirely different, but equally unpredictable, nature: He may find himself "zoned out" of business entirely by new zoning laws, or he may be "forced out" financially because of the cost of complying with newly passed air, water and noise regulations.

The foregoing reasons require the continuance of the present depletion rates. We believe that a change in a tax provision is not a "reform", if the reasons which prompted the provision originally remain valid. We submit that we have shown they do remain valid. No one has suggested, insofar as this industry is concerned, that they do not.

The depletion allowance is not a "loop hole". It is not a special provision favoring a few. It is the incentive the Congress has provided to induce any person to invest his money in the stone producing business in order that the requirements of this nation for stone products will be fulfilled.

We urge this Committee to retain the present rates of depletion for the crushed stone industry in order that the needs of this nation will be properly supplied in 1985 and in 2000.

STATEMENT

My name is S. James Campbell. I am Executive Vice President of Harry T. Campbell Sons' Company, Towson, Maryland.

This statement, filed by the National Crushed Stone Association of which I am the spokesman today, is submitted on the behalf of its members and all other stone producers for the purpose of informing the members of this Committee and the members of the Senate generally of the reasons the depletion rates now allowed upon the mining and production of crushed stone for construction, chemical, flux and agricultural limestone uses should not be reduced.

By the Revenue Act of 1951, Congress determined that companies engaged in the mining and production of crushed stone required a depletion allowance in order to encourage the search for and the production of, products that were vital to the economy and well-being of this country.[1] That decision was sound then and the reasons which made it sound at that time today serve not only to ratify its soundness but to compel the continuance of the present depletion rates.

We believe that tax "reform" should be based upon a need to eliminate or

---

[1] The rate of 5 percent is allowed on construction aggregates and 15 percent on chemical and agricultural stone. Under the provisions of H.R. 13270, the rates would become, respectively, 4 percent and 11 percent (Sec. 501(b)(7) and (8)).

modify those tax provisions which, although sound when passed, no longer serve the purpose they were intended because the reasons therefor no longer exist. But a change in a tax provisions is not "reform" if the original reasons for such provision require its continuance.

To appreciate that those reasons which made the original granting of the depletion allowance to the crushed stone industry a sound decision today require that the existing rates be continued—if not increased—, the facts surrounding the crushed stone industry, including the risks attendant thereto, and the demand for its products must be examined.

1. The Products of the Crushed Stone Industry are Vital to the Growth and Security of the Nation.

Stone may not have the glamor that copper, gold, silver, oil shale and iron ore have, but its production is just as essential to the growth and security of this country as the production of any of those minerals.

Take transportation—stone must be produced to provide roads on which cars and trucks can move, roadbeds on which trains can travel and airfields so planes may operate. Take construction—stone must be produced for buildings and dams to be erected. Take agriculture—without agricultural limestone farm production would not flourish. Take steel—without fluxing stone steel could not be produced. All of the foregoing industries are basic ones and stone is required for each. But it is also a necessary ingredient for the products of many other industries—paint, glass, pharmaceutical to name a few. We need not labor the point that stone is an essential and critical product to the economy of this nation, for the myriad uses to which stone in its many forms is put can leave no doubt that its its production has been, is and will continue to be an absolute necessity to the growth and security of this nation.

2. The Future Demand for the Products of This Industry.

In 1951, the year Congress granted the crushed stone industry a depletion allowance and established the present rates, 364,484,000 tons of stone were produced and used in the United States. By 1968,—just 17 years thereafter—the members of this industry were, with the assistance of the depletion allowance, able to more than double that rate of production and thereby to keep pace with the great demands for its products. But the 815,946,000 tons produced in 1968 must be increased, according to the latest projections of the U.S. Bureau of Mines, between 50% and 75% by 1985 to stay abreast of the requirements of this nation and it must be more than doubled by the year 2000 if the stone producing industry is to fulfill its obligations to serve the needs of the burgeoning population.

To accomplish the goals forecast by the U.S. Bureau of Mines, the existing depletion rates allowed the stone producing industry must be retained—if not increased—, as we shall show below.

3. The Economics of the Crushed Stone Industry.

To appreciate that any lowering of the present depletion rates granted the crushed stone industry will adversely affect the production of stone, the facts relative to the production of stone must be understood.

The crushed stone business is not one to be undertaken by the faint-hearted. Today, it is a business that entails heavy capital investment and many risks. I am afraid that too many people have the mistaken idea that all one has to do to produce stone is to buy some land and to start digging. Such is not the fact.

The production of stone requires heavy capital investment. Conservatively speaking, it will cost between one million dollars and two million dollars to open a quarry and place it in operation. First one must strip the overburden which requires heavy loading equipment (shovels, bulldozers, pans and trucks), the cost of which can be $50,000–$90,000. After stripping, one must have one or more heavy shovels ($80,000–$210,000 a piece), quarry trucks ($45,000–$75,000 each), a primary crusher—which can weigh up to 150 tons ($100,000–$250,000), heavy duty conveyors ($45,000–$300,000), secondary and tertiary crushers ($50,000–$100,000), screening and washing equipment ($150,000–$250,000), dust collectors ($70,000–$230,000), and various miscellaneous items (such as dryers, bins, loading equipment, delivery trucks and trailers, and weighing stations). Thus, it may be seen that one cannot open a stone quarry without making it a very heavy investment in machines and equipment. And this does not include the cost of the land, including land needed as buffer area, nor the exploration costs incurred to locate the deposit.

What risks face the man who must decide whether to put that kind of money into a stone producing operation beyond those that are faced ordinarily by any business venture? There are many.

One must disabuse himself of the thought that stone is stone and that any stone is marketable stone. To comply with the specifications of the several states and the Federal Government that deal with highway construction, for example, one must produce stone of particular densities, hardness, soundness, gradation, particle shape and other requirements depending on the area. If one is to service agricultural needs, one must have limestone that is of high calcium and/or high magnesium content. Special qualities must exist in stone that is used for flux. In short, a good portion of the stone that is in the ground is not of marketable quality.

Moreover, that which is of marketable quality is becoming more difficult and more costly to find. This is due not only to the past and the present great demand for stone products, but it is also the result of the advancement in the knowledge of the characteristics of stone and, as a consequence, the creation of more specialized specifications by purchasers of stone. And it is due also to the fact that a number of otherwise available marketable reserves cannot be utilized today because of zoning restrictions which preclude quarrying operations in certain areas. The hunt for available reserves of stone that will meet particular market requirements encompasses more than a stroll across the country side. Utilization of geographical and geological information and exploration techniques by professional geologists are prerequisites in the search for stone of particular characteristics, all of which entails large expense. An area which preliminarily appears feasible is first subjected to one or more of a number of general survey techniques (aerial photography, surficial mapping etc.) and then to core drilling. A scientific analysis of the core samples is made to determine the characterstics of the stone. Should the desired characteristics be found, the area is then re-mapped on the basis of such cores to determine if a commercially feasible quantity is available. Should the available information thus obtained so indicate, the great investment necessary to open a quarry is made. Nevertheless, certain very real risks remain.

Let us present them to you for your consideration. Besides those risks that are inherent in the production of any mineral that lies beneath the surface of the land—in the case of stone production unexpected "sink-holes," water intrusions and faults which reduce the quantity of stone that was anticipated and upon which the determination to invest was made—, other risks are faced by a stone producer. One of these is attributable to the empirical nature of stone, that is, stone does not always perform in actual use as the tests thereof indicate it will. Although the core samples and the stone when produced at the quarry may have passed the applicable specifications, such stone still may prove unsatisfactory in actual use. When this phenomenon occurs, that stone is excluded by the purchasing party for future use, despite its theoretical acceptability, and the stone producer's investment in that quarry is lost.

Another risk the stone producer runs is that, having made an investment in a quarry because the stone met certain specifications, the purchasing parties may change their specifications in such a manner as to eliminate that stone from consideration. When this is done, the stone producer's investment in that quarry may be rendered valueless because—unlike a manufacturer of a product—there is often nothing he can do to change the characteristics of his product to meet the newly specified quality requirements.

But there are other most significant kinds of risks we face today—risks that, because of the ever expanding population, are ever more present—those arising from zoning and related legislation. Time and again land that had been purchased by a stone producer for future development as a quarry has been "zoned out" for that purpose with the result that the added investment made in the land for such purpose is a total loss. Of even greater threat to the stone producer is the chance that his land which is currently being worked as a quarry and the investment in the machines and equipment used in such operation will be rendered of substantially less—or of no—value by zoning and related restrictions which require that he stop using the land as a quarry. *Goldblatt v. Town of Hempstead*, 369 U.S. 590 (1962).

Not only do we face the risk of being "zoned out" of business by zoning and related laws without any recourse, but some of those laws now require that mining for stone be undertaken only when it is done underground. Such requirement not only increases greatly the actual cost of producing stone, but the possibility of underground water problems and of ceiling failures due to unsuitable stone structures add greatly to the risks of producing needed stone.

As adjuncts to the zoning problems which confront us, there are those that arise by reason of air and water pollution legislation. The additional costs that can be—and are—imposed by such legislation can make a currently profitable operation a losing one.

The possibility of being either "zoned out" of business or of being forced out by the extra costs attributable to air and water pollution legislation is becoming greater each year. This is due to the simple fact that our population is growing at such a great rate that our once rural areas are now residential areas whose residents would prefer that a stone producer close his existing operations and move elsewhere. Although we seek constantly to effect anti-pollution and anti-noise measures that will make stone producing operations more acceptable to our neighbors, there is more and more pressure being mounted by citizens' groups to close quarries that now find themselves surrounded by homes. It is an ever present risk that confronts those of us in the stone producing business and adds to our reluctance to open new quarries.

We ask your favorable consideration of our plea that the present rates of depletion granted the stone producers not be reduced. For one to venture the very heavy capital investment required to find and to open a stone quarry in the face of the extraordinary uncertainties that face this industry—the many possibilities to lose a great portion or all of one's investment by reason of factors that cannot be controlled by the investor—requires that he have the necessary incentive. The present depletion rates have served this purpose in the past: The stone that was needed to fulfill the demands of the nation in the Fifties and Sixties was supplied because Congress had provided that incentive necessary to persuade people to take the risk of investing their money in this business. The future demand for the products of this industry are such that additional supply must be found if that demand is to be met. Yet despite the fact that the risks of the business have increased as have its costs—*and neither this Committee nor the Ways and Means Committee has heard any testimony to the contrary*—a reduction in those rates which provided the incentive to produce the needed stone in the pas thas been proposed in H. R. 13270. Such action, in our judgment, will cause the capital required to find and open the new quarries that will be required to meet that demand to move to other fields where fewer risks are involved. As I said earlier, a change in a tax provision is not a "reform" if the reasons which prompted the provision originally remain valid. We submit that we have shown that they do remain valid. No one has suggested they do not.

The depletion allowance is not a "loop hole." It is not a special provision favoring a few. It is the incentive the Congress has provided to induce any person to invest his money in the stone producing business in order that the requirements of this nation for stone products will be fulfilled.

I would add one more consideration: Because of the heavier capital investment required to purchase the great machines and equipment needed in the mining industry generally, the investment tax credit has been particularly helpful in keeping our operations abreast of the many innovations recently made in mining machines and equipment. If that tax credit is withdrawn, as seems likely, and there is a reduction of the depletion allowance, this industry will suffer greater tax consequences than will other industries.

We urge this Committee to retain the present rates of depletion for the crushed stone industry in order that the needs of this nation will be properly supplied in 1985 and 2000.

The CHAIRMAN. The next witness will be Mr. Philip L. Corson and Mr. Robert S. Boynton, National Lime Association Tax Committee.

STATEMENT OF PHILIP L. CORSON AND ROBERT S. BOYNTON, NATIONAL LIME ASSOCIATION TAX COMMITTEE

Mr. CORSON. Good morning.

The CHAIRMAN. Pleased to have you here, sir.

Mr. CORSON. Thank you, Mr. Chairman.

My name is Philip L. Corson. I am chairman of the board of G. & W. H. Corson, Inc., a quarrier and processor of limestone and manufacturer of lime in southeastern Pennsylvania. I am appearing today as the chairman of the Tax Committee of the National Limestone. This association represents over 85 percent of the commercial lime capacity in the United States. The products of its members are quicklime, hydrated lime, crushed stone for the metallurgical chemical processing industries and for other purposes.

We wish to protest the proposed cutback in the depletion rates on limestone embodied in the tax reform bill H.R. 13270. We would greatly appreciate your consideration of the following arguments in support of our position.

Essentially for metallurgical and chemical users of limestone and for lime manufacturers, the highest quality of limestone is required to satisfy stringent specifications on purity. Such stone must meet a minimum of 95 percent of total carbonate content as well as meet specific tolerances on impurities.

Limestone is one of the key basic building blocks that is vital to industry. Directly or indirectly as stone or limestone it enters into the manufacture of most products. In most instances its uses are irreplaceable. There is no substitute.

Nearly one-third of a ton of limestone is required to produce a ton of steel. Thus it is difficult for us to reconcile how iron ore escaped the proposed cut where limestone did not. Both of these vital basic materials should be accorded equal treatment.

In like fashion, limestone or lime is essential in copper ore beneficiation and copper refining. If copper retains its 15 percent depletion rates, we believe that limestone should too.

It is an essential raw material for alumina and magnesia from which metallic aluminium and magnesium are made by reduction. Similarly it is essential in the manufacture of many chemicals, glass, sulphate paper, animal feed, sugar, and for potable water purification and sewage and trade waste treatment.

There are numerous other uses for limestone and lime, so many that chemical and metallurgical grade limestone has long been recognized as strategically necessary for national defense. Moreover, in the growing movement to arrest air pollution, limestone and hydrated lime offers possibly the most economical method of neutralizing noxious sulfur fuels from industrial stacks.

Thus without limestone, modern industry would cease.

2. The relative scarcity. Currently, about 72 million tons of metallurgical and chemical grade limestone is being consumed annually. Such a massive withdrawal of our natural resources depletes existing deposits. To replace exhausted deposits, costly geologic exploration and development is essential, as Dr. Kenneth K. Landis, professor of geology, University of Michigan, contends in his recent study on limestone reserves, which we request be included in the record of this hearing.

Dr. Landis concludes that "the discovery of new high-grade deposits is becoming increasingly difficult and expensive," largely since this grade of stone comprises only 2 to 3 percent of known stone reserves.

3. Industry cost-price squeeze: Bureau of Mines statistics bear out the fact that limestone is one of the country's most uninflated commodities. For example, in the 10-year period between 1957 and 1967, the average mill price for all limestone advanced by only 3 percent, from $1.34 to $1.38 per ton. During this period, cost of capital equipment and labor gained 50 percent.

The only possible explanation for this paradox is that the industry mechanized greatly, increasing its output per man-hour, and the unremitting competitive pressures that exist.

Considerable by-product limestone sales depress prices. The resulting effect of the cost-price squeeze on profits is obvious.

The limestone industry is not big. The total FOB plant value of all crushed limestone produced in 1967 was only $783 million, less than the sales income of just one of any of the 191 largest corporations in the United States during that year. So proportionately a cut in depletion rates hurts our industry much more than the corporate giants.

4. Risks in operation. Limestone quarries and mines are beset with most of the hazards characteristic of the mining industry plus a few more that are unique to limestone. These include flooding, irregularities or faults in limestone deposits, soaring transportation costs that exceed mill prices, and increasingly stringent specifications for our products. Solution of these problems, as we detail in our prepared statement, are either very costly or insurmountable, causing a number of producers to close down each year.

Rezoning in recent years has proved to be an increasing boobytrap for producers located near large metropolitan areas. The limestone operation may have originated in a rural environment but today many quaries find themselves surrounded by expensive suburban homes, high-priced apartments and so forth. Harassed by city officials and property owners, the limestone operator decides to move farther out to stone reserves he has owned for some time, but to his dismay, he finds that his land has been recently rezoned as nonconforming for quarrying, even though his land purchase predated the rezoning.

He then finds sky-rocketing land values in country estates farther out making exploitation economically unprofitable. Other hitherto available lands with good stone have been removed by governments for national parks, interstate highways and so forth.

Urbanization has irrevocably moved some high-grade limestone deposits from exploration. My native Philadelphia is an example, and so is Chicago.

Another major problem we must face is air pollution. With the State and Federal drive against air pollution, limestone companies are being forced to invest heavily in elaborate dust control equipment and systems, in order to comply with recent stringent air pollution standards on particulate matter. In extreme cases the capital investment involved to conform to the exacting dust control standards approximates one-fourth of the total plant investment.

In conclusion, let me say that a reduction in depletion rates on limestone at the present time could not be more poorly timed. With the many industry problems I have cited, limestone needs profit stimulation, not a financial penalty in order to justify the many risks inherent in this business.

Accordingly we respectfully ask you to restore to the tax reform bill the current 15-percent depletion rate on limestone as well as the 5-percent rate on construction aggregates, in which limestone also plays a major role.

In so doing the best interests of the country and the limestone industry will be served.

Thank you.

The CHAIRMAN. Thank you very much.

Senator MILLER. May I ask if your association or if your members make sales of agricultural limestone?

Mr. CORSON. Yes; we do.

Senator MILLER. What is the total annual gross sales by your association, and the estimated depletion allowance on these sales?

Mr. CORSON. We have no breakdown of sales of agricultural limestone by the members of National Lime Association. Stone sales for agricultural uses are not a very large factor in our small segment of the stone industry. On an overall basis, however, we would guess that the amount might be in the neighborhood of 5 to 10 percent of our members' sales of limestone products. Based upon Minerals Yearbook price information for 1967 and our rough estimate that our members produce around 7 million tons of agricultural limestone a year, the gross sales would be around $12 million. The estimated depletion allowance on such sales would be approximately $1.3 million, assuming the nonapplicability of the 50 percent of net income limitation.

Senator MILLER. Could you give us a breakdown on total stone sales by category, and how your members fared financially?

Mr. CORSON. Because of the highly competitive nature of the lime industry, statistics on total stone sales by category and net profits of the members of the National Lime Association are not available. Based upon Minerals Yearbook figures for 1967, we would estimate that the present 15-percent depletion allowance on high-grade limestone used for chemical and metallurgical purposes would give an annual depletion allowance of around $19 million without regard to 50 percent of net limitation.

Senator MILLER. How would the reduction to 11 percent affect you?

Mr. CORSON. Based on such data, a reduction in the rate of depletion from 15 to 11 percent would adversely affect the producers of high-quality limestone for chemical and metallurgical uses by an estimated $5 million a year. For agricultural stone sales of our association members, the reduction in percentage depletion of an estimated $500,000 a year could result in higher prices to farmers if the increased cost is passed on.

Senator MILLER. Thank you, Mr. Corson.

Senator FANNIN. Just how do we use limestone?

Mr. CORSON. I have a small table here. Based upon Minerals Yearbook data, the approximate breakdown of limestone in 1967 by end use category is as follows:

	Millions of tons
Concrete and roadstone (aggregate)[1]	375
Agriculture	30
Chemical and metallurgical[2]	72
Other industrial[3]	100
Refined fine aggregate[4]	3
Total	580

[1] Includes railroad ballast, riprap, and fill.
[2] Includes all metallurgical fluxing for steel and nonferrous metals; stone for lime manufacture; whiting; glass; paper; animal feeds; refractories; chemical manufacture, etc.
[3] Largely for cement manufacture, but also includes coal mine dusting, filtration, acid neutralization, mineral wool insulation, etc.
[4] Includes asphalt filler and limestone sand.

Senator FANNIN. Thank you, sir.

Mr. CORSON. Could I give two samples of chemical metallurgical limestone so you might examine them? These are both polished but they show the lack of impurities and the pureness of the stone and I think they might be interesting to the committee.

The CHAIRMAN. Are both of those pure or just one of them?

Mr. CORSON. Both. Both will run over 98 percent calcium carbonate.

The CHAIRMAN. Senator Anderson has some questions.

Senator ANDERSON. You indicated how many firms are going under.

Mr. CORSON. I am sorry?

Senator ANDERSON. Can you furnish us with the firms that are having trouble?

The CHAIRMAN. A list of the firms in your association that are having difficulty making ends meet.

Mr. CORSON. We will supply that.

(The following response for the record was received from Mr. Corson:)

It would be inappropriate for us to list on the public record the names of members of our association or industry who are presently hard-pressed financially. However, we estimate that at least 20 to 25 plants have been closed due to either bankruptcy, exhaustion of stone deposits or other insurmountable problems in recent years. If desired, we could list the name and location of such plants for use by the committee in executive session but not for publication.

The CHAIRMAN. Thank you, sir.

(Mr. Corson's prepared statement, with an attached statement of Kenneth K. Landes follows:)

STATEMENT OF THE NATIONAL LIME ASSOCIATION, PRESENTED BY PHILIP L. CORSON, CHAIRMAN, TAX COMMITTEE

SUMMARY

H.R. 13270 ("Tax Reform Act of 1969") would reduce the 27½% oil depletion allowance to 20% and prohibit its use on foreign oil production. Apparently almost as an afterthought (and certainly without adequate hearings on the subject) the Ways and Means Committee also included in H.R. 13270 a provision reducing the percentage depletion rate for all other minerals—other than gold, silver, oil shale, copper and iron ore mined from deposits in the United States—by amounts roughly proportionate to the reduction in the rate for oil. As a consequence, H.R. 13270 would generally reduce the depletion rate for limestone from 15% to 11%, with the reduction being from 5% to 4% where the limestone is used as road stone or for similar purposes.

Reasons for Opposing Drastic Reduction in Depletion Rate for Limestone When Used as Other than Common Stone

1. High quality limestone is indepensable in the manufacture of iron and steel and in the beneficiation of copper ore and copper refining. For example, on the average, about ⅓ ton of limestone is required to produce one ton of steel. It is difficult to reconcile no cut in the depletion rates for iron and copper ores when limestone is slashed. All these basic materials should be given equal treatment with their current 15% rate maintained.

2. Known reserves of high quality ("metallurgical grade") limestone in this country are in relatively short supply. This grade of limestone comprises only 2% to 3% of known limestone reserves. The discovery of new deposits is becoming increasing difficult and expensive.

3. The limestone industry for at least the past ten years has been experiencing slender and narrowing profit margins because of a cost-price squeeze in the industry. A substantial cut in the depletion allowance for this strategically important industry, because of the public clamor for cutting oil and gas depletion rates, is both unfair and short-sighted.

4. In addition to the cost-price squeeze, there are many deterrents to limestone exploration and development, including necessary expenditures to comply with air pollution standards. As a consequence, reduction in depletion rates on limestone at the present time could not be more poorly timed.

STATEMENT

The National Lime Association wishes to protest the proposed cutback in the depletion rate on limestone embodied in the Tax Reform Bill, H.R. 13270. We will greatly appreciate your serious consideration of the following arguments in support of our position. The protestant is a national trade association, representing over 85% of the U.S. commercial lime industry production capacity. Its products are quicklime and hydrated lime made by calcining at high temperatures high quality limestone. Members of the association also sell crushed and ground limestone to the metallurgical and chemical process industries and for other purposes.

High grade limestone

For lime manufacture and for the metallurgical and chemical uses. the highest quality of stone is demanded to satisfy stringent specifications on purity. Generally such limestone must meet a minimum of 95% total carbonate content (calcium carbonate plus magnesium carbonate). In some regions the minimum total carbonate content specified is 97% or even 98%, in addition to maximum tolerances on specific impurities, such as silica, iron, and sulfur.

Essentiality of limestone: Unappreciated by the layman is the basic essentiality of limestone and its first product—lime—to modern industry. Directly or indirectly limestone, as stone or lime, enters into the manufacture of most finished products and many other basic commodities. It is low cost, unglamorous, and taken-for-granted, but it is one of the few most basic building blocks around which industry revolves. In most instances its uses are vital and irreplaceable.

Iron and steel

Limestone is indispensible in the manufacture of iron and steel as a flux (purifier) in which impurities are removed as a molten slag. There are no substitutes, at least, that are even remotely economically feasible. In addition dolomitic limestone and lime are required as refractory materials. A vast tonnage of limestone (as stone) and as lime are used annually by the steel industry. In 1967, according to the U.S. Bureau of Mines, 41.3 million tons of limestone (as stone and its equivalent as lime) were consumed by the U.S. steel industry as follows:

	In millions of tons
Blast Furnace flux	21.06
Open Hearth flux	3.80
Misc. flux: foundries, cupolas, electrics	2.88
Dol. limestone refractory	.46
for lime flux [1]	9.36
for dol. lime refractory [1]	3.76
Total	41.32

[1] Since 2 tons of limestone are required to make 1 ton of lime, the lime figures were doubled for conversion to a limestone equivalent.

Since 127.4 million tons of steel were produced in 1967, from the above limestone total it is apparent that nearly ⅓ ton of limestone was required per ton of steel. Since it is as essential as iron ore for pig iron and steel, it is difficult to reconcile that no cut in the depletion rates is proposed for domestic iron ores when limestone is ignored. Where is the equity in such treatment? Both of these basic materials should be given equal treatment with their current rates of 15% maintained.

Other industrial uses

In addition much lesser (but significant) tonnages are required in the beneficiation of copper ore and copper refining; for the manufacture of alumina and magnesia from which metallic aluminum and magnesium are obtained by reduction. Lime is even employed in the concentration of gold and silver ores and other non-ferrous metals. Again, a cut in depletion rates is avoided for copper ore. Yet limestone and lime are also essential to the manufacture of copper. Similarly gold and silver ores are proposed to be exempt from a rate cutback. yet lime is used in the winning of these metals.

In chemicals manufacture it is required in the Solvay process for soda ash and caustic soda manufacture; for calcium carbide, an important source of acetylene; for many calcium inorganic and organic salts, i.e., phosphates, hypochlorites, stearates, etc; pesticides; paints and protective coatings.

It is essential in glass manufacture. Next to sand, limestone-lime and soda ash, are the major raw materials used in glass. Lime is essential to the sulfate (kraft) process for paper pulp manufacture, and limestone whiting is used for paper coating and as a filler. Lime is required for municipal water purification and softening and in sewage and industrial waste treatment processes to reduce stream pollution. All sugar manufactured requires lime; the limestone factor in a ton of beet sugar is nearly ½ ton. It is the major ingredient in animal feed to provide calcium. There are many other uses. In the growing movement to arrest air pollution limestone and hydrated lime may offer possibly the most economical method of absorbing sulfurous fumes from industrial exhaust gases through neutralization. If this materializes, expanded quarry operations would be required to satisfy this huge new demand.

Thus, it is apparent that without high grade limestone modern industry would cease, and in time of war it is just as strategic as steel, iron ore, petroleum, and coal. This fact was specifically recognized by Congress during the Korean War when chemical and metallurgical grade limestone was exempted from the Excess Profits tax as a strategic mineral. Thus, for defense and our civilian economy it is clear that this industry should be encouraged.

Relative scarcity of high grade limestone

The foregoing metallurgical and chemical uses of limestone and lime that demand high purity stone total currently about 72 million tons per year. Such a massive annual withdrawal of our natural resources obviously depletes the existing deposits. Limestone is no different from any other mineral; its quarries and mines also are exhaustible. To replace exhausted deposits, systematic costly geologic exploration and exploitation is essential.

Attached to this testimony is a report by Dr. Kenneth K. Landes, Prof. of Geology, University of Michigan entitled "Metallurgical Limestone Reserves in the U.S." (2nd edition). In this report Dr. Landes delineates the principal areas of the country that are the sources of high grade limestone and outlines the problems encountered in exploration work. He concludes that "the discovery of new deposits is becoming *increasingly difficult* and *expensive.*" This grade of limestone comprises only 2% to 3% of known existing limestone reserves. Dr. Landes is regarded as this country's foremost authority on limestone exploration and reserves and he has spent over 40 years in investigative work on limestone.

Cost-price squeeze

As evidence of the highly competitive nature of the limestone business, the average FOB price of crushed and broken limestone for all purposes only advanced 3% in the 10-year period from 1957 to 1967, according to the U.S. Bureau of Mines.[1] When the prices of nearly all commodities were soaring, many alarmingly so, during this inflationary decade, it must mean that the price of limestone is about the most uninflated of all U.S. commodities. The specifics on comparative limestone prices between these two years is set forth as follows:

Average f.o.b. price per net ton in bulk

Use category:	*1957*	*1967* [1]
Concrete and roadstone	$1.32	$1.32
Metallurgical flux	1.42	1.52
Agricultural Liming	1.66	1.76
Lime manufacture	1.50	1.73
Sugar refining	2.39	2.38
Asphalt filler	2.60	3.00
Glass manufacture	2.98	3.33
Average for all limestone	1.34	1.38

[1] Current (1969) average prices are estimated to be close to 1967 figures, perhaps 2 percent higher.

During this same period labor and capital equipment costs soared about 50% for this industry. The only explanation for this paradox is that the industry mechanized considerably during this period, increasing its output per manhour. This and the unremitting competitive pressures peculiar to this industry can be the only possible explanation. Considerable by-product limestone acts as a de-

[1] 1957 Minerals Yearbook, p. 1095, 1967 Minerals Yearbook, pp. 1081–2.

pressant on prices. In balance it means that the industry has been working with slender and narrowing profit margins.

The typical limestone producer is often a small manufacturer, usually a family-owned or closely-held company. The impact of a cut in depletion rates would hurt him proportionately much more than the large corporations and conglomerates that are protected by diversification. The total FOB plant value of *all* crushed and broken limestone produced in the U.S. was only $783 million in 1967, less than the income of just one of any of the 191 largest corporations[2] in this country during that year. Yet the country for strategic reasons needs the output of our relatively small industry.

Risks in limestone extraction

Limestone operations are often beset with most of the hazards characteristic of the mining industry. Following are the principal problems encountered, the solutions of which are usually either very costly or insurmountable forcing each year a number of producers to abandon their business.

1. *Flooding* of quarries and mines will occur from underground springs and streams or torrential rains. In many cases continuous or intermittent pumping at considerable cost will control this problem, but there have been many quarries abandoned due to inability to adequately control flooding or the costs involved proved to be prohibitive.

2. *Irregularities* in limestone deposits is a continuing problem. In the direction of the quarry or mine expansion or strike, abrupt *faults* may occur in the deposit or thick layers of impure or unsalable stone or shale may be encountered overlying the desired stone. Stratas of *overburden* will frequently deepen to the point that the cost of stripping the deposits becomes prohibitive. Due to these situations that even with the most prudent geologic and engineering practices are not always predictable, drastic revamping of the quarry layout is often necessary. Frequently the only economical solution is to start over afresh and develop a new deposit at another location, but the same risks may prevail at the new location.

3. Sudden increases or changes in the competitive status quo of *transportation costs* can create an economic crisis for some limestone producers. Being such a low cost commodity, the shipping range is much more restricted than with most commodities, and transportation costs will range from 50% to 250% of the mill price of the material. As an example, the sudden emergence of low-cost water transportation can cause certain producers, dependent on higher-priced rail or truck traffic to lose their major markets. A producer, who has to move to another quarry 10 to 20 miles farther away from his processing plant and railhead due to insurmountable problems encountered, may find the added transportation costs attendant to this move more than he can absorb.

4. Changes and tightening of quality *specifications* on limestone can render deposits obsolete and force companies out of business. As an example, a consumer may decide that it must have limestone with a lower sulfur content (from 0.1% to 0.05%) or higher carbonate content (from 95% to 97%) even though it will cost him more. Unless the current limestone supplier can beneficiate his stone to meet the more exacting specifications, he may face a serious loss of business that in some cases can be disastrous.

5. *Rezoning* in recent years is proving to be an increasing booby-trap for producers located near large metropolitan areas. 15 to 20 years ago such problems could not be reasonably anticipated, but then who could have foreseen the tremendous growth of many urban areas as suburbs began inundating the adjoining rural areas forming satelite cities and more suburbs with their complex shopping centers, beltways and cloverleafs that absorbed great chunks of land.

The limestone operation that was built up in a farming environment may be today surrounded by expensive suburban homes, high rise apartments, and shopping centers. The noise from blasting, dust, and truck traffic irritates the new residents, who along with public officials harass the limestone operator as a nuisance. If the operator decides to move his plant to a new quarry site a few miles away on property that he has owned as a strategic limestone reserve, he may find that even this area may be zoned as non-conforming for industrial operations, like limestone, even though his purchase of the land greatly pre-dated the zoning.

[2] Fortune magazine corporate statistics.

Deterrents to limestone exploration

There are, of course, untouched deposits of high grade limestone that can never be exploited, at least, in the foreseeable future. The deposits are too small or are of marginal quality and do not justify the capital investment for exploitation. In other instances, are located too deep under the earth or they are located in remote, inaccessible areas where transportation problems are insurmountable and markets too distant.

However, in recent years increasingly lime operators have been denied other potentially productive limestone properties. Land located in or on the fringe of the burgeoning suburbs that only a few years ago was rural is now zoned nonconforming to industrial business, like limestone, chemical or heavy industry. Philadelphia and surrounding cities and the Chicago area have thousands of acres of land underlain with high quality limestone that are irrevocably committed to urbanization and blanketed with high cost housing, shopping centers, schools, etc.

Beyond urban areas are large country estates, country clubs, etc. where land values have skyrocketed so high in recent years that it is increasingly uneconomic for limestone exploitation. High acreages have been retired in recent years from public use for national and state parks, some of which have otherwise exploitable limestone deposits. The vital interstate highway program with the huge acreage it has devoured has similarly reduced exploration prospects.

Air pollution problems

In addition with the state and federal drive against air pollution, limestone companies are being forced to invest heavily in elaborate dust control equipment and systems in order to comply with recent stringent air pollution standards on particulate matter. In extreme cases the capital investment involved to conform to the exacting dust control standards approximates one-fourth of the total plant investment.

Conclusion

Consequently, a reduction in depletion rates on limestone at the present time could not be more poorly timed. But with the many problems described above, this industry needs profit stimulation, not a financial penalty, to justify the many risks inherent in this business.

Accordingly, we respectfully ask you to restore to the Tax Reform Bill the current 15% depletion rate on limestone as well as the 5% rate on construction aggregates, in which limestone also plays an important role. In so doing, the best interest of the country, as well as the limestone industry, will be served.

METALLURGICAL LIMESTONE RESERVES IN THE UNITED STATES (SECOND EDITION)

(By Kenneth K. Landes, professor of geology, University of Michigan, Ann Arbor, Mich.)

The National Lime Association

SUMMARY AND CONCLUSIONS

High quality ("metallurgical grade") limestone is just as essential to the making of steel as iron ore; it is also necessary for the burning of lime and for the manufacture of many chemicals. Limestone, the rock, is common and abundant in the United States, but metallurgical stone constitutes only a very small part of the total volume of limestone rock. It is a valuable, essential, and exhaustible mineral resource.

Metallurgical stone occurs in deposits within geologic formations. Geologic maps show the areas of outcrop of formations and groups of formations, some of which are notable for their high quality limestone deposits. It should be observed, however, that the workable deposits themselves occupy but an insignificant part of the total area covered by the formations. In many places where a formation is mapped, erosion has stripped away all of the good stone, or due to environmental conditions at time of deposition good stone was never present in this area, or the overburden is too thick for removal, or the good stone is too deeply buried beneath poor stone to permit profitable exploitation.

The popular concept of an unlimited supply of limestone must be abandoned so far as metallurgical grade stone is concerned. Every metallurgical limestone quarry or mine today is working a deposit which has definite boundaries, either physical or economic, or both, beyond which exploitation cannot go. Many of these deposits will reach those boundaries within the next ten years. The writer of this report, who has been investigating limestone deposits in various parts of the United States during the last 37 years, knows of only two metallurgical grade limestone deposits that he believes will still be yielding metallurgical stone 50 years hence. Of course, new deposits will be discovered in the future as in the past, but their discovery is becoming increasingly difficult and expensive.

The conclusion is inescapable that metallurgical limestone is a valuable natural resource occurring in deposits definitely limited as to recoverable volume. Each year's withdrawals from a deposit of metallurgical grade limestone <u>exhaust the value of the property</u>.

DEFINITIONS

Some words have different meanings to different people. In many instances the same word may have a much more restricted meaning to the scientist than it has for the man in the street, and even for the man in industry who may use the word constantly. Therefore, in order to avoid confusion some of the more common terms used in this report are defined in the following paragraphs as they are used herein. For practical reasons the terminology followed tends to favor the trade usage rather than the academic definition.

Limestone. The word "limestone" without qualifying adjective as used in this report is a sedimentary rock composed largely of the mineral calcite (calcium carbonate) or the mineral dolomite (calcium-magnesium carbonate) or mixtures of the two.

High calcium limestone. A limestone consisting dominantly of the mineral calcite. When the term "limestone" is used in scientific reports, high calcium limestone is implied.

Dolomite. Limestone rock composed chiefly of the mineral dolomite (calcium-magnesium carbonate). Limestones which are mixtures of the minerals calcite and dolomite may be referred to as "dolomitic limestones" or "magnesian limestone." Where the end use does not depend upon the chemical composition dolomitic rocks are referred to as a limestone in accord with the first definition above.

Carbonate rock. A very convenient term to include all stone covered by the three preceding definitions. It is derived from the fact that both calcite and dolomite are carbonate minerals.

Metallurgical stone. A term applied to all carbonate rocks which are used as a flux in metallurgical processes, such as in the blast furnace to assist in the conversion of iron ore to pig iron and in the open hearth furnace where pig iron becomes steel. Dolomite is also used as a refractory in furnace linings. As can be seen in Table 1 both high calcium limestone and dolomite have metallurgical uses.

Chemical stone. Carbonate rock that is used by the chemical industry.

Lime. The product obtained by heat treatment in a kiln of either high calcium limestone or dolomite. The heat treatment drives off carbon dioxide leaving either calcium oxide or the oxides of calcium and magnesium (in the case of dolomitic raw material).

Lime is sold either as quicklime which unites vigorously with water, or the water is added prior to sale in which case it is marketed as hydrated lime.

Cement stone. A high calcium limestone which can be used in the manufacture of cement. Portland cement specifications limit the amount of magnesium oxide to 5% which means that the raw material cannot run over 3%. However, argillaceous (clay) impurities may be present up to about 25%; in fact if they are not present in adequate proportion in the rock, clay or similar raw material from outside sources has to be added.

Commercial stone. Stone used in concrete aggregate and as road metal. Also referred to as "road stone".

Place value. Limestone, even that of highest grade, is a bulk commodity with a relatively low value per ton. In consequence most limestone buyers pay more for transporting the raw material than the cost of the stone at its source. For this reason limestone as well as other mineral bulk commodities are said to have "place value". A high-grade limestone in Montana would have very low place value, the place value of a limestone of equal grade in eastern Iowa would be much higher, and such a stone within the city limits of Chicago would be at the very top in place value.

USES AND SPECIFICATIONS

Usable and not usable limestones. Both high calcium limestone and dolomite which can be used for metallurgical and chemical purposes are scarce in terms of the total volume of limestone within the United States. Somewhat larger, but still limited in volume, is the limestone that can be used commercially, mainly for concrete aggregate and as road metal. The remaining limestone is either too impure chemically or inadequate physically for any use whatsoever. Wherever there are limestones this completely non-usable stone is by far the most abundant, occupying many cubic miles of the earth's crust.

Metallurgical limestone specifications. Limestones that are satisfactory for metallurgical or chemical uses as stone, or satisfactory for raw material for the production of calcined products, may be classified in four grades as follows:

Table I

		A-1	A-2	B-1	B-2
Silica	less than	1.0%	3.0%	1.0%	2.0%
Alumina	" "	1.5	1.5	1.5	1.5
Sulfur	" "	0.1	0.1	0.1	0.1
Magnesia	" "	5.0	5.0	21.8	21.8

These specifications are arbitrarily made to provide a means of identifying various classes of limestone since there are no generally agreed upon standards. Silica, alumina and sulfur are impurities. Magnesia is an active basic agent, but limestones with varying proportions of magnesia may have different uses.

Uses of metallurgical stone. Over half of the total volume of stone here classified as "metallurgical" consumed annually is used as blast furnace flux. The blast furnace is the fundamental unit in the conversion of iron ore to pig iron. An average of 800 pounds of limestone is used in producing each ton of pig iron. The function of the flux is to furnish basic constituents, namely lime and magnesia, which will combine with the acid compounds normally present in an ore, such as silica and alumina, and remove them in the form of the resulting slag at the top of the molten metal in the blast furnace. Also the flux is very important in the removal of sulfur present in the coke in the blast furnace charge. Because the efficiency of the flux is dependent upon the amount of basic elements it can contribute, it becomes obvious that the presence of such compounds as silica and alumina in the flux itself serves to reduce the effectiveness of the flux as a metallurgical agent. It is, of course, possible to compensate for these increases in acid compounds in a flux by the addition of more flux. However, this practice has its limitations because it not only increases the slag volume, decreasing the furnace capacity, but in addition more coke is required to heat the additional stone to flux the acid compounds already in the stone and further, the addition of more coke to a blast furnace means that more impurities present in the coke have to be fluxed as well. Therefore, grade A-2 stone is used only where the delivered cost of A-1 stone is more than the additional costs involved in using an A-2 fluxstone obtainable near by.

The presence of magnesia does not seem to interfere with the fluxing property of limestone; in fact some blast furnace operators specify from 5 to 9% MgO in the belief that with such stone they obtain a more satisfactory slag. Therefore, B-1 (and even B-2) grade stone may be used either directly as a blast furnace flux, or as a supplementary material to be added to the A-1 charge.

Metallurgical stone can only be used in lump form. The fines produced during mining and processing must be agglomerated or marketed elsewhere. Pulverulent types of limestone such as chalk and marl cannot be used for metallurgical purposes, regardless of purity, unless agglomerated.

Most of the conversion of pig iron to steel is done in the open hearth furnace. During this operation from 130 to 370 pounds of flux, depending upon the amount of phosphorus that has remained in the pig iron, is added for each ton of steel produced. A-1 (or A-2) grade stone is used for this purpose; the dolomitic limestones (B-1 and B-2) are not used.

Dolomite is refractory and is used in lining basic open hearth steel furnaces. Only B-1 grade, and that at or close to the pure dolomite end of the calcium-magnesium series, can be used.

One of the most important uses of calcined limestone (lime) is as a flux in the production of steel. Chemical stone, used in making such products as soda ash and calcium carbide, and in the refining of beet sugar, must be of A-1 grade in most instances, although B-1 stone is used in quantity for some purposes. Quality plasters can be made only from A-1 or B-1 stone.

The utilization of the various grades of limestone as metallurgical stone is summarized in the following table:

Table II

Grade	Blast Furnace Flux	Open Hearth Flux	Furnace Linings	Lime	Chemicals
A-1	Yes	Preferred	No	Yes	Yes For more uses than B-1
A-2	Yes	Yes	No	No	No
B-1	Yes Usually as a supplement to A-1	No	Yes	Yes	Yes
B-2	Yes	No	No	No	No

The total metallurgical grade stone production is roughly one-eighth of the annual domestic crushed limestone produced (the amount of limestone mined for building stone is relatively insignificant). The remaining seven-eighths of the crushed stone has many uses, especially in concrete and road metal, and as cement stone.

It can be seen from the above table that either nearly pure high calcium limestone (A-1) or nearly pure limestone composed chiefly of the mineral dolomite (B-1) are essential to practically all metallurgical operations except in fluxing the blast furnace charge where A-2 (or B-2) quality stone can be used if necessary. Only the B-1 stone can be used as refractory material for steel furnaces.

Variations in quality in natural deposits of limestone. Nearly pure deposits of high calcium limestone (A-1) or dolomite (B-1) are due to a combination of favorable geological conditions both at time of deposition and subsequently. The sea in which the carbonate minerals were being deposited must have been clear; no streams on nearby land surfaces were bringing in sand, silt, or clay particles to be deposited contemporaneously with the carbonate grains. Subsequently no circulating ground waters precipitated silica or sulfides in that particular rock.

Limestones vary in quality both vertically and laterally. Vertical changes are the result of changed environments in the geological past. Just as a limestone may be succeeded by a shale, sandstone, or other rock due to different conditions of deposition at different times, so may a pure limestone be succeeded by a highly impure limestone (such as a shaly or cherty limestone). Likewise limestones vary laterally in purity due to different environmental conditions at time of deposition, or due to more active ground water circulation subsequently. Lateral variations are not as sudden as vertical changes. but may be just as complete. Many instances are known of limestones merging into shales and even sandstones laterally.

It may be concluded that a deposit of nearly pure stone is the result of an unusual combination of circumstances and that this combination was in effect locally but not regionally so the deposit is definitely limited in scope. Consequently every deposit of high-grade limestone may be looked upon as a lens. Some lenses are small, covering but a few acres, and others are large, covering several square miles. Many metallurgical stone operations cease, not because the limestone becomes exhausted, but because the high-grade lens within the limestone formation has been worked out.

LIMESTONE PRODUCTION

Quarrying and underground mining costs compared. Most stone is produced in open cut quarries. Underground mining is much more expensive, and is resorted to only where (1) no surface stone of adequate quality is available, and (2) the consuming district is so remote from open cut quarries that local stone can be mined and delivered cheaper.

Because of much cheaper production costs the outcrop deposits of metallurgical limestone constitute the number one domestic reserve. This stone carries down the regional dip from the outcrop and may underlie, at varying depths, hundreds of square miles of younger rocks. It therefore constitutes a secondary reserve, which will be considered in this report in the discussion on geographical distribution which follows. But it should also be remembered that (1) quality varies laterally, and in many instances A-1 stone in the outcrop becomes A-2 or less pure stone down the dip, and (2) not only does it cost much more to mine stone underground, but those already high costs increase with greater depth so that the potential value of a deeply buried limestone, even though it be of the highest quality, is highly questionable.

Deterrants to continued operation of metallurgical limestone quarries. In many parts of the United States there are dozens of abandoned quarries. Reasons for abandonment follow:

Public pressure. Although a quarry may be started in a rural area and antedate all zoning restrictions, it subsequently may become completely surrounded by residences and subject to harassment by the new neighbors who resent the presence of an industrial plant in their midst even though it was there first. Suits to abate either noise of blasting, plant operation, and truck movement, or dust may lead to the abandonment of a high-grade deposit before exhaustion.

Condemnation for highway and other purposes. Large reserves of high-grade limestone in the Chicago area and no doubt elsewhere have been retired from development through condemnation of a part of the quarry area for expressway use.

Increased thickness of overburden. In quarry operations there is an economic limit due to cost of overburden removal and disposal in order to uncover the stone beneath. When this limit is reached, usually due to increased thickness of overburden as the quarry is extended, the operation must end.

Increased cost with increased depth. This is an especially potent factor in terminating operations in underground mines. In addition to increased operating costs with increased depth every ton of stone produced from a deeper level also has to pay its prorata share of the cost of sinking the shaft to that level.

Pumping costs. Many limestones are very porous and some are even cavernous. Where these limestones lie below the water table either in quarries or underground mines, the pumping expense may eat up the entire profit margin and cause the operation to cease even though high quality stone is still present.

Changes in quality or in quality specifications. As a quarry or mine expands from the original area of operation, relatively slight changes in the chemical character of the rock may make it no longer acceptable to buyers. For example, an increase in the sulfur content of even as little as .01% may shut down an operation. Likewise a tightening of the sulfur requirements by the same amount could have the same effect.

Increased mine to market transportation costs. As with all bulk commodities the major cost is usually transportation. If these costs increase perceptibly the stone may become priced out of its market. Likewise, stone from more distant sources but traveling a cheaper route such as by water, may be able to compete successfully with stone from nearby. For example lake stone (term applied to limestone produced along the shores of the Great Lakes and transported by ship) can move inland for considerable distances invading markets hitherto held by local producers.

Exhaustion of deposit. Many limestone operations have closed down in the past and will continue to close down in the future because exploitation of the deposit has completely exhausted it.

Deterrents to opening up new deposits. Many adequate deposits of metallurgical grade limestone with excellent place value cannot be developed for the following reasons:

Zoning. Zoning restrictions have now spread from the city into the township and even the county. Therefore, in most metropolitan areas today current mining or quarrying operations are nonconforming and no new operations can be initiated even though a company may have owned mineral property for many years within the subsequently restricted area. As a consequence, producers supplying such necessities to urban development as stone, sand, and gravel now have to discover and develop deposits many miles (and many transportation dollars) distant from the concentrated market area.

Urban spread. Even without zoning the ever expanding urbanized area has removed, and will continue to remove, large deposits of limestone from ever being developed. For example, within the last twenty years in eastern Pennsylvania valuable high-grade limestone deposits have been covered by subdivisions, shopping complexes, and drive-ins.

Rural development. Beyond the urbanized zones are large areas covered by country estates and country clubs. The land thus covered is too expensive for acquisition for limestone exploitation.

Parks. Some very large areas are not available for mineral development because they lie within federal, state, or county parks. Examples are wilderness parks, national parks, local parks, parkways, and bird and game refuges. More land is retired for these purposes every year. We even have had recent examples of some states leasing park or game land for mineral development and then refusing the necessary permits to start the development.

Expressways and interchanges. Every year more expressways are built and each year the rights-of-way become wider and the acreage covered by the interchanges becomes greater. Without doubt a considerable tonnage of high-grade limestone becomes no longer available in this manner.

The search for new supplies. Because of the ever expanding market due to increased consumption, and the annual abandonment of many limestone quarries for reasons stated previously, the major limestone producers have to be continuously searching for new reserves. The discovery of such new reserves becomes increasingly difficult because of prior discovery and development, man-made restrictions on areas where stone can be exploited, and the necessity of finding the stone where its transportation cost to market will not be prohibitive.

The search for new supplies is also expensive. Geologists must be employed to locate prospects, land must be optioned, and the prospects core drilled for thickness of overburden and quantity and quality data. It may take months of searching and exploration to obtain a single adequate deposit of metallurgical grade limestone.

DISTRIBUTION OF METALLURGICAL LIMESTONE RESOURCES

Each state in the United States containing significant and accessible reserves of limestone of metallurgical grade is discussed in this section. The state by state summaries are based almost entirely on published information; their accuracy, completeness, and freshness are therefore no better than the quality and dating of the source material. In every instance where specific publications were available on the limestone resources of a state those publications are listed at the end of the pertinent discussion.

Analytical data are not available for many deposits, and the available information is questionable for others. In many instances the published analyses are for isolated "grab" samples which are rarely typical of the deposit as a whole. Only where the deposit has been sampled by the technical methods employed in industry can the analyses be averaged to give a reliable picture of the chemical character of the "run of mine" stone. Where adequate chemical information is lacking the best clues to the quality of a deposit are to be found by a survey of its utilization, including changes in its marketability across the years. Although a premium grade stone may be sold for low quality uses, an inferior stone cannot be marketed for metallurgical purposes, especially in recent years.

It will be noted that some of the references consulted, although the latest available, are of such vintage that the information obtained can hardly be considered up-to-date, especially in regard to areas of current exploitation. However, this report is primarily concerned with the reserve picture, and it can be stated that, as a general rule, the reserve situation has deteriorated instead of improved since the publication of the source data. This has been due to the subsequent exhaustion of many deposits and to the increased quality of stone demanded by the metallurgical market. New discoveries have failed to equal these losses in the metallurgical stone reserve supply.

Ninety per cent of the limestone produced and sold as fluxing stone in the United States in 1961 came from the following seven states:

Rank	State	Production in M tons
1	Michigan	10,565
2	Pennsylvania	4,924
3	Ohio	4,433
4	West Virginia	1,480
5	Alabama	1,269
6	Virginia	972
7	Illinois	737
	Total	24,380

In addition there was considerable production of limestone as chemical stone and for burning chemical lime.

In the following description of metallurgical grade limestone by states, the seven leading states in fluxstone production will be taken up first, in decreasing order of annual output. States of lesser importance as sources of this type of stone will follow, in order of geographic location, from east to west.

All state rankings are based on 1961 production figures as published in the Minerals Yearbook for 1961, Vol. 1, pp. 1157-1158.

Maps are included for the states which supply most of the metallurgical limestone produced in the United States. On these maps are patterns showing the areas in which certain geologic formations, know to contain local deposits of metallurgical grade stone, occur. Two points should be kept in mind in using these maps. First, the pattern refers to the top of the bed rock surface and not to the top of the ground; tens and even hundreds of feet of glacial deposits, wind blown sand, river alluvium, or even deep soil may lie between the surface and the bed rock. Secondly, the commercially usable high-grade deposits occupy only a small fraction of the area covered by a formation pattern, therefore the map does not pinpoint a possible quarry or mine site, but it does give the geologist a less-than-statewide area in which to hunt.

Michigan

Michigan's rank in the production of metallurgical limestone is due to a combination of strategic location in respect to the Great Lakes waterborne commerce and the presence of high quality stone in unusual abundance. Three formations (Fig. 1), the Burnt Bluff, Engadine, and Dundee-Rogers City are exploited for metallurgical stone in Michigan.

Burnt Bluff formation. The Burnt Bluff formation crosses the southern part of the Northern Peninsula from the Garden Peninsula to the east side of Drummond Island. A large lens of high calcium limestone (A-1) in the Burnt Bluff dolomite is quarried north of Port Inland.

Engadine formation. The Engadine formation at the top of the Niagaran series contains some dolomite of B-1 grade. This formation crops in the Northern Peninsula only, from the Lake Michigan shore near the Schoolcraft-Mackinac County line eastward across the foot of the St. Ignace Peninsula to southern Drummond Island. It is quarried north of Port Dolomite and on Drummond Island. The amount of stone of B-1 grade in this formation is definitely limited by local topography and structural geology. The southerly dip, which carries the Engadine beneath the lake waters in a relatively short distance, makes underground mining virtually out of the question.

Dundee-Rogers City. An exceptionally large deposit of A-1 grade stone lies within the Dundee-Rogers City formations southeast of the town of Rogers City. These rocks are quarried at Calcite and Stoneport. The belt occupied by the Dundee-Rogers City extends from False Presque Isle north and west to Little Traverse Bay. However, west of Black Lake, and perhaps west of Rogers City, the cover of glacial drift is too thick to permit exploitation of the underlying limestone. Down the dip, to the southwest of the outcrop zone between Rogers City and False Presque Isle, the Rogers City-Dundee stone continues beneath successively younger formations. The distance down-dip over which it retains A-1 quality is now known, but it is probable that a large reserve exists in the first few miles basinward from the outcrop. This reserve cannot be tapped, however, until prices justify underground mining.

To the southeast from False Presque Isle the Rogers City-Dundee stone disappears beneath Lake Huron. The Dundee formation reappears in a belt of few outcrops which crosses the corner of southeastern Michigan. Unfortunately, however, this stone loses its A-1 quality between northeastern and southeastern Michigan.

Limestone of metallurgical grade was shipped from the following ports (Figure 1) during the 1961 season:

Port	Formation	Type		Tonnage (M tons)
Port Inland	Burnt Bluff	High calcium		3,591
Port Dolomite	Engadine	Dolomite		2,330
Drummond Island	Engadine	Dolomite		2,048
Calcite	Dundee-Rogers City	High calcium		12,567
Stoneport	Dundee-Rogers City	High calcium		3,552
			Total	24,088

During the same year the fluxstone production was recorded as 10,565 M tons, so over half of the lake stone produced was used for other purposes, including as chemical, cement, lime, refractory, and commercial stone.

Michigan contains many other limestone and dolomite beds beside those mentioned, but all other known deposits of adequate size for large scale quarry operations are below A-2 and B-2 grade.

Pennsylvania

The production of limestone is a major industry in Pennsylvania, and Pennsylvania is a leading state in its annual output of limestone of all types. It is second in metallurgical stone production. Although Pennsylvania is underlain by many cubic miles of carbonate rock, the percentage that is of metallurgical and chemical grade is quite small.

The metallurgical stone resources of Pennsylvania occur in various formations of early Paleozoic age (Ordovician and Cambrian) in central and eastern Pennsylvania and in the late Paleozoic (Carboniferous) Vanport limestone of western Pennsylvania (Fig. 2). Four areas produce most of the metallurgical grade stone from the early Paleozoic rocks, whereas the production of Vanport limestone comes mainly from a single county in western-most Pennsylvania.

Early Paleozoic limestones. The four areas where Ordovician and Cambrian limestones are exploited are (1) Centre and Mifflin Counties in central Pennsylvania, (2) the Lebanon Valley of southeastern Pennsylvania, (3) the Philadelphia dolomite district, and (4) Adams and York Counties, also in southeastern Pennsylvania.

Centre County in central Pennsylvania contains the highest grade limestone (A-1) in quantity in the state. The Valentine formation ("Bellefonte ledge") crops out along the limbs of the Nittany anticline on opposite sides of Nittany Valley. On the northwest flank the beds are vertical, but the southeastern flank dips from 18° to 45°. Although formerly quarried to a considerable extent, most of the Valentine formation now comes from underground mines in the Bellefonte area and across the valley near Pleasant Gap. This stone is used as furnace flux, for chemical purposes, and for lime burning.

The Annville limestone, which like the Valentine is also of Ordovician age, is the A-1 stone which is quarried in the Lebanon Valley of southeastern Pennsylvania. The strata in this area have been tilted beyond the vertical so that they now dip from 30° to 50° south. The Annville likewise is used for lime burning and chemical and metallurgical purposes. In addition some is shipped into the Lehigh Valley cement district for mixing with the local cement rock in order to bring it within magnesia specifications.

Large quarries to the northeast and southwest of Philadelphia produce high-grade dolomite (B-1) from Cambrian rocks. Southeastern Pennsylvania also contains high calcium limestone of similar age. Centers of production are near Hanover in Adams County and in the vicinity of Thomasville in York County.

The east coast steel mills are largely dependent for their metallurgical stone upon the Cambrian dolomite and high calcium limestone deposits of southeastern Pennsylvania. However, both here and in the Lebanon Valley land values are very high and the urban spread westward from the Philadelphia metropolitan area have limited greatly the available reserves for future development.

The Carboniferous Vanport limestone of western Pennsylvania is produced today mainly in the Hillsville-Bessemer district of Lawrence County, but many quarries and underground mines have operated in the past in other parts of the Vanport outcrop area, especially in Armstrong and Butler Counties to the east. The Vanport stone is of marginal quality chemically (mostly A-2) and its furnace use has been due to its place value, lying as it does on the periphery of the Pittsburgh-Youngstown steel district. The Vanport is quite variable in thickness; where exploited it has an average thickness of about 18 feet, but due to erosion prior to deposition of overlying formations this limestone has been cut out altogether in many places. It lies nearly flat, which makes possible quarry operations

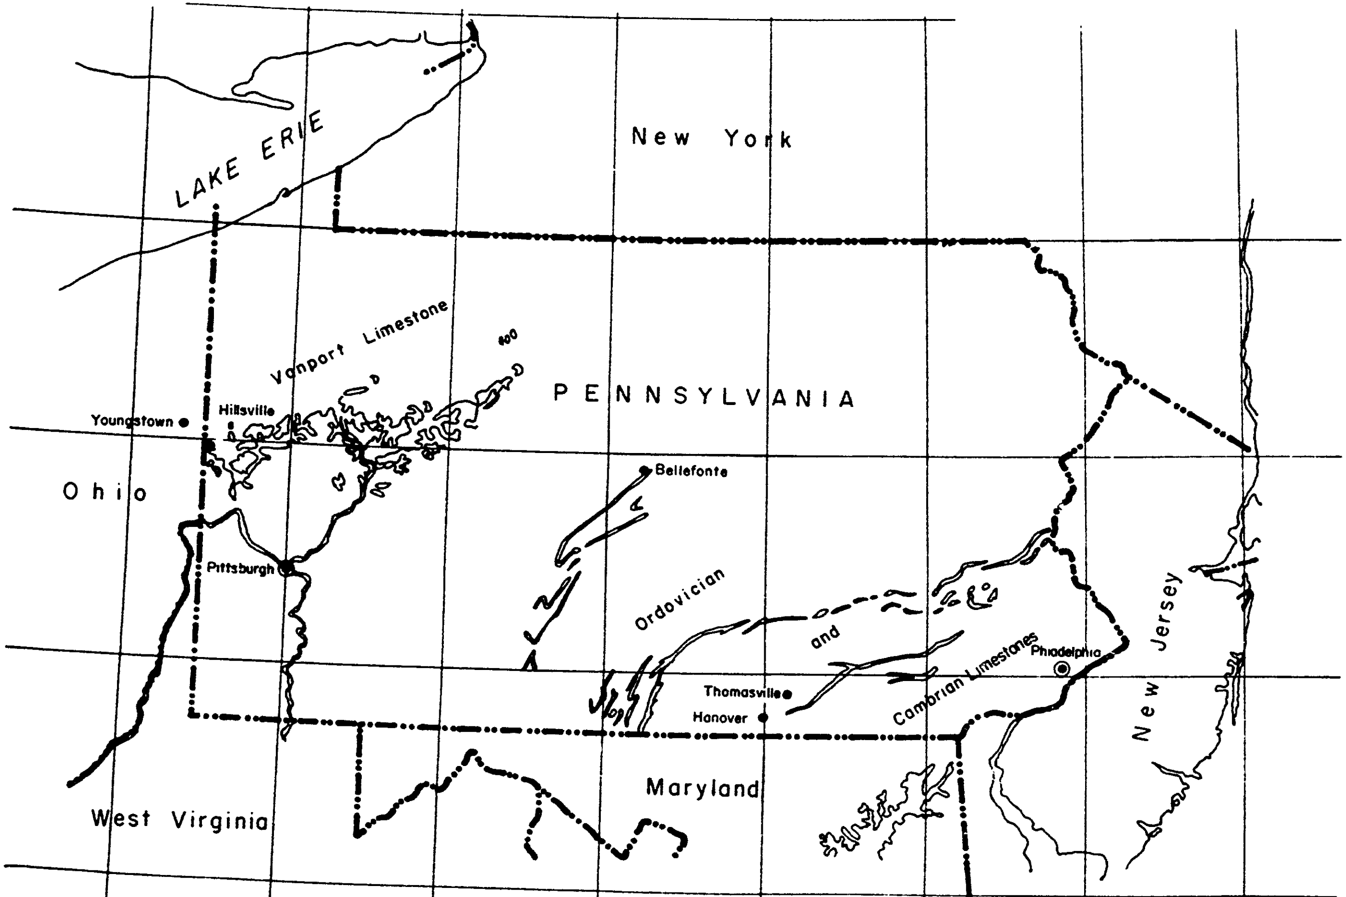

Figure 2
Scale: 1" = 40 miles.

33-865 O—69—pt. 5——27

in the Hillsville-Bessemer area, but farther to the east this ledge crops out along the sides of steep walled valleys so it has been necessary to follow the limestone bed beneath the overlying rock by underground mining in order to exploit it.

Ohio

Ohio ranks third in metallurgical limestone and first in lime production. Two rock groups, the Niagara and the Columbus, are the principal sources of metallurgical stone. The distribution of these rocks in Ohio is shown on Figure 3.

Niagaran dolomite. The only really high quality carbonate rock occurring in abundance in Ohio is the Niagaran dolomite which underlies a considerable area in western Ohio. Local names used for this rock include Peebles, Lilley, Cedarville and Guelph. The best stone appears to be localized in the northern part of the Niagaran outcrop to the southeast of Toledo in the general vicinity of Woodville. Here is the largest lime burning district in the United States. Because of the purity of the dolomite the lime is likewise high-grade and is used in chemical manufacture. Raw (unburned) dolomite is also shipped directly to chemical and steel plants. There is a large reserve of dolomite in the Woodville area, but future development will involve the removal of more and more overburden per ton of stone produced because the localities where thick dolomite lies at shallow depth are being exhausted.

Although the map shows another and larger outcrop band of Niagaran rock, crossing from Indiana into west central Ohio and continuing down to (and across) the Ohio River into Kentucky, most of this stone is B-2 or lower in grade.

Columbus limestone. The Columbus limestone, an A-2 stone, is the principal source of fluxing stone and chemical stone in Ohio. It extends from Kelleys Island in Lake Erie to south of Columbus (Fig. 3). The workable deposits at the north end of this zone have been largely exhausted. Abandoned quarries are numerous both on Kelleys Island and south of Sandusky Bay on the mainland.

As a general rule the Columbus limestone increases in silica and magnesia content with depth, so the downward limit of exploitation, so far as furnace stone is concerned, is an assay level rather than a geologic contact. Chert bands may be present locally at higher levels in the Columbus formation. However, in spite of its marginal chemical character for use as metallurgical stone is concerned, this limestone is so close to major consuming centers that it has unusually high place value.

The Columbus limestone dips to the east from the outcrop band and is mined at a depth of 2248 feet at Barberton, southwest of Akron, for chemical stone. The limestone exploited by this mining operation is also cherty.

Formations not shown on Ohio map. The Vanport limestone of Carboniferous age is extensively quarried in western Pennsylvania (see Pennsylvania) and some of the workings extend across the line into Ohio.

The Brassfield formation, somewhat older than the Niagaran but still of Silurian age, crops out in southwestern Ohio where it is practically the only commercial limestone. Chemically the stone is A-2 in grade. Its exploitation is handicapped by the fact that is has maximum thickness of only about 12 feet, except locally where it may be as much as 20 feet.

Various other formations are quarried in Ohio for crushed stone, but are too impure for metallurgical use.

West Virginia

West Virginia is the fourth state in the United States in annual production of metallurgical stone. In addition to a considerable volume of fluxstone, this state ranks high among the lime producing states, and also produces some dead-burned dolomite for refractory purposes. The metallurgical stone is confined to the Ordovician Mosheim limestone and Cambrian Tomstown dolomite which lie within the band of rocks which cuts across the northeastern or "panhandle" corner of West Virginia between Maryland and Virginia (Fig. 4).

Mosheim limestone. This is the only high quality limestone (A-1) in West Virginia. It crops out in Berkeley County and to a lesser extent in Jefferson County. It averages less than 1% silica and 2% magnesia, and is likewise low in alumina. The Mosheim, therefore, makes a very fine fluxstone and is ideal for lime burning.

Due to close folding and erosion the Mosheim limestone occurs in more or less isolated pockets. Many of the individual deposits have been completely worked out, and other pockets are so small that they cannot be profitably exploited. The volume of Mosheim stone yet to be quarried or mined in West Virginia is relatively small.

Tomstown dolomite. The Tomstown formation is a true dolomite of B-1 rank. Chemical analyses made of samples of this stone obtained from active quarries have shown a uniform silica content of less than 1%. It is quarried in considerable volume for refractory purposes. The center of the Tomstown exploitation is in the vicinity of Millville in Jefferson County. Like the Mosheim limestone the Tomstown dolomite occurs in infolded deposits, many of which have already been worked out and the remainder are definitely limited as to reserves.

Alabama

Alabama ranks fifth in annual output of fluxstone and eighth in lime. Most of the crushed limestone produced is used for flux in the Birmingham iron furnaces. The Alabama fluxstone and lime rocks occur in both Cambro-Ordovician and Mississippian formations (Figure 5).

Cambro-Ordovician formations. The largest quarries are in the Upper Cambrian Katona (Knox) dolomite in the vicinity of Birmingham. Some ledges run less than 1% silica in carload lots and so qualify for B-1 rating. Some lump dolomite is also mined in this district for refractory purposes. Dolomite and limestone of Lower Ordovician (Beekmantown) age are also quarried, especially in Shelby County, for both chemical and metallurgical uses.

Mississippian formations. Mississippian limestone has been rather extensively mined and quarried in Shelby, Jefferson, Blount, and Etowah counties, for flux in the Birmingham iron district. These limestones are A-2 in grade as a general rule. As yet untapped deposits occur along the Tennessee River in northern Alabama.

Palliser, "Alabama", in Industrial Minerals and Rocks, Chapter 8, "The Carbonate Rocks", American Institute of Mining, Metallurgical, and Petroleum Engineers, 1960, pp. 151-159; Benjamin Gildersleeve and James L. Calver, "Guntersville Reservoir Quarry Site Limestone Investigations", Tennessee Valley Authority, April 1943, 95 pp.

Virginia

Virginia is sixth in fluxstone and seventh in lime production. It also has a considerable chemical stone industry. The metallurgical stone resources of Virginia are confined to the upper Cambrian and Ordovician belt of rocks which crosses the western part of the state from northeast to southwest (Fig. 6). Topographically this region is known as the Appalachian Valley and in it are found over thirty lime plants and fluxstone and chemical stone quarries. Both high calcium limestone and dolomite are present in this belt of carbonate rock. Some stone of A-1 and B-1 quality is present, larger quantities of A-2 and B-2 are available, but the greater part of the limestone in Virginia (as elsewhere) is not of metallurgical grade.

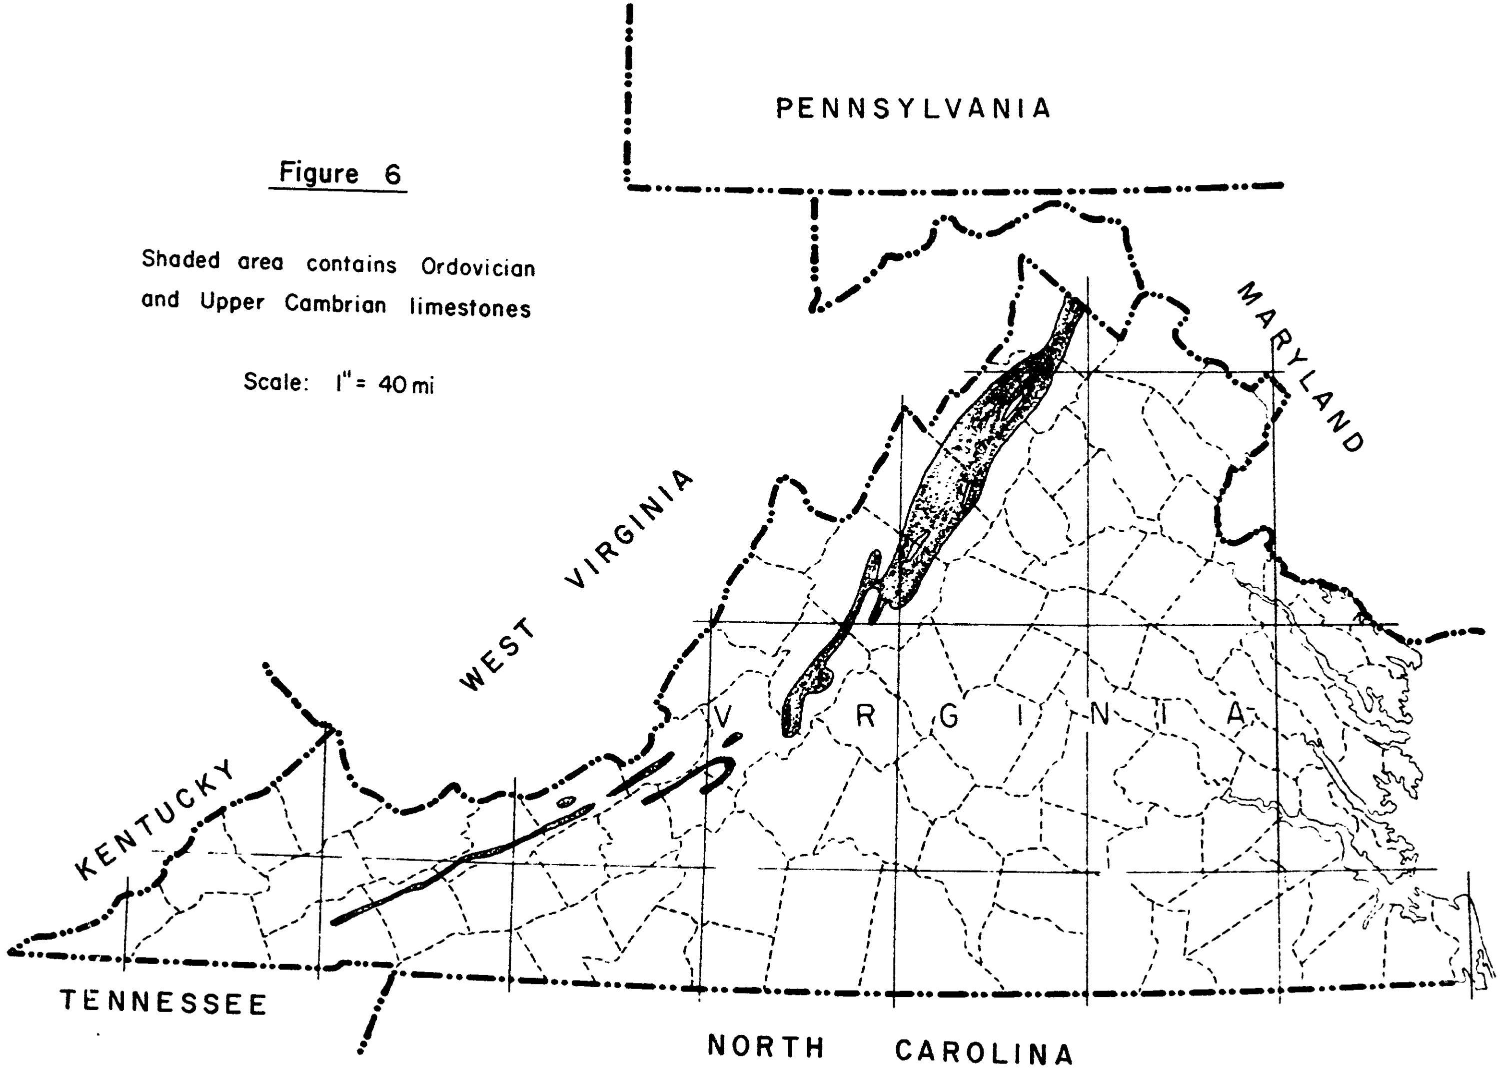
Shaded area contains Ordovician and Upper Cambrian limestones

Scale: 1" = 40 mi



Because of the pockety nature of the infolded early Paleozoic limestones of Virginia the quarriable reserves of the individual deposits are quite limited. Furthermore, the Virginia stone lessens in place value to the southwest of the West Virginia panhandle because of increasing distance to steel centers in the northeastern United States, and to tide water.

Illinois

Illinois is the first state in the annual production of crushed limestone. Most of this stone is used in concrete aggregate and for road metal, in which Illinois is the leading producer. It ranks seventh in the production of fluxstone, and is also a large producer of lime. Although several formations are worked in Illinois for metallurgical stone the leading areas are in Silurian (Niagaran), Mississippian, and Ordovician rocks (Figure 7).

Niagaran dolomite. Illinois has considerable production of dolomite of B-1 grade quarried from the Niagaran dolomite outcrop zone of northeastern Illinois (including Cook County). Some quarry sections here are unusually thick and fairly pure, but this situation is not true throughout the outcrop belt. Dolomite is extensively quarried in Chicago and vicinity for use in lime burning and for fluxstone, as well as for other volumetrically much more important uses. Although there is a considerable quantity of Niagaran dolomite of good quality not yet quarried in the Chicago district, most of it is not available because of high land costs, zoning laws, and highway construction. Many of the quarries are completely surrounded by built-up areas. The quality of the Niagaran stone becomes poorer to the south, and at Kankakee in Kankakee County the dolomite runs from three to ten percent silica.

Mississippian limestones. A belt of middle Mississippian limestones crops out in the bluffs of the Mississippi River both upstream and downstream from the Alton-East St. Louis industrial area. Included are the Salem, St. Louis, and Sainte Genevieve limestones. They are mined and quarried for many purposes, including lime burning, fluxstone, and chemical manufacture. The stone is high calcium limestone and is mostly of A-2 quality, but some of the ledges qualify for A-1 classification. Occurring as it does in the St. Louis metropolitan area, this stone is high in place value.

The same series of limestones also crosses the southern tip of Illinois from the Mississippi River to the Ohio River.

The next oldest Mississippian limestone, the Burlington, is not shown on the map because it rarely qualifies for metallurgical or chemical uses. It is, however, an important source of lime in the Quincy area where it is both mined and quarried. In some quarries the upper part of the Burlington may run as much as 50% chert.

Kimmswick limestone. This much older limestone of Ordovician age occurs in patches along the Mississippi River between Quincy and Alton, below East St. Louis, and north of Cairo (Figure 7). It has been mined in a deposit below East St. Louis as a source of lime. A part at least of this stone is of A-1 quality.

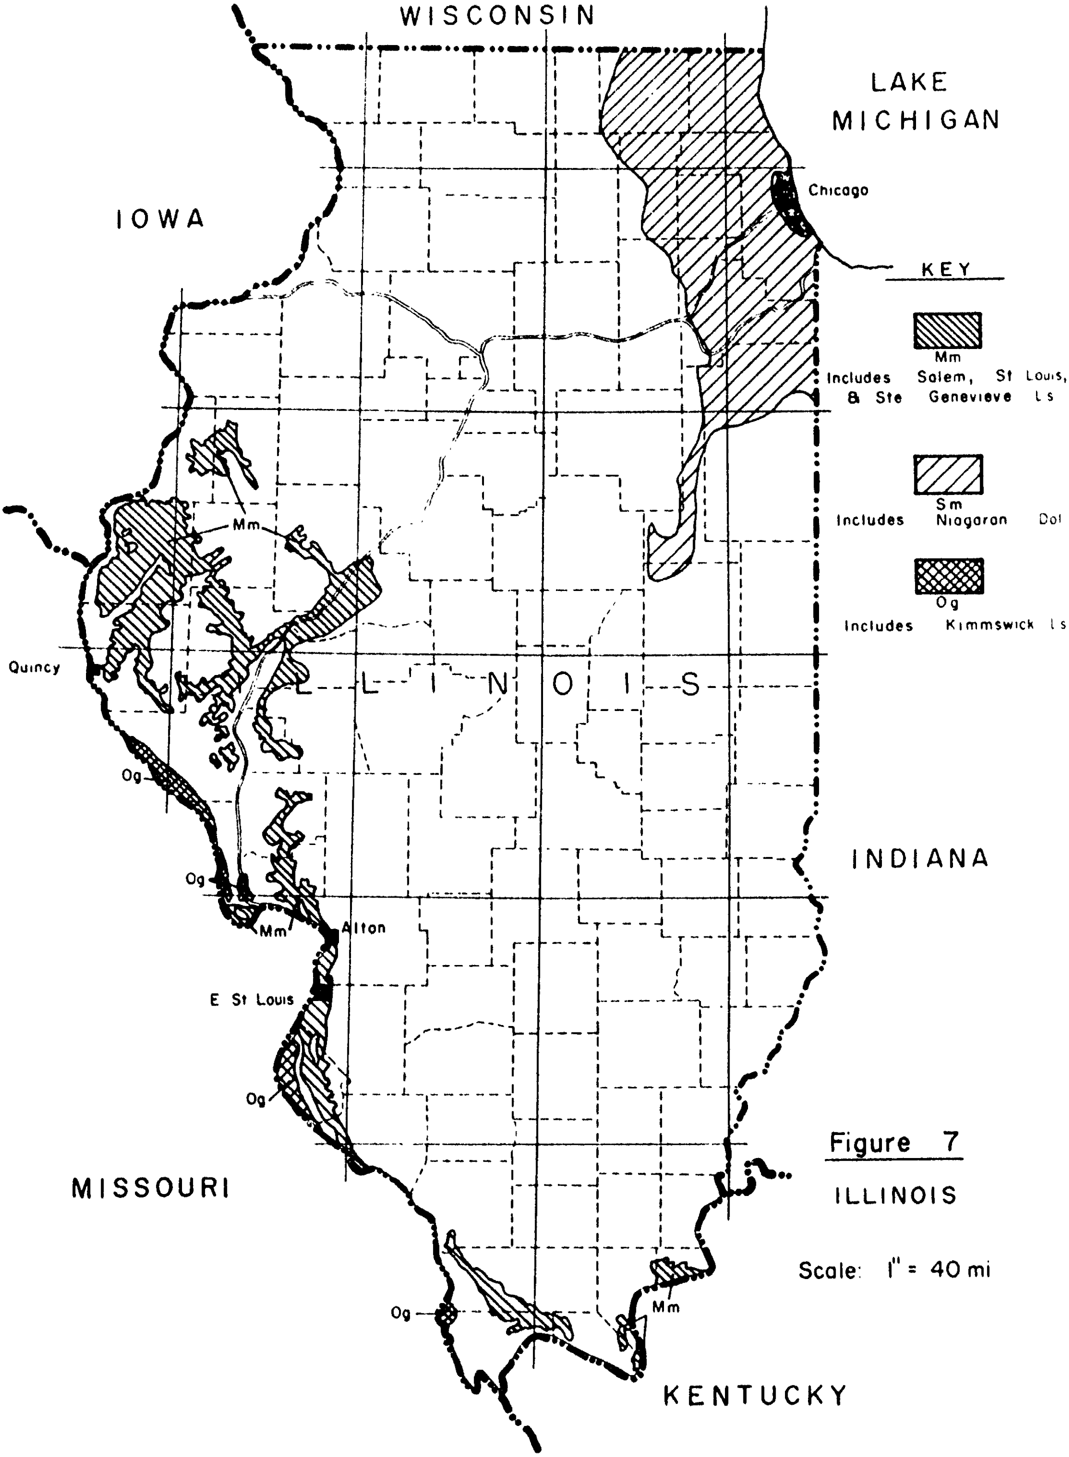

Figure 7

ILLINOIS

Other States

There are, or course, other states containing high calcium limestone and dolomite of metallurgical grade, and there is some production from those states of limestone for fluxing and chemical purposes. These states produce relatively small quantities of such stone for one of three reasons (1) the deposits are small and the reserves inadequate for large scale production; (2) the stone does not meet usual flux and chemical stone specifications, but is exploited locally because of abnormally high place value of the deposit; or (3) the deposits are remote from metallurgical or chemical markets so is low in place value and has a very limited market for furnace or chemical use.

Massachusetts. Massachusetts dropped from fourth place in lime production in 1932 to sixteenth place in 1961, probably due to the working out of the higher grade stone deposits. All of the commercial limestone deposits in this state are in Berkshire County in western Massachusetts. The calcareous formations are Cambrian and Ordovician in age. Some A-1 limestones are present and some of the dolomites and dolomitic limestones are of B-1 grade. The higher quality stone is burned for lime, and a few thousand tons are marketed each year for flux.

Reference: T. Nelson Dale, "The Lime Belt of Massachusetts", U. S. Geological Survey, Bulletin 744, 1923, 71 pp.

New York. Although New York ranks eighth among the states in crushed limestone production, its annual output of fluxstone and lime rock is relatively insignificant. Most of New York's limestone is below A-2 or B-2 in grade and is used in concrete aggregate, road metal, and railroad ballast. The metallurgical stone resources are largely confined to Precambrian dolomite and Silurian limestone.

Some of the Grenville dolomite (Precambrian) which occurs in St. Lawrence and Jefferson Counties in northern New York is B-1 in grade. It has been quarried near Natural Bridge, Jefferson County, and dead-burned for use as a refractory. Likewise some of the Precambrian dolomites in Westchester and Dutchess Counties north of New York City are B-1 in grade and have been exploited for lime manufacture. These occurrences are, however, local in character and because of the variable silica content of the Precambrian carbonate formations it is very unlikely that large deposits of B-1 grade stone are to be found in the New York-New England province.

From the available analyses there appears to be little or no A-1 Silurian stone in New York in quarriable volumes. The Clinton limestone becomes fairly pure in the western part of the state and is there of A-2 grade. It has been extensively quarried in the vicinities of LeRoy and Stafford, Genesee County, and Lockport and Gasport, Niagara County, for use as flux in the blast furnaces of the Buffalo district. Waterborne A-1 grade stone from Michigan and rail-borne high calcium limestone from Ontario have replaced local fluxstone in this district in recent years.

Devonian limestone has been exploited for many years near Syracuse for the manufacture of soda ash and other chemicals.

Swain, "Limestone and Dolomite Along the Pennsylvania Railroad System in New York", Pennsylvania State College, School of Mineral Industries Experiment Station, Dec. 1944 , 13 pp.; David H. Newland, "The Mineral Resources of the State of New York, Bulletin N. Y. State Museum, Nos. 223, 224, pp. 255-268, 1921.

Maryland. Maryland is unimportant as a source of metallurgical stone, but does produce a little lime. The same Ordovician formations which contain the better quarry ledges in southeastern Pennsylvania to the north and in the "pan-handle" of West Virginia and in northwestern Virginia to the south cross western Maryland at almost its narrowest part, passing through Frederick and Washington counties. A-2 stone is quarried and burned for lime at several communities in the former county, and at Cavetown in Washington County. These infolded limestone bodies are lenticular and decidedly limited in volume.

Reference: R. B. Neuman, "St. Paul Group, A Revision of the 'Stones River Group' of Maryland and Adjacent States", Geological Society of America, Volume 62, March 1951, pp. 267-324.

Indiana. Indiana, although the leading producer of limestone building stone, ranks tenth in crushed limestone and only an insignificant percentage of this material is used for metallurgical purposes. The reason for this is the virtual absence of metallurgical grade stone in quarriable deposits except the Salem limestone which is more valuable for building purposes. Niagaran rock, the outcrop of which extends into Indiana from the northwest, is not suitable for furnace use. The only limestones which are quarried in volume are the Sainte Genevieve, Salem, and other Mississippian formations. These are exploited in Washington and Harrison Counties in southern Indiana for roadstone.

To the northwest, in Lawrence and Monroe Counties, the Salem high calcium limestone is quarried in considerable volume for dimension stone; some lime is burned and a little furnace flux is sold as by-products of the building stone industry.

References: Duncan J. McGregor, "Indiana" in Chapter 8 "The Carbonate Rocks", American Institute of Mining, Metallurgical, and Petroleum Engineers, Industrial Minerals and Rocks, 1960, pp. 162-164; John B. Patton, "Crushed Stone in Indiana", Division of Geology, Indiana Department of Conservation, Report of Progress No. 3, April 1949, 47 pp.

Tennessee. Tennessee produces considerable crushed limestone, but most is below A-2 or B-2 in grade. Some stone is sufficiently pure, however, for lime burning. The lime rocks occur in both Cambro-Ordovician and Mississippian formations. Within the broad belt of Cambro-Ordovician formations crossing southeastern Tennessee are several limestones and dolomites which are locally of A-1 or B-1 grade. Some of the purest limestones in Tennessee are the upper Mississippian Gasper oolite and Sainte Genevieve limestone which occur in deposits up to 150 feet in thickness in the Highland Rim area.

References: R. G. Sterns, "Tennessee", in Chapter 8 "The Carbonate Rocks", American Institute of Mining, Metallurgical, and Petroleum Engineers, Industrial Minerals and Rocks, 1960, pp. 173-174; George I. Whitlach, "Limestone and Lime", Tennessee Geological Survey, Markets Circular No. 10, April 1941, 38 pp.

Wisconsin. Only minor amounts of limestone quarried in Wisconsin are used for lime and flux. By far the greater part of the production goes into concrete aggregate, road metal, and agricultural stone.

The only metallurgical stone quarried is the Niagaran dolomite which crops out in a broad band parallel to the Lake Michigan shore line from the Door Peninsula to northeastern Illinois. The largest lime production is in Manitowoc County. Lime is or has been burned in Sheboygan, Fond du Lac, Dodge, and Ozawkie counties. The Niagaran dolomite used for lime burning ranges in grade from B-1 to B-2. Scattered analyses show a silica content varying from .02% to 8.2%, with over half above 1%.

Reference: Edward Steidtmann, "Limestones and Marls of Wisconsin", Wisconsin Geological Survey, Bull. 66, 1924, 208 pp.

Iowa. Devonian limestones in eastern Iowa are quarried mainly for commercial stone, but a small percentage is sold as fluxing stone. The only lime plant in the state produces chemical and industrial lime from a Devonian limestone in Scott County.

Reference: H. Garland Hershey, "Iowa", in Chapter 8 "The Carbonate Rocks", American Institute of Mining, Metallurgical, and Petroleum Engineers, Industrial Minerals and Rocks, 1960, pp. 176-178.

Missouri. Missouri ranks third in the annual production of lime. The yearly output of fluxstone is negligible, but much of the lime is used for metallurgical purposes. Some of the lime is obtained from the Ordovician Kimmswick formation, but most is burned from limestones of Mississippian age.

The Trenton Kimmswick formation contains deposits of metallurgical grade limestone in eastern Missouri south of St. Louis. It is actively exploited for lime rock in Jefferson and Sainte Genevieve Counties.

Mississippian formations outcrop in a broad band fringing the Ozark uplands area and extending northward into northeastern Missouri and western Illinois. The Mississippian rocks are predominantly limestones, and some of the limestones contain deposits of metallurgical grade stone. Three centers of lime production have been established in the belt of Mississippian outcrop. The largest of these is in the vicinity of Sainte Genevieve in Sainte Genevieve County. Here the lime rock is the Spergen formation. To the west, in southwestern Missouri, is a second lime producing district. The largest plants are in Greene County in and near Springfield. The third district is in the vicinity of Hannibal in northeastern Missouri, where the Mississippian Burlington limestone is quarried and burned.

References: W. C. Hayes, W. V. Searight, and J. W. Koenig, "Missouri", in Chapter 8 "The Carbonate Rocks", American Institute of Mining, Metallurgical, and Petroleum Engineers, Industrial Minerals and Rocks, 1960, pp. 170-173; E. R. Buckley and H. A. Buehler, "The Quarrying Industry of Missouri", Missouri Bureau of Geology and Mines, 2nd series, Volume 2, 1904, 371 pp.

Texas. Texas has risen from a relatively small lime industry in 1946 to sixth place; in fluxing stone it has risen to ninth place. The state contains many limestones, but metallurgical grade stone is scarce.

The smelters of the El Paso district furnish a market for metallurgical lime and fluxstone obtained from Ordovician and Lower Cretaceous limestones which crop out in the immediate vicinity.

The principal lime rock in Texas is the Austin chalk formation (Cretaceous) which averages only 70 to 90 per cent calcium carbonate, but locally may have adequate purity for exploitation. This formation is quarried and burned for lime in several places in east central Texas, especially in Comal, Travis, and Williamson Counties. Chemical lime is produced south of San Antonio and shipped to the growing industrial area about Corpus Christi. Bedrock limestone has to compete with dredged oyster shell for the high quality stone market along the Gulf coast.

Colorado. About 20 per cent of Colorado's annual crushed limestone production is used as a flux in the Pueblo iron furnaces and in the smelters of Colorado's mineral belt. Most of the limestones in this state are too impure for metallurgical purposes, but two formations, occurring in the Mississippian and the upper Cretaceous, are locally adequate for fluxstone and lime burning.

The Leadville and other massive limestones of the Mississippian system are exploited in Colorado for metallurgical stone. Biggest production is at Monarch west of Salida in Chaffee County where fluxstone is quarried for use at Pueblo and Leadville. Another Mississippian limestone deposit at Rockwood north of Durango in La Plata County, southwestern Colorado, has been developed for both lime rock and flux.

The Timpas member of the Cretaceous Niobrara formation is exploited in east central Colorado, especially in Pueblo, El Paso and Fremont counties, for cement, lime, and flux.

Reference: John W. Vanderwilt, "Mineral Resources of Colorado", Colorado Mineral Resources Board, 1947, pp. 244-246.

Utah. Utah is the eighth state in fluxstone production, immediately following Illinois. About one-third of the crushed limestone produced in this state is used as a fluxing stone, not only in the copper smelters and steel plants within the state, but also in similar plants in California and in the El Paso, Texas, area. Limestones are scarce in the southwest so metallurgical grade stone here has high place value and can also travel unusual distances to market.

33-865 O—69—pt. 5——28

Leading counties for metallurgical and lime burning stone are Tooele and Utah. In addition to fluxing stone, dolomite is also quarried for refractory uses.

California. California is the leading state in the production of portland cement. It is ninth in lime production. This state also produces refractory dolomite, chemical stone, and fluxing stone, but the quantities are small because there is very little metallurgical grade stone in California. For this reason, steel companies have gone as far away as Utah, British Columbia, and Alaska in seeking stone of the quality needed.

The California limestones, used mainly in the manufacture of portland cement and in lime burning, are mostly of Paleozoic age. They occur as inliers in the highly folded Mesozoic and Cenozoic sedimentary and volcanic rocks. The deposits are discontinuous and individual deposits have a relatively short life.

Limestone has been reported from 52 of the 58 counties of California. During 1961 nineteen lime plants were in operation in thirteen counties; four-fifths of the total production came from plants in northern California. Much of the lime produced is used in open hearth steel furnaces and by the chemical industry.

Although most of the limestone produced is high calcium stone, dolomite also is produced and is used as a refractory and for chemical purposes.

RESERVE PICTURE

It was determined during the preparation of the first edition of this study 15 years ago, by inquiries sent to members of the National Lime Association, that the average life expectancy of the metallurgical grade limestone deposits then being worked was less than 30 years, and that an average of $10,000 was being spent by each responding company each year in the search for new deposits. Since then many deposit life expectancies have been shortened by increases in quality specifications, or by condemnation of valuable stone land for highway (including interchanges) rights-of-way, or for other reasons.

Likewise the search for adequate undiscovered limestone deposits has become more and more difficult, and more and more expensive.

It can be assumed that most of the limestone of metallurgical grade that will be needed fifty years hence has not yet been discovered, and the finding of it will not be cheap.

The CHAIRMAN. The next witness will then be Mr. Paul W. Seitz, first vice chairman of the board, National Limestone Institute, Inc., accompanied by Richard Brady.

STATEMENT OF PAUL W. SEITZ, FIRST VICE CHAIRMAN OF THE BOARD; ACCOMPANIED BY RICHARD BRADY, COUNSEL, AND ROBERT KOCH, PRESIDENT, NATIONAL LIMESTONE INSTITUTE, INC.

Mr. SEITZ. Thank you.

Senator CURTIS. Mr. Chairman, could I ask a question. I would like to know to what extent there is an overlap in the organizations of the National Crushed Stone, the National Lime Association, and the National Limestone Institute. Is it true that all three of them are involved with some of the types of lime?

Mr. SEITZ. Yes; that is true.

The CHAIRMAN. Is there an overlap in these organizations or are they testifying to the same point or is there some difference of opinion between them?

Mr. SEITZ. The organizations are distinct organizations operating separately from one another.

The CHAIRMAN. I see.

Mr. SEITZ. I am Paul W. Seitz, first vice chairman of NLI's board of directors, and am appearing today on behalf of all members of the National Limestone Institute. I am also president of May Stone and Sand, Inc., of Fort Wayne, Ind. I am accompanied by Richard Brady of Covington & Burling, counsel to the National Limestone Institute, and on my left Robert Koch, president of the National Limestone Institute.

The institute's members appreciate this opportunity of presenting to the committee its views on section 501(a) of H.R. 13270.

The National Limestone Institute is an industry association composed of 549 limestone producers located in 34 States. Its members produce aggregates for highways and other construction, agricultural limestone, and other limestone products.

The National Limestone Institute opposes the proposed reductions under the House bill in the existing percentage depletion rates for limestone from 15 and 5 percent to 11 and 4 percent.

Percentage depletion recognizes that mineral resources are wasting assets, and it is an important part of the national minerals policy to assure an adequate supply of natural resources at a reasonable cost to the consuming public. The proposed rate reductions indicate a significant change in this policy, and should be carefully considered. They were not based upon any study of either the limestone industry or the mining industry generally. It is unlikely that the Ways and Means Committee even considered them in terms of any mining industry other than oil and gas.

I think I could best serve your time this morning by giving you some examples of what percentage depletion has meant to the limestone industry. Congress passed the Highway Act of 1956, the largest peacetime construction program in the history of our country—40,000 miles, costing $41 billion, later raised a 42,500 miles, costing $60 billion.

Our industry, together with others have supplied all aggregates required for the construction without any outside help. After the 1956 Highway Act was enacted, the Federal Bureau of Public Roads contacted the States, offering Federal aid in exploration and development of aggregate sources as the immensity of the program was thought too large for private industry.

When these people visited Indiana, and offered their views, we suggested our industry could provide the know-how and capital without outside help. To this day we have not faltered, nor has any faltering anywhere in the United States been brought to our attention.

Percentage depletion has offered us the opportunity to get the job done, and of course we do not stop here, for ahead is an ever greater demand for our industry, to supply the basic materials for progress.

Since our industry is a depletable natural resource, we are constantly exploring for new deposits, especially to meet ever more rigid specifications. We as an industry not only deplete our resources but in many instances are curtailed by zoning regulations where the aggregate is available, which can mean additional exploration and development. In order to obtain and hold this natural resource, many capital dollars are invested for many years ahead.

Senator GORE. Could I ask my question now?

You have made a statement: The percentage depletion allowance has absolutely no connection with depletion or with discovery. It is merely a formula for tax reduction. You would get it whether or not you made any discovery or whether or not you depleted your product.

Thank you, Mr. Chairman.

The CHAIRMAN. Do you want to reply to that?

Mr. SEITZ. No; I think not.

Senator GORE. Well, it is a factual statement.

Mr. SEITZ. Our industry is quite different in selecting a plant site as compared to a manufacturing industry which locates a plant by availability of manpower, transportation and consumer market; however, we go to the natural resource.

Even with these handicaps our industry has maintained a very favorable selling price, not escaping inherent higher costs which have been influenced by inflation, with an average selling price in 1967 of $1.38 for all limestone products compared with $1.40 in 1950.

We have kept pace with many technological advancements, and maintain a supply of limestone for the marketplace, even though we are a group of many small businesses working on small profits. Any change in percentage depletion, and the incentive it offers the mining industries, could materially affect our ability to keep pace as an independent enterprise. If we have proven our ability to supply an ever-expanding economy, we certainly have proven the value of private enterprise at work.

Nonetheless of importance is our role in the health of the Nation in supplying much needed calcium in the form of agricultural limestone.

The major direct role of limestone in national health is the influence of the calcium released from it to be absorbed by the exchange complex of soils taken up by plants and eventually by animals including man.

Today we supply agricultural limestone at an annual rate of 30 million tons, but college agronomists tell us that 80 million tons are needed on an annual basis just to maintain a calcium balanced soil.

We as an industry can do the job as we have been doing it if the incentive for private enterprise is allowed to progress without interference by changing the encouragement offered by percentage depletion.

Thank you.

The CHAIRMAN. Thank you very much.

The next witness will be——

Senator MILLER. Mr. Chairman, I have four questions.

The CHAIRMAN. The four questions being submitted, will you please provide the answers to Senator Miller?

Mr. SEITZ. Yes, sir.

The CHAIRMAN. Thank you, Mr. Seitz.

(Mr. Seitz' prepared statement and answers to questions of Senator Miller, follow:)

COVINGTON & BURLING,
Washington, D.C., September 30, 1969.

Senator JACK MILLER,
Committee on Finance, U.S. Senate,
New Senate Office Building, Washington, D.C.

DEAR SENATOR MILLER: Paul W. Seitz, witness for the National Limestone Institute, Inc. has asked me to deliver to you the following answers to the questions you asked Mr. Seitz at this morning's hearings. Mr. Seitz and National Limestone Institute regret that the information to answer your questions more precisely is not available.

If you or other members of the Committee have any further questions, Mr. Seitz and the National Limestone Institute will be pleased to do whatever they can to respond.

Q. What are estimated total gross sales of your Association of agricultural limestone?

A. National Limestone Institute does not accumulate statistics on sales of agricultural limestone by its members. It believes, however, that its members are responsible for a significant portion of the total production of agricultural limestone in the United States. The total production of agricultural limestone (including small quantities of dolomite) for 1967 has been reported by the Department of the Interior in the Minerals Yearbook as 29,245,000 short tons valued at $51,463,000.

Q. What is the total annual percentage depletion allowance (for tax purposes) for agricultural limestone?

A. The Treasury Department has never included in its published statistics the aggregate percentage depletion deduction claimed with respect to agricultural limestone, and the general statistics it does make available to the public offer no basis on which to compute the amount of this deduction. Since in any given year some agricultural limestone operations will result in a loss or a small profit, some production of agricultural limestone will have either no percentage depletion deduction or a deduction measured by the 50 percent of taxable income limitation. These factors make it impossible to compute the percentage depletion deduction for agricultural limestone on the basis of production statistics.

Q. Please relate the foregoing to any estimates you wish to submit of additional costs to the agriculture industry if the rate of percentage depletion is reduced for agricultural limestone as provided in the House bill.

A. The impact of the proposed cutback on the agriculture industry is uncertain. First, the amount of additional taxes to be paid by producers of agricultural limestone is not known. Second, there is no clear indication of how agricultural limestone producers will respond to their additional tax burden. Some will likely attempt to raise their prices to transfer the burden of their additional taxes to the agriculture industry.

Q. What is the estimated annual expenditure by your Association for exploration, research and development, including construction of mining facilities?

A. National Limestone Institute has no information on which to base such an estimate. Neither the Bureau of Mines nor any private studies have attempted to develop the necessary information. The diversity of operations that exist among producers within the limestone industry makes impractical any estimate not based on an actual survey.

Very truly yours,

RICHARD A. BRADY,
Counsel for National Limestone Institute, Inc.

STATEMENT OF NATIONAL LIMESTONE INSTITUTE, INC., PRESENTED BY PAUL W. SEITZ, FIRST VICE CHAIRMAN OF THE BOARD OF DIRECTORS

SUMMARY

(1) The National Limestone Institute, Inc. is an industry association composed of some 549 limestone producers located in 34 states. Its members produce aggregates for highways and other construction, agricultural limestone, and other limestone products.

(2) The National Limestone Institute opposes the proposed reductions under the House bill in the existing percentage depletion rates for limestone from 15 and 5 percent to 11 and 4 percent.

(3) Percentage depletion recognizes that mineral resources are wasting assets and is an important part of the National minerals policy to assure an adequate supply of natural resources at a reasonable cost to the consuming public. The proposed rate reductions indicate a significant change in this policy and should be carefully considered. They were not based upon any study of either the limestone industry or the mining industries generally, and it is unlikely that the Ways and Means Committee even considered them in terms of any mining industries other than oil and gas.

(4) The economic impact of the proposed rate reductions would be severe in the case of individual producers in the limestone industry. It is an industry of small businesses and modest profit margins. The average price of limestone has actually decreased from $1.40 per ton to $1.38 per ton since 1950, when limestone was granted percentage depletion, although the producers' costs have increased substantially during the same period.

(5) Investors in the limestone industry need the incentive of percentage depletion to develop limestone deposits and produce marketable limestone products efficiently in order to meet the demand for limestone which has almost tripled since 1950 and which is expected to continue to grow parallel to the trends in population and gross national product.

STATEMENT

I am Paul W. Seitz, First Vice-Chairman of NLI's Board of Directors, and am submitting this statement on behalf of all members of the National Limestone Institute. I am also President of May Stone and Sand, Inc., of Fort Wayne, Indiana. National Limestone Institute's members appreciate this opportunity of presenting to the Committee its views on Section 501(a) of H.R. 13270.

The National Limestone Institute, Inc. is an industry association composed of some 549 limestone producers located in 34 states. Its members produce aggregates for highways and other construction, agricultural limestone, and other limestone products.

Limestone is presently entitled to a 15 percent depletion rate unless it is used, or sold for use, or riprap, ballast, road material, rubble, concrete aggregates or for familiar purposes. The rate for limestone used for these purposes is 5 percent.[1] Under the House bill, the allowable rates would be cut from 15 and 5 percent to 11 and 4 percent.

---

[1] Under the 1939 Code only metallurgical grade and chemical grade limestone were entitled to 15 percent. During those years substantial controversy developed over the classification of a limestone deposit, and several litigated cases failed to develop a satisfactory distinction between metallurgical and chemical grade and other limestone. The matter was resolved in the 1954 Code by elimination of the metallurgical and chemical grade classification and introduction of the end-use test under which limestone used for aggregates, etc. is entitled to only 5 percent. The present statutory rule is a rational classification, and National Limestone Institute believes that a classification based on metallurgical and chemical grade is not sound.

The National Limestone Institute opposes the proposed reductions in the existing percentage depletion rates.

Percentage depletion was made available to limestone in 1951 as part of the National minerals policy to provide an adequate supply of all minerals to satisfy the demands of an expanding economy and the requirements of security and to assure an orderly development of the Nation's natural mineral resources. Percentage depletion is a fundamental part of this National policy. It recognizes that mineral resources are wasting assets and that new reserves must be found and developed.

During the years percentage depletion has been available, the limestone industry has participated in the Nation's economic growth. According to statistics published by the Bureau of Mines, production has almost tripled.[2] All segments of the

Short tons	180,918,910
Value	$252,755,827
1967 (including small quantities of dolomite):	
Short tons	508,902,000
Value	$783,135,000

limestone industry have contributed to this growth. As is the case with the mining industry generally, the impact of limestone's growth has been felt directly in construction, agriculture and the many other industries using limestone products, and indirectly throughout the economy.[3]

Any change in National policy that would adversely affect the growth of the mining industries should be carefully considered. The symbolism of tax reform and revenue gains should not be allowed to change this country's successful minerals policy. The proposed percentage depletion rate reductions would change this policy, however, even though the decisions of the Ways and Means Committee were not based upon any study of either the limestone industry or the mining industries generally. It is unlikely that the Committee even considered the proposed rate reductions in terms of any mining industries other than oil and gas. The mining industries should not be the unfair victims of tax reform.

The economic posture of the limestone industry should be understood in order to evaluate the impact of the proposed percentage depletion rate reductions. Although the volume of limestone production has grown impressively, the industry continues to be primarily small businesses. As the Bureau of Mines' statistics cited above indicate, the average selling price of limestone since 1950, a period of National growth—and generally rising prices—has actually decreased from $1.40 per ton in 1950 to $1.38 per ton in 1967. On the other hand, the industry has not escaped cost increases prevailing in the Nation's economy. Air and water pollution control, noise control, and compliance with land zoning requirements have been additional factors in increasing costs. The consequence has been that the industry has spent large sums to develop limestone deposits and produce marketable limestone products *efficiently* in order to be competitive with other minerals, especially those also suitable for use as aggregates.[4] Nevertheless, profit margins have been narrow.

Although the aggregate percentage depletion deduction for limestone is not available, it is very doubtful that the proposed rate reduction will yield a meaningful increase in revenues. The impact on individual producers, however, will be significant. As in the case in the mining industries generally, percentage depletion has become an integral part of the economics of the limestone industry, and maintenance of the existing percentage depletion rates is necessary to avoid serious dislocations. These rates are not generous—15 percent is the rate for minerals generally and 5 percent is the minimum rate. Cutbacks from these levels in an industry of small businesses and modest profits will have adverse consequences, including possible price increases and reduced expenditures to find and obtain new deposits and to modernize operating methods.

---

[2] 1950:

[3] Hearings on Mineral Shortages Before the Subcommittee on Minerals, Materials, and Fuels of the Senate Committee on Interior and Insular Affairs, 90th Cong., 2d Sess., 32 (1968).

[4] Modernization is discussed, for example, at pp. 1067–68 of Minerals Yearbook, 1967 of the Department of Interior.

It is inevitable that the economic dislocation of the House proposal will affect the capital values the risk element of limestone producers with adverse effects on supply. The impact on the Nation would be significant. The Bureau of Mines has projected massive increases in the demand for limestone during the remainder of this century. Its growth will closely parallel trends in population and gross national product. Although reserves of limestone are substantial, they are being depleted at a high rate. The Bureau of Mines has reported [5] that "exacting specifications determine the marketability of stone in important instances and sources adequate for such needs at reasonable costs are not unlimited," and further that "because of the variety of industrial uses the local availability of stone that will meet specifications of local markets influences the industrial and economic development potential of an area."

The CHAIRMAN. The next witness is Mr. Rhyne Simpson, Jr., first vice president of the Gypsum Association.

STATEMENT OF RHYNE SIMPSON, JR., FIRST VICE PRESIDENT OF THE GYPSUM ASSOCIATION

Mr. SIMPSON. Good morning, Mr. Chairman.

Good morning, members of the committee. My name is Rhyne Simpson, Jr. I am president of Republic Gypsum Co. and first vice president of the Gypsum Association. We mine gypsum and manufacture gypsum wallboard. We are one of the 13 companies in the United States who mine and then process gypsum into a building material product called gypsum wallboard.

The Gypsum Associattion represents over 90 percent of the mining capacity and the gypsum wallboard manufacturing capacity in the industry. I am speaking on behalf of the Gypsum Association members in opposing a reduction in the depletion allowance on gypsum from 15 percent to 11 percent.

You have a copy of my formal statement. I will not go over it in detail.

The CHAIRMAN. It is in the record.

Mr. SIMPSON. But I would like to make a few points about how the reduction in the depletion allowance will affect our company.

As I mentioned, we mine gypsum and manufacture gypsum wallboard. Gypsum wallboard is a prefabricated building material used primarily in the construction of residential shelter. Our company is also active in the manufacture of housing.

Gypsum is mined by various ways in the United States, both underground mines and strip mines.

Our industry is unique in that 75 percent, over 75 percent of the gypsum mined is used in some form or another in residential house construction.

In this last year our industry has been very hard hit by the very restrictive monetary policies of the Federal Government to control inflation. In spite of the fact that there has been a very significant increase in the demand for shelter, both demographic and social, we have seen a decrease in residential house construction in the last year.

---

[5] These facts and many other important considerations are discussed in Hearings on Mineral Shortages before the Subcommittee on Minerals, Materials, and Fuels of the Senate Committee on Interior and Insular Affairs, 90th Cong., 2d Sess., 77 (1968), and at pp. 884–893 of Mineral Facts and Problems, 1965 Edition, a publication of the Department of Interior.

At the same time it is the policy of our National Government to increase residential house construction. It is our position that under the precedents set by retaining accelerated depreciation on residential house construction, we ask that gypsum be excluded from a drop in depletion from 15 percent to 11 percent.

We ask that it be added to those other minerals excluded from the drop. We feel that a continuation of the gypsum depletion allowance at 15 percent will help hold the price line on the cost of residential shelter to the consumer. At the same time, however, I should point out that gypsum products have not experienced an inflationary spiral like other building products. Just the contrary. In our prime marketing area in the Southwest, Texas, Oklahoma, and the States surrounding, gypsum wallboard today is sold at prices cheaper than during the depression years.

At the same time that the Federal Government is holding the line through monetary pressures on the economy, the building material industry has been asked to participate in ways to help increase the production of low-cost shelter. Operation Breakthrough is one of these ways.

Our company participated in Operation Breakthrough. As a matter of fact, we made our proposal September 19th to the Department of Housing and Urban Development. It might be interesting to you to know that the cost in just preparing this breakthrough proposal was greater than our entire depletion allowance last year.

Senator GORE. Is there any connection between the two?

Mr. SIMPSON. There is no connection between the two except for the fact that 75 percent of the rock that we mine does go into residential shelter.

Senator GORE. Why mention it then? There is no connection between depletion and anything except tax reduction.

Mr. SIMPSON. That is correct. That is our point, sir.

Senator GORE. Good.

Senator BENNETT. I would like to discuss that with my colleague at some other time, having invested in a mine that ran out before the depletion allowance was recovered.

Senator GORE. But it would not have affected percentage depletion if it had run out, or if it had not, if you had discovered further, or if you had not.

Mr. SIMPSON. Senator Gore, I did not mention the discovery of new gypsum reserves. As a matter of fact, I think it should be referred to quite frankly as a tax advantage, and that is what accelerated depreciation is, and I feel that for the same reason it should be applicable to our industry.

Senator GORE. Mr. Chairman, I have heard so much of this business: the relation between discovery and depletion of resources and in this booklet he has prepared, the relation of these to percentage depletion allowance, that I just wanted to make the record clear: there is no requirement that the amounts permitted a taxpayer in percentage depletion be set aside for discovery, there is no connection whatsoever between depletion of the resource, discovery of the new, and the setting aside of the reserve. As a matter of fact, I happen to know of an instance in which a mineral corporation had developed a reserve of several million dollars from percentage depletion. Control of the corporation was bought by another corporation, and it was promptly milked out and not $1 of it used for further discovery.

The CHAIRMAN. I would think if the Senator ever had my experience being the private possessor of a dry hole he would understand what it is all about better than he does.

Senator GORE. I have discovered a few sulfur wells trying to find water. I understand that. But that still has nothing to do with whether or not percentage depletion relates to finding a successful hole or finding a dry hole.

The CHAIRMAN. Let me see if I get the connection here.

Senator GORE. There is no connection.

The CHAIRMAN. Well, the witness said something. I am entitled to know what he said.

Senator GORE. He has a booklet there in which he referred to and talked about percentage depletion.

The CHAIRMAN. Let me see if I understand what the witness said. Would you mind explaining what is that booklet that you have there?

Mr. SIMPSON. Mr. Chairman, this booklet represents our proposal on Operation Breakthrough, which is a proposal of the Department of Housing and Urban Development to help foster and create new ways of building low-cost houses. In addition to mining gypsum we manufacture factory-built houses, another part of our business.

The CHAIRMAN. So as I understand it, you worked out at the expense of your company a proposal to produce housing cheaper for people?

Mr. SIMPSON. That is right. We have a large investment tied up in our management time, overhead, hard dollars invested in prototype units on this proposal. Now, there is no relation whatsoever between this and depletion, but I only wanted to relate that those are about the same dollars that we saved last year on taxes because of depletion.

What I did not say, was that we spent about four times that many dollars on looking for new gypsum reserves. While our industry is unique at this time because of the national policy to increase residential construction, the depletion allowance is important and necessary to help explore for new reserves.

Senator GORE. In other words, you say on the one hand that there is no relation but you say on the other that you want to relate?

Mr. SIMPSON. Yes, sir, I say exactly that. I want to relate it.

Senator GORE. Thank you. That is about how clear the relation is.

Mr. SIMPSON. Yes, sir. I want to relate it the same way that accelerated depreciation is being used as a tax shield to help foster increased residential housing.

The CHAIRMAN. As I understand it you are saying you save some money against taxes and what you save you put into lower cost houses to be built?

Mr. SIMPSON. Yes, sir.

The CHAIRMAN. That is the connection?

Mr. SIMPSON. Yes, sir.

The CHAIRMAN. What you save is spent trying to find a cheaper way to build somebody homes?

Mr. SIMPSON. Yes.

Senator MILLER. Yes, but in addition to that what you are saying is that the amount of the allowance for percentage depletion for your industry is more than spent for exploration and development?

Mr. SIMPSON. That is correct, for our company by a factor of 4 this last year.

Senator GORE. But you could have used the percentage depletion tax break you got for bigger dividends or for a new resort, a new motorboat, a new booklet. Or you can simply put it in reserves. I know of nothing that better illustrates the utter fallacy of the percentage depletion allowance as a tax principle. We ought to abolish it completely and put everyone on a cost depletion basis.

The CHAIRMAN. As I understand it, what you said here was that you spent four times as much money as you had in depletion allowance trying to find more gypsum somewhere?

Mr. SIMPSON. That is correct, and let me make another point. Our industry and the entire building material is changing, changing a great deal. You are seeing companies that have traditionally been active in nothing but gypsum wallboard leading the front on urban development in the United States. Our company a year ago was 90 percent active in gypsum wallboard, now only 35 percent active in gypsum wallboard, and over 50 percent of our sales come in house construction, so there is not a tie, but at the same time there is, because of an evolutionary process in American business.

The CHAIRMAN. Since we have digressed in this the latest figure I saw indicated that in this country on exploration for new oil, only one wildcat well in 43 was actually a good commercial producer.

That is not counting marginal wells. The point is—and I do not expect my good friend from Tennessee to agree with it, but the point is that just letting a man recover his money will not quite be enough incentive when the odds are 43 to 1 against you.

Mr. SIMPSON. That is correct.

The CHAIRMAN. You need something more than that.

Mr. SIMPSON. Yes, sir.

Senator GORE. Mr. Chairman, I will put in the record some very interesting figures on exploration; but since we have diverted to this I would like also to point out that there is a current writeoff of such exploration expenses. So they get it in two ways.

The CHAIRMAN. I made reference to that. The point is that if the odds are 43 to 1 against you, just getting your money back will not quite make it. That is the point.

Senator GORE. Mr. Chairman, the record shows that the odds are not of that proportion. They might be for one particular wildcat operation.

Senator BENNETT. I call for the regular order.

The CHAIRMAN. The regular order has been called for and I will call myself to order. Let the witness proceed.

Mr. SIMPSON. Let me summarize very briefly. W feel that our industry has suffered because of restrictive monetary policy. We feel that there has been a precedent set by including and retaining accelerated depreciation on residential shelter. We think by the same reasoning that gypsum should be left at 15 percent depletion rather than dropped to 11 percent. We, therefore, respectfully request that it stay at that level. I will be happy to answer any questions, and I do thank you for the opportunity to appear.

Senator MILLER. What is the annual total gross sales by your association?

Mr. SIMPSON. Although gross sales of the Gypsum Association total gypsum sales are not published. My personal estimate is approximately $350 million.

Senator MILLER. What is total annual depletion allowance—for tax purposes—of your association?

Mr. SIMPSON. The total annual depletion allowance is approximately $1,700,000, giving a tax savings of about $825,000.

Senator MILLER. Please relate the foregoing to any estimate you wish to submit of increased costs to consumers (by category, if possible—for example, homebuilders) resulting from reduction of percentage depletion rate from 15 to 11 percent for gypsum as provided in the House-passed "tax reform" bill.

Mr. SIMPSON. If the reduction of gypsum depletion from 15 to 11 percent is passed on to gypsum purchasers, shelter costs will increase by at least the amount of the total industry depletion allowance. Also, the loss of revenue to the industry will limit its participation in urban redevelopment products, and research and development in low-cost housing. This investment will ultimately reduce the cost of housing to all consumers. Thus, the effect is compounded by restricting research funds at a crucial time in the shelter industries development.

Senator MILLER. Thank you.

The CHAIRMAN. Thank you very much.

(Rhyne Simpson's prepared statement follows:)

STATEMENT OF GYPSUM ASSOCIATION PRESENTED BY RHYNE SIMPSON, JR., FIRST VICE PRESIDENT

PRELIMINARY STATEMENT

The Gypsum Association on behalf of its members oppose any reduction in percentage depletion rates. In the alternative, the Association requests relief for gypsum from the general 30% reduction in percentage depletion rates which had been proposed. Others have capably presented the argument against reducing depletion allowance for any industry. To avoid repetition we simply state our concurrence and deal here with the alternative should the Congress not see fit to maintain depletion allowances at their present level.

The gypsum mining industry, more than any other, is a part of the construction industry. It is substantially devoted to housing. How to increase construction of single and multi-family housing units is currently one of the country's most pressing problems. The need is obvious but the obstacles are almost insurmountable. Rising costs, labor problems, high interest rates and lack of funds, particularly in urban areas which have been greatly restricted by the tight money policies used to combat inflation, are paramount.

The gypsum industry is particularly hard hit because of its major dependence on construction. It respectfully requests that it not be further penalized, that it be exempt from any reduction which is voted, and allowed to retain its 15% depletion rate. Adequate precedent exists in the policy which already suggests exemption of iron and copper and which proposes to allow for residential construction the continued use of accelerated depreciation.

DISCUSSION

The Gypsum Association consists of 10 companies which operate over 75 gypsum mines and plants. The companies are:

The Celotex Corporation.
The Flintkote Company.
Georgia-Pacific Corporation, Gypsum Division.

GAF Corporation.
Grand Rapids Gypsum Company.
Kaiser Gypsum Company, Inc.
National Gypsum Company.
Republic Gypsum Company.
Texas Gypsum Company.
United States Gypsum Company.

The gypsum industry mined approximately 10,000,000 tons of gypsum domestically in 1968 based on preliminary Bureau of Mines figures.

The mineral gypsum in the ground is a rock, usually gray in color, which chemically is the dihydrate of calcium sulphate ($CaSO_4.2H_2O$). It is closely related to anhydrate which is calcium sulphate without the water of crystallization ($CaSO_4$). Gypsum has many uses, but its principal use is in the production and manufacture of low cost items, including retarder rock, plaster, lath and wallboard used by the construction industry, mainly in residential housing.

"Retarder" rock is sized crude gypsum used by Portland cement manufacturers as an additive to control the setting time of cement. This use accounted for approximately 3,154,000 tons of gypsum consumed in 1967 (the last year for which figures are available) having a total value of $14,704,000. The principal use of gypsum, however, is to manufacture products primarily used in residential housing (plaster, lath and wallboard). These are products made from calcined gypsum.

When raw gypsum rock is "calcined" or heated to approximately 320° F. literally three quarters of the water of crystallization ($2H_2O$) is boiled off. The resulting dry powdery product is known as stucco or plaster of paris, and is the basic ingredient for wall plaster, lath and wallboard.

Plaster is created by re-adding water to the stucco at the job site and spreading the resulting plastic mass on the desired surfaces where on drying it returns to its original rock state.

Gypsum lath and wallboard consist of materials such as paper or wood sandwiched around a core of reconstituted gypsum. In other words, stucco with the water added back. They are produced at the various gypsum plants located throughout the country.

These calcined products accounted for approximately 9,000,000 tons of gypsum during 1967 with a total value of approximately $342,000,000 over 90% of which was used in building and residential housing.

The calcined products are in great demand in housing as they provide relatively inexpensive walls with great fireproofing qualities. The price of standard ½" gypsum wallboard is approximately the same as it was in 1959 (Bureau of Mines figures). This undoubtedly is a unique record with today's inflation. Gypsum's fireproofing qualities result from the fact that a temperature of 250° F. releases gypsum's water of crystallization which absorbs heat and in effect puts out fire with water at its source.

The gypsum industry is an integrated mining-manufacturing industry. With minor exceptions, domestic gypsum is mined by the same company which manufactures it into plaster, lath and wallboard. This is due to the fact that it has been proven more economical to locate the plants for producing the calcined products at the mining locations. During the year 1967, there were gypsum mines or plants located in 33 states employing over 21,000 people, as follows:

CRUDE GYPSUM MINED IN THE UNITED STATES, BY STATES

[Thousand short tons and thousand dollars]

State	Active mines	1967 quantity	Value
Arizona	(1)	(1)	(1)
California	9	1,241	$3,150

Total	76	7,879	115,467	224	77

[1] Withheld to protect confidential information.

Because it produces products for the construction industry, and particularly for residential construction, the gypsum industry has been uniquely hard hit by the government's anti-inflationary policies. The Federal Reserve Board, commencing in 1966, embraced an anti-inflationary policy which was primarily directed to allocating resources by increasing borrowing costs. Thus, prime interest rates have increased from 4.5% to 8.5% since 1965, or an increase of approximately 9%. This has had a direct effect on the housing market. In 1965, housing starts were 1,510,000. These shrunk to 1,196,000 in 1966 and revived to 1,543,000 in 1968. However, recent interest rate increases have again depressed housing starts so that it appears starts will drop to an annual rate of of 1,000,000 in 1969, or a decline of approximately 33% from 1968. This is in the face of strong indications of an extremely high demand for housing. The long term demand for residential construction is generally measured by four factors: net housing additions, housing vacancies, housing removals and mobile homes. All of these consistently indicate a pent-up demand for 1,800,000 housing starts in 1969.

Further, because of the general lack of money supply, funds which would normally be channeled into home mortgages, such as loans by commercial banks and savings and loan institutions have been absorbed by industry. Even when potential home purchasers are willing to pay the very high interest rates, they are having difficulty obtaining funds from banks because of competition with commercial bank customers at the prime rate. Also, the increase in interest rate has led to problems in granting loans because of some state usury laws. For example, in Illinois up until recently, it was usurious to loan mortgage money to individuals at a charge of more than 7%, although loans to corporations at any percentage could be made. Under these circumstances, further problems in financing were created for the housing market.

The gypsum industry is undoubtedly unique in its dependence on residential construction. In 1967, approximately 95% of its revenue came from the sale of construction products with 75% being accounted for by products which are primarily used in residential construction. This is much greater than any other mining industry. Other typical mining industries manufacturing construction products had from 9% to 30% of their production accounted for by residential construction products.

While the government's anti-inflationary policy has caused a downtrend in residential construction, government policy, particularly with regard to urban areas, is to stimulate such construction. Currently, the Department of Housing and Urban Development (HUD) headed up by George Romney is actively engaged in a program which has as its objective the development of 3,000,000 residential units per year by 1975, or a growth of approximately 20% per year. In order to implement this program, HUD has started "Operation Breakthrough" and to this end it has declared it will spend $15,000,000 in a research and development program where it will be soliciting bids from various companies in the construction areas including several members of the Gypsum Association. It is recognized that this program will require innovation and a change of existing construction patterns. Such innovation and change of course requires the large expenditures of funds by the various companies with no guarantee of return.

So far, there has been no money appropriated by Congress to implement substantial portions of this research and the bulk of the money must be provided by private ventures.

The gypsum industry has demonstrated its initiative and leadership in the development of low cost urban residential housing. Currently, two of the industries' top executives are serving on the President's Committee for urban development. The gypsum industry has or plans to expend over $10,000,000 of its own funds into low cost urban redevelopment. Programs have either taken place or are contemplated in urban centers in New York, Chicago, Detroit, Cleveland and Columbus, Ohio, and involved work not only with the City administrations but local groups and unions. As with any pioneering effort, this has been extremely time consuming and expensive and presently has no guide lines. One of the chief elements in this program has been work with the unions to develop new apprentice programs for the use of gypsum products. For example, arrangements have been currently worked out whereby it is only necessary for a two-year apprentice program to qualify as a journeyman for the hanging of wallboard as contrasted with a general four-year program to becoming a journeyman carpenter. This not only reduces costs but hastens the entry of minority groups into the construction trades.

To the best of our knowledge, the gypsum industry is the only mining industry so completely engaged in a program of urban development. Members of the gypsum industry hope to continue this program not only to stimulate use of their products but as part of their responsibilities as corporate citizens. The industry hopes to participate in "Operation Breakthrough" and other new programs for urban and residential construction.

It is estimated the reduction in percentage depletion rates proposed by the House would cost the gypsum industry approximately $825,000 per year in increased taxes. This coupled with reduction of revenues resulting from the government tight money anti-inflation policy and a cutback in federally financed construction programs is a triple blow on this one industry which will reduce the cash funds available to the gypsum companies. Such reduction, of course, comes at a time when it is most desirable to increase expenditures to help residential housing in general and to attack the revolutionary problems which confront the inner city.

For all of these reasons, if the Congress decides to reduce percentage depletion rates generally, the gypsum industry requests that it be exempted. Such an exemption would be similar to the exemption granted residential construction from the general cutback on accelerated depreciation rates in the House passed Bill. The same policy which dictated no change in depreciation for residential housing should also dictate no change in the depletion granted to the industry whose output is most heavily committed to such construction.

Specifically, the gypsum industry requests the words "gypsum" and "anhydrite" be added after the word "copper" in Section 501(a)(3)(A) of the House Bill so that gypsum and anhydrite from domestic sources, along with gold, silver, copper and iron ore, will be excluded from any general cutback in depletion voted by the Congress.

We thank you for the opportunity to present our views.

The CHAIRMAN. Senator Allott has arrived in the room while we were hearing the last witness, and I will call Senator Allott at this time.

STATEMENT BY HON. GORDON ALLOTT, A U.S. SENATOR FROM THE STATE OF COLORADO

Senator ALLOTT. Mr. Chairman, members of the committee, I appreciate the opportunity to appear before you this morning to discuss three provisions of H.R. 13270 which are of paramount concern to the Rocky Mountain region.

These are:

1. The proposed change in the point of application of the oil shale depletion allowance.
2. The change in the depletion allowance for molybdenum.

3. The inequitable ramifications of those provisions of H.R. 13270 which require divestiture by all foundations of the voting stock of a business enterprise.

I. Oil Shale Depletion Allowance

I invite the committee's attention to the proposed change in the point of application of the oil shale depletion allowance which is found on page 281 of H.R. 13270. This provision amends section 613(c)(4) of the Internal Revenue Code to permit the depletion allowance on the oil shale to be taken after the retort process. This important change is accomplished by simply adding a new subparagraph "(H)" to section 613(c)(4) which defines those treatment processes considered as mining.

Mr. Chairman, this is a sample of oil shale as it comes out of the ground, and I will leave this with you to examine.

Obviously, rock in this State has no commercial value. To apply a 15 percent depletion allowance on rock in this state is meaningless. This is the rock as it comes out of the ground. This oil shale must undergo complicated and expensive retort processes in order to derive the liquid kerogen necessary for the production of oil.

Only after the completion of the retort process, therefore, is there a glimmer of economic value. The House bill recognizes this economic reality and would apply the depletion allowance to the postretort stage of processing.

This is but an infinitesimal fraction of the enormous reserves which are found in Colorado, Wyoming and Utah. It is estimated that in Colorado alone 800 billion barrels of oil lie embedded in the oil shale formations. A great portion of this treasure house of energy resource is owned by the Federal Government.

Despite the fact that these fantastic reserves have been known for over a hundred years, the development of a viable oil shale industry remains a complete nullity.

This country has failed to develop an economic method of converting this rock into liquid petroleum. Costs of production have been too great to offer industry the incentive to invest the necessary capital to develop commercial production facilities. As was pointed out in the 1967 hearings before the Antitrust and Monopoly Subcommittee, the magnitude of investment for a 50,000 barrel per day mine and retort facility exceeds $100 million.

Failure to develop realistic and equitable Federal tax incentives has had a direct bearing on the unwillingness of business management to commit the huge blocks of capital requisite for the development of an oil shale industry.

Mr. Chairman, I want to assure members of this committee that industry has not been timid in the expenditure of capital for research and development to determine the most feasible method of producing shale oil from oil shale. It has been estimated that at least $100 million has been spent by both private industry and the Federal Government to test the economic feasibility of oil shale production.

These research and development expenditures have only succeeded in proving that it is economically infeasible to produce shale oil under the present tax structure. The retention of the House proposal as it now is would be the first step on the road to providing the necessary economic incentives to create a viable oil shale industry.

Mr. Chairman, the administration has opposed the retention of this provision in the House bill. The administration has proposed an additional incentive "should be granted in terms of the research and development objective."

The administration feels this proposal would constitute "an important breach in the principle that percentage depletion is to be computed on gross income from mining, not manufacturing to any extent."

Mr. Chairman, I believe these objections simply are not in accord with the facts.

First, as I previously stated, government and industry have invested nearly $100 million in oil shale research and development. Accordingly, to suggest that further research and development efforts should be expended simply overlooks the realities of the present situation and its economics.

With regard to the administration's second objection, under existing law, treatment processes are considered mining for the purpose of applying the depletion allowance to ores or minerals which are not customarily sold in the form of the crude mineral product (26 United States Code 613(c)(4)(D)). Examples covered by this section are: lead, zinc, copper, gold, silver, uranium, fluorspar ores and potash.

Mr. Chairman, present tax law even considers the loading of coal or sulfur for shipment as part of the treatment process. The House bill only extends the treatment process to include the retorting of oil shale. As such, it is only "half a loaf" as compared to coal and sulfur since even after retorting the shale oil is not acceptable as refinery feedstock because retorted shale oil is hydrogen-deficient and requires hydrogenation before it is acceptable to a pipeline.

I point this out because the proposed definition of "treatment processes" specifically excludes hydrogenation, refining, or any other processes subsequent to retorting as they may apply to oil shale.

For the present, however, I only ask that the House-passed provision be retained to include these other necessary commercial processes for marketability of the product. Let us see what effect this provision will have upon the possibility of creating an incentive for the development of an oil shale industry. If the present provision does not provide sufficient inducement I may be back. In fact, Mr. Chairman, I will promise to be back.

Mr. Chairman, despite the importance of the recent North Slope discovery, projections indicate a requirement for a mix of conventional and synthetic fuels in the future. Because of the long leadtime involved, action is necessary now to provide the tax climate to assure the existence of an adequate oil shale industry in the 1980's.

The tremendous capital outlays, the development of advanced technology, and the long leadtime should allay any sudden fear of a flood of shale oil on the market.

Mr. Chairman, this provision in H.R. 13270 is an investment in the future energy needs of this country and a hedge against potential interdiction of foreign supply lines. As such, to paraphrase Neil Armstrong's famous exclamation from the moon, this would be the first small step for oil shale development in the Rocky Mountain region, but it would be a giant leap forward for the economic development of this most important energy resource.

Mr. Chairman, at this point in the hearing record, I would like to have inserted the statement of the Colorado Governor's Oil Shale Advisory Committee on this same subject. (See p. 4373.)

Senator ALLOTT. II. Molybdenum Depletion Allowance:

On another subject, Mr. Chairman, and with the committee's indulgence, I should like to point out one inequity in our tax structure which the House bill fails to correct.

This involves the question of equitable depletion treatment for molybdenum.

Mr. Chairman, molybdenum is the only nonferrous metal to be excluded from the 23 percent depletion allowance category set forth in section 613(b)(2) of the Revenue Code. Under present law molybdenum receives 15 percent under the provisions of section 613(b)(6). It is my belief that due to its unique properties, it should receive the same depletion treatment afforded those industrial metals enumerated in section 613(b)(2). Molybdenum is the only ferro-alloy not included in this section.

As you know, the House bill would reduce the depletion allowance on these minerals contained in section 613(b)(2) industrial metals down to 17 percent. Molybdenum would be reduced under the House bill to 11 percent.

I want to make it clear that the objection I raise here today is the continued discrimination against molybdenum. My concern is that this continued discrimination against molybdenum is due to an oversight and perhaps a lack of information with regard to the strategic uses and unique characteristics of this metal.

Molybdenum is a vitally important metal which is chiefly used by the steel industry as an alloying element. Over 80 percent of molybdenum produced is used in this alloying with iron and steel in making tool steels, stainless steels, and a wide range of constructional alloy steels, as well as special steels for corrosion resistance and elevated temperature service.

Molybdenum also has smaller but growing use in such "space age" applications as rocket motors and electronics. Molybdenum was classified as a strategic mineral under the Korean excess profits tax and it has been stockpiled as a strategic and critical material by the U.S. Government.

At the present time molybdenum is entitled to only a 15-percent percentage depletion allowance, whereas all the other important ferro-alloys used in making alloy steel are entitled to 23 percent. These other alloys are chromite, columbium, manganese, nickel, tungsten, and Vanadium.

There appears no reasonable basis for this discrimination. In fairness, molybdenum should be included in the 23 percent category. Equity would seem to require that it should be treated no differently. than other ferro-alloy materials and, therefore, it would be appropriate at this time to specifically include molybdenum in section 613(b)(2)(B) of the Internal Revenue Code.

III. Requirement of Divestiture by all foundations of voting stock in business enterprises:

Finally, Mr. Chairman, I should like to direct the committee's attention to certain inequitable results which would develop if the proposed revision of section 4943 of the Internal Revenue Code actually became law. The provision in question is found at page 34 of H.R. 13270. This section provides that if a foundation owns more than 20 percent of the voting stock of a business enterprise it must divest itself of sufficient stock to bring such holdings to no more than 20 percent.

Mr. Chairman, we have several unique foundations in Colorado, the charitable purposes of which would be severely imperiled if this proposed change actually becomes law—among these are the Helen G. Bonfils Foundation and the El Pomar Foundation.

In 1961, the Helen G. Bonfils foundation received a gift of a 42 percent stock interest in the Denver Post, subject to the restriction that the stock was to be sold at a fair price to a trust for the benefit of the employees of that newspaper as the employees purchase interests in the trust. The object of this plan was to insure that:

(a) the value of the stock would be devoted to charitable purposes, and

(b) The Post would survive as a vigorous and independent newspaper owned by its employees. More than 400 Denver Post employees have purchased interests in the trust in expectation of the full implementation of the plan.

The Post stock was thus received by the foundation subject to a plan requiring complete disposition of such stock in a manner serving the public interest in maintaining independent newspapers. Accordingly, no substantial legislative purpose would be frustrated if this stock were required to be disposed of at a rigidly fixed time schedule as contemplated by the provisions of the House bill dealing with this subject.

This situation will be more fully explained by former Ambassador Arthur Goldberg when he appears before your committee on October 8.

Mr. Chairman, the El Pomar Foundation of Colorado Springs is another Colorado foundation which may be severely hampered, in fact I believe it will, in its charitable activities if this divestiture provision of the House bill is enacted into law.

Created under the provisions of the will of Spencer Penrose in 1937, 32 years ago, the El Pomar Foundation contributes to public, educational, scientific, and other benevolent purposes in order to encourage and promote the well-being of the inhabitants of Colorado. The entire State has been the beneficiary of this unique and worthwhile foundation.

One of the principal assets of the foundation, however, is the El Pomar Investment Co. which in turn owns and operates the Broadmoor Hotel. The directors of the El Pomar Investment Co. have consistently placed service to the community and the general welfare of the inhabitants high on their list of priorities. Like the Green Briar and the Homestead, the Broadmoor has placed primary emphasis on the excellence of its service and facilities, far above the level which would be maintained to maximize profits. I am sure that those of you who have stayed at the Broadmoor will undoubtedly agree with me that this is an outstanding asset to Colorado.

I am very concerned that under the proposed revision of section 4943 suggested in the bill, the El Pomar Foundation will be required to divest itself of its relationship with the Broadmoor Hotel.

I have been particularly impressed by the arguments developed in opposition to the enactment of the proposed section 4943 as they relate to the El Pomar Foundation. Because these arguments are developed in greater detail by Mr. Russell Tutt, president of the El Pomar Foundation, I should like to ask that his entire statement be included at the conclusion of my remarks on this subject.*

I may say, Mr. Chairman, Mr. Tutt has foregone his own time before this committee in order to conserve the time of the committee, but his statement is very pertinent and very vital.

In conclusion, I believe that there is a great deal of merit in enacting certain limitations on the activities of foundations which are clearly beyond the realm of charitable or benevolent concern. On the other hand, I do believe that amendments to section 4943 might be adopted to assure that this section is structured in such a way so as to assure that foundations exist for charitable purposes and not for perpetuating donor control or for tax evasion.

Mr. Chairman, and members of the committee, I thank you for your attention on these important matters this morning, these three important matters as they affect my own State in particular.

I shall be happy to answer any questions I can.

Senator ANDERSON. I desire to take my time to congratulate my colleague on a fine statement. Molybdenum is far more important to his State of Colorado than to mine of New Mexico, but it is still important and we are very happy to have his support.

Are there questions?

Senator ALLOTT. I thank the Senator very much.

Senator ANDERSON. On the foundation question—regarding El Pomar —this involves not only a hotel but an office building also. Didn't the foundation build a new office building in Colorado Springs?

Senator ALLOTT. I do not know. None that I know offhand. You may have in mind the new office building that was built on the site of the Antlers Hotel site. There is a new Antlers Hotel and a new office building there. I think that may be the one the Senator has in mind, but there may be one that I do not know about.

Senator ANDERSON. I guess I am wrong and you are right. But it is a fine venture and a fine thing.

Senator ALLOTT. Incidentally, there is no connection between the two.

Senator BENNETT. I have no questions except to join my chairman in expressing my great satisfaction and my appreciation to my colleague from Colorado for this presentation of three distinct problem parts of this bill.

Senator ANDERSON. Senator Curtis?

Senator CURTIS. Mr. Chairman, I want to congratulate our colleague. I agree with all three of his premises. I might call attention to the fact that the divestiture provisions of the House bill relating to foundations will not bring in one dime of revenue. It cannot be justified on any revenue basis. It should be deleted from the bill entirely. Your statement is so valuable I wonder if the distinguished Senator from Colorado would have any objection if we propounded a unanimous consent request asking that that part of your statement relating to foundations be printed with the testimony that will be taken

---

*The statement of the El Pomar Foundation appears in part 6 of these hearings.

in reference to foundations by other witnesses. Would you have objection to that?

Senator ALLOTT. I would have no objection to it, and I appreciate the Senator's suggestion. I mixed these three together because I thought it would save the time of the committee and it was the committee's staff suggestion.

Senator CURTIS. Mr. Chairman, I ask unanimous consent that the statement of the Senator from Colorado with respect to foundations be incorporated in our permanent printing of our hearings along with the testimony of other witnesses pertaining to foundations.

Senator ANDERSON. I am sure that will be agreeable. Without objection that will be done.

Senator Gore?

Senator GORE. In this atmosphere of euphoria, and because of my friendship with the distinguished Senator from Colorado, with regret I suggest that he raises a very important and a very costly principle which would almost double the depletion allowance for oil shale. Though I disagree with the very principle of percentage depletion—I think it is entirely erroneous—I nevertheless have recognized through the years that a very important factor, if, unfortunately we are to have such a formula for tax reduction, is the point at which it is applied.

The Sentaor will recall that at one time it was necessary for Congress to enact a bill (which I introduced) urged by President Eisenhower to prevent steel companies from taking percentage depletion on bolts and nuts. What you propose here, and what is in the House bill, is percentage depletion on a manufacturing process.

Now, if this is permitted for oil shale, I respectfully suggest that soon all other minerals would be asking for the same thing, so if this is approved, it will be a precedent that I predict will be very costly. It may well be, Senator Allott, that the country needs to subsidize the development of the oil shale resource, and I am willing to consider it. But not in this form. For this would be far more costly than an outright subsidy would be.

Senator ALLOTT. May I say to my good friend this: You have up there somewhere on the desk the piece of oil shale which I brought with me. I am not sure that I have made a clear presentation to the Sentaor of what the situation is.

The House provision is not a costly process or a costly suggestion for the reason that the provision in the law now, which puts oil shale in the 15 percent category, is entirely meaningless, because as applied to the mine process, that piece of mining product, that piece of rock, there is nothing to which a depletion allowance can be applied, because it is worthless, at least as far as any known uses presently are known. It is worthless as it comes out of the ground.

Now, the retorting process. There have been millions spent by various oil companies and by the Federal Government. The Federal Government spent at Anvil Point some $18 to $20 million in research on oil shale in the 1950's. It terminated in the latter part of the 1950's. Now the retorting process in one form or another consists of heating the shale to a point where it will give up the carboniferous material known as kerogen, which is embedded in that rock. When it is heated to a certain temperature, the rock will give up this material, and then you have a very raw form of oil.

May I just finish to make this definition clear. Then after that, you really get to the refining and manufacturing process, because it will take huge amounts of water, for example, to provide the hydrogenation and for the reduction of the high sulfur content of this by refining it, before it can be put in a pipeline for any kind of use.

Senator GORE. Senator Allott, I thank you for your able explanation. You have succeeded in making the point clearer than I could. You have described graphically that you are asking for, you are supporting, a provision to give percentage depletion for a manufacturing process.

I suggest to you that if we start that, then it will be tremendously costly, as one mineral after another follows the precedent.

Senator ALLOTT. Well I would suggest to the Senator that in the case of coal, for example, the depletion process even applies to the loading of the coal, as I had in my statement here, and it includes much more than that. The same is true with sulfur. I reiterate, present law even considers the loading of coal or sulfur for shipment as a part of the treatment process.

I admit that this is a matter that has to be given thought, but at the present there is no depletion allowance at all for shale oil, because 15 percent of nothing is nothing, no matter how we figure it, and if we move it to the first retorting process, where you really just sweat out of this rock the raw material, then you have a meaningful depletion allowance for the first time.

But until that time, the 15 percent of nothing is nothing.

Senator MILLER. I want to join my colleagues in commending the Senator from Colorado for an excellent statement.

On the point of the colloquy between the Senator from Tennessee and the Senator from Colorado, it seems to me that there is precedent in the law, precedent in the committee action on this subject of making percentage depletion meaningful.

We went all through this about 8 or 9 years ago in connection with the fire clay problem, of what constitutes a readily marketable condition, and if you take a very restrictive view, as the Internal Revenue Service did, the amount of percentage depletion allowance became rather meaningful. But if you took it according to the practice that had been going on for years in the industry, taking the percentage or applying the percentage depletion to the product in a readily marketable condition, that was something else. Well, the Congress about 8 or 9 years ago tried to do something about this, so I think there is precedent for the position taken by the Senator from Colorado.

I will add that your argument in connection with the molybdenum seemed to me to be very persuasive, and with respect to the foundation problem, I think you have pointed up the need for this committee to go into the foundation provisions in the House-passed bill with a great deal of care.

Granted that the House is trying to do something about abuses, it seems to me that we have to be very careful that the abuses that are covered are not covered in such a way as to destroy some legitimate foundations.

Senator ALLOTT. I want to thank the Senator very much. If the committee would indulge me for about 30 seconds, I am sorry that the Senator from Tennessee had to leave the room for a moment, but referring again to title 26 of the code, article 613(b)(4), and then I want to refer to subparagraphs (a), (b), (c), (d), (e), (f), (g) and (h). I am just going to read a couple of these to show that the request for oil shale is not out of line here at all in conformity with the action of Congress.

The title of this is "Treatment Processes Considered as Mining". "(a) In the case of coal—cleaning, breaking, sizing, dust allaying, treating to prevent free sink and loading for shipment.

"(b) In the case of sulfur recovered by the Frasch process—cleaning, pumping to vats, cooling, breaking, and loading for shipment."

I won't read the others but of these particular sections, subsection (A) through (H) are not in the record, I would particularly like to have them included in the record at this point in my remarks, or at the conclusion of my remarks about the oil shale.

Senator ANDERSON. Without objection that will be done.

(The material referred to follows:)

TITLE 26.—INTERNAL REVENUE CODE

§ 613. PERCENTAGE DEPLETION

(a) General rule

In the case of the mines, wells, and other natural deposits listed in subsection (b), the allowance for depletion under section 611 shall be the percentage, specified in subsection (b), of the gross income from the property excluding from such gross income an amount equal to any rents or royalties paid or incurred by the taxpayer in respect of the property. Such allowance shall not exceed 5 percent of the taxpayer's taxable income from the property (computed without allowance for depletion). For purposes of the preceding sentence, the allowable deductions taken into account with respect to expenses of mining in computing the taxable income from the property shall be decreased by an amount equal to so much of any gain which (1) is treated under section 1245 (relating to gain from disposition of certain depreciable property) as gain from the sale or exchange of property which is neither a capital asset nor property described in section 1231, and (2) is properly allocable to the property. In no case shall the allowance for depletion under section 611 be less than it would be if computed without reference to this section.

(b) Percentage depletion rates

The mines, wells, and other natural deposits, and the percentages, referred to in subsection (a) are as follows:

(1) 27½ percent—oil and gas wells.

(2) 23 percent—

(A) sulfur and uranium; and

(B) if from deposits in the United States—anorthosite (to the extent that alumina and aluminum compounds are extracted therefrom), asbestos, bauxite, celestite, chromite, corundum, fluorspar, graphite, ilmenite, kyanite, mica, olivine, quartz crystals (radio grade), rutile, block steatite talc, and zircon, and ores of the following metals: antimony, beryllium, bismuth, cadmium, cobalt, columbium, lead, lithium, manganese, mercury, nickel, platinum and platinum group metals, tantalum, thorium, tin, titanium, tungsten, vanadium, and zinc.

(3) 15 percent—

(A) metal mines (if paragraph (2)(B) does not apply), rock asphalt, and vermiculite; and

(B) if paragraph (5)(B) does not apply, ball clay, bentonite, china clay, sagger clay, and clay used or sold for use for purposes dependent on its refractory properties.

(4) 10 percent—asbestos (if paragraph (2) (B) does not apply), brucite, coal, lignite, perlite, sodium chloride, and wollastonite.

(5) 5 percent—

(A) gravel, mollusk shells (including clam shells and oystershells), peat, pumice, sand, scoria, shale, and stone, except stone described in paragraph (6);

(B) clay used, or sold for use, in the manufacture of building or paving brick, drainage and roofing tile, sewer pipe, flower pots, and kindred products; and

(C) if from brine wells—bromine, calcium chloride, and magnesium chloride.

(6) 15 percent—all other minerals (including, but not limited to, aplite, barite, borax, calcium carbonates, diatomaceous earth, dolomite, feldspar, fullers earth, garnet, gilsonite, granite, limestone, magnesite, magnesium carbonates, marble, phosphate rock, potash, quartzite, slate, soapstone, stone (used or sold for use by the mine owner or operator as dimension stone or ornamental stone), thenardite, tripoli, trona, and (if paragraph (2)(B) does not apply) bauxite, flake graphite, fluorspar, lepidolite, mica, spodumene, and talc, including pyrophyllite), except that, unless sold on bid in direct competition with a bona fide bid to sell a mineral listed in paragraph (3), the percentage shall be 5 percent for any such other mineral when used, or sold for use, by the mine owner or operator as rip rap, ballast, road material, rubble, concrete aggregates, or for similar purposes. For purposes of this paragraph, the term "all other minerals" does not include—

(A) soil, sod, dirt, turf, water, or mosses; or

(B) minerals from sea water, the air, or similar inexhaustible sources.

(c) *Definition of gross income from property*

For purposes of this section—

(1) *Gross income from the property*

The term "gross income from the property" means, in the case of a property other than an oil or gas well, the gross income from mining.

(2) *Mining*

The term "mining" includes not merely the extraction of the ores or minerals from the ground but also the treatment processes considered as mining described in paragraph (4) (and the treatment processes necessary or incidental thereto), and so much of the transportation of ores or minerals (whether or not by common carrier) from the point of extraction from the ground to the plants or mills in which such treatment processes are applied thereto as is not in excess of 50 miles unless the Secretary or his delegate finds that the physical and other requirements are such that the ore or mineral must be transported a greater distance to such plants or mills.

(3) *Extraction of the ores or minerals from the ground*

The term "extraction of the ores or minerals from the ground" includes the extraction by mine owners or operators of ores or minerals from the waste or residue of prior mining. The preceding sentence shall not apply to any such extraction of the mineral or ore by a purchaser of such waste or residue or of the rights to extract ores or minerals therefrom.

(4) *Treatment processes considered as mining*

The following treatment processes were applied by the mine owner or operator shall be considered as mining to the extent they are applied to the ore or mineral in respect of which he is entitled to a deduction for depletion under section 611:

(A) In the case of coal—cleaning, breaking, sizing, dust allaying, treating to prevent freezing, and loading for shipment;

(B) in the case of sulfur recovered by the Frasch process—cleaning, pumping to vats, cooling, breaking, and loading for shipment;

(C) in the case of iron ore, bauxite, ball and sagger clay, rock asphalt, and ores or minerals which are customarily sold in the form of a crude mineral product—sorting, concentrating, sintering, and substantially equivalent processes to bring to shipping grade and form, and loading for shipment;

(D) in the case of lead, zinc, copper, gold, silver, uranium, or fluorspar ores, potash, and ores or minerals which are not customarily sold in the form of the crude mineral product—crushing, grinding, and beneficiation by concentration (gravity, flotation, amalgamation, electrostatic, or magnetic), cyanidation, leaching, crystallization, precipitation (but not including electrolytic deposition, roasting, thermal or electric smelting, or refining), or by substantially equivalent processes or combination of processes used in the separation or extraction of the product or products from the ore or the mineral or minerals from other material from the mine or other natural deposit;

(E) the pulverization of talc, the burning of magnesite, the sintering and nodulizing of phosphate rock, and the furnacing of quick-silver ores;

(F) in the case of calcium carbonates and other minerals when used in making cement—all processes (other than preheating of the kiln feed) applied prior to the introduction of the kiln food into the kiln, but not including any subsequent process;

(G) in the case of clay to which paragraph (5)(B) of subsection (b) applies—crushing, grinding, and separating the mineral from waste, but not including any subsequent process; and

(H) any other treatment process provided for by regulations prescribed by the Secretary or his delegate which, with respect to the particular ore or mineral, is not inconsistent with the preceding provisions of this paragraph.

(5) *Treatment processes not considered as mining*

Unless such processes are otherwise provided for in paragraph (4) (or are necessary or incidental to processes so provided for), the following treatment processes shall not be considered as "mining" electrolytic deposition, roasting, calcining, thermal or electric smelting, refining, polishing, fine pulverization, blending with other materials, treatment effecting a chemical change, thermal action, and molding or shaping.

(d) *Application of percentage depletion rates to certain taxable years ending in 1954*

(1) *General rule*

At the election of the taxpayer in respect of any property (within the meaning of the Internal Revenue Code of 1939), the percentage specified in subsection (b) in the case of any mine, well, or other natural deposit listed in such subsection shall apply to a taxable year ending after December 31, 1953, to which the Internal Revenue Code of 1939 applies.

(2) *Method of computation*

The allowance for depletion, in respect of any property for which an election is made under paragraph (1) for any taxable year, shall be an amount equal to the sum of—

(A) that portion of a tentative allowance, computed under the Internal Revenue Code of 1939 without regard to paragraph (1) of this subsection, which the number of days in such taxable year before January 1, 1954, bears to the total number of days in such taxable year; plus

(B) that portion of a tentative allowance, computed under the Internal Revenue Code of 1939 (as modified solely by the application of paragraph (1) of this subsection), which the number of days in such taxable year after December 31, 1953, bears to the total number of days in such taxable year.

(Aug. 16, 1954, ch. 736, 68A Stat. 208; Sept. 2, 1958, Pub. L. 85-866, title 1, § 36 (a), 72 Stat. 1633; June 30, 1960, Pub. L. 86-564, title III, § 302 (a), (b) 74 Stat. 291; Oct. 16 1962, Pub. L. 87-834, § 13(e), 76 Stat. 1034; Sept. 2, 1964, Pub. L. 88-571, § 6(a), 78 Stat. 860.)

AMENDMENTS

1964—Subsec. (b)(2)(B), (6). Pub. L. 88-571 inserted "beryllium" following "antimony" in subpar. (2)(B), and deleted "beryl" following "baurite" in both subpars. (2)(B) and (6).

1962—Subsec. (a). Pub. L. 87-834 inserted provisions requiring the allowable deductions taken into account with respect to expenses of mining in computing the taxable income from the property to be decreased by an amount equal to so much of any gain which is treated under section 1245 as gain from the sale or exchange of property which is neither a capital asset nor property described in section 1231, and is properly allocable to the property.

1960—Subsec. (b)(3), Pub. L. 86-564, § 302(a)(1), limited the 15 percent allowance for ball clay, bentonite, china clay, and saggar clay to cases where paragraph (5)(B) does not apply, and authorized a 15 percent allowance, if paragraph (5)(B) does not apply, for clay used or sold for use for purposes dependent on its refractory properties.

Subsec. (b)(5). Pub. L. 86-564, § 302(a)(2), substituted provisions authorizing a 5 percent allowance for clay used, or sold for use, in the manufacture of building or paving brick, drainage and roofing tile, sewer pipe, flower pots, and kindred products for provisions which authorized a 5 percent allowance for brick and tile clay.

Subsec. (b)(6). Pub. L. 86–564, § 302(a)(3), eliminated provisions which authorized a 15 percent allowance for refractory and fire clay. See subsec. (b)(3) of this section.

Subsec. (c)(2). Pub. L. 86–564, § 302(b)(1), substituted "the treatment processes considered as mining described in paragraph (4) (and the treatment processes necessary or incidental thereto)" for "the ordinary treatment processes normally applied by mine owners or operators in order to obtain the commercially marketable mineral product or products", and "such treatment processes" for "the ordinary treatment processes."

Subsec. (c)(4). Pub. L. 86–564, § 302(b)(2), substitued "The following treatment processes where applied by the mine owner or operator shall be considered as mining to the extent they are applied to the ore or mineral in respect of which he is entitled to a deduction for depletion under section 611" for "The term 'ordinary treatment processes' includes the following" in the opening provisions, included cleaning in cl. (B), substituted "ores or minerals which" for "minerals which" and included substantially equivalent processes in cl. (C), included uranium and minerals which are not customarily sold in the form of the crude mineral product and substituted "from the ore or the mineral or minerals from other material from the mine or other natural deposit" for "from the ore, including the furnacing of quicksilver ores" in cl. (D), included the furnacing of quicksilver ores in cl. (E), and added cls. (F)—(H).

Subsec. (c)(5). Pub. L. 86–564, § 302(b)(2), added subsec. (c)(5).

1958—Subsec. (d). Pub L. 85–866 added subsec. (d).

EFFECTIVE DATE OF 1964 AMENDMENT

Section 6(b) of Pub. L. 88–571 provided that: "The amendments made by subsection (a) [to this section] shall apply to taxable years beginning after December 31, 1963."

EFFECTIVE DATE OF 1962 AMENDMENT

Amendment of subsec. (a) of this section by Pub. L. 87–834 applicable to taxable years beginning after Dec. 31, 1962, see section 13(g) of Pub. L. 87–834, set out as a note under section 1245 of this title.

EFFECTIVE DATE OF 1960 AMENDMENT

Section 302(e) of Pub. L. 86–564, as amended by Pub. L. 86–781, § 4, Sept. 14, 1960, 74 Stat. 1018, provided that:

"(1) In general.—Except as provided in paragraph (2), the amendments made by subsections (a) and (b) [to subsecs. (b), (3), (5), (6), (c), (2), (4), (5) of this section] shall be applicable only with respect to taxable years beginning after December 31, 1960.

"(2) Calcium carbonates, etc.—

"(A) Election for past years.—In the case of calcium carbonates or other minerals when used in making cement, if an election is made by the taxpayer under subparagraph (C)—

"(i) the amendments made by subsection (b) [to subsecs. (b), (3), (5), (6), (c), (2), (4), (5) of this section] shall apply to taxable years with respect to which such election is effective and

"(ii) provisions having the same effect as the amendments made by subsection (b) [to subsecs. (b), (3), (5), (6), (c), (2), (4), (5) of this section] shall be deemed to be included in the Internal Revenue Code of 1939 and shall apply to taxable years with respect to which such election is effective in lieu of the corresponding provisions of such Code.

"(B) Years to which applicable.—An election made under subparagraph (C) to have the provisions of this paragraph apply shall be effective for all taxable years beginning before January 1, 1961, in respect of which—

"(i) the assessment of a deficiency,

"(ii) the refund or credit of an overpayment, or

"(iii) the commencement of a suit for recovery of a refund under section 7405 of the Internal Revenue Code of 1954,

is not prevented on the date of the enactment of this paragraph [Sept. 14, 1960] by the operation of any law or rule of law. Such election shall also be effective for any taxable year beginning before January 1, 1961, in respect of which an assessment of a deficiency has been made but not collected on or before the date of the enactment of this paragraph.

"(C) Time and manner of election.—An election to have the provisions of this paragraph apply shall be made by the taxpayer on or before the 60th day after the date of publication in the Federal Register of final regulations issued under authority of subparagraph (F), and shall be made in such form and manner as the Secretary of the Treasury or his delegate shall prescribe by regulations. Such election, if made, may not be revoked.

"(D) Statutes of limitation.—Notwithstanding any other law, the period within which an assessment of a deficiency attributable to the application of the amendments made by subsection (b) [to subsecs. (c), (2), (4), (5) of this section] may be made with respect to any taxable year to which such amendments apply under an election made under subparagraph (C), and the period within which a claim for refund or credit of an overpayment attributable to the application of such amendments may be made with respect to any such taxable year, shall not expire prior to one year after the last day for making an election under subparagraph (C). An election by a taxpayer under subparagraph (C) shall be considered as a consent to the application of the provisions of this subparagraph.

"(E) Terms; applicability of other laws.—Except where otherwise distinctly expressed or manifestly intended, terms used in this paragraph shall have the same meaning as when used in the Internal Revenue Code of 1954 (or corresponding provisions of the Internal Revenue Code of 1939) and all provisions of law shall apply with respect to this paragraph as if this paragraph were a part of such Code (or corresponding provisions of the Internal Revenue Code of 1939).

"(F) Regulations.—The Secretary of the Treasury or his delegate shall prescribe such regulations as may be necessary to carry out the provisions of this paragraph."

EFFECTIVE DATE OF 1958 AMENDMENT

Subsec. (d) of this section applicable to taxable years beginning after Dec. 31, 1953, and ending after Aug. 16, 1954, see section 1 (c) of Pub. L. 85–866, set out as a note under section 165 of this title.

REFUND OR CREDIT OF OVERPAYMENTS; LIMITATIONS; INTEREST

Section 36 (b) of Pub. L. 85–866 provided that: "If refund or credit of any overpayment resulting from the application of the amendment made by subsection (a) of this section [adding subsec. (d) of this section] is prevented on the date of the enactment of this Act [Sept. 2, 1968], or within 6 months from such date, by the operation of any law or rule of law (other than section 3761 of the Internal Revenue Code of 1939 or section 7122 of the Internal Revenue Code of 1954, relating to compromises), refund or credit of such overpayment may, nevertheless, be made or allowed if claim therefor is filed within 6 months from such date. No interest shall be paid on any overpayment resulting from the application of the amendment made by subsection (a) of this section [adding subsec. (d) of this section]."

ELECTION FOR CLAY AND SHALE USED IN MANUFACTURE OF CLAY PRODUCTS

Pub. L. 87–312, Sept. 26, 1961, 75 Stat. 674, provided:

"That (a) *Election for past years.*—In the case of brick and tile clay, fire clay, or shale used by the mineowner or operator in the manufacture of building or paving brick, drainage and roofing tile, sewer pipe, flower pots, and kindred products (without regard to the applicable rate of percentage depletion), if an election is made under subsection (c), for the purpose of applying section 613(c) of the Internal Revenue Code of 1954 [subsec. (c) of this section] (and corresponding provision of the Internal Revenue Code of 1939) for each of the taxable years with respect to which the election is effective—

"(1) gross income from the property shall be 50 per centum of the amount for which the manufacured products are sold during the taxable year except that with respect to such manufactured products, gross income from the property shall not exceed an amount equal to $12.50 multiplied by the number of short tons used in the manufactured products sold during the taxable year, and

"(2) for purposes of computing the 50 per centum limitation under section 613(a) of the Internal Revenue Code of 1954 [subsec. (a) of this section] (or the corresponding provision of the Internal Revenue Code of 1939), the taxable income from the property (computed without allowance for depletion) shall be 50 per centum of the taxable income from the manufactured products sold during the taxable year (computed without allowance for depletion).

"(b) *Years to which applicable.*—An election made under subsection (c) to have the provisions of this section apply shall be effective for all taxable years beginning before January 1, 1961, in respect of which—

"(1) the assessment of a deficiency,

"(2) the refund or credit of an overpayment, or

"(3) the commencement of a suit for recovery of a refund under section 7405 of the Internal Revenue Code of 1954,

is not prevented on the date of the enactment of this Act [Sept. 26, 1961] by the operation of any law or rule of law. Such election shall also be effective for any taxable year beginning before January 1, 1961, in respect of which an assessment of a deficiency has been made but not collected on or before the date of the enactment of this Act [Sept. 26, 1961].

"(c) *Time and manner of election.*—An election to have the provisions of this section apply shall be made by the taxpayer on or before the sixtieth day after the date of publication in the Federal Register of final regulations issued under authority of subsection (f), and shall be made in such form and manner as the Secretary of the Treasury or his delegate shall prescribe by regulations. Such election, if made, may not be revoked.

"(d) *Statutes of limitation.*—Notwithstanding any other law, the period within which an assessment of a deficiency attributable to the election under subsection (c) may be made with respect to any taxable year for which such election is effective, and the period within which a claim for refund or credit of an overpayment attributable to the election under such subsection may be made with respect to any such taxable year, shall not expire prior to one year after the last day for making an election under subsection (c). An election by a taxpayer under subsection (c) shall be considered as a consent to the application of the provisions of this subsection.

"(e) *Terms; applicability of other laws.*—Except where otherwise distinctly expressed or manifestly intended, terms used in this section shall have the same meaning as when used in the Internal Revenue Code of 1954 (or corresponding provisions of the Internal Revenue Code of 1939) and all provisions of law shall apply with respect to this section as if this section were a part of such Code (or corresponding provisions of the Internal Revenue Code of 1939).

"(f) *Regulations.*—The Secretary of the Treasury or his delegate shall prescribe such regulations as may be necessary to carry out the provisions of this sections."

ELECTION FOR QUARTZITE AND CLAY USED IN PRODUCTION OF REFRACTORY PRODUCTS

Pub. L. 87–321, § 2, Sept. 26, 1961, 75 Stat. 683, provided that:

"(a) *Election for past years.*—If an election is made under subsection (c), in the case of quartzite and clay used by the mine owner or operator in the production of refractory products, for the purpose of applying section 613 (c) of the Internal Revenue Code of 1954 [subsec. (c) of this section] (and corresponding provisions of the Internal Revenue Code of 1939) for each of the taxable years with respect to which the election is effective—

"(1) the term 'ordinary treatment processes' shall include crushing, grinding, and separating the mineral from waste, but shall not include any subsequent process; and

"(2) the gross income from mining for each short ton of such quartzite or clay used in the production of all refractory products sold during the taxable year shall be equal to 87½ percent of the lesser of—

"(A) the average lowest published or advertised price, or

"(B) the average lowest actual selling price, at which, during the taxable year, the mine owner or operator offered to sell, or sold, such quartzite or clay (in the form and condition of such products after the application of only the processes described in paragraph (1) and before transportation from the plant in which such processes were applied). For purposes of this paragraph, exceptional, unusual, or nominal sales or selling prices shall be disregarded. If the mine owner or operator makes no sales of, or makes only exceptional, unusual, or nominal sales of, such quartzite or clay after application of only the processes described in paragraph (1), then in lieu of the price provided for in subparagraph (A) or (B) there shall be used the average lowest recognized selling price for the taxable year for such quartzite or clay in the marketing area of the mine owner or operator published in a trade journal or other industry publication.

"(b) *Years to which applicable.*—An election made under subsection (c) to have the provisions of this section apply shall be effective on and after January 1, 1951, for all taxable years beginning before January 1, 1961, in respect of which—

"(1) the assessment of a deficiency,

"(2) the refund or credit of an overpayment, or

"(3) the commencement of a suit for recovery of a refund under section 7405 of the Internal Revenue Code of 1954,

is not prevented on the date of the enactment of this Act [Sept. 26, 1961] by the operation of any law or rule of law. Such election shall also be effective on and after January 1, 1951, for any taxable year beginning before January 1, 1961, in respect of which an assessment of a deficiency has been made but not collected on or before the date of the enactment of this Act [Sept. 26, 1961].

"(c) *Time and manner of election.*—An election to have the provisions of this section apply shall be made by the taxpayer on or before the 60th day after the date of publication in the Federal Register of final regulations issued under authority of subsection (f), and shall be made in such form and manner as the Secretary of the Treasury or his delegate shall prescribe by regulations. Such election, if made, may not be revoked.

"(d) *Statutes of limitations.*—Notwithstanding any other law, the period within which an assessment of a deficiency attributable to the election under subsection (c) may be made with respect to any taxable year for which such election is effective, and the period within which a claim for refund or credit of an overpayment attributable to the election under such subsection may be made with respect to any such taxable year, shall not expire prior to one year after the last day for making an election under subsection (c). An election by a taxpayer under subsection (c) shall be considered as a consent to the application of the provisions of this subsection.

"(e) *Terms; applicability of other laws.*—Except where otherwise distinctly expressed or manifestly intended, terms used in this section shall have the same meaning as when used in the Internal Revenue Code of 1954 (or corresponding provisions of the Internal Revenue Code of 1939) and all provisions of law shall apply with respect to this section as if this section were a part of such Code (or corresponding provisions of the Internal Revenue Code of 1939).

"(f) *Regulations.*—The Secretary of the Treasury or his delegate shall prescribe such regulations as may be necessary to carry out the provisions of this section."

Allowance of deduction for depletion, see section 611 of this title.

Percentage depletion inapplicable to certain owners of coal or iron ore, see section 631 (c) of this title.

Sale of oil and gas properties, surtax on sale, see section 632 of this title.

Senator ALLOTT. I want to thank the committee very much for the generous consideration and the time they have given.

Senator HANSEN. Mr. Chairman, let me join with my colleagues in complimenting my very distinguished colleague and neighbor from Colorado on the excellent statement he has made this morning. I hope that it will not go unnoticed that the distinguished Senator from Colorado has added in a very meaningful fashion to a better understanding of the importance of considering our energy requirements now.

I think that it has largely gone unnoticed to date that by 1980 we will need to have discovered 87 billion more barrels of oil than we now have. It has also largely gone unnoticed that the very lowest estimate of that discovery cost is $16 billion. So, to take steps now which will enable us to contemplate energy that can be derived from oil shale seems to me to be a very logical suggestion.

In support of the statement of Senator Allott, let me observe that insofar as the point of depletion being concerned, there is no point. There is no oil at all until heat has been applied to the oil shale, and with the kerogen having been subjected to heat it is my understanding, and I would ask the Senator from Colorado if I am correct or not, that at that point and only at that point do vapors start to be released from the oil shale which, when cooled, becomes shale oil. Am I right about that, Senator.

Senator ALLOTT. That is correct.

Senator HANSEN. I think it can be argued successfully that until that point has been reached, we are not talking about manufacturing oil. There is not any oil, period. It is only at that point that oil actually comes into existence.

It seems to me that we ought to be thinking about the foresight that I hope the Congress will manifest in recognizing rising demand and be conscious of our diminishing reserves. We should not think of these things in terms of costs to our people, but in terms of the contribution that wise legislation can make in order that our very critical needs will be fulfilled. To that end, I am certain that you, my colleague from Colorado, have made a most important contribution.

Senator ALLOTT. I thank the distinguished Senator. Both he and the distinguished Senator from Utah have long been interested in the oil shale matter, and are very knowledgeable on it. I am sure that I could not produce anything here which is not within the knowledge of these two Senators, but I am very happy for this opportunity to make this matter clear.

The CHAIRMAN. Thank you very much, Senator, for your fine presentation.

Senator ALLOTT. Mr. Chairman, on another matter: I have received a letter from the trustees of Temple Buell College Trust. May I have this included in the record?

The CHAIRMAN. Without objection.

(The letter, and the statement of the Colorado Governor's Oil Shale Advisory Committee referred to previously, follow:)

TEMPLE BUELL COLLEGE,
Denver, Colo., October 8, 1969.

Re Tax reform bill of 1969.

Senator GORDON ALLOTT,
New Senate Office Building,
Washington, D.C.

DEAR SENATOR ALLOTT: The purpose of this letter is to acquaint you with the crippling effect which the Tax Reform Bill of 1969 would have on Temple Buell College of Denver, Colorado, in the event the bill is passed in its present form.

We call your attention to Section 201(a)(1)(H) found at page 114 of H.R. 13270. This section of the proposed Bill would amend Section 2055 of the Internal Revenue Code. The effect of the section is to deny a charitable deduction for federal estate tax purposes when more than 20% of the stock of a closely held corporation is bequeathed at death.

The apparent reason for the inclusion of Section 201(a)(1)(H) in the bill is to parallel the provisions of Section 4943 as they apply in the area of federal estate taxation. We disagree with this conclusion for the reasons set forth in this letter.

The purported purpose of the Tax Reform Bill is to eliminate inequities in the income tax law and to keep the income tax burden on a fair basis at a level which is tolerable for all taxpayers. The House Ways and Means Committee Report specifically indicated that available time did not permit the inclusion of reform measures relating to estate and gift tax laws or the related problems of tax treatment of property passing at death. Nevertheless, Section 201(a)(1)(H) will affect with heavy tax consequences property passing at death in the case of Temple Buell College as explained hereafter.

Several years ago, Temple H. Buell established an irrevocable endowment trust for Temple Buell College. He has transferred stock of the Buell Development Corporation to that endowment trust. It is anticipated that the largest transfer to the endowment trust will occur on the death of Mr. Buell after which time the endowment trust will have 100% ownership of the Buell Development Corporation. The Buell Development Corporation owns substantial real estate holdings in Colorado including the Cherry Creek Shopping Center in Denver and other shopping centers and properties. If the remaining stock of Buell Development Corporation passes to the endowment trust on the death of Mr. Buell and after the passage of H.R. 13270 in its present form, the endowment trust's share of the federal estate taxes will amount to about $20,000,000. This amount will come directly from the college's endowment and would virtually eliminate the only substantial endowment of the college.

The endowment trust was established to provide independent guidance and judgment in the operation of the Buell Development Corporation. Everyone involved agrees that the Buell Development Corporation has substantially greater value to the College as an operating business than it would in liquidated form. The trust is designed to free the Buell College Board of Trustees from the responsibilities and details of directing and controlling a business enterprise of great magnitude and complexity. It was felt that the Board of Trustees of the College is in a better position to operate and develop the College from an educational standpoint if freed from business responsibilities. The trust provides for three independent trustees, one of whom is the President of the College for purposes of coordination and communication. All income and principal of the trust are devoted exclusively to the benefit of the College without interference or control by persons in any way related to Temple H. Buell.

We recognize that the purpose of the Tax Reform Bill is to break up control by private foundations where such control provides the owner of the corporation with substantial income tax advantages. The application of Section 201(a)(1)(H) to the facts above related does not accomplish this purpose. Since the control of the Buell Development Corporation will pass from Mr. Buell to the Trustees of the endowment trust upon Mr. Buell's death, no useful purpose will be served by eliminating the endowment to the College.

We are aware of your testimony before the Senate Finance Committee relating to the divesture by private foundations of voting stock of business enterprises. Your testimony in this regard is equally applicable to the Temple Buell College endowment trust, but the bill has the further aspect of dealing with estate taxation when there has been no study of these effects and there is an obvious need to consider in greater depth how the proposed law will harm charitable and educational institutions.

As you can well understand, we are vitally concerned with the future of Temple Buell College if H.R. 13270 is passed in its present form. We make several recommendations, any one of which will be effective in eliminating the dire consequences to the College under Section 201(a)(1)(H), to-wit:

1. Entire elimination of Section 201(a)(1)(H) from the bill.
2. Amendment of Section 201(a)(1)(H) of the bill by addition of a proviso substantially as follows:

> "Nothing in this sub subparagraph (H) shall apply to bequests, legacies, devises, transfers or gifts to an organization established prior to December 31, 1969, regardless of the date of death giving rise to the bequest, legacy, devise, or transfer or the date of actual delivery of the gift."

3. Amendment of Section 201(a)(1)(H) by elimination of sub subpart (B) commencing with the words "For a transfer in trust (other than one in which the provisions of subparagraph (A) of this paragraph apply)" and ending with the last provision thereof reading: "(iv) making any taxable expenditures (as defined in Section 4945(d))."

We feel confident that the reforms sought by the Tax Reform Bill of 1969 were not intended to include a situation like the one concerning Temple Buell College. We feel that there is definite need to explore further the many undesirable results which will flow from the passage of Section 4943 of the bill. And we feel that there is definite need to eliminate Section 201(a)(1)(H) until comprehensive study of the state tax laws can be completed. We sincerely hope that you will be able to bring about changes in the proposed bill which will eliminate those results which are socially and equitably unjust and of substantial harm to the community in the broadest terms.

Very truly yours,

TRUSTEES OF TEMPLE BUELL COLLEGE TRUST,
By LAEL S. DEMUTH.

STATEMENT OF THE COLORADO GOVERNOR'S OIL SHALE ADVISORY COMMITTEE BEFORE THE SENATE FINANCE COMMITTEE, SEPTEMBER 30, 1969

The Colorado Governor's Oil Shale Advisory Committe urges the Senate Finance Committee to retain the provisions of House Bill 13270 insofar as such bill applies to the depletion allowance provided for oil derived from oil shale.

I. *House bill 13270 eliminates the present inequity which results from the Treasury's construction of section 613(c)(4) of the 1954 Revenue Code that the retorting of oil shale is not a treatment process considered as mining within the meaning of that section*

Treasury has discriminated against oil produced from oil shale in favor of oil from conventional sources by holding that the 15 percent depletion allowance applies to crushed oil shale rock rather than retorted oil. There is no market for the crushed oil shale rock since the vast quantities of rock required for the processing of oil from shale are too great to permit transportation of crushed oil shale significant distances from the mine portal. Therefore, the only way to determine the value of such crushed rock is to attribute to it that portion of the value of the first marketable product (retorted oil) which the aggregate cost of mining and crushing bear to all costs necessary to obtain such retorted oil. Since mining and crushing constitute approximately 50 percent of the total cost of processing oil from shale prior to hydrogenation or other refining, the crushed oil shale rock has a value of approximately 50 percent of the value of the retorted oil. Thus the effect of Treasury's position is to accord the oil shale industry an effective depletion allowance not of 15 percent, but of approximately 7½ percent. The deterrent effect of Treasury's position upon would-be investors in the oil shale industry is obvious.

Students of the industry look forward to oil shale as a supplemental source of crude to shore up the dwindling domestic reserves. It is inequitable to burden the new industry with a depletion rate which represents less than half of the rate intended by Congress and an even smaller fraction of the rate available to the conventional oil industry.

Treasury's present position not only discriminates against oil from oil shale as compared with conventional oil, but will result in discrimination between different methods of processing oil shale. Each process for the retorting of oil shale will result in a different depletion allowance, depending upon the relative cost of the process to the aggregate costs of mining and crushing. In the event that the extraction of oil from shale by an "in situ" process becomes feasible, the inequities created by the Treasury's position become even more apparent. Since no mining or crushing would be used, the depletion allowance would have to apply to the value of the retorted oil.

The elimination of the inequity by the House Bill is consistent with the intent of the drafters of Section 613(c)(4). It achieves the result which Senator Byrd hoped would be effected by the Secretary of the Treasury in enacting Section 613(c)(4)(H). In explaining the final bill to the Senate, he said:

* * * "The conference agreement also adds a new subparagraph (H) to provide administrative flexibility in the application of this provision by providing that the Secretary or his delegate may by regulation provide for the allowance of any other treatment process which is not specifically denied in the other subparagraphs of paragraph (4). *Your Committee hopes that the Secretary will use this subparagraph to equalize treatment insofar as possible under the different processing techniques and with respect to competitive minerals.*" [Italic supplied for emphasis.]

Since Treasury has failed to avail itself of the remedies provided in Section 613(c)(4)(H), we urge the Senate to eliminate the inequity by adopting the provision already passed by the House.

II. *The House provision is consistent with the intent of Congress in enacting section 613(c)(4)*

Oil shale is clearly a mineral intended to come within the ambit of Section 613(c)(4)(D) as one "which is not customarily sold in the form of the crude mineral product." Retorting is a substantially equivalent process . . . "used in the separation or extraction of the product or products from the ore or the mineral or minerals from other material from the mine or other natural deposit."

A process virtually identical to the retorting of oil shale is the furnacing of quicksilver ores now included under subparagraph (D) of Section 613(c)(4). The inclusion of retorting of oil shale as a treatment process considered as mining, therefore, does no violence to the spirit or the letter of Section 613(c)(4).

III. *House bill 13270 will not deprive the Treasury of revenue*

Although the commercial production of oil shale is in the final states of development, there is no shale oil production yielding revenue to the Treasury at the present time. Accordingly, enactment of the House provision dealing with oil shale will not adversely affect revenues of the Federal Government. Indeed, enactment of the House provision will eliminate one of the present major obstacles to the development of a new domestic industry needed to supplement domestic sources of petroleum and will add a substantial source of revenue for the United States Treasury.

The CHAIRMAN. Next we will have Mr. John W. Roberts.

STATEMENT OF JOHN W. ROBERTS, PRESIDENT OF SOLITE CORP., RICHMOND, ACCOMPANIED BY RICHARD BRADY, COUNSEL

Mr. ROBERTS. Mr. Chairman, gentlemen, my name is John Roberts, President of Solite Corp., Richmond, Va., a company that has manufacturing and mining activities. I am here today to speak only about our mining activities and appear in behalf of the Expanded Shale, Clay and Slate Institute. I have with me Mr. Richard Brady, counsel for the institute.

The Expanded Shale, Clay and Slate Institute is an industry association representing approximately 80 percent of the production of sintered lightweight aggregate in the United States.

Sintered lightweight aggregate is produced by burning or sintering shales, clays, and slates, to expand or stabilize them and is sold as concrete aggregate to make lightweight concrete. It is competitive with sand, gravel, and crushed stone, and replaces an equal volume of these other concrete aggregates.

The percentage depletion rate for shales, clays, and slates used as lightweight aggregate was raised from 5 to 7½ percent in 1966 by conference action in lieu of a provision approved by the Senate Finance Committee and the Senate which would have treated as a mining process the burning or sintering of shale, clay, and slate used for lightweight aggregate.

This would have restored what all of the industry felt was its allowable cutoff point, and what the courts held until 1965 was its cutoff point. It would have offered encouragement to an industry that grew in size about 600 percent in the previous 15 years, but which has grown only 15 percent in the past 4 years.

The House bill, as part of the general reduction in percentage depletion allowances would cut the rate applicable to lightweight aggregate from 7½ to 5 percent. The proposed rate reductions under the House bill, if enacted, would signal a change in the national minerals policy which provided depletion as a stimulus to encourage people to go into the mining business.

If such encouragement is no longer considered by Congress to be as important to the public interest, this change in policy will be reflected in diminished growth of the mining industry.

The proposed rate reductions under the House bill were not based upon any study of either the lightweight aggregate industry or the mining industry generally. They should be more carefully considered.

For example, the recognition given iron ore in the House bill, under which no reduction is proposed in its 15 percent depletion rate, should also be given to lightweight aggregates because their use in construction effects substantial savings in reinforcing and structural steel with the resultant saving for the Nation of its iron ore.

Lightweight aggregate is a small industry, and the proposed one-third cutback of its percentage depletion deduction amounts to no more than $400,000, and cannot have a significant impact on national revenues.

Individual producers, however, and there are some 70 of them in the United States, will be substantially affected by a one-third cutback in their already modest percentage depletion allowance.

Lightweight aggregate producers need percentage depletion to offer them the incentive to develop deposits of suitable raw materials. The depletion allowance under the House bill of 5 percent based on a pre-kiln cutoff does not offer a satisfactory incentive.

Our institute opposes the proposed reduction in rate applicable to lightweight aggregate and on the other hand urges your consideration of action to be taken regarding clay, shale, and slate on the basis of three possible points of view.

Let me point out that clay, shale and slate suitable for lightweight aggregate is different from that suitable for clay brick, tile, and sewer pipe:

1. If it is the judgment of the Senate Finance Committee that it is in the public interest to encourage investment in the mining industry, and specifically in our segment of the industry because of its contributions to the building industry, we would recommend no reduction in the 7½-percent rate afforded our industry at its present cutoff point.

2. If, however, circumstances dictate at this time a change in national policy regarding the importance of percentage depletion as it relates to the public interest and if it is decided to reduce the rate for all minerals across the board, we would point out that fairness among competitors demands that similar commodities receive the same percentage of reduction. In our case this would involve a reduction to 6 percent instead of the 5 percent proposed in the House bill. The rates applicable to other concrete aggregates competitive with lightweight aggregate are reduced under the House bill by only 20 percent compared with the 33⅓-percent reduction in the lightweight aggregate rate.

3. If you believe, as did the House Ways and Means Committee, that it is in the public interest that certain minerals such as iron ore should receive special consideration, we request, for the same reasons that apply to iron ore, and for the same reasons this committee relied on in 1966, your enactment at this time of the Senate amendment of 1966 to treat as a mining process sintering or burning of shale, clay, and slate used for lightweight aggregate. Other competitive industries such as sand, gravel, and crushed stone get percentage depletion on the selling

price of their depletable mineral products, and lightweight aggregate producers believe they should receive similar treatment.

The maximum tax benefit from a depletion allowance of 5 percent on the selling price of lightweight aggregate is probably no more than $800,000.

The CHAIRMAN. Thank you very much, sir.

(John W. Roberts' prepared statement follows:)

STATEMENT OF JOHN W. ROBERTS ON BEHALF OF EXPANDED SHALE, CLAY AND SLATE INSTITUTE

(1) The Expanded Shale, Clay and Slate Institute is an industry association representing approximately 80 percent of the production of sintered lightweight aggregate in the United States. Sintered lightweight aggregate is produced by burning or sintering shales, clays and slates to expand and stabilize them and is sold as concrete aggregate to make lightweight concrete. It is competitive with gravel, sand and crushed stone and replaces an equal volume of these other concrete aggregates.

(2) The percentage depletion rate for shales, clays and slates used as lightweight aggregate was raised from 5 to 7½ percent in 1966 by conference action in lieu of a provision approved by the Senate Finance Committee and the Senate which would have treated as a mining process the burning or sintering of shale, clay and slate used for lightweight aggregate.

(3) The House bill as part of a general reduction in percentage depletion allowances would cut the rate applicable to lightweight aggregate from 7½ percent to 5 percent.

(4) The proposed rate reductions under the House bill, if enacted, will signal a change in the National minerals policy which provided percentage depletion as a stimulus to encourage people to go into the mining business. If such encouragement is no longer considered by Congress to be as important to the public interest, this change in policy will be reflected in diminished growth of the mining industries.

(5) The proposed rate reductions under the House bill were not based upon any study of either the lightweight aggregate industry or the mining industry generally. They should be more carefully considered. For example, the recognition given iron ore in the House bill, under which no deduction is proposed in its 15 percent depletion rate, should also be given to lightweight aggregates because their use in construction effects substantial savings in reinforcing and structural steel.

(6) Lightweight aggregate is a small industry, and the one-third cutback of its percentage depletion deduction amounts to no more than $400,000 and cannot have a significant impact on National revenues. Individual producers, on the other hand, will be substantially affected by a one-third cutback in their already modest percentage depletion allowances.

(7) Lightweight aggregate producers need percentage depletion to undertake the difficult and expensive project of discovery and development of deposits of suitable raw material for lightweight aggregate. The depletion allowance under the House bill of 5 percent based on a pre-kiln cutoff does not offer a satisfactory incentive to make deposits suitable for lightweight aggregate available to the public with the consequent benefits in quality and cost of construction materials.

(8) The Expanded Shale, Clay and Slate Institute opposes the proposed reduction of the percentage depletion rate applicable to lightweight aggregate and urges in the following order of preference:

(a) Enactment at this time of the Senate amendment in 1966 to treat as a mining process sintering or burning of shale, clay and slate used for lightweight aggregate. Other competitive industries such as sand, gravel and crushed stone get percentage depletion on the selling price of their depletable mineral product, and lightweight aggregate producers believe they should receive similar treatment. The maximum tax benefit from a depletion allowance of 5 percent on the selling price of lightweight aggregate is probably no more than $800,000.

(b) Continuation of the 7½ percent rate for lightweight aggregate.

(c) If no other changes are made in the proposed rate reduction, fairness among competitors demands that shale, clay and slate used as lightweight aggregate be allowed a 6 percent rate, a cutback of one-fifth from the present rate.

The rates applicable to other concrete aggregates competitive with lightweight aggregate are reduced under the House bill by only 20 percent compared with the one-third reduction in the lightweight aggregate rate.

STATEMENT

I am John W. Roberts, a member of the Percentage Depletion Committee of Expanded Shale, Clay and Slate Institute, and am submitting this statement on behalf of all members of the Institute. I am also President of Solite Corporation, Richmond, Virginia, a member company of the Institute. The Institute's members appreciate this opportunity of presenting to the Committee its views on the provisions of Section 501(a) of H.R. 13270.

The Expanded Shale, Clay and Slate Institute is an industry association representing approximately 80 percent of the production of sintered lightweight aggregate in the United States. Sintered lightweight aggregate is produced from clays, shales, and slates by burning or sintering in a rotary kiln or traveling grate. Before burning or sintering there are no significant uses or markets for the clays, shales and slates from which lightweight aggregate can be and is obtained. Burning or sintering expands and stabilizes the raw material to make it suitable for use as lightweight aggregate. Almost 100 percent of the lightweight aggregate produced in the United States is sold as concrete aggregate and usually is mixed with portland cement and water by the consumer to make lightweight concrete. Lightweight aggregate is competitive with gravel, sand and crushed stone and replaces an equal volume of these other concrete aggregates.

Clays, shales and slates used or sold for use as sintered or burned lightweight aggregate are presently authorized percentage depletion at 7½ percent; under the House bill, the allowable rate would be cut to 5 percent. The rate applicable to lightweight aggregate was raised from 5 to 7½ percent under the Foreign Investors Tax Act of 1966. At that time the Senate Finance Committee and the Senate approved an amendment to the Foreign Investors Tax Act which would have amended Code Section 613(c)(4) to provide that the sintering or burning of clay, shale and slate used or sold for use as lightweight aggregate would be considered a mining process. The Senate amendment would not have changed the 5 percent rate. The House had not acted on a bill corresponding to the Senate amendment. Under the conference action, the Senate amendment was eliminated and the new rate category of 7½ percent was created to include clay, shale and slate used or sold for use as sintered or burned lightweight aggregate.* The lightweight aggregate industry had estimated that the maximum tax benefit from the Senate amendment, based upon existing prices and tonnages, probably would be no more than $500,000 annually. The saving under the rate increase has probably been only a minor fraction of the amount that would have been saved under the Senate amendment.

The Expanded Shale, Clay and Slate Institute opposes the proposed reduction in the existing percentage depletion rate for lightweight aggregate. The Institute urges, at the least, (1) continuation of the 7½ percent rate for lightweight aggregate, or preferably, (2) amendment of Code Section 613(c)(4) to treat as a mining process the sintering or burning of clay, shale and slate used or sold for use as lightweight aggregate.

The Institute would also like to draw to the Committee's attention the discrimination between clay, shale and slate used as lightweight aggregate and other competitive concrete aggregates under the House bill. The rate for clay, shale and slate used as lightweight aggregate is reduced from 7½ percent to 5 percent, a one-third cutback. The rate for gravel, sand and crushed stone used as concrete aggregate is reduced from 5 percent to 4 percent, only a one-fifth cutback. If no other changes are made in the proposed rate reductions, fairness among competitors demands that clay, shale and slate used as lightweight aggregate be allowed a 6 percent rate, a cutback of one-fifth from the present rate comparable to the reduction for competitive concrete aggregates. The higher percentage depletion rate for clay, shale and slate used as lightweight appregate recognizes that under present law the percentage depletion allowance for them is subject to cutoff before burning or sintering whereas competitive concrete aggregates get percentage depletion on the selling price. While prices for lightweight aggregate are generally somewhat higher than the prices of heavyweight aggregate with

---

*The new rate category also included clay or shale used or sold for use in the manufacture of sewer pipe and brick.

which they compete, there cannot be too much difference between the two; otherwise lightweight aggregate would lose out to heavyweight aggregate.

The basic purpose of the percentage depletion allowance has always been to insure an adequate supply of the Nation's natural resources at a reasonable cost to the consuming public. The percentage depletion allowance recognizes that minerals in the ground have no usefulness to the public unless someone has the courage and persistence to spend substantial amounts of risk capital in searching for, finding, acquiring, developing and making them available to consumers.

Any change in National policy that would adversely affect the growth of the mining industries should be carefully considered. The Ways and Means Committee reported that it believes (1) "that even if percentage depletion rates are viewed as a needed stimulant at the present time they are higher than is needed to achieve the desired beneficial effect on reserves;" and (2) "that there is need to strike a better balance than now exists between the objective of encouraging the discovery of new reserves and the level and revenue cost of percentage depletion allowances." The conclusions of the Ways and Means Committee were not based upon any study of either the lightweight aggregate industry, and especially as the lightweight aggregate industry relates to the iron ore industry, or the mining industries generally. It is unlikely that the Committee even considered the proposed rate reductions in terms of any mining industries other than oil and gas.

The mining of shale, clay and slate for use as lightweight aggregate is a small industry. It consists of approximately 70 plants operating in many parts of the country. In recent years their annual production of aggregates has averaged approximately 7 million tons with an aggregate fair market value of about $45,500,000, although no precise figures are available. The maximum annual percentage depletion deduction based upon the existing 7½ percent rate and the pre-kiln cutoff point is estimated by the industry to be about $1,200,000. The one-third cutback of this deduction, or $400,000, under the proposed rate reduction cannot have a significant impact on National revenues. Individual producers of lightweight aggregate, however, will be substantially affected by a one-third cutback in their already modest percentage depletion allowances. The other provisions of the House bill applicable to all businesses serve whatever may be the reasonable demands of tax reform on the lightweight aggregate industry.

The lightweight aggregate industry needs percentage depletion. Only special shales, clays and slates are expansible to as much as several times their original size when they are subjected to high temperatures for use as lightweight aggregate. Discovery and development of a deposit of suitable raw material for lightweight aggregate is a difficult and expensive project. Deposits that are suitable for cement or brick and tile are not ordinarily suitable for lightweight aggregates. To determine the suitability of deposits for production of lightweight aggregates, samples cannot be appraised by chemical analysis alone. The samples must be actually processed in laboratory or pilot plant equipment to determine if bloating characteristics exist and the firing range is acceptable. The raw mineral may bloat too little and be too heavy or it may bloat too much and lack the necessary strength and stability. Bloating may also occur within a narrow temperature range which results in production problems and makes it difficult to obtain a product of uniform quality. If a material appears to give good results in laboratory and pilot plant tests, then samples of concrete made from the aggregate must be tested for compressive strength, durability under freezing and thawing, modulus of elasticity and many other characteristics to make certain that the aggregates will give good results in actual service.

Even though a deposit of raw material is suitable as to quality, it may not be suitable for development because of other factors. The deposit may lie under an excessive layer of overburden which makes mining too expensive or it may not have access to the necessary water supply, electric power and rail service. The deposit must be located where its production into lightweight aggregates does not violate zoning or other government regulations. If all other factors are favorable, a deposit may still not be economically attractive if it is not within a satisfactory market area.

A depletion allowance of 5 percent based on a prekiln cutoff does not offer a satisfactory incentive for the efforts and expenses needed to seek out shale, clay and slate deposits suitable for lightweight aggregates and to make these deposits available to the public with the consequent benefits in the quality and costs of construction materials.

By virtue of their light weight, aggregates made from expanded shales, clays and slates effect substantial savings in reinforcing and structural steel. In the construction of the Chesapeake Bay Bridge, for example, spanning 4.3 miles of open water, lightweight aggregate was used for the concrete deck. The dead weight of the deck was thereby reduced more than 3 million pounds per mile, as contrasted with ordinary concrete, resulting in a great saving in steel.

Prudent National policy indicates that alone these savings in steel are justification for not reducing lightweight aggregate's percentage depletion allowance. The lightweight aggregate industry should be encouraged in order to make these economies generally available in peacetime, and, of course, it is vital that these savings in steel are available during periods of national defense emergency. The recognition given iron ore in the House bill, under which no reduction is proposed in its 15 percent depletion rate, should also be given to lightweight aggregate because of its beneficial effect on meeting the Nation's demands for steel.

BURNING OR SINTERING AS A MINING PROCESS

As a preferable alternative to continuation of the 7½ percent depletion rate, Code Section 613(c)(4) should be amended to treat as a mining process the sintering or burning of clay, shale and slate used or sold for use as lightweight aggregate. Justification for this proposal was fully documented in materials made available to Congress in 1965 and 1966, at the time the Senate Finance Committee and the Senate voted for the same provision. The reasons in favor of this proposal can be summarized as follows:

1. Other competitive industries such as sand, gravel and crushed stone get percentage depletion on the selling price of their depletable mineral products. Lightweight aggregate producers believe they should receive similar treatment.
2. Other thermal processes including sintering under some circumstances are allowable as mining under the statute. Sintering of iron ore is basically the same as sintering or burning of lightweight aggregate and is allowable under Revenue Ruling 184.
3. Burning or sintering of lightweight aggregate expands and stabilizes the raw minerals. It does effect a significant chemical change or produce a finished or manufactured product.
4. Treatment of burning or sintering as a mining process will promote availability of lightweight aggregate with consequent benefit to the public in quality and cost of construction materials. It will also eliminate needless controversies between the industry and the Internal Revenue Service over the theoretical value of the raw mineral at the pre-kiln cutoff point. Lightweight aggregate is a small industry and the maximum tax benefit from a depletion allowance of 5 percent on the selling price is probably no more than $800,000.

The CHAIRMAN. The next witness will be Mr. Clark Sutherland, chairman of the Clay Pipe Industry Depletion Committee, National Clay Pipe Institute.

STATEMENT OF CLARK SUTHERLAND, CHAIRMAN, CLAY PIPE INDUSTRY DEPLETION COMMITTEE OF AKRON, OHIO

Mr. SUTHERLAND. Mr. Chairman and members of the Senate Finance Committee, I welcome the opportunity to come before you today. I am only going to take about 3 minutes of your very valuable time.

My name is Clark Sutherland. I am president of the Robinson Clay Product Co. of Akron, Ohio. I used to work for the Pacific Clay Products in Los Angeles. I came into the industry 40 years ago as a young geologist graduate from Cal Tech and went to work for a clay sewer pipe company prospecting for clays, in order to keep their plants going.

I have been concerned in this depletion question for a good many years. I would like to say that first of all the clay pipe industry recommends that no reduction be made in the present 7½-percent depletion allowance. We are a small industry. In total, we have only about $100 million sales annually. Our total depletion benefits are pretty hard to determine because of course we have no definite figures, but they are in terms of maybe a half million dollars as a tax advantage or benefit.

Ordinarily many people think of sewer pipe as being a part of the mud industry, but it really is not. We have to use only certain types of clays, to maintain dimensional tolerances. Also we have to obtain high-crushing strengths and other characteristics to meet rigid standards for our product, which demands certain types of clays.

Ordinarily, we use in the normal sewer pipe mix a mixture of shale and fire clay. One of the problems that we face is that traditionally back in the fifties we were allowed a 15-percent rate on the fire clay that we used in the mix, and this was justified after quite a lot of argument with the Treasury Department.

We had to use fire clay in order to obtain certain characteristics of the product. Now, in 1960, we were cut down to a 5-percent rate for all clays which were used in sewer pipe, regardless of whether they were refractory or not. One of the absurdities that resulted, for example, was that the Robinson Clay Product Co. happened to operate both sewer pipe plants and refractory brick plants in the same area, and we literally alternated power shovelfuls of fire clay going into refractory brick and going into sewer pipe, and on one type of use we got 15 percent. On the other type of use we got 5 percent.

We did not use the fire clay for any other reason but we had to use it in the product in order to attain the characteristics which we had to have to meet Federal specifications.

Then back in 1966 we went back to Congress and we talked about our competitive problem with cement, and Congress raised our depletion rates to 7½ percent. But the fire clay portion still is at 7½ percent, so our fire clay really is the only mineral that has been reduced down through the years from 15 down to 5 and then back to 7½.

Under the provisions of the bill that you are now considering, we will be reduced back down to 5 percent, which is clearly, of course, an inequitable situation.

The other factor which we face is that we are in competition with cement. Cement is our principal competitor, both for sewer pipe and for many other applications.

Limestone and the clays used in their mix are allowed 15 percent. How they got that rate on clay was the fact that there was a natural cement rock which contains both clay and limestone. Cement is a calcium aluminum silicate, so that clay is necessary in it. They were allowed 15 percent on that natural cement rock and finally by Treasury regulation all other cement producers were allowed 15 percent on the clay that they added into the mix, whether it be shale or fire clay.

We are in competition with an industry which enjoys 15 percent while we get 7½, and we also have the problem that we had 15 percent, deservedly so, on the fire clay portion, and we have been reduced down to the present 7½ percent.

What we really need in our industry, and to make it equitable, is to have the fire clay portion raised up to the same rate that limestone and the clay that is used in cement enjoys, regardless of whatever happens to them in terms of whether you retain the present 15 percent, or if you take it down to the proposed 11.

For those reasons, I want to say that we first of all need and deserve no reduction in our depletion benefit, and if anything we need an increase. I will be glad to try to answer any questions that I can.

The CHAIRMAN. Thank you.

Senator MILLER. I would like to ask a question or two, Mr. Chairman.

Of course, it seems to me we have to look at this problem from two standpoints; No. 1, the percentage depletion rate.

Mr. SUTHERLAND. Yes.

Senator MILLER. And No. 2, the basic instance in which it is applied, because if you have a very low base such as the oil shale which Senator Allott was referring to, no matter how high percentage depletion is, you are not going to end up with anything. And so the base has to be looked at.

Mr. SUTHERLAND. Right.

Senator MILLER. Now, I am sure you live with the problem that I referred to a few moments ago.

Mr. SUTHERLAND. Yes, the end product valuation.

Senator MILLER. The end product readily marketable concept. It seems to me that Congress tried to resolve, generally I think with Treasury acquiescence, and that amounted to sort of a compromise that instead of taking Internal Revenue Service's position of this very low base which would have really been extremely costly to your industry, we came up with a higher base. I cannot recall.

Mr. SUTHERLAND. It was what we call the pug mill cutoff which was the end of the grinding but before the manufacturing point started.

Senator MILLER. That is right, but that gave you a higher base, though at the same time it was not as high as perhaps you would have liked to have.

Mr. SUTHERLAND. As the end product.

Senator MILLER. On the other hand, the percentage depletion rate was left alone, was it not, at that time, or was that increased?

Mr. SUTHERLAND. No, that was all a part at the same time of adjustment not only to go back from the end product point down to a start of what the Treasury called the manufacturing process, and also a reduction in the rate.

Senator MILLER. Yes, so that there was a tradeoff. There was a reduction in the rate on the one hand, but there was a very substantial increase over Treasury's position on what the base would be, to which the rate was applied, is that not so? Granted it was not as much as you would like, as your industry would like to have had, but it was a great deal higher than what the Treasury position had been in some of this litigation, is that not so?

Mr. SUTHERLAND. That is true.

Senator MILLER. And so the point I am making is that it seems to me that just a few years ago the Congress tried to resolve this by working out a compromise, a package both with respect to the base against which the rate was to be applied, and the rate itself, and now all of a sudden, just a few years later, under the House-passed bill, the rules of the ball game are supposed to be changed, so that there is a reduction in the percentage depletion rate, is that not so?

Mr. SUTHERLAND. Yes, partially so, but the problem is, of course, that if we are going to talk about cutoff points, the cement industry has a kiln feed cutoff point, and the clay pipe industry has a pug mill cutoff point, which is entirely different from say loading pipe into kilns. We are not talking about a cutoff point here. We are not talking about the cutoff point in either case.

What I am saying is that we are in competition with an industry that gets a 15-percent rate, and we are only getting 7½.

Now, the matter of the compromise was never fully satisfactory to our industry. It was just something that we had to take.

Senator MILLER. I understand that, but the point I am making is that after a compromise was worked out, and I grant you that it was not all that your industry desired, but it was a case of pretty much take-it-or-leave-it.

Mr. SUTHERLAND. Yes.

Senator MILLER. Still with respect to the rate that was settled on, now the House bill comes along and proposes to cut that.

Mr. SUTHERLAND. Yes, sir.

Senator MILLER. And it is compounding the problem that you had a few years ago.

Mr. SUTHERLAND. Yes, exactly so.

Senator MILLER. Thank you, Mr. Chairman.

The CHAIRMAN. Thank you very much.

Mr. SUTHERLAND. Thank you, gentlemen.

(Clark Sutherland's prepared statement follows:)

STATEMENT OF CLARK SUTHERLAND ON BEHALF OF CLAY PIPE INDUSTRY DEPLETION COMMITTEE

SUMMARY

1. The Supreme Court and the Treasury Department have long agreed on the purpose of this wise Congressional tax policy. Thus, the Clay Pipe industry recommends no reduction of its current 7½% depletion allowance.

2. This small industry ($100 million annual sales) plays a vital role in the water pollution control program of the nation. It requires its depletion allowance to assure a continued supply of raw materials and to maintain modernization of its production facilities.

3. Only certain kinds of clay may be used in the successful production of clay sewer pipe. Such clays do not exist everywhere and must be prospected for on a continuing basis. For example, not a single clay pipe plant exists in all of New England. The plants themselves must be located near the deposits, because of the low profit margin in the industry. The history of the industry is replete with plant-closings because of exhaustion or change of quality of the raw materials.

4. Many clay pipe plants are approaching obsolescence. Expansion and modernization are sorely needed, but risk capital is hard to find and would doubtless be less than adequate with a further reduction in the percentage depletion allowance.

5. Limestone and shale (clay), the principal ingredients used in the manufacture of cement, have long enjoyed a 15% depletion allowance while sewer pipe clay has been reduced. Cement pipe is clay pipe's severest competitor. Also, refractory clay purchased for manufacture of sewer pipe, although 15% when mined, becomes 7.5% when used in clay pipe production. We seek an equitable adjustment in our allowance to eliminate these arbitrary competitive disadvantages.

6. Clay used in the manufacture of sewer pipe, supported by IRS Rulings, under earlier law enjoyed a 15% allowance until it was summarily reduced in 1960 to 5%. Its subsequent increase to 7½% in 1966 was merely a return to 50% of its original allowance. It is clearly unfair to reduce again an already reduced percentage on an across-the-board basis, compared to other minerals which have not heretofore suffered any reductions.

7. Clay used in the manufacture of sewer pipe should be included with that clay which is "used or sold for use for purposes dependent on its refractory properties."

STATEMENT

Mr. Chairman: The Clay Pipe Industry Depletion Committee represents nearly ninety percent of the vitrified clay pipe manufacturers in the United States. We take this opportunity to present our views with respect to Section 501(b)(6) of H.R. 13270, the "Tax Reform Act of 1969".

Comments and recommendations

The percentage depletion should be at least maintained at its present rate for the Vitrified Clay Pipe Industry. The Clay Pipe Industry Depletion Committee believes and recommends that there should be no diminution of the incentives for mineral production provided by a wise Congressional policy of 40 years of successful application.

Relative to the nature and purpose of percentage depletion allowance, the Supreme Court, in the Cannelton Sewer Pipe Company Case 364 U.S. 76 (1960) enumerated as follows:

"Mineral depletion for tax purposes is an allowance from income for the exhaustion of capital assets. *Anderson* v. *Helvering*, 310 U.S. 404 (1940). In addition, it is based on the belief that its allowance encourages extensive exploration and increasing discoveries of addition minerals to the benefit of the economy and strength of the nation."

The Treasury interpretation outlined in a statement submitted to the U.S. Committee on Ways and Means by David A. Lindsay, Assistant to the Secretary of the U.S. Treasury, on March 5, 1959[1] states:

". . . it is apparent that the percentage depletion allowance was provided by Congress not only to permit recovery of the investment in the wasting asset but also to provide incentives for explanation necessary for replenishment of the wasting asset by the discovery and development of additional deposits."

It would appear that the Supreme Court and the Treasury are in agreement on the nature and basic purpose of percentage depletion. The manufacturers of vitrified clay pipe support these views and hereby submit the following arguments to support our contention that there should be no diminution of the incentives for mineral production in our industry.

The Clay Pipe Industry is a small one, measured against any one of the giant corporations of America. Total sales in 1968 amounted to approximately $100 million (Bureau of Census). But, our industry plays a vital role in the national program to control the pollution besetting our nation's waters by supplying an essential ingredient—long-life sewage facilities. This is particularly true in urban areas, since many cities recommend clay pipe for sanitary sewerage systems. This is a necessary, highly specialized, low-profit industry. Curtailment of the current percentage depletion allowed the manufacturers of clay pipe would cause severe disruption of an industry which provides an indispensable feature in the nation's housing and construction program.

Manufacturing and exploration

Clay sewer pipe must have the necessary strength, chemical resistance, lack of porosity, dimensional control, and other product characteristics to meet the exacting requirements of Federal and ASTM Specifications.

Only a restricted number of clays have the properties and purity to make an acceptable clay sewer pipe. Among the many qualities necessary in the clay mix is sufficient refractoriness so that the pipe does not deform at the high tempeartures necessary to produce vitrification. Many other essential characteristics such as plasticity, and the ability to dry and fire into a salable product all impose restrictions on acceptable clays for sewer pipe manufacture. Contrary to widely-held and erroneous views, such clays are not available just anywhere for the taking. There is not, for example, a single vitrified clay pipe plant extant in all of New England, for the simple reason that this great region possesses insufficient refractory clay deposits.

The importance of proper and adequate raw materials for a clay sewer pipe plant cannot be over-emphasized. Upon the quality and quantity of this supply is based the ability to produce a marketable product at a profit. Upon this factor is based the investment of the plant and equipment costing millions of dollars.

---

[1] Page 22 of Hearings before the Committee on Ways and Means, House of Representatives, 86th Congress, 1st Sess., on the legislative proposal of the Treasury Department specifying the treatment processes which shall be considered mining for the purpose of computing percentage depletion in the case of mineral products, March 5, 6, 9, 10 and 11, 1959.

Clay sewer pipe plants are highly specialized but *not* highly profitable operations and are *not* readily convertible to other types of manufacturing.

In order to be sure that this investment is secure, clay sewer pipe companies maintain exploration departments to prospect for new deposits. They are staffed by men skilled in the science of finding clay beds (in many areas a difficult task), in recognizing the potential ceramic properties and in determining the quality and quantity of materials present in the deposits. This determination usually involves core drilling, elaborate and costly sampling procedures and dozens of laboratory tests on a single deposit.

Test samples must be subjected to all of the processes of pipe making. If the laboratory tests and all of the other factors appear favorable, plant runs must be made in several sizes of pipe under standard manufacturing conditions. This is the ultimate criteria. These plant runs may cost more than all the prospecting, drilling and laboratory testing procedures before them, and yet may finally indicate that the use of the deposit is not feasible.

A modern clay sewer pipe plant is a highly specialized manufacturing facility which is inescapably wedded to its clay deposits. The characteristics of its grinding and screening equipment, extrusion equipment and dies, the heat and humidity cycles of its dryers, and the recirculation, burning and cooling methods in its kilns are all based on the characteristics of the raw material upon which it must feed.

If the clay deposit must be changed for another or its ceramic properties change, the resultant costs in adapting the plant's facilities are enormous. When the clay supply is exhausted, the plant has lost its value unless another source can be located where the clay can be obtained at equally low cost. Because of the low profit margin in the industry, it is impracticable to ship clays into the facility at any great distance under normal competitive conditions.

The history of the industry is replete with examples of clay product plants closing because of a lack or a change of their raw materials.

Depletion is an incentive to plant expansion to help meet the health and pollution control needs of the Nation. Many clay pipe plants are approaching obsolescence by today's standards. Expansion and modernization are definitely needed in this era of expanding population but because of the low profit potential it is difficult to obtain risk capital and ploughed back earnings have not always been adequate to meet the needs for expansion in the United States.

In many metropolitan areas in the United States sanitary conditions are deplorable. The Business and Defense Service Administration of the U.S. Department of Commerce, estimates that some 40 million people need new or improved sewage collection systems.

The clay pipe industry is highly essential to the health and welfare of our people. Members of the industry are well aware of the need for new plants to increase production for tomorrow's needs and are moving forward in that direction within their limited financial ability to do so. Continuation of the allowance for percentage depletion under the law as now written will provide our taxpayers with some of the funds which will be needed to finance expansion and modernization and exploration.

Additional recommendation for equitable adjustment

We understand and concur in the difficult efforts of the Committee to revise our income tax laws so that all may share in the burdens fairly. It is in this spirit that we invite the attention of the Committee to the discrimination inherent in the present provisions which authorize for limestone (used in the manufacture of cement) a percentage depletion of 15%, whereas the allowance for clay (used in the manufacture of sewer pipe) is one-half that amount. We do not protest the higher rate; we believe that the availability and cost of recovery of natural resources should be the major factors in the determination of the allowable rate. Nevertheless, we do believe that equity is not served by a double allowance for clay's major competitor (concrete pipe made from cement) producing its product in all 50 states while sewer pipe clay is mined in less than half that number. Furthermore, the Committee should be aware that the shale (clay), which forms another basic ingredient of cement, is also entitled to a current 15% allowance. This fact of tax life adds one more weight to the competitive imbalance which favors clay pipe's competitors.

Under earlier law, refractory and fire clay used in the manufacture of clay pipe was allowed the 15% rate, just as even now refractory clay used in making fire brick is allowed the higher rate. Please refer to Internal Revenue Ruling 56-59 which defined refractory clay and included this sentence: "In this connection, fire clay used to enable sewer pipe to retain its shape and dimensions under extremely high temperatures required for vitrification is considered to be used as refractory fire clay."

Subsequent legislation unfairly and probably inadvertently reduced clay pipe's allowance through failure to recognize the essentiality of refractory clay to the manufacture of clay sewer pipe whereby it had obtained its original standing with refractory clay at 15%. It is also of interest to observe the singular inequity which arises in those instances where clay pipe manufacturers purchase fire clay for use in the manufacture of clap pipe. Although fully entitled to the 15% depletion allowance in the possession of the seller, the rate on this self-same material drops dramatically to 7.5% when put to use in the production of vitrified clay sewer pipe.

We believe the United States Senate Committee on Finance will welcome this opportunity to correct a long-standing inequity by restoring the depletion allowance of clays used in the manufacture of vitrified clay sewer pipe through revision of Sections 501(b)(6) and 501(b)(4)(B) of H.R. 13270 to include in the latter a specific reference to vitrified clay sewer pipe.

The CHAIRMAN. I would like if I may, to ask a few more questions of Mr. John Greenlee. I would like to call him back for that reason. Is he available to us?

STATEMENT OF JOHN R. GREENLEE—Resumed

Mr. GREENLEE. Yes, Mr. Chairman.

The CHAIRMAN. I would like to ask you a little bit about the capital gains royalty. I understand that your group is against that, at least they opposed it when it became law.

Mr. GREENLEE. That is right, sir.

The CHAIRMAN. Here is the thought that occurs to me. If a man has minerals, and he wants to sell them, he is entitled to sell them by any fraction he wants to. He can sell you 1 percent of his minerals, one-third, one-quarter, or one thirty-second. In any event, that is a capital gains transaction. He is selling part of his minerals.

Mr. GREENLEE. Yes, sir.

The CHAIRMAN. Now, it would be similar if he is selling you some of his lands. He can sell you 1 acre or 10 acres out of 100 or he can sell you an undivided interest. In any event, that would be capital gains. But when he is selling his stock investment, whether he is selling a fraction interest or selling it by the share, he still gets capital gains treatment.

Mr. GREENLEE. Yes, sir.

The CHAIRMAN. But when he sells his minerals, if he tries to sell a fraction of a share, he always comes up the loser in that the purchaser will get an estimate which invariably is conservative for good reason. It tends to destroy a geologist's reputation if he estimates that there is more there than there is. If he estimates on the short side his reputation is honored, but any bank that makes the loan or any purchaser who buys, and finds there is not at least as much there as was estimated, he would tend to lose his reputation as a geologist.

Mr. GREENLEE. I quite agree.

The CHAIRMAN. That being the case, he cannot very well sell and be sure that he is going to get paid for everything he is selling unless he does sell by the unit. Therefore, I would wonder why would it be wrong that a property owner should be permitted to sell his minerals or any part of his real estate by the unit rather than selling it as a fractional interest and receive a capital gains treatment in either event?

Mr. GREENLEE. Senator Long, I do not suggest that we feel it is wrong that he be able to do that. We were looking, if you will, sir, at the other side of the coin. The problem that I personally have with this, that if it is a capital gain to the lessor, to the fee owner, it could raise the question as to the right of the operator to deduct the royalty payment. We have a little problem with that side of the question. We wanted to preserve our deduction and we felt there was some difficulty with the capital gain on one side and with the ordinary deduction on the other side. If you will, I think we were quite selfish in our appraisal of this. I do not disagree at all with what you have stated.

The CHAIRMAN. In other words, then as I understand it your opposition was based on the fact that you felt that you ought to be able to deduct?

Mr. GREENLEE. Quite right.

The CHAIRMAN. As an ordinary expense to you?

Mr. GREENLEE. Quite right.

The CHAIRMAN. And if it was a capital gain to the other fellow you felt that you could not very well deduct it as an ordinary expense to you?

Mr. GREENLEE. We felt at least that might raise the question and I think this was the major reason for our position in opposition and not at all on the side of the fee owner as you have suggested, sir.

The CHAIRMAN. So it was not that you quarreled with him about the merits of his position?

Mr. GREENLEE. Right.

The CHAIRMAN. It is just that it gave you a tax problem on the other end?

Mr. GREENLEE. I think you are quite right, yes, sir.

The CHAIRMAN. Thank you very much.

That clears it up for me. That completes this morning's session.

We will meet again tomorrow at 9:30.

(Whereupon, at 12:15 p.m. the Senate Finance Committee recessed, to reconvene at 9:30 a.m., Wednesday, October 1, 1969.)

TAX REFORM ACT OF 1969

WEDNESDAY, OCTOBER 1, 1969

U.S. SENATE,
COMMITTEE ON FINANCE,
Washington, D.C.

The committee met, pursuant to recess, at 9:30 a.m., in room 2221, New Senate Office Building, Senator Russell B. Long (chairman) presiding.

Present: Senators Long, Anderson, McCarthy, Byrd of Virginia, Williams of Delaware, Bennett, Curtis, Miller, Fannin, and Hansen.

The CHAIRMAN. The hearing will come to order.

Today we will continue receiving testimony with respect to that part of the House tax reform bill which reduces depletion allowance and cuts back on tax advantages of production payments of natural resources.

The subject before us this morning concerns the effects this bill will have on oil and gas.

Our first witness I am pleased to say is the Honorable John G. Tower, distinguished Senator from Texas.

Senator and neighbor, we are proud to have you.

STATEMENT OF HON. JOHN G. TOWER, A U.S. SENATOR FROM THE STATE OF TEXAS

Senator TOWER. Thank you, neighbor, Mr. Chairman. It is a great pleasure to be here this morning and to discuss something that I know is dear to the hearts of both of us.

Mr. Chairman, I have asked to come before this distinguished committee this morning because I am fearful that proposed changes in our tax laws, as set forth in H.R. 13270, will strike a particularly heavy blow to the oil and gas industry of this country, and in turn to our Nation's defense capability.

As a member of the Senate Armed Services Committee, I am well aware of the vital role a healthy oil and gas industry plays in maintaining a strong defense posture.

In Southeast Asia today, for example, one-half of the military effort there is supplied by the United States, with about 65 percent imported from the Arabian Gulf and 25 percent from the Caribbean and other localities.

I believe it is crucial for our Nation's defense that there be maintained in this country the capability to supply our own petroleum needs in case foreign oil resources are denied as they were for a short time during the Middle East crisis of 1967. Even within the past 30 days we have heard threats of boycott from the Arab nations.

Mobilization studies of the Defense Department show that any type of extended emergency involving the United States and its allies could not be adequately fueled by the United States alone. Therefore, reliance must be placed upon other free world sources in the Western Hemisphere such as Canada and the Caribbean area. The target date for any appreciable amount of oil production from the Northern Slope of Alaska is estimated to be 1972, so we cannot depend on that resource at the immediate moment.

Our national security dictates that we have in existence petroleum resources capable of satisfying our needs. Petroleum cannot be stockpiled like hardware. The only way of insuring an adequate domestic petroleum supply is through a healthy domestic oil and gas industry. A healthy oil and gas industry requires continual exploration, continual employment of a labor force and continual access to risk capital.

The Defense mobilization studies to which I just referred indicate that we need a petroleum industry in our own country which is capable of producing even more oil and gas than it is now. I am fearful that if Congress approves the tax changes now proposed for the petroleum industry, it will gravely reduce the industry's production capability precisely at a time when there is need for even greater production.

It is imperative that our domestic oil industry be capable of sustaining this country's requirements under any conditions. This strategic material is one of the items absolutely essential to defense and thus it is foremost in the minds of military commanders. The difference between military success or failure could easily hinge on the availability of enough petroleum products at a given particular time.

In the petroleum industry, production hinges on the availability of capital. The importance of capital to our oil industry and in turn to our defense posture, our national economy and the well-being of all Americans, cannot be overemphasized.

Over 90 percent of all the work done in this country is done by machinery. This machinery is lubricated adn often powered by petroleum products. The use of machinery has contributed heavily to the high wages and high standard of living possible for the people of this country.

The accumulation of capital to finance growth in our business economy has been historically successful in promoting and maintaining our position as the greatest industrial nation in the world.

In order for our private enterprise system to function successfully, it must have a steady and continuous supply of new private capital. One of the world's serious problems today is the shortage of investment capital. In spite of the great benefits our American system has brought us, I fear it is in danger of being severely damaged through an unreasonable system of taxation.

There is a very great difference between capital and income. Our federal tax system is based on income and should remain so. Taxation of capital results in a draining away of that capital and in turn less and less income for all.

As you know, I have firmly advocated the continuation of the 27½-percent depletion allowance for oil. I continue to do so. This allowance, together with the ability to deduct intangible drilling costs and associated exploration expenses from oil and gas income, is the prime source of generating new capital within the oil and gas industry itself. That generation of new capital must be maintained in order to encourage continued health in our petroleum industry and continued overall economic benefits for all Americans.

Today, you will hear excellent testimony of a highly technical nature to substantiate the vital importance of finding and using our domestic oil and gas reserves. Various forms of production payments have been successful in the past as a means of consolidating and transferring newly discovered reserves to skilled oil and gas operators, resulting in greater efficiency in production. I urge you to consider carefully, ways of updating and refining the method of sale and purchase of these unproduced natural resources, not eliminating this avenue of financing.

In summary, I would stress the need for a system of taxation of our oil and gas industry which will encourage continued health within that industry. I urge this because of our Nation's dependency on the industry economically and because of its dependency for an adequate defense operation. I know you are anxious to hear other witnesses who are capable of providing far more expert testimony and so I have tried to keep my remarks brief.

Thank you for your kind attention.

Mr. CHAIRMAN. Thank you very much, Senator.

As you know, we are limiting ourselves to either no questions or only one question verbally. However there may be written questions that you can provide answers to for the record. Thank you very much.

Senator TOWER. I will be glad to provide any answers that I can for the record. Thank you, Mr. Chairman.

Senator HANSEN. Mr. Chairman, before we go further today, may I ask is it your thought that there will be no questions from members of the committee? We will not have even one question to the witnesses?

The CHAIRMAN. What I would suggest would be that we will ask no more than one verbal question of the witnesses until they have all been heard. At that point if you want to call the witness back, Senator, you can call all you want.

Senator HANSEN. I would like to ask one question if I could.

The CHAIRMAN. Go right ahead.

Senator HANSEN. Senator Tower, on the 30th of September our colleague Senator Proxmire testified before this committee, and made this observation:

"The rationale for the depletion allowance is supposedly rooted in national security. Without depletion allowance so the argument goes"—he continued—"we would not explore for the oil which we need in order to protect ourselves from possible interruptions in our oil supply. This myth was destroyed by the CONSAB Committee."

You are a member of the Armed Services Committee and I would like to ask you if you get the feeling from the military that there is not an interrelationship between the depletion allowance and the availability of supplies of oil adequate to assure our national security.

Senator TOWER. Senator Hansen, I think I can attest that the military is vitally concerned. Oil production is not something you can turn on and off. I think some people have the idea that we have got so much in the way of reserves, all we have to do is leave it there, and if we ever need it we just turn the tap and the oil flows. It does not happen that way.

It is a high risk business, and it is difficult to get capital to invest in this kind of high risk venture, unless you provide some tax incentives, and without these incentives, there will be not much in the way of additional petroleum exploration in this country.

Now about 80 percent of our oil reserves in this country were discovered by independent operators, adventurers if you please, gamblers if you please, but people who had the guts to go out and look for oil, knowing that the risks were very great indeed, and if we do not continue these incentives, if we destroy wildcatting, if we destroy the incentive to go out and explore for oil we are not going to have adequate resources to meet our needs if we get into a crisis, and we could very well be in one today or tomorrow that shuts off our source of supply from the Middle East.

The national security will be very gravely jeopardized. If we get into a worldwide conflagration of any kind, we are going to need our domestic resources, because we are not going to be able to transport adequate supplies from other parts of the world.

Senator HANSEN. Thank you, Mr. Chairman.

Senator FANNIN. Mr. Chairman, one question.

Referring back to the copper strike and problems we have had when we have had to go for foreign copper, the price went up about 50 percent. Don't we face the same problem as far as oil is concerned if we start depending on it?

Senator TOWER. Yes, Senator Fannin, we do. The fact of the matter is it has been alleged that by virtue of the fact that we have import quotas, by virtue of the fact we have all these incentives to keep domestic production going, we artificially maintain a high price for petroleum products, including those that come in from the Middle East, but the fact of the matter is if we were without a domestic supply, then we would be really under the gun, and the foreigners who ship oil into this country, the foreign interests, could control our petroleum prices as well. This could be an economic weapon in the world war, for example.

Senator FANNIN. We would be at their mercy?

Senator TOWER. Yes, sir, we certainly would be.

Senator FANNIN. Thank you.

The CHAIRMAN. I think I will ask one question.

Texas produces about half of this Nation's oil?

Senator TOWER. We used to, Mr. Chairman. We do not any more I am afraid.

The CHAIRMAN. We produce about 10 percent in Louisiana. I also claim that we produce more than you do for our size, not comparing my size to yours but comparing Louisiana's size to Texas.

Senator TOWER. Mr. Chairman, my grandfather was born in Red River Parish, La., so I can claim to be a Louisianan here today.

The CHAIRMAN. Senator, isn't it true that even the present incentives have not been sufficient to make this country self sufficient in this basic resource? We now import about 25 percent of our needs. I am told that with regard to your west Texas wells, there are only about six or seven oilfields in Texas that could really increase their production by as much as 25 percent if the Nation's demand required it and if the nearest oil was shut off and denied to us, and we could not get oil in from Venezuela.

Most of these little upland fields have been depleted to the point that they could not be expanded by any 25 percent.

Senator TOWER. This is true, Mr. Chairman. You would have to go to a very expensive process of secondary recovery which I think would be uneconomical by present standards.

Now if you want to put yourself in a position of paying an extremely high price for domestic production, you could get some additional oil out of the ground, but the fact of the matter is why take that route when indeed we know that there are additional sources available to us in this country if we can just go find them, and we need to maintain the incentives to go find them.

The CHAIRMAN. Thank you very much, Senator.

Senator TOWER. Thank you, Mr. Chairman.

The CHAIRMAN. The next witness is the Honorable Dewey F. Bartlett, Governor of the State of Oklahoma, and I think the Senator from Oklahoma will want to introduce the witness.

Senator HARRIS. Thank you very much, Mr. Chairman. I just want to say that I ask the committee to hear at this time from Oklahoma's Governor, Dewey Bartlett, because I knew that he would be a strong voice for the concern which our State feels about the detrimental impact that this bill and the Treasury recommendations would have on the oil and gas industry which are so important particularly in our own State.

Governor Bartlett and I served as members of the Oklahoma State Senate together. From his own background, his activities as a member of the Interstate Oil Compact Commission and his present position as Governor of our State, we feel that he is an excellent spokesman on this issue, and I am proud to welcome him here.

STATEMENT OF HON. DEWEY F. BARTLETT, GOVERNOR OF THE STATE OF OKLAHOMA

Governor BARTLETT. Thank you, Senator Harris.

Mr. Chairman and members of the Finance Committee of the U.S. Senate, I wish to discuss certain provisions of the so-called tax reform measure now before you as it affects the basic economic or the State of Oklahoma.

The oil industry, aside from agriculture, is the largest industry in Oklahoma. We live in an economy that is largely tied to the well-being of this industry. Our cities, towns, and school districts have largely been developed as oil has been developed.

Since 1956 we have seen in Oklahoma a consistent decline in the number of wildcat wells drilled, producing wells completed, crude reserves available for future demand, and the number of people directly employed in the industry. However, more than 51,500 people in Oklahoma are directly engaged in the exploration for oil for drilling, developing and production and the processing of crude oil.

The annual direct payrolls of these employees exceeds $400 million. These wage earners provide the direct livelihood for over 200,000 of our population and the indirect livelihood for almost an equal number. Our cities and towns are dependent upon the maintenance of this employment.

Many of our school districts are almost wholly dependent upon the nearby presence of an oilfield, a pipeline terminal or a refinery for survival.

We have approximately 3,600 oil operators in Oklahoma producing oil and/or gas from 72 of our 77 counties. Many of them are small independent operators, dependent upon stripper wells for their livelihood. A stripper well is one that averages 10 barrels a day or less, making it a marginal operation from the profit standpoint.

The latest published figures showed there were 56,893 stripper wells in Oklahoma. Nationally there were 376,000 such marginal wells. The average daily production of an Oklahoma stripper well is 4.28 barrels per day. The independent historically has been the finder of new oil. He has been able to take the chance to drill the wildcats, to seek new fields and pools.

He has developed a successful business within the existing tax structure, and by his ingenuity many millions of barrels of oil have been discovered that have strengthened and supported the Nation both in peace and in war.

The effect of this bill is to increase sharply the taxes on those engaged in the production of petroleum. The major oil company will be faced with two alternatives. One, reducing his exploratory drilling and research activity and keeping expenses at a minimum and, two, to increase costs of the refined products such as gasoline.

Undoubtedly the large company will do both. It will result in the added costs being passed on to the consumer and the price of oil and expense to the integrated company being held as low as possible.

On the other hand, the price of crude oil represents the principal source and often the only source of revenue to the average independent. He is not in a position to pass on his increased expense. Therefore the independent operators will further decrease in number and will no longer be a viable segment of the oil industry.

Oklahoma derives 29 percent of its tax revenues from the petroleum industry, in addition to the economic taxes paid by the many companies and their employees. This is also exclusive of the ad valorem taxes paid to the counties and school districts on pipelines, pump stations, refineries, and other properties.

Oklahoma is in the midst of a tremendous economic development effort. In 1966 the capital expenditure for the manufacturing industry was $50 million. Last year this figure was $155 million, and through the first 8 months of this year it has already reached $174 million.

The gains in manufacturing would be offset by a significant decline in the oil industry. Obviously a decline in oil activity will sharply reduce revenues to the State of Oklahoma, revenues on which we are dependent.

This is another point that I think has not been made enough, Mr. Chairman and members of the committee. That in addition the State will pay directly a part of the increased taxes to the oil companies. This is because Oklahoma is one of the 12 States permitting Federal taxes paid as a deduction on State income taxes due.

When Federal income taxes are increased, Oklahoma suffers a decline in revenue. Eleven other States will likewise suffer, and this includes the States of Louisiana, Arizona, Montana, and a total of 12.

I have touched briefly on the effect that the bill will have on the States in general, the small businessman and the consumer. Finally I must warn you of the dangers hidden in this bill to the national security and the national resources of this country. If we shut down the stripper wells, many of which can never be reopened, we have wasted a great national resource by abandoning it beneath the surface.

If we dry up our source of discovery, the independent, we will never find millions of barrels which is tantamount to wasting the same resources.

When this happens, and it has already started happening from the pressure of other costs, the United States will become more dependent on foreign oil. I know no Member of this Congress will gamble on our country's future.

On the municipal bond features of this bill I concur in the excellent presentation made by Gov. John Love of Colorado and the other five Governors that appeared before this committee previously. The proposed method of handling this matter is ill-advised and unnecessary, and if an evil exists, that should be checked. It can easily be done by placing a limit on the amount of tax-exempt income one may have in relation to total income.

In conclusion, the true measures that should be applied to the existing law as it relates to the petroleum industry, aside from the element of national defense, preservation of our reserves, our oil reserves, are the availability of petroleum products at reasonable prices, the profitability of the industry as compared to other domestic industries, the ability of the industry to keep down prices, and whether the oil industry is paying its fair share of taxes.

If the oil industry is not paying its fair share of taxes, this committee should provide the pertinent facts.

We enjoy a lower price for petroleum products than any other free nation. The price of gasoline at the wholesale level is now one-third less than it was during World War I. The U.S. wholesale price in

1918 was 23 cents. In 1966 it was 15.89, the last year figures are available.

It has 50 percent more power than the 1918 product.

Over a period of 43 years, the oil industry has received a lower return on net worth than all manufacturing industry according to the First National City Bank monthly economic letter. Obviously tax burdens placed on the oil industry will be passed on to the consuming public. The independent operator will be unable to offset his increased burden. Exploration will dry up. Many stripper wells will be shut down hurting primarily the independent operator. His activity will be increased sharply.

Our dependence upon foreign oil will be increased and every little man that buys a gallon of gasoline will pay part of the bill. For Oklahoma to maintain its present level of services, this proposed legislation will require the Oklahoma taxpayer to be further burdened with a significant tax increase.

The CHAIRMAN. Thank you very much.

Governor BARTLETT. Thank you, Mr. Chairman.

Senator HANSEN. Mr. Chairman, may I ask a question?

Governor Bartlett, your testimony sounds very much as though you might have been testifying for Wyoming. In our State I think a third of all of the county taxes are paid by the petroleum industry. We have an equal dependence as does Oklahoma upon this industry. I would like to ask you if this tax bill as presently before us should be passed, would it affect significantly the employment rate of people in your State?

Governor BARTLETT. Yes, sir. Our employment rate would decline very sharply. There is just no question about this. The revenues to the State would also decline. It would be necessary to have a tax increase to provide the same level of services.

Senator HANSEN. Thank you, Mr. Chairman.

Senator MILLER. Mr. Chairman.

Governor Bartlett, you stated that the oil industry is paying its fair share of taxes. I presume you were referring primarily to Oklahoma, with which you are most familiar. Can you give us an idea of how much in State and local taxes the petroleum industry pays in your State?

Governor BARTLETT. I believe the gross production tax figure for the latest, for the last year, I believ ewas $45 million. This of course is a large part of the moneys available to the State. The total paid for on the income tax, I do not have that figure, bnt they pay, I think my testimony shows, 29 percent.

Senator MILLER. 29 percent?

Governor BARTLETT. Yes.

Senator MILLER. Of what?

Governor BARTLETT. Oklahoma derives 29 percent of its tax revenues from the petroleum industry.

Senator MILLER. And by that do you mean either from the income tax or from——

Governor BARTLETT. This is all sources.

Senator MILLER (continuing). All sources?

Governor BARTLETT. Yes.

Senator MILLER. That is the State?

Governor BARTLETT. Yes.

Senator MILLER. What about local taxes?

Governor BARTLETT. This is in addition to the ad valorem taxes, and of course they would pay ad valorem taxes throughout the State.

Senator MILLER. Do you have any idea of how much that amounts to?

Governor BARTLETT. No, sir; I do not.

Senator MILLER. Would it be difficult to find out and furnish it for the record?

Governor BARTLETT. I will make every effort to furnish that. I know it will be very significant.

Senator MILLER. I think it might be helpful for us to find out the total tax package outside of the Federal income taxes that the industry is paying to the State and local governments in your State.

Governor BARTLETT. Senator Miller, I will furnish you with that information.

Senator MILLER. Thank you, Governor.

(The information to be furnished for the record had not been received at the time of printing.)

The CHAIRMAN. Governor, since that point came up, many people contend that the industry is entitled to no credit for carrying a very heavy excise tax on its product. You mentioned that the wholesale price of gasoline today is 15.8 cents. The retailer usually has a markup of about 6 cents. That would make it 21.8, and the product carries an excise tax of about 10 cents a gallon State and local.

Now, the overall tax burden that industry carries is roughly $8 billion. It is the most heavily taxed industry in America. Percentagewise whisky carries more. It cost about 90 cents to manufacture a gallon of whisky and it carries $9 in Federal taxes, so you buy a bottle of whisky, you are buying 90 percent taxes and 10 percent alcohol.

Senator HARRIS. That is not quite the same as 90 proof.

The CHAIRMAN. Maybe that is what they mean when they say 90 proof. But people say that the industry passes the taxes on to the consumer. Well, every industry has to pass the taxes on to the consumer if it is going to stay in business. If it does not pass the taxes on in the price of a product, it would have to go out of business. It goes broke. Capital leaves that industry and invests it in something else.

Do you know of any other industry paying $8 billion a year in taxes to Government?

Governor BARTLETT. No, sir; Mr. Chairman, I do not. I think another thing that is not often thought of in the oil industry, it is a very competitive industry with many independents, many people competing with major oil companies, many large companies. The independent cannot pass on his extra costs, the extra taxes, that would be a result of the lowering of the depletion allowances.

He cannot do that because he does not set the price on crude oil as you well know, and so he is going to either go out of business, reduce his operations, reduce the reserves available to this Nation, reduce his activity, or go into some other business.

So the independent is faced with a very questionable future.

The larger company also the same. He is burdened with more expensive exploration costs in Alaska and offshore, where the independent is not so active, and without the depletion allowance which has worked so well for a long time, he would be operating in a very questionable area costwise and would have to pass this on to the consumer.

The CHAIRMAN. Thank you very much, Governor Bartlett.

Governor BARTLETT. Thank you, sir.

The CHAIRMAN. The next witness will be Mr. Emilio G. Collado, executive vice president, Standard Oil of New Jersey. Down Louisiana way he is better known as "Pete."

Is Mr. Collado here?

Mr. Robert DUNLOP. If we may take a moment of privilege, we were going to present a panel at this point in time, Mr. Chairman.

The CHAIRMAN. Senator Scott, the newly elected minority leader of the Senate, would like to introduce Mr. Dunlop, president of the Sun Oil Co.

STATEMENT OF HON. HUGH SCOTT, A U.S. SENATOR FROM THE STATE OF PENNSYLVANIA

Senator SCOTT. If I may, Mr. Chairman, I have another committee meeting.

Would you come up, please, Mr. Dunlop. I believe as Mr. Dunlop said, he would like the privilege of introducing the whole panel including the witness whose name you mentioned.

It is a privilege for me, Mr. Chairman, members of the committee, to introduce Mr. Robert G. Dunlop, president of the Sun Oil Co., who is an old friend, and who when named to this post was one of the youngest executives in the oil industry and one of the most knowledgeable.

I am very proud to have known him, to have been his friend all these years. I imagine that a number of the members of the panel have heard Mr. Dunlop before, and he will indicate to you other representatives of the industry who wish to be heard.

I am most appreciative of the courtesy and of this opportunity. If it were not a matter of deference to the time of the committee and the witnesses, I would go on further, but it is a great privilege and I am glad to have this opportunity.

COORDINATED TESTIMONY OF THE AMERICAN PETROLEUM INSTITUTE: MID-CONTINENT OIL & GAS ASSOCIATION; ROCKY MOUNTAIN OIL & GAS ASSOCIATION; AND WESTERN OIL & GAS ASSOCIATION; PRESENTED BY ROBERT G. DUNLOP, PRESIDENT, SUN OIL CO.; WILLIAM I. SPENCER, EXECUTIVE VICE PRESIDENT, FIRST NATIONAL CITY BANK; GEORGE V. MYERS, EXECUTIVE VICE PRESIDENT, STANDARD OIL CO. OF INDIANA; AND EMILIO G. COLLADO, EXECUTIVE VICE PRESIDENT, STANDARD OIL CO. OF NEW JERSEY

Mr. DUNLOP. May we call our associates, please, Mr. Chairman.

Mr. Spencer, Mr. Myers, and Mr. Collado.

The CHAIRMAN. Mr. Dunlop, I am in your debt whether you know it or not. Your company found some oil in Louisiana and I have sued your company and was successful and I appreciate it.

Mr. DUNLOP. That is correct.

Senator BENNETT. Mr. Chairman, before this group of witnesses starts to testify, and in view of the fact that the whole day practically is going to be spent hearing witnesses representing the oil industry, I would like to suggest that each of them who may have an important point of view to suggest to the committee take a minute to talk to us about the potential effect of the Alaska discovery on the situation that we face. I think that would be very helpful.

The CHAIRMAN. I think that is fine, but, Senator Bennett, I do not see any particular point in somebody discussing Alaskan oil if he does not have some of it. Now Standard Oil of New Jersey has some of it. Does the Sun Oil have some of that discovery?

Mr. DUNLOP. We are not that fortunate, Senator.

The CHAIRMAN. How about the other two companies? One speaks for the First National City Bank. I imagine you are financing some of it. Does Standard Oil of Indiana have some of it?

Mr. MYERS. We are sure optimistic about finding some.

Senator BENNETT. Not necessarily now but I think at some time during the discussion.

Mr. COLLADO. I am Emilio G. Collado, executive vice president of the Standard Oil Co. of New Jersey. I would be happy to answer your question, Senator Bennett.

It is true that our affiliate, Humble, is in partnership with Atlantic Richfield in the Prudhoe area in the north slope of Alaska, and we and the British Petroleum Co. had the initial discovery in that field.

We have been making a number of projections both for other committees of the Senate and for the oil import study. As you know, the President has established an oil import task force under Secretary Schultz, and our people have submitted a number of projections of what we think of the prospects of north Alaska into the public record.

If you wish, we can bring out some of that material here now. I happen to have it in another case over here.

(The material referred to appears on p. 4428 of the record.)

Something like this is what is involved. The present oil reserves of the United States are about 31 billion barrels. These are the booked reserves at the end of last year. We would anticipate that between now and 1985, there will be additional bookings of reserves on something of the order of 72 billion additional barrels, if the existing economic environment of the industry is continued, by that I mean the present tax structure, and an import policy perhaps somewhat modified from the present, but basically of the same order of impact as the present import policies.

Under those circumstances, we estimate that 31 billion barrels will be found in the north slope of Alaska, about 20 billion barrels in the deep offshore including up to depths of perhaps 2,000 feet, and then perhaps something just under another 20 billion barrels—these are reserve figures, billions—for the land areas of the 48 States. That adds up to approximately the 72 I am talking about.

These are very important reserves in Alaska. We think that the Prudhoe Bay structure, which is the one area that has definitely been found, may have not less than 10 billion barrels. Some other companies have estimated reserves of 10 to 12 billion barrels, but all the public announcements are generally compatible.

We think this discovery is important. It is the largest field ever found in North America. On the other hand, when you start comparing it with reserves in the Middle East, when you start comparing the production that can come from it, with the very vast increases in our domestic requirements, it is important and we are happy to have found this oil, but it does not begin to answer all the problems. I think there has been a great misconception, that somehow our adventuresome transportation experiments and the fact of this oil have revolutionized things. It is important but it is not decisive.

We figure that in the 1970's the production that can be removed from Prudhoe Bay to the United States will be of the order of 1½ to 2 million barrels a day. We are consuming now 14 or 15 million barrels a day. We expect that consumption to go up to 19 million barrels a day by the end of this period, so it is important, but it is not all that big, Senator.

The CHAIRMAN. You think we have 30 billion barrels of oil in reserves within the United States including Alaska right now, I take it?

Mr. COLLADO. Including Alaska, but no bookings yet for the Prudhoe Bay. That is before the Prudhoe Bay. It includes the booked reserves of southern Alaska which are relatively minor.

The CHAIRMAN. All right. Now, how long would that last this country at present rates of production?

Mr. COLLADO. It is only about something like 9 years at the rate that we are producing it.

The CHAIRMAN. So we have found enough——

Mr. COLLADO. And on top of that we are also importing some from other countries, but it is about a 9-year production rate in the United States.

The CHAIRMAN. So if we were cut off from foreign oil, we have enough to last us for about 9 years, unless we find more.

Mr. COLLADO. That is correct, Senator. The only problem is that you cannot actually produce it that quickly. There is an ultimate recovery of 31 billion barrels but you do not necessarily get it in 9 years, because of the problem of maximum economic recovery which prevents you from taking the entire amount of oil out in those 9 years. You would lose a lot of oil if you tried to take it out that quickly.

The CHAIRMAN. If you tried to produce it all in 9 years——

Mr. COLLADO. You would not get it.

The CHAIRMAN. You would leave an awful lot of oil in the ground.

Mr. COLLADO. Yes, also the facilities are not there to take it out. The water and gas drives and other things are just not all in place to get it out that quickly.

Senator MILLER. Mr. Chairman, could I ask a question at this point?

There are two facets to this question, Mr. Collado. No. 1, can you tell us approximately how much has been spent by the petroleum industry or by any segment of it in making the find in Alaska, and second, can you tell us how much more would be spent between now and 1985 in order to achieve the 31-billion-barrel resources that you referred to?

Mr. COLLADO. Well, I am afraid I cannot give you anything like precise answers to the first part of your question, and I am afraid I cannot even give you imprecise answers to the second part.

I believe that the industry has indicated in various surveys that have been made that the total expenditures of the whole industry, in all parts of Alaska, to date are on the order of $1.9 billion. A good deal of that was in quite unrewarding efforts in parts of Alaska that so far have not become economic for most companies.

As to the future, we have been quite careful not to talk about what we expect our ultimate costs will be, because these things are still so uncertain. We feel that to get the oil out of Prudhoe Bay will require a great deal of expenditure in field facilities through water flooding and that sort of thing.

The chairman of Humble, who is an old expert in producing matters, which I am afraid I am not Senator, told the task force working on the import policy the other day that until a field has been produced at least 5 percent, you really cannot be very precise as to what the ultimate recovery of the field will be nor what the costs of recovery will be.

Now there has not been anything taken out of this field yet. We are just beginning.

I think it is safe to say that the costs of recovery on the Prudhoe field will be several times the figures that have been publicly mentioned by some academic and other interests that have been writing on the subject.

In addition to that, the costs of transportation to get it out of the northern part of Alaska will be enormous. A group of companies has announced a $900 million pipeline project across Alaska, and that would only bring the oil to the southern part of Alaska.

At the rate of escalation which we may expect in costs, plus the very complicated problems of building a pipeline there, plus the additional problems of not disturbing the ecology, which as you know has been the subject of a great deal of discussion in Alaska just in the last few months, I think that $900 million is at best a low estimate of what it will cost.

We are spending something on the order of $39 million on our experiment with the tanker *Manhattan*, which I am sure you have read about, and I think it is now indicated that it is possible to get up there.

Whether it is possible to get up there 12 months a year is not completely settled by the existing experiments, nor is it clear how much it will cost to design tankers of a proper shape. These are very expensive—$50 to $60 million for each tanker. These costs are going to be tremendous, and we have not added them all up.

Other projects which are still in the talking stage are whether you build a fleet of tankers to come down from southern Alaska to the Pacific coast, and then a pipeline into the central part of the United States and possibly all the way to the east coast, or whether you build a pipeline starting up in Alaska and going through northern Canada and down.

There are any number of possibilities here. These things all run into billions of dollars. Every item we talk about runs billions of dollars. I cannot answer you any more precisely today.

Senator MILLER. Thank you very much.

The CHAIRMAN. Proceed.

Mr. DUNLOP. Mr. Chairman and members of the Finance Committee, I am Robert G. Dunlop, president of the Sun Oil Co., Philadelphia, Pa., I am accompanied by Mr. William Spencer of the First National City Bank, Mr. George V. Myers of Standard Oil Co. of Indiana, and Mr. Emilio G. Collado of the Standard Oil Co., New Jersey. Our appearance today is in behalf of the American Petroleum Institute, Mid-Continent Oil & Gas Association, Rocky Mountain Oil & Gas Association, and Western Oil & Gas Association.

In the next 10 years the United States will consume 60 billion barrels of liquid petroleum and 225 trillion cubic feet of gas. Everything we say today must be considered in the context of the challenge this poses for our industry. I hope to indicate why it is vital to the Nation's security that the domestic industry provide the bulk of that petroleum. I will also discuss the present condition of the industry, and the likely impact of proposed tax changes on the industry's ability to fulfill present and future petroleum needs.

It is not an overstatement to say that petroleum is the lifeblood of our Nation. Oil and gas supply nearly three-fourths of all energy consumed in this country. The Department of Defense has asserted that oil is one of the few strategic materials that is absolutely essential.

The policy of the Congress has been to provide the incentives necessary to assure the continuance of a strong domestic industry, capable of meeting the essential oil and gas needs of the Nation. Today this policy is being questioned.

The basic decision we now face is the choice between:

1. Maintaining a strong domestic petroleum industry, or
2. Relying to a greater extent on less secure imported petroleum.

This decision should be based on a careful consideration of two questions.

First, are the tax incentives effective in achieving an adequate domestic petroleum supply?

Second, is an adequate domestic supply still essential to our national interest?

I should like to affirm that these tax incentives have been successful.

At the end of World War II, productive capacity was barely equal to demand. We had no reserve capacity. From this low point the tax incentives, together with the thrust of rising prices during the late 1940's, enabled the industry to improve steadily the supply situation.

As a result, since the early 1950's we have had significant reserve-producing capacity. In 1968 this capacity amounted to 3 million barrels daily.

We have met the current needs of this Nation, and have also helped to meet the emergency needs of friendly nations on three occasions since World War II when their supplies of petroleum were interrupted. I submit that without sufficient petroleum supplies in the United States, during and since World War II, the course of history might indeed have been different.

Tax incentives have played a key role in enabling the industry to provide adequate supplies of energy at reasonable prices to the American people. In addition, the depletion provision has provided important technological and economic contributions to the Nation's welfare. Technological advances have enabled the industry to produce economically oil and gas previously impossible to recover. Improved drilling capabilities have permitted the industry to recover oil and gas at depths that were formerly impossible to drill. Secondary recovery techniques have doubled the amount of oil we can recover. I want to emphasize that percentage depletion is a particularly effective incentive for technological improvement in exploration and recovery since it is based on production.

Existing petroleum tax policies have contributed positively to our balance of payments and have played a major role in the economic progress of developing nations.

Tax incentives have likewise made a contribution to the conservation of natural resources by encouraging the production of marginal oil rather than abandoning this oil.

It is often asserted that petroleum tax incentives result in excessive profits, and that the industry does not pay a fair share of taxes. The facts are that the industry's profits have been less than average, and the industry has paid more than its share of taxes overall.

With respect to profits, petroleum producing and refining companies in 1968 earned a return of 12.9 percent on net assets compared with an average of 13.1 percent for all manufacturing companies. In 8 of the past 10 years the average rate of return for manufacturing companies was higher than for petroleum companies. Profits in our industry are not excessive.

With respect to taxes, direct taxes exclusive of motor fuel and excise taxes paid by the petroleum industry in 1966, the last year for which the complete figures are available, were 6 percent of industry revenues. This was more than 5.8 percent of revenues paid by mining and manufacturing companies, and the 4.8 percent of revenues paid by all business coporations. The petroleum industry is carrying more than its fair share of the tax burden, even though its Federal income taxes are reduced by the depletion provision.

The real beneficiaries of percentage depletion have been the American consumers, who have had an ample supply of energy at reasonable prices. The wholesale price index for crude oil has risen just 5 percent from the 1957–59 base, while the index for all commodities has increased by 13 percent. The price of gasoline excluding excise taxes has advanced approximately 10 percent since the 1957–59 base period, while consumer prices generally were up some 28 percent.

Now, I would like to turn to the problem of national security, placing this matter in a current context. What would be the situation tomorrow if Israel and the Arab countries were to fight on a full-scale basis?

If this should occur, access to Arab-bloc oil would undoubtedly be severely restricted. This would be critical, because the Arab-bloc countries control overall 71 percent of the Free World's oil reserves outside the United States and Canada.

It is my judgment under these circumstances that Canada and the United States would share available spare capacity. Today the two countries have sufficient capacity to cover their imports from Arab nations plus some additional reserve to help Europe and Japan. However, if the United States did not have a large domestic petroleum industry, our military security and economic strength would be crippled.

A Middle East conflagration is not a remote possibility, but rather a situation which we might have to face up to at any time as events of recent years have clearly indicated. Therefore it is imperative that we maintain a viable domestic producing industry.

A reduction in the depletion allowance would either result in higher product prices or an increased dependence on less secure foreign crude. Neither alternative is desirable.

Higher prices for gasoline and heating oil, for example, would fall more heavily on the Nation's lower income groups since they spend a much larger proportion of their income on such necessities.

If prices do not increase, the reduced depletion allowance would result in reduced investment in domestic exploration and development, and increased reliance on foreign oil.

Reduced investment is clearly undesirable at a time when we have been unable to expand domestic reserves in step with our growing domestic requirements. Both oil and gas reserves declined last year and the gas supply situation has been called critical by a member of the Federal Power Commission. Overall, even with the new Alaskan discoveries, the industry will have difficulty in providing for our expanding petroleum needs.

In accepting this alternative we would be assuming a long-run risk that cannot be measured in monetary terms. We could be drawn into a conflict in the Middle East, in an attempt to insure stability. A substantially increased U.S. role in the Middle East could well lead to a direct confrontation between the two nuclear superpowers.

In conclusion, it is my considered judgment that the tax incentives granted the petroleum industry are effective, and that an adequate domestic petroleum supply is a critical need for the security of the United States.

In the national interests, gentlemen, I urge you to maintain existing tax incentives at their present level.

Thank you very much for your kind invitation.

Mr. Spencer will now make the next presentation.

Senator HANSEN. Mr. Chairman, if I may interrupt for just a moment, in order to understand what the situation will be, I do gather from what you have said earlier we will be permitted to ask one question of each of these witnesses. When would you like us to do that?

The CHAIRMAN. Any time you want.

Senator HANSEN. If I may, since Mr. Dunlop has just testified, I would like to ask do I conclude correctly from what you have said that continued domestic exploration is absolutely essential to assure the safety and well-being of this Nation?

Mr. DUNLOP. Yes, sir, Senator Hansen. I do not think there is any question about that. We anticipate that in the 1970's we will have a consumption of some 60 billion barrels of liquid petroleum, and 225 trillion cubic feet of gas, and as Mr. Collado indicated a few moments ago. we have a reserve position currently of somewhat better than 30 billion barrels, not including the Alaskan North Slope reserves. This means that the industry in this period of time, the 1970's, is going to have to discover and develop something in the neighborhood of 50 to 60 billion barrels. In order to discover reserves of that magnitude, I feel it is very important that these tax incentives be maintained, because the discovery of these reserves will provide the assurance that we will be able in that area of interest to preserve our national security.

Senator HANSEN. Thank you, Mr. Chairman.

Senator FANNIN. Mr. Chairman.

Mr. Dunlop, you certainly brought out the importance of exploration and what is involved in our Nation depending upon the petroleum reserves. You say that nearly three-fourths of all energy consumed in this country comes from oil and gas.

Now, as I understand it, there are many products involved, and a sufficiency in one product does not necessarily mean that there is a sufficiency in others. You mentioned the liquefied petroleum products, 60 billion barrels I think you mentioned.

Mr. DUNLOP. This would be crude oil and what we call natural gas liquids, the liquids as distinguished from——

Senator FANNIN. Propane and butane?

Mr. DUNLOP. Propane and butane would be in that category, liquefied petroleum, yes, sir.

Senator FANNIN. Then you are going into other products as I understand it, bottling ethane and methane?

Mr. DUNLOP. Well, these other lower hydrocarbon fractions, are used in the energy market, but over and beyond that, of course they are one of the significant supplies of petrochemicals.

Senator FANNIN. What I am alarmed about is that here we are talking about using natural gas to propel motor vehicles when we have a tremendous shortage of natural gas, and even this year we may have trouble in some areas of our country. Now that will not be alleviated by our production in Alaska, so we will need to have greater exploration in this country, in order to take care of that need; is that correct?

Mr. DUNLOP. Senator, that is very true. Just one comment on the use of some of these lighter fractions in the internal combustion engine. That is generally the area of propane. There has been a move in that direction more recently.

The real concern with respect to natural gas is the fact that last year in the United States we consumed something on the order of 19 trillion cubic feet of gas. Our additions to reserves were only in the neighborhood of 13.5 trillions, so we only found about 70 percent of the natural gas, that was consumed, and our concern in that regard, of course, relates to an increasingly expanding market, and the ability of the industry to discover the natural gas that will take care of these needs.

Senator FANNIN. Yes. That is what I understand.

Mr. DUNLOP. You do emphasize a very significant factor.

Senator FANNIN. It is one of the very critical needs as far as our exploration in this country.

Mr. DUNLOP. Yes, sir.

Senator FANNIN. Thank you.

Senator HARRIS. Mr. Chairman. Perhaps one of the other witnesses can get to this. If so, all right, but that is particularly what Senator Fannin raised I wanted to raise.

You mentioned that the oil and gas reserves have declined. I am particularly interested in the gas end of that, the natural gas end of that. What is demand doing and what do you expect it to do with regard to natural gas?

Mr. DUNLOP. Well, actually there are two factors in the natural gas situation. The natural gas situation, of course, enjoys these tax incentives the same as liquid petroleum. However, you have the further factor with regard to natural gas that the well-head price of gas is controlled by the Federal Power Commission. Frankly, it would be my feeling that that over certainly the last decade or 15 years the price of gas has been inadequate to induce the amount of investment that would have been required to develop gas reserves. I think this is another very critical aspect of this problem, Senator Harris, that not only do you need the incentives that are inherent in the tax system, but it is my opinion the industry also needs a more reasonable price at the wellhead in order to go out and search and discover gas.

In your own State we recently drilled a gas well which was successful. It cost somewhat in excess of $4½ million. We found gas, but there is a real question in our mind at the present price levels as to whether or not we would be justified in continuing a development program in that area.

I just would like to say this. We believe there is an awful lot of gas yet to be found, but you need not only the incentives which the Congress has wisely provided in the tax legislation, but we also believe that we need more adequate prices, Senator.

The CHAIRMAN. May I ask if this is about the size of it. If you consider all taxes rather than just one tax, consider all taxes, State, local. Federal, excise as well as income—this industry is paying more taxes or at least it is carrying a heavier tax burden than any industry in America. It is making less profits after taxes than the average for manufacturing companies. To provide the Nation with its fuel requirements in the next 10 years, it must find twice as much oil as it has found or presently has on hand in recoverable reserves. To do all this the industry needs enormous amounts of capital, both to find oil. refine it and move it around.

These heavy capital requirements presuppose sufficient profits to attract the capital into the industry. At the present time the profits in the industry are not as good as the average for manufacturing. Isn't that about the problem?

Mr. DUNLOP. You have stated it extremely well, Mr. Chairman. In fact, Mr. Spencer, our next panelist, will direct his attention to this problem in some detail.

Senator HARRIS. That is his problem to find you some money to do all of this stuff with.

Mr. DUNLOP. That is very true.

Senator MILLER. Mr. Dunlop, I am referring to pages 70 and 71 of the committee print of the various testimonies for today, and I believe this relates to pages 20 and 21 of your testimony, at least in my printed copy. I want to raise a question about the point you make regarding oil imports.

On page 20 of your statement, I find the statement that "Elimination of the import control program * * * would result in an 85 percent drop in the volume of exploratory drilling."

Mr. DUNLOP. Yes, sir.

Senator MILLER. And then on the next page I find a reference to projections made by the Department of Interior predicting that upwards of 58 percent, using a pessimistic approach, upwards of 58 percent dependency on foreign oil by 1980 if oil import controls were eliminated.

Now on the one hand I see an 85 percent drop in exploratory drilling estimated. On the other hand, I see a dependency of upwards of 58 percent on foreign imports. Can you give us the interrelationship between these percentages, or is there any interrelationship?

Mr. DUNLOP. Yes, Senator: I believe there is. In the first instance in the testimony that I supplied or in the detail statement, I indicated that in the replies to the questionnaires that were submitted to the Cabinet Task Force on Oil Import Control, it was stated that if there was a reduction in revenues of approximately one-third, there would be an 85 percent reduction in the exploratory effort. As a consequence of that reduction, we would have the result indicated on page 21 of my longer statement, namely that going into the 1970's you would then be in a position as a Nation to have to depend on foreign sources of oil for better than 50 percent of our total requirement.

Senator MILLER. When you refer to a drop of one-third in revenues, what were you referring to?

Mr. DUNLOP. Well, a drop of approximately one-third in revenues would be the drop in revenues as a result of a change in the import control, and the allusion that I was making there was that a similar drop in available funds as a result of an impairment of the tax incentives, primarily the statutory depletion allowance, would have a similar effect.

I might suggest, Senator, Mr. Myers is going to deal with that question a little more specifically in terms of varying percentages that may shed some light on that.

Senator MILLER. Thank you very much.

The CHAIRMAN. Proceed.

Mr. SPENCER. I am William I. Spencer, executive vice president of First National City Bank, New York. For many years, I was directly associated with the petroleum and mineral activities of our bank. I, therefore, feel honored to appear at these important hearings, and to discuss with you a few of the basic problems presented by some of the proposals now being examined by this committee.

I shall confine my remarks to two broad areas. In the first place, I shall briefly discuss the importance of petroleum in strengthening the U.S. position in international trade and payments. Second, I shall urge you to consider most carefully the industry's capital needs.

On the first point, let me make it clear that I have no doubt of the advantages to the United States of a growing flow of international trade and payments. I have just returned from a visit to Africa where I was struck by the extent to which American people, American capital, and American ideas are now working to enhance our image and increase our income in the most remote places. To forget the interdependence of the United States and its trading partners abroad would be a little like trying to run Manhattan without the tunnels and bridges connecting the island to the mainland.

Our bank has often expressed concern over the policy of restricting capital outflows by the system of controls introduced early in 1965. Similar objections would apply to tax changes likely to interfere with earnings from direct investments abroad. Over the years, petroleum investments abroad have shown their ability to earn a return on book value appreciably better than that of other investments abroad. The net effect of the foreign investment activity of the petroleum industry has been an inflow of funds of nearly $1 billion annually. Most of the capital now required to support this inflow is not drawn from sources in the United States, but from earnings made and reinvested abroad, and from sums raised from investors abroad.

Now, gentlemen, I should like to turn to the capital outlook. The reason investors have in the past been willing to risk their money in this business is, of course, that they were anticipating an adequate return on their money. Tax incentives played an important role in attracting investors to this industry. At the same time, the industry's profits have not been excessive, as Mr. Dunlop has demonstrated.

There seems to be an impression, expressed during the hearings early in September, that these tax incentives are expendable. I support the case for sharing the tax burden as equitably as possible. As the President himself has pointed out, taxes can be made fair—but not popular. Reducing the mineral tax incentives, as now under discussion by this committee, might be popular today. But will it be popular 10 years from now? In the long run, because of the danger of an energy shortage, I do not think it would be wise or fair. In fact, during the 1970's, tax incentives for mineral production will be even more essential than during the 1960's.

I am not saying that the tax system should be left unchanged. But any tax system should meet the tests of being simple, stable, and in tune with long-term economic needs. Insofar as the mineral provisions are concerned, I do not find that the proposed measures meet any of these tests. The proposals now before the committee appear to make the system even more complex. They appear to undermine the stability so vital to productive investment. And they conflict with long-term needs by adding a bias in favor of consumption and unfavorable to investment at a time when the Nation is struggling to rein in an inflation that threatens to run away.

My concern with regard to the tax proposals extends across the whole range of minerals. Coal, uranium, copper, and other basic resources will be essential to our economy in the future even more than they have been in the past. Oil shale will one day come into its own as a major source of the Nation's energy. But, in the rest of what I say, I shall be focusing on oil and gas.

Looking at the petroleum industry from a banker's viewpoint, I see no reason for overconfidence that this country can successfully cope with the petroleum demands of the 1970's. I see no justification for a crackdown on the petroleum industry. Instead, I think the industry will need all the cooperation it can get from this Nation. Let me tell you why.

As a banker, I am uneasy about the petroleum industry's capital outlook—how much capital it will require and how much it can obtain. I see all too little basis for the confidence that was expressed by administration spokesmen before this committee concerning the adequacy of the capital supply.

In the first place, there is the shortage of capital in the economy as a whole. With the big corporations—and even the Federal Government—having to pay 8 percent or more on recent bond and note issues, the present stringency is clear for all to see. Nor do we expect any early relief. In a recent 5-year forecast, we came up with the prospect of a sharp increase in the need for both short- and long-term borrowing by leading U.S. industries. For petroleum, we expect to see a drastic increase in the use of outside funds, with the total of short-term borrowing likely to double by 1974.

This trend has already set in. Over the past 10 years, the call for outside financing has obliged the five largest U.S. oil companies to step up the long-term debt component in their total capitalization. Their long-term debt has risen sharply—from about 9 percent of the total in 1958, to over 17 percent last year. There comes a point beyond which even the strongest company cannot continue to depend on borrowing to finance its expansion plans.

In the second place, the needs of the energy sector as a whole are bound to mount rapidly. The expected demand for energy in 1980 represents some 45 million barrels a day of crude oil equivalent. Some 42 percent of it will come from oil—including a small contribution from synthetic fuels, such as shale oil. Over 25 percent will come from gas.

In order to meet this demand for oil, we estimate that gross additions to proved reserves required during the 1970's will total 55 billion barrels—57 percent more than during the 1960's. Continuation of additions at the rate of the 1960's would leave the country 20 billion barrels short of oil by 1980.

For the sake of illustration, let us assume that capital expenditures will increase by the same 57 percent as the necessary additions to petroleum liquid reserves. This yardstick indicates that the industry may require at least $70 billion for domestic exploration and development expenditures alone over the 10-year period 1970 to 1980—an annual average of $7 billion per year in comparison with $4.5 billion annually during the past decade.

Now I should like you to ponder over whether the petroleum industry will be able to attract this stepped-up inflow of capital during the 1970's.

As I have just demonstrated, there are certainly not enough reserves, already known and proved in the ground, to get the industry through the 1970's. Similarly, there is no excess cash within the industry.

What is the petroleum industry's profit outlook for the future? An adequate answer to this question requires, as one most important condition, a clearer view than we now possess of the tax prospect. I shall not try to go into the detail of the tax bill prepared in the House of Representatives. But I must frankly confess that I am struck by the negative emphasis in some of the proposals now being considered by this committee.

Petroleum industry profits emerge as a main target of these various tax proposals. If the Congress adopts part or all of this package. an investor must expect to earn less from his petroleum ventures.

To sum up, a reduction in established tax incentives could reduce petroleum industry profitability to something well below that of other industries, thereby endangering the future capital supply. This could have serious—and insufficiently understood—long-term consequences for our balance of payments, our economic stability, and the welfare of the Nation as a whole.

Thank you, Mr. Chairman.

Senator HANSEN. Mr. Chairman. Mr. Spencer, you speak of the shortage of capital in the U.S. economy to day. You take note of the fact that interest rates are now 8 percent, and that is low as far as I can find out. You call attention to the short-term borrowings that will be doubled by 1974. You also point out that the five largest international oil companies' long-term debt component was around $2 billion in 1959 and that today it is around $5 billion. I would like to ask if you feel that the oil industry will be able to raise the capital necessary to provide the 6 million barrels of oil per day that will be required by 1980, in order to satisfy the needs of our economy, if these proposals made by H.R. 13270 and the Treasury proposals were to be enacted?

Mr. SPENCER. Senator, I think that the industry will have a very difficult time providing the total energy needs of a burgeoning economy with present incentives. We heard Mr. Collado talk about the capital requirements to develop and exploit what appears to be a major reserve on the North Slope. I think under any circumstances, with the industry earning at less than the national average, there will be great problems.

Certainly, if the ability of the industry to earn profits is materially affected, it will in a compounding way increase the difficulty.

Senator HANSEN. Thank you.

Senator FANNIN. Mr. Chairman.

Mr. Spencer, you emphasize the heavy overseas expenditures by the oil companies. Then you also talked about the balance of payments, that a favorable balance of payments would result. Could you just review that?

In other words, you are making heavy expenditures but still the balance of payments is favorable according to your testimony?

Mr. SPENCER. Over the past years, being an aggressive industry, the oil companies were early in the business of looking for reserves overseas. As in all phases of the industry, this does require substantial amounts of money.

However, in recent years, when our international balance of payments has become critical, the oil industry, by virtue of repatriations of capital over and above expenditures, have on a net basis contributed $1 billion annually to a plus balance of payments.

Senator FANNIN. Thank you very much.

Senator ANDERSON. You paint a pretty gloomy picture. Some people made some bids in Alaska not long ago. What was the size of those bids—$900 million?

Mr. SPENCER. It was in the neighborhood of $1 billion; yes, sir.

Senator ANDERSON. Wasn't that pretty large? Were they all fools?

Mr. SPENCER. We think not.

Senator ANDERSON. Why do you——

Mr. SPENCER. Could I suggest they have some confidence in the lawmakers of the country who have enabled them to produce energy. They have defined a major new source of energy and they have some hope that the ground rules will not be changed so they will be shot down in midair.

The CHAIRMAN. Might I just ask about the other side of that question. As far as just drilling the ordinary wildcat well is concerned, it is my understanding that people do not just pay bonuses for ordinary wildcat prospects any more.

Mr. SPENCER. That is right.

Senator ANDERSON. They want you to pay them something to drill and see if there is oil down there.

Mr. SPENCER. That is right.

Senator ANDERSON. As a practical matter it used to be that somebody would pay you $10, $20, $30 an acre as a bonus to drill a well. Nowadays my impression is for the ordinary upland prospect, there is no bonus. If they want to drill it people just practically volunteer the land. Bonuses are not paid any more.

Mr. SPENCER. I believe that is correct.

Senator ANDERSON. Of course what you are talking about in Alaska is where somebody went and found some fantastic field up there and somebody next door to it will pay for that. They paid $900 million. They can't be complete fools about it.

The CHAIRMAN. How deep is the oil sand in that Prudhoe Bay field?

Mr. COLLADO. I am not sure that I can really get into this.

The CHAIRMAN. Just an offhand guess.

Mr. COLLADO. How deep?

The CHAIRMAN. How thick is the oil sand in Prudhoe Bay?

Mr. COLLADO. How thick?

The CHAIRMAN. Yes; how thick is the producing sand?

Mr. COLLADO. The producing sand runs several hundred feet.

The CHAIRMAN. All right. If you find 5 feet of oil sand down my way you think you are lucky.

Mr. COLLADO. Could I add one thing, Senator, although I was not asked the question. I do not think that if we had had the circumstances that Mr. Dunlop referred to in answering a question from Senator Hansen, that is if one-third price decline took place, whether from a change in the import policy or a comparable complete elimination of tax benefits, there would not have been any bids in Alaska, because a company could not possibly afford to go to Alaska on that basis.

I did want to add one thing to my previous answer to Senator Miller concerning reserves in Alaska. The 31 billion barrel eventual reserve by 1985 is entirely contingent on opening up both the naval reserve and the wildlife refuge which present other problems. Without those areas the central part of the north slope we could not possibly arrive at any such large reserve figures.

The CHAIRMAN. Proceed.

Senator MILLER. May I ask a question?

Can you give us two figures. No. 1, an estimate, for example, for 1968 of the total amount of percentage depletion allowance of the petroleum industry or such segment thereof as you might be familiar with. And the second figure would be the total amount of 1968 exploration, drilling, development, and other activity.

Mr. SPENCER. I do not have those figures here, but I think I can get some pretty close numbers which I will be glad to supply later.

Senator MILLER. Am I correct, maybe you can answer at this time, am I correct in my feeling that the amount of expenditure on exploration, research, and developing drilling by the industry is substantially in excess of the amount of the percentage depletion allowance?

Mr. SPENCER. That is correct, sir.

Mr. DUNLOP. Senator Miller, I think maybe we can contribute some numbers. The statutory depletion provisions is somewhere between $2½ and $3 billion, and the effort expended by the industry resulted in an expenditure of some $4.5 billion, in the magnitude of those figures, but as Mr. Spencer says, we will be glad to supply precise figures to the extent they are available.

Senator MILLER. Thank you.

(The information to be furnished for inclusion in the record at this point follows:)

SUN OIL CO.,
Philadelphia, Pa., October 2, 1969.

Hon. JACK MILLER,
U.S. Senate,
Washington, D.C.

DEAR SENATOR MILLER: At the hearing before the Senate Finance Committee on October 1, I was asked how much the Petroleum Industry had deducted in depletion and how much it had spent on exploration and development. I agreed to furnish the Committee that information.

The Industry's estimated depletion deduction was 2.4 billion in 1966 and 2.6 billion in 1967. The Industry spent 4.9 billion in exploration and development in 1966, and 5.3 billion in 1967. Thus, these expenditures have been almost twice as much as its depletion deductions. These are the most recent figures available.

I appreciate the opportunity to appear before your distinguished Committee to express my views. If I can be of further assistance to you in your important deliberations on tax reform legislation, please do not hesitate to so advise me.

Sincerely yours,

ROBERT G. DUNLOP, *President.*

The CHAIRMAN. Proceed.

Mr. MYERS. I am George V. Myers, a director and executive vice president of the Standard Oil Co. of Indiana.

I will discuss the risks inherent in exploring for petroleum. Then I will comment briefly on the provisions of H.R. 13270, and other proposals affecting oil and gas producers.

Unique risks accompany the search for oil and gas. Despite technological progress there is but one sure way to know whether there is oil and gas in a particular place in the ground and that is to drill a hole. Only about 11 percent—one out of nine—of the wildcat wells drilled during the period 1953 to 1967 were producers. In 1968 the rate dropped to 8.5 percent—one out of 12.

However, many of the wells that find oil or gas do not find enough to be profitable. The million barrel finds are where success begins. Here the average is about 2 percent—one well out of 50.

Furthermore, past averages may well mean little in the coming years. Costs increase as we drill deeper and explore in the more remote areas.

The CHAIRMAN. May I just interrupt you. I regret that one of my colleagues is not here. He disputed that figure when I said only one wildcat well out of 43 was a good well. Now, you are saying it is actually less than that. It is about one in 50 that is considered a good find.

Mr. MYERS. That is right, Mr. Chairman, and as I further said, there is some doubt about some of those one in 50 being profitable. Well, you know if you find a field offshore in Louisiana that has a million barrels of oil, you cannot afford to build a $2 million platform to produce it.

Senator ANDERSON. Why do they do it then?

The CHAIRMAN. They don't.

Senator ANDERSON. They do, of course they do.

Mr. MYERS. They walk away.

The CHAIRMAN. The point is that if you have to build a $2 million platform to store the oil and produce it, even though there is $1 million worth of oil down there, the smart thing to do is put cement in that hole and walk off and leave it.

Mr. MYERS. All I am really saying is that many of the wells that are in the million barrel category are now becoming in the same uneconomic posture as some of the little finds that are in the one out of nine.

Confronted with the task that lies ahead, the industry needs more incentives. Now, is hardly the time to cut our depletion rate, to eliminate production payments, and to increase the individual producer's taxes by requiring him to allocate his deductions.

These proposals, in conjunction with the extension of the surtax, the repeal of the 7-percent investment credit, and the capital gains tax changes would siphon a tremendous amount of cash out of an industry already pressed by the need for more capital.

The curtailment of existing tax incentives would restrict future exploration and development expenditures. Our best estimates indicate that reducing the depletion rate from 27½ to 20 percent would reduce exploration expenditures by at least a fifth. Such a reduction would make our Nation become unduly dependent on foreign petroleum with all of the attendant risks and dangers pointed out by Mr. Dunlop. We have been accused of scare tactics when we counsel caution. But bear in mind, petroleum is our business, and we would not be meeting our responsibility if we failed to inform the Nation of the hazards that we foresee.

Under Secretary Walker has observed that the proposed changes affecting tax-exempt securities have made investors in that market "skittish." He thought the psychological impact on the market was out of all proportion to the proposed change. Investors in State and local bonds were afraid "of the rug being pulled out from under them later." We believe the reduction in depletion would engender the same fear among oil and gas producers. They, too, would be apprehensive about further reductions.

As a consequence, expenditures for exploration and development could very well decrease considerably more than the one-fifth I have mentioned.

The percentage depletion deduction was designed to recover the capital value of oil in the ground. At today's price of crude, the deduction provided by the full 27½ percent falls short of the value of reserves as measured by the sales price of proven properties.

Billions of dollars have been invested in the oil business, in reliance on present tax incentives. For example, the industry has paid $3 billion to the Federal and State Governments for mineral leases in the waters of the Gulf of Mexico. It has spent in addition more than twice that amount in exploration and development of that offshore area during the past 23 years.

Senator Fulbright called the increase in the income tax burden of investors in outstanding tax exempt securities a "breach of faith." I feel that reducing the depletion rate on existing oil and gas properties is a similar "breach of faith."

Let me say a few words about some of the other provisions of H.R. 13270.

The CHAIRMAN. Senator Anderson has a question.

Senator ANDERSON. You say it is a breach of faith. Senator Williams has been pushing this reduction for years and years and years. If the Congress decided to accept it why would it be a breach of faith? I cannot understand your term.

Mr. MYERS. I will define the term, sir. The bulk of the billions of dollars that have been invested in the oil business over the past years have been made in the expectation that the then existing tax incentives would continue.

Senator WILLIAMS. When was your company organized?

Mr. MYERS. It was more than 75 years.

Senator WILLIAMS. Seventy-five years ago. When was the depletion allowance started first?

Mr. MYERS. My recollection is that the first special provision for depletion was probably 1918. It was retroactive to 1913, when the income tax was first imposed.

Senator WILLIAMS. Was that a breach of faith when the Congress gave it to you?

Mr. MYERS. By no means, sir.

Senator WILLIAMS. By the same token Congress can take away that which is given to you if they see fit, can they not?

Mr. MYERS. That is right.

Senator WILLIAMS. I fail to see that there would be any breach of faith on the fact that we consider changing the tax structure any more than there would be if we change the corporate rate or any other tax. I realize you have got a great industry and I respect you and I respect your right to come in and argue for it. But like the Senator from New Mexico I do not think it is any breach of faith. I do not think you have any inherent right or constitutional right for this tax break forever. There is nothing sacred in the 27½ percent. It could be increased or lowered as Congress sees fit.

The CHAIRMAN. If I understand it, Mr. Myers, you made an analogy. You mentioned that Senator Fulbright said that when people bought tax exempt State and local bonds, they were relying upon the fact that those bonds were not going to be taxed by the Federal Government, and that it would be a breach of faith to tax them when they were sold on the basis that they were not going to be taxed. That is what Senator Fulbright said and you drew an analogy.

You said you had a $27\frac{1}{2}$-percent depletion allowance to encourage you to go out and provide this Nation with its fuel requirements, and having invested billions of dollars relying upon that law, it would be a breach of faith after you put your money into it then to change the law on you and deny you the incentive that you had when you went out to find the oil.

Now, are you aware of the fact that in this same bill we are proposing to take away the investment tax credit and we are proposing to let every company have 10 years to get that equipment delivered if they had signed the contract for the equipment?

Mr. MYERS. I am aware of that, Mr. Chairman.

The CHAIRMAN. Doesn't that indicate that we sort of believe in keeping the faith when we gave somebody an investment tax credit—that we are not going to take it away, irrespective of an existing contract?

Mr. MYERS. Which is certainly equitable.

The CHAIRMAN. All I am saying is that I think your analogy is correct. You were given this incentive to go out and do something. You did what you were encouraged to do and having spent many billions of dollars somebody wants to change the law on you before you get your money back. It would seem to me that the analogy is correct.

Mr. MYERS. Senator Williams, I would just like to add one comment, and I think that this is merely emphasizing something that Mr. Collado said a few moments ago concerning the importance of new discoveries in Alaska. I am sure that those of us that went up there and spent many millions of dollars on leases, and probably his company, when it went up there and drilled a discovery well, would not have spent those millions of dollars had not we felt that the present tax incentives would be continued.

Now, we may have been completely foolish, but having adopted this attitude, I think that there is some justification in my use of the term "breach of faith."

Senator WILLIAMS. The point is that just as we change the investment tax credit we can change the depletion allowance. At the time you were getting the investment tax credit, we were proposing to repeal it. At the time the leases were purchased the House had already taken action to reduce the depletion allowance. So you knew that it was at least being seriously considered, and as you admitted when your company was first organized there was no depletion allowance.

Now, I just do not think there is anything sacred about the $27\frac{1}{2}$ percent depletion allowance. When the first depletion allowance was started it was around 14 percent. Later $27\frac{1}{2}$ percent depletion allowance was considered as a necessary contributing factor to orderly exploration. Times change.

Now the question in the minds of some of us is whether the petroleum industry is paying its fair share of the cost of operating our $100 to $200 billion Government. It is a debatable point. There are two sides to the question. I appreciate the arguments that can be made against it, but I do not like to think we should have to accept the approach that there is a locked-in advantage for the industry. Nor do I think that it would be a breach of faith if some of us are successful in our arguments that it should be somewhat modified. I think that we can argue it on its merits.

The CHAIRMAN. It would not be any breach of faith for Senator Williams to do it. He has been voting against depletion allowance since the day he came here.

Mr. MYERS. Thank you, Senator, for giving me the opportunity to elaborate a little on why I feel as I do about this. I certainly respect your viewpoint.

Shall I go ahead?

Senator ANDERSON. I raised the question because I think I have been a pretty consistent voter on the depletion allowance. But I do not think you should accuse the Congress of a breach of faith when it is just doing what it has the right to do. We hear in newspaper stories about a breach of faith. And you are right here stating it. I do not think it is so at all. We vote with the finest of motives. It may be wrong but it is honestly not a breach of faith at all.

The CHAIRMAN. It would be a breach of faith if I did because I ran for office saying I wasn't going to vote that way, so it just depends I think on the conscience of each Senator. That is just about the size of it.

Mr. MYERS. Senator Anderson, just one more comment on this subject. I believe there is a differentiation between investments that were made in the past in reliance on incentives and investments that are made in the future. If we want to go ahead and make these risky investments in the future after Congress has acted to take some incentives away from us, I think then we perhaps are being foolish. I think there is a strong distinction here between past investments and what we do in the future.

Senator ANDERSON. I think that is so also. I merely do not like your term "breach of failth" when you vote your own convictions. I know Senator Byrd had some questions about voting at one time——

Mr. MYERS. Sir, if you find the words very offensive I apologize for having used them, but I feel compelled to express my own conviction.

The CHAIRMAN. I think the record is amply clear on this point. You might get on with the rest of it now.

Mr. MYERS. All right, sir.

Let me say a few words about some of the other provisions of H.R. 13270. The treatment of production payments as loans puts another squeeze on the industry's capital, particularly on the independent. It will cause a 15- to 20-percent reduction in the value of producing properties, thereby restricting their use in obtaining the financing necessary to continue the search for new petroleum reserves.

Another drain, through the back door this time, on an individual operator's capital is the provision that would require him to allocate his itemized deductions solely because he claims legitimate business deductions for depletion and intangibles.

The only bright spot we find in the natural resource provisions of H.R. 13270 is the treatment of shale oil. The bill not only keeps the 15-percent rate for shale oil, but also clarifies existing law by correctly classifying the retorting of shale oil as a mining process. I urge the committee to accept the House bill provisions relating to shale oil.

Before discussing the Treasury proposals, let me say that the technical memorandum of the Treasury position became available only yesterday. Consequently our analysis has been based on the Treasury's testimony. We may want to submit detailed comments on the technical memorandum after we have had an opportunity to analyze it thoroughly.

There are two Treasury proposals that ought to be rejected. One would add percentage depletion and intangibles to the limit on tax preference. The other would tax the gains on sales of mineral properties as ordinary income to the extent of intangible drilling costs previously deducted in some cases.

The idea of limiting the deduction for tax preferences at first seems to have some appeal, but after closer consideration, we have concluded the basic concept of LTP is unsound. It hurts most those individuals who respond best to the tax incentives.

Last January there was a lot of publicity about the 154 wealthy individuals who paid no income taxes. Three months later the Treasury Department disclosed that the deduction for percentage depletion amounted to less than 1 percent of the deductions which resulted in their paying no tax.

The proposal to tax gains on sales of properties as ordinary income tax in certain instances could be even more damaging to property values than is the proposal to treat production payments as loans. The combination of eliminating production payments and also imposing ordinary tax rates on gains from property sales would apply an overkill technique which could create almost impossible obstacles to sales of mineral properties.

In summary, the oil business is extremely risky. Tax incentives designed to attract taxpayers to assume those risks have worked well. Proposals to reduce those incentives, if enacted, will encourage present and future investment. This would be most unfortunate. An error in judgment at this time would take years to correct, if indeed it could be corrected at all. We are living in an era of technological progress in a nation thoroughly committed to it. Yet the continuing prosperity that technology promises will be no stronger than our future supplies of oil.

Thank you, Mr. Chairman.

The CHAIRMAN. Mr. Collado?

Mr. COLLADO. Thank you.

I am Emilio G. Collado, a director and executive vice president of the Standard Oil Co. of New Jersey. We strongly urge that sections 431, 432, and 501(a) of the House bill, applying to the foreign activities of U.S. petroleum companies, be rejected.

First, we believe the provisions would harm our country's national security interest in providing ready access to growing foreign sources of oil. If existing domestic tax incentives and import policy are continued we expect that annual additions to oil reserves in the United States will be greater in the future than in the recent past. Notwithstanding this prospect, our country in years ahead will have to rely increasingly on foreign source oil, Canadian and overseas, to meet our growing economic and military needs. The best way to provide for availability of sufficient foreign source oil is to encourage U.S. companies to continue to search for and develop these resources in diverse foreign areas.

The foreign investments of U.S. petroleum companies are also an important source of strength to our balance of payments. Experts outside the oil industry have estimated that a dollar invested in the petroleum industry abroad is fully returned in the balance of payments in 3 to 5 years, and results in substantial additional contributions to U.S. receipts for many years thereafter. Last year these investments contributed income plus royalties and fees from abroad amounting to about $2.5 billion. Moreover, these investments have enhanced our economic welfare and promoted substantial economic progress in the developing countries.

The ability of U.S. companies——

The CHAIRMAN. Could I ask a question at that point? Is that $2.5 billion over and above what you are investing overseas?

Mr. COLLADO. No; the $ 2.5 billion is the income from the investments plus royalties and fees.

The CHAIRMAN. How much did you take over there during the same year?

Mr. COLLADO. Oh, probably $1 billion-plus. The net for the industry, income less capital flow, was about $1 billion.

The CHAIRMAN. So your industry brought home to this country about $1 billion more than it took out?

Mr. COLLADO. That is right. The oil industry has about 30 percent of U.S. foreign direct investment, and we bring home about 44 or 45 percent of all the income from the foreign direct investments of the United States.

The ability of U.S. companies to compete successfully against foreign oil companies would be seriously impaired by the provisions that we urge be rejected. Many foreign oil companies receive substantial incentives, and in some cases, cash subsidies for oil exploration, as noted in the attachments submitted with my written statement. An increasing number of Government-owned or controlled companies are also competing aggressively on the basis of various special advantages.

It would be unfortunate if our Government took actions which would tip the scales in favor of our foreign competitors. By burdening U.S. companies with higher tax costs in all phases of the industry, sections 431, 432, and 501(a) would sharply restrict the contribution which American oil companies could make to our national security and to these other important U.S. goals. Significantly the greatest impact is likely to be felt in the process of bidding for concession rights in new producing areas.

Finally, enactment of these provisions would violate accepted principles of tax equity and of preventing international double taxation. Section 501(a) would eliminate percentage depletion on foreign oil and gas production alone, thereby discriminating against foreign petroleum operations. Assistant Secretary of the Treasury Cohen pointed out that enactment of section 501(a) would do nothing more than penalize U.S. companies, since foreign countries would be encouraged to increase their taxes on the petroleum industry in order to absorb any additional tax revenue that would otherwise go to the United States. We are glad to see that the Treasury has recommended rejection of this provision.

For companies which have elected the per country basis for applying the foreign tax credit, section 431 would not always allow full credit for foreign income taxes paid up to the amount of U.S. taxes otherwise due on such income. In so doing, this provision would introduce new discrimination against foreign source income, and in some circumstances would result in double taxation of foreign income.

In attempts to justify section 431, it has been argued that present law provides a double tax benefit. The first occurs when companies incurring foreign losses are able to reduce their U.S. taxable income in that year by the amount of these losses. The reasonableness and appropriateness of the ability under present law to combine profits and losses in the United States and abroad is accepted. The second so-called benefit, which is the one questioned, is said to occur when operations turn profitable in the country in which the losses occurred, and the taxpayer is then allowed credit for the foreign taxes he actually paid on such income. Far from being a double tax benefit, the credit for foreign income taxes paid is essential to avoid the inequitable situation in which the taxpayer's foreign income would be taxed twice. I believe the examples in the statement which I have submitted to this committee amply demonstrate the inequities and discrimination against foreign income which section 431 would create.

The Treasury's detailed recommendations released yesterday would mitigate some of these problems, but in some cases would aggravate them. In any event, the provisions would in effect partially deny existing deductions for intangible drilling costs, and thus would further impede U.S. companies in their efforts to participate fully in the growth of the oil industry abroad.

Section 432 would deny to the mineral industry alone the effective use of the overall basis for applying the foreign tax credit. It has been suggested that this provision is warranted because income taxes paid by American oil companies in some foreign producing companies may contain hidden royalties. However, royalties on petroleum production abroad are generally as high as and in some cases considerably higher than royalties paid on production in the United States. After further examination of the hidden royalty question, the Treasury has recommended that section 432 be rejected because it would unfairly discriminate against the mineral industry. In its stead the Treasury has proposed, along with the reinstatement of foreign depletion, that excess foreign tax credits arising from U.S. percentage depletion not be available to be applied against other income. This substitute proposal should be studied further.

The integrated nature of the international oil industry makes it particularly appropriate for U.S. companies to use the overall basis for applying the foreign tax credit, thereby averaging together the high and the low rates of tax paid on operations in all foreign areas. U.S. companies could not economically justify the large investments they make in foreign oil producing capacity without making substantial further investments in refineries, pipelines, tankers and other distribution facilities required to serve the foreign markets for this production. To attempt to separate production activities ignores such economic integration, and contradicts the intent of Congress in introducing the overall foreign tax credit limitation. Moreover, by seeking out individual parts of a taxpayer's income in low-tax countries, and increasing the tax to the U.S. level, section 432 would discriminate against foreign source income and would effectively introduce double taxation on the integrated petroleum industry operations abroad.

I would like to add that we believe that the Treasury's recent recommendation concerning the Continental Shelf, while a step in the right direction, can be improved, and we will submit suggestions on this subject.

(Pursuant to the above discussion the witness supplied the following memorandum:)

CLARIFICATION OF THE U.S. INCOME TAX STATUS OF THE CONTINENTAL SHELF

In testimony before the Senate Finance Committee and in its technical submission of September 30, 1969, Treasury recommended that U.S. income tax status of the Continental Shelf areas of the world be clarified by amending the definition of "United States" in the Code to include the Continental Shelf of the United States with respect to the exploration for naural resources and defining the term "foreign country" as used in the Code to include the Continental Shelf which pertains to the foreign country concerned. While we recognize the need for clarification of the law in this area, we think that the proposal set forth is consistent with the position taken by taxpayers and the Internal Revenue Service in past administration of the U.S. income tax law. Accordingly, we think that any legislation enacted on this subject should make it clear that it is declaratory of existing law and should not provide a basis for permitting either taxpayers or the Internal Revenue Service to take a different position with respect to taxable years prior to the enactment of the provisions.

In connection with the proposed definition of the term "foreign country" we think that it is important to define the term so that it includes any part of the Continental Shelf adjacent to a foreign country with respect to which that foreign country exercises jurisdiction to grant licenses or permits to conduct operations. We think it is important that the definition of the term "foreign country" not be limited to just that portion of the Continental Shelf with respect to which the country exercises tax jurisdiction. Because of its license granting authority a foreign country may attach conditions to the license number which cause the licensee to be subject to the payment of income taxes to the foreign country even though that foreign country may not exercise income tax jurisdiction per se with respect to the portion of the Continental Shelf for which the license is granted and from which the licensee derives income from the production of natural resources. Unless a definition such as we propose is used, a taxpayer carrying on operations on the Continental Shelf of a foreign country which exercises jurisdiction with respect to that Continental Shelf might be subjected to international double taxation if the U.S. income tax definition of the term "foreign country" were not broad enough to include the area in which the taxpayer carried on operations.

It is believed that the foregoing modification of the Treasury Department recommendation is consistent with the position of the National Petroleum Council with respect to the policy which the U.S. should follow regarding the area of the Continental Shelf over which the United States should exercise jurisdiction.

Mr. COLLADO. While I have concentrated on the role of U.S. companies in the industry abroad, those appearing with me have emphasized the need to maintain current tax incentives to the domestic industry, if our country's essential security needs are to continue to be met largely from U.S. sources.

I will skip my summing up for the panel and simply conclude, Mr. Chairman, if I may by saying that each of us has raised questions about the economic impact and the equity of the proposed changes in the tax laws. However, we urge above all that the various proposals be assessed in the light of our country's national security interests.

Thank you.

The CHAIRMAN. Mr. Collado, would you mind telling me in general terms with regard to your overseas operations what is your volume of sales in terms of dollars, how much taxes did you pay on it, how much did you bring home in dividends, and how much taxes are paid on that?

Mr. COLLADO. I have the figures in mind for our overall operation. I can try and submit the foreign domestic. I can give you that in more detail later.

I am speaking now for Standard Oil Co. (New Jersey). There are industry figures, but I can speak more freely about my own figures, since I know them better. We are not completely typical but no company is completely typical.

Our total sales worldwide are about $16 billion. This is to outsiders, third parties.

The CHAIRMAN. Outside this country you mean?

Mr. COLLADO. No, this is the whole world.

The CHAIRMAN. Outside the company?

Mr. COLLADO. Outside the company.

The CHAIRMAN. Yes.

Mr. COLLADO. We have a lot of intercompany transactions. I am talking primarily about the consolidated affiliates, the companies in which we have more than a 50-percent interest. There are some others but we would get into too many technicalities to describe them, so I will not bore you with it. I would say that of those sales something in excess of half are outside the United States.

Our total costs from purchases of supplies, oil from others, salaries for our employees, and payments to outside contractors for various services and other work which we contract out, is something on the order of $9 billion. We booked in taxes in the United States and abroad in 1968 production taxes, import duties, State taxes, local taxes, severance taxes, Federal taxes, and foreign income taxes and royalties just under $6 billion.

The CHAIRMAN. Are you including excise taxes?

Mr. COLLADO. I am including everything, $5 billion plus, which makes it a fairly substantial part of the total.

The CHAIRMAN. Six or five?

Mr. COLLADO. It was about 5.6 last year. This figure goes up at the rate of $400 to $500 million a year, because our tax payments unfortunately go up at a much faster rate than our net income. The result of this, after taking depreciation and other normal offsets—our depreciation runs to perhaps half of our capital expenditures, which now are on the order of about $2 billion a year at home and abroad—is that our income last year after all taxes was $1.277 billion.

In arriving at that number, our liabilities to foreign governments in income taxes were just under $800 million, which was slightly in excess of 50 percent of our income abroad before income tax. We booked on our accounts for the U.S. taxes on the order of $200 million plus, which was about 30 percent of our strictly domestic income.

Our average income tax booking was about 45 percent. Total worldwide earnings before income tax were split about two-thirds foreign and one-third at home, and the net came down as I say.

After booking those taxes we had $1.277 billion. We brought home from abroad something in excess of $800 million. We made profits at home. We did quite a little reinvestment. We paid dividends of about $800 million to largely American shareholders, although there is a certain small proportion of foreign shareholders among them. We estimate our foreign shareholders are less than 5 percent, although we do not have exact figures, because much foreign-owned stock is held in the names of banking firms. We had almost $500 million of retained earnings that went to make up that half of our capital expenditures that we did not finance out of depreciation funds, and we borrowed about half a billion dollars, a quarter of a billion dollars in a debenture issue last year in the United States and something of the same order in various foreign countries.

We are one of those companies that Mr. Spencer said had to borrow very heavily to keep going. It was easier when the rates of interest were lower.

Of the $800 million that went to the shareholders, I suppose according to Treasury estimates close to half of it, at least 40 percent of it, was recouped by the Federal Treasury in income tax payments. Thus we did $16 billion worth of business in order to give the shareholders something less than a half billion dollars' worth of net income.

The CHAIRMAN. How much did you say you paid in taxes, all taxes on sales?

Mr. COLLADO. $5.6 billion I think the figure is.

The CHAIRMAN. All right, so——

Mr. COLLADO. Income taxes were a bit over $1 billion.

The CHAIRMAN. If you had to borrow $500 million, that means to stay competitive and to stay modern you were not able to plow back in enough money and still pay a fair dividend to your stockholders to expand?

Mr. COLLADO. That is right.

The CHAIRMAN. And by the time you got through you were able to pay out $800 million in dividends. After all taxes paid, the people who own the company, the shareholders, succeeded in earning $800 million after taxes on $16 billion in sales, is that about the size of it?

Mr. COLLADO. That is about right; yes.

The CHAIRMAN. So you might say out of every $40 you managed, of sales, you managed to get $2 to your shareholders after taxes?

Mr. COLLADO. That is about right.

The CHAIRMAN. And for every dollar that you managed to pay from after tax profits to your shareholders, the Government is collecting about $14 in taxes, $5.6 billion in taxes you just said?

Mr. COLLADO. Some Government is; yes.

The CHAIRMAN. Some Government?

Mr. COLLADO. Some Government somewhere in the world, including state governments, foreign governments.

The CHAIRMAN. If they are getting $14 out of you for every dollar that you are managing to pay out in dividends, they are doing pretty well, aren't they?

Mr. COLLADO. Senator, sometimes I think we are one of the greatest tax collecting organizations in the world.

The CHAIRMAN. Thank you.

Senator CURTIS. Mr. Chairman.

I would like to ask the panel a question. I have a special responsibility toward the State of Nebraska. Prior to World War II, we did not have any oil. A little bit of oil was found in southeast Nebraska, but after 2 or 3 years no mention was made of it. In the Panhandle of Nebraska we have some activity going on now in two, three or four counties.

As I read the papers, I find once in a while the name of a large company that I recognize. Oftentimes the concerns drilling the wells are not nationally known concerns.

These producing wells are very hard to find. We have not found any yet of any rich deposit. We have not found any as yet that appeared to have a long sustaining production. As a matter of fact, even though it is a very infant industry in my State, most of it is over the peak.

On the other hand, it means a great deal to us. My question is this, If the House-passed bill is enacted into law, what will be the effect upon an oil industry in a State such as mine, the State of Nebraska?

Mr. DUNLOP. Senator, we were one of the companies that several years ago had a rather extensive activity in the State of Nebraska, with not too distinguished success. We drilled a number of these shallow wells, and developed a certain amount of reserve capacity and production.

We did it under the economic and tax climate that existed at that point in time, but because the results were generally uneconomic. Even under the existing situation, we have not felt that with the shortage of funds that are available, that we were justified in pursuing that line of exploratory effort any further.

Senator CURTIS. But some people are going on. I am not asking you why your company chose a particular course.

My question is if the House bill becomes law, what in your opinion is the prospect of this industry? Now I think we are producing more oil than we consume in the State of Nebraska. I know that it has added materially to the tax base in areas affected. What will be the effect of the House bill on oil production in any State similar to the one I describe in Nebraska?

Mr. DUNLOP. I was just trying to indicate, sir, that the results having been unsatisfactory under existing circumstances, I would seriously question that the industry as a whole would be disposed to mount a substantial exploratory effort in those areas where the promise of success was not substantial, and I suspect that under the present known geological information that is available in Nebraska, that unfortunately that would quite possibly be the circumstance.

Senator CURTIS. Do you have any idea what it costs to bring in a well there?

Mr. DUNLOP. Yes. In the shallow production in Nebraska we were drilling in the neighborhood of 3,000 to 4,000 feet, talking in the neighborhood of maybe $35,000 to $40,000, in that general area.

Senator CURTIS. Now, I would like to ask the panel another question. Is it true that the United States is on the verge of facing a shortage of natural gas? If so, was it caused in any considerable degree by any act taken by the U.S. Government? I do not care who answers.

Mr. DUNLOP. I had spoken to that point a few moments ago, and all I would reiterate is that last year, for example, our discoveries of gas were considerably less than the amount that was consumed by the American people, and it is our opinion that discovery was less than it otherwise might have been, had there been an adequate price incentive made available to the industry. You are familiar, Senator, that the wellhead price of gas is under the control of the Federal Power Commission, and those wellhead prices in our opinion, as determined by the

Commission, are woefully inadequate to stimulate the degree of exploration and development that should occur, if we are going to develop the necessary gas reserve position.

Senator CURTIS. Is it your honest opinion then that if the homes, businesses, and other places that are set up to burn gas for heat some day in the not too distant future find that there is not enough gas, that part of the responsibility goes back to an erroneous national decision made with respect to controlling the price of gas at the wellhead. Is that your opinion?

Mr. DUNLOP. That is correct. I would just like to indicate a little further data on that. If you go back 10 years, we had a reserve position in terms of years' supply of natural gas of somewhere around 20 years. Now that does not mean that gas could all be produced efficiently and economically within a 20-year period. But taking that as an index of available supply, as a result of the developments in the last few years we are now down to a 15-year reserve index of gas supply, and if the conditions continue as they were in 1968, that reserve index would suffer further decrease, Senator Curtis.

The CHAIRMAN. Thank you very much, gentlemen.

Senator MILLER. I have a question. On the basis of your interesting testimony regarding your own company's profit operations, am I correct in stating that there is no necessary relation between gross sales and net profit of a company, of a petroleum company?

In other words, for example, take company A that has $1 million in gross sales, company B has $2 million in gross sales. Is it not possible that the first company with only $1 million in gross sales may end up with more net profit than the second company with $2 million in gross sales?

Mr. COLLADO. That is of course correct, Senator. I think that you will find that the ranges around an average would not be perhaps as great as your example might suggest, but obviously a company that happens to have a very prolific source of oil will probably have a greater return on its investment, and a greater percentage of earnings to gross sales than a company that has relatively high cost oil reserves or may even have to buy from other producers a good deal of the oil that it refines and markets. These things happen in a big industry, and you will have a big range.

I think that we are interested in two things here. What is the range. Obviously each of us tries to have our company in terms of returns the most successful and the most profitable and we work very hard at it. I would like to think that we do better than other people.

Second, though it is a question of trends. What I was talking about in terms of the tax bill, and I am now talking about the worldwide tax bill, or the tax take of governments wherever they may be located, the trend for total taxes to increase has moved much more rapidly in the case of our company than have either gross sales or net earnings after taxes, and I think this has been the general experience of the oil industry.

Senator MILLER. For example, what I am getting at, let us take a company with $2 million in gross sales and it has a lot of intangible drilling and development costs because it does a lot of exploration and development. It may end up with very little net profit after taking off the intangible drilling and development costs. Another company with $1 million in gross sales may have no program for exploration and development and so it may end up with a higher net profit than the corporation with the larger gross sales, is that not so, Mr. Collado?

Mr. COLLADO. That is quite possible, Senator. The extreme case of course can be a company that has no producing at all. There are some such companies. They will probably have a pretty modest return in the United States, but they may have a net profit year after year on marketing and refining. Those who are more venturesome and go looking for oil over a period of years may have a considerable profit. They may not have a profit as recorded for tax calculations in those years when they are carrying on a particularly vigorous exploration effort.

You will notice if you read the history of companies over 10, 15, 20 years that these things for individual companies go in some cycles.

Senator MILLER. Now another question.

The CHAIRMAN. Gentlemen, if I may, Senator, I am going to ask that the panel of witnesses, which of course is presenting very important evidence, make themselves available in our conference room here. That is where our committee meets. Senator Miller, Senator Hansen, and others can ask questions there.

Senator MILLER. I only have one more question.

The CHAIRMAN. Senator Hansen wants to interrogate the witnesses too. I want to get on with other witnesses.

Senator MILLER. May I ask one more question, please, and then I am through. I do not have quite the same problem that Senator Curtis has because there is no producing oil to be found in the State of Iowa, but I think Senator Curtis and I as well as other Members of the Senate have a similar problem, especially out in our area we have a lot of farmers using tractor fuel, and of course all of us have a lot of consumers using automobile gas and oil.

I understand that the position of the panel is that if the 27½ percent depletion is cut to 20 percent, that this will result in additional costs to consumers. Is that the position of the panel?

Mr. MYERS. Senator Miller, it has to result in one of two things, either additional cost to consumers or a lower level of investment in the industry, and in all probability it will be some combination of those two things. But to answer your question directly, there is every reason to believe that if these incentives are taken away, the cost of motor fuel to the consumer will go up.

Senator MILLER. Thank you.

Senator HANSEN. Mr. Chairman, if I could—I have been restricting myself to one question per witness. May I be privileged to ask two. I would like to ask Mr. Collado how do you reconcile your views with those of Mr. Dunlop? Isn't your position in conflict with his?

As I understand his testimony, he wants to strengthen our domestic petroleum position. You want to strengthen our foreign position?

Mr. COLLADO. Senator, you have raised a very reasonable question. I do not believe there is any incompatibility at all. As you will recall from statements that he made as well as some of those I made in that impromptu initial comment on Alaska, we do not find that under the most favorable circumstances of tax policy, import policy, et cetera, that we envisage, that it would be possible to find and produce enough oil say in the year 1980 or 1985, which is what you have to look at when you are talking national security, to keep pace with the increase in demand. So under any projection that we have seen, that we have made ourselves or anyone else, we will be importing much more from Canada, from Venezuela, from overseas generally than we are today, and our own projections are that this mounts very rapidly.

Under those circumstances it is completely compatible simply because of U.S. consumption to seek a strong U.S. position abroad, so that those imports can be forthcoming, and a diversified position maintained abroad so we can have a variety of sources and not be completely dependent on certain countries that, as was mentioned earlier, might seek to put the squeeze on us, or might be prevented from serving us for one reason or other.

Beyond that, as Mr. Dunlop and I have quoted in our longer statements, the Department of Defense has pointed out the importance of our allies also receiving oil. The foreign oil situation is very important to our allies.

I do not think there is any incompatibility at all. I only would like to stress even more perhaps than Mr. Dunlop the importance of the domestic part of this thing.

Senator HANSEN. I do have one question if I may for Mr. Myers.

Earlier this week our distinguished colleague, Senator Proxmire, testified that the rationale for the depletion allowance "is supposedly rooted in national security. Without the depletion allowance" so the argument goes, and these are his words:

> We would not explore for the oil which we need in order to protect ourselves from possible interruptions in our oil supply.

Then he goes on to observe that:

> This myth was destroyed by the CONSAD report. CONSAD after a detailed study of the oil industry found that we would experience a mere 7 per cent decline in our discovery of oil reserves from a 12-year reserve to an 11-year reserve.

Now, as I recall your testimony, you say that there are many flaws in the Consad study. These are outlined in your so-called reference to attachment A. You continue:

> The principal error which makes the study irrelevant is that the economic model used in the study assumes that there is no relationship between the level of crude oil production and industry profitability.

Then you conclude:

> This of course is nonsense, and no credence can be given to the study.

My question is since depletion and a lot of other things are all interrelated insofar as the profitability of this industry is concerned, I would ask you what would be the effect upon the supply of oil we have if the depletion allowance were cut from its present 27½ percent to 20 percent?

Mr. MYERS. Senator Hansen, the best estimate that we are able to make, and this is on an arithmetic basis, is that the suggested reduction from 27½ percent to 20 percent would result in a decrease in exploration and development expenditures of at least one-fifth. I will not take up your time going through the arithmetic. The arithmetic is furnished in the detailed statement, but we feel that the estimate of a reduction by one-fifth is on the low side.

Senator HANSEN. Thank you, Mr. Myers.

Thank you, Mr. Chairman.

The CHAIRMAN. Gentlemen, I think I ought to make it clear to our audience that we have a situation here that requires us to press ahead as fast as we can with this measure, because the Democratic Policy Committee voted some time ago that the revenue bill necessary to finance this Government should not be passed without a tax reform bill. And this Senator said that he would, if he could, try to prevail upon the committee to report this bill by the end of this month. Let me show you something.

Here is 2,000 pages of testimony that has been presented so far, and the policy committee should be aware of what has been said here. And here is about another thousand pages of questions and answers that we have had before this committee already, and we have about 2 more weeks. We have five more volumes to add on top of this that have not yet been edited, and we have about another ten days to go. So I hope you will understand why the chairman is pressing to try to make the testimony as brief as possible.

If the Senators want to ask this distinguished panel to make themselves available for further questions they will be invited to come back this afternoon if someone wishes to request that.

Senator FANNIN. Mr. Chairman, I have not asked my one question.

Mr. Myers, you and the panel thoroughly covered the depletion allowance rate reduction. Could you restate the basis for your objections to the inclusion of percentage depletion and intangible drilling costs in the category of limit on tax preference? I was out of the room. I know that this was in your testimony, but I wanted to be sure that I understood just exactly what you were referring to.

Mr. MYERS. We feel that the inclusion of those two items, percentage depletion and the intangible drilling costs, in the limited tax preference, particularly in the case of the independent operator, very much dilutes the incentives that are intended by the statutory depletion and by the option to expense intangibles. This really comes about in an indirect way. These are held out to the independent operator as an incentive, but through the method of limited tax preference, they are taken away from him somewhat indirectly.

It is our feeling that this will greatly reduce the incentive for the independent operator to continue his exploration for oil.

Senator FANNIN. My answer from a selfish standpoint would be my State of Arizona has not been as fortunate as the State of Nebraska. We have perhaps produced one-tenth of 1 percent of the product that is being used, so I am concerned.

One other item that you talked about and I would like to get closer to home when we talk about these foreign depletion allowances. I wonder with the elimination of foreign depletion would it have any substantially adverse impact on the competitive position of Canadian oil in the northern United States market that we are all concerned about?

Do you feel it would have any great effect?

Mr. COLLADO. The Canadian law provides a depletion allowance in a somewhat different form from ours; it is a third of net income. If we were to eliminate the depletion allowance in the United States, the U.S. companies with branch operations up there would find that they would be paying on a U.S. tax basis a higher tax rate than they would now be paying in Canada. As a result they would be subject to further U.S. tax in all probability. It would depend a bit on the circumstances of each company.

Beyond that, if we gave up the depletion allowance here, there might be pressures in Canada that would suggest reducing it up there. Well, the total Canadian tax before the depletion allowance runs up very close to 60 percent from both income and withholding taxes. Thus elimination of U.S. depletion allowance would make operations in Canada considerably less profitable, and this will have impacts up there, as well as on our balance of payments. We take in quite a lot of balance-of-payments income from the return on our investments in Canada. I believe that I have answered your question correctly.

Senator FANNIN. I think that you have. In other words, the impact would be considerable then, and that it would have a detrimental effect as far as the costs of fuel in the northern part of the United States?

Mr. COLLADO. We think so.

Senator MILLER. Under the provisions of section 431 of the bill, which requires that certain tax benefits be recouped, is there any limit on the time between which the tax benefit is received and the required recoupment?

Mr. COLLADO. In section 431 of the House bill, there is no limit as to the time which can elapse between the deduction of losses and the operation of the recapture provision. As I pointed out in my written statement submitted to the committee (p. 19 of my written statement, p. 25 of the committee print), this means that even unrelated projects undertaken many years after the losses occurred in a foreign country could be burdened with the additional taxes imposed by this provision. However, the Treasury indicated in its detailed statement submitted yesterday that it would submit recommendations for technical changes which would limit the number of years to which the taxpayer could be affected by the recapture provision. The Treasury did not indicate the number of years of limitation it would recommend. However, at the same time, Treasury has recommend eliminating the annual 50 percent limitation on recapture as is provided in the House bill. This change recommended by the Treasury could result in the taxpayer paying 100 percent or more of his income in a foreign country in taxes for the years required to effect the recapture.

Senator MILLER. Is the subsequent activity resulting in recoupment required to be related in some way to the activities resulting in the prior loss producing the tax benefit?

Mr. COLLADO. No; any subsequent activity resulting in a profit in the country in which the losses occurred could be burdened with the recapture provision, and I refer again to my written statement, page 19 (p. 25 of the committee print).

Senator MILLER. If the project is abandoned, or if it is successful but is nationalized and confiscated, is the prior tax benefit then not required to be recouped?

Mr. COLLADO. Under section 431 of the House bill, recapture or recoupment is require in cases in which the property which gave rise to the loss is subsequently abandoned or expropriated without compensation. The requirement is that in either of these circumstances gross income for tax purposes must be increased by the amount of the prior losses. I have noted the peculiar inequities in this provision in my written statement submitted to this committee (pp. 19–20 of my written statement, or pp. 25–26 of the committee print). However in its technical statement submitted yesterday, the Treasury has recommended that in cases of disposition of property before recapture of prior losses has been achieved, that the amount of recapture be limited to the amount of gain on such disposition. Thus, the Treasury's recommendations would not require recapture in cases of abandonment of the properties or of expropriation without adequate compensation.

Senator MILLER. Thank you.

Senator FANNIN. Mr. Collado, I understand the theory underlying the separate foreign tax credit limitation for mineral income in section 432 is that some part of foreign taxes on mineral income are necessarily disguised royalties.

Do you know whether the Treasury has taken the position that if royalties are paid to the foreign government which at least equal those paid in the United States, it would not consider the foreign tax a disguised royalty?

Mr. COLLADO. As Assistant Secretary of the Treasury Cohen stated when he appeared before this committee, section 432 presumes that any foreign tax on mineral income in excess of the effective U.S. tax on such income is a disguised royalty. As I noted in my written statement (pp. 22–23 of the statement; pp. 28–29 of the committee print), on further examination of the hidden royalty question the Treasury has concluded that the presumption underlying section 432 is improper, and has, therefore, recommended in lieu of section 432 that excess credits for foreign taxes on foreign mineral income resulting from the allowance of U.S. percentage depletion (which the Treasury has recommended be reinstated on foreign production) not be available to be applied against other income. As I stated in my testimony, we believe this proposal should be studied further.

Senator FANNIN. Is it true that royalties at least equal to those paid in the United States are paid to countries like the United Kingdom, Canada, and Venezuela?

Mr. COLLADO. As I indicated in my written statement (p. 22 of the statement and p. 28 of the committee print), royalty payments to governments in foreign producing countries are generally as high as, and in some cases considerably higher than, royalties paid on production in the United States. In the countries you have mentioned specifically, the effective rates of royalty are at least as high, or higher than the effective rates of royalty of from 12½ to 16⅔ percent paid on production in the United States. In the case of Venezuela, the effective rate of royalty is considerably higher than in the United States, and exceeds 25 percent.

Senator FANNIN. Yet I take it section 432 would apply to mineral operations in all foreign countries?

Mr. COLLADO. It would apply in all foreign countries.

Senator FANNIN. Thank you.

Senator WILLIAMS. Mr. Chairman, I do not have any questions but I want to state to the panel that while there may be a slight disagreement among us as to the provisions of the bill, you have made an excellent presentation this morning. Thank you.

The CHAIRMAN. Thank you very much, gentlemen.

(Material referred to previously and the prepared statements of the panel follow. Oral testimony of the next witness commences at page 4483.)

STANDARD OIL CO.,
INCORPORATED IN NEW JERSEY,
New York, N.Y., September 29, 1969.

PHILLIP AREEDA,
Executive Director, Cabinet Task Force on Oil Import Control,
Washington, D.C.

DEAR MR. AREEDA: In response to your request, I attach a memorandum estimating the impact on U.S. oil production of a reduction in the oil depletion rate from the present 27½% to 20%.

While the estimates for each of the years through 1985 have been derived from our models and expressed in precise terms, I am sure you recognize that we did not intend to imply that such a degree of precision is possible in making the estimates for each of the specific years. We have much greater confidence, of course, in our projection of the *ultimate* impact over a long period of time of a 20% depletion rate than we can have about the impact in any one year, or over a relatively short period of time. We are, of course, prepared to discuss our estimates with you or to provide any additional information which you may find helpful.

I assume that you will want to insert the attached material into the public record, and I have no objection to your doing so.

With best regards.

Sincerely yours,

EMILIO G. COLLADO.

Attachments.

EFFECT OF REDUCING STATUTORY DEPLETION RATE TO 20 PERCENT ON U.S. OIL PRODUCTION

The attached table and chart show the effect on domestic crude oil production of reducing the statutory depletion rate from 27.5 percent to 20 percent. As indicated, the reduced economic base for new exporation would ultimately cause a reduction in production of 600,000 barrels per day in 1980 and 1,400,000 barrels per day in 1985.

Recent detailed analyses of the sensitivity of oil exploration and development to changes in producing economics were the basis of this assessment. It should be recognized that only the effects of changes in producing economics were considered in this evaluation. That is, it does not include any effect due to a shortage of capital, either resulting from reduced industry cash flow or reduced investor interest. Lease bonuses would be reduced by about $65 million per year or about 10 percent. The fact that lower lease bonuses would tend to offset the change in tax treatment was fully considered in assessing the producing economies.

It was assumed that initially only the production from future reserves would be affected. A reduction in exploratory oil wells drilled of about 1,000 wells per year and a reduction in development oil wells drilled of slightly less than 2,000 wells per year would result.

The assumption that production from currently proved reserves (reserves currently booked by the American Petroleum Institute) would be relatively unaffected is probably conservative. The reduced industry cash flow would result in some expenditures being omitted that are required to produce these reserves.

The effect on the production rate of such a change in producing economics is delayed for several years primarily due to two factors. 1) As long as excess producing capacity exists a decline in reserves and producing capability is not reflected in the production rate. 2) There is often a sizable delay between the decision which commits an operator to drill and significant production from the prospect. However, as can be seen on the attachments, the effect increases rapidly have been influenced by the reduced producing economics.

Thought it is reasonable to assume that the magnitude of the effect on exploration for gas would be similar, the effect on condensate and gas plant liquids production was not quantified. Also, it was assumed that synthetic crude production (1.0 million barrels per day in 1985) would be unaffected.

EFFECT OF REDUCING THE STATUTORY DEPLETION RATE FROM 27.5 TO 20 PERCENT ON U.S. CRUDE OIL PRODUCTION

Year	U.S. crude oil production—MMBPD: Standard Oil (New Jersey),[1] base case	U.S. crude oil production—MMBPD: Statutory depletion rate 20 percent, Jan. 1, 1970	Year	U.S. crude oil production—MMBPD: Standard Oil (New Jersey),[1] base case	U.S. crude oil production—MMBPD: Statutory depletion rate 20 percent Jan. 1 1970
1969	8.8	8.8	1978	10.8	10.4
1970	8.9	8.9	1979	11.1	10.6
1971	9.0	9.0	1980	11 4	10.8
1972	9.2	9.2	1981	11.7	10.9
1973	9.4	9.4	1982	12.0	11.1
1974	9.6	9.5	1983	12.4	11.3
1975	9.8	9.7	1984	12.9	11.6
1976	10.1	9.9	1985	13.3	11.9
1977	10.5	10.2			

[1] Assumes no change in oil taxation.

PRESENTATION ON PETROLEUM INDUSTRY EXPLORATION AND PRODUCTION COSTS AND VOLUMES FOR THE CABINET TASK FORCE ON OIL IMPORT CONTROLS, SEPTEMBER 16, 1969

(Mr. M. A. Wright, Humble Oil & Refinery Co.)

FUTURE SUPPLY FORECAST

1. This picture of long-range outlook was presented in the original submission. It illustrates that with current incentives, sufficient reserves could be found to satisfy demand through 1985.
2. The importance of future reserves is clearly shown on this chart. Existing reserves down to 1.7 MME/D in 1985. Assumes 72 billion barrels of crude reserves added.
3. The following presentation explains basis for this forecast.

U.S. INDUSTRY CRUDE OIL

Area	Cumulative production MMB	Remaining booked reserves MMB	Forecast reserve additions, MMB/year									
			1969	1970	1971	1972	1973	1974	1975	Average year 1976–80	Average year 1981–85	Total, 1969–85
Inland (ex-Alaska)	84,328	26,451	1,790	1,724	1,640	1,572	1,523	1,433	1,362	1,132	854	20,974
Offshore (out to 2,000 ft. water depth)	2,379	4,169	865	784	763	758	796	830	880	1,062	1,712	19,546
Alaska (inland)	89	87	3,500	1,500	1,400	1,200	800	606	500	1,590	2,810	31,506
Total, United States	86,796	30,707	6,155	4,008	3,803	3,530	3,119	2,869	2,742	3,784	5,376	72,026

Note: 1969–75 average year, 3,750; 1976–80 average year, 3,780.

AREA BREAKDOWN OF RESERVE ADDITIONS

1. This chart shows an area breakdown of the future reserve add estimates. The methods used to make this estimate are attached in a letter from Mr. M. A. Wright to Senator Philip Hart.

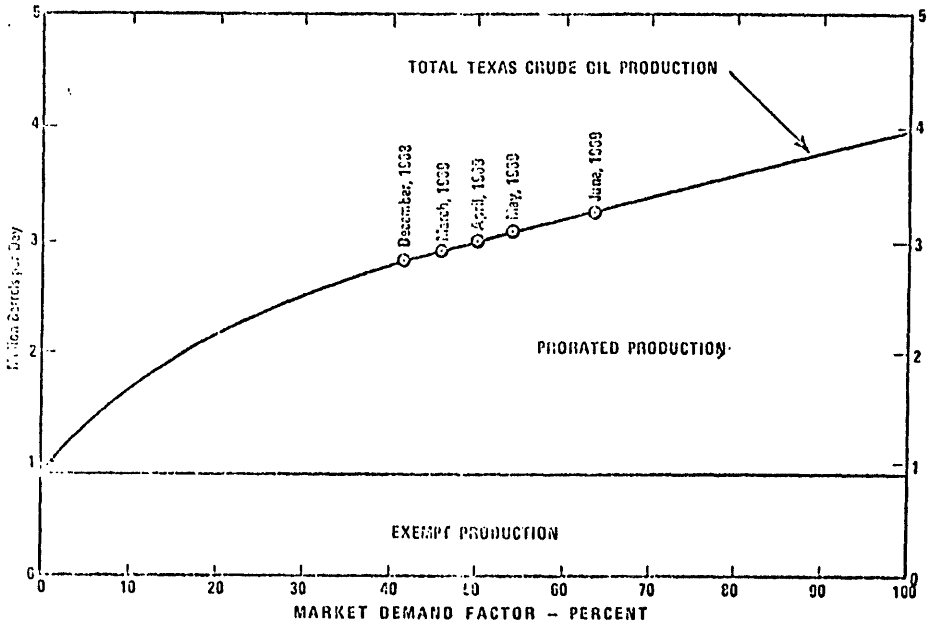
2. It is anticipated that inshore (ex Alaska) reserve additions will total 21.0 billion barrels by 1985. This is a relatively mature exploration area.

3. Offshore areas include the Gulf of Mexico, Atlantic and Pacific, and offshore Alaska. No reliable estimate for a specific area could be made, but the estimate for the total area should be more accurate.

4. The current estimate for Alaska (inland) reserves is 31.5 billion barrels. This assumes additional acreage in NPR-4 and the wildlife refuge are opened for exploration.

5. The importance of acreage becoming available from lease sales is clearly evident since there is shown to be potential for finding more reserves in the latter period.

TEXAS INDUSTRY CRUDE OIL PRODUCTION
RESPONSE TO MARKET DEMAND FACTOR

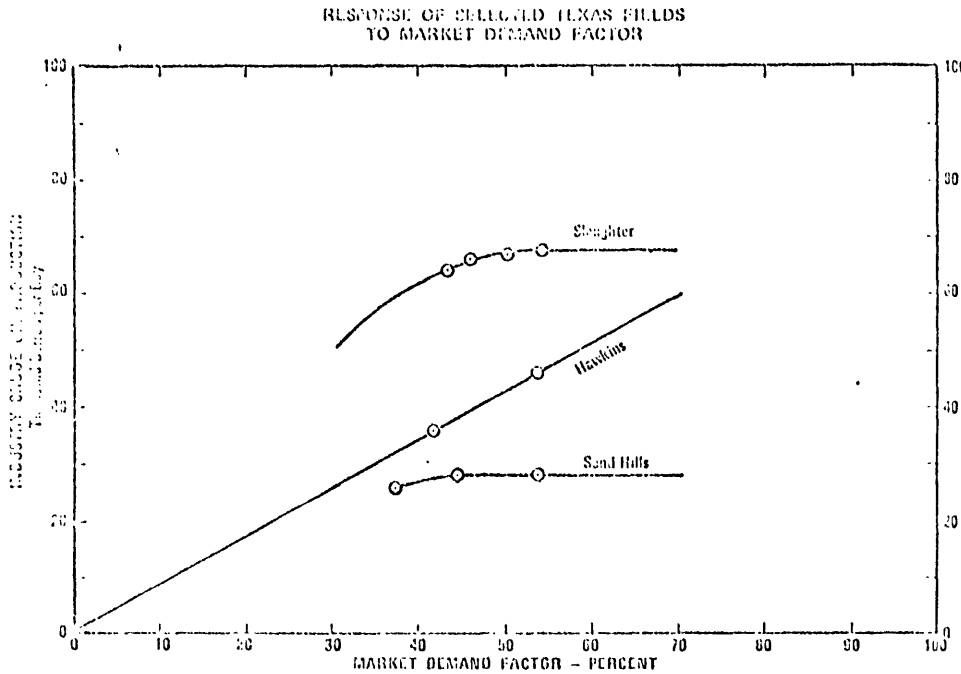


TEXAS RESPONSE TO PRORATION FACTOR

1. The next chart illustrates the effect that proration has on production from existing reserves in Texas.

2. In Texas, production at a 50 percent proration factor is approximately 3 MM BPD. If the proration factor were raised to 100 percent, production would grow to almost 4 MM BPD. The fact that production response is not proportionate to the increase in proration factor is due to the almost 1 MM BPD of exempt production and the large number of fields that have limited capacity.

3. This curve represents a specific point in time. Similar but lower curves would apply in future years.

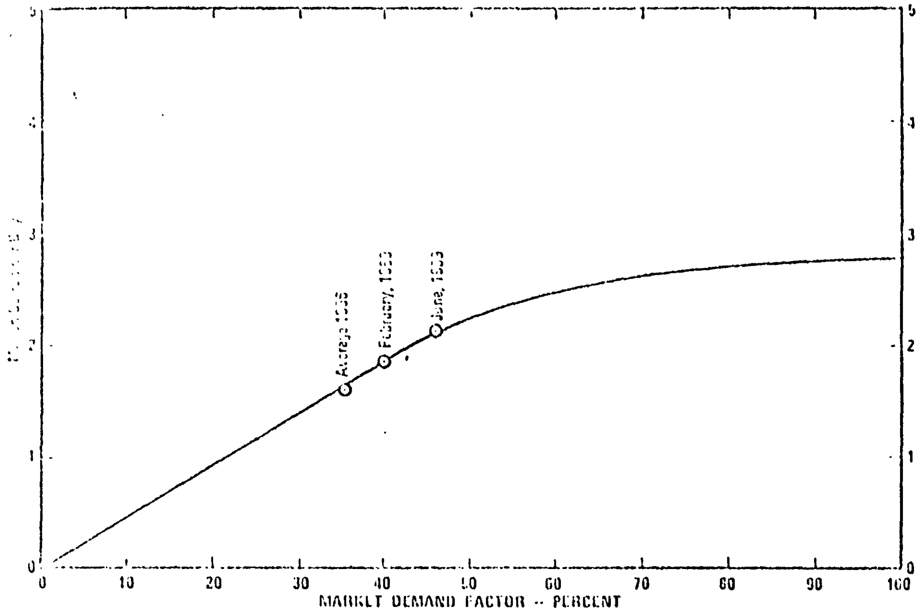


RESPONSE OF SELECTED TEXAS FIELDS TO MARKET DEMAND FACTORS

1. An example of the varying field response in Texas is shown. The Hawkins field has good response to increased market demand factors.

2. The Slaughter and Sand Hills fields are both under waterflood and show very little response.

LOUISIANA INDUSTRY CRUDE OIL PRODUCTION
RESPONSE TO MARKET DEMAND FACTOR



LOUISIANA RESPONSE TO PRORATION FACTOR

1. This chart shows the estimated response of Louisiana crude oil production to proration factor.
2. Poorer response is projected at the higher proration factors.
3. All industry estimates of producing capacity in Louisiana (IPAA, API) are in substantial agreement.

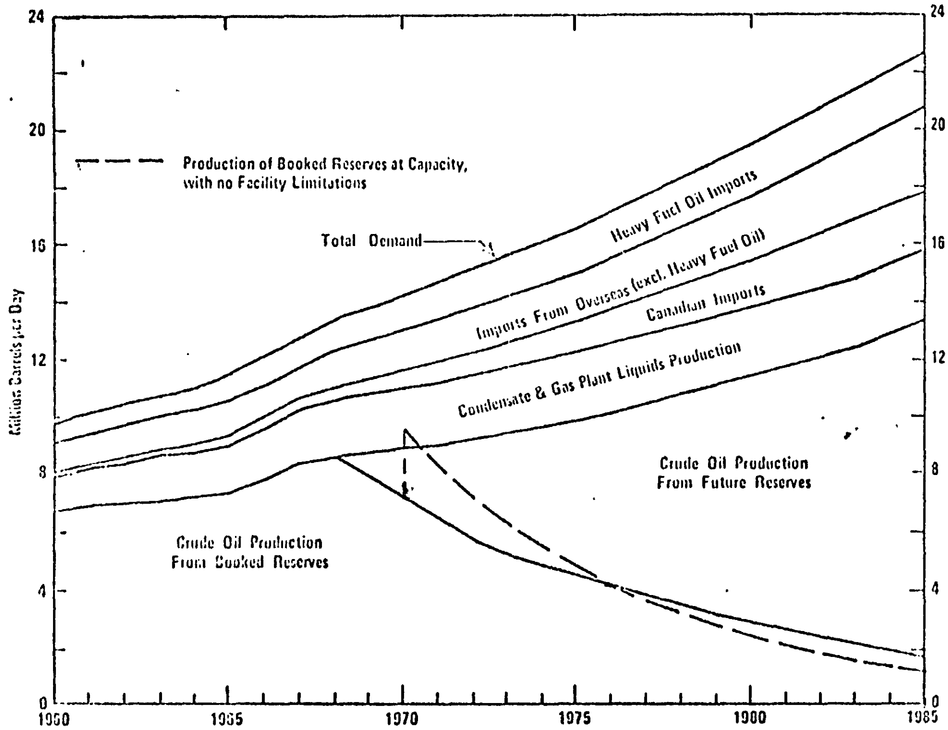
WELLHEAD CAPACITY OF MAJOR TEXAS FIELDS

Field	Production rate at 100 percent MDF MB/D	Wellhead capacity MB/D	Wellhead capacity above 100 percent MDF MB/D
East Texas	275	500	225
Kelly Snyder	180	250	70
Yates	50	100	50
Tom O'Connor	75	100	25
Anahuac	35	100	65
Hastings	75	160	85
Van	50	80	30
Hawkins	87	140	53
Conroe	50	120	70
Total, major fields	877	1,500	673

MAJOR FIELD CAPACITY

1. There is additional capacity in selected fields in Texas above the 100 percent market demand factor. It is primarily located in the nine major fields shown.
2. The total capacity above the 100 percent proration factor is approximately 800 m BPD.
3. While this capacity is available, it would require significant expenditures in production, pipeline, and storage facilities and in many cases this would not be economic due to the rapid fall off of capacity once the fields were produced at high rates.

U.S. LIQUID PETROLEUM SUPPLY AND DEMAND
WITH CONTINUED IMPORT CONTROLS



EFFECT OF MARKET DEMAND PRORATION ON LONG RANGE SUPPLY

1. While there is additional capacity available in Texas and Louisiana, it would only have a short range effect if fully utilized. The chart illustrates the potential to raise production in the U.S. using the spare capacity previously mentioned and shows that after 1976 production from existing reserves would be less than had proration continued.

2. Facility and pipeline limitations would preclude the full utilization of this capacity. The effective spare capacity in 1970 would be only about 1.8 MM BPD, as shown in exhibit D of our original submission to the task force.

3. Although facility and pipeline bottlenecks could be removed, the large expenditures required would be uneconomic because of the short-term nature of this capacity.

U.S. oil industry—exploration-production function cost 1962–66 period

1962 to 1966 exploration costs, $MM	11,604
1962 to 1966 drilling and equipment costs, $MM	12,301
1962 to 1966 production costs, $MM:	
Operating	9,259
Production and ad valorem taxes	2,978
Royalty	9,023
Total	21,260
December 31, 1968 booked reserves credited to 1962–66 new field discoveries, MM gross equivalent barrels	5,860
Estimated ultimate hydrocarbon production from 1962–66 new field discoveries, MM gross equivalent barrels	10,370
1962 to 1966 hydrocarbon reserve additions from extensions and revisions plus new field discoveries, MM gross equivalent barrels	20,554
1962 to 1966 hydrocarbon production, MM gross equivalent barrels	18,786
Exploration costs, dollar/gross equivalent barrel	1.11
Drilling and equipment costs, dollar/gross equivalent barrel	0.60
Production costs, dollar/gross equivalent barrel	1.13
Total costs, dollar/gross equivalent barrel	2.84

U.S. INDUSTRY COSTS

1. An analysis of overall industry costs can be made from data published by the joint association survey. The costs are broken into exploration, drilling and equipping, and production costs. From 1962–1966 the industry spent a total of $45.2 billion dollars in these categories.

2. By using statistical extrapolations of the new reserves discovered during that period to determine their ultimate size, the finding cost for new reserves was $1.11 per equivalent barrel.

3. By using the reserve additions from extensions and revisions and discoveries, the drilling and equipment cost was $.60 per barrel.

4. The production costs including royalty amounted to another $1.13 per barrel. The overall cost was $2.84 which compares with the average crude price of $2.88 per barrel at that time.

5. These are not the only costs to an operator. At current interest rates the normal 3-year delay from lease purchase to production may add an additional cost of $0.20 per barrel to the $1.11 per barrel finding cost. Other costs include federal and state income taxes. The return on investment anticipated by the operator must also come out of this difference.

EXPLORATION-PRODUCTION FUNCTION COST DATA FROM VARIOUS SOURCES

	From JAS data 1962–66	From H. J. Struth data 1962–66[1]	Foster & Associates 1962–66[2]: Gulf of Mexico	Foster & Associates 1962–66[2]: Inshore southern Louisiana	Foster & Associates 1962–66[2]: Other continental United States
Exploration cost: cost/gross equivalent barrel	1.11	0.72	1.19	1.17	1.07
Development cost: cost/gross equivalent barrel	.60	.74	(3)	(3)	(3)

Adjusted cost/gross equivalent barrel	1.13	1.22	1.07	1.32	1.25
Total exploration-production function cost	2.84	2.68	2.26	2.49	2.32
Adjusted total exploration-production function cost[5]	2.84	2.68	2.85	3.06	2.79

[1] Reported in May 1967 World Oil; crude oil only; gross barrel basis instead of net as reported in World Oil.
[2] As prepared for the Department of the Interior, Bureau of Land Management, December 1968.
[3] Exploration and development costs included under exploration costs.
[4] Royalty assumed to be 16.67 percent (1/6) 1962–66 average crude oil price $2.88 per barrel.
[5] Foster & Associates exploration-development costs were adjusted for the current estimate of ultimate reserves found by new discoveries in the period 1962–66.

COMPARISON OF INDUSTRY COST ESTIMATES

1. Other studies of finding, developing, and producing costs have been published and the results are tabulated. All of the studies show essentially the same result.

2. While the entire industry is not at a high profit level, the point driving most operators on is the potential to make higher returns. The wide variation of bids in recent lease sales indicates the wide assessment of risks and profit potentials placed on prospects by various companies. Some examples of the returns on several sales will be shown along with some individual company variations.

ECONOMIC RETURN FOR INLAND U.S. EXPLORATION (EXCLUDING ALASKA)[1]—7 MAJOR COMPANIES, 1963-67

Company	Exploration expenditure	Reserves discovered (barrels)[1]	Finding cost (dollars per barrel)	DCF return (percent)
A			0.61	9-12
B			.85	6- 9
C			1.03	5- 8
D			1.09	5- 7
E			1.13	5- 7
F			1.44	3- 5
G			3.93	(3)
Total	$1,668,000,000	1,399,000,000	1.19	4- 6

[1] Estimated by Humble from public data.
[2] Oil equivalent barrels.
[3] Negative.

ECONOMIC RETURN FOR INLAND U.S EXPLORATION (EX ALASKA)

1. This chart illustrates the economic results on exploration in inland U.S.A. (excluding Alaska) from 1963–1967. The industry spent $1.7 billion and discovered 1.4 billion barrels for a finding cost of $1.19 per barrel. The average industry return was 4 to 6 percent.

2. Individual companies finding costs ranged from $.61 per barrel to $3.93 per barrel, and the returns ranged from negative to 12 percent.

3. The first chart showed that 21.0 billion barrels could still be found in this area, but it is obvious that the economic environment must remain stable to do this.

ECONOMIC RETURN FROM COOK INLET EXPLORATION[1]

TOTAL INDUSTRY

	Exploration expense (in millions)	Production investment (in millions)	Net oil production (million barrels)	Finding cost (per barrel)	DCF return (percent)
1966 STUDY RESULTS (BASED ON PRELIMINARY COST AND RESERVOIR INFORMATION)					
1951-65	$213	$349	919	$0.23	20.0
1969 STUDY RESULTS (BASED ON LATEST COST AND RESERVOIR INFORMATION)					
1951-68	520	870	627	.71	3.5

INDIVIDUAL COMPANY RESULTS

Company	Finding cost (per barrel)	DCF return (percent)
A	$0.41	17
B	.58	16
C	1.90	(2)
D	1.29	(2)
E	1.40	(2)
F	1.74	(2)

[1] Estimated by Humble from public data.
[2] Negligible.

ECONOMIC RETURN ON COOK INLET EXPLORATION

1. The difficulty in exploring for oil is shown by economics on Cook Inlet. An early study showed that industry should expect a 20 percent rate of return on fields discovered between 1951 and 1965. It was estimated that almost a billion barrels would ultimately be in these fields and total exploration costs would be $213 MM.

2. A 1969 study of the same area showed that exploration from 1951 through 1968 would result in only a 3.5 percent return. Several things happened since the 1965 study that changed the results. First of all the fields did not respond as well as anticipated and reserve estimates had to be lowered. Also the production costs were increased significantly with the need to inject water in the reservoirs. The last point is that no significant fields were found from 1965 to 1968 but substantial exploration expenditures were made.

3. Again some companies fared better than others with returns ranging from 17 percent to negative. Two-thirds of the companies will lose money over that period.

INDUSTRY OFFSHORE ECONOMICS [1]

[Dollar amounts in millions]

Year	State	Bonus	Est, rec. MMO. E. B.	Payout, years	Profit	D.C.F. (percent)
1954	Louisiana	$116	670	18	$593	7
1962	do	445	2,300	13	2,177	9
1967	do	510	1,270	12	820	7
1968	California	603	930	11	785	7
1968	Texas	594	240	None	−179	(2)
Total for 21 sales		3,360	7,150	13	5,090	6

[1] Estimated by Humble from public data.
[2] Negligible.

INDUSTRY OFFSHORE ECONOMICS

1. When leases are bid, the fierce competition generally keeps overall returns low. The industry results from 5 major sales are shown along with the overall industry results on 21 lease sales.

2. In general, most operators try for a reasonable return in the range of 10 to 15 percent. However the companies view the prospects differently and the most optimistic bidder gets the lease every time. This drives the average returns down below 10 percent as shown.

3. The risk is also shown in the Texas offshore sale which has been very disappointing and will show a loss for industry.

4. It can be seen from the results of the sales that a company will profit in some and lose in others, and the exploration program must be viewed in an overall sense to determining how effective it is. This is also why it is necessary to look at the overall costs of the industry rather than any particular field or basin.

33-865 O—69—pt. 5——34

ESTIMATED ECONOMICS OF DEEPWATER DISCOVERY, OFFSHORE CALIFORNIA

Recoverable reserves (millions of barrels)	50	200
Number of producing wells	60	230
Peak production rate (barrels per day)	25,000	60,000
Water depth (feet)	1,000	800–1,400

Grand total	2.900	2.140
Rate of return (percent)	(1)	8

[1] Negative.

SANTA BARBARA CHANNEL

1. With the current economic environment, the industry has looked for new reserves to the very limit of technology. An excellent example is the Santa Barbara Channel where leases were purchased in 1,800 feet of water. Prior to this the water depth record for exploratory drilling was 632 feet. Industry spent $603 MM for leases on 350,000 acres in the sale.

2. Humble spent $218 M for 154,000 acres in the sale. Since that time, an additional $11 MM has been spent to develop technology to operate in deep water. The costs will be extremely high in deep water. For example, Humble's deepest water platform is now in 170 feet of water and cost $2.5 MM. A platform in 1,000 feet of water in Santa Barbara will cost $25 MM.

3. To illustrate how much oil must be found to make a sale of this type profitable, two cases are shown. This assumes a prospect covering several leases with a total lease bonus of $40 MM. If a 50 MM barrel field is found, the exploration costs would total $1.02 per barrel and the prospect would be an economic loss. A field of this size might be developed however, so the operator could get part of his lease money back. If a major 200 MM barrel field were found, the return would be 8 percent. Of course, if that was the only field found for a company like Humble, the overall sale would still be an economic loss.

COMPARISON OF BIDS ON SELECTED TRACTS 1969 NORTH SLOPE OF ALASKA LEASE SALE

[Dollars in thousands]

Tract	High bidder	High bid	HO&R bid	ARCO bid	BP bid
57	Amerada-Hess, Getty	$72,277	$26,099	$26,087	$47,150
56	Amerada-Getty, LL&E, Placid; Hunt Int	43,555	8,499		14,156
36	Phillips, Mobil, SoCal	18,130	9,899		
33	Phillips, Mobil	12,100	6,400	1,043	
60	Amerada, Marathon, Getty, Placid, Hunt	53,031	2,301		
54	Mobil, Phillips	4,060	1,400	261	
67	Amerada, Hess, LL&E, Getty, Marathon	31,122	399		
61	Amerada, Marathon, La Land, Getty, Placid, Hunt	43,555			

PRUDHOE BAY

1. Another example of the varying costs and returns is the recent lease sale on the north slope of Alaska. The industry spent over $900 MM on leases in that sale.
2. The table shows that the companies who already have a lease position in that area did not bid in the same range as newcomers.

EXPLORATION ECONOMICS

[Dollar amounts in millions]

	Current tax rules	20-percen depletion allowance, capitalized intangibles
Bonus	$20	$20
Provit AFIT	$52	$48
Rate of return (percent)	13	11.5
Bonus reduction to gain equivalent rate of return		$3.2

EFFECT OF TAX CHANGES

1. Relatively low overall returns have been indicated for several competitive sales and in mature exploration areas. The bids were made on the basis of existing tax laws and any change in these laws will lower returns even more.
2. As an example, a typical bid for an operator is shown. For a bid of $20 MM the operator could expect a profit of $52 MM and a rate of return of 13%. However, if the depletion allowance was cut to 20% and it was required that successful intangible drilling costs be capitalized, the profit would drop to $48 MM and the return to 11.5%.
3. On future bids, under these changes, the operator would still try for the same return on his capital, and his bid would have to be lowered by 3.2 MM.

STATEMENT OF EMILIO G. COLLADO, EXECUTIVE VICE PRESIDENT, STANDARD OIL CO. (NEW JERSEY), NEW YORK, N.Y., IN BEHALF OF AMERICAN PETROLEUM INSTITUTE; MID-CONTINENT OIL & GAS ASSOCIATION; ROCKY MOUNTAIN OIL AND GAS ASSOCIATION; AND WESTERN OIL AND GAS ASSOCIATION

SUMMARY

We strongly urge that Sections 431 and 432, and Section 501(a) of H.R. 13270, applying to the foreign activities of U.S. petroleum companies, be rejected. By increasing the tax burden on U.S. petroleum companies' operations abroad, these provisions would seriously weaken the ability of U.S. companies to compete effectively with foreign oil companies, many of which receive substantial tax benefits and, in some cases, cash subsidies from their home governments. This adverse impact is likely to be felt particularly on the ability of U.S. petroleum companies to obtain concession rights in new producing areas, and thus the provisions would place important obstacles in the way of U.S. companies' participation in the future growth of the international oil industry. These measures must be assessed in the light of the contribution which U.S. petroleum investments abroad make to important U.S. national objectives.

Our national security requires that we maintain adequate and assured sources of oil to meet our growing economic and military needs for energy. Despite the high rate of growth expected in our domestic oil producing capacity in the future, the United States will have to rely increasingly on foreign-source oil to meet our growing requirements. The best way to provide that our country will have access to sufficient foreign-source petroleum is to encourage U.S. companies to continue to search for and develop these resources in diverse foreign areas.

The foreign oil investments of U.S. companies also make a substantial positive contribution each year to our balance of payments, and last year contributed about $2.5 billion to U.S. receipts of income and royalties and fees from abroad. Moreover, these investments have enhanced our economic welfare and have promoted economic progress in the developing countries.

Sections 431, 432, and 501(a) would also seriously undermine valid and long-standing principles of tax equity and of preventing international double taxation, which United States tax laws have traditionally sought to achieve. Section 501(a) would discriminate against the foreign activities of U.S. petroleum companies by denying them tax treatment comparable to petroleum operations conducted in the United States. Section 431 would double-tax individual parts of a taxpayer's income, while Section 432 would introduce international double taxation on the integrated petroleum industry operations abroad by denying to the mineral industry alone the effective use of the overall basis for applying the foreign tax credit. Such discrimination against foreign-source income, and against the mineral industry in particular, seems unjust and unwarranted. Moreover, enactment of these provisions seems unlikely to produce a significant amount of revenue for the United States. The Treasury has offered recommendations which would alleviate some of these problems.

STATEMENT

My name is Emilio G. Collado. I am a Director and Executive Vice President of the Standard Oil Company (N.J.), and my statement is submitted on behalf of the American Petroleum Institute, the Mid-Continent Oil and Gas Association, the Rocky Mountain Oil and Gas Association, and the Western Oil and Gas Association. My statement concerns the major provisions of H.R. 13270 relating to U.S. taxation of the petroleum industry's operations abroad. I fully concur with the views expressed in the statements submitted by Messrs. Dunlop, Spencer and Myers.

In our opinion, the changes in U.S. tax laws contained in H.R. 13270 applying to the foreign activities of U.S. petroleum companies ought to be rejected. The specific provisions that we urge be rejected are: Sections 431 and 432, which 501(a) which, in addition to reducing percentage depletion on domestic production, would eliminate percentage depletion entirely for foreign oil and gas production.

We have three principal reasons why we believe these provisions should be rejected. First, after careful analysis we have concluded that the provisions would be harmful to the national security interest of the United States and our foreign allies in maintaining adequate and growing foreign sources of oil. Second, we believe the provisions would be detrimental to the U.S. balance of international payments and general economic welfare. Finally, there enactment would seriously undermine long-established and accepted principles of tax equity and of preventing international double taxation.

National security of the United States and the free world

U.S. tax policy pertaining to the foreign activities of U.S. petroleum companies must, above all, be assessed in the light of the importance of these activities to the national interest of the United States in maintaining adequate and secure sources of oil to meet our growing economic and military needs for energy.

Today the United States consumes nearly 40 per cent of the oil consumed in the entire Free World, yet less than 10 per cent of the Free World's petroleum reserves are in this country. In the future we will have to rely increasingly on foreign-source oil to meet our growing requirements. The estimates vary, but considering currently known reserves and with reasonable assumptions about the future with respect to new discoveries and the development of synthetics, and assuming continuation of existing domestic tax incentives and import policy, the coverage of domestic demand for petroleum (including residual fuel oil) by domestic producing capacity is expected to decline from 93 per cent currently, to 83 per cent in 1975 and 76 per cent in 1[illegible]. These expectations do not rely on pessimistic assumptions of a lower rate of discovery of petroleum resources in the United States in the future than in the past, nor even on a simple projection of past trends. On the contrary, average annual discoveries in the United States, including Alaska and offshore, are expected to be considerably greater in the future than the recent past, provided that existing domestic tax incentives and import policy are continued.

Foreign-source oil is also of substantial strategic importance to our country. As the U.S. Department of Defense stated in its submission to the Task Force on Oil Import Control:

"In carrying out our treaty commitments, we, as a nation, face a variety of threats on many fronts. Despite the enormous and costly effort of our nation's intelligence organizations and resources, it is impossible to predict the place, time, scope, and contestants in any future emergency; hence, our logistics planners face a continuing challenge. It, therefore, follows that our national security extends far beyond the shores of the United States. *The Department of Defense reaffirms that it is in the best interests of the United States and, in fact, our national security dictates that we have in existence dependable, capable, and willing overseas sources to satisfy our petroleum needs on a global basis.*

"In summary, the DoD is primarily concerned with an assured adequate source of supply in close proximity to the area of need and at the lowest possible cost to the taxpayer. One fact is clear and that is the U.S. alone cannot realistically plan to fuel any Free World type of an emergency, therefore, we believe that no drastic action should be taken which would jeopardize our other Free World sources of supply. The interest of the DoD in expanding oil development by areas in order of priority is first the Continental U.S., secondly the Western Hemisphere and, thirdly other Free World areas. This order of priority includes, but is not limited to, the maintenance of a domestic production and refining capability to meet military and essential civilian requirements." (Emphasis added.)

Thus, the future availability of growing quantities of foreign oil is of great economic and strategic importance to the United States to meet our growing needs, both in the United States and for use in our military installations abroad. In the future, we will have to rely increasingly on sources elsewhere in the world—both our traditional sources of supply and new producing areas of the future.

Our allies, with more limited potential for developing domestic producing capacity, must rely to a much greater degree on foreign oil to meet their needs. For example, Western Europe currently imports 96 percent of its petroleum requirements. Moreover, energy consumption abroad is growing much faster than in the United States, and petroleum is supplying an increasing share. In the future, the United States will not be in a position to meet Europe's needs in the event of an interruption of supplies from the Middle East without impinging on U.S. consumption, as we were able to do during the last two Suez crises.

It seems clear that the future security of the United States and the Free World will depend on ready access to diverse and growing foreign sources of oil. In the case of the United States, the best way to provide future access to sufficient foreign-source petroleum is to encourage U.S. companies to continue to search for and develop these resources in diverse foreign areas.

What does this mean in terms of the provisions in H.R. 13270? Primarily, we think it means that the Congress ought to avoid making changes in U.S. tax laws relating to foreign income which would place obstacles in the way of U.S. companies participating in the growth of petroleum industry activities abroad. We are convinced that the changes in the House Bill would seriously impede the efforts of U.S. oil companies to participate fully in this growth.

Impact of U.S. tax system on competitiveness of U.S. oil operations abroad

Today the international oil industry is highly competitive. U.S. companies are continuously vying for position relative to foreign companies in all phases of activity—all the way from acquiring new producing concessions, up through refining and selling in final product markets. In this intense competition, cost advantages of particular companies are readily reflected in competitive bidding for new concession rights and in aggressive marketing tactics.

As confirmed by Assistant Secretary Cohen when he appeared before the Committee, foreign companies generally receive more favorable tax treatment from their home governments on their operations abroad than do American companies, and in many cases are totally exempt from taxation on their foreign income. In addition, many foreign oil companies also receive outright subsidies and other favored treatment from their home governments for foreign and domestic operations. Many of these benefits substantially reduce the costs of doing business and the associated risks, and are unavailable to American companies which compete with foreign companies receiving such benefits. For example, several foreign countries actually eliminate the risks of unsuccessful exploration by providing outright subsidies.

The significance and widespread use of incentives and cash subsidies for oil exploration by countries such as Australia, Germany, Japan, and the United Kingdom are described in Attachment I, "Summary of Incentives Granted by Foreign Governments in Regard to the Production of Oil and Gas Under Petroleum and/or Tax Laws." Germany has already adopted a system of interest-free loans to German nationals to finance the costs of foreign exploration, and if such exploration is unsuccessful, the loans need not be repaid. In addition, overseas losses can be offset against taxable income in Germany. The U.K. grants cash incentives for both domestic and overseas oil and gas exploration and development. The French government permits its national companies to deduct overseas exploration expenses against income derived within France. Japan, in addition to financial aid to Japanese companies exploring overseas, grants bonus exploration deductions and has committed itself to support exploration in Alaska, Southeast Asia, Africa, and the Persian Gulf. Many other consuming countries are intensifying efforts to encourage local ownership of foreign oil reserves, and additional incentives are now being contemplated. For example, the countries of the European Common Market are considering extending uniform tax incentives to national companies for foreign exploration. Also, government-owned or controlled companies from various foreign countries have entered the industry in increasing numbers and have proven to be aggressive competitors. Such state-owned or controlled companies frequently have political and monopoly advantages in their home markets and their actions are not necessarily determined by economic considerations.

Despite these differences, American oil companies have successfully achieved a leading position in the international oil industry. U.S. companies currently hold more than half of the world's known oil reserves outside the United States, account for roughly 60 per cent of Free World oil production, and own more than half of Free World refining facilities. It would be unfortunate if the Government of the United States took steps which in themselves could tip the scales in favor of our foreign competitors.

Foreign oil investments' contribution to balance of payments and other U.S. goals

Our country's national interest in providing for access to diverse and growing foreign sources of oil is sufficient reason, in itself, to reject the current tax proposals. However, there are other important reasons why these proposals should be rejected.

One is the important which these investments have for our balance of payments. The earnings generated by the more than $17 billion which U.S. companies have invested in foreign petroleum operations make a substantial positive contribution each year to the U.S. balance of payments and strength of the dollar. Last year, U.S. receipts in the form of income remitted from petroleum direct investments and royalties and fees related to these investments amounted to about $2.5 billion. In addition, these investments have directly resulted in substantial U.S. exports of capital equipment and other merchandise.

U.S. foreign investments in petroleum activities have also yielded a better-than-average contribution to our balance of payments. Petroleum investments have in each of the last three years contributed at least 44 percent of the income remitted to the U.S. from all direct investments abroad, while these investments represent a considerably smaller proportion—about 30 per cent—of the book value of all U.S. direct investments. Various estimates made by experts outside the petroleum industry suggest that, on the average, U.S. direct investments in foreign petroleum operations are fully returned in the balance of payments in from three to five years and result in substantial additional contributions to our payments position in subsequent years.

At a time of continuing international monetary uncertainities, with our balance of payments made weaker by the impact of persistent inflation in the United States on the competitiveness of U.S. production, it seems clearly unwise to take measures which would discourage the contribution U.S. petroleum investments abroad can make to our international payments strength.

The foreign petroleum investments of U.S. companies have not only served our national interest in securing foreign oil resources and benefited our international payments position, but also have contributed to other national objectives. Our economic welfare has been enhanced by the annual returns these investments have brought to the United States and by the substantial annual exports of U.S. goods and services they have generated. Moreover, the annual income received from these investments abroad has resulted in substantial additional U.S. tax revenues as this income is distributed to U.S. individual shareholders.

Another prominent U.S. objective in the postwar period has been to promote economic progress in the developing countries. U.S. petroleum companies have made a substantial contribution to progress in these areas by directly creating income and employment, and by providing host governments with substantial annual revenues which can be used to finance their countries' development. Moreover, American petroleum companies have frequently taken it upon themselves to build roads, hospitals, and schools, and to provide other facilities and services not directly related to their commercial operations.

In considering the provisions in the House Bill, we must recognize that a significant increase in the costs of doing business abroad—which could well result from the various proposed tax changes—would inevitably restrict the future contribution American oil companies could make to U.S. national security, to the balance of payments, and to other U.S. goals. A substantial impact is likely to be felt in the process of bidding for new concession rights abroad. Cost disadvantages for U.S. companies such as those which are entailed in the provisions of H.R. 13270 could have the effect of closing the door on U.S. companies' participation in future promising areas for petroleum production. These provisions would not only tend to discourage new U.S. petroleum investments abroad and thereby retard future growth in earnings for our balance of payments and economy, but could also have a depressing effect on the earnings of existing petroleum investments. In today's competitive world, an investment, once it is made, cannot be expected to continue to earn the same returns year after year without additional investment in expansion and modernization. Companies must keep roughly in line with the industry's growth and technological advances. In addition, of course, the foreign petroleum investments of U.S. companies must continue to be competitive with foreign petroleum companies and to earn returns at least commensurate with other U.S. investments abroad in order to continue to attract the capital which is required for their growth.

Principles of U.S. taxation on foreign-source income

Concerning foreign-source income, United States tax laws have traditionally sought to achieve equity among taxpayers and to prevent international double taxation. As noted earlier, many countries prevent international double taxation simply by imposing no taxes at all on the foreign income of their corporations which has already been subjected to foreign taxes. The United States, while recognizing the primary claim of the country of source to tax, has traditionally taxed the worldwide income of its citizens and corporations. Since 1918, the United States has sought to avoid international double taxation by means of the foreign tax credit. Thus, the United States has allowed credit against the U.S. tax liability on foreign-source income for income taxes paid to foreign governments on such income. In electing this method of avoiding international double taxation, the United States has long recognized that foreign income tax laws might very well differ in rate and method of computation from those of the United States. In arriving at the allowable credit, U.S. taxing concepts have been applied even if the foreign country does not necessarily follow such concepts in imposing its income taxes. That is, in taxing worldwide income, the same rules for determining income subject to tax have generally applied whether the business operations were conducted in the United States or abroad. While this approach has ensured that at least the U.S. income tax rate would apply, U.S. taxpayers have also been allowed the choice of computing their foreign tax credit on the basis of the per-country or the overall method of calculation. The general result has been that the burden of income taxes on foreign-source income has been either the foreign or U.S. tax rate, whichever is higher. Under this method, the foreign tax credit cannot exceed the U.S. tax which would be due on the foreign income. These concepts are basically sound and equitable, and should be continued.

To do otherwise could effectively shut off further U.S. foreign investments. As former Assistant Secretary of the Treasury Stanley S. Surrey has said:

"American investment would not proceed at all without the foreign tax credit because then, as the Chairman pointed out, two taxes would be imposed and the overall burden of two taxes would be so great that international investment would practically cease." [1]

Sections 431 and 432 and Section 501(a) of H.R. 13270, if enacted, would violate the traditional principles followed by the United States of achieving tax equity and of avoiding international double taxation. A more detailed discussion of these provisions follows.

Section 501(a)

While Section 501(a) would reduce percentage depletion for oil and gas production in the United States, it would eliminate the allowance entirely for

[1] Source: *Hearings before the Committee on Foreign Relations, United States Senate, 90th Congress, 1st Session, on Tax Convention With Brazil, Executive Journal,* 1967, pp. 19–20.

foreign production. Of course, this provision involves outright discrimination against foreign versus domestic operations by U.S. petroleum companies. This contrasts to the existing equitable situation in which the U.S. generally does not require business operations abroad to pay more income taxes than the same operations would pay if they were conducted entirely in the United States. It would be particularly harsh on U.S. companies operating in Canada, whose oil industry is closely linked to the U.S. industry.

The various incentives and subsidies which foreign governments give to their petroleum companies for foreign production have already been noted and are described in Attachment I. In view of such practices on the part of foreign governments, the elimination of foreign depletion for U.S. companies could substantially reduce the ability of U.S. companies to compete with foreign companies in seeking to acquire new concession rights in foreign producing areas. In considering this provision we must recognize this fact and all its implications for the Unted States national interest.

Moreover, Assistant Secretary of the Treasury Cohen, in his appearance before the Committee, has already pointed out that enactment of Section 501(a) would do nothing more than penalize U.S. companies, with virtually no benefit to the U.S. Treasury:

". . . Our analysis of this provision indicates, in the light of our foreign tax credit provisions, that after a brief period it will probably result in foreign countries increasing their effective tax rates on income from oil and gas production to 'sponge up' any additional tax revenue otherwise accruing to the United States. Thus the denial of foreign depletion will increase the effective U.S. rate of tax on such income, which tax the foreign governments will then offset by increasing their rates. The end result will be that the U.S. taxpayer will pay additional tax to those countries, but no additional tax to the United States.

"For these reasons, the elimination of percentage depletion on foreign deposits of oil and gas is unlikely to increase U.S. revenues significantly, and will merely increase the burden of foreign taxes on U.S. businesses . . ."

Similar statements have been made in the past to the Congress by former Secretary of the Treasury C. Douglas Dillon [2] and former Deputy to the Secretary of the Treasury Dan Throop Smith.[3]

Thus, any increased tax revenue would be lost to the U.S. Treasury and U.S. balance of payments. In addition, the likely impact of the higher tax burden on U.S. oil companies' foreign activities would be to reduce earnings available for distribution to U.S. stockholders and thus would tend further to reduce Treasury tax revenues, owing to the reduction in taxable dividend income. This impact would tend to increase over time, as new investments were deterred by the greater burden of taxation.

The Treasury has recommended deleting the provision in Section 501(a) which would eliminate depletion on foreign oil and gas production. We strongly support the Treasury's recommendation.

Section 341

For companies which have elected the per-country basis for calculating their foreign tax credits, Section 431, in contrast to existing law, would not always allow full credit for foreign income taxes paid up to the amount of U.S. taxes which would otherwise be due on such income. In so doing, this provision would introduce new discrimination in U.S. tax laws affecting foreign-source income and would in some circumstances result in double taxation of foreign income. Therefore, we recommend that Section 431 be rejected.

In attempts to justify Section 431, it has been argued in the Ways and Means Committee report on H.R. 13270 that the current law provides a so-called "double tax benefit" to companies which incur initial losses in foreign activities and are able under the per-country foreign tax credit provision to reduce their U.S. taxable income in that year by the amount of such foreign losses. The first so-called tax "benefit" is that the taxpaying company is able to combine profits earned in the United States and abroad with losses incurred in the United States and abroad in determining taxable income. The reasonableness and appropriateness of combining profits and losses for tax purposes is accepted in the House-passed Bill, as it should be. This is a long-accepted and valid principle of taxation. The ability to combine profits and losses in the case of foreign and domestic

[2] "Statement on Hon. C. Douglas Dillon," *Hearings before the Committee on Ways and Means on the President's 1963 Tax Message, 88th Congress, 1st Session*, Feb. 7, 1963, p. 606.

[3] Dan Throop Smith, Letter dated May 6, 1958, to Harry F. Byrd, Chairman, Senate Finance Committee, on H.R. 8381, *Congressional Record*, August 11, 1958, p. 16923

operations is simply consistent with the U.S. principle of taxing the worldwide income of its citizens.

The second part of the so-called "double tax benefit," so the argument goes, is said to occur when operations turn profitable in the country in which the losses were incurred and the U.S. taxpayer is then allowed credit for the foreign taxes he actually pays on such income. This, of course, reflects the operation of the foreign tax credit, which is required in order to prevent international double taxation. Far from being a "double tax benefit," the credit for foreign taxes paid avoids the inequitable situation in which the taxpayer's income would be taxed twice.

Section 431 would deny to the taxpayer up to half of the credits currently allowable for foreign taxes actually paid until the Treasury effectively "recaptured" in actual U.S. tax revenues the amount of U.S. taxes which would be due on income equivalent to the earlier losses *if no foreign income taxes had been paid*. The point is, of course, that when foreign taxes are paid, any further taxation of income which has already been taxed at the U.S. rate, or higher, is double taxation which U.S. law has traditionally sought to avoid. The proposal would not eliminate a "double tax benefit," because there is no double tax benefit.

The following examples compare the results which occur under existing law with the results which would occur if Section 431 of the House-passed bill is enacted. The first example illustrates the results of the foreign country allows the taxpayer to carryover his losses and the second example if the foreign country does not allow any loss carryover.

EXAMPLE I—LOSS CARRYOVER ALLOWED BY COUNTRY A

For simplicity, assume that the taxpayer elects to claim the foreign tax credit in the year he incurs a foreign loss, that the U.S. and foreign tax rates are each 50%, and that foreign country A allows a loss carryover. The following example shows what would occur under both present law and section 431, assuming the financial results shown in Column 1:

	Income or (loss) (1)	Foreign tax (2)	U.S. tax—present law (3)	U.S. tax—sec. 431 (4)
1970:				
U.S. business	$1,000	0	$500	$500
Business in country A	(200)	0	(100)	(100)
Business in country B	1,000	$500	500	500
Total	1,800	500	900	900
Foreign tax credit—Country B			(500)	(500)
Net U.S. tax			400	400
1971:				
U.S. business	1,000	0	500	500
Business in country A	200	0	100	100
Business in country B	1,000	500	500	500
Total	2,200	500	1,100	1,100
Foreign tax credit—Country B			(500)	(500)
Net U.S. tax			600	600
1972:				
U.S. business	1,000	0	500	500
Business in country A	400	200	200	200
Business in Country B	1,000	500	500	500
Total	2,400	700	1,200	1,200
Foreign tax credit:				
For country A tax			(200)	[1] (150)
For country B tax			(500)	(500)
Net U.S. tax			500	550

[1] Note.—This result occurs because sec. 431 would reduce the amount of the allowable foreign tax credit in 1972 by 25 percent (limitation fraction of $300/2 400 instead of $400/2 400 times the U.S. tax of $1 200) which has the effect of doubling up on the taxation of the foreign source income in 1972. Although not clear from the committee report, statutory construction of sec. 431 appears to require a partial recapture of the 1970 loss incurred in country A in 1971 in the amount of $100 (not to exceed 50 percent of taxable income from country A in 1971 of $200) even though no tax was paid to country A in 1971. If this partial recapture is not made in 1971 the inequitable tax result shown here as occurring in 1972 would become twice as great resulting in a $100 additional U.S. tax instead of $50 as shown in the example.

Under present law, shown in column (3), the $200 loss in Country A in 1970 reduces the taxpayer's U.S. tax in 1970 by $100. In 1971, when $200 of income is earned in Country A, present law results in a U.S. tax of $100. Since Country A imposed no tax on this income, no foreign tax credit is available to satisfy the U.S. tax on this income. Thus, in countries which allow loss carryovers, when sufficient income is earned to offset the prior loss, the taxpayer automatically bears a U.S. tax liability equal to the earlier reduction in his U.S. taxes resulting from the loss. In 1972, when the taxpayer earns $400 of income in Country A and pays $200 of foreign income taxes, he owes no further U.S. taxes because of the foreign tax credit.

Under Section 431, shown in column (4), identical results occur in 1970 and 1971. However, in contrast to present law, in 1972 Section 431 would impose a further U.S. tax of $50 on the $400 income from Country A, thereby resulting in double taxation. As a result of this double taxation, the U.S. taxpayer in the example bears an effective income tax rate of 62.5 per cent on his 1972 income in Country A. Of course, the effective rate of tax which would result from the double taxation imposed by Section 431 can be much higher, or slightly lower than occurs in the example, depending on the amount of income earned in the year concerned. The point is that the inequitable result of double taxation occurs. Moreover, this occurs despite the fact that the earlier reduction in U.S. tax revenue resulting from the original loss was, in effect, "recaptured" by the United States when sufficient income was earned to offset the earlier loss.

EXAMPLE II—LOSS CARRYOVER NOT ALLOWED BY COUNTRY A

Assume the same facts as in Example I except that Country A does not allow a loss carryover.

	Income or (loss) (1)	Foreign tax (2)	U.S. tax—present law (3)	U.S. tax—sec. 431 (4)
1970:				
U.S. business	$1,000	0	$500	$500
Business in country A	(200)	0	(100)	(100)
Business in country B	1,000	$500	500	500
Total	1,800	500	900	900
Foreign tax credit—country B			(500)	(500)
Net U.S. tax			400	400
1971:				
U.S. business	1,000	0	500	500
Business in country A	200	100	100	100
Business in country B	1,000	500	500	500
Total	2,200	600	1,100	1,100
Foreign tax credit—country A			(100)	(50)
Foreign tax credit—country B			(500)	(500)
Net U.S. tax			500	550
1972:				
U.S. business	1,000	0	500	500
Business in country A	400	200	200	200
Business in country B	1,000	500	500	500
Total	2,400	700	1,200	1,200
Foreign tax credit:				
For country A tax			(200)	(150)
For country B tax			(500)	(500)
Net U.S. tax			500	550

The results in 1970 are identical to that in the first example, in which Country A allowed a foreign loss carryover. However, in 1971, since no loss carryover is allowed in Country A, the taxpayer pays a $100 tax to Country A. Present law permits the taxpayer to claim a tax credit for the taxes paid to Country A to the extent that the U.S. would have imposed a tax on such income had it been earned in the United States. Thus, the taxpayer is allowed a tax credit of $100 against his U.S. tax liability on the income from Country A. Also, in 1972, present law allows the taxpayer a $200 credit for income taxes paid on the $400 of income earned in Country A.

In contrast to the situation under present law, in which the taxpayer pays a tax rate of 50 per cent on his worldwide income, Section 431 would impose additional taxes in 1971 and 1972. Thus, under Section 431 the taxpayer would owe a U.S. tax of $50 in both 1971 and 1972 on the income from Country A, despite the fact that such income had already been taxed by Country A at the U.S. rate. As a result, in 1971 the taxpayer would bear an effective income tax rate of 75 per cent, and in 1972 a tax rate of 62.5 per cent on his income from Country A. As in Example I, the effective rates of the tax burden on this income in the years following the loss will depend on the amount of income earned in those years, and can be higher or lower than the rates shown.

Proponents of Section 431 would argue that the impact of double taxation such as occurs in 1971 and 1972 is justifiable because the taxpayer's loss in 1970 reduced his worldwide taxable income and, thus, his U.S. tax in 1970. Without the additional tax imposed by Section 431, the taxpayer would have a so-called "double benefit": (1) the recognition of the loss incurred in 1970 in determining total taxable income; and (2) the allowance of a tax credit for income taxes paid to a foreign government on subsequent income from that country.

It is difficult to see how taking a loss into account in determining worldwide taxable income can be considered to be an undue "benefit" to the taxpayer. Without recognition of the loss, taxable income would be overstated. In subsequent years, recognition of income taxes actually paid to a foreign country as legitimate credits against U.S. taxes imposed on the same foreign-source income is just, equitable, and essential to avoid the inequity of double taxation of the taxpayer's income.

In addition to the results described in the examples, if Section 431 is enacted unrelated projects in a country in which losses were incurred by a taxpayer could be burdened with double taxation as a result of the "recapture provisions" relating to losses incurred on earlier projects which never earned subsequent profits sufficient to offset those losses. This could affect completely unrelated projects undertaken many years later. For example, suppose a taxpayer initiated unsuccessful drilling activity in Country A in 1970, incurring substantial losses in the early years of the decade. Suppose that in 1980, while continuing to carry on small-scale exploration activity, the taxpayer decides that it would be economically attractive to establish a fertilizer plant in Country A, and expects during the first year of operations to earn profits. Under Section 431, even if the taxpayer would pay foreign taxes on his profit at the U.S. rate, he would nevertheless owe additional taxes to the U.S. Government on such income because of the prior losses from his drilling activities. The prospect of an additional tax burden on the fertilizer project, owing to losses on unrelated earlier operations, could well make an otherwise attractive investment uneconomic for the taxpayer.

Moreover, Section 431 would create tax liabilities relating to earlier losses even if the property which had given rise to the loss was subsequently expropriated by a foreign government without compensation. To illustrate, suppose a taxpayer experienced an operating loss of $50,000 in his branch operation in Country A in 1971, and in 1972 the government in Country A expropriated without providing any compensation for the $200,000 worth of property involved. Although the taxpayer would be allowed a tax deduction based on the cost of the property expropriated, Section 431 would require him to include in taxable income in 1971 an amount equal to the prior operating loss. Similarly, Section 431 would require the creation of taxable income equal to prior losses in cases in which property which gave rise to a foreign loss is subsequently abandoned or sold off at a loss. That is, while the taxpayer would be allowed to deduct the amount of the loss of property, he would also incur a tax liability for income equivalent to the prior loss.

Thus, the operation of Section 431 leads to the strange result that when a taxpayer incurs an operating loss followed by a loss of property, taxable income is somehow created out of thin air. In these situations it would have been advantageous if the properties had instead been destroyed by fire or windstorm, or some other casualty, since in such cases Section 431 would not require the creation of income subject to tax.

The operation of Section 431 would in some cases so severely discriminate against foreign activities as to preclude many new foreign ventures for U.S.

companies. Particularly risky foreign projects such as exploratory activities for foreign oil resources would be most seriously discouraged by this provision. Indeed, Section 431 would, over time, have the effect of denying existing deductions for intangible drilling costs to the extent these deductions resulted in a loss in a foreign country. Section 431 substantially adds to the deterrents in H.R. 13270 to the continued effective participation by U.S. oil companies in the international oil industry.

The Treasury supports this provision and recommends that it be extended to apply to situations in which there has been an overall foreign loss for a company which calculates its tax credit on the basis of the overall limitation. The proponents of Section 431 argue that the provision will increase revenues to the U.S. Treasury. It should be noted, however, that those who make this argument generally fail to take into account the impact these provisions would have on tax revenues resulting from taxes on U.S. dividend income. Profits from foreign ventures contribute significantly to the income and dividends of the companies involved, and such dividends are taxed in the hands of individual shareholders. To the extent U.S. companies find their ability to compete abroad impaired by the increased tax burden imposed by Section 431 they will lose investment opportunities to foreign competitors. Thus, U.S. corporate dividends will tend to diminish and, accordingly, U.S. tax revenues from dividend income will tend to decline.

For all the reasons outlined above, we urge that Section 431 be deleted from the House Bill.

Section 432

Section 432 would introduce a special limitation on the amount of credits allowed for foreign income taxes paid in connection with foreign mineral producing activities. This provision is highly discriminatory against extractive industries and apparently reflects faulty analysis of the taxes incurred on petroleum operations abroad as well as a failure to recognize the integrated nature of these operations. We recommend that it be rejected.

It has been suggested that the income taxes paid by U.S. petroleum companies in some foreign producing countries must contain an element of "royalty" in them, since the income tax rates in such countries are sometimes higher than the U.S. rate, or higher than the rate applying to other industries in that country. However, those who have argued that income taxes in petroleum-producing countries contain an element of royalty (for which credits against U.S. taxes are not allowed) are apparently not aware that royalty payments in these countries are generally as high as, and in some cases considerably higher than, royalties paid on production in the United States. For example, in the case of Venezuela, the effective rate of royalty on gross producing income exceeds 25 per cent, compared to the 12½ to 16⅔ per cent the U.S. industry generally pays on gross producing income in the United States.

Moreover, the fact that both royalties and income taxes are paid to the same government—on the one hand as the owner of the property from which the minerals are produced, and, on the other hand, as the authority levying a tax on the income resulting from such production—does not alter the nature of either payment. Both royalties and income taxes relating to petroleum production are paid to the Federal and State governments in the United States, and to foreign governments, including Canada, Australia, the United Kingdom, and the Netherlands, as well as countries in Asia and Africa. It is clearly possible to distinguish between royalties and income tax payments to these countries.

As Assistant Secretary Cohen expressed the Treasury's view, in discussing Section 432:

"The Administration supports, in part, the effect of this second provision. However, while we recognize the hidden royalty problem at which the House Bill is directed, we do not feel that the bill provides an equitable solution to that problem. On further examination of the tax and royalty structure applicable to the international minerals industry, we do not feel that it is proper to characterize all foreign taxes on mineral income in excess of U.S. taxes on such income as disguised royalties. It is impossible to ascertain the extent to which income taxes in any particular country are a substitute for royalties, and in many cases the foreign country receives royalty payments which are even greater than royalties customarily paid in the United States. Also, foreign countries frequently impose income tax on non-mineral income, as well as on mineral income, at a rate in excess of the U.S. rate.

"If, then, this separate limitation in the bill regarding mineral income is not justified on the ground that any foreign tax in excess of the effective U.S. tax on mineral income is a royalty, it works unfairly for mineral companies as compared to all other U.S. taxpayers with foreign operations. It completely denies mineral companies the opportunity, available to other taxpayers, to average the excess of foreign tax over U.S. tax on mineral income against any excess of U.S. tax over foreign tax on their other foreign income. This result occurs even though the foreign tax on the mineral income is at a reasonable rate judged by world standards and even though such averaging is precisely the purpose of the over-all limitation."

In our opinion, the Treasury is correct in urging rejection of Section 432 as it now stands, since it would, in effect, unfairly deny the use of the overall credit to the mineral industry. The Treasury has recommended in lieu of Section 432 that excess credits for foreign taxes paid on mineral income resulting from the allowance of U.S. percentage depletion which Treasury has recommended be reinstated on foreign production not be available to be applied against other income. The Treasury has also said that a similar rule now applies in the case of Western Hemisphere Trade Corporations. We believe that this proposal should be studied carefully.

The Treasury has also expressed a broader concern about high foreign tax rates and noted that, apart from percentage depletion, it could be provided for the mineral industry that excess credits resulting from foreign income tax rates higher than 60 percent not be available to be used against other income. However, as the Treasury has stated, such singling out of the mineral industry cannot be justified on the grounds that high foreign tax rates contain disguised royalties. Therefore, Treasury has decided to study the question of high foreign tax rates in a general context, as they apply to all industries. We agree with the Treasury that there is no justification for singling out the mineral industry for discriminatory treatment in this area. However, in our opinion, there is also no justification for invading the overall foreign tax credit limitation as it applies to all industries, such as a generalized limitation with respect to credits resulting from foreign tax rates in excess of 60 percent would do.

Section 432 of H.R. 13270 would go much further than this for the mineral industry by preventing mineral companies on the overall foreign tax credit limitation basis from using any excess tax credits from mineral producing activities abroad. Thus, Section 432 would separate for U.S. tax purposes a part of the foreign petroleum industry production which is economically inseparable from activities such as refining, transporting and marketing this production. Investments in foreign oil producing activities are closely linked to investments in refineries, pipelines, tankers, and other distribution facilities. For example, since the beginning of 1960 my Company alone has spent about $1.5 billion to add a crude oil producing capacity abroad. This oil was, and is, destined primarily for markets outside the United States—in Western Europe, Latin America, Asia, Africa, and the Far East. But without heavy further investments by Jersey Standard in refineries, pipelines, tankers, and other distribution facilities to serve these markets, we simply could not have justified such large investments in additional producing capacity. An international oil company is a closely tied network of oil trade which simply cannot be untied or separated into segments. To attempt to do so contradicts economic fact.

In enacting the overall limitation for purposes of the foreign tax credit in 1960, the Congress stated in House Report No. 1358, 86th Congress, 2nd Session, page 866:

"In most cases American firms operating abroad think of their foreign business as a single operation and in fact it is understood that many of them set up their organizations on this basis. It appears appropriate in such cases to permit the taxpayer to treat his domestic business as one operation and all of his foreign business as another and to average together the high and low taxes of the various countries in which he may be operating by using the overall limitation."

Thus, the existing option available to U.S. companies to elect the "overall" basis for determining the credit for foreign taxes paid results from deliberate Congressional action, in which the Treasury concurred. In this connection, it may be recalled that former Assistant Secretary of the Treasury for Tax Policy Stanley S. Surrey praised such action by the Congress in the 1962 Revenue Act, by noting that the Act:

". . . sets a precedent for looking at the foreign activities of a U.S. corporation on a consolidated basis, as if together they comprised a single entity. In this respect the tax law is beginning to recognize the 'international corporation' and to grapple with the technical tax problems which it involves." [4]

As noted in the House Report cited above the introduction of the overall limitation was based on the fact that many U.S. companies regard their foreign activities as an integrated operation outside the United States. Accordingly, in such cases it is appropriate, and would reflect economic reality, to permit such companies to compute the foreign tax credit on the basis of income from all sources outside the United States rather than a country-by-country basis. As explained previously, the integrated nature of the international oil industry makes it particularly appropriate to allow U.S. oil companies to elect the overall foreign tax credit limitation, and thereby average together the high and low rates of tax paid on operations in all foreign areas. Notwithstanding this fact, Section 432 effectively would deny the use of the overall concept to the mineral industry. As was noted by Secretary Cohen before this Committee early last month, to introduce a separate limitation for tax credits on income from mineral production would effectively deny to mineral companies the option under existing law for companies to elect to calculate their foreign tax credit on the basis of the overall limitation, while permitting all other industries to continue to elect the overall basis. Such discrimination is clearly unjust and unwarranted.

Moreover, the proposed limitation in Section 432 would have the effect of double taxation of the income from integrated petroleum activities abroad. Rather than allowing the averaging of the high and low tax rates, Section 432 would seek out individual parts of a taxpayer's income in low-tax countries and increase the tax to the U.S. level. In so doing, this provision would effectively require mineral business operations abroad to pay more income taxes than the same operations would pay if conduced wholly within the United States. However, the end result would be a net gain for the treasuries of foreign governments with no significant increase in revenues for the United States. This would occur because foreign governments with lower income tax rates would recognize that if they increased their taxes on the American mineral industry abroad, such taxes would be creditable against U.S. taxes on the same foreign income.

Conclusions

In our opinion, Sections 501(a), 431, and 432 of H.R. 13270 ought to be rejected. By increasing the tax burden on U.S. petroleum companies' operations abroad, the provisions contained in these sections could seriously impair the ability of U.S. companies to compete effectively with foreign companies in the international oil industry. This could affect U.S. companies' participation in all phases of the industry, but the most severe impact is likely to be felt on the ability of U.S. companies to obtain concession rights in new producing areas.

The national security interest of the United States requires that our country have ready acess to growing and diverse foreign sources of oil to meet our expanding economic and military needs for energy. The provisions in H.R. 13270 relating to the foreign activities of U.S. petroleum companies would place new obstacles in the way of U.S. companies participating in the future growth of the industry abroad, and thus would run counter to our national security interest. Moreover, by discouraging the foreign investments of U.S. petroleum companies and delivering investment opportunities to foreign competitors, the provisions would be detrimental to our balance of payments and general economic welfare. Finally, the provisions are inequitable, would result in double taxation, and are unlikely to produce a significant amount of revenue for the United States.

Sections 501(a), 431, and 432 all would discriminate against foreign-source income, and would unfairly increase the tax burden on U.S. investors who have made substantial foreign investments on the basis of existing tax law. Section 501(a) would discriminate against the foreign activities of U.S. petroleum companies by denying them comparable tax treatment to operations conducted in the United States. Section 431 would double-tax individual parts of a taxpayer's income, while Section 432 would introduce international double taxation on the integrated petroleum industry operations abroad by denying to the mineral industry alone the effective use of the overall basis for applying the foreign tax credit. All these provisions would seriously depart from valid and long-standing principles of tax equity. We strongly urge that they be rejected.

---

ATTACHMENT I

SUMMARY OF INCENTIVES GRANTED BY FOREIGN GOVERNMENTS IN REGARD TO THE PRODUCTION OF OIL AND GAS UNDER PETROLEUM AND/OR TAX LAWS

Argentina

Immediate deduction is allowed for exploration costs as well as amortization thereof. An option is available to deduct exploration expenses and normal depreciation on capital assets against non-petroleum activities.

Australia

Recovery of expenditures.—A taxpayer is permitted to recover allowable capital expenditures in regard to exploration and producing activities before any production income becomes subject to income tax. This provision accumulates expenditures for formation, exploration/development and production as deductions against future income from the sale of petroleum production. Income tax is thus postponed until the deductions have been fully offset against producing sales. A petroleum exploration company is allowed to transfer the tax deduction for any producing or exploration expenditures from itself to its shareholders. In this way, the shareholder can claim the deduction for the stock investment in a petroleum exploration company against current taxable income and the deferred deduction of the exploration company is correspondingly reduced.

Partial additional deduction for investment.—A deduction for ⅓ of the "calls" on shares to the stockholder investing in the exploration venture is allowed. Since the exploration company may claim a tax deduction for its expenditures, this will result in an aggregate deduction of 133⅓% between the company and its shareholders.

Direct subsidies.—Subsidies are also used to create favorable conditions for petroleum exploration activities. Originally limited to a subsidy of ½ the cost of a company's approved-stratigraphic drilling program; now extended to include off structure drilling, detailed structure drilling, borehole surveys, and geophysical surveys employing magnetic, seismic, gravimetric or other physical methods of obtaining petroleum exploration information. Both past and future subsidies are not taxable, but the taxpayer's deduction for exploration expenditures has to be reduced by the amount of subsidy received. The government now pays up to 30% of the cost of all geophysical surveys and test drilling operations. In the case of stratigraphic drilling the limit is 40%.

Belgium

Allows producers a tax-free reserve limited to 50% of the taxable profits from production. Such reserves must be reinvested within 5 years.

British Honduras

Allows percentage depletion of 27½% of gross income limited to 50% of net petroleum income after royalties but before depletion. Intangible drilling costs are deductible when incurred, limited to 50% of net petroleum income after royalties but before depletion.

Canada

Allows percentage depletion at 33⅓% of overall profits. All drilling, exploration and general operating costs on a company-wide basis must be deducted before depletion is computed.

Colombia

Allows normal percentage depletion of 10% of the gross value of production less any royalties or participations, limited to 35% of net income before depletion. In addition, a special depletion allowance, computed on the same base, of 18% in the East and Southeast Region, and 15% in the rest of the country, is also allowed. The total of normal and special depletion is limited to 50% of net taxable income in the East and Southeast Region and to 45% in the rest of the country. Amounts allowed as special depletion must be reinvested within three years in petroleum related facilities. Failure to reinvest results in their restoration to taxable income, but over-investment may be carried forward to apply against future reinvestment obligations.

France

Allows producers a reserve equal to 27½% of the gross value at the wellhead of the crude oil extracted. This reserve is limited to 50% of the net profit from production and from the first stage of processing in the producer's own refineries. For the tax exemption to be retained such amounts must be reinvested within 5 years, either in the way of fixed assets or research work for new discoveries of oil or gas, or by making investments in certain companies approved by the government. If not reinvested within this time limit, the reserve is required to be restored to the taxable profits of the fiscal year during which such 5 year period expires, and taxed as ordinary income.

Germany

German (domestic) oil companies operating outside Germany could obtain through December 31, 1968 low interest loans in amounts of up to 75% of the costs of exploration. Such loans were repayable only when commercial production was obtained. Exploration for or production of oil during the years 1959 to 1962 was a prerequisite. There is a new government incentive for foreign operations which was signed on July 7, 1969, effective for the years 1969 through 1974. Under the new proposal a total of DM 575 million will be allocated under a loan scheme. Loans will be granted up to 75% of exploration expenditures and if there is no discovery, no repayment will be required. Even with discovery, up to 50% of the loan can be waived under certain circumstances. If the financial situation warrants it, the plan contemplates a non-repayable contribution of up to 30% of the costs of acquiring a productive field or shares in a producing company. To be eligible under this new plan, the company must be domiciled in Germany and have produced petroleum in Germany or been processing petroleum within Germany prior to January 1, 1969. Loans will not be granted if the enterprise can reasonably be expected to finance itself. However, it is expected that if a group of the major German-controlled companies form a new company to explore overseas, this new company will not be considered able to finance itself. Until January 1, 1970, oil and gas companies are permitted to write off drilling costs, geological and geophysical expenditures, dry holes, etc., immediately against other income, whether a branch or subsidiary is used. An oil company can also write down its investment in a foreign subsidiary. When production is achieved the investment must be restored, but this restoration can be written off on a very liberal basis. Presumably this legislation will be extended.

Guatemala

Allow percentage depletion of 27½% of gross income, limited to 50% of net income. Exploration and intangible drilling costs can be expensed. Losses can be carried forward indefinitely.

Guyana

Allows percentage depletion and deduction of intangible drilling costs at a "reasonable" level as established by the Commissioner.

Honduras

Allows percentage depletion of 25% of gross production, limited to 50% of net taxable profits. Exploration expenses as well as intangible drilling costs can be expensed. Losses can be carried forward for ten years.

Israel

Allows percentage depletion of 27½% of gross income, limited to 50% of net income.

Japan

Allows percentage depletion for companies conducting petroleum exploration, subject to a recapture to the extent that, within a 3-year period, an amount equivalent to the deduction has not been invested in further exploration. The amount is 15% of sales revenue, limited to 50% of net income. A current deduction of intangible drilling and development costs for unsuccessful wells is also provided. These incentives apply to both domestic and overseas exploration.

Overseas incentive.—The government has organized the Petroleum Development Public Corporation (PDPC) as a government-owned entity for the purpose of channeling government funds into exploration and production in order to promote the development of petroleum resources and to ensure stablized supplies of petroleum.

The PDPC accomplishes these objectives by:

(1) Making investments and loans necessary for petroleum exploration in overseas areas.

(2) Guaranteeing debt resulting from loans necessary for overseas petroleum exploration and production,

(3) Leasing equipment required for oil exploration, and

(4) Giving technological guidance on oil exploration and production.

The loans referred to in (1) are extended on favorable terms and repayment is required only if the venture financed is successful. Loans amounts may be as high as 50% of the cost of the undertaking, and joint exploration ventures by Japanese and foreign companies, in which the Japanese interest is at least 50%, may also receive these benefits. To date, the PDPC has committed itself to extend financial support to exploration ventures in Alaska, Southeast Asia, and the Persian gulf.

Domestic incentives. Presently, the government is in the process of developing a policy to actively encourage development of domestic oil and gas reserves. There is in effect a duty rebate system for certain offtakers of indigenous crude. There has been pressure on the government to extend the above PDPC incentives to domestic production, consequently, the government is now reviewing this possibility.

Nicaragua

Allows percentage depletion of 27½% of wellhead value less royalties, limited to 50% of net taxable income before depletion. Intangible drilling costs and dry hole costs are deductible once production is attained. Losses may be carried forward ten years.

Nigeria

Exploration losses, intangible drilling costs and dry holes can be expensed. Losses may be carried forward indefinitely.

Norway

The government may grant companies engaged in the exploration and exploitation of offshore oil and gas deposits the right to carry losses forward over a 15-year period rather than the normal 10-year period.

Pakistan

Allows percentage depletion at the rate of 15% of the wellhead value, subject to a maximum of 50% of net income.

Peru

Allows percentage depletion from 15% to 27½% of the gross value of production (adjusted for transportation in certain areas) depending on whether a national or foreign company is involved and the region in which production is located. A foreign company with production in the Coastal Region is limited to 50% of net profit after deducting depletion and the 20% minimum advance payment of income tax. All others are limited to 50% of net profit before deduction of depletion and the advance payment of income tax. Deduction for intangible drilling costs is also allowable.

Philippine Republic

Allows percentage depletion of 27½% based on gross income, after an amount equal to any rents or royalties paid or incurred in respect to the property has been deducted.

Sabah

Allows percentage depletion at rates deemed reasonable by the Commissioner.

Spain

Allows percentage depletion of 25% of the field value of production less royalties, but limited to 40% of the net profit before deducting depletion: Similar rules apply in the Spanish Sahara.

St. Maarten

Allows percentage depletion at rates deemed reasonable by the Commissioner.

Trinidad and Tobago

Allows percentage depletion of 20% of the gross value of production of submarine wells limited to 40% of income without the deduction of certain specified allowances.

Turkey

Allows percentage depletion of 27½% of the gross income from production after deducting rentals and royalties, limited to 50% of net income before deduction of depletion.

United Kingdom

Cash grants of 20% (40% in certain onshore areas) for oil and gas operations onshore and offshore are available generally as follows:

(1) Geological and geophysical expenses are usually eligible for grant except for the cost of general surveys to determine whether or not to begin exploration in an area.

(2) Lease acquisition costs are not eligible.

(3) Exploration, evaluation and production drilling costs qualify.

(4) Production equipment, certain pipelines and drilling platforms including overheads qualify.

In effect all exploration and drilling expenses (not in excess of investment grants) incurred prior to proving reserves may be expensed. Thereafter until production is achieved, both tangible and intangible drilling costs are capitalized and amortized on a unit of production basis. After production is achieved, tangible costs are still capitalized and amortized, but intangible costs are expensed. Losses may be carried forward for an unlimited number of years. All of the foregoing items that require capitalization must be so treated because only an item that is capitalized is eligible for an investment grant. If for any reason an investment grant is not received, such items may be expensed.

STATEMENT OF ROBERT G. DUNLOP, PRESIDENT, SUN OIL COMPANY, PHILADELPHIA, PA., AMERICAN PETROLEUM INSTITUTE; MID-CONTINENT OIL & GAS ASSOCIATION; AND WESTERN OIL AND GAS ASSOCIATION

SUMMARY

1. The United States economy is heavily dependent upon petroleum energy; oil and gas today provide nearly three-fourths of all energy consumed in this country.

2. Assured supplies of petroleum are vital to the national security of the United States.

3. With present tax incentives, the domestic petroleum industry has met this country's essential petroleum needs.

4. Present tax and other incentives have enabled the industry to develop a reserve producing capacity amounting to 3,000,000 barrels daily in 1968.

5. Similarly, the United States today has a spare producing capacity—producible and deliverable with existing facilities—of 1,000,000 barrels daily, which is available to meet emergency needs of this country and its Allies.

6. With existing tax incentives, the industry has made oil and gas available to consumers at reasonable prices.

7. Since it is based on production, the depletion provision is a particularly effective incentive for research leading to technological improvement; as such it has contributed significantly to broadening the nation's petroleum resource base.

8. Existing tax incentives have contributed significantly to improving the international payments balance of the United States and to world economic progress.

9. Tax incentives have contributed to the conservation of natural resources by encouraging the use of marginal oil.

10. The petroleum industry earns only average profits on investment.

11. The petroleum industry carries an overall tax burden equivalent to or exceeding that borne by other industries.

12. The combination of sharply rising costs and modestly rising prices is limiting funds available for investment; reserves of oil and gas declined both relatively and absolutely in 1968.

13. Federal control of natural gas well-head prices is partially offsetting the effect of tax incentives and creating a serious supply problem for the future.

14. Increased taxes would likely result either in higher petroleum prices or in reduced investment; neither alternative is desirable.

15. Complete elimination of tax incentives would make the United States heavily dependent on foreign oil; that dependency would range up to 48 to 58 per cent of supplies.

16. This dependency could very well involve this country in a Middle East conflict, through our attempting to insure stability in the area.
17. Contrary to popular notions today, the United States is not running out of oil. Neither is it indicated that Alaska will produce enough additional oil to meet our future needs.

STATEMENT

I am Robert G. Dunlop, president of Sun Oil Company, Philadelphia, Pa. My appearance today is on behalf of the American Petroleum Institute, the Mid-Continent Oil and Gas Association, the Rocky Mountain Oil and Gas Association and the Western Oil and Gas Association.

I will attempt to give you an over-view of the present petroleum situation in the United States and of the likely impact of proposed tax changes on that situation. Appearing with me are Mr. William Spencer, executive vice president of the First National City Bank of New York, who will discuss future petroleum requirements and capital investment needs; Mr. George V. Myers, executive vice president, Standard Oil Company (Indiana), who will evaluate the impact of the proposed tax changes on domestic operations; and Mr. Emilio G. Collado, executive vice president of Standard Oil Company (New Jersey) who will close our presentation with a discussion of the tax treatment of foreign petroleum operations.

My colleagues and I appreciate this opportunity to present the petroleum industry's views on proposed tax changes for oil and natural gas. We feel strongly that this Committee's decisions on petroleum tax policies will significantly affect the Nation's future economic progress and its security. Accordingly, we feel that it is vitally important that the Committee's decisions be based on a comprehensive review of the effect of the proposed changes on our Nation and all of its citizens. It is our intent to contribute to this review by providing you with pertinent background information on the present petroleum situation and how it would be affected by the tax changes now under consideration.

In providing an over-view, I will attempt to define the role of tax incentives in the Nation's petroleum progress; to place the industry's tax payments, prices and profits into perspective; to discuss the relevance of petroleum tax policy to national security; to describe the present status of the industry; and to look at the impact of the tax proposals on the United States petroleum supply position.

First, however, I would like to state the industry's basic position on proposed changes in tax policy. It is this. Our experiences as oil men demonstrates that tax incentives provided by the Congress in present law have very effectively achieved the purpose for which they were created: to provide an incentive for development of our petroleum resources. That our resources have, in fact, been effectively developed is a matter of record—a record of which we in the industry are indeed proud.

We observe two kinds of pressure being applied for a reduction in petroleum tax incentives. One is the pressure of emotional argument for boosting taxes on oil companies, come what may. The second is a more reasoned approach, recognizing the need for incentives but questioning whether the present level is necessary.

The facts of the situation appear to be of little interest to those who have been advancing the emotional arguments. But we are hopeful that the facts will be of paramount importance to those who are sincerely interested in reaching tax policy decisions that will be in the long-run best interests of the people of the United States.

We seek to be open-minded. We are not blindly opposed to change. If petroleum tax policy changes can be demonstrated to be in the best interests of the American public, we will surely not oppose them. But we strongly oppose change based on emotion rather than reason—change which is inimical to the progress of this Nation and to its security.

PETROLEUM ENERGY IN THE UNITED STATES

Against that background, I want first to look with you at the role of petroleum energy in the United States today. I submit that it would not be overstating the case to say that petroleum is the virtual lifeblood of this country. The Department of the Interior has aptly summed up the Nation's heavy dependence upon oil and natural gas in these words:

> "The importance of petroleum to the national life of the United States at this particular moment in history is abundantly in evidence. It supplies

nearly three-fourths of all energy consumed. Virtually all movement of goods and people depend on it. The Armed Forces would be immobilized without it. Countless industrial processes employ it exclusively, and nine-tenths of all space-heating is provided by it. And quite apart from its use as a fuel, petroleum forms the base for 88 percent of all organic chemicals manufactured in the United States."

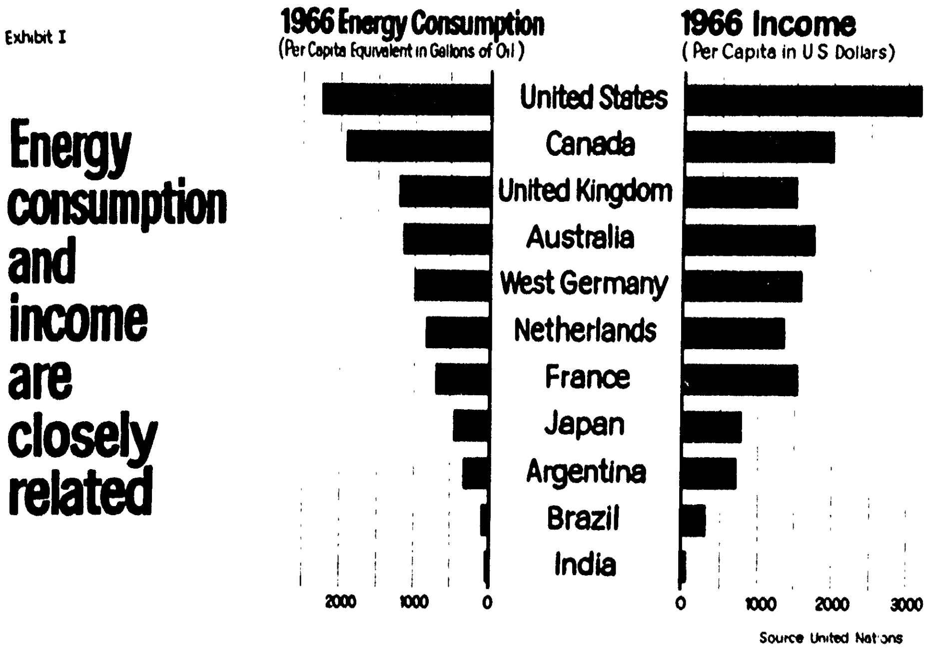
I have taken a moment to include that quotation because I feel that it points up sharply why we are here today. Petroleum is vital to our country—so vital that the Nation could not exist today as we know it without adequate supplies of oil and natural gas.

The industrial revolution which is at the base of our prosperity could just as accurately be characterized as an energy revolution. Our ability to substitute inanimate energy for muscle power has made possible the tremendous increase in per capita production which is the essential measure of economic development.

The correlation between energy consumption and income is one of the significant facts of modern life. (See Exhibit I.)

Petroleum is also essential to our defense capability, although in this age of nuclear weapons some observers seriously challenge this view. I would remind those challengers that, fortunately, the nations of the world have so far avoided nuclear war as a means of solving differences. And we all live in the hope that they will continue to do so. Conventional warfare, on the other hand, is likely to be with us for the foreseeable future. So petroleum is now, and will continue to be, vital to our national security.

Exhibit I



Although surprising to many, the truth is that petroleum is becoming increasingly important to our defense capability. In 1968, defense procurement of petroleum per man under arms *was twice the peak World War II level*—even though the fighting in progress last year was restricted to a very limited geographic area.

The Department of Defense has put it this way:

"The part that oil plays in the defense posture of the United States is vitally important. It is a strategic material and one of the few items that is absolutely essential and foremost in the minds of military commanders. Along with weapons and ammunition, the needs of petroleum get the most attention."

In my view, these facts add to an inescapable conclusion: The future of the United States as we know it is vitally dependent upon assured supplies of oil. Realistically, we have only two routes to travel in obtaining oil:

(1) maintaining a strong domestic industry capable of meeting our essential needs, or

(2) turning increasingly to foreign supplies and, ultimately, becoming dependent upon those less secure foreign sources.

PETROLEUM DEVELOPMENTS UNDER EXISTING TAX POLICIES

Up through the present day we have chosen to travel the first route, seeking to provide the incentives necessary to assure the continuance of a strong domestic petroleum industry capable of meeting the essential oil and gas needs of the Nation.

Was this a wise course of action?

Petroleum needs fully met

The record affirms that it was. For under past and present policies the United States petroleum industry has historically met the petroleum supply needs of this Nation and at the same time contributed immeasurably to the needs of our friends and allies. I need not recount to this Committee the major supply crises we have successfully met in the past.

It would perhaps be of interest and value, however, to show by example how petroleum tax incentives, working in conjunction with other incentives, have contributed to the development of our petroleum resources.

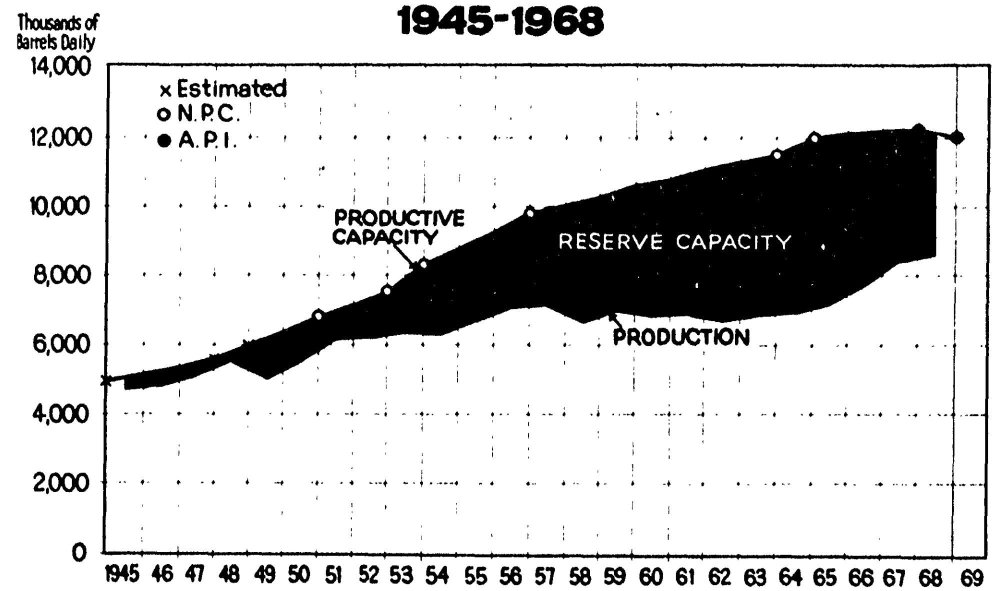
At the close of World War II, the heavy war-time drain on United States petroleum supplies had resulted in a situation where productive capacity was barely equal to demand.

The tax incentives, together with the thrust of rising prices during the late 1940's, enabled the industry steadily to improve the supply situation. By 1955, as shown in Exhibit II, we had reserve capacity of more than 2,000,000 barrels daily. In 1968, reserve capacity was 3,000,000 barrels daily.

Exhibit II

RESERVE CRUDE OIL PRODUCTIVE CAPACITY

1945-1968



I suggest that this is a dramatic demonstration of the role played by the depletion provision and other incentives in helping to assure adequate supplies of petroleum for the United States.

To carry the discussion one step further, we might with profit examine our present available spare producing capacity in the light of potential requirements. I am referring now to deliverable capacity—that capacity which can be produced and transported with existing facilities.

I can best demonstrate this by posing a hypothetical situation. Assume for a moment a Middle East war in which the United States, Canada, Western Europe and Japan would be denied Arab bloc oil—that is, all oil from North Africa and the Middle East with the exception of Iran.

Assume also that the United States, Canada, Latin America and Iran choose to supply oil to the maximum of their ability to Western Europe and Japan, which are heavily dependent on Arab bloc oil.

First, what would be the oil supply position of the United States and Canada in this hypothetical situation? And, second, what would be the combined position of the United States, Canada, Western Europe and Japan?

A table demonstrating the supplies that could be made available in relation to requirements is attached as Exhibit III.

In response to question one, the figures show that the United States and Canada would lose 400,000 barrels daily of supply from the Arab Bloc. However, our country and Canada have a combined spare capacity of some 1,200,000 barrels daily, and could cover that loss.

EXHIBIT III.—EFFECT OF LOSS OF ARAB BLOC SOURCES OF CRUDE OIL FOR THE UNITED STATES, WESTERN EUROPE, AND JAPAN

[In thousands of barrels per day]

	United States and Canada	Western Europe and Japan	Combined
1968 requirements	14,700	12,700	27,400
Available from—			
Domestic production	11,700	400	12,100
Present production from non-Arab sources	2,600	3,000	5,600
Spare capacity:			
United States	200	800	1,000
Canada	200		200
Iran and Latin America		1,100	1,100
Total available sources	14,700	5,300	20,000
Shortage		[1] 7,400	7,400
Total	14,700	12,700	27,400
1968 imports from arab sources	400	9,300	9,700

[1] If the United States were to share the burden, there would be a shortage in the United States and a correspondingly lower shortage in Western Europe and Japan.

In regard to question two, by making the best possible use of existing pipeline connections between the U.S. and Canada, we would have, together, remaining spare capacity of only 800,000 barrels daily. Assuming that we made this oil available, and that Latin America and Iran similarly made their spare capacity available, Western Europe and Japan would then be short 7,400,000 barrels daily, or 58 per cent of their needs. If the U.S. were to share this burden, there would then be a shortage in the U.S. and a correspondingly smaller shortage in Western Europe and Japan.

This example clearly demonstrates two important points. First, the United States, with its total deliverable capacity of 10,000,000 barrels daily, is the bulwark of Western oil supply. And, second, even with the spare capacity now available in the United States, there is a significant gap between oil supply and normal requirements in the West. We can permit that gap to continue to grow only at our peril.

Petroleum Provided at Reasonable Prices

In addition to stimulating the development of adequate supplies of petroleum to meet our domestic needs, existing tax policies have helped to make that oil and gas available at reasonable prices to consumers. In terms of real purchasing power, the average price of crude oil has declined in the neighborhood of 20 per cent since 1926. Price comparisons over a more recent period show that since 1957–59 the wholesale price index for crude oil has risen just five per cent while the index for all commodities has increased by 13 per cent.

Gasoline prices, excluding direct taxes, are up only 10 per cent, or approximately two cents per gallon, since 1926. Over the same period, the consumer price index has doubled. Again, over a more recent period, the price of gasoline has advanced approximately 10 per cent since 1957–59 while consumer prices generally went up some 28 per cent. (See Exhibit IV.)

Exhibit IV

Price of gasoline is low

Technological Advances Benefit the Nation

I also want to point out that tax incentive have helped to create benefits for the Nation over and above the development of adequate supplies of petroleum at favorable prices.

The depletion provision, for example, through encouraging investment in the industry and helping to keep it strong, has spurred technological advances in finding and recovering America's oil and gas. The economic impact of these advances has been substantial.

It should be emphasized that percentage depletion is a particularly effective incentive for research leading to technological improvement, since it is based on production. A direct subsidy to exploratory drilling might stimulate that activity, but percentage depletion stimulates *both* exploration and technological advance after discovery. Percentage depletion rewards the successful explorer in proportion to the amount of oil he finds and produces—and hence in proportion to his contribution to the national interest. After successful exploration, it rewards successful research designed to increase producibility of the reserves discovered. It applies in neither case in the event of failure because it becomes effective only when oil is produced. In contrast, a subsidy applies regardless of failure or success.

In exploration technology, improved drilling capabilities have enabled the industry to recover oil and gas at depths that were formerly impossible to drill. In 1930, the deepest well yet drilled went down only slightly more than 9,200 feet. Today the industry is drilling below 25,000 feet.

On another front, offshore drilling in the United States was negligible until the latter half of the 1940's. Today, in contrast, offshore production accounts for some 10 per cent of oil output and 12 per cent of gas output, and the offshore search is one of our brightest prospects for the future. Again, improved technology was the key.

To cite one more example, improved exploratory and drilling know-how is playing an important role in tapping the tremendous reserves of the Alaskan Arctic.

Technological advance is also opening many new horizons in older fields once thought to be nearly-depleted. Before World War II, production was limited to primary recovery—pumping out the oil until the flow became so small as to be economic. This procedure left five or six times more oil in the ground than was recovered, with only 15 to 20 per cent of the oil in place actually produced.

The development of waterflood and other secondary stimulants changed this picture sharply. By upping recovery to 30 to 35 percent of the oil in place, the new techniques have esssentially doubled the Nation's recoverable reserves.

I repeat, technology has doubled recoverable reserves. It has increased the estimated ultimate recovery of crude oil from proved reservoirs by almost 60 billion barrels—20 times current annual production.

In the future, the industry should continue to increase cumulative recoverability through broader application of existing techniques and the development of new techniques.

In brief, invention and innovation encouraged in part by tax incentives have substantially augmented our recoverable reserves and in doing so have contributed importantly to the goal of strengthening the domestic supply position of the United States.

Other economic benefits attributable to tax incentives

Finally, existing petroleum tax policies have contributed significantly to improving the international payments balance of the United States and to world economic progress which has in turn been beneficial to this country.

In regard to international payments, the key plus factor has been the substantial inflow of earnings from past investments abroad.

These same investments have also played a major role in the economic progress of developing nations. Revenues generated by petroleum development projects have provided these nations with the foreign exchanges so essential to economic development, and have contrbuted to secondary benefits such as the creation of modern transportation and communication systems.

Tax incentives have likewise made a contribution to the conservation of natural resources by encouraging the use of marginal oil rather than abandoning this oil. To leave oil of marginal value in the ground is an inexcusable waste of an exhaustible, non-replaceable natural resource. If a marginal well is shut down, the likelihood of its again producing is remote. If it is reopened, it will only be at a considerably higher price for its output. If the production is lost, the country is the poorer.

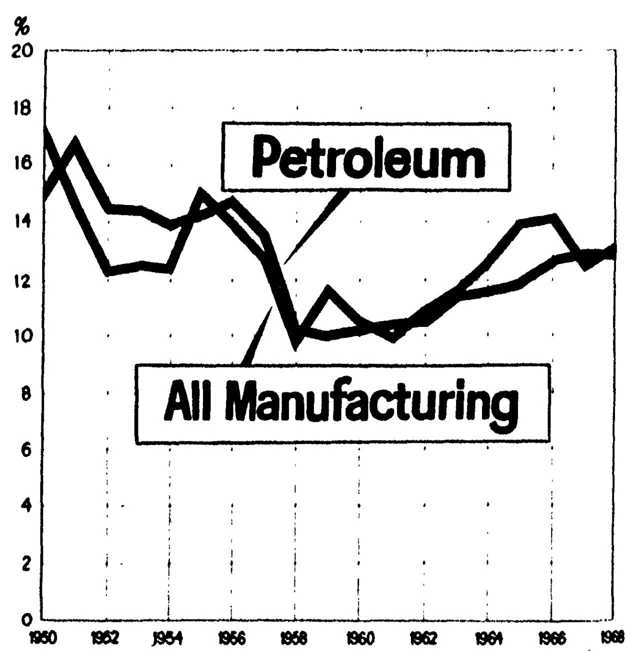
Incentives provided are not excessive

All of these benefits—adequate oil supplies, favorable oil prices, technological progress—have been achieved with the aid of incentives which are not excessive.

If the percentage depletion rate were excessive, for example, this should be reflected in petroleum industry profit performance considerably better than that of other industries. This is not the case. Rather, figures compiled by the First National City Bank of New York demonstrate that the petroleum industry earns only average profits. In 1968, 99 petroleum producing and refining companies earned a 12.9 per cent return on net assets compared with an average return of 13.1 per cent for all manufacturing companies. In fact, the rate of return on net assets for the petroleum industry was higher than the average for all manufacturing companies in only two of the last 10 years. (See Exhibit V).

Exhibit V

Return on net assets Petroleum Industry and all manufacturing after Taxes

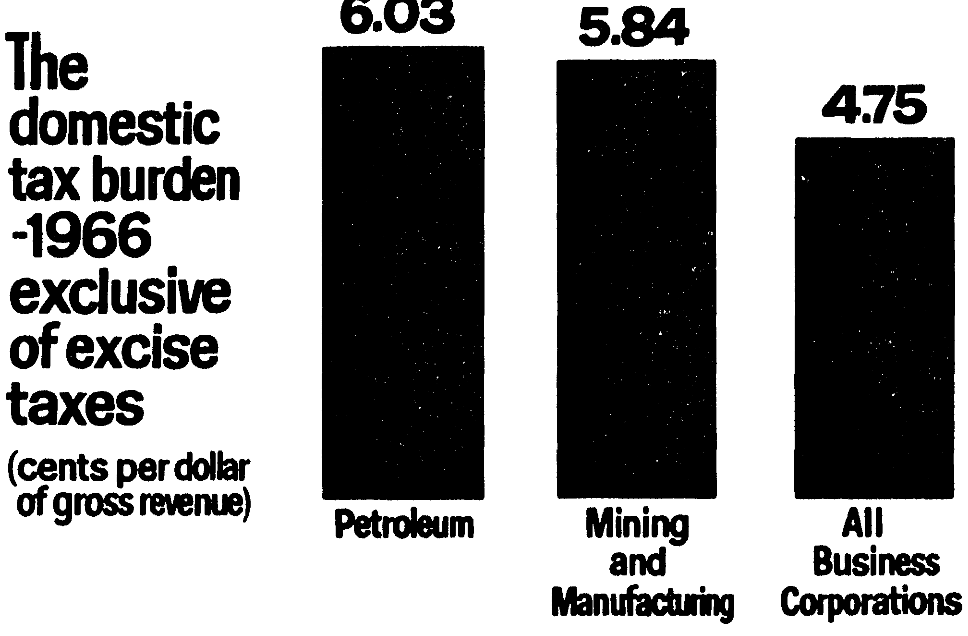


SOURCE First National City Bank

The May 15, 1969 issue of *Fortune* magazine published 1968 financial data of the 500 largest industrial companies in the United States. These data show that, of the 25 largest companies (determined on the basis of sales), seven were oil companies. From a profitability standpoint, however, the record is quite different. Only one of those seven oil companies that rank in the top 25 on the basis of sales was even in the top 100 when ranked on the basis of return on invested capital – and that company ranked only 99th. The companies in the *Fortune* study included 27 oil companies, whose weighted average rate of return on invested capital was 12.0 per cent compared to 12.3 per cent for the other companies.

Similarly, the petroleum industry carries an overall direct tax burden exceeding that borne by other industries, even though its federal income tax bill is reduced by the depletion provision. Lower income taxes are offset by the heavier burden of other direct taxes such as severance and property taxes. As a result, studies have shown that total taxes paid by the petroleum industry, exclusive of motor fuel and excise taxes, in 1966 were equivalent to 6.0 per cent of revenues. (See Exhibit VI). Mining and manufacturing corporations paid direct taxes equivalent to 5.8 per cent of revenues in that year, and all business corporations paid taxes equal to 4.8 per cent of revenues.

Exhibit VI



Current problems and future prospects

Against that background of past experience, I would like now to direct your attention to the petroleum industry's present situation and to its future prospects.

Very frankly, the industry today is eyeball to eyeball with some very serious problems. Steady and substantial increases in petroleum demand have collided head-on with sharply-rising oil finding and development costs, with the result that reserves relative to requirements have been declining. Last year the decline was not only relative, but absolute. Proved petroleum reserves dropped across-the-board during 1968, with the life index of crude oil reserves falling to under 10 years and that of natural gas reserves decreasing to less than 15 years. This does not include the new Alaska reserves which are still being evaluated.

The industry's capability to respond successfully to this challenge could well be determined by the decisions made by this Committee. For this reason I will take a few moments to delineate our major difficulties.

First, the domestic industry is caught squarely between sharply rising costs and moderately rising prices. As I noted earlier, the price of crude oil has risen considerably less than the wholesale price index over the past decade. On the other hand, inflation has boosted exploration costs sharply, and, more significantly, unit costs have been rising because fewer giant fields are being discovered. This upward trend in unit costs is likely to continue since the major new successes are occurring in offshore areas and in Alaska where per well costs are several times higher than onshore ventures in the "lower 48." Parenthetically, it should be recognized that in the long run the cost of crude from Alaska's North Slope will likely average substantially above the unit cost of the enormous field initially discovered.

While improvements in exploration technology have helped to offset rising unit costs a gap continues to exist, particularly in onshore areas where economic exploration ventures are becoming increasingly scarce. A similar problem exists in regard to recovery technology. The most attractive opportunities have already been developed, and further expansion will be dependent upon improved economics based on new technology and the continuance of effective tax incentives.

The natural gas problem differs somewhat from that of crude oil in that the federal government has provided incentives with one hand and taken them away with the other. In other words, the positive effect of tax incentives has been offset by Federal Power Commission regulation of well-head natural gas prices. Under regulation, natural gas sold in interstate commerce is priced below its free market value. In carrying out its gas regulatory responsibilities, the Commission has unfortunately focused its efforts on costs at the expense of supply. It has attempted to apply regulatory techniques developed for public utilities to an intensely competitive industry where survival depends on not investing in low or negative return areas. As a result, only the most favorable natural gas prospects warrant investment in an exploratory venture today.

The serious nature of the present situation was pointed up recently by Federal Power Commissioner Albert B. Brooke, Jr., who declared that the gas industry today faces a "crisis situation." He said that the most obvious, urgent and pressing problem is that of gas supply, and that the next five years "may well prove to be the crucial years." Estimating that demand would grow at a 5 to 7 per cent annual rate, he added that it was unquestionably certain that eliminating or modifying any of the provisions of the tax incentive package would lead to higher consumer prices or more restricted supplies.

In spite of the gas industry experience, it appears that some observers would like to see the crude producing sector of the petroleum business follow the same course as that mandated for gas—to produce at minimum short-run costs regardless of the effect on supply and long-run costs to consumers. If we had followed this advice in the past, the giant fields where our reserve productive capacity is concentrated would be largely depleted, and encouraging new discoveries offshore and in Alaska would probably not have been made. As a result, we would have no reserve capacity today and we would be unduly dependent on foreign oil. In contrast, I believe that proposals for modification of the incentive structure should be directed toward increasing the efficiency of resource development in the long run.

Problems exist also for United States oil companies operating abroad. First, economic factors have led to a deterioration in return on investment. Second, host governments, to further improve their positions, are establishing national oil companies and demanding participatory shares in the development and sale of their crude oil. At the same time, crude deficient countries are establishing their own oil companies to discover and develop new supplies. As a result, United States firms find the going increasingly difficult. They must compete with nationally supported companies to obtain the right to explore and develop new areas, and then, having done so, must compete with national producing companies in selling their crude in foreign markets.

In the financial area, sharply increased capital requirements pose additional problems for the industry. I will mention just two points for your consideration. First, there has been a substantial increase in the debt to equity ratio of the larger oil companies. Since this trend cannot, of course, continue indefinitely, any further reduction in internally generated funds must necessarily lead to reduced expenditures on petroleum exploration. And, second, present tax proposals that would reduce the availability of funds to independent operators will immediately and directly reduce their exploratory activities.

As I noted earlier, the petroleum industry is not excessively profitable. To the extent that tax change proposals are geared to the assumpton that it is, they are off base, indeed.

In brief, our present petroleum situation suggests that the industry today requires increased rather than reduced incentives.

THE IMPACT OF HIGHER TAXES ON PETROLEUM

Now, in the light of the current petroleum situation and the problems faced, what would be the impact of higher taxes on the industry?

Increased taxes, in the absence of any remedial action, must affect either profits and investment or prices. The alternative effects would be (1) reduced earnings and consequent reduction in capital invested in petroleum exploration and development; (2) increased product prices; or (3) some combination of the two.

Since the petroleum industry at present earns only average profits, a decline in profitability due to higher taxes would impair its earnings position relative to that of other industries. Since added tax costs cannot reasonably be expected to be absorbed, a tax increase would mean a reduction in the rate of investment by the industry. However, decreased investment in the face of a declining reserve trend and a steady increase in petroleum requirements is an unacceptable alternative if we are to continue our present policy of maintaining a strong domestic industry capable of meeting essential petroleum requirements.

The second alternative would be to shift the increased tax costs to consumers through product price increases. Because of the relative price of competitive fuels for other uses, price increases would probably be limited to fuels supplying transportation energy, such as jet fuel, diesel fuel and gasoline.

To the extent these products are used in business endeavors, the added cost would simply shift the deduction from one industry to another with no net gain to the Federal revenues, or shift the impact further along the line through succeeding price increases. The Federal Government, as the largest single consumer of petroleum products, would bear a significant portion of any price increase. Only to the extent such additional costs were borne by individuals in non-business pursuits can it be assumed that, in the short run, the federal revenues would benefit.

An examination of this phenomenon discloses the effect to be regressive. A recent study indicates expenditures for gasoline per dollar of income are greater for the low income group than for middle and high income groups. The lowest income group, with earnings of less than $3,000 annually, spends an average of 6.2 cents of every dollar of income on gasoline, compared to only 1.5 cents per dollar in the group earning $15,000 or more. Because much of the driving of the low income group is work-oriented, their demand is relatively fixed, according to this study. Hence, the impact of an increase in gasoline prices would be four times greater on the lowest income group than on the highest income group.

Thus, a price increase to offset a tax increase would bear most heavily on the federal government and on low income households. It is by no means clear to me that this would be a net social gain.

Before leaving this topic, I would like to present some background information indicating the effect on the industry of complete elimination of tax incentives. In my view, these data point up very sharply the importance of present petroleum tax provisions to our national security.

Elimination of all petroleum tax incentives would have approximately the same impact on the domestic industry as the elimination of import controls, which would reduce revenues per barrel by about one-third. In the view of most industry respondents to the questionnaire issued by the Cabinet Task Force on Oil Import Control, the key effect of a one-third drop in revenue per barrel would be the "virtual cessation" of exploratory drilling. According to one company, elimination of the import control program or an equivalent decrease in revenue would result in an 85 per cent drop in the volume of exploratory drilling. According to another, the resulting reduction in industry cash flow would mean a "sharply curtailed" exploration program with a resultant permanent loss of "supporting industries, technology and trained people."

What this reduction in exploratory drilling might mean for future reserves was examined by another respondent. According to this estimate, "the amount of oil not discovered—which otherwise would be discovered—might approximate 1 to 2 billion barrels *each year* in the established older exploration provinces." This would amount to some 10 to 20 billion barrels lost over the next decade, *not* including the unknown amount which "otherwise would be discovered" in newer or future geologic provinces. The same respondent estimated the loss in reserves in existing developed fields at 6 to 10 billion barrels. The loss in reserves in fields which have been discovered but not developed was estimated at 5 billion barrels.

Six companies estimated that by 1980 the United States would be dependent on foreign sources for one-half to two-thirds of its petroleum supplies if oil import controls were eliminated. (See Exhibit VII). The average of these forecasts was 57 per cent dependency on foreign oil. And this allows for remaining production from reserves already discovered today, including the prolific discovery on the

North Slope of Alaska, which has not yet been produced. The estimates made by these companies are in close agreement with projections made by the United States Department of the Interior, which predicted 48 per cent (optimistic) to 58 per cent (pessimistic) dependency on foreign oil by 1980 if oil import controls were eliminated.

Source: Computed from data in submissions in July 1969 to the Cabinet Task Force on Oil Import Control.

Earlier, I indicated that the only alternative to maintaining a strong domestic industry was increased reliance on foreign oil. The above data clearly indicate how heavy that reliance would be if all petroleum tax incentives were eliminated.

In respect to the security aspect of these foreign supplies, I would like to quote from the summary of a recent API statement on this subject:

"Interference with foreign petroleum supplies can come from any of three sources: (1) military action during war; (2) shutdown (or sabotage) for political reasons or (3) shutdown for economic reasons. The first of these is most important in general wars. Even in the absence of general war, however, there can be serious petroleum security problems in all three categories. Since World War II, there have been *eight* noteworthy interruptions of overseas petroleum supply—all in the prolific Middle East and African producing areas.

"None of these interruptions has succeeded in obtaining economic or political concessions from the United States or its allies—primarily because there has been a large, viable North American oil industry on which to rely in the event of emergency.

"If the United States were to adopt public policies which would make further exploration in North America generally unattractive, the United States would then have to turn to the Middle East-North Africa region for the bulk of its petroleum supplies because 86 per cent of overseas reserves are concentrated in this area (Venezuela currently accounts for 17 per cent of production but has only 4 per cent of reserves—See Exhibit VIII.) While no single overseas producing country has a sufficiently large share of reserves to be able to dominate the international oil market, *groups* of countries having common interests do have large shares.

EXHIBIT VIII

Arab nations	71

[1] Organization of Petroleum Exporting Countries.

"Certain groups have, in fact, demonstrated an intent to operate as economic units for certain objectives. In the absence of a viable North American industry to counter the potential market power of these groups, there is every reason to anticipate that they would act as monopolistic entities for economic and political gains at the expense of consuming countries. The potential danger of this situation to the security of Free World energy supplies is compounded by increasing Russian adventures in the Middle East and North Africa, the principal overseas producing areas."

While we would gain a short-run benefit from foreign oil in temporarily lower prices, we would bear a long-run cost that cannot be measured in monetary terms. If we became dependent upon that oil, we might well be drawn into any conflict that occurred in the Middle East in order to insure stability. This position would be analogous to our present role in Southeast Asia, except that here the the military and economic reasons for intervention would be compelling.

Furthermore, given the Soviet Union's support of the Arab world, any increased United States role in the Middle East could lead to a direct confrontation between the two nuclear superpowers. In any event, our options in international affairs would be severely limited and our military commitments would be increased at a time when we seek to limit them.

In summary, I would like to leave these five salient points with you.

(1) Present petroleum tax incentives have served the national interest by providing *adequate, secure* supplies of oil and gas, efficiently produced.

(2) Petroleum industry profits have been *less* than average.

(3) Petroleum industry total taxes have been *more* than average.

(4) Petroleum industry prices have risen *less* than average.

(5) Petroleum industry supply problems over the next decade will be enormous, since we *must produce 40 per cent more oil than in the 1960's.*

Before closing, I should like to dispel two contradictory notions which are prevalent today. The first is that the United States is running out of oil. The second is that we have found enough oil in Alaska to meet our needs forever. Neither of these notions is true. In my view, recent experience indicates that it is reasonable to expect a substantial uptrend in new oil found in the United States during the next decade. Crude oil reserves in Alaska could very well be as large as the present total in the continental United States 31 billion barrels. However, that would only be 55 per cent of estimated required additions to reserves during the 1970's (and all of the Alaskan oil will probably not be found and developed during that period). We need, therefore, more discoveries in the "lower 48" states. I am convinced that a realistic national petroleum policy continuing to provide reasonable tax incentives for investment will enable us to find and develop the oil we need, to the benefit of this Nation and all of its people.

In conclusion, I urge the Committee to give careful consideration to the future outlook for the United States petroleum situation in reaching its decision about petroleum tax policy. The continued existence of the United States as we know it could well rest on the decisions you reach.

STATEMENT OF WILLIAM I. SPENCER, EXECUTIVE VICE PRESIDENT, FIRST NATIONAL CITY BANK, NEW YORK, N.Y., IN BEHALF OF AMERICAN PETROLEUM INSTITUTE; MID-CONTINENT OIL & GAS ASSOCIATION; ROCKY MOUNTAIN OIL & GAS ASSOCIATION; AND WESTERN OIL & GAS ASSOCIATION

SUMMARY

1. Changes in the tax treatment of minerals, as existing for many years, could endanger both the international payments position and the energy supplies of the United States. They could thus have serious, long-term consequences for the welfare of the nation as a whole.

2. The petroleum industry has been responsible for the largest share of United States direct investments abroad, and for those showing the highest return on book value. Helped by a flow of almost \$2 billion (1967) in earnings remitted back to parent companies, the industry has made a major and sustained contribution to the strength of the dollar. Most of the funds required to make this possible come from sources outside the United States.

3. The national need for energy will grow by more than 50% by 1980. Two-thirds of the supply will come from oil and gas, supplemented by other capital-intensive sources such as shale oil. If this petroleum supply is to be made available, and if there is to be no increase in dependence on imports, the annual rate

of additions to proved reserves in the ground will have to be 57% higher in the 1970's than in the 1960's.

4. Making conservative assumptions concerning the cost of raising the rate of discoveries to this extent, the petroleum industry will have to attract, for domestic exploration and development alone, as much as $70 billion for the 10-year period through 1980.

5. In attracting capital on this scale, the industry will be hampered by the likely continuance of monetary stringency in the economy as a whole; also, by the fact that the liquidity of leading petroleum companies has been declining, while their dependance on long-term debt has been rising sharply.

6. The ability of the industry to finance its greatly-increased exploration and development will depend upon its future ability to maintain and improve its profitability. When related to investments, its profits are at best average and significantly below those of other industries facing a lesser degree of risk.

7. The tax structure should be designed to enable the industry to meet our national energy goals. The proposals before the Committee do not meet this test. They are not simple; they are not stable; and they are not in tune with long-term needs.

STATEMENT

I am William I. Spencer, Executive Vice President of First National City Bank, New York. My appearance today is on behalf of the American Petroleum Institute, the Mid-Continent Oil & Gas Association, the Rocky Mountain Oil and Gas Association and the Western Oil and Gas Association. For many years I was directly associated with the petroleum and mineral activities of our Bank. I therefore feel honored to appear at these important hearings, and to discuss with you a few of the basic problems presented by some of the proposals now being examined by this Committee.

Since the importance of energy to the national economy has already been so clearly set out by Mr. Dunlop, I shall confine my remarks to two broad areas. In the first place, I shall briefly discuss the importance of petroleum in strengthening the United States position in international trade and payments. Secondly, I shall urge you to consider most carefully the industry's capital needs.

On the first point, let me make it clear that I have no doubt of the advantages to the United States of a growing flow of international trade and payments. I have just returned from a visit to Africa where I was struck by the extent to which American people, American capital and American ideas are not only working to increase our income but also to strengthen our image in the most remote places. To forget the interdependence of the United States and its trading partners abroad would be a little like trying to run Manhattan without the tunnels and bridges connecting the island to the mainland.

Yet the balance of payments problem will remain with us for years to come. International liquidity and the strength of the dollar are likely to be matters of great concern for policy-makers here in Washington throughout the 1970's. In this international context, the importance of petroleum is well known. It occupies first place in seaborne trade and foreign earnings. No change in the tax treatment of this and other mineral industries should be attempted before carefully weighing the impact on international payments.

Our Bank has often expressed concern over the policy of restricting capital outflows by the system of controls introduced early in 1965. Similar objections would apply to tax changes likely to interfere with earnings from direct investments abroad. Over the years, petroleum investments abroad have shown their ability to earn a return on book value appreciably better than that of other investments aboard.

The net effect of the foreign investment activity of the petroleum industry has been an inflow of funds of nearly $1 billion annually. Not only has this been most important in supporting the national balance of payments; but it has also greatly strengthened the economies of developing countries. In key countries in Asia and Africa, as well as in international shipping, more than half of United States direct investment abroad has been channeled into oil and gas ventures.

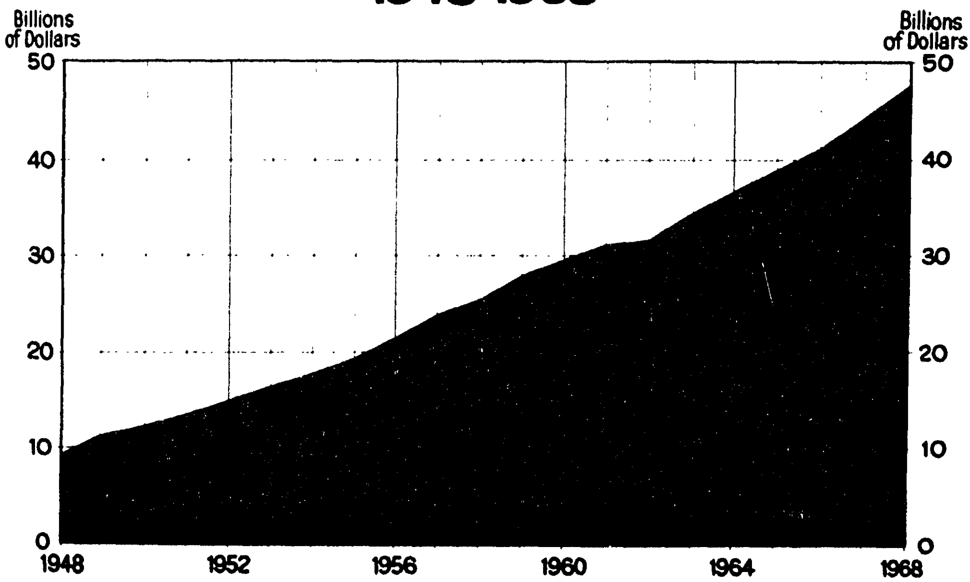
Needless to say, an exact accounting for these benefits is difficult to make. On the minus side is the outflow of capital and the cost of tanker and other foreign services. But the capital invested abroad gives rise to far larger plus items. There are exports of services such as fees and royalties, and exports of merchandise such as products, equipment and petrochemicals. There is also the sizable return flow of earnings remitted back to parent companies. In 1967 (the latest available year), this amounted to almost $2 billion. Without these earnings, the United States balance of payments deficit would have been half as large again as that actually recorded. This seems a good reward for the outflow of $1.1 billion that took place in 1967 in order to support investments abroad. Indeed, most of the capital now required for this purpose is not drawn from sources in the United States, but from earnings made and reinvested abroad and from sums raised from investors abroad.

Now, gentlemen, I should like to turn to the capital outlook. Specifically on petroleum, I should like you to look at Exhibit I. We have prepared it to show the trend of capital investment in the petroleum industry over the past 20 years. You will note that the net assets of United States petroleum companies have grown from $9.2 billion in 1948 to $47.5 billion in 1968. The reason investors have been willing to risk their money in this business is, of course, that they were anticipating an adequate return on their money. Tax incentives played an important role in attracting investors to this industry. At the same time, the industry's profits have not been excessive, as Mr. Dunlop has demonstrated.

Exhibit I

CAPITAL INVESTED IN THE PETROLEUM INDUSTRY

1948-1968



There seems to be an impression, expressed during the hearings early in September, that these tax incentives are expendable. I support the case for sharing the tax burden as equitably as possible. As the President himself has pointed out, taxes can be made fair—but not popular. Reducing the mineral tax incentives, as now under discussion by this Committee, might be popular today. But will it be popular 10 years from now? In the long run, because of the danger of an energy shortage, I do not think it would be wise or fair. In fact, during the 1970's, tax incentives for mineral production will be even more essential than during the 1960's.

I am not saying that the tax system should be left unchanged. But any tax system should meet the tests of being simple, stable and in tune with long-term economic needs. Insofar as the mineral provisions are concerned, I do not find that the proposed measures meet any of these tests. The proposals now before the Committee appear to make the system even more complex. They appear to undermine the stability so vital to productive invesment. And they conflict with long-term needs by adding a bias in favor of consumption and unfavorable to investment at a time when the nation is struggling to rein in an inflation that threatens to run away.

My concern extends across the whole range of minerals. Coal, uranium, copper, and other basic resources will be essential to our economy in the future even more than they have been in the past. Oil shale will one day come into its own as a major source of the nation's energy. But, in the rest of what I say, I shall be focusing on oil and gas. These provide the foundation for the largest industry in the mineral group. Moreover, the added petroleum tax load proposed in the mineral provisions of HR 13270—over $500 million out of a total of about $600 million for all minerals—is far larger than for any of the other minerals.

Looking at the petroleum industry from a banker's viewpoint, I see no reason for overconfidence that this country can successfully cope with the petroleum demands of the 1970's. I see no justification for a crack-down on the petroleum industry. Instead, I think the industry will need all the cooperation it can get from this nation. Let me tell you why.

As a banker, I am uneasy about the petroleum industry's capital outlook—how much capital it will require and how much it can obtain. I see all too little basis for the confidence that was expressed by Administration spokesmen before this Committee concerning the adequacy of the capital supply.

In the first place, there is the shortage of capital in the economy as a whole. With the big corporations—and even the Federal Government—having to pay 8% or more on recent bond and note issues, the present stringency is clear for all to see. Nor do we expect any early relief. In a recent 5-year forecast, we came up with the prospect of a sharp increase in the need for both short and long-term borrowing by leading United States industries. For petroleum, we expect to see a drastic increase in the use of outside funds, with the total of short-term borrowing being doubled by 1974.

This trend has already set in. Over the past 10 years, the call for outside financing has obliged the five largest international oil companies based in the United States to step up the long-term debt component in their total capitalization. Their long-term debt has risen sharply—from about $2 billion in 1958 (9% of the total) to $6 billion (17%) last year. There comes a point beyond which even the strongest company cannot continue to depend on borrowing to finance its expansion plans.

In the second place, the needs of the energy sector as a whole are bound to mount rapidly. By 1980, we expect the United States to be consuming nearly 95 quadrillion British thermal units of energy (see Exhibit II). This would represent an increase of more than 50% over the present total of 62 quadrillion.

The expected demand for energy in 1980 represents some 45 million barrels a day of crude oil equivalent (see Exhibit III). Some 42% of it will actually come from oil—including a small contribution from synthetic fuels, such as shale oil. Over 25% will come from gas. But this leaves some 33% to come from other sources. One of these will continue to be coal, which will contribute nearly 18%. Other sources may include 12% from nuclear power and 3% from water power. The new energy sources are likely to prove quite as capital-intensive as petroleum. To an unparalleled extent, oil companies will be competing with other companies for the capital needed to secure the nation's energy supply.

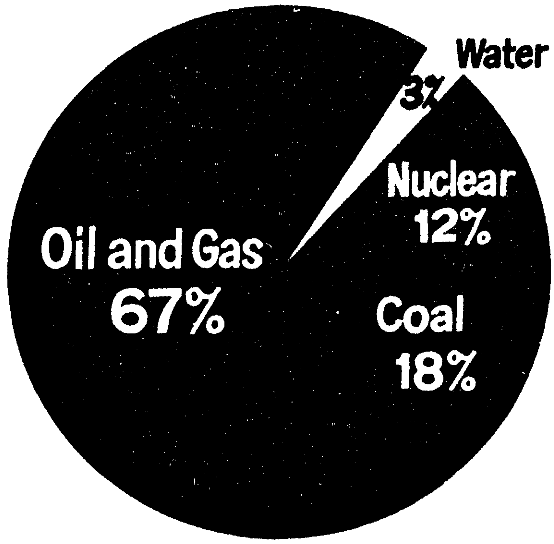
Exhibit III

Distribution of Total Energy Consumption in 1980



Let us next look to the future, and try to apply a yardstick to the capital requirements of the industry in the years ahead. At the outset and very broadly, let me say that, over the 10-year period 1970 to 1980, the petroleum industry may require at least $70 billion for domestic exploration and development expenditures alone. This average expenditure of $7 billion a year would be more than half as high again as the average for the last 10 years.

Even this figure may prove to be a low estimate rather than a high one. It does not include at least $5 billion for transportation investment. Further, it makes no allowance for the possible impact of inflation or for the cost increases due to exploration at greater depths and in less accessible areas. Here is how we arrive at our projection.

We estimate the energy consumption in the United States will grow at nearly 4% a year during the 10-year period 1970 to 1980. We believe that, through 1980—and for a good many years thereafter—petroleum liquids will continue to furnish the energy for almost all our transportation. This market, together with petrochemical feedstocks, will provide a strong springboard for the growth of total consumer requirements for petroleum products.

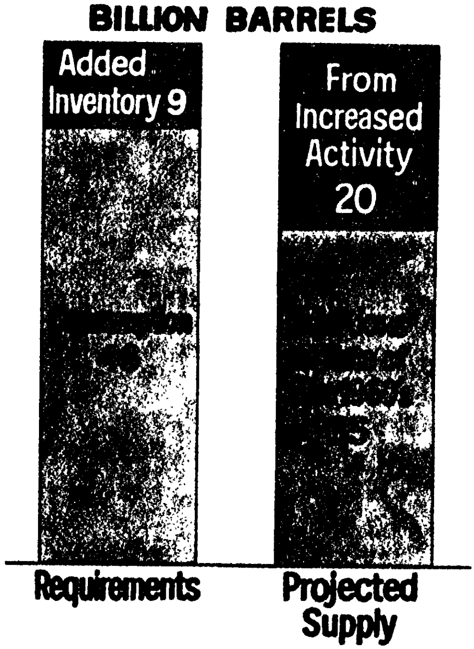
In 1980, according to our estimate, United States consumption of petroleum liquids will reach 19 million barrels daily, nearly 6 million barrels daily more than we consumed last year. (This forecast, incidentally, falls within the same general range as a number of estimates prepared by other groups.) Assuming that imports continue to provide 22% of domestic demand (as in 1968), this would mean that the domestic industry will be called upon to supply some 41% more petroleum liquids in 1980 than in 1968—if the country is to attempt to avoid becoming relatively more dependent on imports.

Shown in Exhibit IV is an indication of the scale of the exploration effort that will be required to meet a growth in demand of this magnitude. The industry would have to produce 46 billion barrels of liquid hydrocarbons during the 1970's. By comparison, total production during the 1960's was only 33 billion barrels.

33-865 O—69—pt. 5——36

Exhibit IV

55 billion barrels required gross additions to liquid hydrocarbon reserves during the 1970's



In addition to this need for 46 billion barrels, if the industry is to meet the full requirement in 1980, another 9 million barrels will probably have to be added to the inventory of proved reserves. The reason for this is the technological limit on the percentage of reserves that can be produced from any reservoir during a given year.

Thus, gross additions to reserves required during the 1970's total 55 billion barrels: 46 billion for consumption and 9 billion for inventory. This total—an average of 5.5 billion barrels per year—is 57% more than the annual average of 3.5 billion barrels that the industry added during the 1960's. Continuation of additions at the 1960's rate during the 1970's would leave the country 20 billion barrels short by 1980.

These figures are based on the assumption that the nation will continue its reliance on petroleum imports at today's 22% level. Our own estimate is that this dependence will increase to around 24% by 1980. This would decrease, but not by a sizeable amount, the need for additions to domestic reserves.

Nor must we forget the demands of the gas consumer. Our estimates suggest that potential demand for this fuel is now entering a new period of growth. For reasons of convenience, domestic and commercial users are turning increasingly to gas. Nearly half of the industrial energy needs of the United States are already supplied by gas. More than one-fifth of the nation's electric power supply also depends on this fuel.

Yet, is it clear to us that the future availability of gas is becoming a matter of grave concern. By 1980, we expect demand to have grown to 66 billion cubic feet a day—more than 20% above the present level. This comparatively modest growth takes account of the fact that gross additions to gas reserves are no longer growing as fast as the market potential. More funds will have to be earmarked for gas exploration if the consumer is not to be forced to resort to higher-cost synthetic sources, or to substantial dependence on gas imports. These imports would have to come both by pipeline from Canada and by tanker, in most costly liquefied form, from overseas.

Returning to petroleum liquids, what is likely to be the cost of obtaining the required 5.5 billion barrels a year? During the last 10 years, the industry spent an estimated $4.5 billion annually to obtain the annual increments of 3.5 billion barrels, mentioned above. If average gross additions to reserves must increase 57%, recent levels of capital expenditures cannot be expected to meet the needs of the future.

Yet there is no neat relationship between capital expenditures and gross additions to reserves. The additions include not only new discoveries, but extensions and revisions. They also include the result of improvements in recovery processes, and the liquids to be derived from gas wells. At the same time, gas-oil ratios will vary, thus altering the capital requirement. There is no guarantee whatever that changes on these various fronts will allow the industry to hold its overall rate of expenditures per barrel at the average achieved in recent years.

There is the further complication that the industry is having to pioneer into more and more difficult areas in order to meet the nation's needs. Wells are getting deeper. More of them have to be located offshore. Average costs per well in Alaska are likely to be at least five times those in the Lower Forty-eight. Other oil frontiers are also having to be opened up.

Some figures drawn from recent history will help to illustrate my point. For example, the cost of drilling and equipping an average producing well in 1953 was $54,000. It had increased to $81,000 by 1967, and as high as $913,000 for a productive well over 15,000 feet deep. Compare the 1967 average, however, with 1967 costs of $550,000 for a typical productive offshore well, and $1,250,000 for a productive well in Alaska. The higher of these figures are more representative of drilling costs in the areas and at the depths that will require a major exploratory effort, if we are to meet our future requirements for oil and gas reserves.

As I have already mentioned, there is also the onward march of inflation. I am not one of those who believes that a price increase automatically generates additional earnings and attracts the necessary supply of capital. As has been demonstrated by Mr Dunlop, the industry has been in a cost-price squeeze. Wellhead and refined product prices have clearly failed to keep up with the rise in the price level as a whole.

Merely for the sake of illustration, however, we have assumed that capital expenditures will increase by the same percentage as the necessary additions to petroleum liquid reserves. Using the 57% estimated increase, the average annual expenditures will grow from $4.5 billion to $7 billion. That is how we arrived at our total of $70 billion for the decade 1970 to 1980.

Let us now consider the prospect of attracting this stepped-up capital inflow into the petroleum industry.

As I have already indicated, I see no evidence whatever that there is a surplus of available capital in the country today. Nor is there the prospect of one in the years ahead. Is there a surplus of capital in the petroleum industry itself? The answer is clearly negative. As I have just demonstrated, there are certainly not enough proved reserves in the ground to get the industry through the 1970's. Similarly, there is no excess cash within the industry

For a representative group of companies that we analyzed, the ratio of current assets to current liabilities at the end of last year was only 1.8 to 1. This is less than the 2 to 1 ratio that is often taken as the desirable minimum. The petroleum ratio compares with an average of 2.2 to 1 for other manufacturing industries, and with even higher rates for steel, chemicals and so on. At a time when these other industries have been maintaining their liquidity at reasonable levels, it is ironic that petroleum, one of the most vital of all, has not fared so well.

Are the industry's profits high enough to attract the huge sums of capital likely to be needed? Although large in absolute terms, when related to investments, the profits are at best average. Industries which do not have to face the risks and uncertainties borne by petroleum have in recent years been earning up to some 20% in relation to their assets against oil's ratio of less than 13%. Among the more fortunate group in 1968 were office equipment, instruments, pharmaceuticals, toiletries and soft drinks. Hardware and tools earned more than 16%, as did the automobile industry. The petroleum industry is only likely to attract the stepped-up capital needs of the 1970's if its profit performance is maintained and improved.

What is the petroleum industry's profit outlook for the future? An adequate answer to this question requires, as one most important condition, a clearer view than we now possess of the tax prospect. I shall not try to go into the detail of the tax bill prepared in the House of Representatives. But I must frankly confess that I am struck by the negative emphasis in some of the proposals now being considered by this Committee.

You, yourself, Mr. Chairman have referred to recent proposals as "anti-oil". I note, in this connection, that there are the proposed changes in the depletion allowance, reducing the rate for domestic production and eliminating it for foreign production. There is the new concept of the limit on tax preferences, restricting the use of percentage depletion and intangible drilling-cost expensing. There are the further complexities in the application of foreign tax credits; the proposed restrictions could introduce a new element of double taxation, thereby breaching one of the most fundamental principles of fairness in taxation.

Petroleum industry profits emerge as a main target of this array of tax proposals. If the Congress adopts part or all of this package, an investor must expect to earn less from his petroleum outlays.

Some people argue that the impact will be slight. In the report of the Committee on Ways and Means, I read the surmise that the proposed reduction in percentage depletion rates "should have only a minimal effect on efforts to discover new reserves".

Judging by the Treasury's figures, I find this statement hard to support. Moreover, there is the psychological impact. Once the gate to change has been opened, investors become increasingly nervous. These tax changes are not only retroactive; they cast shadows before them. Any undermining of the existing tax structure will inevitably have a more than proportionate effect on investor expectations, and therefore on capital availability.

At the same time, lower profits mean a smaller flow of internal funds available for reinvestment in the industry. In the past, over 70% of the capital spending of the leading oil companies has been provided from internal sources. In the future, under an impaired system of tax incentives, these internal funds could be deeply eroded.

I think it is unfortunate that there is so much eagerness to place obstacles in the industry's path at a time when its capital needs are so great, and when the country's petroleum requirements are on such a steady rise. I am, indeed, puzzled by the timing, and by the sense of haste during some of the hearings on the complex and varied tax proposals now being considered by this Committee. I think there is a danger that perspective will be lost. With the Treasury expecting to raise almost $200 billion in revenues during the current fiscal year, budgetary savings and tax simplifications are more desirable than ever before—but only if they do not backfire on the economy. Tax savings that might risk the future energy supplies of the nation could do just that.

I fully agree with those around the nation who feel the need to "do something" about our mammoth and ever-mounting budget. Yet let us not underestimate the gravity of the problem, nor the need for cautious study before far-reaching actions are taken.

To sum up, a reduction in established tax incentives could reduce petroleum industry profitability to something well below that of other industries, thereby endangering the future capital supply. This could have serious—and insufficiently understood—long-term consequences for our balance of payments, our economic stability, and the welfare of the nation as a whole.

STATEMENT OF GEORGE V. MYERS, EXECUTIVE VICE PRESIDENT, STANDARD OIL CO. OF INDIANA, CHICAGO, ILL., IN BEHALF OF THE AMERICAN PETROLEUM INSTITUTE; MID-CONTINENTAL OIL & GAS ASSOCIATION; ROCKY MOUNTAIN OIL AND GAS ASSOCIATION; AND WESTERN OIL AND GAS ASSOCIATION

SUMMARY

1. Risks in Finding:
   a. Significant discoveries, one well out of 50.
   b. Unpredictability of success for individual prospectors.
   c. Past averages may mean little in view of the increased costs of deeper wells and wells offshore and in remote areas.
2. H.R. 13270:
   a. Effect of Reducing Domestic Depletion Rate.
      i. Curtailment in exploration and development leading to an undue reliance on foreign oil.
      ii. Apprehensions of investors that further reductions may follow.
      iii. Investments made on assumption that long-standing depletion deductions would continue.
   b. Treating production payments as loans will reduce value of producing properties and restrict borrowing power for financing exploration.

c. Allocation of deductions discriminate against independent individual operator by reducing the effectiveness of his percentage depletion and intangible drilling costs.
d. Oil Shale.
i. House versión should be adopted.
ii. Retorting is a mining process and is proper cut-off point for depletion.

3. Comments on Treasury Department Proposals:
a. Inclusion of percentage depletion and intangible drilling costs in LTP computation.
i. Percentage depletion not categorized by Treasury Department study of 154 individuals as a "major tax reducing factor". Amounted to less than 1 percent of total deductions claimed by 154 individuals.
ii. Sixty percent rule for intangible drilling costs is arbitrary and discriminatory and will dry up sources of risk capital for independent operators.
b. Taxation as ordinary income of gains from sale of properties to extent of previously allowed intangible drilling costs will lower incentives for investment in exploration.

4. Other Proposals:
a. Plow-back of depletion deductions.
i. Depletion a reward for past success. Plow-back locks in investors.
ii. Encourages the drilling of inferior prospects.
iii. Industry will become concentrated in fewer producers.
iv. Producers who have borrowed against future production will lose part of their depletion unless they can repay their loan and plowback.
b. Capitalization of intangible drilling costs of development wells.
i. Will not ultimately increase tax revenues.
ii. Will seriously disrupt available funds.
c. Percentage depletion at graduated rates.
i. Industry not concentrated.
ii. Effect of proposal is to reduce the industry to a rate a little higher than 15 percent.
iii. Risks same for all.

5. Conclusion:
a. High risks are deterrent in attracting capital under present economic conditions.
b. Proposals to reduce depletion rate, and to eliminate capital incentives in form of production payment sales and ABC transactions will adversely affect the capital raising abilities of the independent operator.
c. The discriminatory proposals of the Treasury with respect to depletion and intangible drilling costs in the LTP and allocation of deductions computations will seriously affect the capital raising potential of independent operators.
d. In view of the high risks involved, the proposals in the House bill and in the Treasury testimony, if enacted, would drive capital out of the search for petroleum.

STATEMENT

My name is George V. Myers. I am Executive Vice President and a Director of the Standard Oil Company (Indiana) of Chicago, Illinois. I am appearing today on behalf of the American Petroleum Institute, the Mid-Continent Oil & Gas Association, the Rocky Mountain Oil and Gas Association, and the Western Oil and Gas Association. I will discuss, first, the risks inherent in exploring for oil. Then I will review the provisions of H.R. 13270, the proposals made by the Treasury, and a few other proposals that would reduce economic incentives for domestic petroleum exploration and development.

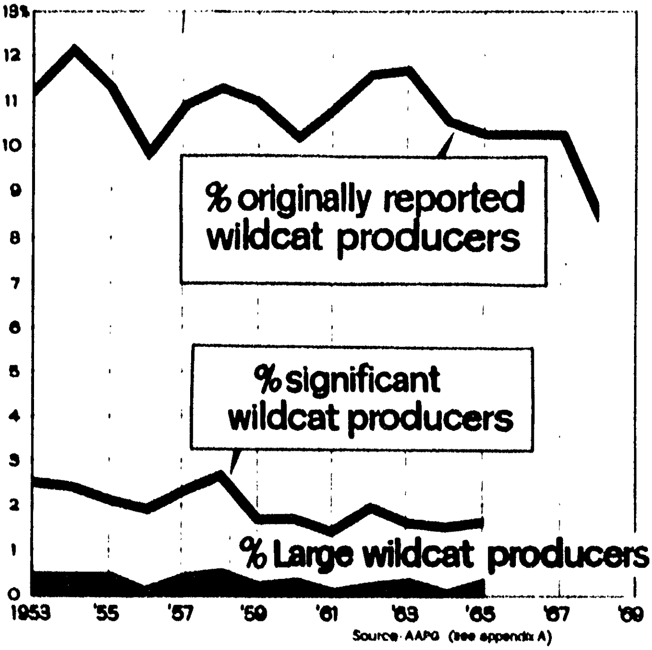
RISKS IN FINDING OIL

Unique and heavy risks are involved in finding and producing oil and gas. These risks are just as real today as they were 10, 20, or 50 years ago. In spite of all of our scientific progress and new exploration tools, there is still only one way to establish the presence of oil and gas in the ground; and that is to drill a hole. Recent experience shows that, on the average, only about one out of 50 exploratory wells will find oil and gas in significant quantities; that is, the equivalent of at least one million barrels of oil.

There is still a common belief that one of every nine wildcats will succeed. It is true that, for many years, about 11 percent of wildcats produced some oil or gas, but that figure can be misleading. (Exhibit I) The top line of Exhibit I shows that about 11 percent of wildcats drilled during the period 1953–1967 were originally reported to be producers. In 1968, this rate dropped to 8.5 percent. However, this line is misleading because many of the wells that find oil or gas do not find profitable quantities.

Exhibit I

Productive fields per wildcat well drilled 1953-68



APPENDIX A.—PRODUCTIVE FIELDS PER WILDCAT DRILLED, 1953-68

Year	Number of wildcats drilled	Number of hits: Originally reported	Number of hits: Significant[1]	Number of hits: Large[2]	Percentage of total wildcats: Originally reported	Percentage of total wildcats: Significant[1]	Percentage of total wildcats: Large[2]
1953[1]	6,925	774	164	36	11.2	2.5	0.5
1954	7,380	902	167	34	12.2	2.4	.5
1955	8,105	919	164	36	11.3	2.1	.5
1956	8,742	868	159	15	9.9	1.9	.2
1957	8,014	872	171	38	10.9	2.3	.5
1958	6,950	786	176	39	11.3	2.7	.6
1959	7,031	772	121	18	11.0	1.7	.3
1960	7,320	745	124	26	10.2	1.7	.4
1961	6,909	745	98	16	10.8	1.4	.2

1965	6,182	638	[3] 99	[3] 23	10.3	[3] 1.6	[3] .4
1966	6,158	635	(4)	(4)	10.3	(4)	(4)
1967	5,271	544	(4)	(4)	10.3	(4)	(4)
1968	5,205	442	(4)	(4)	8.5	(4)	(4)

[1] 1,000,000 barrels reserves or more. Applies to 17 States before 1959. Percentages before 1959 based on 17-State total shown in appendix B.
[2] 10,000,000 barrels reserves or more (included in significant hits). Applies to 17 States before 1959. Percentages before 1959 based on 17-State total shown in appendix B.
[3] Preliminary.
[4] Not available.

Source: Derived from American Association of Petroleum Geologists data, most of which are reported in June 1967 bulletin. Care must be exercised in the use of these figures because those reported in 1965-67 bulletins are not precisely comparable with past years.

The next line on the chart shows the percentage of wildcats which found fields having more than one million barrels of oil (or the equivalent amount of gas). You will note that the highest percentage is almost twice as great as the lowest.

with an average of about 2 percent. Therefore, about one well in 50 is a better measure of the industry's average success rate.

The bottom line on the chart represents discoveries of 10 million barrels or more. The odds here are about one out of 250, or a four-tenths of a percent success ratio.

The search for oil and gas is one of high risk, and the degree of industry success is unpredictable, as shown by extreme year-to-year fluctuations of the industry averages. It follows that the degree of success for any one company is completely unpredictable, since no one company is large enough to have "average" characteristics. In any event, wildcats are drilled on the basis of the geological outlook for individual prospects, not on the basis of industry average.

Furthermore, past averages and ratios may well mean little for the future; witness the decline in the wildcat success rate in 1968. Since costs increase as we drill deeper and explore in the more remote areas, million-barrel fields which were significant at shallower depths in mature areas may well be unprofitable at greater depths or in frontier areas. Increased costs effectively decrease the success rate since the average profitable field must be larger in order to offset higher costs. This certainly indicates that the incentives for finding oil and gas should be at least maintained at present levels. Risk capital will be forthcoming only if potential rewards are sufficiently attractive. Past rewards have not been excessive, as indicated by the average rate of return for the industry, which Mr. Dunlop discussed. Adequate rewards were the primary consideration underlying Congress' adoption and continuation of percentage depletion and related incentive provisions in our income tax law.

H.R. 13270

As passed by the House, H.R. 13270 would cut back on the existing incentives to explore for and develop domestic oil and gas reserves by:

1. Reducing the percentage depletion rate on domestic oil and gas wells from 27½ percent to 20 percent.
2. Effectively eliminating the use of production payments.
3. Reducing deductions allowed for interest, charitable contributions, state and local taxes, and other nonbusiness expenses incurred by individual oil and gas operators.

The Treasury Department estimates that the proposed reduction in the percentage depletion rate on domestic oil and gas production would increase the industry's annual tax burden by some $350 million. The elimination of the use of production payments would impose an additional $200 million burden.

Although there is no Treasury estimate of the monetary effect of the third proposal, it is a change that would have a serious impact on the independent segment of the business.

Prior to discussing these proposals in greater detail, I think it is important to point out that their adoption in conjunction with other proposals in H.R. 13270, such as the extension of the surtax, the repeal of the 7 percent investment tax credit, and the capital gains tax changes would siphon a tremendous amount of cash out of the already strained financial resources of our industry. Mr. Spencer has pointed out that our industry will need more, not less, funds if it is to keep up with the demand for ever-increasing volumes of oil and gas required by our economy. This, to me, points up the need for at least maintaining present tax incentives, particularly in view of the increases in future petroleum requirements as outlined by Mr. Spencer.

Reduction in domestic depletion rate

Turning now to the specific provisions of H.R. 13270, I believe that the proposed reduction in the domestic percentage depletion rate from 27½ percent to 20 percent contravenes our national interest. Last year, the Department of the Interior report, "United States Petroleum Through 1980," recognized the importance of existing tax provisions to the development of sufficient new reserves to serve increasing demands. The following statement from this report summarizes the conclusions reached:

> "Both intangible expensing provisions and percentage depletion have been long-standing and durable features of the tax treatment of the petroleum industry, despite repeated efforts to change, reduce or eliminate them.
>
> "They are an integral part of the petroleum industry's structure of income and expense, and the available evidence suggests that any substantial

change in them would have a direct and significant effect upon the future availability and cost of oil and natural gas."

In the capital-intensive petroleum industry, any impairment of existing tax incentive would inescapably cause a restriction in future exploration and development expenditures. Unless compensating product prices could be realized, our economic progress would be dampened and our military and economic security weakened. As my colleagues on this panel have pointed out, the projected increases in consumer demand, supply requirements, and capital needs clearly demonstrate that now is not the time to experiment with the depletion rate.

Under Secretary Walker has observed that the proposed change relating to income from tax exempt securities has made investors in that market "skittish," with the result of market impact out of all proportion to the proposed change. He said,

"... it can be viewed as a direct taxation for the first time of state and local government securities, which would cause investors to worry that greater taxation, full taxation, might take place at a later date. So that in purchasing securities today they would be skittish about the possibility of the rug being pulled out from under them later. It is the toe in the door argument, and it has its effect on markets, there is no doubt about it."

The proposed reduction of the rate to 20 percent would similarly have a more dampening effect on the industry's exploration efforts. It should be recognized that the psychological impact of such a reduction would cause oil and gas producers to be apprehensive about further reductions later, and these apprehensions would be reflected in greater reductions in expenditures for exploration and development.

Mr. Dunlop has pointed out that industry submissions to the Cabinet Task Force on oil import controls indicate that a one dollar per barrel reduction in the price of crude oil would make virtually all exploration in the United States uneconomic. Reduction of the depletion allowance to 20 percent would be equivalent to a price reduction of about 20 cents per barrel. If we were to make a simple interpolation between the effect of a 20 cent price cut and a one dollar cut which eliminated exploration, one might anticipate that the proposed reduction in depletion would reduce exploration by one fifth ($20¢ \div 100¢ = 1/5$)—assuming that the rate decrease were not offset by a price increase.

I feel certain that this is a conservative estimate of the importance of the rate decrease provided in H.R. 13270. Petroleum explorers would find themselves in precisely the same position as the municipal bond buyers referred to by Under Secretary Walker. The toe would be in the door of change in petroleum tax incentives. And a half century of faith in stable tax treatment of the industry would have been breached. Under these conditions, we can only predict that explorers' expectations about future tax treatment would be gravely and adversely affected. They would ask, "What tax increase next?"

The result would be a reduction in exploration greater than any decrease indicated by a direct evaluation of prospects which would appear uneconomic with a 20 cent lower price. Furthermore, *other* reductions in petroleum tax incentives—added to a 7½ point depletion rate reduction—would make exploration still less attractive.

This Committee was told by the Secretary of the Treasury that reducing the depletion rate to 20 percent probably would not make a substantial change in exploratory drilling activity. The Treasury Department of the previous Administration expressed a similar view which was based primarily on a study made by CONSAD Research Corporation.

The principal conclusion of the CONSAD study is that *elimination* of percentage depletion and of the option to expense intangibles would result in a maximum petroleum reserve reduction of only 7 percent. From this the Treasury concluded that annual exploratory and drilling expenditures would be reduced by only $150 million per year, even though the tax increase to the petroleum industry would be $1.6 billion per year. Simply on the grounds of common sense, it is obvious that reducing profits of oil companies by $1.6 billion would have a far greater impact on new expenditures.

There are many flaws in the CONSAD study. These are outlined in Attachment A. The principal error which makes the study irrelevant is that the economic model used in the study assumes that there is no relationship between the level of crude oil production and industry profitability. This is, of course, nonsense and no credence can be given to the study.

Many billions of dollars have been invested in the oil business in good faith reliance on the tax incentives that have been provided in the tax law for over a half century. To arbitrarily reduce the percentage depletion on past discoveries at this time would raise a question of the government's good faith. For example, the oil industry has paid $3 billion to the Federal and state governments for mineral leases in the waters of the Gulf of Mexico and in addition has spent more than twice that amount in exploration and development in this offshore area during the past 23 years. Total industry expenditures for domestic exploration and development have averaged about $4.5 billion annually during the past decade. All these expenditures have been based on the assumption that long-standing tax provisions would be continued.

The percentage depletion deduction is designed to recover the capital value of oil in the ground. At today's price of crude oil, this deduction provided by the full 27½ percent falls short of the value of net reserves as measured by the sales price of proven properties.

Production payments

The second provision of H.R. 13270 is the proposal to treat production payments as loans. Oil and gas operators have to rely primarily on producing properties to provide the security needed to obtain additional financing. The treatment of reserved production payments as loans will cause a reduction in value of 15 percent to 20 percent. This reduction decreases the funds available to independents thus impairing their ability to continue in the business of exploring for and developing oil and gas reserves.

According to Treasury estimates, this proposal will initially generate additional tax revenues; but these estimates may not take into account the loss of revenues that would result from discouraging sales of producing properties.

Allocation of deductions

The third provision of H.R. 13270 that will hurt the individual independent operator in his efforts to obtain needed capital is the one which would reduce his otherwise allowable nonbusiness deductions solely because he claims legitimate business deductions for his intangible drilling costs and percentage depletion. Examples of these nonbusiness deductions are interest, taxes, casualty losses, charitable contributions, and medical expenses. This proposal would tend to restrict the effectiveness of percentage depletion and intangible drilling cost deductions as incentives to invest the huge amounts of money needed to supply our petroleum needs. It will be a back-door subversion of such incentives.

Tax treatment of oil shale

H.R. 13270 retains the present rate of depletion for shale oil. It also recognizes that retorting of oil shale is a mining process. This properly takes into account the fact that the retorting of oil shale is essentially a process that separates the kerogen from the rock waste. The kerogen, which represents about 11 percent of the total volume of rock shale, must then be upgraded by coking and hydrogenation to process it into a crude petroleum.

This provision clarifies existing tax law and is desirable because depletion on the kerogen extracted from the rock shale is necessary if this important natural resource is to be developed.

TREASURY DEPARTMENT PROPOSALS

On September 4 and 5 the Treasury Department made two recommendations to your committee which would impose additional taxes on oil and gas producers. These recommendations would:

1. Include percentage depletion in determining the "limit on tax preferences" in all cases and include intangible drilling costs where less than 60 percent of the taxpayer's gross income is from the sale of oil and gas.
2. Tax as ordinary income gains on sales of mineral properties to the extent of intangible drilling costs previously deducted.

Limit on tax preferences

The Treasury Department's recommendation to include percentage depletion and intangible drilling costs in computing the "limit on tax preferences" (LTP) should be rejected.

On the first examination, the idea of LTP may have some appeal as a means of preventing escape from Federal income taxes by wealthy individuals. But on mature consideration it is questionable whether the basic concept of LTP is sound. The provisions for (1) exemption of municipal bond interest (included in LTP in the House bill but not in the Treasury proposal), (2) treatment of capital gains, (3) percentage depletion and (4) intangible drilling costs were written into the tax law after thorough analysis and evaluation by the Congress. They have been frequently reconsidered by many different Congresses and have been retained because there is good reason for them. The LTP approach, in effect, disallows almost 50 percent of these deductions for a limited number of taxpayers without consideration of the merits of the respective deductions. Actually, the proposal hurts those most who respond best to the incentives.

The Treasury Department's proposal, with its 60 percent rule, would be especially burdensome on the small independent producer even though he may not be personally subject to the rule. Many small producers depend heavily on suppliers of outside risk capital who would be affected by the proposal. If an investor cannot deduct all of his intangible drilling costs, his investments will obviously be curtailed. This would dry up an important source of capital for independent operators.

The Treasury Department stated last January that 154 individuals with adjusted gross incomes of more than $200,000 paid no Federal income tax in 1966. This statement has been given wide publicity and has been used to imply that percentage depletion was an important factor in these 154 individuals escaping taxation. On April 22, 1969, the Treasury Department revealed, however, that percentage depletion amounted to less than 1 percent of the total deductions which resulted in their paying no tax. Percentage depletion was so insignificant that the Treasury Department did not categorize it as a "major tax reducing factor."

Taxation of gains on sales of mineral properties

The Treasury Department has proposed that gains on sales of mineral producing properties be taxed as ordinary income to the extent of intangible drilling costs which have been allowed as deductions.

Adoption of this proposal would substantially reduce the real value of mineral properties. Consequently, it would make investment in exploration and development ventures less attractive at a time when there is a vital national need to make it more attractive.

This new proposal to tax gains on sales of properties as ordinary income is even more damaging to the industry's property values than is the proposal to treat production payments in ABC deals as loans. The combination of eliminating ABC deals and also imposing ordinary tax rates on gains from property sales would apply an "over-kill" technique which would create almost impossible obstacles to sales of mineral properties.

OTHER PROPOSALS

Other changes have been proposed that would reduce tax incentives for oil and gas producers. Three of these changes are (1) "plow-back" of depletion deductions, (2) capitalization of intangible drilling costs of development wells, and (3) graduated depletion rates. Each would reduce the incentive to develop domestic mineral reserves; hence, each is a threat to national security.

"Plowback" proposal

Under this proposal, producers would be permitted a 27½ percent depletion rate if they spend an equal amount in domestic exploration and development. The proposal is based on the false assumption that exploration and development expenditures are less than the industry's depletion deduction. The industry spent about $4.5 billion annually during the last ten years on exploration and development—almost twice the amount claimed for depletion. In addition to this false basis, the proposal has other defects:

1. The prospect of percentage depletion is, in part, what motivated the producers to explore for and develop the oil properties that are being depleted. Assistant Secretary Cohen correctly characterized depletion as a reward. He said, "If you are attracting capital for exploration, and a lot of capital is needed for exploration in oil and gas . . . it is difficult to get it from people if the incentive is given only so long as they keep their money invested constantly in exploration. If they cannot withdraw it, if the capital is not mobile, it will be difficult to raise."

2. If the depletion deduction is to be based on future exploration and development, then inevitably a producer's expenditures for exploration and

development will be influenced by and scheduled according to the amount of depletion that needs vesting. He may not be inclined to spend any more in a particular year than is necessary to cover the year's depletion even though he has attractive prospects. On the other hand, a producer who has not invested enough could make additional expenditures at no after-tax cost and would probably make additional expenditures even though his prospects were inferior. Thus, the "plow-back" requirement could induce one producer to spend money on inferior prospects and at the same time delay another producer from drilling prospects more likely to be productive. These are the dangers inherent in any subsidy approach.

3. Diluting the depletion incentive will deter others from entering the natural resource business, especially since those already in the business who have excess depletion would have lower costs of exploration and development through the vesting of past depletion. The natural resource industry in the United States, as a result, could become concentrated in fewer producers.

Many mineral producers have borrowed substantial amounts of money and have made firm and binding commitments for repayment. Some of these producers would be unable to repay these loans and also to maintain exploration and development expenditures high enough to satisfy "plow-back" requirements. As a result, those producers would lose a part of their depletion deductions; their tax payments would increase; and their ability to repay their present loans or to borrow money in the future would be impaired.

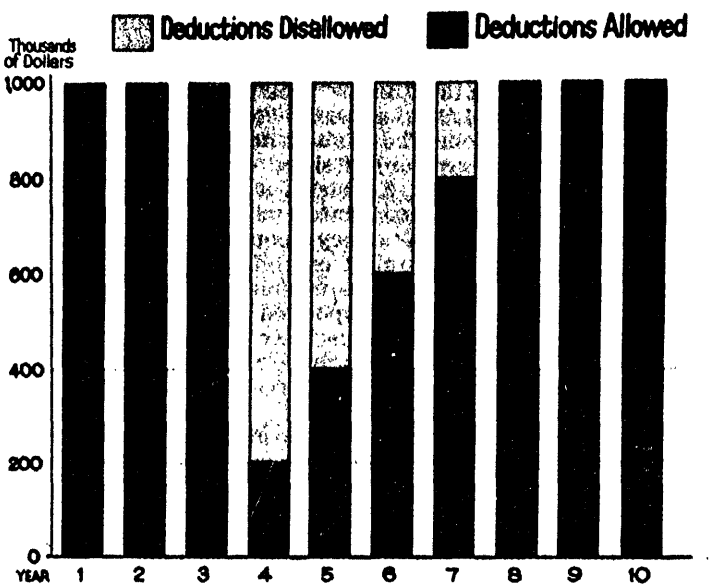
Capitalization of intangible drilling costs of development wells

The proposal to remove the current option to either capitalize or expense the intangible costs of drilling oil and gas wells is apparently based on the false assumption that taxes will be increased. Capitalization of these intangible costs will not ultimately increase taxes. It will merely change the timing of deductions. Deductions that can now be taken in the current year will instead be taken piecemeal over a period of years—the total deduction does not change.

The result of the proposal will be a serious disruption in funds available for exploration and development. The consequence will be a serious discontinuity in the finding and development of petroleum reserves in relation to the discontinuity of available deductions as shown by the example in Exhibit II. The resulting reduction in available funds would force small independent producers to withdraw from the industry. Using Exhibit II as an example, allowable deductions would be reduced $2 million over four years which, at a 50 percent tax rate, would reduce available funds by $1 million.

Exhibit II

Deductions disallowed if intangible drilling costs are capitalized



ASSUMPTIONS: 1. Annual Expenditures of $1 million
2. Capitalization Beginning in 4th year
3. Amortization over Five years

Percentage depletion at graduated rates

Proposals which advocate percentage depletion rates on a graduated scale according to the taxpayer's gross income are based on the false assumption that the industry is dominated by a few large companies. The industry actually consists of some 12,000 business firms with the four largest accounting for only about 24 percent of net domestic production, and twenty-three largest for only about one-half. This is a low degree of concentration when compared to other basic industries in the country.

One such proposal would change the depletion rates as follows:

Gross income	*Depletion rate (percent)*
$1,000,000 or less	27½
$1,000,000–$5,000,000	21
Over $5,000,000	15

The net effect of such a proposal would be to reduce percentage depletion for the industry as a whole to an effective rate of little more than 15 percent. Such a proposal would "punish" those who furnish the bulk of the nation's energy supply. Such a proposal would also reduce the incentive for a small company to grow larger. Penalizing success will not sustain the strong and viable petroleum industry needed to supply the energy requirements of our country.

The present tax law grants an exemption from the surtax for all corporations on the first $25,000 of taxable income. Large individual operators already are burdened by a progressive system of tax rates. To impose progressive depletion rates would double up on progressivity in a most inequitable manner.

In fact, the inequity of the graduated depletion type of progression is most obvious in the case of property owned jointly by a large company and a small independent producer. There is no more reason for this proposal than there would be for disallowing half of a large company's depreciation charges while allowing smaller operators the full deduction. After all, the value of oil in the ground is the same for all producers, regardless of size.

Moreover, the inherent risks in exploration are the same for large and small operators, all of whom have essential roles in the search for new petroleum deposits. No company is large enough to avoid these risks because: (1) they cannot participate in enough exploration ventures to be sure of achieving a success ratio equal to that of the entire industry; and (2) the size of any discovery in relation to its cost is unpredictable. Furthermore, we should not forget that while a corporation may be large, the ultimate taxpayers, in effect, are the many stockholders who in many cases hold relatively small amounts of stock in these large corporations.

SUMMARY AND CONCLUSIONS

While we know that the origin of the 27.5 percent oil depletion rate was one of compromise, we also know that Congress, in compromising at a level higher than any other extractive rate, recognized the unusual financial risks associated with oil exploration. These risks have not diminished. To the contrary, current conditions of exploration, offshore operations, and now the Arctic ventures all reaffirm, if not magnify, the risks.

As the financial risk associated with oil exploration has, if anything, increased, so has our national dependency upon oil, in terms of security. Through the years, the Congress, in continuing established incentives, has reaffirmed that the oil industry must supply the requirements of the nation under all conditions. The financial community has responded to the rewards offered, and the oil industry has utilized the capital effectively, as evidenced by our present national self-sufficiency in oil. This Committee must realize fully that an about-face in exploration activity and national security would occur if the various proposals discussed were implemented.

One other aspect of these proposed actions also troubles me. In preparing for this panel, in reviewing the proposed tax law changes and the published commentary and debate concerning them, I have detected something that cannot be analyzed or discussed in terms of economics or barrels of petroleum supply. Whatever it may be called, it is to me something completely alien to our form of government and our free enterprise system.

As applied to the oil industry, it indicates a desire on the part of many to "punish" the industry for being successful. It does not regard the success of the oil industry as the aggregate success of millions of employees, stockholders and property owners. It seems to disregard the success of the industry in enabling the United States to have the highest per capita consumption of energy in the world.

I believe that our industry is fulfilling its obligation to supply energy for this country at a price which has led to 75 percent reliance upon oil and gas and, concurrent with it, the greatest degree of industrialization of any country in the world.

ATTACHMENT A

THE CONSAD REPORT ON THE INFLUENCE OF U.S. PETROLEUM TAXATION ON THE LEVEL OF RESERVES

The conclusions of the CONSAD report can be given no credence because:

I. The mathematical formula (an "economic model") from which the conclusions are drawn is conceptually inappropriate for the purpose.

II. CONSAD, itself, issues repeated warnings about the pitfalls of its model-building. The combined impact of these cautions is a clear signal that CONSAD should have rejected this model, as it did two other models—and as it did *this* one for natural gas.

III. The quality of the data used in the formula is questionable, as is the method of manipulation.

IV. There are factual errors in the report.

V. The study proceeds from a number of doubtful premises about the economics of the petroleum industry.

I. *Inappropriateness of the CONSAD Formula*

The CONSAD study employed mathematical methods to predict the change in petroleum reserves that would result from elimination of percentage depletion. A fundamental error was made by using a formula that cannot answer this question. It was assumed that *production would not change* in the event of an increase in petroleum taxation, and the formula was designed to determine the level of reserves that would be required to accommodate the assumed fixed level of production.

Once it made the assumption that output is fixed regardless of profitability, it was inevitable that CONSAD would find that there would be little change in the desired level of reserves, since the required level of reserves is technologically determined by the level of production. It is indisputable, owing to the nature of petroleum deposits, that any given level of production requires a supporting amount of reserves which is a multiple of production—as CONSAD acknowledges on page 7.3 of the report. (To produce one barrel of oil annually, there must be about ten barrels of supporting reserves in the ground.)

CONSAD actually ignored the *real* problem, which is how the long-run level of output would change in reaction to a decrease in profitability resulting from increased taxation. Instead, CONSAD indefensibly assumed that the desired level of production is independent of the level of profitability of the industry.

Indeed, the CONSAD model makes no provision for unprofitability (except at a zero price of crude oil). The mathematical model is so formulated that it tells us that the industry would find and develop reserves even if price were less than cost. Any model which states that businessmen desire to invest when price is less than cost is indefensible because no firm desires to invest at a loss.

II. *CONSAD cautions*

CONSAD raised such an extended and serious list of objections to its own procedures that the reader should be convinced of the mathematical formula's lack of merit without further independent inquiry.

The formula was developed for use in describing the behavior of individual firms in manufacturing. CONSAD questioned whether the formula would be reliable if extended to the petroleum industry—see page 6.31.

CONSAD also questioned whether the historical data employed can be used to predict the future—see pages 6.12 and 6.13. In the report, it was said that "If the quantity of reserve necessary to support a certain level of output has changed during the period of the study, it will cause errors" in the estimates—page 6.13. (In fact, the ratio of proved reserves to production actually *has* declined steadily since 1960.)

CONSAD warns that reliable economic models require reliable data. In addition to the problem of finding reliable figures, it was recognized that there are massive problems in using the data. Perhaps the best example is finding costs.

"the most ambiguous area in the data in this study"—page 6.16. Computing industry finding costs involves multiple difficulties, e.g., (a) the impossibility of determining from industry data when the exploration dollars for a given year's discoveries were actually spent; (b) the difficulty of estimating how much has been found until a number of years after discovery; and (c) the random variability of the amount spent per barrel found from year to year.

III. *Statistical problems*

The CONSAD report points out that there are "many missing links" in the quantitative data available for making a reliable economic study—page B.1. It nevertheless proceeded with the study on the basis of estimated data and often relied on doubtful stand-in data to estimate the effects of important items for which it could not obtain direct information. Moreover, the data were used to predict the effect of a change in industry taxation for which there is no historical precedent. Such an extrapolation beyond the range of historical experience violates fundamental statistical principles.

IV. *Incorrect information*

The report contains factually incorrect statements. Some involve data—even matters as basic as the current level of U.S. crude oil production. Others refer to petroleum tax provisions which do not exist.

If a research company is so unfamiliar with the petroleum industry as to err on basic data and tax provisions, it is unlikely to have sufficient knowledge of the industry to be able to develop accurate complex mathematical models for analyzing industry behavior.

V. *Doubtful petroleum economics*

Some of the premises of the CONSAD study are, in our opinion, based on unreliable assumptions about the economics of the industry. A notable example of these propositions asserts that Canadian crude reserves can "substitute" for United States reserves. However, the amount of crude oil imports from Canada is limited by agreement between the two governments. Since crude oil imports from Canada are controlled, Canadian reserves—like overseas reserves—are not substitutes for U.S. reserves. Thus, CONSAD should not have aggregated Canadian and U.S. reserves in its economic model. And drawing conclusions from this model entailed the error of assuming that changes in the U.S. tax law would have the same effect on Canadian reserves as on domestic reserves.

Conclusion

No useful conclusions can be drawn from the CONSAD study because the mathematical model and the data are defective and because some of the basic premises are not appropriate. Indeed, it was predestined that CONSAD's exercise would be futile because CONSAD assumed that production would not change in the event of an increase in petroleum taxation.

Furthermore, we firmly believe that *no* aggregative mathematical mode of the oil industry—no matter how sophisticated—can be used as a guide to estimating the effects of eliminating percentage depletion. Two of the most important reasons for this are:

(1) Part of the period upon which such a model must be based (the 1950's and 1960's) was one of industry readjustment to excess capacity, a readjustment now well on the way to completion. Sound statistical theory holds that projection of a past period assumes that any changes that occurred in the base period will be repeated in the future. Since further significant adjustment to excess capacity is not likely, the 1950's and 1960's cannot be used as a base for forecasting the future.

(2) The largest year-to-year crude oil price change since 1950 was +30¢ per barrel (1956 to 1957). Elimination of percentage depletion would be equivalent to a price reduction of about 75¢ per barrel. Thus, any prediction of the results of such a tax change based on a model reflecting the 1950's and 1960's would require extrapolation far beyond the limits of the base period data.

Sound statistical theory holds that such extrapolation is invalid because there is simply no historical basis for evaluating how firms would react to changes so far beyond the range of experience.

CONSAD admitted the existence of these problems, but it proceeded undeterred.

Our criticism is not so much that CONSAD's exercise predictably proved futile, as that CONSAD drew serious public policy conclusions from its mathematical

model despite the obvious and admitted statistical problems involved in constructing any such model. The model used is especially subject to criticism because it is based on the improper assumption that industry exploration and development expenditures are not dependent on an adequate rate of return.

The CHAIRMAN. The next witness will be Mr. H. A. True, Jr., speaking for the Independent Petroleum Association of America, and Mr. Clinton Engstrand, chairman of the Liaison Committee of Cooperating Associations.

With these two witnesses will be representatives of the independent oil and gas producers of California: the Independent Oil Producers and Land-Owners Association, Mr. D. F. McKeithan, Jr., Kansas Independent Oil and Gas Association, Tom Schwinn, executive vice president and counsel, Oklahoma Home and Independent Petroleum Association, Mr. William B. McCleary, Panhandle Producers and Royalty Association, Mr. C. H. Hinton, Texas Independent Producers Royalty Owners Association, Mr. William J. Murray, and West Central Texas Oil and Gas Association, Mr. A. V. Jones.

Senator HANSEN. May I be permitted to add my personal word of welcome to Mr. Dave True, a longtime friend of mine. He has discharged a great many distinguished responsibilities with distinction to himself and the benefit of my State of Wyoming. He is president of the university board of trustees and, which I suspect he will confine his testimony today to questions pertinent and relevant to the oil business, I might also add that he has a very real interest as I know from personal knowledge of him in other facets of this total tax package, and I am pleased indeed and proud to welcome my fellow Wyomingite, Dave True, to this panel today.

The CHAIRMAN. There are some charts that the witnesses have and I will ask that they put them up here so the audience will see them.

Senator Pearson.

STATEMENT OF HON. JAMES B. PEARSON, U.S. SENATOR FROM KANSAS

Senator PEARSON. Mr. Chairman and members of the committee, taking into account the comments of the chairman and the size of this record, I am intimidated enough so I am going to make a very brief introduction of some outstanding men of the State of Kansas of the independent oil and gas industry.

I should like to introduce Mr. Clinton Engstrand, chairman of the Liaison Committee of Cooperating Associations and in addition thereto to introduce Mr. Hoover and Mr. Carl Sebits.

Mr. Hoover is president and Mr. Sebits is vice president of the Kansas Independent Oil and Gas Association.

The testimony this morning, Mr. Chairman, will be presented by Mr. Tom Schwinn, executive vice president and counsel.

I thank the chairman of the committee very much.

Senator HARRIS. I want to note the presence of Bill Cleary, president of the Oklahoma Independent Petroleum Association in Oklahoma, a man that I have found very easy to work with. He represents an association which speaks for an industry of tremendous importance to us in our State. We are privileged that he is here to speak for that association.

The CHAIRMAN. I do not see any Louisianian, but I am happy to see someone speak for the independents. We have a few left in Louisiana.

Proceed.

COORDINATED TESTIMONY OF INDEPENDENT OIL AND GAS PRODUCERS

STATEMENTS OF H. A. TRUE, JR., TRUE OIL CO.; CLINTON ENGSTRAND, CHAIRMAN, LIAISON COMMITTEE OF COOPERATING OIL & GAS ASSOCIATIONS; STARK FOX, EXECUTIVE VICE PRESIDENT, INDEPENDENT OIL AND GAS PRODUCERS OF CALIFORNIA; D. F. McKEITHAN, JR., PRESIDENT, INDEPENDENT OIL PRODUCERS & LAND OWNERS ASSOCIATION, TRI-STATE, INC.; TOM SCHWINN, B.S., LL. D., J.D., EXECUTIVE VICE PRESIDENT AND COUNSEL, KANSAS INDEPENDENT OIL & GAS ASSOCIATION; WILLIAM B. CLEARY, PRESIDENT, OKLAHOMA INDEPENDENT PETROLEUM ASSOCIATION; C. H. HINTON, PETROLEUM CONSULTANT, PANHANDLE PRODUCERS & ROYALTY OWNERS ASSOCIATION; WILLIAM J. MURRAY, JR., PRESIDENT, TEXAS INDEPENDENT PRODUCERS & ROYALTY OWNERS ASSOCIATION; AND A. V. JONES, JR., PRESIDENT, WEST CENTRAL TEXAS OIL & GAS ASSOCIATION

Mr. TRUE. Thank you, Mr. Chairman, and thank you, Senator Hansen, for your kind remarks.

I am H. A. True, representing the Independent Petroleum Association of America, and 10 other State and local associations who could not be with us as representatives today.

They are as follows: Bradford District, Pennsylvania, Oil Producers Association; California Independent Producers & Royalty Owners Association; Kentucky Oil & Gas Association; Michigan Oil & Gas Association; National Stripper Well Association; New York State Oil Producers Association; Ohio Oil & Gas Association; Pennsylvania Grade Crude Oil Association; Southwestern Pennsylvania Oil & Gas Association; and the North Texas Oil & Gas Association.

In the judgment of the domestic oil and gas producers, the adequacy of future U.S. oil and gas supplies is seriously threatened by proposed changes in Federal tax provisions. In addition to proposals that would adversely affect all businesses, including the petroleum industry, there are many proposed changes that would directly affect U.S. oil and gas exploration, development, and production.

The changes in petroleum tax provisions approved by the House and the additional proposals made by the Treasury Department would not only decrease substantially the funds available for exploration and development, but also greatly lessen the incentive to make investments in this high-risk business.

The ultimate victim would be the consumer who would be faced with less oil and gas, higher prices, or both.

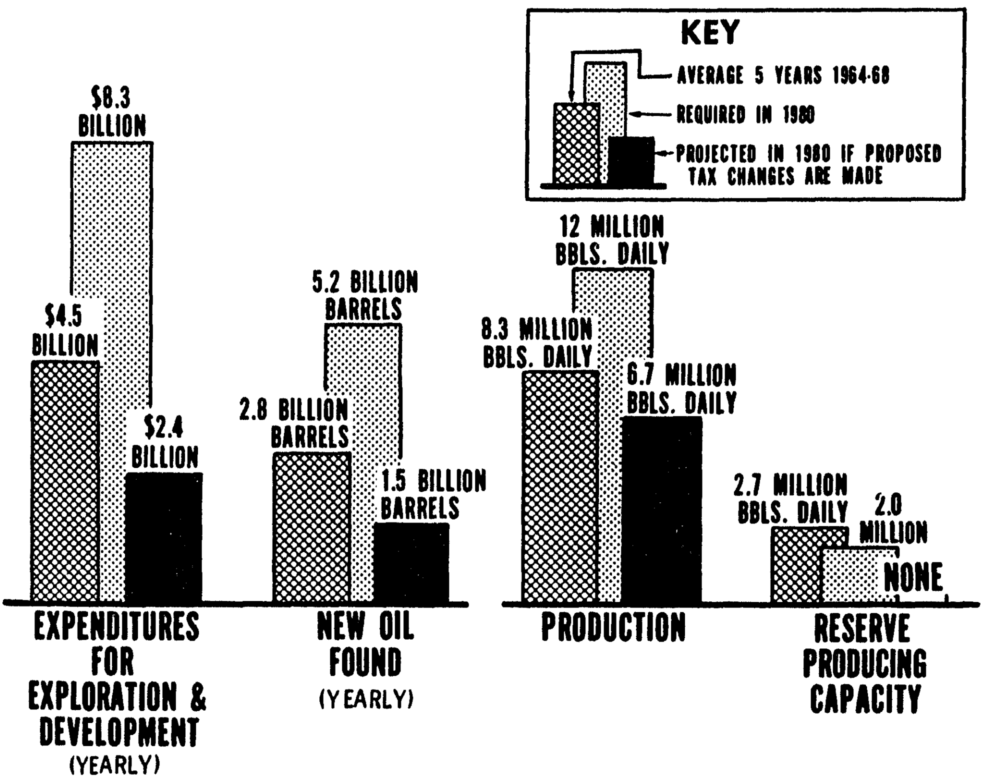
In the hope it will be helpful in your deliberations we submit our assessment of the overall long-range effect of adopting the proposed tax changes.

The results of our analysis are summarized on the chart before you now, which shows annual expenditures for U.S. exploration and development, total amount of new crude oil found yearly, the daily average domestic crude oil production, and the amount of reserve producing capacity.

In each case the first bar shows the average of the latest 5 years. The second bar shows the projected requirement for 1980. The third bar shows our projection of the situation in 1980 if the proposed changes in petroleum tax provisions are adopted.

You will note from the chart that the total expenditures for U.S. exploration and development would decline by about $2 billion or 47 percent from the level of the last 5 years.

U. S. CRUDE OIL SUPPLY



Expenditures in 1980 would total only $2.4 billion compared with the required expenditure of $8.3 billion, a deficiency of $5.9 billion or more than 70 percent.

At this point it should be noted that the proposed tax changes would have serious adverse effects upon expenditures and new discovery in the immediate future as well as in the long run.

In other words, it is estimated that about half of the $2 billion decrease from recent levels of expenditure would occur within the first 12 to 24 months, after the first tax changes were adopted. The decline in production would be less abrupt but equally serious. To assure adequate domestic supply with dangerous increased dependency on foreign sources, U.S. crude oil production should be expanded 12 million barrels daily by 1980.

This would be an increase of 3,700,000 barrels daily or about 45 percent over the average of the past 5 years. As a result of declining expenditure and less new oil found, however, production would decrease and fall far short of these requirements. The 1980 deficiency in crude oil production will result in imports supplying about 50 percent of the total U.S. requirements, with no U.S. reserve producing capacity. In fact, we would be increasingly and dangerously dependent on foreign oil in the very near future.

Senator ANDERSON. Could you state what those figures are? Where can we find those figures?

Mr. TRUE. We will submit a detailed statement of where these figures came from, of how we arrived at these conclusions.

(The following memorandum was subsequently received for the record:)

MEMORANDUM RE PROCEDURES USED IN ESTIMATING EFFECT OF PROPOSED TAX CHANGES ON U.S. CRUDE OIL PRODUCING INDUSTRY

This memorandum outlines the procedures used to assess the impact of the proposed tax changes on domestic crude oil supplies during the next ten years.

The assumptions and projections of U.S. petroleum requirements and supplies are based on a comprehensive study submitted by the IPAA on July 15, 1969, to the Cabinet Task Force on Oil Import Control. That study showed a growth in total U.S. requirements for petroleum liquids increasing from 14 million barrels per day in 1970 to 18.2 million barrels per day in 1980, an increase of 30 percent. Using the assumption that foreign oil imports would continue to supply approximately 20 percent of total U.S. requirements, estimates of required domestic crude oil supplies would increase from 9.5 million barrels daily in 1970 to 12.0 million barrels daily in 1980.

If the proposed tax changes affecting the U.S. crude oil producing industry were adopted, the impact on new oil found would be felt immediately due to lower available funds for exploration and development and progressively worsen so that, by 1980, estimated domestic supplies available would total only 6.7 million barrels daily compared with requirements of 12.0 million, or a shortfall of 5.3 million barrels daily. Further, after two years and continuing to 1980, U.S. production would be declining with no reserve available for emergency use.

Exploration and Development Expenditures

The proposed tax revisions would substantially decrease the retained funds available to producers for exploration and development activities because of additional taxes. Further, proved reserves in the ground not yet produced would fall in value. Third, and perhaps of equal or greater significance, such tax changes unquestionably would have the psychological effect of further substantial reduction in the incentive to invest capital in the high-risk business of new oil and gas exploration.

The proposed reduction in percentage depletion from 27.5 to 20 percent, coupled with the extension of the surtax, repeal of the investment tax credit, and the change in treatment of capital gains, are estimated in the aggregate to reduce both the funds available for exploration and development by the larger units of the oil producing industry and the incentive to risk capital. As a result, total expenditures for U.S. exploration and development by larger companies are estimated to decline by about 20 percent within the first 12 to 24 months following the adoption of the proposed tax changes.

Since other tax proposals would affect primarily the independent producer, (the treatment of production payments as loans, the allocations of deductions which could make percentage depletion and intangible drilling cost deductions less effective, inclusion of depletion as a "tax preference" for individual operators, limitation on expensing of intangible, or non-recoverable expenditures, by inclusion as a "tax preference" for individual operators that obtain less than 60 percent of gross income from the sale of oil and gas, and the taxation of ordinary income, under a "recapture rule" on the sale of oil or gas properties to the extent of intangible drilling costs previously deducted) the impact of all the proposed tax changes on the independent producer's funds and incentives would be far greater than the estimated 20 percent reduction for larger companies. We estimate, in the aggregate, a 40 percent reduction in expenditures for exploration and development activities by individual independent producers in the 12 to 24 months following adoption of the proposed tax changes.

These short-range effects of adopting the proposed tax changes may be summarized as follows:

TOTAL EXPENDITURES, U.S. OIL AND GAS EXPLORATION

[In millions of dollars per year]

	Actual 5 years 1964-68[1]	Estimated within 12 to 24 months after adoption of tax changes	
Larger companies	3,200	2,560	−640
Independents	1,300	780	−520
Total	4,500	3,340	−1,160

[1] Data from Chase Manhattan Bank.

Further erosion over the years in the funds available to the industry for exploration and development would take place because crude oil production would reach capacity within three years and decline steadily thereafter. An annual decrease of 5 percent is projected in funds expended for exploration and development activities from that time through 1980 due primarily to declining annual production volumes of crude oil.

New Oil Found

Since exploration and development expenditures are estimated to decline in the aggregate (larger companies plus independents) by 26 percent from year earlier levels in the year following change in the tax provisions, a similar 26 percent reduction was estimated for new oil found from your earlier levels. Beginning with the year when production is estimated to equal capacity to produce, new oil found was estimated to decrease 5 percent annually in concert with a similar percentage decrease in funds available for exploration and development.

Crude Oil Production

Currently the U.S. reserve capacity to produce crude oil amounts to approximately 2 million barrels daily. Thus, crude oil production could increase for a few years by drawing upon the reserve producing capacity in being even though smaller volumes of new oil were found annually than in the past due to a reduction in exploration and development expenditures. This situation would exist for only two years before production volumes equalled capacity to produce with no reserve capacity available.

Accordingly, our evaluation indicates that crude oil production could increase during each of the first two years following changes in the tax provisions by 2.5 percent and 3.7 percent respectively. In the third year, crude oil production would be equal to capacity since rising oil production in excess of new oil found during the preceding years would eliminate the reserve producing capacity available currently. In the third, and subsequent years, with new oil found declining 5 percent per year and production at capacity levels, crude oil production would begin to decrease annually and average only 6.7 million barrels daily in 1980 with no reserve capacity available. The deficit of 5.3 million barrels daily would constitute an additional import volume over current levels.

Proved Reserves

Lower volumes of new oil found due to the reduction in retained funds available for exploration and development coupled with larger volumes of crude oil production during the first two years after the proposed tax revisions were effected would eliminate reserve producing capacity and result in lower crude oil reserves as well. Proved domestic crude oil reserves would continue to decline each year thereafter in line with smaller and smaller volumes of new oil found in harmony with decreased spending for exploration and development. Crude oil reserves in 1980 would total only 19 billion barrels compared with required reserves of 40 billion.

Year end proved crude oil reserves were calculated by adding new oil found to the previous year's proved reserves and subtracting annual production.

Producing Capacity

Reserve producing capacity is a function of proved reserves and actual production. Crude oil productive capacity in January 1969 was 11.1 million barrels daily, compared with actual production of 9.2 million barrels daily, or a reserve capacity to produce oil from existing wells of 1.9 million barrels daily. The ratio of reserves to capacity during the period 1964–68 was 7.8 (31.2 billion reserves divided by 4.0 billion barrels annual production capacity).

Crude oil producing capacity for each year through 1980 was arrived at by dividing year end reserves by 7.8. The reserve crude oil producing capacity for a given year was arrived at by subtracting estimated crude oil production from the crude oil producing capacity total.

Mr. TRUE. This would be an intolerable situation from the standpoint of both national security and the maintenance of peace in the free world. Russia would be the only major world power in the position of self-sufficiency as to essential petroleum supply: the United States would have lost its posture of strength in petroleum and would become subject to the political pressures and demands of producing countries of the Eastern Hemisphere.

It should be emphasized that independent producers would bear the primary and most damaging impacts of some of the proposals, including the improper inclusion of percentage depletion and intangible drilling costs in the LTP proposal and the virtual elimination of one of the most important means of financing operations through carved-out production payments and ABC sales transactions.

The True Oil Co. by the way has sold several carved-out oil payments. This has been done for one purpose and one purpose only, to finance drilling obligations. It has been my experience that independent producers generally use carved-out oil payments and ABC transactions to raise needed funds, and not for tax purposes.

If the proposed tax changes were adopted, many independent producers, including our own operation with its 300 employees, would be forced to liquidate their properties and discontinue exploration and development activity.

Competition in the domestic producing industry and the multiplicity of effort has been a key factor in the discovery of new reserves and would be seriously reduced.

It is our firm belief that the proposed tax changes would result in a declining domestic petroleum industry, greatly reduced tax revenues in the oil industry for many hard-pressed local and State governments, less income to manufacturers, servicing companies and allied businesses, and in the final analysis less and not more Federal tax revenues.

In conclusion, we respectfully urge that the following additional considerations be taken into account by your committee.

First. A healthy expanding domestic industry has provided the assurance of adequate supply of both oil and natural gas, and would be the best assurance for the future.

It should be kept in mind that the efficiency of the domestic industry has provided petroleum energy—the producer's average price of both oil and natural gas combined—at a cost of less than $1.90 a barrel as compared with over $2 per barrel for imported oil. There is no saving or safety in relying on foreign oil.

Second. The domestic industry's activities in searching for and developing U.S. petroleum resources have declined to inadequate levels, imperiling the Nation's economic progress and future security.

Assurances of adequate oil and gas supplies to meet future requirements requires much more, not less, domestic exploration and drilling.

Third. The search for new reserves of oil and natural gas is interrelated and inseparable. Natural gas is already in short supply, and the proposed changes in tax revisions would aggravate and intensify the existing critical situation as to gas supply.

Fourth. To offset the effect of the proposed tax changes, and assure adequate supplies of both oil and gas, the alternative would be increased prices that would cost the consuming public billions of dollars annually.

Fifth. Governmental decisions as to the Federal tax revision and import policy will determine whether the historical position of the U.S. self-sufficiency and indispensable petroleum supply will be preserved or whether the United States will embark on a course knowingly leading to insufficiency and dangerous dependency on foreign sources.

Thank you.

Senator HANSEN. Mr. Chairman, may I ask one question?

Senator ANDERSON. Go ahead.

Senator HANSEN. I have often heard the inference made that oil producers pay no or little Federal income tax. What is your experience in that regard?

Mr. TRUE. Senator Hansen, I have been in business for 21 years. I have personally paid income tax each of these 21 years and, in addition, our total operations have paid substantial amounts of Federal income tax over these years.

To put it in perspective, I think we have paid about nine times as much income tax as my family and I have personally withdrawn from our business.

Senator CURTIS. Mr. True, were you in the room a few minutes ago when I asked about the effects upon a State such as Nebraska, with a very small oil industry if the House bill passes?

Mr. TRUE. Yes, sir; I was, Senator.

Senator CURTIS. I would value your opinion because Wyoming is an extension of the Panhandle of Nebraska. We are very fond of our neighbors. What do you think the enactment of the House provision would do to our rather small, very small oil industry in Nebraska?

Mr. TRUE. Senator, I believe I could possibly elaborate a little by looking at the chart. The expenditures as you see under these provisions we estimate to go down $2 billion, and certainly the oil industry as a whole is going to look for the very most prolific areas in which to spend the reduced exploratory funds.

Senator CURTIS. In other words, the marginal areas will be hit worse than those that there is good reason to believe would provide quite rich and sustaining yield?

Mr. TRUE. That is correct, and your State as well as mine are kind of out on the end of the main pipeline system, and this gives us another disadvantage already. In other words, our transportation costs to the main markets are higher.

Senator CURTIS. Thank you very much.

Senator HARRIS. Mr. Chairman, I want to ask Mr. True a question. You indicated the high risk involved in the industry, and I wondered if from your own personal experience you might give some further elaboration on that point?

Mr. TRUE. With your permission, Senator Harris, I will give the worst first and the best last. During these last 3 years we have participated in 68 oil wells, not exploratory oil wells but total oil wells. Out of that 68, we drilled 64 strictly dry holes. We have drilled three subcommercial producers which will probably not return the cost, and we have drilled one infield well primarily for secondary recovery purposes, so our success ratio has been terrible and it certainly substantiates the risk ratios that the former panel was talking about.

On the other hand, we went through a period prior to this 3 years where we discovered several not significant but for our country satisfactory oilfields in this same area, and it was at that time that some referred to us as the lucky oil company, because we did have a good series of success.

What I am trying to say, you have such tremendous peaks and valleys in finding oil, because you cannot tell what is there until you dig a hole in the ground.

Senator HARRIS. Thank you, Mr. Chairman.

Senator MILLER. Mr. True, are there both unincorporated and incorporated independents?

Mr. TRUE. Yes, sir.

Senator MILLER. Are there some independents either incorporated or unincorporated who gross over $1 million a year?

Mr. TRUE. This brings a pretty tough definition to mind--just what is an independent. There are some rather large incorporated companies that gross over $1 million a year, which have production alone.

Senator MILLER. Well, are there members of your association that gross over $1 million in sales?

Mr. TRUE. Yes; we have several members who gross over $1 million.

Senator MILLER. Are there any that gross over $5 million?

Mr. TRUE. Yes.

Senator MILLER. Because one grosses $6 million and another grosses $4 million, does it necessarily follow that the one that grosses $4 million has more net profit?

Mr. TRUE. No, sir; it does not necessarily follow.

Senator MILLER. Thank you.

Senator ANDERSON. You said that there are 68 wells and 63 of them were dry holes?

Mr. TRUE. Sixty-four were dry.

Senator ANDERSON. Were they dry holes?

Mr. TRUE. Yes, sir.

Senator ANDERSON. Who is your banker?

Mr. TRUE. I am a member of the board, Senator.

Senator ANDERSON. You cannot stay in business very long.

Mr. TRUE. That is true, Senator, but we had a successful period prior to this and frankly we are still living on our success of the early 1960's.

The CHAIRMAN. Do the other witnesses wish to make a statement?

Mr. TRUE. Yes. I think Mr. Clinton Engstrand has already been introduced, but he will take over from here.

Mr. ENGSTRAND. Thank you, Mr. Chairman and members of the committee.

I do not want you to be alarmed by this big panel because they have been instructed to be very short-winded. They have a few remarks to make and they will hold them very briefly. I am authorized to appear here as chairman of the liaison committee of the Cooperating Gas Associations and organizations consisting of representatives from 21 independent producer oil and services associations located throughout the Nation.

Our group range geographically from Alaska to the gulf coast and from California to Pennsylvania.

The producers we represent operate almost exclusively in inland areas of the United States and concentrate their activity and their exploration development and production segment of the domestic oil industry.

Consequently we seek national tax policies that encourage rather than discourage development of domestic oil reserves.

Independents operate as individual small partnerships or in venture combinations of small corporations. However, they do rarely incorporate, thereby maintaining the freedom required for well-drilling decisions, subject of course to veto by the bankers.

They are therefore highly vulnerable to any adjustment in current tax laws that offer them the incentives needed to drill.

There are several of the member associations who have representatives here at the table and I am going to call on them to make a short statement and then, when they have completed their short statement, I would like to have a couple of minutes to summarize if time permits.

So first I would like to call on Mr. Jack McKeithan. He is the president of the Tri-State Oil & Gas Association, composed of Indiana, Illinois, and Kentucky.

Jack, would you take over.

Mr. McKEITHAN. Thank you, Clint.

As Mr. Engstrand has said, I am from the tristate area of Illinois, Indiana, and Kentucky representing the Independent Oil Producers & Land Owners Association, whose membership is composed entirely of small independent oil producers and landowners located in those three areas.

Before I proceed, I would like to go on record on behalf of my association as supporting fully the other testimony to be given here today by the independent associations from throughout the country.

In our judgment their remarks are sound and accurate.

I want to confine myself to making a few statements to you gentlemen as to the possible effects of tax revisions on the industry in my area, because you may not know how significant what you do could be in its effect on us.

The oil industry to which I refer is almost exclusively composed of small independent producers, suppliers, and drillers. They are the same type of independent who has historically found 80 percent of our reserves. His usual operation is long on guts, short on capital, but nevertheless he manages to get out, drill, and search for oil. Normally he raises the principal portion of his exploration capital from investors outside the oil business, from men and women who can afford to risk capital on the 1-in-15 chance that he will find oil in our area.

Ironically, these same investors who provide the funds necessary to our small independents are now primary targets of this Congress in its effort to revise the tax structure.

The proposed revisions, if adopted, can only affect adversely those individuals and firms now engaged in our oil and gas industry. This consideration alone is not necessarily a valid reason for avoiding change. However, all the consequences of a tax change must be measured not only in terms of the immediate revenue expected to be realized but more importantly in the long-range effects to be expected in the overall impact on the economy and security of our Nation.

In our tristate area reduced depletion rates will seriously cripple our segment of the industry. This would result in a curtailment of employment, with the resulting loss in payrolls and taxes as well as the loss of oil production, and consequently the loss of royalties to our landowners and taxes to our counties.

If it can be recognized that a cut in the present depletion schedule would seriously cripple our tristate industry, it is even more apparent that a change in the manner of deduction of intangibles will literally, and we believe without exception, destroy our oil business.

We have over 1,500 small businessmen employing approximately 30,000 men and women who annually contribute a gross of about $400 million to our economy, which includes $30 million annually paid to landowners in the form of royalty, and over $6 million in taxes to the local county governments.

As noted, the proposed tax change will not render a temporary hardship upon these independents; such a change will virtually eliminate them as a contributing segment of our economy.

Our local economy would be unable to compensate for such a loss.

More important still, our country cannot afford to lose this segment of its domestic oil industry. Once it is lost, it is doubtful that even the reserves of the skilled technicians could ever be replaced.

In conclusion, therefore, I submit that the action of this committee will very definitely determine the future course of the independent in our area. Unfortunately the choice is not one of compromise. Our very livelihood depends on the actions you men take. Thank you.

Mr. ENGSTRAND. Next is Mr. William Cleary from Oklahoma, president of the OIPA.

Mr. CLEARY. Thank you, Clint.

In terms of the impact on my State—where as many as 40,000 jobs may be at stake—and perhaps on the Nation, the next 3 minutes may be the most important ones of my life. You will hear about Oklahoma independent producers, their impact upon the Nation's energy supply, and the effect of depletion on them.

Our State produces about 500,000 barrels of oil per day, roughly 6 percent of the Nation's total and about 7 percent of its natural gas. Perhaps more important, our operating area contains more than 10 percent of the probable undrilled reserves of natural gas.

For the past 2 years independents have drilled more than 85 percent of the exploratory wells in our State. Because the majors are devoting more and more of their budgets to offshore areas and Alaska, we expect to be responsible for even more of the drilling in the future.

Demand in our area is outrunning supply, even with existing prices and present tax incentives. We have not produced enough oil each month for nearly 2 years to meet the pipelines' demands.

The supply-demand situation in natural gas which particularly affects the Northern States and the eastern seaboard is even more critical, and I am sure that you all are aware of the precipitous drop in the reserve supply.

We are doing our dead-level best to attract capital to find new reserves with present incentives and we cannot keep up with demand. We need all the help we can get from you. More than 70 percent of our risk capital—that is our, the independent's, risk capital—comes from outside the industry in Oklahoma. The threat of tax changes has already caused a substantial drying up of that risk capital just in the past 2 months.

Mr. Jones will tell you of the importance of currently deducting nonrecoverable costs in attracting capital. Depletion is also important and I have a suggestion concerning it.

The depletion concept is sound. When we produce a barrel of oil, we have one less barrel of total reserve in the ground. You might think of us as an apple farmer who cuts off a limb with each apple he harvests, so that when the crop is complete he has no more tree.

The Congress has wisely said that the whole oil crop should not be considered income. A portion of the proceeds should be set aside as a seed crop free of tax liability so that our oil farmer can plant another tree and hopefully raise another vital crop. I can assure you that the risk of crop failure is extremely high.

Oil and gas percentage depletion is presently set at 27½ percent of gross income but is limited to 50 percent of net income. In Oklahoma this limitation accounts for the fact that independents get around 21 percent rather than 27½ percent. The restriction hurts us most when production becomes marginal and we need all the capital we can get for reinvestment.

We believe it is politically feasible to remove this restriction on percentage depletion. Such removal would help our incentives to explore for new reserves. We urge you to consider seriously the removal of the 50-percent net-income limitation when you consider all aspects of percentage depletion.

Thank you.

Mr. ENGSTRAND. Next on the panel is Mr. Charlie Hinton. He is representing the Panhandle Producers & Royalty Owners Association.

Mr. HINTON. I am a petroleum consultant. I live at Amarillo, Tex. For the past 33 years I have spent the major part of my time on the many problems related to natural gas supply and the requirements for natural gas. I am appearing here as a member and in behalf of the Panhandle Producers & Royalty Owners Association.

I have filed a formal statement with the committee detailing the supply of natural gas available to the consumers of America, anticipated needs in the future, and the effect of changes in the Texas laws on meeting those needs. I appreciate this opportunity to summarize within the few minutes allotted to me the situation facing our Nation with regard to natural gas which supplies a third of our total energy requirements.

I respectfully call your attention to these facts. Natural gas is a relative newcomer as a widespread source of energy, its use has grown tremendously since World War II. The householders and industry have demanded more and more natural gas because it is economical, it is adaptable to thousands of industrial uses, and it is clean. It does not pollute the atmosphere. This is of paramount importance today.

Within the past 13 years production of natural gas has almost doubled from 10.1 trillion produced in 1955 to 19.4 trillion cubic feet in 1968. But the available supply of natural gas has not kept up with demand.

In 1955 we had a reserve life index, the ratio of annual production to recoverable reserves, of 22.1 years. In 1968 this reserve life was only 14.8 years. This is for the ultimate recovery of those reserves, and it certainly does not mean that there will be a full supply of natural gas for 14.8 years.

The full supply, based on 1968 production, would only last for a period of 3 to 4 years. In 1968, for the first time in history, production of natural gas was greater than the new reserves discovered and developed. It is obvious that, if this trend continues, the Nation will run out of natural gas in the foreseeable future.

At the same time future gas requirements are estimated to increase to 25.5 trillion cubic feet in 1975, and 36 trillion cubic feet by 1990. I do not mean to imply that someone will go cold next winter for lack of natural gas or the winter thereafter, but I do say that, if proper steps, proper incentives, are not provided now, that there will be a natural gas crisis of shameful proportions in 5 to 10 years. That is because there is a timelag of several years after the first well is drilled before a new field is put into full production and gas from that field can be brought to the consumer.

Historically the natural gas industry has depended on the producer segment of the industry to find its supply. For many years oil well gas supplied a third of the Nation's gas requirements.

That has shrunk to 20 percent. The number of wells drilled has declined sharply from more than 57,000 in 1956 to just over 30,000 in 1968.

There are new gas reserves to be found. Present estimates are estimated at 287 trillion cubic feet. We estimate that there is an additional 1,200 trillion feet to be found, including 400 trillion to be found in Alaska, but this requires enormous outlays of money. It requires incentive and it requires the support of Congress.

National policy requires that the production of energy be stimulated, not retarded. One of the prime elements in our national economic progress, an essential ingredient of our standard of living, is adequate sources of energy. This is true of all industrialized, economically strong nations.

As Congress determines the direction in which we move, it occurs to me that assurance of adequate energy sources should be high on the priority list.

Gentlemen, this Nation runs on energy. Cutting incentives such as the depletion allowance or intangible drilling costs, which have played a vital part in providing that energy, will have a negative effect on the long-range interests of every American.

With regard to natural gas, which is in short supply right now, I hope that a few years from now this committee is not faced with debating how to stimulate production to meet national needs. For that reason I hope that you will support the present policy which has served this Nation well.

Mr. ENGSTRAND. Next on the panel is A. V. Jones, president, West Central Texas Oil & Gas Association.

Mr. JONES. Mr. Chairman and members of the committee, my name is A. V. Jones, Jr., and I am an independent oil and gas producer and live in Albany, Tex. I appear here today as president of the West Central Texas Oil & Gas Association as well as representing the members who belong to our association. I would like to present myself as an individual small businessman, widely experienced in oil exploration and development.

Gentlemen, we feel that the consuming public, and that means all the people of this Nation, has been well served by the petroleum industry. Few industries had supplied the consumer with continually improving products at essentially the same real price.

We maintain that any adverse tax legislation aimed at the petroleum industry will directly affect all consumers. To supply the energy needs of this Nation, most governmental and industry reports emphasize the fact that petroleum exploration must be increased substantially over the next few years.

Historically the independent segment of the petroleum industry explored for and found most of the domestic production. In other words, the necessary domestic exploration effort, the nonrecoverable costs of exploration and drilling known as intangibles, must continue to be recognized as essentially business expense for all participants in the oil and gas industry. There must be no limitation of any kind. All the nonrecoverable costs must be deductible when they are incurred.

Petroleum exploration is a very risky enterprise, and correspondingly there must be substantial profits to balance extensive losses. Many of the people participating in our business are successful, but most of them lose. These losers are a necessary part of the industry.

Legislative proposals have often questioned the need for deducting intangibles from taxable income. Intangibles are the costs of finding petroleum and drilling the wells necessary to produce the oil or gas. They are routine normal costs such as labor, fuel, drilling fluids and bits, and other contracting services.

Gentlemen, these normal expenses are not unlike the nonrecoverable costs of doing business which are deducted by all industries. There should be no limitation whatsoever on what can be invested or reinvested in the business of oil and gas exploration to provide for our Nation's needs.

Most of the currently proposed oil industry tax reforms are directed directly at the small businessman engaged in oil and gas exploration and development. To be specific, so-called limit on tax preferences is applicable only to the individuals, partnerships, trusts, and small corporations. This is a punitive proposal which if it becomes tax law will practically wipe out the independent segment of the industry when the need for our efforts has never been greater.

Not only will the LTP provision wipe out the independents in oil and gas exploration but it could ultimately create a major-company monopoly by destroying all the small businessmen. It does not seem likely that the intent of tax reform is to foster any monopoly, but it will be the inevitable result if there is any limit placed on the amount of drilling that the independents can do.

The basic economic facts of fundamental importance to our industry and the national security have become obscured and confused. It appears that the emotional aspects of tax reform proposals have shaped into a discriminatory program, not to a soundly considered piece of tax legislation.

Instead of creating the necessary economic climate for the expansion required, the proposals you are looking at would destroy most of the incentive for petroleum exploration.

Thank you.

Mr. ENGSTRAND. Next on our panel is Mr. Tom Schwinn, executive vice president of the Kansas Oil & Gas Association.

Mr. SCHWINN. Mr. Chairman, members of the committee, we thank you for the opportunity to appear.

Kansas Independent Oil & Gas Association is one of the largest independent petroleum associations in America. It has no major company members, and it is producer-oriented.

In Kansas the independents play a predominant role in the oil and gas industry. You all know, I think, that historically Kansas has been one of the leading producers of both oil and gas. But I think you might be interested to know that in 1968 independents drilled 96 percent of all the oil wells in Kansas, both development and wildcat. We produced 65 percent of all the oil in the State.

Now, taking that fact into consideration, we submit that it is obvious that in Kansas, and we think also perhaps in most of the great oil producing provinces of the United States, the development of our petroleum resources on shore is going to rest in the hands of the domestic independents.

Now, it is absolutely vital that the tax policies which have fostered and encouraged the development of our Nation's resources be maintained and improved. It is especially important that these incentives, as we term them, be maintained for the independent because of the peculiar way in which independents raise their capital.

Indepedents raise a great deal, may I say most, of their capital from sources outside of the industry, whereas larger, more integrated companies are able to generate at least a certain part of their capital from the sale of products and other matters, and it is going to be impossible in the future, considering the great risks involved, for independents to attract risk capital into this vital industry unless these incentives are maintained and improved.

Of all the incentives currently available to us, the privilege of expensing intangibles is the one most important. I would like to term it the sine qua non of the independent oil business, because no businessman will take the awful risk to look for oil and gas unless he has the privilege of deducting out in that year his cost of participation.

Depletion, of course, is also very, very important, and it is my judgment that, in Kansas, all the active independent oilmen, the people that are actually out looking on a daily basis for oil and gas, are more than drilling up depletion.

Now, we recently did a study of a great number of independent operators in Kansas, and I intend to furnish members of this committee with the study. It is composed of figures not on a selective basis but total figures, company by company, taken from 1968 tax returns which show that the average independent in Kansas does not realize 27½ percent but realizes 20.4 percent.

The cut suggested by the House would reduce that level to below 15 percent, and, gentlemen, we suggest that that would be disastrous.

Now, as I pointed out, indepedents drill most of the wells in Kansas, 96 percent last year. The percentage is going up. Several of the Senators have questioned the availability of gas supply, and I would like to make one remark that has not been made, but it should be, and that is that most gas is found in connection with the search for oil. This is particularly true in Kansas.

Kansas stands seventh in the production of natural gas, but there is literally no available supply of free gas in Kansas for dwelling heat and industrial development because of the intrusion of the Federal Power Commission into the production of natural gas. All the big reserves in our field are tied up. Nevertheless, we need to continue the search for these small gas fields which cumulatively are very important.

As our reserves of gas and oil have gone down, and we have submitted, I think, a graphic chart which appears on page 198 of the committee print today. We are not only running out of these items, we are running out of oilmen. The University of Kansas used to have a petroleum—a fine petroleum engineering department. They do not even call it a department any more. It is a little cubbyhole with one or two students enrolled, and I think that this is happening in most of the great universities of the Midwest and Southwest.

Now, we have done a particular study on the limited tax preference proposal by the Treasury Department. I would very quickly like to go over those. Although not mentioning the proposals formally, quite a number of Treasury officials have talked about the inclusion of capitalization of intangibles. This would be disastrous.

Depletion again is very important. The effect of LTP proposals, though, if you mention sound assumptions, would be most adverse upon the young oil operator or the new small investor in the business. It would not be so harsh on perhaps other classes.

We think the recapture rule that is suggested in the LTP would be very adverse, because it would not only deny the privilege that independents now have of selling a lease to pay off a bank, but it would require the maintenance of records over years and years, the result being maddening.

There has been some talk today about losses that the industry might incur or do incur and thereby affect their tax position, but the petroleum industry is a great deal different than most other kinds of industries.

There are offset obligations, there are farm-out commitments, there are production problems that occur in the last quarter of the year. There are very expensive problems in deep holes, any of which can occur at any time and do, to completely revise a well-planned, prudent program.

Therefore, we say that the Treasury proposal with respect to tax preferences should be turned down. In our State we pay over $20 million in ad valorem taxes. This goes to a great extent to support the schools and local governments. Many of our counties, and of the 105 we have got 90 that produce oil and gas, over 50 percent of their total revenue in the counties support schools and local government, is paid by the oil and gas industry, most of which as I say are independents.

We have attached at the very rear a study that was done by the Kansas Geological Survey in conjunction with the economics department of the Kansas State University which graphically shows the contribution that the petroleum industry makes, the producing petroleum industry makes, to our State of Kansas, and we submit to you therefore, gentlemen, that both the proposals contained in the House bill and the Treasury Department proposals with respect to our industry be rejected.

I thank you very much.

(The committee subsequently received the following statement from Senator Pearson relative to the preceding testimony:)

Statement of Hon. James B. Pearson, a U.S. Senator From the State of Kansas

Mr. Chairman, I have read and studied the testimony presented by Mr. Tom Schw[illegible] and Mr. Richard Hoover representing the Kansas Independent Oil and Gas Association, (KIOGA). I think theirs is an excellent statement and an effective analysis of the very adverse impact that HR 13270 would have on the Kansas independent oil and gas industry and the state economy as a whole. I want to endorse KIOGA's statement. I believe it is a real contribution to the record of these hearings. I know that the members of this committee and the staff will give it careful consideration.

Because of this excellent statement by the KIOGA representatives I will not make detailed comments about the specifics of those provisions of HR 13270 pertaining to oil and gas. However, I do want to make some general observations.

There are many myths which surround the oil industry in this country. There is the popular image of the oil man as a cigar-chewing, Cadillac-driving fat cat whose money comes not from oil wells but from tax loopholes.

These myths and popular images are especially far removed from reality insofar as the independent oil producer is concerned. I am keenly aware of this discrepancy because in Kansas, which ranks seventh among all the states in crude oil production, the oil industry is made up primarily of relatively small, independent operations. The typical Kansas independent producer is a hard working businessman engaged in high risk oil and gas exploration. It is the independent who is carrying on the tough and speculative business of finding and developing new oil reserves.

From my own observations and study of the Kansas oil industry I am convinced that the depletion allowance continues to be used as originally intended, an incentive for new exploration. I am also convinced that the present practice of expensing non-recoverable business expenses (intangibles) is essential to economic viability of the independent domestic oil industry. This practice is vital to the independent's financing procedures.

In a very real sense the incentives to oil and gas exploration and development are more important today in Kansas than in the past. The principal and more obvious pools have already been identified and the development of new reserves is increasingly more difficult and more expensive.

Crude oil and natural gas reserves in Kansas are declining at a dramatic rate. The number of operators is declining and fewer wells are being drilled.

These trends have disturbing implications for the nation and particularly for the economy of the State of Kansas. About 13 percent of the total economic output in Kansas is based directly or indirectly on oil and gas production. Thus it is obvious that any substantial decline in this vital sector would have adverse ramifications for the entire state economy.

Studies conducted by KIOGA have shown that the enactment of HR 13270 would have the effect of sharply curtailing new exploration and development activity by independent operators in Kansas. As 96 percent of all exploratory and development wells were drilled by independent operators in 1968, it is apparent to me that the oil and gas industry would thus suffer a great deal.

I have couched my statement primarily in terms of the relatively small independent producer because I am most familiar with his problems and concerns. This is not to imply, however, that HR 13270 would not have an adverse effect on the major oil companies as well.

Mr. Chairman, in closing let me just say that I believe the requirements of economic growth in Kansas includes a continuation of the present structure of incentives for oil exploration essentially as it is.

Mr. Engstrand. Next on our panel is William J. Murray, president of the Texas Independent Petroleum & Royalty Owners Association.

Mr. Murray. Mr. Chairman, I came here representing an independent association. I have a prepared statement and a summary which I honestly thought adequately represented their viewpoint and merited your attention, but that was before I realized how much information you have already received.

As I have listened to these other witnesses, the points that I wish to make have been covered. Perhaps I covered them a bit differently. And so if I may, rather than present my prepared summary, might I just confess first of all that, even though I am president of an independent association, I am not a producer of oil or gas or a royalty owner, and my real and honest concern is that of national welfare, of the survival of this Nation.

I would rather than refer to my testimony like the privilege, which may be presumptuous, of endorsing the statement that the distinguished Senator from Wyoming made yesterday relative to the desperate importance of energy to the survival of this Nation.

May I state somewhat of my background. While I come here as a representative of an independent producing association, most of my life I have been employed by Federal and State Governments. I was a teacher of petroleum conservation engineering at the University of Texas. I was a conservation engineer for the Federal Government and for the State of Texas. For many years I was a member and chairman of the State Conservation Regulatory Commission of Texas; I chaired the gas conservation committee.

For 14 years I was chairman of the Petroleum Research Committee. I chaired the Engineering Advisory Council. I was the staff member for the Federal Government for the first study made prior to and at the beginning of World War II of the availability for military needs of oil.

I many years later chaired a confidential study made for the military of the availability of oil for energy in this Nation.

May I state, therefore, that, based on this long experience, I am deeply and dreadfully concerned that the Nation is today not truly aware of the energy crisis that we face, not because of any brilliance but because I so long had to study it and I had available for study records that are not available to many other persons of the overall picture.

Let me acknowledge that those who tell you today that they are not alarmists but that they are concerned about our supply in the future are in my judgment still being overly conservative and that crisis is much closer at hand than has ever been stated.

Therefore, I endorse the statement of the distinguished Senator from Wyoming that we need shale oil. It is distressing that there has not yet been a breakthrough. For 15 years we have been talking about the potential reserves in shale oil, but we do not have them yet.

I am excited and thrilled over the discovery in Alaska. We are going to need every barrel of that. And unfortunately we are going to have to turn to an increasing degree in the future to these admittedly insecure foreign reserves of oil. But so long as it is possible to produce domestic continental reserves of oil and gas, our consumers will be better served and our security will be much less impaired. And so I simply state to you without burdening you with any repetition of the concern of any punitive legislation, tax or otherwise, against the oil industry, that the independent producer is expendable as far as I am concerned, but the results of the independent producers' exploration are vitally needed to this Nation.

One and only one comment about the tax proposals. There has been one proposal, I believe, advanced by Treasury, which I understood was somewhat of a compromise, which would not take away from existing independents earning more than 60 percent of their income from oil those present tax privileges that are necessary for their continued existence in the oil business.

May I simply say as one who is not in the oil business but in hearing Mr. True I do not believe I was in, but I would like that privilege. I would ask that you not consider putting in something that is going to make a closed union like the diamond cutters' union out of the oil industry, and would prohibit from those of us who might like to go in but are not earning 60 percent, not earning anything from oil today, do not close us out, if we some day think we know where to find oil and produce it. Please leave us who are not yet in it the same opportunities.
